cycleZeroTare	BYTE	16#00	Tare/zeroing cycle 16#00 = each weighing procedure is zeroed or tared 16#01 = one fill is not zeroed or tared 16#02... 16#63 = 2...99 fills are not zeroed or tared Other definitions not permitted.
xxxReserve3	WORD	16#0000	Reserve (use not permitted)
minTareValue	REAL	0	Minimum tare weight Taring or external tare input is performed only if gross > minimum tare weight 0 = minimum tare weight is not monitored
maxTareValue	REAL	0	Maximum tare value Taring or external tare input is performed only if gross < maximum tare weight 0 = maximum tare weight is not monitored
timeAutoZeroing	TIME	T#5m	Cycle time for zeroing = 0ms: No time-controlled neutral position ≠ 0ms: Time between two neutral positions **Note:** For weighing mode AWI and country code "OIML", zeroing/taring is performed after 15 min., at the latest.
Step control / check stop			

Name	Data type	Default	Definition
waitDI1InStepX	BYTE	16#00	Step control via digital input 1 Instead of using parameterizable command codes for the digital inputs, step enabling for weighing control can also be controlled via the inputs. The requirement for this is that DR7 (interface parameter) must contain 16#FF. 16#00 = weighing waits in step 0, if DI1 is active 16#01 = weighing waits in step 1, if DI1 is active 16#02 = weighing waits in step 2, if DI1 is active ... 16#07 = weighing waits in step 7, if DI1 is active Other definitions not permitted.
waitDI2InStepX	BYTE	16#00	Step control via digital input 2 (see **waitDI1InStepX**)
waitDI3InStepX	BYTE	16#00	Step control via digital input 3 (see **waitDI1InStepX**)
waitDI4InStepX	BYTE	16#00	Step control via digital input 4 (see **waitDI1InStepX**)
waitDI5InStepX	BYTE	16#00	Step control via digital input 5 (see **waitDI1InStepX**)
waitDI6InStepX	BYTE	16#00	Step control via digital input 6 (see **waitDI1InStepX**)
waitDI7InStepX	BYTE	16#00	Step control via digital input 7 (see **waitDI1InStepX**)
xxxReserve4	BYTE	16#00	Reserve (use not permitted)
timeOutOneStep	TIME	T#0ms	Monitoring time for step control = 0ms: No monitoring > 0ms: Time target for monitoring If a transition to the next step does not occur within the defined time, the "transition timeout" technology error is issued.
stopAfterStep1	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 1 **FALSE** = no check stop
stopAfterStep2	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 2 **FALSE** = no check stop
stopAfterStep3	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 3 **FALSE** = no check stop
stopAfterStep4	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 4 **FALSE** = no check stop
stopAfterStep5	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 5 **FALSE** = no check stop
stopAfterStep6	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 6 **FALSE** = no check stop
stopAfterStep7	BOOL	FALSE	Check stop definition **TRUE** = weighing goes to check stop after step 7 **FALSE** = no check stop
xxxReserve5	BYTE	16#00	Reserve (use not permitted)
Follow-up dosing tolerance check			

Name	Data type	Default	Definition
autoPostDosing	BOOL	FALSE	Automatic follow-up dosing **FALSE** = no automatic follow-up dosing **TRUE** = automatic follow-up dosing for deviation from tolerance limit
modePostDosing	BOOL	FALSE	Follow-up dosing type **FALSE** = follow-up dosing with continuous fine signal **TRUE** = follow-up dosing in JOG mode
stopTO1Limit	BOOL	FALSE	Stop when upper tolerance limit 1 (TO1) violated **FALSE** = weighing is not stopped due to tolerance error **TRUE** = weighing is stopped due to tolerance error (weight above TO1)
stopTO2Limit	BOOL	FALSE	Stop when upper tolerance limit 2 (TO2) violated **FALSE** = weighing is not stopped due to tolerance error **TRUE** = weighing is stopped due to tolerance error (weight above TO2)
stopTU1Limit	BOOL	FALSE	Stop when lower tolerance limit 1 (TU1) violated **FALSE** = weighing is not stopped due to tolerance error **TRUE** = weighing is stopped due to tolerance error (weight below TU1)
stopTU2Limit	BOOL	FALSE	Stop when lower tolerance limit 2 (TU2) violated **FALSE** = weighing is not stopped due to tolerance error **TRUE** = weighing is stopped due to tolerance error (weight below TU2)
continueTolStop	BOOL	FALSE	Continue after stop due to tolerance error **FALSE** = cycle cannot be continued if tolerance error exists **TRUE** = cycle can be continued despite existing tolerance error
numNoTolCheck	BYTE	16#00	Check for tolerance deviations 16#00 = all weighing operations are checked for tolerance deviations 16#01 = a weighing operation is not checked for tolerance deviation 16#02... 16#62 = 2...98 weighing operations are not checked for tolerance deviations 16#63 = tolerance deviation check deactivated Other definitions not permitted.
timePulseInching	TIME	T#1s	Pulse duration of fine signal
Controller			
ctrlErrReaction	BYTE	16#00	Controller response to weighing error Bit 0 = 0: Reset controller in response to technology error (weighing error) Bit 0 = 1: Limit controller to maximum control action Bits 1 to 7 not used
typeController	BYTE	16#00	Selection of controller type 16#00 = no control for switching off coarse/fine signal 16#01 = proportional controller without fine signal time controller 16#02 = proportional controller with fine signal time controller 16#03 = fine signal time controller without proportional controller Other definitions not permitted.
factorController	BYTE	16#1E	Control factor for proportional controller [0 to 100%], 16#1E ≙ 30 %
xxxReserve6	BYTE	16#00	Reserve (use not permitted)
limitController	REAL	1.0	Maximum one-time control action Limitation of maximum one-time control action of proportional controller
optiPlusCtrl	REAL	0.0	Optimum plus controller
optiMinusCtrl	REAL	0.0	Optimum minus controller

Name	Data type	Default	Definition
setFineTime	TIME	T#3s	Fine time setpoint
factorFineTime	BYTE	16#14	Control factor for fine-time controller [0 to 100 %], 16#14 ≙ 20 %
xxxReserve7	BYTE	16#00	Reserve (use not permitted)
Emptying			
xxxReserve8	WORD	16#0000	Reserve (use not permitted)
timeOverlap	TIME	T#0ms	Bridging time The overlap time **timeOverlap** must be less than the emptying time **timeEmptying**. The next weighing operation can be advanced by the bridging time and can begin during the emptying operation, after a predefined time has elapsed.
timeEmptying	TIME	T#0ms	Emptying time = 0ms: Emptying depends on the emptying range > 0ms: Emptying occurs after a predefined time
timeOutEmptying	TIME	T#0ms	Maximum emptying time = 0ms: Monitoring is switched off > 0ms: A technology error is issued if the empty range has not been reached by the emptying timeout.
Loading			
modeLoading	BYTE	16#00	Loading with coarse 16#00 = all weighing operations during loading mode are controlled with coarse and fine signals 16#01 = only coarse feed is used for weighing; however, the last 5 weighing operations are performed with coarse and fine signals 16#02 = only coarse feed is used for weighing; however, the last 4 weighing operations are performed with coarse and fine signals 16#04 = only coarse feed is used for weighing; however, the last 3 weighing operations are performed with coarse and fine signals 16#08 = only coarse feed is used for weighing; however, the last 2 weighing operations are performed with coarse and fine signals 16#10 = only coarse feed is used for weighing; however, the last weighing operation is performed with coarse and fine signals Other entries not permitted.
xxxReserve9	BYTE	16#00	Reserve (use not permitted)

Struct_FTA_DR26

Description

Data structure **Struct_FTA_DR26** contains the internal process values. These internal process values can be used to read out the current internal statuses and data of the scale in the event of servicing.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR26**.

Table 8-110 Struct_FTA_DR26

Name	Data type	Default	Definition
presetTareActive	BOOL	FALSE	**TRUE** = tare memory is assigned and activated by an external default value
xxxReserve1	BYTE	16#00	Reserve (use not permitted)
xxxReserve2	BYTE	16#00	Reserve (use not permitted)
internState	BYTE	16#00	Internal status Bit 0 = 0: SIMOTION mode activated Bit 0 = 1: Stand-alone mode activated Bit 1 = 0: Recording of digital load cell stopped Bit 1 = 1: Recording of digital load cell activated Bits 2 to 7 not used (use not permitted)
actTareWeight	REAL	0.0	Actual tare weight (process value)
actAverTareWeight	REAL	0.0	Actual tare mean (when taring with mean value)
pwrOnZeroValue	REAL	0.0	Zero value Value is set during power-up if "power-on zero value" is activated.
zeroValue	REAL	0.0	Zero value Value is set during zeroing
zeroCorrValue	REAL	0.0	Zero compensation value Value is controlled by automatic zero correction
impedRefValue	INT	0	Impedance reference value
actImpedValue	INT	0	Actual impedance value from last measurement
lastMaxWeight	REAL	0.0	Last maximum weight value
numOpMinutes	UDINT	0	Operating minutes counter
maxTemperature	INT	0	Previous maximum internal temperature measured since the last loading of default values [0.1 °C] , (**maxTemperature** := 300 corresponds to 30.0 °C) If a temperature value is not available: -100.0 °C.
xxxReserve3	BYTE	16#00	Reserve (use not permitted)
xxxReserve4	BYTE	16#00	Reserve (use not permitted)
sigLevel	INT	0	Signal level at measuring input
crc	WORD	16#0000	Checksum

Struct_FTA_DR30

Description

Data structure **Struct_FTA_DR30** contains process values that can be used to observe the current statuses and data in the scale. These observations can then be used as a basis for optimizing the parameters in test mode.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR30**.

Table 8-111 Struct_FTA_DR30

Name	Data type	Default	Definition
NAWI status bits			
stateNAWI	DWORD	16#0000 0000	NAWI status bits, 32 status displays for NAWI The 32 NAWI status bits are listed below.
weightInRange1	BOOL	FALSE	**TRUE** = Weight is within weighing range 1
weightInRange2	BOOL	FALSE	**TRUE** = Weight is within weighing range 2
weightInRange3	BOOL	FALSE	**TRUE** = Weight is within weighing range 3
limit1On	BOOL	FALSE	**TRUE** = Limit value 1 has been activated
limit2On	BOOL	FALSE	**TRUE** = Limit value 2 has been activated
limit3On	BOOL	FALSE	**TRUE** = Limit value 3 has been activated
scaleTared	BOOL	FALSE	**TRUE** = if the scale is tared
scaleTaredManual	BOOL	FALSE	**TRUE** = if the scale has been tared with a manual tare entry
weightMax9e	BOOL	FALSE	Max. weight for weighing range + 9*e (e = verification interval) **TRUE** = if the maximum load has been exceeded by 9 e
weight025dZero	BOOL	FALSE	**TRUE** = if the weight does not exceed ¼ d (d = numerical increment)
waitOfStandStill1	BOOL	FALSE	**TRUE** = if the scale is waiting for standstill after startup
standStill1On	BOOL	FALSE	**TRUE** = standstill 1 is on.
scaleCalibrated	BOOL	FALSE	**TRUE** = if the scale is calibrated
cmdErrOnDI	BOOL	FALSE	**TRUE** = if a command could not be executed on a digital input
simWeighingOn	BOOL	FALSE	**TRUE** = if weight simulation has been activated
serviceModeOn	BOOL	FALSE	**TRUE** = if service mode has been activated
printingOn	BOOL	FALSE	**TRUE** = The log is being printed.
printImpossible	BOOL	FALSE	**TRUE** = The log cannot be printed.
MMCconnected	BOOL	FALSE	**TRUE** = The MMC is connected.
MMCready	BOOL	FALSE	**TRUE** = The MMC is formatted and ready for recording.
MMCreadyForTrace	BOOL	FALSE	**TRUE** = The MMC is ready for the trace function.
MMCreadyForLog	BOOL	FALSE	**TRUE** = The MMC is ready for logging.
MMCTraceActive	BOOL	FALSE	**TRUE** = The trace function is activated.
minFlowCtrl1On	BOOL	FALSE	**TRUE** = Flow control 1 has been activated.
minFlowCtrl2On	BOOL	FALSE	**TRUE** = Flow control 2 has been activated.
scaleEmptyRange	BOOL	FALSE	**TRUE** = The scale is in empty range.
protectionOn	BOOL	FALSE	**TRUE** = The switch for protecting the calibration data is on.
xxxReserve1	BOOL	FALSE	Reserve (use not permitted)
MMCDataPrepared	BOOL	FALSE	**TRUE** = Preparation of the MMC data with the values defined in DR46 is complete. The data can be read out with DR47.
digLCactive	BOOL	FALSE	**FALSE** = digital load cell sensing is not active **TRUE** = digital load cell sensing is in progress
standAloneActive	BOOL	FALSE	**FALSE** = operation with programmable controller is activated **TRUE** = stand-alone mode is activated

Name	Data type	Default	Definition
errorFTAoccurred	BOOL	FALSE	**TRUE** = At least one fault condition (fault) has occurred.
AWI status bits			
stateAWI	DWORD	16#0000 0000	AWI status bits, 32 status displays for AWI The 32 AWI status bits are listed below.
dosingStep0	BOOL	FALSE	Current step 0 of weighing control
dosingStep1	BOOL	FALSE	Current step 1 of weighing control
dosingStep2	BOOL	FALSE	Current step 2 of weighing control
dosingStep3	BOOL	FALSE	Current step 3 of weighing control
dosingStep4	BOOL	FALSE	Current step 4 of weighing control
dosingStep5	BOOL	FALSE	Current step 5 of weighing control
dosingStep6	BOOL	FALSE	Current step 6 of weighing control
dosingStep7	BOOL	FALSE	Current step 7 of weighing control
postDosingActive	BOOL	FALSE	**TRUE** = Follow-up dosing is active.
coarseSigOn	BOOL	FALSE	**TRUE** = The coarse signal is switched on.
fineSigOn	BOOL	FALSE	**TRUE** = The fine signal is switched on.
timerPreDosingOn	BOOL	FALSE	**TRUE** = The timer for pre-dosing is active.
emtyingSigOn	BOOL	FALSE	**TRUE** = The emptying signal is switched on.
weighingStopped	BOOL	FALSE	**TRUE** = The weighing cycle has been stopped.
stoppedForCheck	BOOL	FALSE	**TRUE** = The weighing cycle has been stopped by the check stop command.
checkStopFollow	BOOL	FALSE	**TRUE** = The weighing cycle will be stopped by a check stop (set with check stop command and reset when check stop is reached).
dosingAborted	BOOL	FALSE	**TRUE** = last weighing operation aborted by "residual weighing" or "weighing control reset".
nextStepWaiting	BOOL	FALSE	**TRUE** = if the step enabling to the next step in the weighing cycle has been blocked due to a missing step enable.
upperLimit2On	BOOL	FALSE	**TRUE** = net weight above the TO2 limit
upperLimit1On	BOOL	FALSE	**TRUE** = net weight above the TO1 limit
toleranceOK	BOOL	FALSE	**TRUE** = net weight within tolerance range TU1 to TO1
lowerLimit1On	BOOL	FALSE	**TRUE** = net weight below TU1 but above TU2
lowerLimit2On	BOOL	FALSE	**TRUE** = net weight below the TU2 limit
toleranceBad	BOOL	FALSE	**TRUE** = net weight below TU2 or above TO2
standStill2On	BOOL	FALSE	**TRUE** = standstill 2 is on
standStill3On	BOOL	FALSE	**TRUE** = standstill 3 is on
checkFollows	BOOL	FALSE	**TRUE** = A check weighing operation is performed at the end of the cycle.
comparatorDisable	BOOL	FALSE	**TRUE** = The setpoint/actual comparison is disabled and the weighing operation is being executed without a weight evaluation!
continueModeOn	BOOL	FALSE	**TRUE** = Continuous start is activated for the cycle sequence.
xxxReserve2	BOOL	FALSE	Reserve (use not permitted)
endOfDosingCycle	BOOL	FALSE	**TRUE** = The weighing cycle is complete.
endOfCharge	BOOL	FALSE	**TRUE** = The emptying operation is complete.
Process and weight values			
actGrossWeight	REAL	0.0	Actual gross weight (process value)
actNetWeight	REAL	0.0	Actual net weight (process value)
actTareWeight	REAL	0.0	Actual tare weight (process value)

Name	Data type	Default	Definition
weight	REAL	0.0	Actual weight *1 (numerical increment from DR3)
weightX10	REAL	0.0	Actual weight *10 (numerical increment from DR3)
tareWeight	REAL	0.0	Actual tare weight (numerical increment from DR3)
lastCheckedWeight	REAL	0.0	Net weight from last checked weighing operation (numerical increment from DR3)
pulseCntrValue	UDINT	0	Current value from pulse counter (counter input)
sumMem1	LREAL	0.0	Totalizing memory 1 (with calibration capability) Current value in totalizing memory 1 (numerical increment from DR3)
sumMem2	REAL	0.0	Totalizing memory 2 Current value in totalizing memory 2 (numerical increment from DR3)

Struct_FTA_DR31

Description

Data structure **Struct_FTA_DR31** contains process values that can be used to observe additional current statuses and data in the scale. These observations can then be used as a basis for optimizing the parameters in test mode.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR31**.

Table 8-112 Struct_FTA_DR31

Name	Data type	Default	Definition
Extended process values			
actFlow	REAL	0.0	Current flow rate [amount per second]
actInFlightWeight	REAL	0.0	Current in-flight weight The in-flight weight is initialized with a default value when the filling parameters are received.
actFineWeight	REAL	0.0	Current fine weight The fine weight is initialized with a default value when the filling parameters are received.
actAduValue	DINT	0	Unfiltered ADC value Direct value from the analog/digital converter
actAduValueFilt1	DINT	0	Direct value from the analog/digital converter, after filter 1 (DR3)
actAduValueFilt2	DINT	0	Direct value from the analog/digital converter, after filter 2 (DR3)
actRestLoading	REAL	0.0	Current residual amount in loading mode
actSetpointLoading	REAL	0.0	Current setpoint of an individual weighing operation in loading mode

Name	Data type	Default	Definition
actStateError	DWORD	16#00000000	Operating error (bit-coded) Current status of the 32 operating errors (faults) Bit 0 = TRUE: Fault condition 1 has occurred Bit 1 = TRUE: Fault condition 2 has occurred Bit 2 = TRUE: Fault condition 3 has occurred ... Bit 30 = TRUE: Fault condition 31 has occurred Bit 31 = TRUE: Fault condition 32 has occurred
actDateAndTime	DATE_AND_TIME	DT#1992-01-01-0:0:0.0	Actual date and time in SIWAREX FTA weighing module
actTemperature	INT	0	Current temperature of SIWAREX FTA [0.1 °C], (**actTemperature** := 300 corresponds to 30.0 °C)
actStateDI	BYTE	16#00	Current status of digital inputs Bit 0 = status of digital input 1 Bit 1 = status of digital input 2 Bit 2 = status of digital input 3 Bit 3 = status of digital input 4 Bit 4 = status of digital input 5 Bit 5 = status of digital input 6 Bit 6 = status of digital input 7 Bit 7 = not used
actStateLC	BYTE	16#00	Status of digital load cell Bit 0 = TRUE: Overload Bit 1 = TRUE: Underload Bit 2 = TRUE: Unknown command Bit 3 = TRUE: Command cannot be executed Bit 4 = TRUE: Standstill Bit 5 = TRUE: Hardware fault Bit 6 = TRUE: Not used Bit 7 = TRUE: Communication fault
measImpedance	INT	0	Impedance reference value Measured impedance value of load cells [0.1 Ω], (**measImpedance** := 100 corresponds to 10.0 Ω)
actImpedance	INT	0	Actual impedance value Current impedance value of load cells [0.1 Ω], (**actImpedance** := 100 corresponds to 10.0 Ω)

Struct_FTA_DR32

Description

Data structure **Struct_FTA_DR32** contains the statistical data of the SIWAREX FTA weighing module. The statistical data provide information about the quality of the weighing operations.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR32**.

Table 8-113 Struct_FTA_DR32

Name	Data type	De-fault	Definition
totalNumWeighing	DINT	0	Total number of weighing operations (with and without tolerance check)
numCheckedWeigh-ing	DINT	0	Number of weighing operations with tolerance check
numTO2Weighing	DINT	0	Number of weighing operations with tolerance check above tolerance limit TO2
numTO1Weighing	DINT	0	Number of weighing operations with tolerance check above tolerance limit TO1
numGoodWeighing	DINT	0	Number of weighing operations with tolerance check within the range TU1 to TO1
numTU1Weighing	DINT	0	Number of weighing operations with tolerance check below tolerance limit TU1
numTU2Weighing	DINT	0	Number of weighing operations with tolerance check below tolerance limit TU2
numBadWeighing	DINT	0	Number of weighing operations with tolerance check below TU2 or above TO2
xxxReserve1	DINT	0	Reserve (use not permitted)
xxxReserve2	DINT	0	Reserve (use not permitted)
actSetpointWeight	REAL	0.0	Current setpoint weight (numerical increment with calibration capability, rounded to the nearest numerical increment for AWI applications with country code "OIML")
averValue	REAL	0.0	Mean value of net weights checked for tolerance errors
standardDeviation	REAL	0.0	Standard deviation of net weights checked for tolerance errors
thruputPerHour	REAL	0.0	Throughput per hour [e.g. g/h, kg/h or t/h] is calculated based on the net weight of the last weighing operation.
weighingPerHour	INT	0	Weighing operations per hour are calculated based on the last weighing operation (time for one weighing cycle).

Struct_FTA_DR34

Description

Data structure Struct_FTA_DR34 is used to output the current weight in ASCII format according to the main scale display.

Parameters

Table 8-114 Struct_FTA_DR34

Name	Data type	Default	Definition
actWeightASCII	STRING[16]	' '	Actual weight in ASCII format (as output on the display)

Struct_FTA_DR35

Description

Data structure **Struct_FTA_DR35** contains encrypted data for calibration-capable display via an operator panel that can handle the encryption (for example, SIMATIC HMI).

Parameters

Table 8-115 Struct_FTA_DR35

Name	Data type	Default	Definition
cryptoData	ARRAY [0 to 31] of BYTE	32 (16#00)	Encrypted data for weight display with calibration capability

Struct_FTA_DR39

Description

The **Struct_FTA_DR39** data structure stores the version ID of the "SecureOCX" weight display with calibration capability. For a weight display with calibration capability, the content of DR39 must be identical to the version of the "SecureOCX", which is used in the WinCC flexible configuration.

The version is entered during commissioning.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR39**.

Table 8-116 Struct_FTA_DR39

Name	Data type	Default	Definition
typeVersion	STRING[1]	' '	"V" for product version
xxxReserve1	BYTE	16#00	Reserve 1 (use not permitted)
versionPrimary	UINT	0	Sequential number between 0 and 15
versionSecondary	UINT	0	Sequential number between 0 and 15

Example

The following figure clearly shows the relation between the **Struct_FTA_DR39** data structure and the version ID of the "SecureOCX".

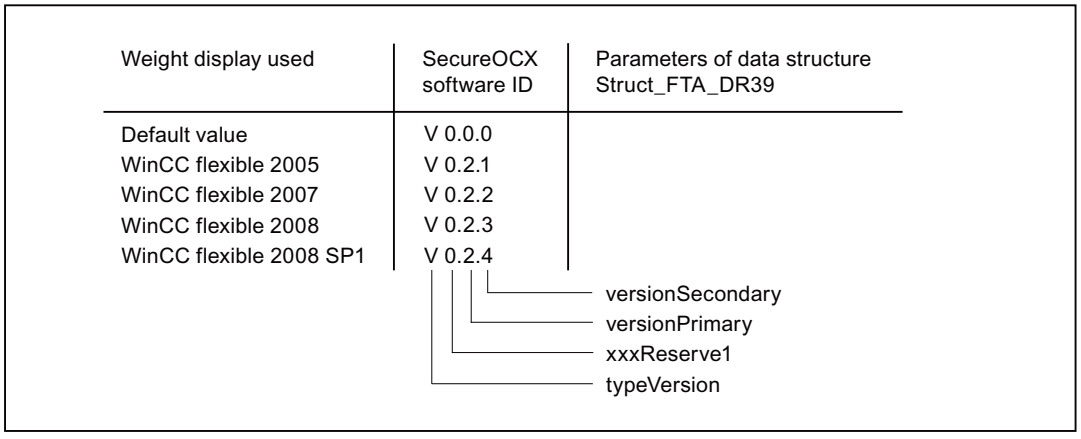

Figure 8-47 SecureOCX software ID

See also

Weight display with calibration capability (Page 6400)

Struct_FTA_DR44

Description

Data structure **Struct_FTA_DR44** stores the log data until the next logging operation. This content can be output again, if necessary.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR44**.

Table 8-117 Struct_FTA_DR44

Name	Data type	Default	Definition
MMCId	ARRAY [0 to 4] of BYTE	5 (16#00)	Identification of micro memory card 1 byte for manufacturer's ID + 4 bytes for serial number; always 0 for log output on RS232 interface
xxxReserve1	BYTE	16#00	Reserve 1 (use not permitted)
xxxReserve2	WORD	16#0000	Reserve 2 (use not permitted)
logId	DINT	0	Log ID ID of stored log text; number is incremented for each logging procedure
lastLogData	STRING[160]	STRING[160] = ' '	Log text from last logging procedure

Struct_FTA_DR45

Description

Data structure **Struct_FTA_DR45** contains variable text that can be inserted in the logs as strings. The content of these strings can be defined via the SIMOTION controller.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR45**.

Table 8-118 Struct_FTA_DR45

Name	Data type	Default	Definition
varText1	STRING[16]	' '	Variable text (string 1)
varText2	STRING[16]	' '	Variable text (string 2)
varText3	STRING[16]	' '	Variable text (string 3)
varText4	STRING[16]	' '	Variable text (string 4)

Struct_FTA_DR46

Description

Data structure **Struct_FTA_DR46** contains the necessary parameters for reading out the logs stored on the MMC of the SIWAREX FTA weighing module. Data structures **Struct_FTA_DR46** and **Struct_FTA_DR47** can be used to read out any log in the the SIMOTION device.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR46**.

Table 8-119 Struct_FTA_DR46

Name	Data type	Default	Definition
selectLogId	DINT	0	ID number for read-out With this setting, the log is read out with its ID number when DR47 is read out. If request last data record (reqLastLog = 1) is activated, the ID number is ignored.
reqLastLog	BYTE	16#00	Request for last data record If this parameter setting = 1, the last log is output via data record DR47.
xxxReserve1	BYTE	16#00	Reserve (use not permitted)

Struct_FTA_DR47

Description

Data structure **Struct_FTA_DR47** provides the log data that were requested via data record DR46.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR47**.

Table 8-120 Struct_FTA_DR47

Name	Data type	Default	Definition
MMCId	ARRAY [0 to 4] of BYTE	5 (16#00)	Identification of the MMC card 1 byte for manufacturer's ID + 4 bytes for serial number; always 0 for log output on RS232 interface
xxxReserve1	BYTE	16#00	Reserve (use not permitted)
xxxReserve2	WORD	16#0000	Reserve (use not permitted)
logId	DINT	0	Log ID ID of the stored log text
logData	STRING[160]	´ ´	Log text

Struct_FTA_DR123

Description

Data structure **Struct_FTA_DR123** contains an overview of the data stored on the MMC card. Based on this information, the user can read out specific recordings and logs.

Parameters

The table below contains all parameters of the data structure **Struct_FTA_DR123**.

Table 8-121 Struct_FTA_DR123

Name	Data type	Default	Definition
logId	DWORD	16#00000000	Log ID Number assigned to each log output; incremented each time a log is output
MMCId	ARRAY [0 to 4] of BYTE	5 (16#00)	Identification of the MMC card 1 byte for manufacturer's ID + 4 bytes for serial number
xxxReserve1	BYTE	16#00	Reserve (use not permitted)
xxxReserve2	WORD	16#0000	Reserve (use not permitted)
MMCCapacity	DINT	0	Total memory capacity of the MMC card in [bytes]
MMCLogCapacity	DINT	0	Total memory capacity of the MMC card in [bytes] for log data

Name	Data type	Default	Definition
traceCapacity	DINT	0	Available capacity for trace data in [bytes] Display depends on the defined trace destination: RAM or MMC in the interface parameters.
oldMMCLogId	DINT	0	Oldest MMC log ID
newMMCLogId	DINT	0	Newest MMC log ID
oldMMCTraceId	DINT	0	Oldest MMC trace ID
newMMCTraceId	DINT	0	Newest MMC trace ID
oldRAMTraceId	DINT	0	Oldest RAM trace ID
newRAMTraceId	DINT	0	Newest RAM trace ID

8.8.4.3 Weight display with calibration capability

Overview

The value for the weight display with calibration capability is formed internally by SIWAREX FTA, encrypted and made available to the user in the DR35 data record.

Function description

The DR35 data record is read using the **_FTA_control** function block and stored in the **Struct_FTA_scaleData** data structure in the DR35 element.

The DR35 and DR39 data records and the winccOcxWrite element of the **Struct_FTA_scaleData** data structure are used to ensure reciprocal monitoring of the "SecureOCX" add-on and the SIWAREX firmware.

The version number (ID) of the weight display with calibration capability used has to be entered in the DR39 data record (see table below).

Table 8-122 Version numbers of weight displays with calibration capability

Display used	Version number
WinCC flexible 2005	V0.2.1
WinCC flexible 2007	V0.2.2
WinCC flexible 2008	V0.2.3
WinCC flexible 2008 SP1	V0.2.4

The "SecureOCX" add-on for WinCC flexible, a special function which is able to decipher the content of the DR35 and display it in a special output field is used for evaluating. "SecureOCX" has to be installed in addition to WinCC flexible.

Note

Refer to the *SIWAREX FTA Electronic Weighing System for Automatic Scale* Manual for details of how to install and configure the weight display with calibration capability in WinCC flexible and which visualization devices can be used.

This documentation is included in the SIMOTION SCOUT scope of supply as electronic documentation!

Error messages

If the data received are incorrect, "ERROR 1" is output. If the DR35 data record is not updated (monitoring time approx. 2 s), the text "ERROR 2" appears on the display instead of the weight value. Errors in the reciprocal recognition of the SIWAREX firmware and "SecureOCX" produce ERROR 3, if regulations = OIML is set. When regulations = ----, the current weight value is displayed.

Create variable

An ARRAY[0..1] OF WORD type variable must be created as VAR_GLOBAL in the interface area in the SIMOTION device for data transfer between the "SecureOCX" add-on and SIWAREX FTA. The name of these variables must be configured for write-only access in the "SecureOCX", e.g. myWinccOcxWrite (see following diagram). The further processing of these variables in the SIMOTION device is explained in the call example for the **_FTA_control** function block, see Calling the function block (Page 6402).

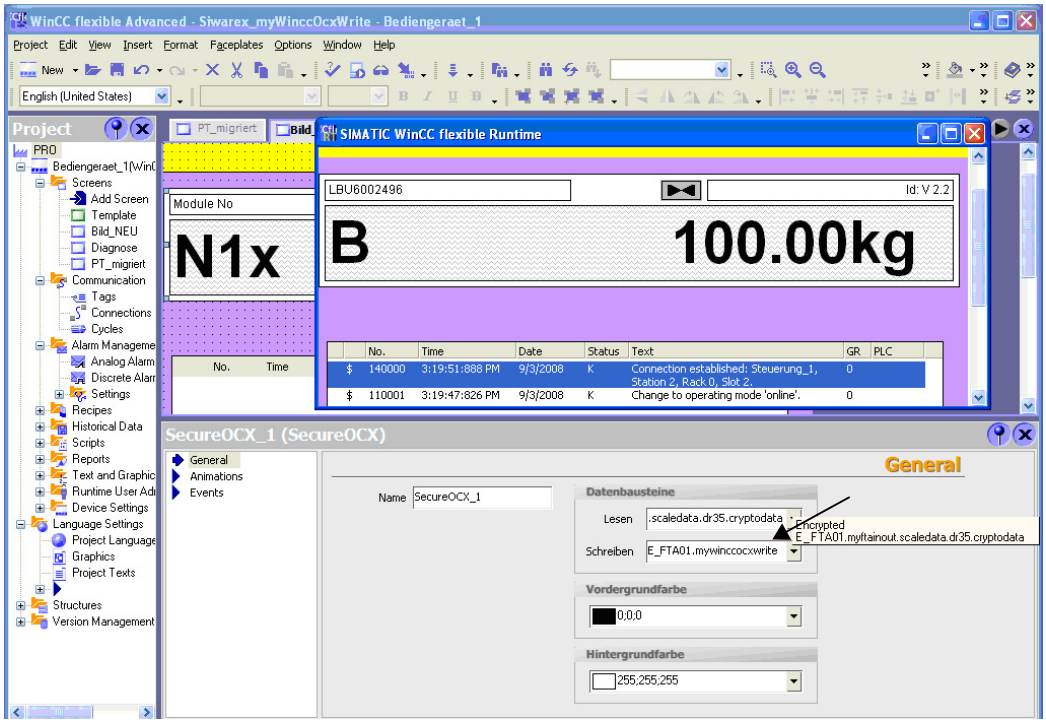

Figure 8-48 Configuration of reading and writing access in the "SecureOCX" add-on

8.8.4.4 Calling the function block

Procedure

In order to work with the **_FTA_control** function block in your user program, proceed as follows (the numbers shown in the following program segment correspond to the steps below):

1. Set up variables for the **Struct_FTA_scaleData** data structure.
2. Create an instance of the **_FTA_control** function block.
3. Create variable for module address from **HW config** and assign module address.
4. Create a field for in/out parameters of the function block.
5. Variable for the data transfer between the "SecureOCX" weight display with calibration capability and SIWAREX FTA.
6. Assignment of module address.

7. Assign ARRAY OF WORD type variable (e.g. myWinccOcxWrite) to winccOcxWrite element of **Struct_FTA_scaleData** data structure.
8. Call the function block instance.
9. Transfer input parameters.
10. The output parameters of the function block are accessed with <instance name of FB>.<name of output parameter>.
11. The data prepared by the function block for the I/O outputs are assigned to the I/O variable by the field created in step 3.

Note

This call example is excerpted from the "E_FTA01" application example, which is included on the "SIMOTION Utilities & Applications" CD-ROM.

If you would like to control multiple weighing modules, you must create a new variable for the data structure and FB instances with a new name for each weighing module.

Call example

```
UNIT E_FTA01;

INTERFACE

    TYPE
        // input - parameters

END_IMPLEMENTATION
```

8.8.5 Application example

8.8.5.1 General information about the application example

Task

This application example shows you how you can use the **_FTA_control** function block to control the SIWAREX FTA weighing module using 3 commands:

- Read data from the SIWAREX FTA weighing module
- Write data to the SIWAREX FTA weighing module
- Start weighing function

Hardware platform

The application example is available for various SIMOTION hardware platforms and is designed for the distributed application of the SIWAREX FTA weighing module.

Note

If the application example is not available for your hardware platform, you must change the hardware configuration.

Calling the application example

The application example can be found on the "SIMOTION Utilities & Applications" CD-ROM. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and is supplied with SIMOTION SCOUT.

1. Retrieve and open the project containing the application example.
2. Check the hardware configuration: for example, PROFIBUS DP addresses and module addresses.
3. Check the module addresses (hardware configuration) against the I/O addresses of the controller in SIMOTION SCOUT and the module address in the program.
   If necessary, adapt your example project to the available hardware (see "Adapting the application example").
4. **Save** and **compile** your example project. You can now download the example to the SIMOTION device and switch to **RUN** mode.

Adapting the application example

The configuration in the example and your available hardware must be compatible.

The following options are available:

1. You can adapt the configuration of the example to the available hardware.
2. You can adapt the configuration of the hardware to the example.

Configuration of the example

You have assigned a module address <> 256 in **HW Config**.

1. In the symbol browser, change the I/O address to the value you assigned in **HW Config**:

	Name	I/O address	Read only	Data type	Field length
1	⊞ myperiin	PIB 272		Array	16
2	⊞ myperiout	PQB 272	☐	Array	16

Figure 8-49 Adapting the I/O address

2. Enter the same value in the **myModuleAddr** variable of the application example.

8.8.5.2 Sequence of the application example

Command processing

Proceed as follows to start the command processing in the example program:

1. Open the symbol browser in SIMOTION SCOUT.
2. To select a command, set the **myCommand** parameter in the symbol browser to the command to be executed.
3. Define the command-specific parameters.
4. Start the command by setting the **myCmdExecute** parameter to **TRUE**.
5. Wait until an error-free command execution is indicated with **TRUE** on the **done** output parameter of the function block. An error in the command execution is indicated with **error** = **TRUE**.
6. If the command is executed successfully, the value of data record x (x = number of corresponding data record) is displayed on the **myFTAInOut.scaledata.DRx**in-out parameter.

Reading a data record

Proceed as follows to read a data record:

1. Set the **myCommand** parameter to **CMD_READ_SINGLE_DR**.
2. To select the data record to be read, set the **myFTACommand** parameter to **2xx** (read single data record, xx = data record number), e.g. **myFTACommand := 220** (read setpoint weight).
3. Set the **myCmdExecute** parameter to **TRUE**.
   This initiates the reading of the data record from the SIWAREX FTA. You can find the read data in the **scaleData.DRx** data structure (xx = data record number).

Writing a data record

Proceed as follows to write a data record:

1. Write the values to be transferred to the **scaleData.DRx** data structure (xx = data record number).
2. Set the **myCommand** parameter to **CMD_WRITE_SINGLE_DR**.
3. To select the data record to be written, set the**myFTACommand** parameter to **4xx** (read single data record, xx = data record number), e.g. **myFTACommand := 420** (write setpoint weight).
4. Set the **myCmdExecute** parameter to **TRUE**.
   This initiates the transfer of the data record to the SIWAREX FTA.

Start weighing function

Proceed as follows to start the weighing function:

1. Set the **myCommand** parameter to **CMD_START_WEIGHING**.
2. Start the weighing function by setting the **myCmdExecute** parameter to **TRUE** .

8.8.6 Alarm processing

8.8.6.1 Overview of alarm processing

Pending error messages are processed and evaluated differently than in a SIMATIC system. By default, diagnostic and hardware interrupts are not activated.
Activate the alarms for the weighing module in the hardware configuration (see section Integrating the weighing module in a SIMOTION project (Page 6359)).

Once you have defined parameters for the process and/or diagnostic alarms, you can refer to the flow chart below to program the alarm processing sequence.

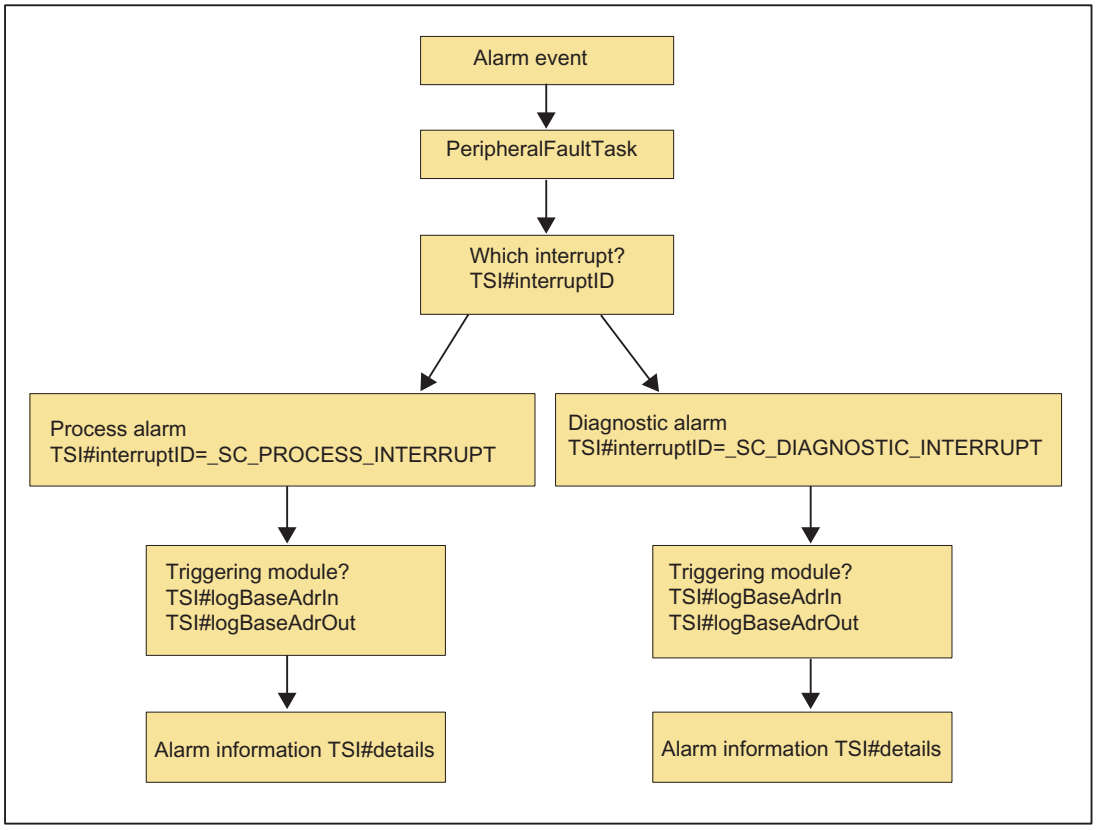

Figure 8-50 Alarm processing for the weighing module

Note

The application example contains an example for programming the alarm processing.

The application example can be found on the "SIMOTION Utilities & Applications" CD-ROM. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and part of the SIMOTION SCOUT scope of delivery.

Alarm evaluation

Alarms reported by the I/O are evaluated in the **PeripheralFaultTask**. When the **PeripheralFaultTask** is started, the **Taskstartinfo** is made available, which you can evaluate in the user program.

The **Taskstartinfo** (TSI) of the **PeripheralFaultTask** is comparable to the local data of OB 40 and OB 82 in the SIMATIC system.

Table 8-123 Meaning of the Taskstartinfo

Task	TSI		Definition
PeripheralFaultTask	DT	TSI#startTime	Start time of the task
	UDINT	TSI#interruptID	Identifies the triggering event: • _SC_PROCESS_INTERRUPT • _SC_DIAGNOSTIC_INTERRUPT • _SC_STATION_DISCONNECTED • _SC_STATION_RECONNECTED
	DINT	TSI#logBaseAdrIn	Logical base address if a process alarm (PRAL) or a diagnostic interrupt (DAL) was caused by an input area on the module, otherwise _SC_INVALID_ADDRESS
	DINT	TSI#logBaseAdrOut	Logical base address if a process alarm (PRAL) or a diagnostic interrupt (DAL) was caused by an output area on the module, otherwise _SC_INVALID_ADDRESS
	DINT	TSI#logDiagAdr	Diagnostic address of a DP slave if the alarm was caused by a station failure or recovery of the associated DP slave, otherwise _SC_INVALID_ADDRESS
	DWORD	TSI#details	Detail information (bit fields)

8.8.6.2 Process alarms

On the SIWAREX FTA weighing module, you can specify which events should trigger a process alarm. You can use the process alarm to very flexibly respond to technological events and the process status of the SIWAREX FTA weighing module.

Parameters for hardware interrupts are assigned in the **Struct_FTA_DR7** data structure, see section Data structures (Page 6370).

Defining a process alarm

If an event outside of the SIMOTION device cycle requires a response, the weighing module can trigger a process alarm.

Events triggering a process alarm

The criteria (events) for triggering process alarms in a SIMOTION system correspond to those in a SIMATIC system. For more information, refer to the *SIWAREX FTA Weighing Electronics for Automatic Scale* Manual.

Responses to a process alarm

If a process alarm is issued, the following occurs:

- Process data are written to the **TSI#details** variables in the Taskstartinfo of **PeripheralFaultTask**.
- The SIMOTION device goes into STOP mode if a program has not been assigned in the **PeripheralFaultTask**.

Bit assignment

The **TSI#details** variable is assigned in the same way as in a SIMATIC system.

Note

For more information, refer to the *SIWAREX FTA Weighing Electronics for Automatic Scale* Manual.

Evaluating process alarms

When a process alarm is triggered, the data in the **PeriperalFaultTask** Taskstartinfo are written to the **TSI#details** variables and made available to you.

Note

If an event that should trigger a process alarm occurs, and the same previous event is not yet acknowledged, a new alarm is not triggered. The new process alarm is lost.

Depending on the parameter definition, this can lead to the "Lost process alarm" diagnostic alarm.

8.8.6.3 Diagnostic alarms

Diagnostic alarms enable operating messages (hardware faults) of the SIWAREX FTA to be detected in the SIMOTION device.

Defining a diagnostic alarm

If the user program should respond to an internal or external error, you can define a diagnostic alarm that will interrupt the cyclic program of the SIMOTION device.

Events triggering a diagnostic alarm

The criteria (events) for triggering diagnostic alarms in a SIMOTION system correspond to those in a SIMATIC system. For more information, refer to the *SIWAREX FTA Weighing Electronics for Automatic Scale* Manual.

Responses to a diagnostic alarm

If a diagnostic alarm is issued, the following occurs:

- Diagnostic data is written to the **TSI#details** variables in the Taskstartinfo of **PeripheralFaultTask**.
- All programs which are assigned in the **PeripheralFaultTask** are called one after another. The SIMOTION device goes into STOP mode if a program has not been assigned in the **PeripheralFaultTask**.
- The group error LED (SF) lights up on the weighing module. The group error LED (SF) is extinguished as soon as the error has been corrected.

Bit assignment

The **TSI#details** variable is assigned in the same way as in a SIMATIC system.

Note

For more information, refer to the *SIWAREX FTA Weighing Electronics for Automatic Scale* Manual.

Evaluating diagnostic alarms

If a diagnostic alarm is triggered, the data in the Taskstartinfo of the **PeripheralFaultTask** are written to the **TSI#details** variables. The **PeripheralFaultTask** is called automatically and provides 4 bytes of diagnostic information for fast analysis. The diagnostic information content is the same as in a SIMATIC system.

8.8.7 Appendix

8.8.7.1 Selection list for process values

The I/O interface of the SIWAREX FTA weighing module is available for fast output of a process value to the SIMOTION device. The process value selection is defined in the **indexProcessValue1** and **indexProcessValue2** parameters of the **Struct_FTA_DR7** data structure.

Process values are selected from the following list:

Table 8-124 Selection list for process values

Selection number (hexadecimal)		Process value
0	16#00	NAWI status
1	16#01	Gross weight (process value)
2	16#02	Net weight (process value)
3	16#03	Tare (process value)
4	16#04	Gross/net weight (numerical increment with calibration capability)

Selection number (hexadecimal)		Process value
5	16#05	Gross/net weight (numerical increment with calibration capability x 10)
6	16#06	Tare (with calibration capability)
7	16#07	Pulse counter value
8	16#08	Temperature
9	16#09	Fault condition (32-bit information)
10	16#0A	Unfiltered ADC value
11	16#0B	Filtered ADC value (for process value)
12	16#0C	Flow rate per second
30	16#1E	AWI status
31	16#1F	Totalizing memory 1
32	16#20	Totalizing memory 2
33	16#21	Total number of dosages
34	16#22	Number of check weighing operations
35	16#23	Number of TO2-class dosages
36	16#24	Number of TO1-class dosages
37	16#25	Number of dosages in the "good" class (within the range TU1 - TO1)
38	16#26	Number of TU1-class dosages
39	16#27	Number of TU2-class dosages
40	16#28	Number of incorrect dosages
41	16#29	Reserve0
42	16#2A	Setpoint
43	16#2B	Average value of actual weight
44	16#2C	Standard deviation
45	16#2D	Last actual weight
46	16#2E	Weighing operations per hour
47	16#2F	Throughput per hour
48	16#30	Actual in-flight weight
49	16#31	Actual fine weight
50	16#32	Filtered ADC value (for coarse and fine signals)
51	16#33	Residual amount
52	16#34	Current load setpoint

Struct_FTA_DR7 (Page 6376)

8.8.7.2 Command groups and commands

Command groups

The commands of the SIWAREX FTA weighing module are divided into groups. Commands are assigned to a group based on their functional similarity.

The table below provides an overview of the command groups.

Table 8-125 Command group overview

Command group	Definition
1...199	These commands are passed on to the module without reading or writing data records (scale commands, weighing commands, logging commands). Refer to the "Command list" for the meaning of the command numbers.
203...247...399	Read a data record 3 to 47. The numbers 248 to 399 are reserved (use not permitted).
403...447...599	Write a data record 3 to 47. The numbers 448 to 599 are reserved (use not permitted).
601...699	Range of composite commands. The **_FTA_control** function block can transfer multiple data records in succession. Refer to the "Command list" for the meaning of the command numbers.

Command list

The table below lists the commands and their meaning.

Table 8-126 Command list

Command	Meaning of command
Service and calibration commands	
1	Switch on service mode The SIWAREX must be switched to service mode for calibration to be performed. A non-calibrated scale cannot switch out of service mode.
2	Switch off service mode Service mode can be switched off when calibration is complete. Only then can the scale accept weighing commands.
3	Zero point valid calibration command The start of the characteristic curve – zero point of the scale – is defined with the current dead load.
4	Calibration weight 1 valid calibration command The first calibration weight is assigned to the current weight.
5	Calibration weight 2 valid calibration command The second calibration weight is assigned to the current weight.
6	Calibration weight 3 valid calibration command The third calibration weight is assigned to the current weight.
7	Calibration weight 4 valid calibration command The fourth calibration weight is assigned to the current weight.
8	Assign default values to all data records All parameters are set to the delivery condition.

Com-mand	Meaning of command
9	Acknowledge error Fault conditions and fatal system errors that have caused a system restart are acknowledged. The error status is abandoned if no other operating errors are pending.
10	Run impedance check The resistance of the load cells is measured and compared with the stored impedance reference value.
11	Determine impedance reference value The resistance of the load cells is determined and stored as a reference value for future impedance checks.
12	Switch on stand-alone mode This command enables stand-alone mode. This command has a storing effect, i.e., the module remains in stand-alone mode after the power supply is cycled off and back on. Stand-alone mode is deactivated automatically as soon as the module is operated with a higher-level programmable controller.
13	Switch off stand-alone mode This command disables stand-alone mode. Stand-alone mode is automatically deactivated as soon as the module is operated with a higher-level programmable controller.
14	Min/max pointer reset This command resets the **lastMaxWeight** parameter to 0 (see Struct_FTA_DR26 (Page 6389)).
15	Characteristic curve shift This command shifts the entire characteristic curve (calibration coordinates) such that the currently filtered digital value from the ADC becomes a new zero point. Only permitted if the calibration switch is not set. If this shift results in an illegal digital value for a calibration coordinate, the command is rejected.
Scale commands	
21	Zero scale The current weight is set to 0. Subject to restrictions (-1 %, +3 %) during operation with calibration capability ("OIML"). The tare is deleted at the same time.
22	Tare The current weight is set to 0 and the weight display is designated at the same time as "Net" and "Tare".
23	Delete tare The tare is deleted. The current weight is displayed, the designation "Net" is changed to "Gross", and the designation "Tare" or "Preset tare" is reset.
24	Accept tare entry The tare entered is accepted as tare, and at the same time, "Preset tare" is designated along with the weight display.
25	Switch on increased resolution Activates the output/display of the weight value with calibration capability at an increased resolution for 5 s.
26	Display tare weight Activates the output/display of the tare value for 5 s.
29	Display firmware Activates output/display of the firmware version in data record 34 for 5 s.

Com-mand	Meaning of command
Log commands	
31	Output log text 1 The log is output with text layout 1.
32	Output log text 2 The log is output with text layout 2.
33	Output log text 3 The log is output with text layout 3.
34	Output log text 4 The log is output with text layout 4.
35	Repeat last logging operation The last log output is repeated.
Digital weighing commands	
40	"Send digital load cell" On A command is output to the digital load cell to send the weight values.
41	"Send digital load cell" Off Command to the digital load cell to stop sending weight values
Micro memory commands	
70	Start recording Starts the recording (trace function).
71	End current recording Ends the activated recording (trace function).
72	Delete logs in MMC Deletes logs stored on the micro memory card.
73	Delete recording (trace) in MMC Deletes recordings (trace function) stored on the micro memory card.
74	Delete recording (trace) in RAM Deletes recordings (trace function) stored in the RAM memory.
75	Format MMC Formats the micro memory card according to the parameters specified in the module data. Deletes all content stored on the MMC.
76	Delete all MMC data (log data, measurement data, etc.) Deletes data stored on the micro memory card.
77	Trace single recording This command initiates a single recording of a trace element. The time between two trace recordings can be defined in any interval. With trace to MMC, new trace commands initiate a new trace recording only after 50 ms. With trace to RAM, the recording is performed within 10 ms, maximum.
Scale commands	

Command	Meaning of command
100	Start weighing operation with tare/zeroing mode A weighing operation with zeroing or taring is started according to the tare/zeroing mode setting.
101	Start weighing operation without tare/zeroing mode A weighing operation is started without zeroing or taring. This command is only permitted when operation does not require calibration (country code is not "OIML").
102	Start weighing operation in continuous mode Continuous start of sequential weighing cycles. This command is only available for AWI mode.
103	Continue weighing cycle This command is used to continue weighing as well as emptying operations.
104	Continue weighing in JOG mode Weighing is continued in JOG mode (pulse/pause) only.
105	Stop during weighing cycle The weighing or emptying cycle is stopped immediately, the scale stops and remains in "stopped" mode. Possible subsequent commands: 103 – Continue weighing cycle 104 – Continue weighing in pulse mode 108 – Abort 110 – Residual weighing
106	End continuous operation The current weighing operation is completed, after which continuous operation is ended.
107	Activate check stop The scale is stopped at the next defined step for check stop. Continued with: 103 – Continue weighing cycle 104 – Continue weighing in pulse mode 108 – Abort 110 – Residual weighing
108	Abort The stopped weighing cycle is ended with no further activity. Automatic emptying is not performed. The previous weight is not taken into account in the totalizing calculation.
109	Empty On This command activates the emptying signal in idle state (no active weighing). If the emptying time is 0, the emptying signal remains activated until the weight is in the empty range. Independently of this, the emptying operation can be terminated with command 118.
110	Residual weighing A weighing cycle in progress is stopped if necessary, and the emptying operation is started immediately. The current weight is balanced before emptying. In certain cases, continuous operation is ended.
111	Activate inhibit time for setpoint-actual comparison The setpoint-actual comparison is not performed for a defined period of time. Command 112 can be used to shorten this defined time, thus immediately ending the inhibit time for the setpoint-actual comparison.
112	Stop inhibit time for setpoint-actual comparison The activated inhibit time is stopped early.
113	Logging and deleting calibration-capable totalizing memory 1 This command is only executed if the log text contains total 1.

Com-mand	Meaning of command
114	Delete totalizing memory 1 Permitted only if the country code is not "OIML".
115	Delete totalizing memory 2 Totalizing memory 2 can be deleted at any time.
116	Delete statistical data Deletes statistical data, with the exception of the totalizing memories.
117	Output totalizing memory 1 for 5 s The content of totalizing memory 1 is output instead of the calibration-capable weight value. When in SWT operating mode, the totalizing memory 1 is displayed permanently. In the other operating modes, it automatically switches back to the weight with calibration capability after 5 s. Command 125 also re-activates the weight with calibration capability.
118	Empty Off The emptying operation initiated with command 109 is terminated immediately.
121	Start weighing operation with/without taring/zeroing A single start with/without tare/check is to be performed. The counters for the tare and check cycle run in the background (as in continuous mode) and determine whether the scale should be tared or, in certain cases, a check should be performed.
122	Execute taring/zeroing The scale is to be tared/zeroed the next time it is started. After this is performed, the taring-cycle counter is reset.
123	Check follows After the check is performed, the counter is reset, but only restarted after being adjusted to the control optimum.
124	Residual emptying Continuous operation is ended and residual emptying performed. The emptied residual amount is not logged.
125	Display weight with calibration capability The content of weight with calibration capability is output instead of the totalizing memory 1.
126	Display log values with calibration capability Display the log values with calibration capability (log ID, gross or net, tare, total 1 and setpoint) one after another in a 4s cycle and then switches back to the original value. (cannot currently only be used via SIWATOOL)
127	Residual weighing without emptying Emptying is stopped. The amount emptied so far is added to the current total 1. The cycle is emptied without any more emptying.
Composite commands	
601	Read DR30 and DR31
602	Read DR34 and DR35
610	Read DR20 and DR22
649	Read all data records from the SIWAREX FTA: DR3, DR4, DR7, DR8, DR9, DR15, DR16, DR17, DR18, DR20, DR21, DR22, DR23, DR30, DR31, DR32, DR34, DR35, DR44, DR45, DR46, DR47)
651	Write scale data 1 (DR22) and setpoint weight (DR20) to the SIWAREX FTA and the start the weighing operation with command 100 (Start weighing operation with tare/zeroing mode)

Com-mand	Meaning of command
652	Write scale data 1 (DR22) and load quantity (DR21) to the SIWAREX FTA and the start the weighing operation with command 100 (Start weighing operation with tare/zeroing mode)
653	Write scale data 1 (DR22) and setpoint weight (DR20) to the SIWAREX FTA and the start the weighing operation with command 102 (Start weighing operation in continuous mode with tare/zeroing mode)
654	Write scale data 1 (DR22) and load quantity (DR21) to the SIWAREX FTA and the start the weighing operation with command 102 (Start weighing operation in continuous mode with tare/zeroing mode)
660	Write DR20 and DR22
699	Write the following data records to the SIWAREX FTA: DR3, DR4, DR7, DR8, DR15, DR18, DR21, DR22, DR23, DR45, DR46

8.8.7.3 SIMOTION and SIMATIC names

The following table contains a comparison of the SIMOTION and the SIMATIC names.

Table 8-127 SIMOTION and SIMATIC names for the SIWAREX FTA weighing module

Name in SIMOTION System, V4.1 and higher (command library in SCOUT)	Name in the SIMATIC system
Function block parameter	
execute	AUT_CMDEN
cmdNumber	AUT_CMD
ackErrorFTA	ERR_MSG_Q
periIn	-
moduleAddress	LADDR
simValue	SIM_VAL
setAO	ANA_OUT
forceDO	DO_FORCE
transitions	TRANSITION
scaleData	UDT12
periOut	-
done	CMD_FOK
busy	CMD_INPR
error	FB_ERR
errorID	FB_ERR_C
errorIdTransfer	-
errorIdCommand	CMD_ERR_C
errorFTA	ERR_MSG
errorTypeFTA	ERR_MSG_TYPE
errorIdFTA	ERR_MSG_C
cntrRefresh	REF_COUNT
val1Process	PROC_VAL1

Name in SIMOTION System, V4.1 and higher (command library in SCOUT)	**Name in the SIMATIC system**
val2Process	PROC_VAL2
scaleStatus	SC_STATUS

Table 8-128 Abbreviations

Abbreviation	Definition
ADC	Analog-Digital Converter
ADC	Analog-digital converter
AWI	**A**utomatic **W**eighing **I**nstrument
DAL	Diagnostic alarm
DR	Data record
FB	Function block
FTA	**F**lexible **T**echnology, **A**utomatic Weighing Instrument
HW	Hardware
IM	Interface module
IN	Input parameter
IN/OUT	In/out parameter
I/O	Input/Output
LAD	Ladder diagram
LC	Load Cell
MMC	Micro Memory Card
NAWI	**N**on **A**utomatic **W**eighing **I**nstrument
OD	Output disable (response to CPU-STOP)
OIML	International Organization of Legal Metrology
OUT	Output parameter
PRAL	Process alarm
PS	Power supply
RAM	Random Access Memory
SecureOCX	Add-on for WinCC flexible for configuration of the weight display with calibration capability
SW	Software
AWI	Automatic Weighing Instrument (weighing operating mode)
SWE	Automatic scale for single weighing machine (weighing operating mode)
SWT	Automatic scale for loading - totalizing (weighing operating mode)
TO	Upper tolerance limit
TSI	Taskstartinfo
TU	Lower tolerance limit
WB	Weighing range
WinCC flexible	Software for configuring the weight display with calibration capability
Tool	Load cell

8.9 Extension to the command interface for AS-Interface master modules

Introduction

Contents of the function manual

This **document** is part of the **SIMOTION Programming References documentation package**.

Function block

The **_ASI_cmdInterface** function block for the AS-Interface master modules CP 343-2 P, DP/AS-Interface Link 20E, DP/AS-Interface Link Advanced, and IE/AS-Interface Link PN IO is part of the command library of the "SIMOTION SCOUT" engineering system.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

http://www.siemens.com/mdm

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

8.9.1 Fundamental safety instructions

8.9.1.1 General safety instructions

⚠ WARNING

Risk of death if the safety instructions and remaining risks are not carefully observed

If the safety instructions and residual risks are not observed in the associated hardware documentation, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life or malfunctions of the machine as a result of incorrect or changed parameterization

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

8.9.1.2 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

8.9.2 Description

8.9.2.1 General

This chapter describes the general differences and the common features of the AS-Interface master modules CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced, and IE/AS-Interface Link PN IO that result from operating a SIMOTION system (as opposed to a SIMATIC system) for data transfer and command interface operation purposes.

Note

This manual is a supplement to the following SIMATIC manuals:

- *SIMATIC NET CP 343-2/CP 343-2 P AS-Interface Master*
- *SIMATIC NET DP/AS-Interface Link 20E*
- *SIMATIC NET DP/AS-Interface Link Advanced*
- *SIMATIC NET IE/AS-Interface Link PN IO*

These documents are shipped with SIMOTION SCOUT in electronic form.

The following software versions are required for the standard function described in this documentation:

- For AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced):
  - SIMOTION SCOUT V4.0 or higher
  - SIMOTION Kernel V4.0 or higher
- For AS-Interface master IE/AS-Interface Link PN IO:
  - SIMOTION SCOUT, V4.1 SP1 or higher
  - SIMOTION Kernel, V4.1 SP1 or higher

8.9.2.2 Product description

The following modules can be operated using automation systems from both the SIMATIC and SIMOTION ranges:

- CP 343-2 P
- DP/AS-Interface Link 20E
- DP/AS-Interface Link Advanced
- IE/AS-Interface Link PN IO

They permit the connection of an AS-Interface line to the above mentioned automation systems.

You can use the modules to access from the SIMOTION motion control system to the input/output of the AS-Interface slaves. You can access binary or analog values depending on the slave type.

The following AS-Interface slaves can be used:

- Standard slaves
- Slaves with extended address area (extended addressing mode)
- Analog slaves to 7.3/7.4 slave profile

Additionally, for IE/AS-Interface Link PN IO it is possible to use slaves with data transfer mechanisms in accordance with the AS-Interface Specification V3.0-Combined Transaction Type (CTT) 1-5.

Function block

The **_ASI_cmdInterface** function block is provided for operating the command interface of the AS-Interface master CP 343-2 P and DP/AS-Interface Link 20E/Link Advanced with SIMOTION. The function block is described in this manual.

Note

No specific function blocks are required for operating the command interface of the IE/AS-Interface Link PN IO AS-Interface master. Data transfer is performed using the SIMOTION system functions **_readRecord** and **_writeRecord**.

Functionality of the function block and the AS-Interface master CP 343-2 P, DP/AS-Interface Link 20E, and DP/AS-Interface Link Advanced

Although the functionality of the **_ASI_cmdInterface** function block and the AS-Interface master is unchanged when compared with their use in a SIMATIC S7 automation system, the execution of the data transmission and the handling of the FB has been adapted to the given SIMOTION general conditions.

Possible applications

In addition to the applications described in the SIMATIC manuals, you can use the AS-Interface master modules with a SIMOTION system. The CP 343-2 P can be used centrally (on the SIMOTION C2xx only), or the CP 343-2 P and DP/AS-Interface Link 20E/Link Advanced can be used on a distributed basis (SIMOTION C2xx, SIMOTION P350, and SIMOTION D4xx). The IE/AS-Interface Link PN IO can be operated with all SIMOTION devices that feature a PROFINET interface (e.g. D435 with CBE30).

You can operate several AS-Interface masters with the associated AS-Interface slaves on a single SIMOTION device.

The following figures show how the AS-Interface master can be connected to various SIMOTION devices.

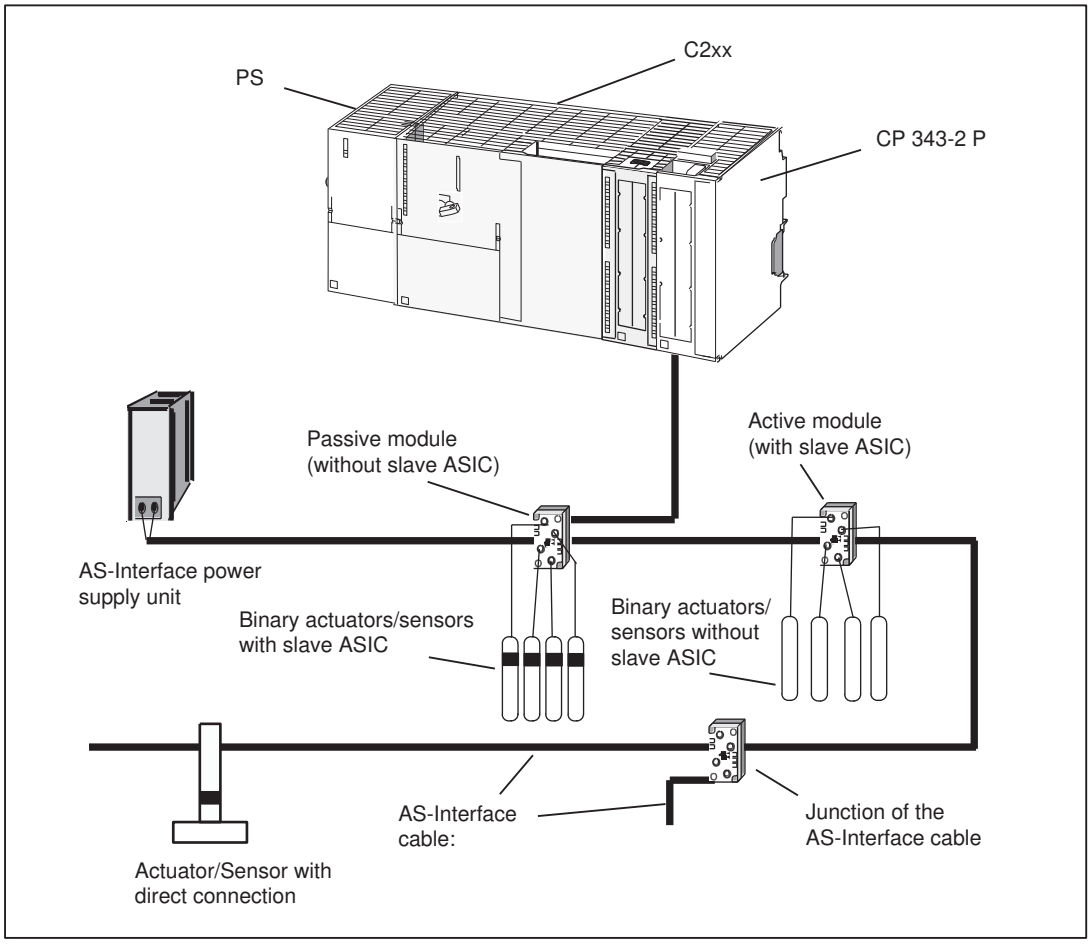

Figure 8-51 Centralized use of the CP 343-2 P AS-Interface master module on the SIMOTION C2xx device

Note

For AS-Interface modules, a differentiation is made between active and passive modules.

- Active modules with slave ASIC:
  It is possible to connect actuators (using a digital or analog output signal) or sensors (using a digital or analog input signal) to active modules.
  This enables actuators and sensors to be interconnected using the AS-Interface.
- Passive modules without slave ASIC:
  These do not have any electronics of their own, but act as distributors and enable connection of the AS-Interface actuators and sensors with integrated slave ASIC (e.g. AS-Interface LED displays).

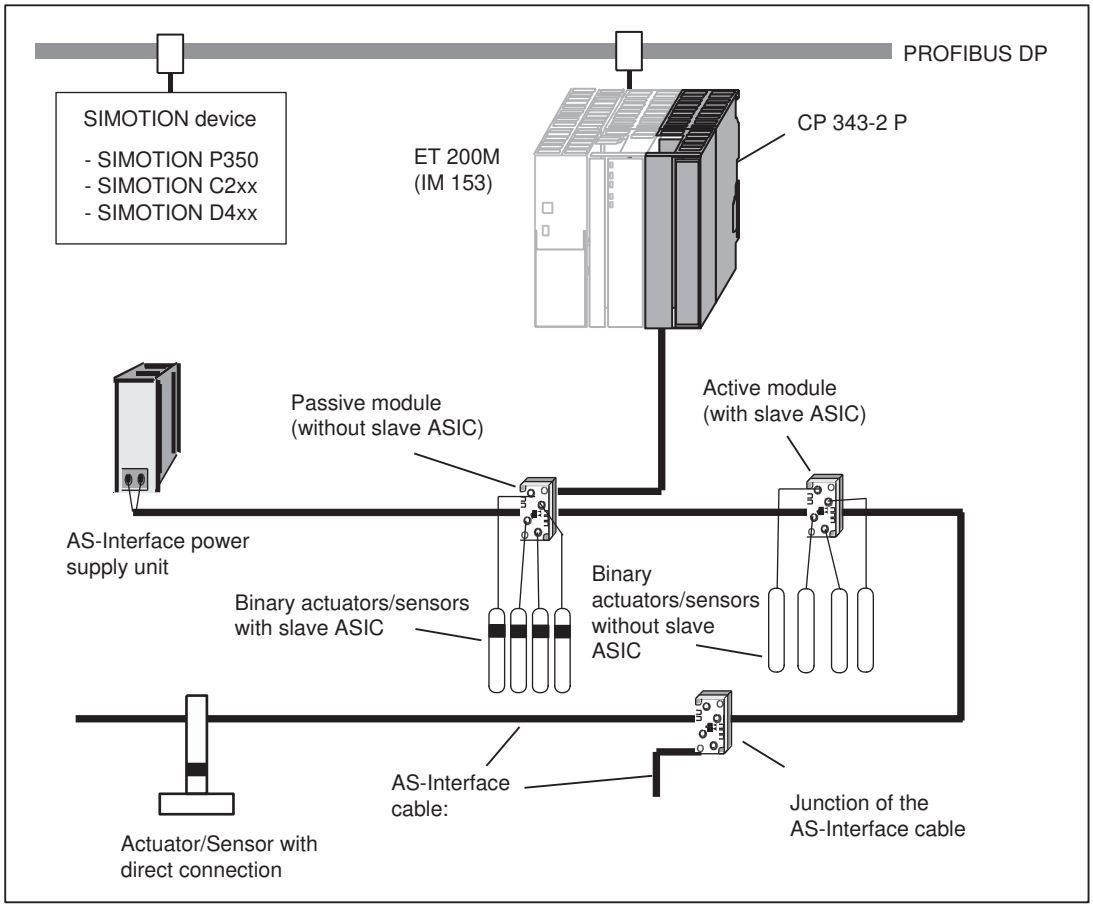

Figure 8-52 Distributed use of the CP 343-2 P AS-Interface master module with ET 200M on a SIMOTION device

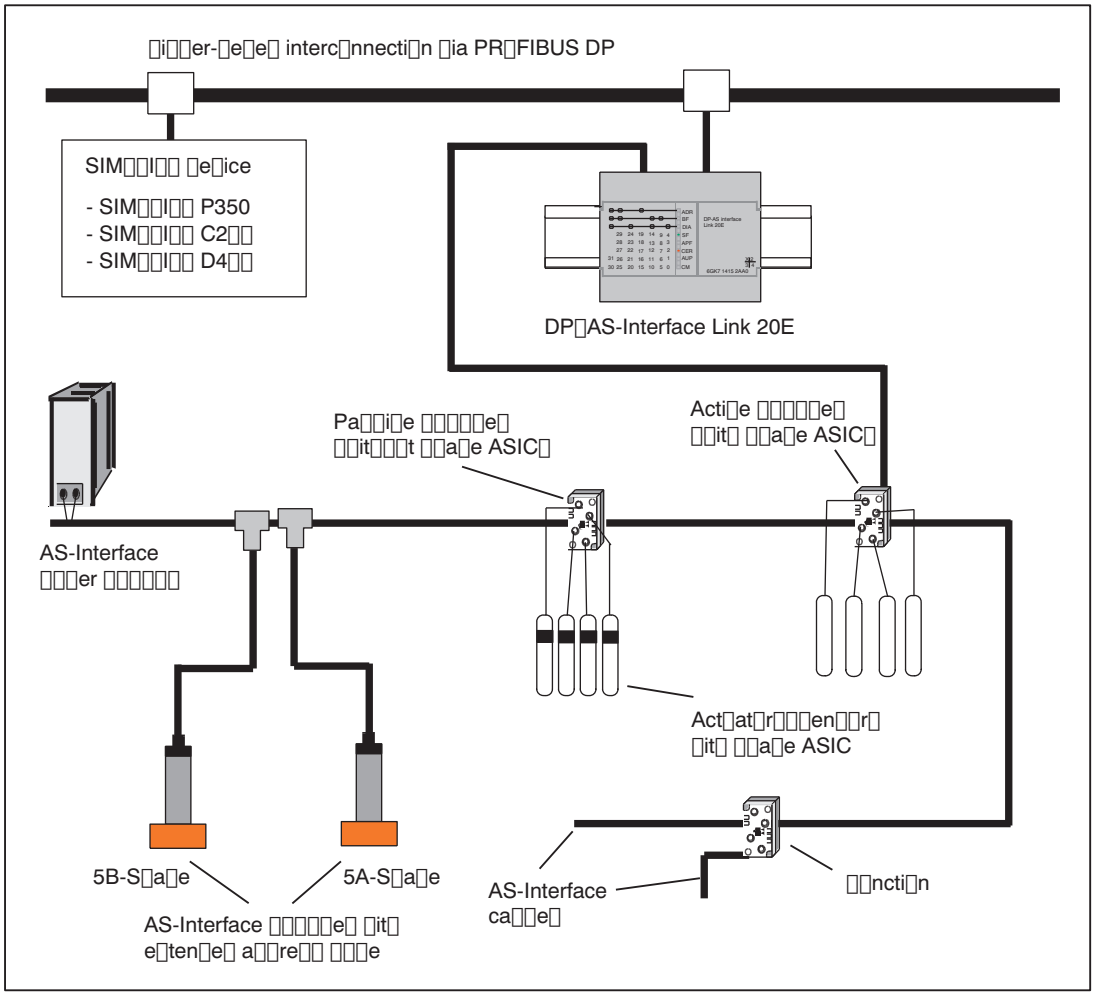

Figure 8-53 Distributed use of the DP/AS-Interface Link 20E AS-Interface master module on a SIMOTION device

Note

AS-Interface A/B slaves use an extended address area. This allows two A/B slaves to be assigned as a pair to an address on the AS-Interface.

The address organization thus allows up to 62 A/B slaves (rather than 31 slaves) to be connected to the AS-Interface.

Addressing is performed on a module-specific basis. For a more detailed description of addressing, refer to the SIMATIC Manual of the AS-Interface master module being used.

8.9.3 Program

8.9.3.1 Operating the command interface of the IE/AS-Interface Link PN IO AS-Interface master

Overview

The command interface of the IE/AS-Interface Link PN IO AS-Interface master is operated by means of data record transfer.

Data record transfer

Data record transfer is performed in the SIMOTION system using the functions **_readRecord** and **_writeRecord**. In terms of their functionality, these correspond to system function blocks SFB 52 and SFB 53 in the SIMATIC system (see the table below).

Table 8-129 Parameter assignment

Parameters for SFB 52/ SFB 53 (SIMATIC)	Parameter _readRecord (SIMOTION)	Parameter _writeRecord (SIMOTION)	Meaning
ID	logAddress	logAddress	I/O address or diagnostic address of the IE/AS-Interface Link slot
-	ioId	ioId	Input/output assignment of logical base address of the drive [1]
INDEX	recordNumber	recordNumber	Data record number
MLEN/LEN	dataLength	dataLength	Length of the data record
RECORD	StructRetReadRecord.data	Data	Interface for net data

[1] Parameter **ioId** is parameterized as type Input (for addresses in the I/O input range) or Output (for addresses in the I/O output range). Diagnostic addresses are always of type Input. Two identical ID-logic addresses may be in both the input and output range.

Note

Data record transfer using **_readRecord** or **_writeRecord** is shown in the application example for FB **_ASI_cmdInterface**.

The application example is included on the "SIMOTION Utilities & Applications" CD-ROM and is available for various SIMOTION hardware platforms. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and is part of the SIMOTION SCOUT scope of delivery.

Addressing the AS-Interface master (IE/AS-Interface Link PN IO)

Communication between the SIMOTION device and the AS-Interface master takes place via direct access to the I/O (cyclic data transfer) and data record transfer (acyclic data transfer). Addresses starting at 256 are recommended for the AS-Interface master.

For data record transfer, the module address is transferred as input parameter **logAddress** to the **_readRecord**/**_writeRecord** system functions. Communication via direct access to the I/O takes place using I/O variables in the recommended address area (addresses starting at 256).

There are no fixed specifications in terms of how the AS-Interface slave addresses are assigned to the IE/AS-Interface Link PN IO address area; this can be changed in the Step7 HW configuration.

Note

When using the IE/AS-Interface Link PN IO AS-Interface master, a distinction is made between parameterizing AS-Interface line calls and AS-Interface slave calls.

In the case of AS-Interface line calls, the parameters are implemented using the system functions **_readRecord** and **_writeRecord** as follows:

- **logAddress** with the "diagnostic address" of the IE/AS-Interface Link PN IO AS-Interface master
- **recordNumber** with the data record index of the AS-Interface line command
- **datalength** with the max. data record length of 240 bytes

In the case of AS-Interface slave calls, the parameters are implemented using the system functions **_readRecord** and **_writeRecord** as follows:

- **logAddress** with the "I/O address" of the AS-Interface slave modules
- **recordNumber** with the data record index of the AS-Interface slave command
- **datalength** with the max. data record length of 240 bytes
- **ioId** with type Input (for addresses in the I/O input range) or Output (for addresses in the I/O output range)

Additional information on the AS-Interface line calls and AS-Interface slave calls can be found in the *SIMATIC NET IE/AS-Interface Link PN IO* Manual. This document is shipped with SIMOTION SCOUT in electronic form.

8.9.3.2 Operating the command interface of the AS-Interface master CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced

Integrating the _ASI_cmdInterface function block and the application examples in the user project

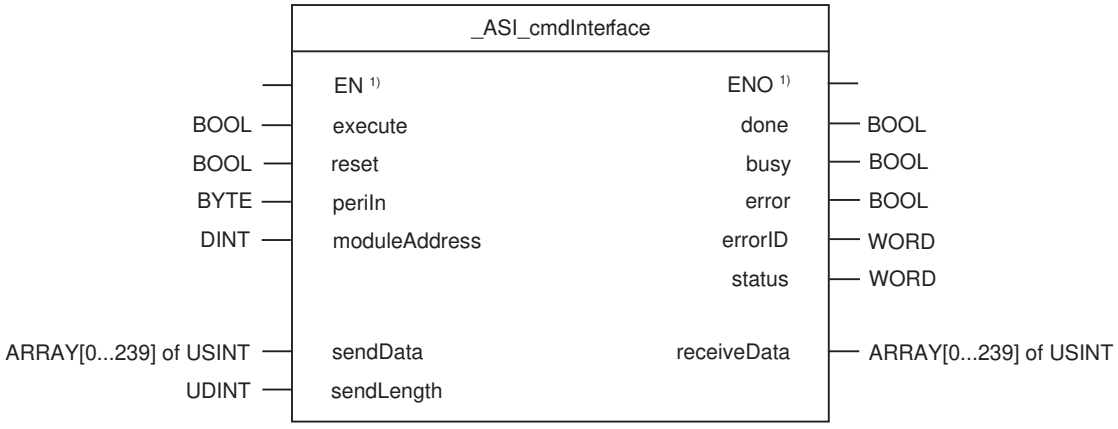
Creating the FB instance in the user project

The **_ASI_cmdInterface** FB is part of the command library of the “SIMOTION SCOUT” engineering system. For the operation of the command interface, an instance of the **_ASI_cmdInterface** FB for the corresponding AS-Interface master must be created in the user project. If several AS-Interface masters are operated, an instance of the FB for each master must be created in the user project.

Example:

```
VAR
   myFB_ASI_cmdInterface : _ASI_cmdInterface;  // instance of FB _ASI_cmdInterface for
                                               // one AS-Interface Master
END_VAR
```

Call (LAD representation)



1) LAD-specific parameters

Example of an application

The application example is included on the "SIMOTION Utilities & Applications" CD-ROM and is available for various SIMOTION hardware platforms.

The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and is part of the SIMOTION SCOUT scope of delivery.

Addressing the AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced)

Overview

Communication between the SIMOTION device and the AS-Interface master takes place via direct access to the I/O (cyclic data transfer) and data record transfer (acyclic data transfer). Addresses starting at 256 are recommended for the AS-Interface master.

For data record transfer, the module address is transferred as **moduleAddress** input parameter to the **_ASI_cmdInterface** FB. Communication via direct access to the I/O takes place using I/O variables in the recommended address area (addresses starting at 256).

Creating I/O variables

You must create an I/O variable in the symbol browser for each read or write access to addresses outside the process image (addresses ≥ 64).

When you create the I/O variable, you must enter the parameterized address of the AS-Interface master from the HW configuration in the "I/O address" parameter. The value in the "field length" parameter depends on the associated AS-Interface master.
Specify the value 16 (= 16 bytes) as the field length for the CP 343-2 P.

The field length (xx) to be parameterized for the DP/AS-Interface Link 20E/Link Advanced must be entered as appropriate for the assigned address space (from HW Config). These values are used to create an I/O variable of types ARRAY[0..15] of byte (CP 343-2 P) and ARRAY[0..(xx-1)] of byte (DP/AS-Interface Link 20E 20E/Link Advanced) in the SIMOTION project for direct write/ read access to the I/O.

Example

I/O variables for access to the AS-Interface slaves with CP 343-2 P:

	Name	I/O address	Read only	Data type	Field length
1	⊞ myperiincp3432	PIB 256		Array	16
2	⊞ myperioutcp3432	PQB 256	☐	Array	16

Figure 8-54 Addressing with I/O variable

Parameter transfer

- Addressing with I/O variables
  The **periIn** call parameter is used to transfer the control information to the **_ASI_cmdInterface** FB. These are contained in array element 0 of the I/O variable created.
- Addressing using addresses within the process image
  For addressing using address within the process image, the input byte of the AS-Interface master start address must be transferred to the **_ASI_cmdInterface** FB.

Example: Calling FB _ASI_cmdInterface

Addressing using addresses outside the process image by means of I/O variables

```
myFBcmdInterface (execute    := ..,
                  reset      := ..,
                  periIn     := myPeriInCP3432[0], // control information
                  moduleAddress := 256,
                  sendData   := ..,
                  sendLength := .. );
```

Addressing with addresses of the process image

```
myFBcmdInterface (execute       := ..,
                  reset         := ..,
                  periIn        := %IB0,       // control information
                  moduleAddress := 0,
                  sendData      := ..,
                  sendLength    := ..);
```

Note

For additional information, see the following sources:

- *SIMOTION SCOUT* online help
- Programming Manuals for the relevant programming languages, such as:
  - *SIMOTION ST, Structured Text* Programming Manual
  - *SIMOTION MCC, Motion Control Chart* Programming Manual
  - *SIMOTION LAD/FBD, Ladder Diagram and Function Block Diagram* Programming Manual

These documents are shipped with SIMOTION SCOUT in electronic form.

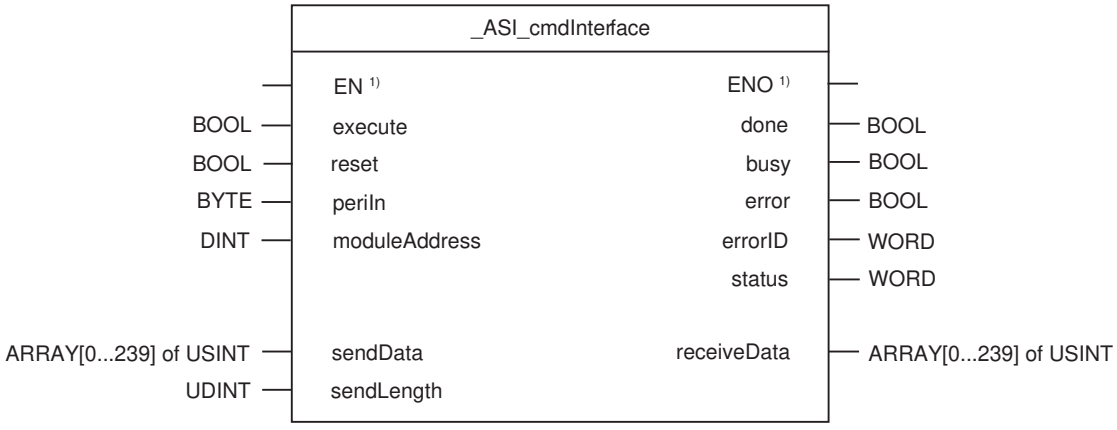
8.9.4 Parameter assignment,

8.9.4.1 _ASI_cmdInterface function block

Task

You can use the **_ASI_cmdInterface** FB to easily and completely control the AS-Interface master behavior from the user program. The **_ASI_cmdInterface** FB transfers the commands and data to the AS-Interface master, receives the response data provided by the module, and transfers this data. The calls for the reading and writing of data records are managed in the **_ASI_cmdInterface** FB.

Call (LAD representation)



1) LAD-specific parameters

parameter description

The following table contains all parameters of the **_ASI_cmdInterface. function block**

Note

You can find a comparison of SIMOTION and SIMATIC names in the Appendix SIMOTION and SIMATIC names (Page 6465).

Table 8-130 FBs _ASI_cmdInterface parameters

Name	Type	Data type	Default	Meaning
execute	IN	BOOL	FALSE	Starting a new request with a rising edge
reset	IN	BOOL	FALSE	**TRUE** = Error acknowledgement/reinitialization (takes priority over command processing)
periIn	IN	BYTE	16#00	Control information from AS-Interface master for FB **_ASI_cmdInterface** (see Chapter Addressing the AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced) (Page 6442))
moduleAddress	IN	DINT	0	Module address from **HW Config**
sendData	IN	ARRAY[0...239] of USINT	0	Data to be sent (command number, possibly parameters)
sendLength	IN	UDINT	0	Length of the data to be sent (depends on the command to be sent)
done	OUT	BOOL	FALSE	**TRUE** = request was processed successfully
busy	OUT	BOOL	FALSE	**TRUE** = request in progress
error	OUT	BOOL	FALSE	**TRUE** = error during the request processing

Name	Type	Data type	Default	Meaning
errorID	OUT	WORD	16#0000	Error specification of the error For **error** = **TRUE**, the **errorID** parameter contains the error information (see table titled "Error and status messages", Chap. Error and status messages of the FB _ASI_cmdInterface (Page 6460)).
status	OUT	WORD	16#0000	Status of the command processing (see table titled "Status messages", Chap. Error and status messages of the FB _ASI_cmdInterface (Page 6460))
receiveData	OUT	ARRAY[0...239] of USINT	0	Data field for the response data of a request

Function description

A rising edge at the **execute** input initiates a request. The **done** output parameter will be reset. The completion of a request without error will be signaled with falling edge at the **busy** output parameter and with rising edge at the **done** output parameter. The completion of a request with error will be signaled with falling edge at the **busy** output parameter and with rising edge at the **error** output parameter. The error is specified in the **errorID** output parameter.

Errors present at the **error** output parameter must be reset with a rising edge on the **reset** input parameter before a new request is initiated. This resets the **error** and **errorID** output parameters.

The **reset** input parameter has priority over the command processing. A request initiated at the same time will be stored internally and executed once error acknowledgement/reinitialization is complete.

Prior to initiating the request with rising edge at the **execute** input parameter; the user must enter the request number or the data that belongs to the request in the **sendData** input parameter and set as parameter the length of the data to be sent in the **sendLength** input parameter.

If the AS-Interface master passes response data for a command (e.g. read version identification), the **_ASI_cmdInterface** FB will provide this data in the **receiveData** output parameter. The corresponding data for the AS-Interface slave commands and the meaning of the received data are described in the documentation for the CP 343-2 P and the DP/AS-Interface Link 20E/Link Advanced.

The **status** output parameter indicates the processing status of the command and the /**reset** reinitialization (see the table titled "Error and status messages", Chapter Error and status messages of the FB _ASI_cmdInterface (Page 6460)).

Note

A rising edge at the **execute** input parameter will not be detected when a command or a reinitialization is being processed (**busy = TRUE** output parameter).

Example: read parameter value

```
mySendData[0] := 16#03;                              // command number for read parameter
mySendData[1] := 16#01;                              // address ASI-Slave
mySendLength  := 2;
myExecute     := TRUE;

myFbAsiCmdInterface (execute    := myExecute,
                     sendData   := mySendData,
                     sendLength := mySendLength,
                     ...);

myParaValue   := myFbAsiCmdInterface.receiveData[0];  // read parameter value
```

Graphical overview of the functionality

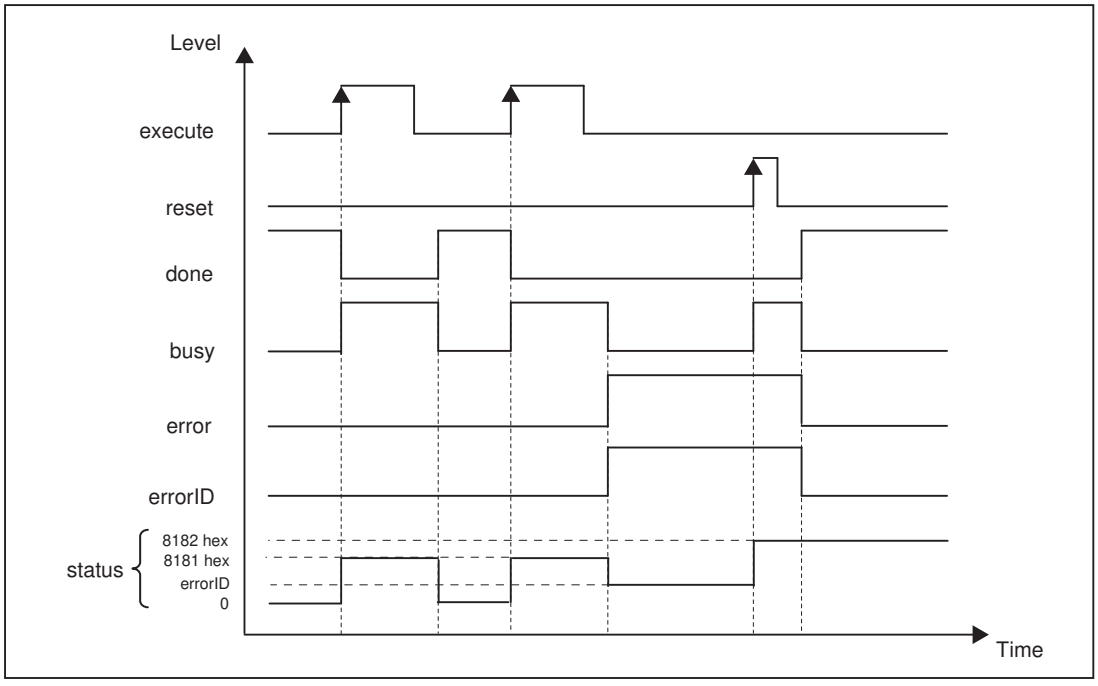


Figure 8-55 Signal sequence diagram

Task integration (call)

The **_ASI_cmdInterface** function block is provided for being called in a cyclical task and must be called in this task for each pass. A request is processed over several cycles. The user decides in which cyclical task the **_ASI_cmdInterface** FB is called. The **_ASI_cmdInterface** FB functionality does not place any restrictions. The call can be made in all cyclical tasks. A fixed time frame (e.g. **IPOSynchronousTask**) is not required for processing.

Error messages

You will find the error and status messages in the chapter titled Error messages / diagnosis (Page 6460).

8.9.4.2 Call example for the FB _ASI_cmdInterface

Calling the function block

In order to work with the function block in your user project, proceed as follows (the numbers shown in the following program snippet correspond to the steps below):

1. Create an instance of the function block
2. Create variable for the send and receive data array
3. Call instance of the function block
4. Transfer input parameters
5. The output parameters of the function block are accessed with <instance name of FB>.<name of output parameter>.

Note

The call example is a fragment from the provided application example contained on the "SIMOTION Utilities & Applications" CD-ROM.

The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and is part of the SIMOTION SCOUT scope of delivery.

If you want to trigger several AS-Interface master modules, you must create a new FB instance with a new name for each used AS-Interface master.

Program fragment from the program example:

```
UNIT E_AsiCmd;

INTERFACE

VAR_GLOBAL
  myAsiCmdInterface : _ASI_cmdInterface;  // Instance of FB _ASI_commandInterface                (1)
  mySendData    : ARRAY[0..239] OF USINT; // send buffer with ASI commands and data              (2)
  myReceiveData : ARRAY[0..239] OF USINT; // receive buffer
  mySendLength  : UDINT;                  // send length
  myResetAsi    : BOOL;                   // reset ASI master
END_VAR

PROGRAM ExampleAsiCommand;
```

```
END_INTERFACE

IMPLEMENTATION

// ***********************************************************************
// program to handle ASI commands
// ***********************************************************************
PROGRAM ExampleAsiCommand

  // prepare send command
  IF (FP_executeAsiCommand.Q=TRUE)      // test new command
  AND (myAsiCmdInterface.busy=FALSE)    // test FB _ASI_cmdInterface is not running
  THEN
    mySendData[0]   := 16#14;           // code of ASI command "read version"
    mySendLength    := 1;               // send length
    myRequestAsiCmd := TRUE;            // set request for new ASI command
  END_IF

  // call FB _ASI_commandInterface                                                    (3)
  myAsiCmdInterface
  ( execute       := myRequestAsiCmd,   // request ASI command
    reset         := myResetAsi,        // reset ASI master
    periIn        := myPeriInDataByte0, // Byte0 of peripheral data ASI master      (4)
    moduleAddress := myModuleAddress,   // module address of ASI master
    sendData      := mySendData,        // send buffer with ASI commands and data
    sendLength    := mySendLength       // send length
  );
  //
  IF(myAsiCmdInterface.done=TRUE)                                                  (5)
  THEN
     // finish without error
     myDone             := TRUE;
     myError            := FALSE;
     myRequestAsiCmd    := FALSE;       // reset request
     myResetAsi         := FALSE;
     // copy received data
     myReceiveData      := myAsiCmdInterface.receiveData;                         (5)

  ELSIF(myAsiCmdInterface.error=TRUE)                                              (5)
  THEN
     // finish with error
     myDone             := FALSE;
```

```
    myError            := TRUE;
    myRequestAsiCmd    := FALSE;       // reset request
    myResetAsi         := FALSE;
    // copy error code
    myErrorID          := myAsiCmdInterface.errorID;                    (5)
  END_IF;

END_PROGRAM

END_IMPLEMENTATION
```

8.9.5 Configuring

8.9.5.1 Setup and connection

Overview

You must perform the following steps in order to commission the AS-Interface master modules and control them from the SIMOTION system:

Distributed use of the CP 343-2 P AS-Interface master module (SIMOTION C2xx, SIMOTION P350 and SIMOTION D4xx)

1. Assemble and install the cables for the ET 200M distributed I/O device complete with power supply (PS), interface module (IM), and the CP 343-2 P AS-Interface master module. Install the cables and address the AS-Interface slaves.
2. Establish the PROFIBUS connection between the ET 200M and the SIMOTION device.
3. Set the PROFIBUS DP node address on the IM.
4. Switch on the terminating resistor at the first and last bus node.

   Note

   Steps 1. to 4. are described in detail in the *"ET 200M Distributed I/O Device"* Manual.

5. Add the CP 343-2 P AS-Interface master module to the SIMOTION project (see the following section).

6. Parameterize the CP 343-2 P AS-Interface master module and the AS-Interface slaves in **HW Config**. For a detailed description of parameterizing the modules, see:
   - *SIMATIC NET CP 343-2/CP 343-2 P AS-Interface Master* Manual.
   - Documentation for the corresponding AS-Interface slaves

   You can use the "Load into the PG" function to import the configuration of the AS-Interface slaves into your hardware configuration:

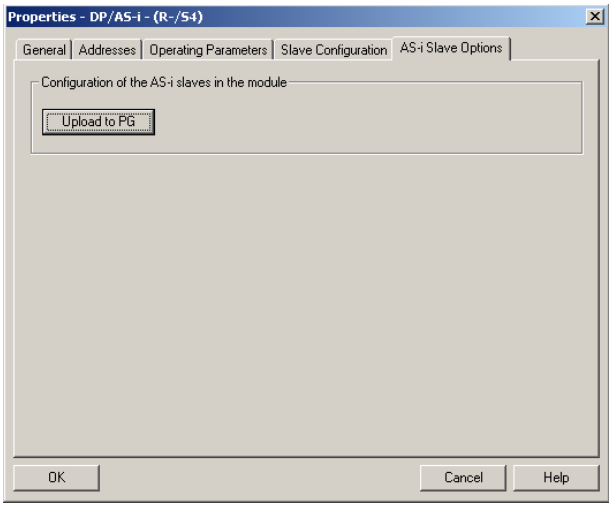

Figure 8-56 Loading the AS-Interface slave configuration into the PG

7. Link the function block to the SIMOTION project (refer to Chapter Integrating the _ASI_cmdInterface function block and the application examples in the user project (Page 6441)).

Distributed use of the DP/AS-Interface Link 20E/Link Advanced AS-Interface master module (SIMOTION C2xx, SIMOTION P350, and SIMOTION D4xx)

1. Assemble and install the cables for the DP/AS-Interface Link 20E/Link Advanced AS-Interface master module. Install the cables and address the AS-Interface slaves.
2. Establish the PROFIBUS connection between the DP/AS-Interface Link 20E/Link Advanced and the SIMOTION device.
3. Set the PROFIBUS DP node address on the DP/AS-Interface Link 20E/Link Advanced.
4. Switch on the terminating resistor at the first and last bus node.

   Note

   Steps 1. to 4. are described in detail in the *SIMATIC NET DP/AS-Interface Link 20E* and *SIMATIC NET DP/AS-Interface Link Advanced* Manuals.

5. Add the DP/AS-Interface Link 20E/Link Advanced AS-Interface master module to the SIMOTION project (see Chapter Adding the AS-Interface master modules to the SIMOTION project (Page 6453)).

6. Parameterize the DP/AS-Interface Link 20E/Link Advanced AS-Interface master module and the AS-Interface slaves in **HW Config**. For a detailed description of parameterizing the modules, see:
   - *SIMATIC NET DP/AS Interface Link 20E* Manual
   - *SIMATIC NET DP/AS-Interface Link Advanced* Manual.
   - Documentation for the corresponding AS-Interface slaves
     You can use the "Load into the PG" function to import the configuration of the AS-Interface slaves into your hardware configuration:

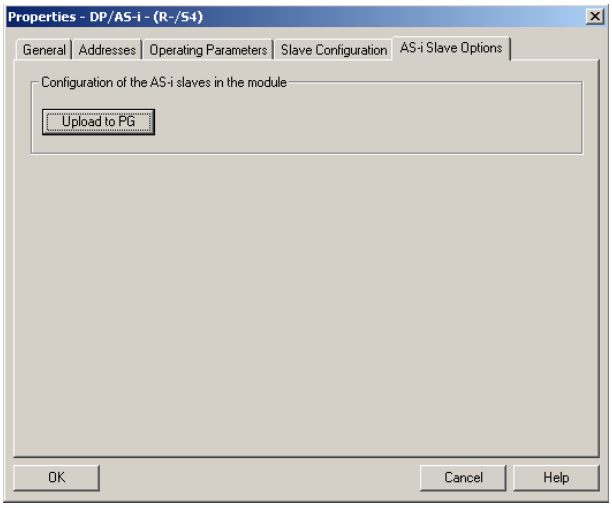

Figure 8-57 Loading the AS-Interface slave configuration into the PG

7. Link the function block to the SIMOTION project (refer to Chapter Integrating the _ASI_cmdInterface function block and the application examples in the user project (Page 6441)).

Distributed use of the AS-Interface master module (IE/AS-Interface Link PN IO)

1. Assemble and install the cables for the IE/AS-Interface Link PN IO AS-Interface master module. Install the cables and address the AS-Interface slaves.
2. Establish the PROFINET connection between the IE/AS-Interface Link PN IO and the SIMOTION device.
3. Add the IE/AS-Interface Link PN IO AS-Interface master module to the SIMOTION project (see Chapter Adding the AS-Interface master modules to the SIMOTION project (Page 6453)).
4. Assign device names according to the rules for address and name assignment in the SIMOTION system (see: *SIMOTION SCOUT Communication* System Manual.
5. Parameterize the IE/AS-Interface Link PN IO AS-Interface master module and the AS-Interface slaves in **HW Config**. For a detailed description of parameterizing the module, see:
   - *SIMATIC NET IE/AS-Interface Link PN IO* Manual.
   - Documentation for the corresponding AS-Interface slaves
     You can use the "Upload to PG" function to import the configuration of the AS-Interface slaves into your hardware configuration.

Centralized use of the CP 343-2 P AS-Interface master module (for SIMOTION C2xx only)

1. To configure the mechanical design, and prepare and install the SIMOTION components for assembly, see:
   - *SIMOTION C* Operating Instructions
   - *SIMATIC S7-300 Automation System, Hardware and Installation* Software Installation Manual.
2. To continue, refer to steps 5. to 7. for distributed use with PROFIBUS.

Note

The listed documents are included in the SIMOTION SCOUT scope of supply as electronic documentation

8.9.5.2 Adding the AS-Interface master modules to the SIMOTION project

Requirements

The following requirements must be met when networking with PROFIBUS:

1. You have created a project in SIMOTION SCOUT and have inserted a rack with a SIMOTION hardware platform in the hardware configuration.
2. You have configured a PROFIBUS subnet (for distributed use only).

Note

For how to create a project and configure a PROFIBUS subnet, refer to the online help of *SIMOTION SCOUT*.

The following requirements must be met when with PROFINET:

1. You have created a project in SIMOTION SCOUT and have inserted and configured a rack with a PROFINET-compatible SIMOTION device in the hardware configuration.
2. You have configured a PROFINET IO System (for distributed use only).

Note

For how to create a project and configure a PROFINET IO system, refer to the online help of *SIMOTION SCOUT*.

Inserting CP 343-2 P AS-Interface master modules (distributed use)

1. In SIMOTION SCOUT, open the **User Projects** dialog box with the **Project > Open** menu command. In this dialog box, select your project and confirm your choice with **OK**.
2. Open **HW Config**.
3. In the **HW Config** window, open the **hardware catalog** with the **View > Catalog** menu command.

4. Open the **PROFIBUS DP** folder and the **ET 200M** subfolder in the hardware catalog. Select, for example, the IM 153-1 interface module (Article No.: 6ES7 153-1AA03-0XB0 or a successor module).
5. Use **drag-and-drop** to place the IM 153-1 I/O device on the PROFIBUS subnet of your project. The **Properties - PROFIBUS IM 153-1 Interface** dialog box opens. In this dialog box, select the address you set on the IM 153-1 (see ET 200M Distributed I/O Device Manual) and confirm with **OK**. The selected IM 153-1 I/O device is inserted in the project.
6. The inserted I/O device must now be fitted with your project modules. Open the **CP-300 > AS-Interface** subfolder under the selected I/O device in the hardware catalog. Select the appropriate CP modules there.

   Note

   Diagnostic alarms are not enabled by default. Activate the alarms for each module in the **Properties** dialog box.

7. **Save** and **compile** your project.

Inserting DP/AS-Interface Link 20E/DP/AS-Interface Link Advanced AS-Interface master modules (distributed use)

1. In SIMOTION SCOUT, open the **User Projects** dialog box with the **Project > Open** menu command. In this dialog box, select your project and confirm your choice with **OK**.
2. Open **HW Config**.
3. In the **HW Config** window, open the **hardware catalog** with the **View > Catalog** menu command.
4. Open the **PROFIBUS DP** folder and the **DP/AS-i** subfolder in the hardware catalog. Here, select **DP/AS-i Link 20E** or **DP/AS-i Link Advanced**.
5. Use **drag-and-drop** to move the DP/AS-Interface Link 20E/Link Advanced AS-Interface master module to the PROFIBUS subnet of your project. The **Properties - PROFIBUS Interface DP/AS-i** dialog box is displayed. Here, select the address you set on the DP/AS-Interface Link 20E/Link Advanced AS-Interface master module (see the *"SIMATIC NET DP/AS-Interface Link 20E"* or *"SIMATIC NET DP/AS-Interface Link Advanced"* Manual) and confirm with **OK**. The selected DP/AS-Interface Link 20E/Link Advanced AS-Interface master module is inserted in the project.

   Note

   Diagnostic alarms are not enabled by default. Activate the alarms for each module in the **Properties** dialog box.

6. **Save** and **compile** your project.

Inserting an IE/AS-Interface Link PN IO AS-Interface master module (distributed use)

1. In SIMOTION SCOUT, open the **User Projects** dialog box with the **Project > Open** menu command. In this dialog box, select your project and confirm your choice with **OK**.
2. Open **HW Config**.

3. In the **HW Config** window, open the **hardware catalog** with the **View > Catalog** menu command.
4. Open the **PROFINET IO** folder and the **Gateway** subfolder in the hardware catalog. Here, select **IE/AS-i Link PN IO**.
5. Use **drag-and-drop** to move the IE/AS-Interface Link PN IO AS-Interface master module to the PROFINET IO System of your project.
6. Assign a device name according to the rules for address and device name assignment in the SIMOTION system.
7. If necessary, adjust how the ASI slave addresses are assigned to the input and output addresses of the AS-Interface master module.
8. **Save** and **compile** your project.

8.9.6 Example of an application

8.9.6.1 General information on the application example

Overview

The application example for the **_ASI_cmdInterface** FB is available for the following AS-Interface master modules:

- CP 343-2 P
- DP/AS-Interface Link 20E
- DP/AS-Interface Link Advanced

Task

The example program for the **_ASI_cmdInterface** FB shows the call and the parameter settings for the **_ASI_cmdInterface** FB. Five AS-Interface commands have been programmed. Further AS-Interface commands can be added to the program.

In addition, the sample project contains 2 programs for reading and writing analog and digital values.

You can choose from 2 sample projects:

- Sample project for **_ASI_cmdInterface** FB with the CP 343-2 P
- Sample project for **_ASI_cmdInterface** FB with the DP/AS-Interface Link 20E/Link Advanced

The two projects contain the following example programs:

Program	Task	Meaning
StartUpAsiCommand	StartupTask	Program for start-up
PeripheralFaultAsi	PeripheralFaultTask	Program for handling diagnostic alarms
ExampleAsiCommand	BackgroundTask	Example for serving the command interface

Program	Task	Meaning
ExampleAsiAnalog	BackgroundTask	Example for reading and writing analog values
ExampleAsiDigital	BackgroundTask	Example for reading and writing digital values

The following addresses are set by default for the example projects:

Sample project	Address
Sample project with CP 343-2 P	256
Sample project with DP/AS-Interface Link 20E/Link Advanced	0 (process image)

The following AS-Interface slaves are used on the AS-Interface addresses 3..5 in both example projects:

Address	AS-Interface slave
Address 3	AS-Interface slave with 2 digital inputs and outputs
Address 4	AS-Interface slave with 2 analog outputs
Address 5	AS-Interface slave with 2 analog inputs

Requirement

The addressing of the AS-Interface slaves and the configuring of the AS-Interface must be completed.

Hardware platform

The application example is available for various SIMOTION hardware platforms. A sample project with CP 343-2 P and DP/AS-Interface Link 20E/Link Advanced is provided for each hardware platform.

Note

If the application example is not available for your hardware platform, you have to adapt the hardware configuration.

Calling the application example

The application example can be found on the "SIMOTION Utilities & Applications" CD-ROM.

The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and is part of the SIMOTION SCOUT scope of delivery.

1. Dearchive and open the project containing the application example.
2. Check the axis configuration.

3. If necessary, adapt the example project.
4. Save and compile the example project. Following this, you can download the sample project to the SIMOTION device and switch to **RUN** mode.

Adapting the application example

The configuration in the example and its available hardware must be adapted to each other. The following options are available:

- You can adapt the configuration in the example to the available hardware.
- Adapt the configuration of the hardware to the example.

You can adapt the configuration in the example to the available hardware.

AS-Interface master:

Check the address in the "moduleAddress" variable and, if necessary, change the parameterized addresses of the I/O variables in the example project.

AS-Interface analog slaves:

If addresses other than the default addresses 4 and 5 are used for the analog AS-Interface slaves, the values of the indexes for the send or receive data array of the **_writeRecord/_readRecord** system functions must be adapted in the following variables.

Default indexes of the send data array based on the analog AS-Interface slave with address 4:

```
highByteAnaOutCh1       :=24;
lowByteAnaOutCh1        :=25;
highByteAnaOutCh2       :=26;
lowByteAnaOutCh2        :=27;
```

Default indexes of the receive data array based on the analog AS-Interface slave with address 5:

```
highByteAnaInCh1        :=32;
lowByteAnaInCh1         :=33;
highByteAnaInCh2        :=34;
lowByteAnaInCh2         :=35;
```

In addition, the value for the bytes to be transferred and the data record number must be adapted for addresses larger than 5 of the analog AS-Interface slaves and for addresses larger than 16, respectively. Data record 140 with a length of 40 bytes is set by default.

Both values are contained in the following variables:

```
dsNumber                :=140;
dsLength                :=40;
```

AS-Interface digital slaves:

The write and read accesses and the bit shift operations must be modified appropriately for digital AS-Interface slaves with addresses other than the default address 3.

Note

For a more detailed description of addressing, refer to the SIMATIC Manual of the AS-Interface master module being used.

8.9.6.2 Execution of the example project programs

Example program for serving the command interface

You can use the **ExampleAsiCommand** example program to transfer AS-Interface commands to the AS-Interface master with the **_ASI_cmdInterface** FB. You use the following variables to control the program execution:

asiCommands : Selection of the AS-Interface command (default: READ_VERSION)
executeAsiCommand : Start the transfer

The data read by the AS-Interface master are contained in the **receiveData** variable.

The status of the command processing is indicated in the following variables:

done : Command processing completed without error
error : Command processing completed with error
errorID : Error specification / error codes

The following AS-Interface commands have been programmed:

AS-Interface command	Meaning
READ_VERSION (default)	Fetch the version identification
CHANGE_ASI_SLAVE_ADDRESS	Change an AS-Interface slave address
READ_EXTENDED_CONFIGURATION	Import the configuration of the AS-Interface slaves connected to the AS-Bus
GET_LAS	Read extended lists and flags
RESET_ASI	Reset/initialize AS-Interface master
WRITE_ANA_PARAMETER	Transfer parameters to the analog AS-Interface slave with AS-Interface address 4 or 5

Example program for reading and writing analog values

The **ExampleAsiAnalog** example program illustrates not only the preparation, but also the reading and writing of analog values to and from analog AS-Interface slaves. Analog AS-Interface slaves (each with 2 channels) with AS-Interface address 4 (analog output) and AS-Interface address 5 (analog input) are used here.

You use the following variables to control the program execution:

wrAnaData : Write analog values
rdAnaData : Read analog values
dataAnaOut1 : Analog value for channel 1 to be written
dataAnaOut2 : Analog value for channel 2 to be written
dataAnaIn1 : Read analog value for channel 1
dataAnaIn2 : Read analog value for channel 2

The following variables indicate the status of the read/write of the analog values:

doneAnaWrite : Write analog value (data record transfer) completed without error
errorAnaWrite : Write analog value (data record transfer) completed with error
errorIdAnaWrite : Error specification of the data transfer/error code (see **_readRecord** and **_writeRecord** system functions, and Chap. Error messages / diagnosis (Page 6460))
doneAnaRead : Read analog value (data record transfer) completed without error
errorAnaRead : Read analog value (data record transfer) completed with error
errorIdAnaRead : Error specification of the data transfer/error code (see **_readRecord** and **_writeRecord** system functions, and Chap. Error messages / diagnosis (Page 6460))

Example program for reading and writing digital values

The **ExampleAsiDigital** example program writes and reads binary values from and to an AS-Interface slave with digital inputs and outputs. A slave with 2 digital inputs, 2 digital outputs, and AS-Interface slave address 3 is used.

Write or read the digital values in the following variables:

dataDigOut1 : Value to be written for digital output 1
dataDigOut2 : Value to be written for digital output 2
dataDigIn1 : Digital value read from input 1
dataDigIn2 : Digital value read from input 2

8.9.7 Error messages / diagnosis

8.9.7.1 Error and status messages of the FB _ASI_cmdInterface

The **error = TRUE** output parameter will be set if an error occurred. In this case, the AS-Interface master will not provide any receive data for requests with response data. The error is specified in the **errorID** output parameter. This output parameter contains the errors from the data record transfer (**_readRecord** and **_writeRecord** system functions) and the errors from the AS-Interface. The *SIMOTION System Functions/Variables Device*.
Parameter Manual contains a detailed description of the system functions.
This document is shipped with SIMOTION SCOUT in electronic form.

Table 8-131 Error messages

Error no.: hex (dec)	Meaning
Error messages (errorID parameter)	
0000 (0)	Request completed without errors
8090 (32912)	Error during data record transfer, request aborted. Specified logical base address invalid.
8091 (32913)	Error during data record transfer, request aborted. The **_readRecord** function cannot reach the specified logical base address.
809E (32926)	Error, request aborted. Attempt to interrupt a non-active function.
809F (32927)	Error, request aborted. Function cannot be executed.
80A0 (32928)	Error during data record transfer, request aborted. Negative acknowledgment when reading from the module: • Module was removed during the read operation • Defective module
80A1 (32929)	Error during data record transfer, request aborted. Negative acknowledgment when writing to module: • Module removed during write operation • Defective module
80A2 (32930)	Error during data record transfer, request aborted. PROFIBUS DP protocol error in layer 2.
80A3 (32931)	Error during data record transfer, request aborted. PROFIBUS DP protocol error in user interface/user.
80B0 (32944)	Error during data record transfer, request aborted. • System function not supported for this module type. • Module does not recognize the data record
80B1 (32944)	Error during data record transfer, request aborted. The length specified in the **sendLength** parameter is incorrect.
8184 (33156)	Invalid data type for the **receiveData** formal operand.
8381 (33665)	The AS-Interface slave address is incorrect.
8382 (33666)	The AS-Interface slave is not activated (not in LAS).
8383 (33667)	Error on the AS-Interface
8384 (33668)	The command is not permitted in the current state of the AS-Interface master.
8385 (33669)	An AS-Interface slave with address 0 exists.
8386 (33670)	The AS-Interface slave has invalid configuration data (I/O or ID codes).
83A1 (33697)	The requested AS-Interface slave was not found on the AS-Interface.

Error no.: hex (dec)	Meaning
83A2 (33698)	An AS-Interface slave with address 0 exists.
83A3 (33699)	An AS-Interface slave with the new address already exists on the AS-Interface.
83A4 (33700)	The AS-Interface slave address cannot be deleted.
83A5 (33701)	The AS-Interface slave address cannot be set.
83A6 (33702)	The AS-Interface slave address cannot be stored permanently.
83A7 (33703)	Error while reading the Extended ID1 code.
83A8 (33704)	The target address is not plausible (e.g. a B-Slave address is used for a Standard slave).
83B1 (33713)	A length error occurred during the string transfer to profile 7.4.
83B2 (33714)	A protocol error occurred during the string transfer to profile 7.4.
83F8 (33784)	The request number or the request parameter is not known.
83F9 (33785)	The AS-Interface master has detected an EEPROM error.
9999 (39321)	The number of repetitions for transient errors has been exceeded. Retry request.

Table 8-132 Status messages

Error no.: hex (dec)	Meaning
Status messages (status parameter)	
0000 (0)	Request successfully completed
8181 (33153)	Command being processed
8182 (33154)	Status after **reset**

8.9.7.2 Diagnosis

Definition of a diagnostic alarm

If the user program is to respond to an internal or external error, you can set the parameters for a diagnostic alarm that will interrupt the cyclical program of the SIMOTION device.

Events that trigger a diagnostic alarm

The criteria (events) that trigger diagnostic alarms in a SIMOTION system are the same as in a SIMATIC system.

More information is available in the following manuals:

- SIMATIC NET CP 343-2/CP 343-2 P, AS-Interface Master
- SIMATIC NET DP/AS-Interface Link 20E
- SIMATIC NET DP/AS-Interface Link Advanced
- SIMATIC NET IE/AS-Interface Link PN IO

These documents are shipped with SIMOTION SCOUT in electronic form.

Responses to a diagnostic alarm

If a diagnostic alarm occurs, the following take place:

- The diagnostic data is written to the TSI#details variable in the Taskstartinfo of **PeripheralFaultTask**. The SIMOTION hardware platform goes into STOP mode if a program has not been assigned in the **PeripheralFaultTask**.
- You can call the **_readRecord** or the **_readDiagnosticData** system function to read additional diagnostic data in the **BackgroundTask** or another cyclic task.
- The group error LED (SF) of the AS-Interface master module illuminates and clears once the error has been corrected.

Error diagnosis of the AS-Interface master

Pending error messages are processed and evaluated differently in a SIMOTION system than in a SIMATIC system. As default, the diagnosis is not activated. Activate the alarms for the AS-Interface master in the hardware configuration.

Once you have parameterized the diagnostic alarms, program the execution of the alarm processing using the principle shown in the following figure:

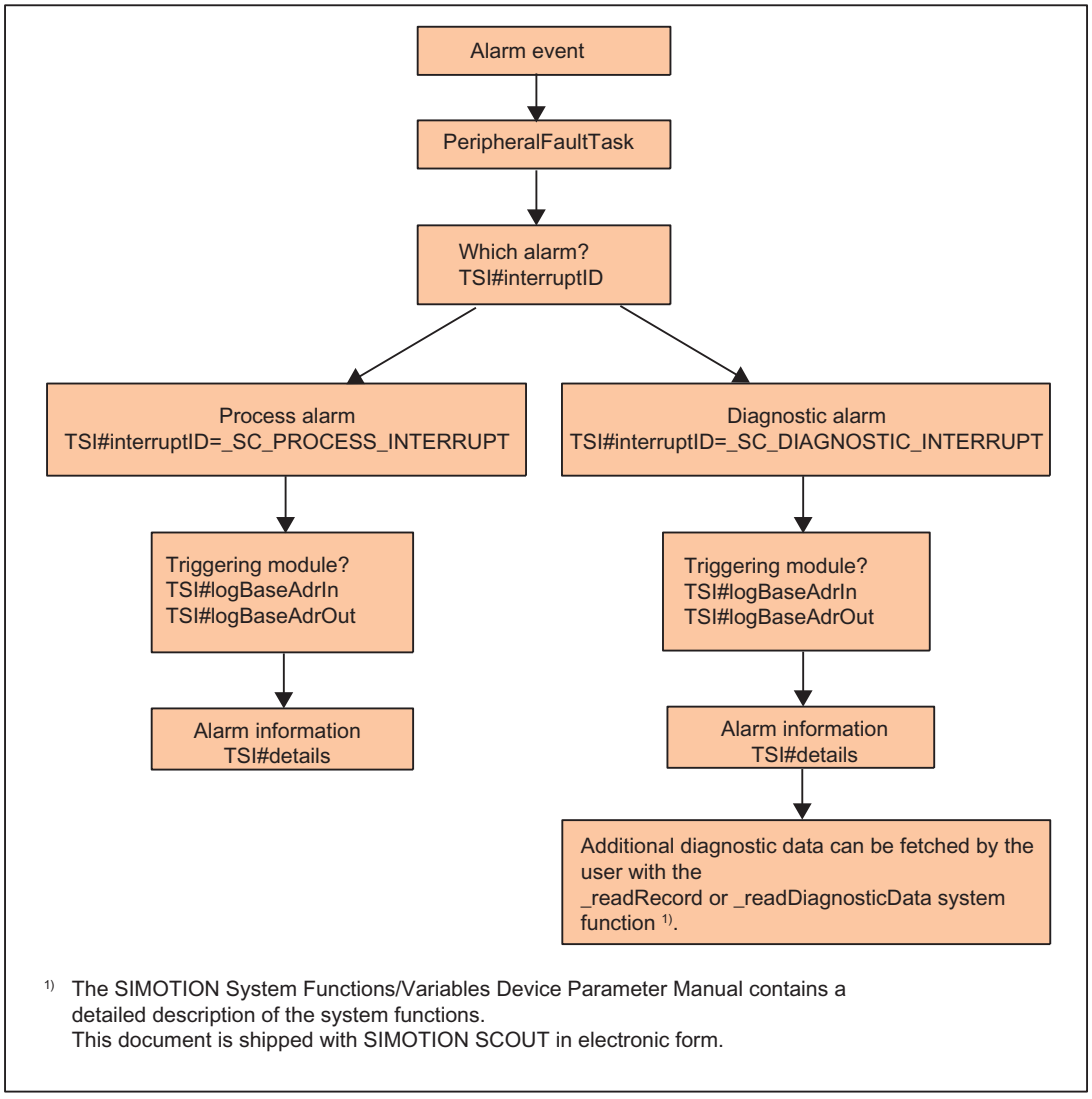

Figure 8-58 Alarm processing

Alarm evaluation

In order to evaluate diagnostic information when a diagnostic alarm occurs, you must integrate an appropriate evaluation program into the **PeripheralFaultTask**. The task start information contains the standard diagnostic data.

You can fetch additional diagnostic data using the **_readRecord** or **_readDiagnosticData** system functions.

Note

CP 343-2 P: The **_readRecord** (data record 1 with length 16) function is called with the parameter logAdress := module address from **HW Config**.

DP/AS-Interface Link 20E/Link Advanced: The **_readDiagnosticData** function is called with the parameter logAddress := diagnostic address from **HW Config**.

IE/AS-Interface Link PN IO: The **_readDiagnosticData** function is called with the parameter logAddress := diagnostic address from **HW Config**.

The **Taskstartinfo** of **PeripheralFaultTask** is comparable to the local data of OB82 in the SIMATIC system.

Table 8-133 Meaning of the Taskstartinfo

Task	TSI		Comment
PeripheralFaultTask	DT	TSI#startTime	Start time of the task
	UDINT	TSI#interruptID	Identifies the triggering event: • _SC_PROCESS_INTERRUPT • _SC_DIAGNOSTIC_INTERRUPT • _SC_STATION_DISCONNECTED • _SC_STATION_RECONNECTED
	DINT	TSI#logBaseAdrIn	Logical base address if a process alarm (PRAL) or a diagnostic alarm (DAL) was caused by an input area on the module, otherwise INVALID_ADDRESS
	DINT	TSI#logBaseAdrOut	Logical base address if a process alarm (PRAL) or a diagnostic alarm (DAL) was caused by an output area on the module, otherwise INVALID_ADDRESS
	DINT	TSI#logDiagAdr	Diagnostic address of a DP slave if the alarm was caused by a station failure or station recovery of an associated DP slave, otherwise INVALID_ADDRESS
	DWORD	TSI#details	Detail information (bit fields)

8.9.8 Appendix

8.9.8.1 SIMOTION and SIMATIC names

The table below contains a comparison of SIMOTION and SIMATIC names.

Table 8-134 SIMOTION and SIMATIC names

Name in the SIMOTION system as of V4.0 (program library in SCOUT)	Name in the SIMATIC system
Function block parameters	
INPUT	-
execute	ACT
reset	-
periIn	-
moduleAddress	LADDR
sendData	SEND
sendLength	-
OUTPUT	
done	DONE
busy	-
error	ERROR
errorID	STATUS (error message)
status	STATUS (status message)
receiveData	RECV

8.9.8.2 List of abbreviations

Table 8-135 Abbreviations

Abbreviation	Meaning
AS	Actor Sensor
ASI	Actor Sensor Interface
CP	Communications Processor
DB	Data block
DP	Decentralized peripherals
DS	Data set
FB	Function block
ID	Identifier (designates a unique coding of a product)
IE	Industrial Ethernet
IM	Interface Module (SIMATIC S7-300 interface module)
IN	Input parameters
IN/OUT	In/out parameter

Abbreviation	Meaning
LAD	Ladder Diagram
LAS	List of active slaves
OUT	Output parameter
PN	PROFINET
PS	Power Supply (SIMATIC S7-300)
SF	System Fault
SFB	System Function Block (SIMATIC)

8.10 Supplement to the ET 200S 1SI serial interface module

Preface

Contents of the function manual

This **document** is part of the **SIMOTION Programming - References documentation package**.

This manual is a supplement to SIMATIC manual *ET 200S 1Sl Serial Interface Modules*.

This documentation is supplied with the SIMOTION SCOUT in electronic form!

Note

The function blocks have been developed for the ET 200S 1Sl serial interface module (3964R, ASCII) with Article No. 6ES7 138-4DF0☐-0AB0.

This supplement will enable you to correctly integrate and commission the ET 200S 1Sl serial interface module in a SIMOTION system.

Differences in handling which result from the software architecture of a SIMOTION system as compared to the software architecture of a SIMATIC system will be described.

Function block

The function blocks for communication between the SIMOTION system and the ET 200S 1Sl serial interface module are part of the program library of the "SIMOTION SCOUT" engineering system.

Sections in this manual

The following sections of the manual describe the function blocks (FBs) used in a SIMOTION system.

- General
  This section describes the similarities and differences in handling the ET 200S 1Sl serial interface module.
- Function blocks of the ET 200S 1Sl serial interface module
  This section describes the function blocks required for communication between a SIMOTION system and an ET 200S 1Sl serial interface module.
- Alarm processing
  This section describes the differences in alarm processing in the SIMOTION system compared to the SIMATIC system.
- SIMATIC and SIMOTION names
  This section contains a comparison of SIMATIC and SIMOTION names.
- The index allows you to locate information quickly.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.3.1:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

8.10.1 Fundamental safety instructions

8.10.1.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life caused by machine malfunctions caused by incorrect or changed parameterization

Incorrect or changed parameterization can cause malfunctions on machines that can result in injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

8.10.1.2 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

8.10.1.3 Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

8.10.1.4 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

8.10.2 Description

8.10.2.1 General

This section describes the general differences for the serial interface module and for data exchange when operated in a SIMOTION system as compared to a SIMATIC system.

Note

This manual is a supplement to SIMATIC manual *ET 200S 1SI Serial Interface Modules*.

This documentation is supplied with the SIMOTION SCOUT in electronic form!

The function blocks have been developed for the ET 200S 1SI serial interface module (3964R, ASCII) with Article No. 6ES7 138-4DF0□-0AB0.

The following software versions are required for the standard functions described in this documentation:

- SIMOTION SCOUT V4.0 or higher
- SIMOTION Kernel V4.0 or higher
- SIMOTION technology packages V4.0 or higher

8.10.2.2 Product description

The ET 200S 1SI serial interface module enables you to exchange data between your SIMOTION system and another communication partner.

You can select the mode of communication for data exchange in the hardware configuration of SIMOTION SCOUT. The serial interface module is displayed in the hardware catalog in the following versions:

- 1SI 3964(R) (4 bytes)
- 1SI 3964(R) (8 bytes)
- 1SI 3964(R) (32 bytes)
- 1SI ASCII (4 bytes)
- 1SI ASCII (8 bytes)
- 1SI ASCII (32 bytes)

8-byte or 32-byte data transfers increase the throughput rate, but require more I/O memory on the ET 200S rack, whereas 4-byte data transfers require less I/O memory on the ET 200S rack, but provide a lower throughput rate. The module variant you choose depends on your application requirements.

Note

The 32-byte interface is only supported by the serial interface modules with Article No. 6ES7 138-4DF01-0AB0!

The serial interface modules with Article No. 6ES7 138-4DF00-0AB0 only support 4-byte and 8-byte interfaces!

Function blocks are required to manage communication. The function blocks for the SIMOTION system are described in this manual; these function blocks are handled differently than the function blocks for SIMATIC S7.

Functionality of the ET 200S 1SI serial interface module

The functionality of the function blocks and the ET 200S 1SI serial interface module in a SIMOTION system is the same as that in SIMATIC S7.

The following ET 200S 1SI serial interface modules are **not** supported by the function blocks:

- 1SI Modbus Master (4, 8, 32 bytes)
- 1SI USS Master (4, 8, 32 bytes)

Possible applications

You can use the ET 200S 1SI serial interface module without restrictions in a SIMOTION system. For this to be possible, the module must be operated as a distributed module via an ET 200S I/O system and a PROFIBUS connection to the SIMOTION system.

You can operate multiple ET 200S 1SI serial interface modules on one SIMOTION device.

The following figure illustrates how to connect an ET 200S distributed I/O system with an IM 151-1 and two serial interface modules on a SIMOTION device (e.g. SIMOTION C2xx).

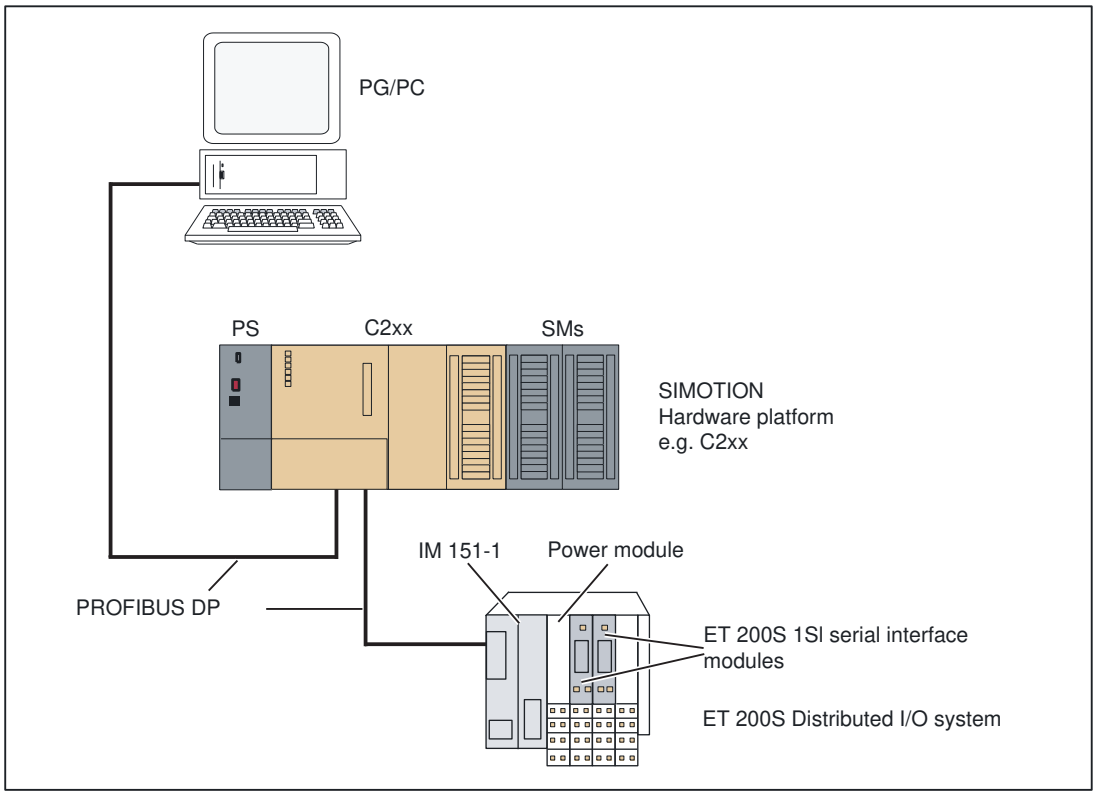

Figure 8-59 Connection of the ET 200S serial interface modules to the SIMOTION C2xx (example)

8.10.2.3 Setup and connection

Overview

You must perform the following steps to commission the serial interface module and control it from the SIMOTION system:

1. Assemble and wire the ET 200S distributed I/O system complete with interface module (IM) and serial interface module.
2. Set up the PROFIBUS connection between the ET 200S and the SIMOTION hardware platform.
3. Set the PROFIBUS DP node address on the IM.
4. Switch on the terminating resistor at the first and last bus node.

Note

For steps 1 to 4, refer to the *ET 200S Distributed I/O System* manual.

This documentation is included in the SIMOTION SCOUT scope of supply as electronic documentation!

5. Insert the serial interface module into the SIMOTION project (refer to Chapter Integrating the ET 200S 1SI serial interface module into the SIMOTION project (Page 6473)).
6. Parameter assignment to the serial interface module.
   To assign parameters for the module, go to **HW Config** and double-click the appropriate module. The **Properties** dialog box will open. Select the **Parameters** tab to access the parameter assignment interface. There you can assign parameters for your module.
   Refer to SIMATIC manual *ET 200S 1SI Serial Interface Modules*.
7. Link the function blocks to the SIMOTION project (refer to Chapter Integrating the function blocks in the user project (Page 6474)).

8.10.2.4 Integrating the ET 200S 1SI serial interface module into the SIMOTION project

Requirement

The following requirements must be met when networking with PROFIBUS:

1. You have created a project in SIMOTION SCOUT and have inserted a rack with a SIMOTION hardware platform in the hardware configuration.
2. You have configured a PROFIBUS subnet.

Note

For information on creating a project and configuring a PROFIBUS subnet, refer to the online help for *SIMOTION SCOUT*.

The following requirements must be met when with PROFINET:

1. You have created a project in SIMOTION SCOUT and have inserted and configured a rack with a PROFINET-compatible SIMOTION device in the hardware configuration.
2. You have configured a PROFINET IO system.

Note

Consult the *SIMOTION SCOUT* online help to learn how to create a project and configure a PROFINET IO system.

Inserting a serial interface module

The description below is an example of networking via PROFIBUS.

1. In SIMOTION SCOUT, open the **User Projects** dialog box with the **Project > Open** menu command. In this dialog box, select your project and confirm your choice with **OK**.
2. Open **HW Config**.
3. In the **HW Config** window, open the **hardware catalog** with the **View > Catalog** menu command.

4. In the hardware catalog, open the **PROFIBUS DP** folder and the **ET 200S** subfolder and select, for example, the **IM 151-1 interface module** (Article No.: 6ES7 151-1AA02-0AB0 or follow-up module).
5. Use a drag-and-drop operation to place the IM 151-1 I/O device on the PROFIBUS subnet of your project. The **Properties - PROFIBUS IM 151-1 Interface** dialog box opens. In this dialog box, select the address that you have set on the IM 151-1 (see the *ET 200S Distributed I/O System*) manual) and confirm your selection with **OK**.
   The selected IM 151-1 I/O device is inserted in the project.
6. The inserted I/O device must now be fitted with your project modules. To do this, open the **IM 151-1** subfolder under the selected I/O device in the hardware catalog, and select the appropriate **modules**, beginning with a power module in slot 1. The serial interface modules with Article No. 6ES7 138-4DF0☐-0AB0 are located in the **CP** subfolder.
   In this subfolder, select the appropriate module for your application. Use a drag-and-drop operation to place these modules in the ET 200S.

   Note

   Diagnostic alarms are not enabled by default. Activate the alarms for each module in the **Properties** dialog box.

7. **Save** and **compile** your project.

8.10.2.5 Integrating the function blocks in the user project

Creating the FBs instance in the user project

The function blocks are part of the program library of the SIMOTION SCOUT engineering system. For working with the blocks, an instance has to be created in the user project for each function block used.

Example:

```
VAR_GLOBAL
...
  myInstET200S_SISend      : _ET200S_SI08_send;        // create FB instance
  myInstET200S_SIReceive   : _ET200S_SI08_receive;     // create FB instance
  myInstET200S_SIGetV24Sig : _ET200S_SI08_getV24Sig;   // create FB instance
  myInstET200S_SISetV24Sig : _ET200S_SI08_setV24Sig;   // create FB instance
...
END_VAR
```

Call (LAD representation)

The LAD representation of the individual function blocks can be found in the respective function block descriptions.

Application example

The application example is contained on the "SIMOTION Utilities & Applications" CD-ROM and is available for various SIMOTION hardware platforms.

The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and part of the SIMOTION SCOUT scope of delivery.

8.10.2.6 Creating I/O variables

Overview

Communication between the SIMOTION hardware platform and the ET 200S 1SI serial interface module takes place by means of direct access to the I/O. The data interface of the serial interface module is specified in the hardware configuration at a 4-byte length, an 8-byte length or a 32-byte length.

I/O variables are used to address the direct read/write access to the I/O. You can freely assign the names of I/O variables in SIMOTION SCOUT. The I/O variables must be specified as type ARRAY [0..3] of BYTE, ARRAY [0..7] of BYTE or ARRAY [0..31] of BYTE. Assign the addresses set in the **HW Config** to them.

The names of the I/O inputs must be transferred to the function blocks as call parameters (**periIn**). The prepared data for the I/O outputs are provided by the FB as in/out parameters (**periOut**). The in/out parameter must be supplied with a variable of type ARRAY [0..3] of BYTE, ARRAY [0..7] of BYTE or ARRAY [0..31] of BYTE. After the block is called, this variable must be assigned to the I/O variables for the I/O outputs (see call example in chapter Calling function blocks (Page 6494).

Note

The variable for supplying the in/out parameters **must not** be created as a temporary variable (VAR_TEMP or local variable of a function).

The following example shows how to assign the module addresses to the I/O variables in SIMOTION SCOUT.

	Name	I/O address	Read only	Data type	Field length
1	⊞ myperipheralinputet200s_1	PIB 256		Array	32
2	⊞ myperipheraloutputet200s_1	PQB 256	☐	Array	32
3	⊞ myperipheralinputet200s_2	PIB 288		Array	32
4	⊞ myperipheraloutputet200s_2	PQB 288	☐	Array	32

Figure 8-60 Address assignment in SIMOTION SCOUT for two ET 200S 1SI serial interface modules with 32-byte data interface

Note

For additional information, see the following sources:

- *SIMOTION SCOUT* online help
- Programming manual of the corresponding programming language, e.g.:
  - *SIMOTION ST, Structured Text* programming manual
  - *SIMOTION MCC, Motion Control Chart* programming manual
  - *SIMOTION LAD/FBD, Ladder Diagram and Function Block Diagram* programming manual

These documents are included in the SIMOTION SCOUT scope of delivery as electronic documentation!

8.10.3 Function blocks of the ET 200S 1SI serial interface module

8.10.3.1 Overview of function blocks

This section describes all of the function blocks (FBs) required for communication between a SIMOTION hardware platform and a serial interface module.

The function blocks form the software interface between the SIMOTION hardware platform and the serial interface module. They must be called repeatedly (in cycles) from the user program.

The following function blocks are available for the 4-, 8- and 32-byte data interface of the ET 200S 1SI serial interface module:

- Function blocks _ET200S_SIxx_send (Page 6477)
- Function blocks _ET200S_SIxx_receive (Page 6481)
- Function blocks _ET200S_SIxx_getV24Sig (Page 6485)
- Function blocks _ET200S_SIxx_setV24Sig (Page 6487)
- Function blocks _ET200S_SIxx_flowXon (Page 6488)

- Function blocks _ET200S_SIxx_flowRts (Page 6490)
- Function blocks _ET200S_SIxx_flowV24 (Page 6492)

Note

xx stands for 04, 08 and 32, e.g.:

- Function block **_ET200S_SI04_send**
- Function block **_ET200S_SI08_send**
- Function block **_ET200S_SI32_send**

The designation with **..._SIxx_...** is retained in the following.

Note

The SIMOTION identifiers have changed as of V4.0. A comparison of the SIMOTION and SIMATIC identifiers can be found in the Appendix SIMOTION and SIMATIC names (Page 6502) in the table "List of parameters".

The provided function blocks can be used to control one or more serial interfaced modules.

8.10.3.2 Function blocks _ET200S_SIxx_send

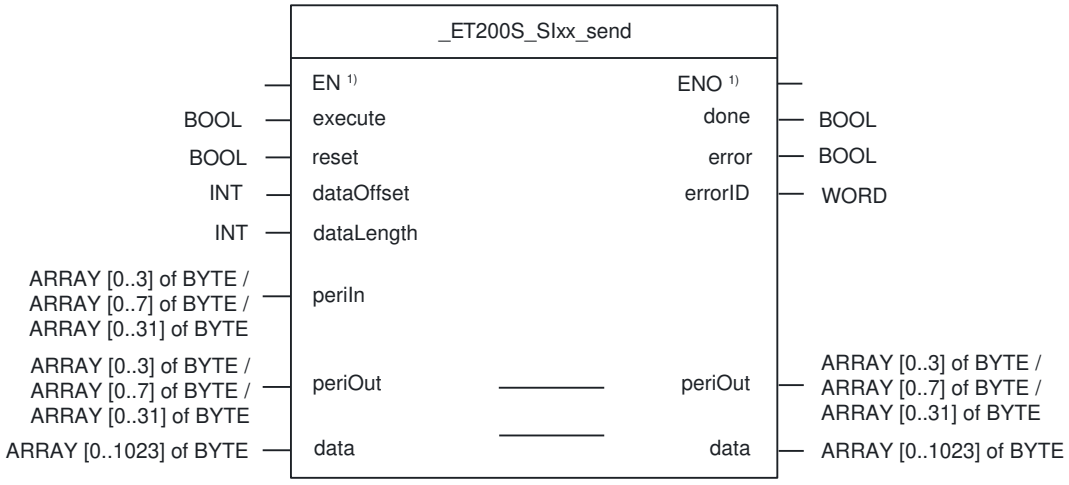
Task

The **_ET200S_SIxx_send** function block can be used to send data from the **data** send data array to a communication partner. 1024 bytes are available.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_send** function block for the 4-byte data interface, the **_ET200S_SI08_send** function block for the 8-byte data interface, and the **_ET200S_SI32_send** function block for the 32-byte data interface of the serial interface module.

For the transfer, you can use the 3964 (R) protocol procedure or ASCII driver.

Call (LAD representation)



1) LAD-specific parameters

Parameter description

Table 8-136 _ET200S_SIxx_send parameters

Name	P-Type 1)	Data type	Meaning	Actions performed by user	Actions performed by block
execute	IN	BOOL	Initiates job with positive edge	Entered	Checked
reset	IN	BOOL	Job cancellation	Entered	Checked
dataOffset	IN	INT	Offset of the first element to be sent	Entered	Checked
dataLength	IN	INT	Number of elements to be sent 1 ≤ dataLength ≤ 224	Entered	Checked
periIn	IN	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Transfer I/O inputs of the serial interface module to FB	Transfer I/O variables of the I/O inputs of the serial module to the FB	Checked
periOut	IN/OUT	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Prepared data of the FB for the I/O outputs of the serial interface module 2)	Checked and entered on the I/O variable for the I/O outputs	Entered
data	IN/OUT	ARRAY[0..1023] of BYTE	Send data array	Entered	Checked
done	OUT	BOOL	Job completed without errors	Checked	Entered

Name	P-Type [1]	Data type	Meaning	Actions performed by user	Actions performed by block
error	OUT	BOOL	Job completed with errors	Checked	Entered
errorID	OUT	WORD	Error specification For **error** = TRUE, the error information (event class and number) is displayed in the **errorID** parameter. [3]	Checked	Entered

[1] Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

[2] **Note:** The **periOut** parameter must be provided with an array of type **ARRAY [0..3] of BYTE** or **ARRAY [0..7] of BYTE**. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

[3] For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System*, chapter "Commissioning and diagnostics", and *ET 200S 1SI Serial Interface Modules*.

Allocation in the data storage area

The data to be sent is transferred to FB **_ET200S_SIxx_send** in the **data** parameter (VAR_IN_OUT) as ARRAY of BYTE. At the beginning of the send operation, the data is copied to a local ARRAY and transferred from there to the serial module.

Note

Once the data has been entered in the static memory of the send FB, you can modify the variable created in the **data** parameter. This does not affect the data to be sent.

_ET200S_SIxx_send time sequence diagram

The following figure illustrates the behavior of the **done** and **error** parameters according to the input circuit of **execute** and **reset**.

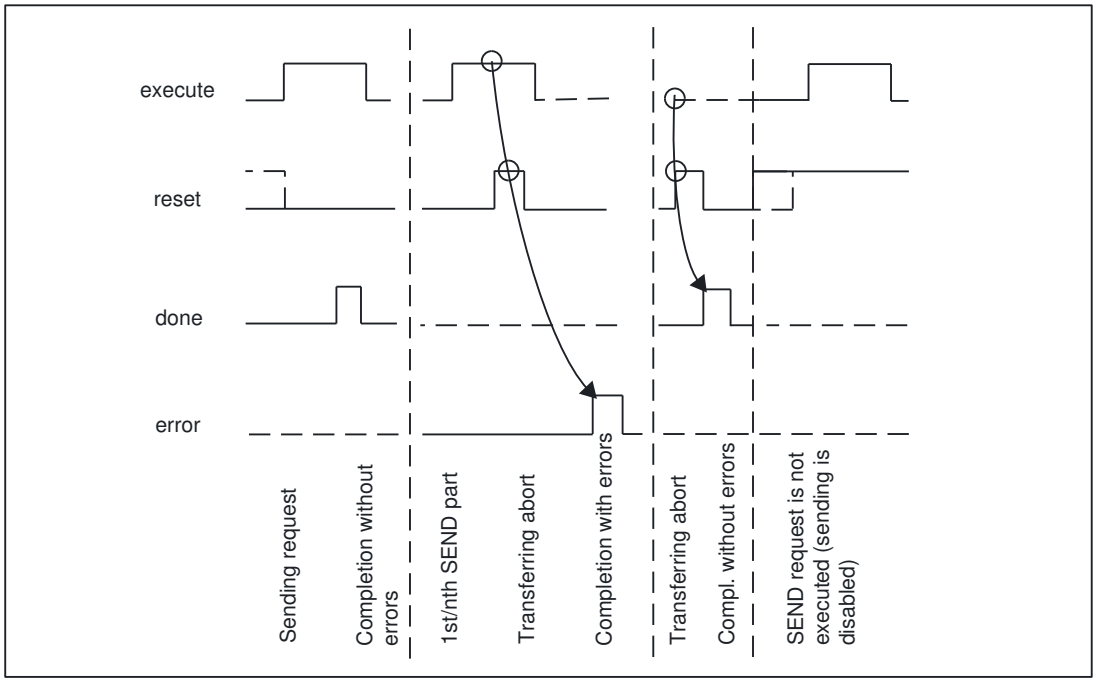


Figure 8-61 _ET200S_SIxx_send time sequence diagram

Note

The **execute** input parameter is edge-triggered. A positive edge at the **execute** input parameter is sufficient.

Task integration (call)

The **_ET200S_SIxx_send** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

The SIMOTION device sends data to a communications partner

The **_ET200S_SIxx_send** FB transfers a data block, which is specified by the following parameters for the serial interface module:

- **data** corresponds to the data array containing the send data
- **dataOffset** corresponds to the array index containing the first send byte
- **dataLength** corresponds to the amount of data to be sent in bytes (maximum of 224 bytes)

The **_ET200S_SIxx_send** FB must be called repeatedly by a program. The send job can only be executed by cyclically calling the send FB.

A positive edge at the **execute** input parameter initiates the transfer. Depending on the data volume, data may be transferred over several calls.

Note

A subsequent transfer at the **execute** input parameter can only be successfully triggered when the previous send job is completed with the **done** output signal ("Job completed without errors").

The active transfer request can be aborted by setting the **reset** parameter to TRUE. This will reset the **_ET200S_SIxx_send** FB to its initial state. The send operation will remain disabled as long as the signal state at the **reset** parameter is TRUE.

Status and error display on _ET200S_SIxx_send

The **done** output parameter indicates that the job has been completed without errors. The **error** output parameter indicates that an error has occurred. When an error occurs, the corresponding event class/number is displayed in the **errorID** output parameter (see table "Parameter _ET200S_SIxx_send"). If no errors have occurred, **errorID** has a value of "0". The parameters **Done** and **error**/**errorID** are also displayed on **reset** of the **_ET200S_SIxx_send** FB.

Parameters **done**, **error**, and **errorID** are present for one block pass only.

8.10.3.3 Function blocks _ET200S_SIxx_receive

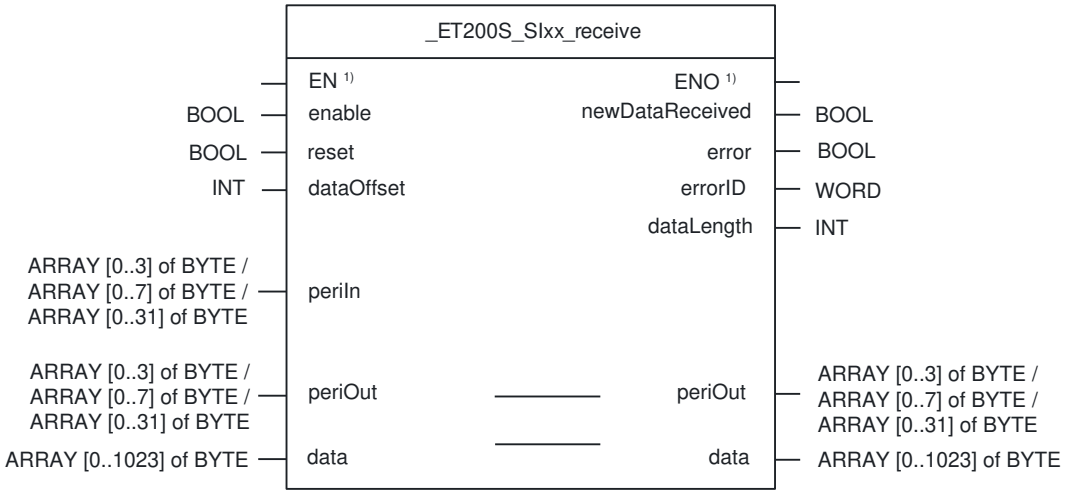
Task

The **_ET200S_SIxx_receive** function block can be used to receive data from a communication partner in the **data** receive data array. 1024 bytes are available.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_receive** function block for the 4-byte data interface, the **_ET200S_SI08_receive** function block for the 8-byte data interface, and the **_ET200S_SI32_receive** function block for the 32-byte data interface of the serial interface module.

For the transfer, you can use the 3964 (R) protocol procedure or ASCII driver.

Call (LAD representation)



1) LAD-specific parameters

Parameter description

Table 8-137 _ET200S_SIxx_receive parameters

Name	P-Type 1)	Data type	Meaning	Actions performed by user	Actions performed by block
enable	IN	BOOL	Receive enable	Entered	Checked
reset	IN	BOOL	Job cancellation	Entered	Checked
dataOffset	IN	INT	Offset of the first element to be received	Entered	Checked
periIn	IN	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Transfer I/O inputs of the serial interface module to FB	Transfer I/O variables of the I/O inputs of the serial module to the FB	Checked
periOut	IN/OUT	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Prepared data of the FB for the I/O outputs of the serial interface module 2)	Checked and entered on the I/O variable for the I/O outputs	Entered
data	IN/OUT	ARRAY[0..1023] of BYTE	Receive data array	Checked	Entered
newDataReceived	OUT	BOOL	New data has been received	Checked	Entered
error	OUT	BOOL	Job completed with errors	Checked	Entered

Name	P-Type [1)]	Data type	Meaning	Actions performed by user	Actions performed by block
errorID	OUT	WORD	Error specification For **error**=TRUE, the error information (event class and number) is displayed in the **errorID** parameter.[3)]	Checked	Entered
dataLength	OUT	INT	Data volume received in bytes	Checked	Entered

1) Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

2) **Note:** The **periOut** parameter must be provided with an array of type **ARRAY [0..3] of BYTE** or **ARRAY [0..7] of BYTE**. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

3) For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System*, chapter "Commissioning and diagnostics", and *ET 200S 1SI Serial Interface Modules*.

Allocation in the data storage area

During the receive operation, the data to be received is stored temporarily in a local ARRAY. After completion of the data transfer from the serial interface module to the SIMOTION device, the data is made available in the **data** parameter (VAR_IN_OUT) of the **_ET200S_SIxx_receive** FB.

_ET200S_SIxx_receive time sequence diagram

The following figure illustrates the behavior of the **newDataReceived**, **dataLength**, and **error** parameters according to the input circuit of **enable** and **reset**.

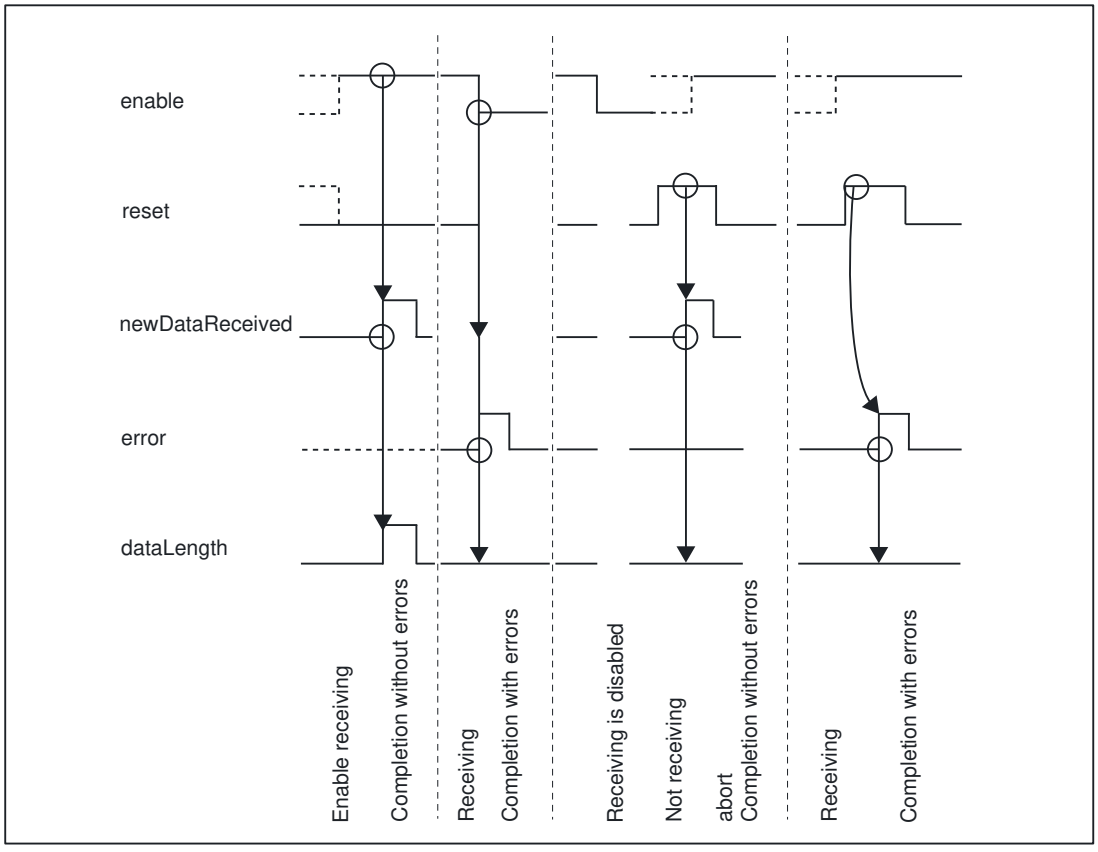


Figure 8-62 _ET200S_SIxx_receive time sequence diagram

Task integration (call)

The **_ET200S_SIxx_receive** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

SIMOTION device receives data from a communications partner

The **_ET200S_SIxx_receive** FB transfers a data block, which is specified by the **data** and **dataOffset** parameters, from the serial interface module to a SIMOTION hardware platform. The **_ET200S_SIxx_receive** FB must be called repeatedly by a program. The receive job can only be executed by cyclically calling the receive FB.

Receiving of data is enabled with static signal state TRUE in the **enable** parameter. An active data transfer is aborted by a FALSE signal state in the **enable** parameter. The aborted receive request is terminated with an error message at the **errorID** output parameter. The receive operation will remain disabled as long as the signal state at the **enable** parameter is FALSE. Depending on the data volume, data may be transferred over several calls.

The active transfer request can be aborted by setting the **reset** parameter to TRUE. This will reset the **_ET200S_SIxx_receive** FB to its initial state. The receive operation will remain disabled as long as the signal state at the **reset** parameter is TRUE.

Status and error display on _ET200S_SIxx_receive

The **newDataReceived** output parameter indicates that the job has been completed without errors. The amount of data received is indicated in the **dataLength** parameter. The **error** output indicates that an error has occurred. When an error occurs, the corresponding event class/ number is displayed in the **errorID** output parameter (see table "Parameter _ET200S_SIxx_receive"). If no errors have occurred, **errorID** has a value of "0". The parameters **newDataReceived** and **error**/**errorID** are also displayed on **reset** of the **_ET200S_SIxx_receive** FB.

Parameters **newDataReceived, dataLength**, **error**, and **errorID** are present for one block pass only.

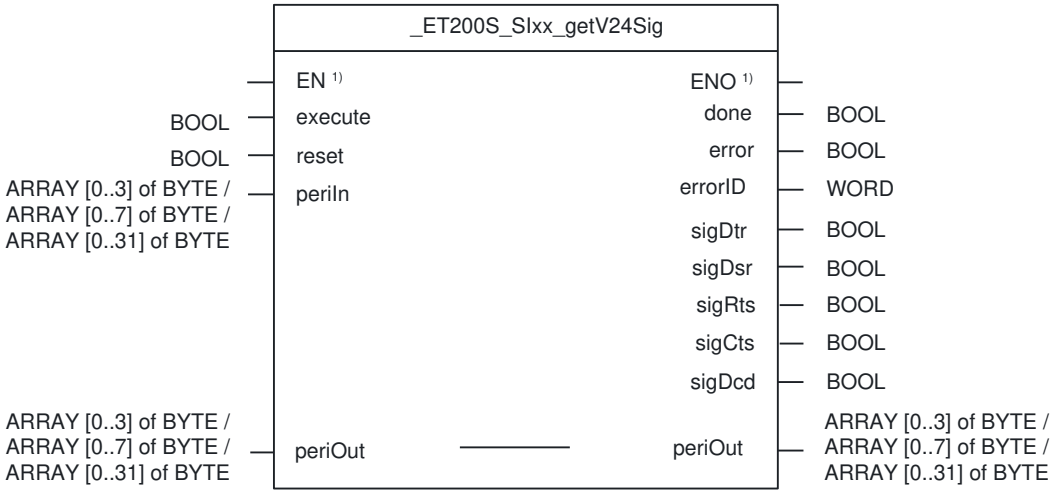
8.10.3.4 Function blocks _ET200S_SIxx_getV24Sig

Task

When an **ASCII driver** is specified, the **_ET200S_SIxx_getV24Sig** function block reads the RS 232C secondary signals and provides them to the user as output parameters.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_getV24Sig** function block for the 4-byte data interface, the **_ET200S_SI08_getV24Sig** function block for the 8-byte data interface, and the **_ET200S_SI32_getV24Sig** function block for the 32-byte data interface of the serial interface module.

Call (LAD representation)



1) LAD-specific parameters

Parameter description

Table 8-138 _ET200S_SIxx_getV24Sig parameters

Name	P-Type [1]	Data type	Meaning	Actions performed by user	Actions performed by block
execute	IN	BOOL	Initiates job with positive edge	Entered	Checked
reset	IN	BOOL	Job cancellation	Entered	Checked
periIn	IN	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Transfer I/O inputs of the serial interface module to FB	Transfer I/O variables of the I/O inputs of the serial module to the FB	Checked
periOut	IN/OUT	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Prepared data of the FB for the I/O outputs of the serial interface module [2]	Checked and entered on the I/O variable for the I/O outputs	Entered
done	OUT	BOOL	Job completed without errors	Checked	Entered
error	OUT	BOOL	Job completed with errors	Checked	Entered
errorID	OUT	WORD	Error specification For **error** = TRUE, the error information (event class and number) is displayed in the **errorID** parameter. [3]	Checked	Entered
sigDtr	OUT	BOOL	Data terminal ready	Checked	Entered
sigDsr	OUT	BOOL	Data set ready	Checked	Entered
sigRts	OUT	BOOL	Request to send	Checked	Entered
sigCts	OUT	BOOL	Clear to send	Checked	Entered
sigDcd	OUT	BOOL	Data carrier detected	Checked	Entered

[1] Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

[2] **Note:** The periOut parameter must be provided with an array of type ARRAY [0..3] of BYTE or ARRAY [0..7] of BYTE. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

[3] For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System*, chapter "Commissioning and Diagnostics", and *ET 200S 1SI Serial Interface Modules*.

Task integration (call)

The **_ET200S_SIxx_getV24Sig** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

RS-232-C secondary signals are updated each time the FB is called (cyclic polling).

Note

A minimum pulse time is necessary for a signal change to be identified. Determining factors are the cycle time (SIMOTION device), the update time on the serial interface module and the response time of the communications partner.

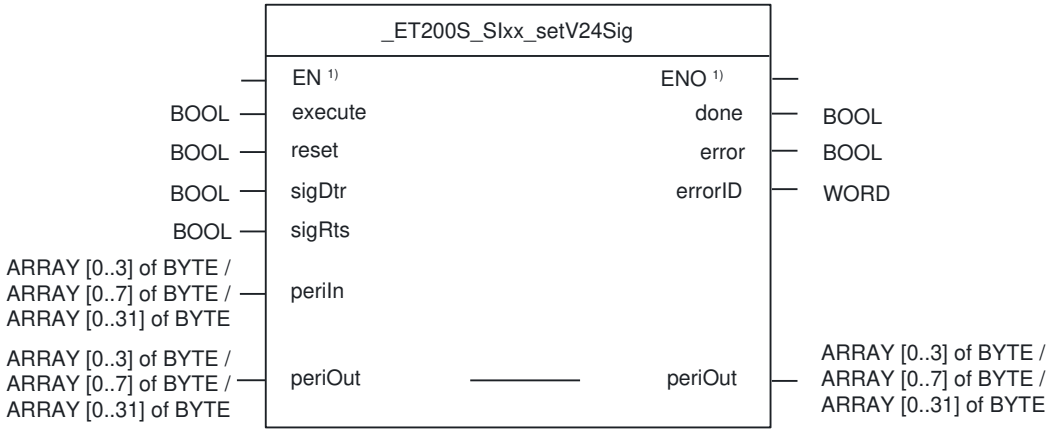
8.10.3.5 Function blocks _ET200S_SIxx_setV24Sig

Task

The **_ET200S_SIxx_setV24Sig** function block enables you to set or reset the RS 232C secondary signals when an **ASCII driver** is specified.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_setV24Sig** function block for the 4-byte data interface, the **_ET200S_SI08_setV24Sig** function block for the 8-byte data interface, and the **_ET200S_SI32_setV24Sig** function block for the 32-byte data interface of the serial interface module.

Call (LAD representation)



1) LAD-specific parameters

Parameter description

Table 8-139 _ET200S_SIxx_setV24Sig parameters

Name	P-Type 1)	Data type	Meaning	Actions performed by user	Actions performed by block
execute	IN	BOOL	Initiates job with positive edge	Entered	Checked
reset	IN	BOOL	Job cancellation	Entered	Checked
sigDtr	IN	BOOL	Data terminal ready	Entered	Checked
sigRts	IN	BOOL	Request to send	Entered	Checked
periIn	IN	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Transfer I/O inputs of the serial interface module to FB	Transfer I/O variables of the I/O inputs of the serial module to the FB	Checked
periOut	IN/OUT	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Prepared data of the FB for the I/O outputs of the serial interface module 2)	Checked and entered on the I/O variable for the I/O outputs	Entered
done	OUT	BOOL	Job completed without errors	Checked	Entered

Name	P-Type [1]	Data type	Meaning	Actions performed by user	Actions performed by block
error	OUT	BOOL	Job completed with errors	Checked	Entered
errorID	OUT	WORD	Error specification For **error** = TRUE, the error information (event class and number) is displayed in the **errorID** parameter. [3]	Checked	Entered

[1] Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

[2] **Note:** The periOut parameter must be provided with an array of type ARRAY [0..3] of BYTE or ARRAY [0..7] of BYTE. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

[3] For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System,* section "Commissioning and Diagnostics", and *ET 200S 1SI Serial Interface Modules*.

Task integration (call)

The **_ET200S_SIxx_setV24Sig** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

8.10.3.6 Function blocks _ET200S_SIxx_flowXon

Task

The **_ET200S_SIxx_flowXon** function block enables you to modify parameters on the module independently of the parameter assignment interface if **"XON/XOFF" data flow control** has been specified for the module.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_flowXon** function block for the 4-byte data interface, the **_ET200S_SI08_flowXon** function block for the 8-byte data interface, and the **_ET200S_SI32_flowXon** function block for the 32-byte data interface of the serial interface module.

Call (LAD representation)

Name	P-Type 1)	Data type	Meaning	Actions performed by user	Actions performed by block
execute	IN	BOOL	Initiates job with positive edge	Entered	Checked
reset	IN	BOOL	Job cancellation	Entered	Checked
sigXon	IN	BYTE	Code for XON character	Entered	Checked
sigXoff	IN	BYTE	Code for XOFF character	Entered	Checked
waitFor-Xon	IN	DINT	Delay time for XON after XOFF Value range: 20 ms ≤ waitForXon ≤ 655350 ms	Entered	Checked
periIn	IN	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Transfer I/O inputs of the serial interface module to FB	Transfer I/O variables of the I/O inputs of the serial module to the FB	Checked
periOut	IN/OUT	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Prepared data of the FB for the I/O outputs of the serial interface module 2)	Checked and entered on the I/O variable for the I/O outputs	Entered
done	OUT	BOOL	Job completed without errors	Checked	Entered

Name	P-Type [1]	Data type	Meaning	Actions performed by user	Actions performed by block
error	OUT	BOOL	Job completed with errors	Checked	Entered
errorID	OUT	WORD	Error specification For **error** = TRUE, the error information (event class and number) is displayed in the **errorID** parameter. [3]	Checked	Entered

[1] Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

[2] **Note:** The periOut parameter must be provided with an array of type ARRAY [0..3] of BYTE or ARRAY [0..7] of BYTE. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

[3] For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System,* section "Commissioning and Diagnostics", and *ET 200S 1SI Serial Interface Modules*.

Task integration (call)

The **_ET200S_SIxx_flowXon** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

8.10.3.7 Function blocks _ET200S_SIxx_flowRts

Task

The **_ET200S_SIxx_flowRts** function block enables you to modify parameters on the module independently of the parameter assignment interface if **"RTS/CTS" data flow control** has been specified for the module.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_flowRts** function block for the 4-byte data interface, the **_ET200S_SI08_flowRts** function block for the 8-byte data interface, and the **_ET200S_SI32_flowRts** function block for the 32-byte data interface of the serial interface module.

[1] Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

[2] **Note:** The periOut parameter must be provided with an array of type ARRAY [0..3] of BYTE or ARRAY [0..7] of BYTE. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

[3] For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System,* chapter "Commissioning and Diagnostics", and *ET 200S 1SI Serial Interface Modules*

Task integration (call)

The **_ET200S_SIxx_flowRts** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

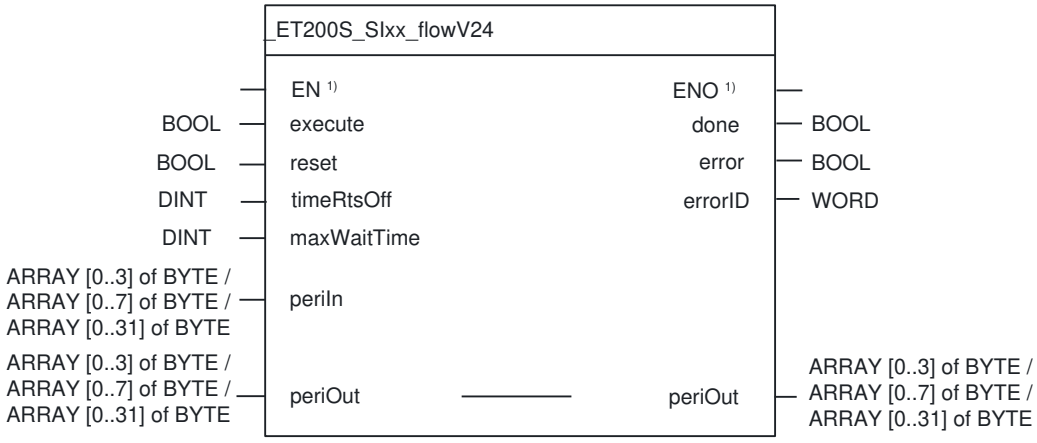
8.10.3.8 Function blocks _ET200S_SIxx_flowV24

Task

The **_ET200S_SIxx_flowV24** function block enables you to modify parameters on the module independently of the parameter assignment interface if the **"Automatic use of V24 signal" data flow control** has been specified for the module.

Depending on which data interface you have chosen in the hardware configuration, you use the **_ET200S_SI04_flowV24** function block for the 4-byte data interface, the **_ET200S_SI08_flowV24** function block for the 8-byte data interface, and the **_ET200S_SI32_flowV24** function block for the 32-byte data interface of the serial interface module.

Call (LAD representation)



1) LAD-specific parameters

Parameter description

Table 8-142 _ET200S_SIxx_flowV24 parameters

Name	P-Type 1)	Data type	Meaning	Actions performed by user	Actions performed by block
execute	IN	BOOL	Initiates job with positive edge	Entered	Checked
reset	IN	BOOL	Job cancellation	Entered	Checked
timeRtsOff	IN	DINT	Time that must elapse after the transfer before RTS is disabled Value range: 0 ≤ timeRtsOff ≤ 655350 ms	Entered	Checked
maxWait-Time	IN	DINT	Wait time for CTS=ON by partner after RTS=ON has been set Value range: 0 ≤ maxWaitTime ≤ 655350 ms	Entered	Checked
periIn	IN	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Transfer I/O inputs of the serial interface module to FB	Transfer I/O variables of the I/O inputs of the serial module to the FB	Checked
periOut	IN/OUT	ARRAY [0..3] of BYTE / ARRAY [0..7] of BYTE / ARRAY [0..31] of BYTE	Prepared data of the FB for the I/O outputs of the serial interface module 2)	Checked and entered on the I/O variable for the I/O outputs	Entered
done	OUT	BOOL	Job completed without errors	Checked	Entered

Name	P-Type [1]	Data type	Meaning	Actions performed by user	Actions performed by block
error	OUT	BOOL	Job completed with errors	Checked	Entered
errorID	OUT	WORD	Error specification For **error** = TRUE, the error information (event class and number) is displayed in the **errorID** parameter. [3]	Checked	Entered

[1] Parameter types: IN = input parameters, OUT = output parameters, IN/OUT = in/out parameters

[2] **Note:** The periOut parameter must be provided with an array of type ARRAY [0..3] of BYTE or ARRAY [0..7] of BYTE. This variable must be static and may be initialized only once (e.g. after switching the operating mode from STOP to RUN). We recommend that a global array is created for VAR_GLOBAL (do not create any temporary array for VAR_TEMP). After calling the FB, this array must be assigned the I/O variables for the I/O outputs of the module. See call example in section "Calling function blocks". See also chapter *Integration of ST in SIMOTION* in the *SIMOTION ST Structured Text* Programming Manual.

[3] For error information, refer to SIMATIC manuals *ET 200S Distributed I/O System,* chapter "Commissioning and diagnostics", and *ET 200S 1SI Serial Interface Modules*.

Task integration (call)

The **_ET200S_SIxx_flowV24** FB must be called cyclically in the **BackgroundTask** or the **TimerInterruptTask**. Calling in the **SystemInterruptTask** is not permitted. Calling the function block in the **IPOSynchronousTask** is not recommended for runtime reasons.

8.10.3.9 Calling function blocks

In order to be able to work with the function blocks in your user program, proceed as follows (the numbers shown in the following program segment correspond to the steps below):

1. Create the function block instance (see the following program segment, e.g. create instance for the **_ET200S_SI08_send** function block).
2. Create an array for the in/out parameters of the FB.
3. Call instance of the function block.
4. Transfer input parameters.
5. The output parameters of the FB are accessed with <instance name of FB>. <name of output parameter>.
6. Data prepared by the FB for the I/O outputs are assigned to the array of the I/O variables created in step 2.

Note

The call example is an extract from the supplied E_SI_8By application example, which is contained on the "SIMOTION Utilities & Applications" CD-ROM.

If you want to control more than one serial interface module, you must create a new variable for the FB instances with a new name for each additional module used.

Call example

```
UNIT E_SI_8BY;

INTERFACE

VAR_GLOBAL

    myExecSend            : BOOL;                     // trigger send task
    myAbortSend           : BOOL;                     // cancel send order
    mySendDone            : BOOL;                     // send: completed

    myInstET200S_SISend   : _ET200S_SI08_send;       // create FB instance                    (1)
    mySendDataArray       : ARRAY [0..1023] OF BYTE;  // send data array 1024 bytes
END_VAR

    PROGRAM ExampleET200S_SI;                         // program for BackgroundTask

END_INTERFACE

IMPLEMENTATION

PROGRAM ExampleET200S_SI
// program for backgroundTask
VAR
    myOutputArrayET200S_1 : ARRAY [0..7] OF BYTE;  // array for ET200S output data
END_VAR                                                                                   (2)

// CALL FB INSTANCE TO SEND

    myInstET200S_SISend (                                                                 (3)

    execute          := myExecSend,                  // trigger order
    reset            := myAbortSend,                 // order cancellation                 (4)
    dataOffset      := myDataOffsetSend,            // data offset
    dataLength       := myDataLengthSend,            // amount of data to be sent
    periIn           := myPeripheralInputET200s_1,   // I/O variable of I/O inputs
    periOut          := myOutputArrayET200S_1,       // output data array
    data             := mySendDataArray              // send data array
    );

    mySendDone       := myInstET200S_SISend.done;
```

```
// TRANSFER DATA TO ET200S                                                    (5)
   myPeripheralOutputET200s_1 := myOutputArrayET200S_1; // array for output data

END_PROGRAM            // end program for backgroundTask

END_IMPLEMENTATION                                                            (6)
```

Note

The ExampleET200S_SI program must be assigned in the execution system.

8.10.3.10 Data consistency

When sending data

Once a request is initiated by a positive edge at the **execute** input, the data to be sent are copied to the static memory area of the send FB. This means that once the FB call has ended, the send data array can be written to again for the next send request on a positive edge. The data are retained as consistent data within the send FB.

Note

During the copy operation to the static memory area of the FB, data consistency cannot be guaranteed if the send/receive data areas are accessed in a higher priority task.

When receiving data

Once the receive request is complete, the data are copied over to the receive buffer in a block from the static memory area of the receive FB. This means that once the FB call has ended, either all data are entered in the receive buffer (**newDataReceived** = TRUE) or no data are entered in the receive buffer (**newDataReceived** = FALSE).

Note

During the copy operation from the static memory area of the receive FB, data consistency cannot be guaranteed if the send/receive data areas are accessed in a higher priority task.

8.10.3.11 Application example for the ET 200S 1SI serial interface module

Task

This example shows how to:

- use the **_ET200S_SI08_send** function block to send data from the send data array to a communication partner (in the example, the second serial interface module).
- use the **_ET200S_SI08_receive** function block to receive data in the receive data array.

In the example program, the first serial interface module is used as the sender, and the second is used as the receiver. The **_ET200S_SI08_send** FB is used to transfer the send data to the second interface module.

The **_ET200S_SI08_receive** FB reads out the data received from the first serial interface module and copies it to the receive data array.

In this example, two serial interface modules with 8-byte data interface are used.

Hardware platform

The application example is available for various SIMOTION hardware platforms.

Note

If the application example is not available for your hardware platform, you have to adapt the hardware configuration.

Assigning module parameters

Proceed as follows:

1. Open your project in SIMOTION SCOUT.
2. Open the hardware configuration in SIMOTION SCOUT.
3. Configure your hardware station with the two ET 200S 1SI serial interface modules (8-byte data interface), see chapter Integrating the ET 200S 1SI serial interface module into the SIMOTION project (Page 6473).
4. The serial interface modules are located below the IM 151-1 PROFIBUS interface module. Double-click the first or second **1SI ASCII (8 byte)** to open the **Properties** dialog for this module. Select the **Parameters** tab to access the parameter assignment interface.
5. Select the following setting (leave all other settings as they are): **Diagnostic alarm: activate.** Confirm your selection with **OK**.
6. Save the hardware configuration with the **Station > Save and compile** menu command.
7. Download the hardware configuration with the **Target system > Download to module** menu command.
   The red "SF" LED of the IM 151-1 turns on and off after the module parameter assignment is downloaded without errors.

Adapting the application example

The configuration in the example and its available hardware must be adapted.

The following options are available:

- You can adapt the configuration in the example to the available hardware (PROFIBUS DP address).
- You can adapt the configuration of the hardware to the example (PROFIBUS DP address).

Calling the application example

The application example can be found on the "SIMOTION Utilities & Applications" CD-ROM. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and part of the SIMOTION SCOUT scope of delivery.

1. Dearchive and open the project containing the application example.
2. Check the axis configuration: PROFIBUS DP addresses.
3. Check the module addresses (hardware configuration) against the I/O addresses of the controller in SIMOTION SCOUT and the module addresses in the program (myModuleAddr_1, myModuleAddr_2).
4. Save and compile the example project. Then, you can download the example to the SIMOTION device and switch to **RUN** mode.

Sequence of the application example

Input icons used

Table 8-143 Input icons used

Symbol	Data type	Description
mySelectPointToPoint	BOOL	Select point-to-point communication
myExecSend	BOOL	Initiate send request
mySendOrder1	BOOL	Select send: Request 1
mySendOrder2	BOOL	Select send: Request 2
myAbortSend	BOOL	Abort send request
myEnableToReceive	BOOL	Receive enable
myReceiveOrder1	BOOL	Select receive: Request 1
myReceiveOrder2	BOOL	Select receive: Request 2
myAbortReceive	BOOL	Abort receive request
myDataLengthSend	INT	Length/number of data to be sent
myDataOffsetSend	INT	1. byte in the send data array
myDataOffsetReceive	INT	1. byte in the receive data array
myModuleAddr_1	DINT	Module address first ET 200S 1SI
myModuleAddr_2	DINT	Module address second ET 200S 1SI
mySendDataArray	ARRAY [0..1023] of BYTE	Send data array

Output icons used

Table 8-144 Output icons used

Symbol	Data type	Description
mySendDone	BOOL	Send: Complete
mySendError	BOOL	Send: Error display
mySendErrorId	WORD	Send: Error number
myNewDataReceived	BOOL	Receive: New data have been received
myReceiveError	BOOL	Receive: Error display
myReceiveErrorId	WORD	Receive: Error number
myDiagAlarm	BOOL	Diagnostic alarm occurred
myProcessAlarm	BOOL	Process alarm occurred
myReceiveDataArray	ARRAY [0..1023] of BYTE	Receive data array

Note

You can monitor and modify the input and output variables used in the programming example in the INTERFACE area of the unit (under VAR_GLOBAL); alternatively, you can assign real inputs and outputs to the input and output variables in your unit.

For the "point-to-point communication" application example, set the "mySelectPointToPoint" input to TRUE. This will call the function blocks contained in the application example.

Receiving data:

To receive data, you must set the "myEnableToReceive" input to TRUE (static signal). If receive request 1 is enabled ("myReceiveOrder1" = TRUE), the data is stored in the "receiveDataArray" data array starting with the "receiveDataArray[0]" array element (data offset is 0). If request 2 is enabled ("myReceiveOrder2" = TRUE), the data is stored in the "receiveDataArray" data array starting with the "receiveDataArray[20]" array element (data offset is 20).
If "myNewDataReceived" = TRUE, this indicates that new data has been received. This signal is present for one cycle only.
If an error occurred during the transfer ("myReceiveError" = TRUE), the error code is stored in the "myReceiveErrorId" variable. The error signals are deleted when you set input "myAbortReceive" = TRUE.

Sending data:

You can use the "mySendOrder1" and "mySendOrder2" inputs to select between two send requests:

- Request 1 sends 10 bytes of data from the "mySendDataArray" data array starting from the "mySendDataArray[0]" array element up to the "mySendDataArray[9]" array element
- Request 2 sends 20 bytes of data from the "mySendDataArray" data array starting from the "mySendDataArray[20]" array element up to the "mySendDataArray[39]" array element

The data is sent to the communication partner if the "myExecSend" input detects a signal change from FALSE to TRUE (positive edge).
If output signal "mySendDone" = TRUE, the send request has been completed. A new request can be sent if the "myExecSend" input signal detects a signal change from FALSE to TRUE.

If an error occurred during the transfer ("mySendError" = TRUE), the error code is stored in the "mySendErrorId" variable. The error signals are deleted when you set input "myExecSend" = FALSE.

If the signal state at the "myAbortSend" or "myAbortReceive" input is TRUE, the send request or receive request, respectively, is aborted. If the signal state remains TRUE, sending and receiving of data is disabled.

8.10.4 Alarm processing

Overview

Pending error messages are processed and evaluated differently in a SIMOTION system than in a SIMATIC system. Diagnostic alarms are not enabled by default. Activate the alarms for the relevant module in the hardware configuration (refer to chapter Integrating the ET 200S 1SI serial interface module into the SIMOTION project (Page 6473)).

If you have parameterized diagnostic alarms, then you should program the alarm processing sequence according to the principle presented below.

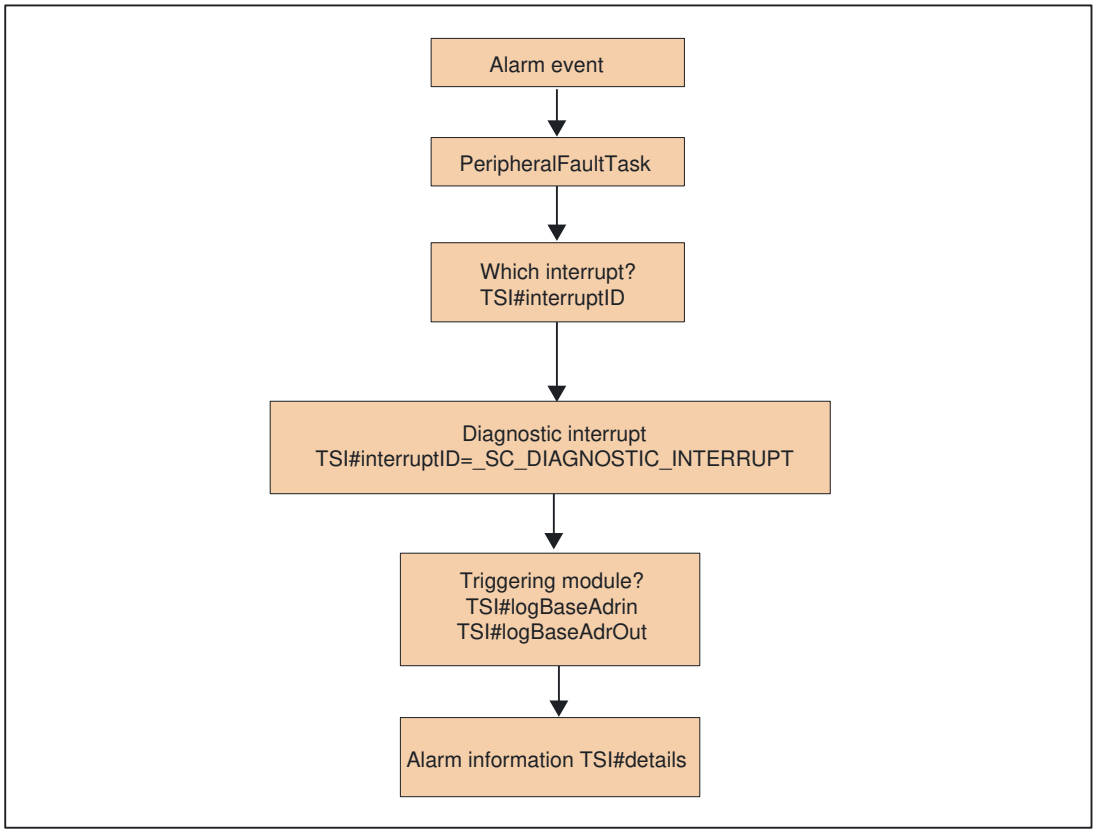


Figure 8-63 Alarm processing for the serial interface module

Alarm evaluation

Alarms originating from the I/O are evaluated in the **PeripheralFaultTask**. When the **PeripheralFaultTask** is started, the **Taskstartinfo** is made available, which you can evaluate in the user program.

The **Taskstartinfo** of **PeripheralFaultTask** is comparable to the local data of OB82 in the SIMATIC system.

Table 8-145 Meaning of the Taskstartinfo

Task	TSI		Remarks
PeripheralFaultTask	DT	TSI#startTime	Start time of the task
	UDINT	TSI#interruptID	Identifies the triggering event: • _SC_PROCESS_INTERRUPT • _SC_DIAGNOSTIC_INTERRUPT • _SC_STATION_DISCONNECTED • _SC_STATION_RECONNECTED
	DINT	TSI#logBaseAdrIn	Logical base address if a process alarm (PRAL) or a diagnostic alarm (DAL) was caused by an input area on the module, otherwise _SC_INVALID_ADDRESS
	DINT	TSI#logBaseAdrOut	Logical base address if a process alarm (PRAL) or a diagnostic alarm (DAL) was caused by an output area on the module, otherwise _SC_INVALID_ADDRESS
	DINT	TSI#logDiagAdr	Diagnostic address of a DP slave if the alarm was caused by a station failure or station recovery of an associated DP slave, otherwise _SC_INVALID_ADDRESS
	DWORD	TSI#details	Detail information (bit fields)

Definition of a diagnostic alarm

If the user program is to respond to an internal or external error, you can set the parameters for a diagnostic alarm that will interrupt the cyclical program of the SIMOTION device.

Events triggering a diagnostic alarm

The criteria (events) that trigger diagnostic alarms in a SIMOTION system are the same as in a SIMATIC system.

For a more detailed description, refer to SIMATIC manual *ET 200S 1SI Serial Interface Module*, "Diagnostics" chapter.

Responses to a diagnostic alarm

If a diagnostic alarm occurs, the following take place:

- Diagnostic data are written to **TSI#details** variable in the Taskstartinfo of **PeripheralFaultTask**.
- In the **PeripheralFaultTask**, you can read out and save the 4 bytes of diagnostic data.
- The group error LED (SF) of the serial interface module illuminates. The group error LED (SF) is extinguished as soon as the error has been remedied.

Bit assignment

The **TSI#details** variable is assigned in the same way as in a SIMATIC system.

Note

For a more detailed description, refer to the SIMATIC manual *ET 200S 1SI Serial Interface Module,* "Diagnostics" chapter.

8.10.5 Appendix

8.10.5.1 SIMOTION and SIMATIC names

The following table contains a comparison of the SIMOTION and the SIMATIC names.

Table 8-146 List of parameters

Name in SIMOTION system, V4.0 and higher (command library in SCOUT)	Name in the SIMATIC system	Name in the SIMOTION system up to V3.2 (SIMOTION Function Library)
Function block parameters		
_ET200S_SI04_send, _ET200S_SI08_send, _ET200S_SI32_send	**FB P_SEND (FB 3)**	**_FB_ET200S_SI4_send, _FB_ET200S_SI8_send, -**
execute	REQ	request
reset	R	abort
dataOffset	DBB_NO	dataOffset
dataLength	LEN	dataLength
periIn	-	inputInterface
periOut	-	outputInterface
data	DB_NO	data
done	DONE	done
error	ERROR	error
errorID	STATUS	errorNumber

Name in SIMOTION system, V4.0 and higher (command library in SCOUT)	Name in the SIMATIC system	Name in the SIMOTION system up to V3.2 (SIMOTION Function Library)
_ET200S_SI04_receive, _ET200S_SI08_receive, _ET200S_SI32_receive	**FB P_RCV (FB 2)**	**_FB_ET200S_SI4_receive, _FB_ET200S_SI8_receive, -**
enable	EN_R	enable
reset	R	abort
dataOffset	DBB_NO	dataOffset

8.11 Standard Function for ASIsafe Safety Monitors

Preface

Contents of the function manual

This **document** is part of the **SIMOTION Programming - References documentation package**.

Function block

The **_ASI_rdAsiMonDiagnostic** function block is part of the command library of the "SIMOTION SCOUT" engineering system.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

http://www.siemens.com/mdm

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

8.11.1 Fundamental safety instructions

8.11.1.1 General safety instructions

⚠ WARNING

Risk of death if the safety instructions and remaining risks are not carefully observed

If the safety instructions and residual risks are not observed in the associated hardware documentation, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life or malfunctions of the machine as a result of incorrect or changed parameterization

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

8.11.1.2 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

8.11.2 Description

8.11.2.1 General

This documentation describes the handling when reading out the diagnostic information of the ASIsafe safety monitors with the **_ASI_rdAsiMonDiagnostic** function block.

Note

The safety function runs independently in the AS-Interface network. The safety monitor and the safety-oriented AS-Interface slaves are self-contained, tested and certified hardware modules. The **_ASI_rdAsiMonDiagnostic** function block on the SIMOTION side does not perform any safety-relevant functions, but only reads out the status of the enabling circuits on the safety monitor.

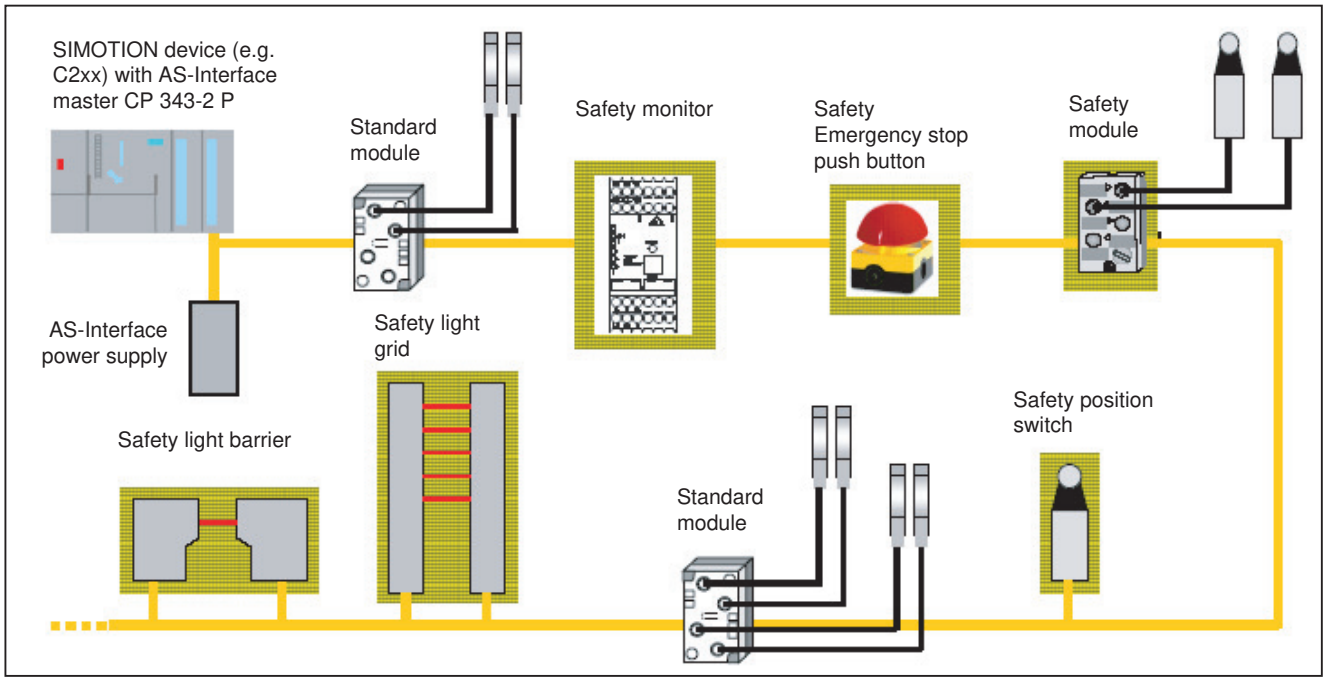

Figure 8-64 System overview

Note

The handling of the **_ASI_rdAsiMonDiagnostic** function block is described in this document. Please refer to the following documents for further information on the commissioning, configuration of the ASIsafe safety monitor and the integration in the AS-Interface:

- *"AS-Interface Safety Monitor"* operating instructions
- *"AS-Interface Safety Monitor IEC61508/EN 954-1* operating instructions
- *"asimon AS-Interface Safety Monitor Configuration Software for Microsoft® - Windows®"* manual
- *"SIMATIC NET CP 343-2/CP 343-2 P AS-Interface Master"* manual
- *"SIMATIC NET DP/AS-Interface Link 20E"* manual
- *"SIMATIC NET DP/AS-Interface Link Advanced"* Manual
- *"SIMATIC NET IE/AS-Interface Link PN IO"* Manual

The following software versions are required for the standard function described in this documentation:

- For AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced):
  - SIMOTION SCOUT V4.0 or higher
  - SIMOTION Kernel V4.0 or higher
- For AS-Interface master IE/AS-Interface Link PN IO:
  - SIMOTION SCOUT, V4.1 SP1 or higher
  - SIMOTION Kernel, V4.1 SP1 or higher

8.11.2.2 Product description

The **_ASI_rdAsiMonDiagnostic** function block is used as a communication interface between the ASIsafe safety monitor, Version 2 and higher (in the Basic/Advanced development stages), and a SIMOTION device. The FB **_ASI_rdAsiMonDiagnostic** reads the diagnostics data provided by the ASIsafe safety monitor, evaluates this and makes the evaluated data available in a data structure.

The **_ASI_rdAsiMonDiagnostic** FB can be operated with the following AS-Interface masters:

- CP 343-2 P
- DP/AS-Interface Link 20E
- DP/AS-Interface Link Advanced
- IE/AS-Interface Link PN IO

8.11.3 Programming

8.11.3.1 Integrating the function block in the user project

Creating the FB instance in the user project

The function block is part of the command library of the "SIMOTION SCOUT" engineering system. To work with the block, an instance must first be created in the user project (see following example).

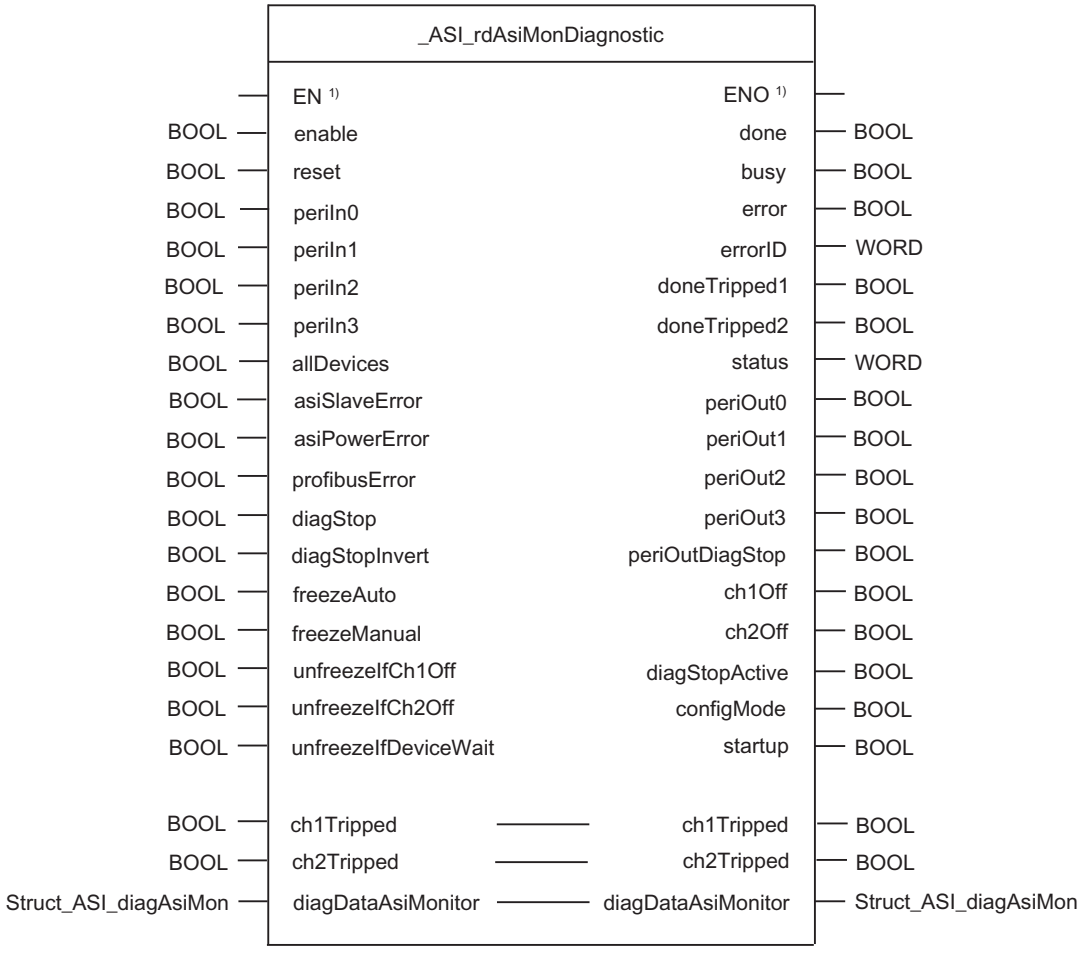
Note

If you wish to control several ASIsafe safety monitors, you must create a variable for the **Struct_ASI_diagAsiMon** data structure and an FB instance with a new name for each safety monitor used.

Example

```
VAR_GLOBAL
...
    myRdAsiMonDiagnostic   : _ASI_rdAsiMonDiagnostic;    // instance of FB
                                                         // _ASI_rdAsiMonDiagnostic
...
END_VAR
```

Call (LAD representation)



1) LAD-specific parameters

Application example

The application example is included on the "SIMOTION Utilities & Applications" DVD and is available for various SIMOTION hardware platforms.

The "SIMOTION Utilities & Applications" DVD is provided free of charge and as part of the SIMOTION SCOUT scope of supply.

8.11.3.2 Addressing the AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/ Link Advanced)

Integrating the ASIsafe safety monitor in the address area of the AS-Interface master

The ASIsafe safety monitor is addressed in the same way as an AS-Interface slave. The diagnostic information is read in via a 4-bit wide interface and control information is output on the ASIsafe safety monitor via a 4-bit wide interface.

This 4-bit input and output data is contained in the address area of the AS-Interface master (CP 343-2 P, Link 20E or Link Advanced) as the high or low part of a byte. Which byte in the address area contains the 4-bit input and output data and whether this data is classified as high or low part, depends on the specified AS-Interface address of the ASIsafe safety monitor.

The following table shows an example of how the AS-Interface slave addresses are assigned to the address area of the AS-Interface master CP 343-2 P (where n is the start address of the I/O address area assigned to the CP 343-2 P).

The assignment of the AS-Interface slave addresses to the address area of the AS-Interface master Link 20E/Link Advanced is the same as that for the CP 343-2 P. The address area of the Link 20E/Link Advanced covers 32 bytes.

Table 8-148 Binary addressing of the AS-Interface slaves in the AS-Interface master CP 343-2 P

Master								
Starting address (n)	**Bits 7 - 4**				**Bits 3 -0**			
	Slave				Slave			
	Bit 3	Bit 2	Bit 1	Bit 0	Bit 3	Bit 2	Bit 1	Bit 0
n+0	Reserved				Slave 1 or 1A			
n+1	Slave 2 or 2A				Slave 3 or 3A			
n+2	Slave 4 or 4A				Slave 5 or 5A			
n+3	Slave 6 or 6A				Slave 7 or 7A			
n+4	Slave 8 or 8A				Slave 9 or 9A			
n+5	Slave 10 or 10A				Slave 11 or 11A			
n+6	Slave 12 or 12A				Slave 13 or 13A			
n+7	Slave 14 or 14A				Slave 15 or 15A			
n+8	Slave 16 or 16A				Slave 17 or 17A			
n+9	Slave 18 or 18A				Slave 19 or 19A			
n+10	Slave 20 or 20A				Slave 21 or 21A			
n+11	Slave 22 or 22A				Slave 23 or 23A			
n+12	Slave 24 or 24A				Slave 25 or 25A			
n+13	Slave 26 or 26A				Slave 27 or 27A			
n+14	Slave 28 or 28A				Slave 29 or 29A			
n+15	Slave 30 or 30A				Slave 31 or 31A			

Addressing the AS-Interface master in SIMOTION

Communication between the SIMOTION device and the AS-Interface master takes place via direct access to the I/O and data record transfer. Addresses as of 256 are recommended for the AS-Interface master. In this address area, communication takes place via direct access to the I/O with the aid of I/O variables.

Creating I/O variables

One I/O variable each must be created in the symbol browser for the read or write access. When you create the I/O variable, you must enter the parameterized address of the AS-Interface master from the HW configuration in the "I/O address" column. The value in the "Array length" column depends on the used AS-Interface master. Enter the value 16 bytes as field length for the CP 343-2 P.

The field length (xx) to be parameterized for the Link 20E/Link Advanced should be entered in relation to the address area assigned (from **HW Config**).

With these specifications, one I/O variable of type ARRAY[0..15] of byte (CP 343-2 P) or of type ARRAY[0..xx] of byte (Link 20E/Link Advanced) is created respectively in the SIMOTION project for direct read/write access to the I/O.

Parameter transfer

The 4-bit wide input data of the ASIsafe safety monitor are transferred bit-by-bit to the FB **_ASI_rdAsiMonDiagnostic** in the **periIn0..3** input parameters.

The output data (periOut0..3) provided by the FB must be assigned to the I/O variable for write access to the AS-Interface master in accordance with the address assignment of the ASIsafe safety monitor.

Example of parameter transfer to FB _ASI_rdAsiMonDiagnostic

An ASIsafe safety monitor with AS-Interface slave address 1 and an AS-Interface master with address 256 are used in the example.

I/O variable for access to the AS-Interface slaves in the CP 343-2 P address area:

	Name	I/O address	Read only	Data type	Field length
1	⊞ myperiincp3432	PIB 256		Array	16
2	⊞ myperioutcp3432	PQB 256	☐	Array	16

Figure 8-65 Addressing with I/O variable

Assignment of the ASIsafe safety monitor with the AS-Interface slave address 1 in the CP 343-2 P address area (corresponds to the table "Binary addressing of the AS-Interface slaves in the AS-Interface master CP 343-2 P"):

Bits 0..3 in input byte 0 with address 256 → periInCP3432[0]

Bits 0..3 in output byte 0 with address 256 → periOutCP3432[0]

Transfer of the input and output data to the FB **_ASI_rdAsiMonDiagnostic**:

```
myRdAsiMonDiagnostic (.......
            periIn0 := ((periInCP3432[0] AND 16#01)<>0),                    // Bit 0
            periIn1 := ((periInCP3432[0] AND 16#02)<>0),                    // Bit 1
            periIn2 := ((periInCP3432[0] AND 16#04)<>0),                    // Bit 2
            periIn3 := ((periInCP3432[0] AND 16#08)<>0),                    // Bit 3
            .......
            );
  // selective deletion of bits 0..3 in output byte 0
  periOut[0]:= periOut[0] AND 16#F0;
  periOut[0]:= periOut[0] OR myRdAsiMonDiagnostic.periOut0;                 // Bit 0
  periOut[0]:= periOut[0] OR SHL(myRdAsiMonDiagnostic.periOut1,1);          // Bit 1
  periOut[0]:= periOut[0] OR SHL(myRdAsiMonDiagnostic.periOut2,2);          // Bit 2
  periOut[0]:= periOut[0] OR SHL(myRdAsiMonDiagnostic.periOut3,3);          // Bit 3
```

Note

For additional information, refer to:

- *SIMOTION SCOUT* online help
- Programming Manual for the corresponding programming language, e.g.:
  - *SIMOTION ST, Structured Text* Programming Manual
  - *SIMOTION MCC, Motion Control Chart* Programming Manual
  - *SIMOTION LAD/FBD, Ladder Diagram and Function Block Diagram* Programming Manual

These documents are shipped with SIMOTION SCOUT in electronic form.

8.11.3.3 Addressing the AS-Interface master IE/AS-Interface Link PN IO

Integrating the ASIsafe safety monitor in the address area of the AS-Interface master

The ASIsafe safety monitor is addressed the same as an AS-Interface slave. The diagnostic information is read in via a 4-bit wide interface and control information is output on the ASIsafe safety monitor via a 4-bit wide interface.

For each AS-Interface slave, 1 byte is reserved in the IE/AS-Interface Link address area. The 4-bit wide input and output data of the ASIsafe safety monitor are transferred in the low part (bits 0 - 3) of this reserved byte.

There are no fixed specifications in terms of how the AS-Interface slave addresses are assigned to the IE/AS-Interface Link PN IO address area; this can be changed in the Step7 HW configuration.

Example of assigning AS-Interface slave addresses to the input/output addresses of the IE/AS-Interface Link PN IO:

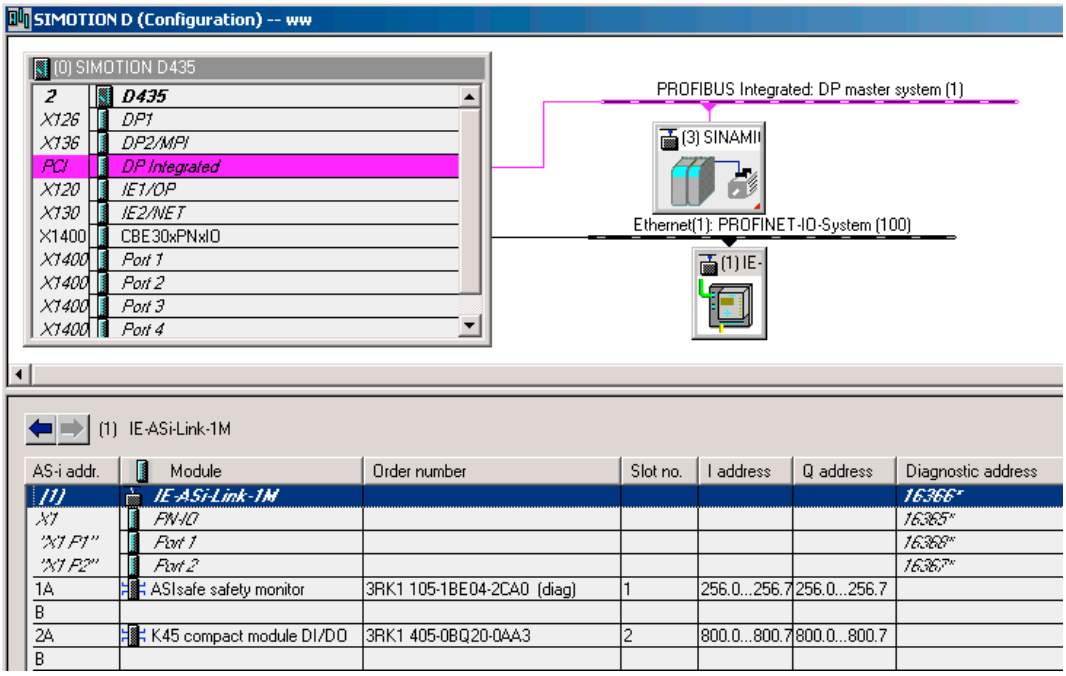


Figure 8-66 Example of address assignment for the IE/AS-Interface Link PN IO

Addressing the AS-Interface master in SIMOTION

Communication between the SIMOTION device and the AS-Interface master is performed through direct access to the I/O and data set transfer. Addresses from 256 are recommended for the AS-Interface master. In this address area, communication takes place via direct access to the I/O with the aid of I/O variables.

Creating I/O variables

One I/O variable of type BYTE must be created in the symbol browser for each instance of read or write access. When you create the I/O variable, you must enter the parameterized address of the AS-Interface master from the HW configuration in the "I/O address" column. Enter the value "1" in the "Field length" column.

Parameter transfer

The 4-bit wide input data of the ASIsafe safety monitor are transferred bit-by-bit to the FB **_ASI_rdAsiMonDiagnostic** in the **periIn0..3** input parameters.

The output data (periOut0..3) provided by the FB must be assigned to the I/O variable for write access to the AS-Interface master in accordance with the address assignment of the ASIsafe safety monitor.

Example of parameter transfer to FB _ASI_rdAsiMonDiagnostic

An ASIsafe safety monitor with AS-Interface slave address 1 and an AS-Interface master with address 256 are used in the example.

I/O variable for access to the ASIsafe safety monitor:

	Name	I/O address	Read only	Data type	Field length
1	myperiinieasilink	PIB 256		BYTE	1
2	myperioutieasilink	PQB 256		BYTE	1

Figure 8-67 Addressing with I/O variable

The 4-bit wide information is transferred in the LOW part (bits 0 - 3).

Transfer of the input and output data to the FB **_ASI_rdAsiMonDiagnostic**:

```
myRdAsiMonDiagnostic (.......
            periIn0 := ((myperiInIEASILink AND 16#01)<>0),              // Bit 0
            periIn1 := ((myperiInIEASILink AND 16#02)<>0),              // Bit 1
            periIn2 := ((myperiInIEASILink AND 16#04)<>0),              // Bit 2
            periIn3 := ((myperiInIEASILink AND 16#08)<>0),              // Bit 3
            .......
            );
 // selective deletion of bits 0..3 in output byte 0
 myPeriOutIEASILink:= myPeriOutIEASILink AND 16#F0;
 myPeriOutIEASILink:= myPeriOutIEASILink OR myRdAsiMonDiagnostic.periOut0;        // Bit 0
 myPeriOutIEASILink:= myPeriOutIEASILink OR SHL(myRdAsiMonDiagnostic.periOut1,1); // Bit 1
 myPeriOutIEASILink:= myPeriOutIEASILink OR SHL(myRdAsiMonDiagnostic.periOut2,2); // Bit 2
 myPeriOutIEASILink:= myPeriOutIEASILink OR SHL(myRdAsiMonDiagnostic.periOut3,3); // Bit 3
```

Note

For additional information, refer to:

- *SIMOTION SCOUT* online help
- Programming Manual for the corresponding programming language, e.g.:
  - *SIMOTION ST, Structured Text* Programming Manual
  - *SIMOTION MCC, Motion Control Chart* Programming Manual
  - *SIMOTION LAD/FBD, Ladder Diagram and Function Block Diagram* Programming Manual

These documents are shipped with SIMOTION SCOUT in electronic form.

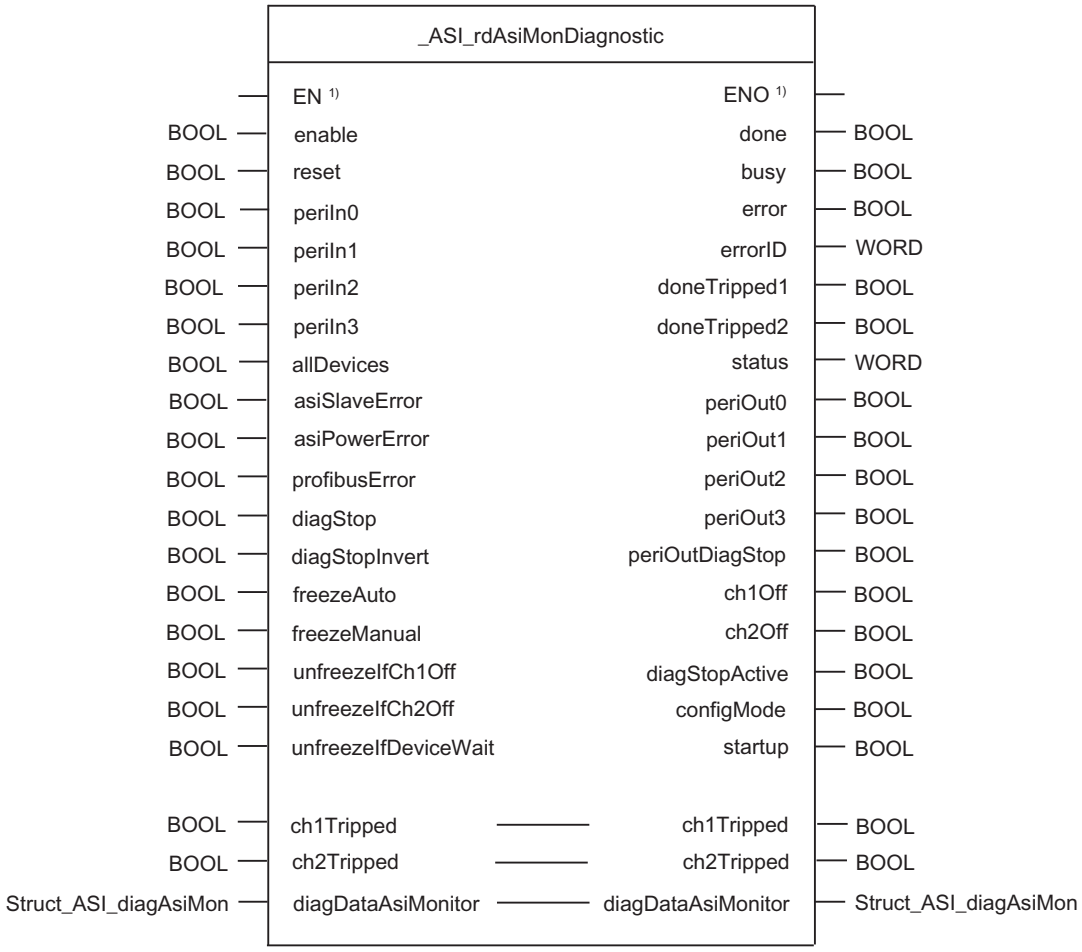
8.11.4 Parameterizing

8.11.4.1 Function block _ASI_rdAsiMonDiagnostic

Task

The FB **_ASI_rdAsiMonDiagnostic** is a function block for reading out the diagnostic information of the ASIsafe safety monitor. The diagnostic information can be used to determine the status of the enabling circuits of the safety monitor and the safety-oriented slaves. For this purpose, during a cyclic call of the FB **_ASI_rdAsiMonDiagnostic** the diagnostic information provided by the safety monitor is continuously read out, evaluated, and made available in the data structure **Struct_ASI_diagAsiMon**.

Call (LAD representation)



1) LAD-specific parameters

Parameter description

The following table contains all parameters of the **_ASI_rdAsiMonDiagnostic** function block.

Note

You can find a comparison of SIMOTION and SIMATIC names in the Appendix SIMOTION and SIMATIC names (Page 6539).

Table 8-149 Parameters of the FB _ASI_rdAsiMonDiagnostic

Name	Type	Data type	Default	Meaning
enable	IN	BOOL	FALSE	**TRUE** = continuous read out of the diagnostic information **FALSE** = the initialization of the ASIsafe safety monitor is run through once
reset	IN	BOOL	FALSE	Rising edge = reset of FB **_ASI_rdAsiMonDiagnostic**
periIn0	IN	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periIn1	IN	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periIn2	IN	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periIn3	IN	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
allDevices	IN	BOOL	FALSE	Data format of the diagnostic data (depends on the ASIsafe safety monitor version and the asimon configuration program); see the section titled "Settings in the asimon conifguration program" in this chapter.
asiSlaveError [1)]	IN	BOOL	FALSE	The parameter must be set (**TRUE**) when an AS-Interface slave has failed.
asiPowerError [1)]	IN	BOOL	FALSE	The parameter must be set (**TRUE**) when the AS-Interface power supply has failed.
profibusError [1)]	IN	BOOL	FALSE	The parameter must be set (**TRUE**) when the communication with the AS-Interface master has been interrupted.
diagStop [1)]	IN	BOOL	FALSE	**TRUE** = activation of the diagnosis stop functionality in FB **_ASI_rdAsiMonDiagnostic** (corresponding to the asimon configuration program)
diagStopInvert [1)]	IN	BOOL	FALSE	**TRUE** = value on output parameter **periOutDiagStop** is output inverted (corresponding to the asimon configuration program)
freezeAuto [1)]	IN	BOOL	FALSE	**TRUE** = control of the diagnosis stop condition via FB **_ASI_rdAsiMonDiagnostic**
freezeManual [1)]	IN	BOOL	FALSE	**TRUE** = manual activation of the diagnosis stop condition
unfreezeIfCh1Off [1)]	IN	BOOL	FALSE	**TRUE** = diagnosis stop condition is also deactivated (unfreeze) when the enabling circuit 1 has shut down (independent of the status in enabling circuit 2)
unfreezeIfCh2Off [1)]	IN	BOOL	FALSE	**TRUE** = diagnosis stop condition is also deactivated (unfreeze) when the enabling circuit 2 has shut down (independent of the status in enabling circuit 1)

Name	Type	Data type	Default	Meaning
unfreezeIfDeviceWait [1]	IN	BOOL	FALSE	**TRUE** = the diagnosis stop condition is also deactivated periodically (unfreeze) when it is detected in the running diagnostic sequence that at least one device is in the "Wait" state (status = 2)
done	OUT	BOOL	FALSE	**TRUE** = diagnostic sequence completed, present for one cycle.
busy	OUT	BOOL	FALSE	**TRUE** = block reading diagnostic information, data not consistent **FALSE** = diagnostic sequence completed, data consistent
error	OUT	BOOL	FALSE	**TRUE** = diagnostic sequence aborted with error, error specification in **errorID**
errorID	OUT	WORD	16#0000	Error specification With **error** = **TRUE**, the error information is in parameter **errorID**, see "Error and status messages".
doneTripped1 [1]	OUT	BOOL	FALSE	**TRUE** = diagnostic sequence completed and shutdown in enabling circuit 1, present for one cycle.
doneTripped2 [1]	OUT	BOOL	FALSE	**TRUE** = diagnostic sequence completed and shutdown in enabling circuit 2, present for one cycle.
status	OUT	WORD	16#0000	0x7A01 = **reset** active 0x00xx = number of cycles for a diagnostic sequence
periOut0	OUT	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periOut1	OUT	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periOut2	OUT	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periOut3	OUT	BOOL	FALSE	I/O variable with bit address of the ASIsafe safety monitor
periOutDiagStop	OUT	BOOL	FALSE	I/O variable with bit address for diagnosis stop (must match the configured address in the asimon configuration program)
ch1Off	OUT	BOOL	FALSE	**TRUE** = enabling circuit 1 will be configured and shut down
ch2Off	OUT	BOOL	FALSE	**TRUE** = enabling circuit 2 will be configured and shut down
diagStopActive	OUT	BOOL	FALSE	**TRUE** = diagnosis stop condition active A device will be "frozen" by the safety monitor
configMode	OUT	BOOL	FALSE	**TRUE** = safety monitor is in configuration mode
startup	OUT	BOOL	FALSE	**TRUE** = safety monitor is starting up
ch1Tripped	IN/OUT	BOOL	FALSE	**TRUE** = status change from ON to OFF in enabling circuit 1
ch2Tripped	IN/OUT	BOOL	FALSE	**TRUE** = status change from ON to OFF in enabling circuit 2
diagDataAsiMonitor	IN/OUT	**Struct_ASI_diagAsiMon**		Data structure for storing the diagnostic information of the ASIsafe safety monitor

[1] The function of this parameter is described in detail in the following.

asiSlaveError, asiPowerError, profibusError

These input parameters inform the FB **_ASI_rdAsiMonDiagnostic** of error statuses of the ASI slaves and the ASI power supply, as well as errors on the PROFIBUS DP with level **TRUE**.

- The following table contains the input parameters in which the error messages with the listed meanings are transferred.

Parameter	Meaning of the error message
asiSlaveError	**TRUE** = failure of the AS-Interface slave safety monitor
asiPowerError	**TRUE** = failure of the AS-Interface power supply (or other general AS-Interface failure)
profibusError	**TRUE** = failure of the communication with the AS-Interface master

Note

PROFIBUS errors are signaled by alarms. The cause of the error can be determined by evaluating the DP slave diagnostics. The AS-Interface master signals faults and errors at the AS-Interface (e.g. failure of the ASI slave, failure of the ASI power supply, etc.) to the higher-level control using alarms.

You can obtain detailed information on how the AS-Interface master responds, as well as the relevant error information, from the following documents:

- For CP 342-2 P from DS1 (see *"SIMATIC NET CP 343-2/CP 343-2 P AS-Interface Master"* Manual)
- For Link 20E from the PROFIBUS slave diagnostics (see *"SIMATIC NET DP/AS-Interface Link 20E"* Manual)
- For Link Advanced from the PROFIBUS slave diagnostics (see *"SIMATIC NET DP/AS-Interface Link Advanced"* Manual)
- For IE/AS Link PNI IO from the alarms and diagnostic data records (see *"SIMATIC NET IE/AS-Interface PN IO"* Manual)

These documents are shipped with SIMOTION SCOUT in electronic form.

- Requirements for transferring the diagnostic data are that the AS-Interface slave address of the safety monitor can be addressed by the AS-Interface master, and that the SIMOTION device is correctly connected to the AS-Interface master.
  The diagnostic sequence must be aborted in the event of a communication failure. The diagnostic sequence must be re-initialized when the communication is restored.
- The diagnostic sequence is aborted if any of the **asiSlaveError**, **asiPowerError**, **profibusError**, or **reset** parameters is set to **TRUE**.
  In this status, no input data are read and no output data are written.
- The function block runs through an initialization phase once as soon as all 4 parameters are **FALSE**:

asiSlaveError := **FALSE**
asiPowerError := **FALSE**
profibusError := **FALSE**
reset := **FALSE**

Diagnostic data is then continuously read in.

- The reset and initialization phase are also run through continuously for as long as parameter **reset** := **TRUE**.
- The initialization phase is also run through once when the block-internal watchdog determines that no data has been received from the safety monitor for some time (2,000 ms) during a running diagnostic sequence.

diagStop, diagStopInvert, freezeAuto, freezeManual, unfreezeIfCh1Off, unfreezeIfCh2Off, unfreezeIfDeviceWait

These input parameters control the "diagnosis stop" function of the safety monitor as of Version V2.x. A safety monitor in Version V1.x does not support this function and ignores these input parameters.

- If a device has registered a shutdown, the "diagnosis stop" function "freezes" the device in its current status. This means that the device remains in the "Off" status even when it is switched on again at a later point, and is frozen in the "Wait" status (YELLOW color display in the diagnostics mode of the asimon configuration program, corresponding to status code 2 in the diagnostics data, as with waiting for local acknowledgement).
- "Freezing" is only possible when the stop condition of the diagnosis stop function is activated.
- A "frozen" device can be enabled again (unfreeze) by deactivating the stop condition of the diagnosis stop function.
- With the "diagnosis stop" function, the diagnostics can register a transient device shutdown, which would otherwise result in a shutdown of the enabling circuit but would not be recognizable in the diagnostics.

Note

The "diagnosis stop" function can delay the reactivation of an enabling circuit of the safety monitor, as the devices must first be enabled (unfreeze). In connection with OR gates, the "diagnosis stop" function can even result in the unwanted shutdown of an enabling circuit, as each individual status of a gate input is frozen and the resulting sum of the possibly frozen inputs can result in the shutdown of the gate output.

- The "diagnosis stop" function can be activated in the asimon configuration program under **Edit > Monitor/bus information > Diagnosis/service > Diagnosis stop** (see "asimon AS-Interface Safety Monitor Configuration Software for Microsoft®-Windows®" manual). It is recommended that this function only be activated for troubleshooting. The function should not be activated especially when using OR gates (as described above).
- When the diagnosis stop function is activated, an AS-Interface slave address including the bit address must be specified in the asimon configuration program. An output must be specified as a bit address for use with the diagnostics function block (output parameter **periOutDiagStop**), so that this can be controlled by the SIMOTION device. The option "Inverted" should remain deactivated. Reason: During the operating mode transition from RUN to STOP, all outputs are in status 0, which means that the diagnosis stop is also deactivated. The safety monitor cannot be blocked by "frozen" devices. If required, the system can then be operated in manual mode.

Note

Connection of output parameter periOutDiagStop with setting in the asimon configuration program

The diagnosis stop condition is controlled with the output parameter **periOutDiagStop**. For the correct sequence, the output parameter **periOutDiagStop** must be linked to a bit output of an arbitrary AS-Interface slave. The bit address of this AS-Interface slave must match the set stop condition in the asimon configuration program (see following example).

Example

The first output is used for controlling the diagnosis stop condition for an AS-Interface standard slave with 2 inputs and outputs and slave address 3.

1. Settings in the asimon configuration program in the **Monitor/Bus Information** window:

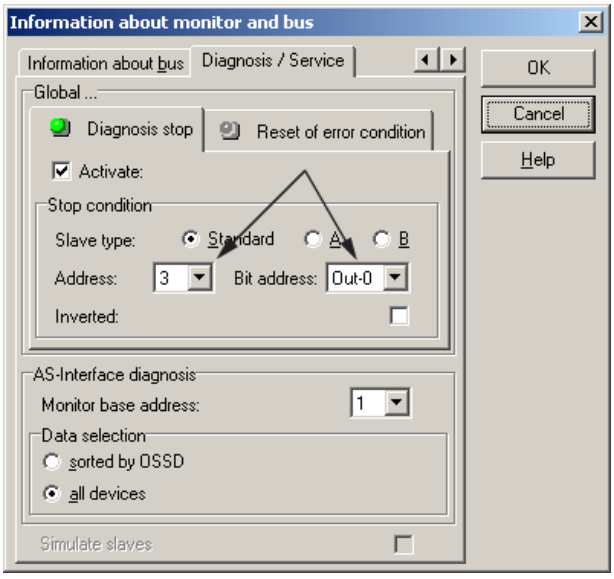


Figure 8-68 Stop condition setting for diagnosis stop (asimon V2.0.3)

2. Linking of the output parameter **periOutDiagStop** to the first output of the AS-Interface standard slave with slave address 3 (see Chapter Addressing the AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced) (Page 6512) or Addressing the AS-Interface master IE/AS-Interface Link PN IO (Page 6515)):

```
myPeriout_cp343_2[1] := (myPeriout_cp343_2[1] AND 16#FE) OR
myRdAsiMonDiagnostic.periOutDiagStop;

 // Explanation
 // myPeriOutCP3432                          : I/O variable with length of 16 bytes for
 //                                          the address area of the AS-Interface master
 // myPeriOutCP3432[1]                      : Byte 1 bits 0..3 of AS-Interface address space
 //                                          Standard slave with address 3
 // (myPeriOutCP3432[1] AND 16#FE)           : Selective resetting of output 1
 // OR myRdAsiMonDiagnostic.periOutDiagStop : OR operation output parameter
 //                                          periOutDiagStop with first output of the
 //                                          AS-Interface standard slave with address 3
```

- in order that the function block can control the diagnosis stop condition, the input parameter **diagStop** := **TRUE**. With **diagStop** := **FALSE**, the diagnosis stop function is not processed; the output bit defined with output parameter **periOutDiagStop** is not changed.
- The input parameter **diagStopInvert** must match the setting in the asimon configuration program:
  - If the option "Inverted" is deactivated (recommended), then **diagStopInvert** := **FALSE** must be set.
  - If the option "Inverted" is selected, then **diagStopInvert** := **TRUE** must be set.
- If both input parameters are **freezeAuto** := **FALSE** and **freezeManual** := **FALSE**, then the diagnosis stop condition is permanently deactivated, i.e. the safety monitor does not "freeze" any devices.

- If the input parameter **freezeAuto** = **FALSE**, then the diagnosis stop condition can be manually activated with **freezeManual** := **TRUE**, so that the safety monitor "freezes" devices. The re-enabling (unfreeze) must also be performed manually! In this case, the input parameters **unfreezeIfCh1Off**, **unfreezeIfCh2Off** and **unfreezeIfDeviceWait** are not taken into account.
- If input parameter **freezeAuto** = **TRUE**, then the function block manages control of the diagnosis stop condition automatically. In this case, the input parameter **freezeManual** is not taken into account. The following rules then apply:
  - At first, the diagnosis stop condition is activated, i.e. the safety monitor can "freeze" devices.
  - After the diagnostics have detected that both enabling circuits have shut down, the diagnosis stop condition is deactivated (unfreeze), i.e. the safety monitor can be reactivated.
  - If the input parameter **unfreezeIfCh1Off** = **TRUE**, the diagnosis stop condition is also deactivated (unfreeze) when enabling circuit 1 has shut down (regardless of the status in enabling circuit 2).
  - If the input parameter **unfreezeIfCh2Off** = **TRUE**, the diagnosis stop condition is also deactivated (unfreeze) when enabling circuit 2 has shut down (regardless of the status in enabling circuit 1).
  - If the input parameter **unfreezeIfDeviceWait** := **TRUE**, the diagnosis stop condition is also deactivated periodically (unfreeze) in the event that the running diagnostic sequence has detected that at least one device is in the "Wait" status (**status** = 2) In this case, periodic deactivation means that the diagnosis stop condition is deactivated for 100 ms and then reactivated for 100 ms. Although it is no longer possible to register transient device shutdowns, "frozen" devices that do not directly lead to the shutdown of the enabling circuit (e.g. gate inputs) may be enabled again during running operation (unfreeze).

doneTripped1, doneTripped2

The parameter assumes the state **TRUE** for one cycle, when a diagnostic sequence has been successfully completed or aborted with error, and a shutdown (transition **ON** to **OFF**) has been registered in enabling circuit 1 or enabling circuit 2 in this diagnostic sequence. This enables, for example, diagnostic data archiving to be triggered.

Functional description

After the safety monitor is ramped up, the diagnostic information of the safety monitor is continuously read out with level **TRUE** on the input parameter **enable** of FB **_rdAsiMonDiagnostic**. During the read out of the diagnostic sequence, output parameter **busy** = **TRUE**. The successful completion of the read out of the diagnostic information is indicated by output parameters **done** = **TRUE** and **busy = FALSE**. The data evaluated by FB **_ASI_rdAsiMonDiagnostic** have been copied to the data structure **Struct_ASI_diagAsiMon** and are up-to-date. The diagnostics data of the safety monitor are then read out again from FB **_ASI_rdAsiMonDiagnostic** (**busy** = **TRUE**).

A faulty completion of the read out is indicated with **TRUE** on the output parameter **error**. The error is specified in output parameter **errorID**.

In the input parameters **asiSlaveError**, **asiPowerError**, and **profibusError**, the FB **_ASI_rdAsiMonDiagnostic** is informed of error statuses of the AS-Interface slaves (e.g. safety monitor), AS-Interface power supply, and communication to the AS-Interface master with level **TRUE**. The read out of the diagnostic information is then aborted.

No diagnostic data is read in if input parameter **enable** = **FALSE** . A running read out of the diagnostic information and an internal reset/initialization is run through once.

With a rising edge on input parameter **reset**, the FB **_ASI_rdAsiMonDiagnostic** is reset to the basic state. This ensures that the function block can start correctly with the readout of the diagnostic data, irrespective of the previous actions (e.g. separate shutdown of the safety monitor).

With level **FALSE** on input parameter **enable** or rising edge on input parameter **reset**, the levels of the output parameters **busy**, **done** and **error** are set to **FALSE**. The value in output parameter **status** is 0x7A02. The levels and states of all further output parameters as well as the data of the elements of the data structure **Struct_Asi_diagAsiMon** are "frozen".

A detected shutdown is output immediately on the in/out parameters **ch1Tripped** and **ch2Tripped**, without waiting for the end of the diagnostic sequence (**done** = **TRUE**). The in/out parameters must be reset in the user program after their evaluation.

Graphic overview of the functionality

Safety operation

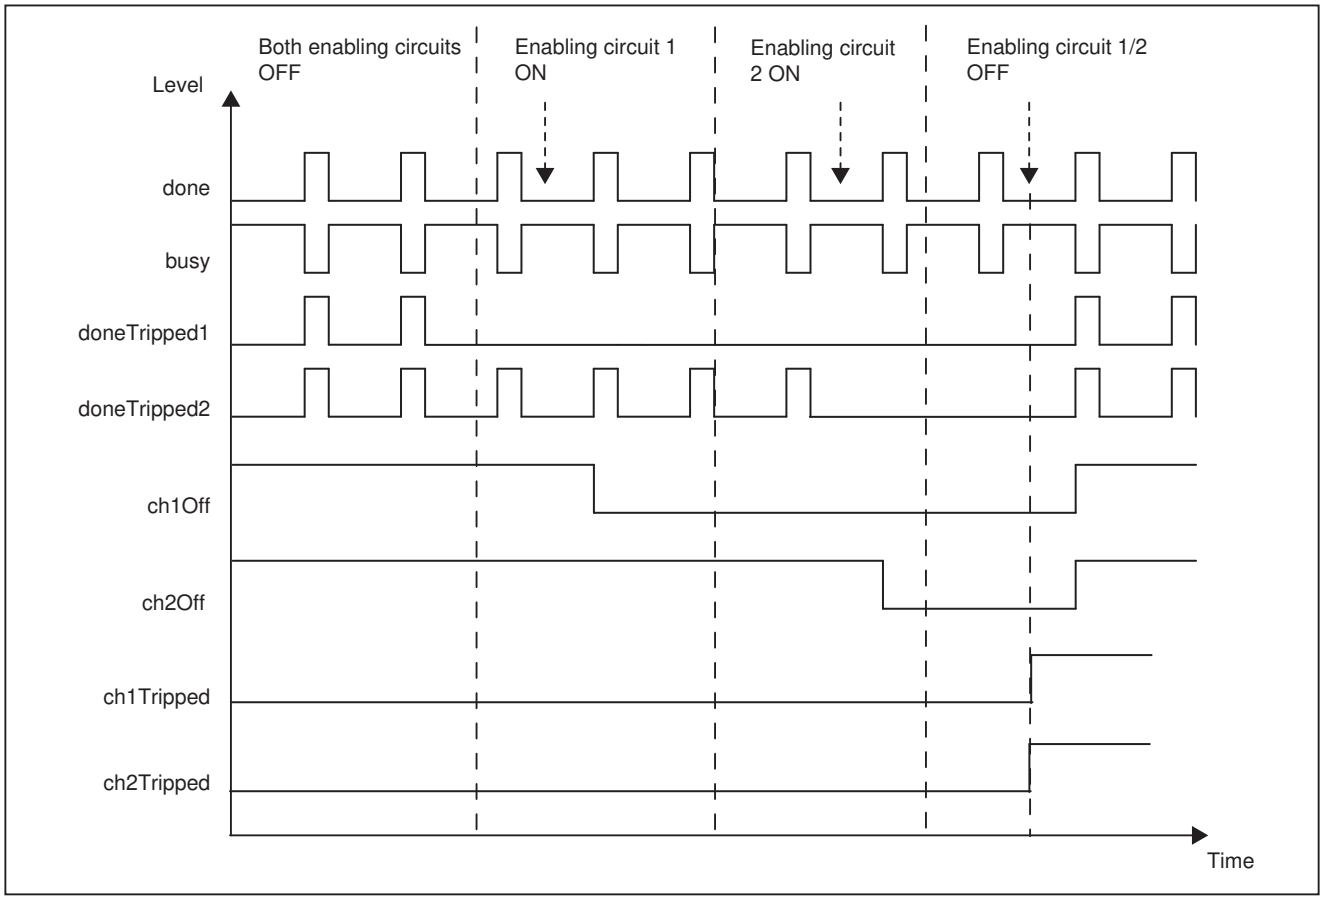

Figure 8-69 Signal flowchart of safety operation

reset := TRUE, enable := FALSE, asiSlaveError := TRUE

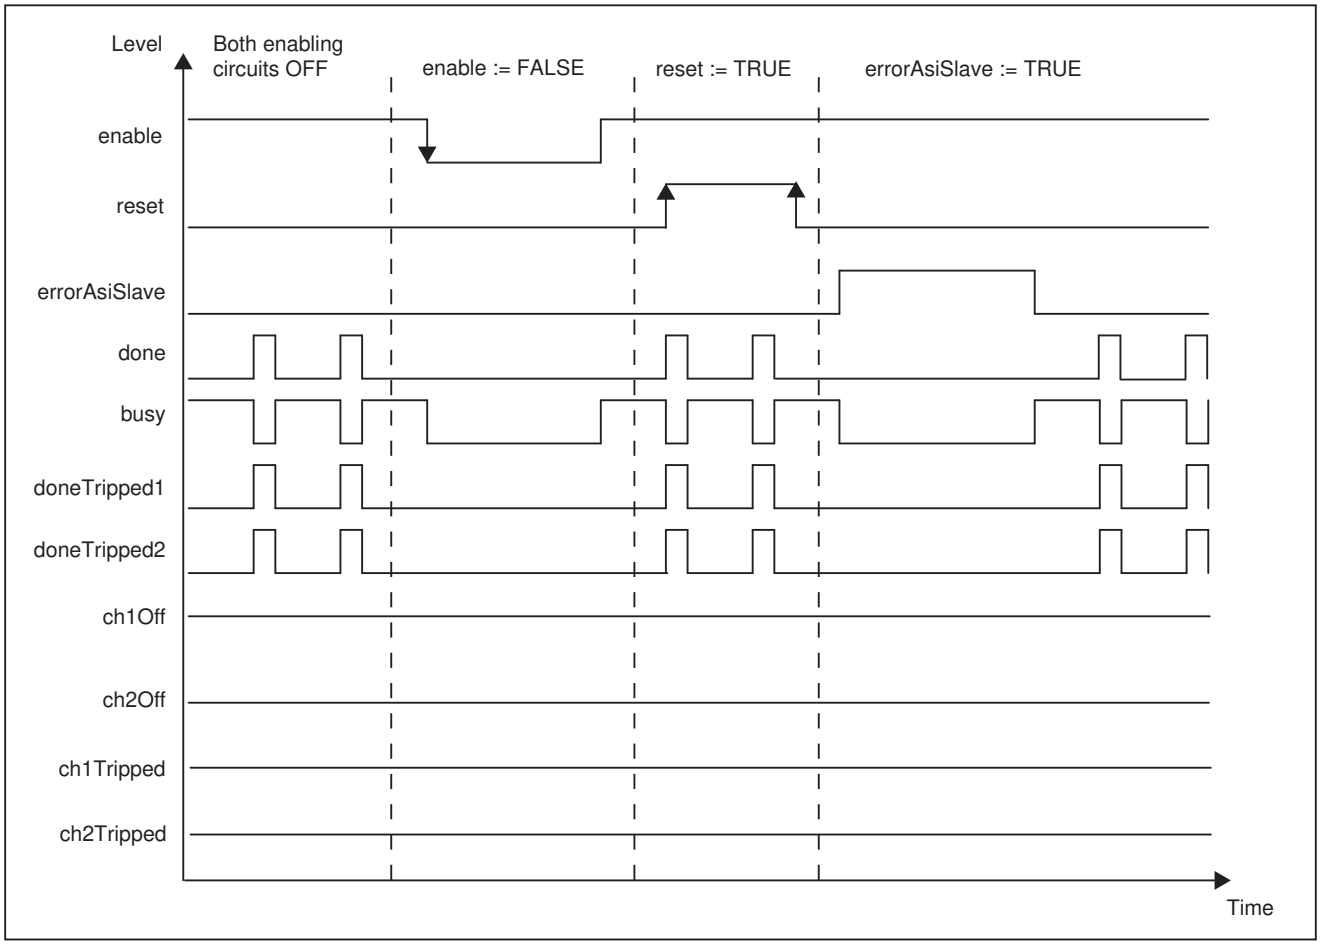

Figure 8-70 Signal flowchart of both enabling circuits OFF

Settings in the asimon configuration program

Data selection

The asimon program is used for the configuration and commissioning of the ASIsafe safety monitor via a PC.

The input parameter **allDevices** on FB **_ASI_rdAsiMonDiagnostic** must be set with level **TRUE** or **FALSE** in accordance with the configuration of the safety monitor.

The selection can be made in the asimon configuration program of the safety monitor. To do this, select the menu item **Monitor/bus information** in the **Edit** menu and open the **Diagnosis/ Service** window:

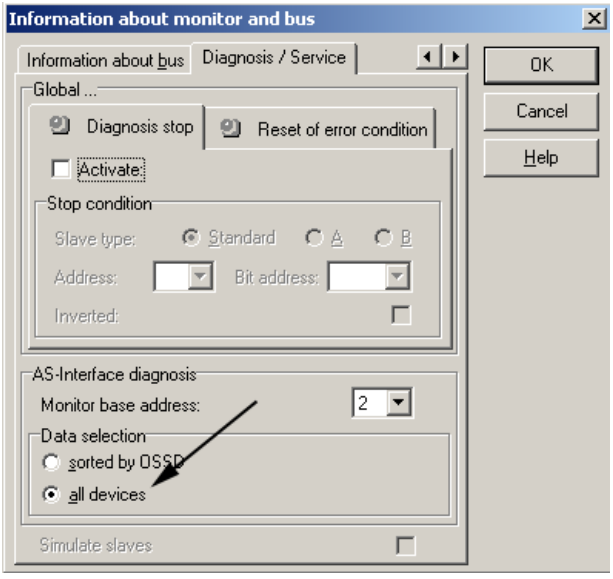

Figure 8-71 Activating the "all devices" data selection (asimon V2.0.3)

With the data selection "all devices" in the asimon configuration program, the input parameter **allDevices** must be set to **TRUE**. If the "all devices" setting is made, the diagnostic data of the devices are also provided during safety monitor preprocessing. With the selection "sorted by OSSD", the input parameter **allDevices** must be set to **FALSE**.

Diagnosis stop

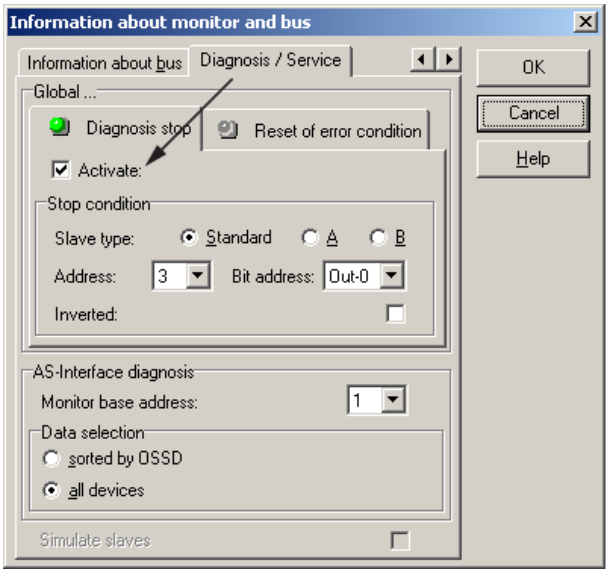

Figure 8-72 Activation of diagnosis stop (asimon V2.0.3)

The following input/output parameters are only relevant for the activation of the "diagnosis stop" functionality in the asimon configuration program of the safety monitor:

Input parameters:	**diagStop, diagStopInvert, freezeAuto, freezeManual, unfreezeIfCh1Off, unfreezeIfCh2Off, unfreezeIfDeviceWait**
Output parameters:	**periOutDiagStop, diagStopActive**

Note

The diagnosis stop is explained in more detail in the description of the input parameters (see "Parameter description" in this section).

Task integration (call)

The **_ASI_rdAsiMonDiagnostic** function block is intended for the call in a cyclic task and must be run through cyclically. The execution of a job can take several cycles. The user decides in which cyclic task the FB **_ASI_rdAsiMonDiagnostic** is called. No restrictions are applied with respect to the functionality of the FB **_ASI_rdAsiMonDiagnostic**. The call can be performed in all cyclic tasks. A fixed time frame (e.g. **IPOSynchronousTask**) is not required for processing.

Error and status messages

Errors that occur are indicated at the **error** output parameter. This includes errors in the FB, communication faults and errors of the safety monitor. In the event of an error, the corresponding error number is displayed at the **errorID** output parameter. If no errors have occurred, **errorID** has a value of "16#0000". The parameter **errorID** is present until the error is corrected.

Table 8-150 Error codes in the output parameter errorID

Error no. errorID	Meaning
0x8010	Watchdog has triggered, no communication to the safety monitor
0x8020	Internal error / no request active
0x8701	Diagnostic sequence aborted, parameter **asiSlaveError = TRUE**
0x8801	Diagnostic sequence aborted, parameter **asiPowerError = TRUE**
0x8901	Diagnostic sequence aborted, parameter **profibusError = TRUE**

The pending errors are acknowledged with a rising edge in input parameter **reset**.

Table 8-151 Status messages

Status messages status	Meaning
0x7A01	The FB is in reset or in the initialization phase.
0x7A02	The FB is inactive, no update of the diagnostics data.
0x00xx	Number of cycles for a diagnostic sequence

After the error-free completion of the read in of the diagnostic sequences, the number of required cycles of the FB **_ASI_rdAsiMonDiagnostic** is displayed in the output parameter **status**.

8.11.4.2 Data structure

Struct_ASI_diagAsiMon for diagnostics data

The data structure **Struct_ASI_diagAsiMon** is a data structure for storing the diagnostic information.

Table 8-152 Struct_ASI_diagAsiMon

Name	Data type	Default	Meaning
stateFb 1)	BYTE	16#00	Status of **_ASI_rdAsiMonDiagnostic** FB
stateAsiMonitor 1)	BYTE	16#00	Status of safety monitor
stateChannel1 1)	BYTE	16#00	Status of enabling circuit 1
stateChannel2 1)	BYTE	16#00	Status of enabling circuit 2
sumChannel1	INT	0	Number of triggered devices in enabling circuit 1
sumChannel2	INT	0	Number of triggered devices in enabling circuit 2
device[32...79]	**Struct_ASI_deviceInfo**		Information on the device
Struct_ASI_deviceInfo			
chInfo 1)	BYTE	16#00	Specification of which enabling circuit contains the device
state 1)	BYTE	16#00	Status of the device
infoMaxDeviceChannel1	USINT	0	Number of the highest device signaled in channel 1 of the ASIsafe safety monitor
stateMaxDeviceChannel1 1)	BYTE	16#00	Status of this device
infoMaxDeviceChannel2	USINT	0	Number of the highest device signaled in channel 2 of the ASIsafe safety monitor
stateMaxDeviceChannel2 1)	BYTE	16#00	Status of this device

Name	Data type	Default	Meaning
infoBits	BYTE	16#00	Additional information • Bit0: TRUE - safety monitor in configuration mode • Bit1: TRUE - safety monitor is ramping up • Bit2: TRUE - safety monitor error
actTime	DT	DT#0001-01-01-0:0:0.0	Current time in FB **_ASI_rdAsiMonDiagnostic**
timeCh1Off	DT	DT#0001-01-01-0:0:0.0	Time of the last shutdown of enabling circuit 1
timeCh1On	DT	DT#0001-01-01-0:0:0.0	Time of the last switch on of enabling circuit 1
timeCh2Off	DT	DT#0001-01-01-0:0:0.0	Time of the last shutdown of enabling circuit 2
timeCh2On	DT	DT#0001-01-01-0:0:0.0	Time of the last switch on of enabling circuit 2
timeConfig	DT	DT#0001-01-01-0:0:0.0	Time of the last switchover to the configuration mode
timeStartupAsiMonitor	DT	DT#0001-01-01-0:0:0.0	Time of the last ramp-up of the safety monitor
timeError	DT	DT#0001-01-01-0:0:0.0	Time of the last communication failure
timeStartupFB	DT	DT#0001-01-01-0:0:0.0	Time of the last ramp-up of the FB **_ASI_rdAsiMonDiagnostic**

[1] The meaning of the data bytes is described in detail below.

stateFb

The 8 bits in this byte have the following meaning:

Bit	Name	Meaning
0	allDevices	Copy of the parameter **allDevices**
1	doublecheck	The diagnostic sequence is run through once again, the data may not be consistent.
2	ch1Tripped	The diagnostic sequence has been completely terminated. A shutdown (transition from ON to OFF) was registered in enabling circuit 1 in this diagnostic sequence.
3	ch2Tripped	The diagnostic sequence has been completely terminated. A shutdown (transition from ON to OFF) was registered in enabling circuit 2 in this diagnostic sequence.
4	done	The diagnostic sequence has been completed successfully.
5	error	The diagnostic sequence has been aborted.
6	ch1Off	Enabling circuit 1 is switched off.
7	ch2Off	Enabling circuit 2 is switched off.

stateAsiMonitor

The data byte **stateAsiMonitor** describes the overall status of the ASIsafe safety monitor. It can be a value between 8 and 15. The meaning of these values is described in the following table.

Decimal value	Binary value (b3 b2 b1 b0)	Meaning
8	1 0 0 0	Both circuits switched on
9	1 0 0 1	Circuit 1 off / circuit 2 on
10	1 0 1 0	Circuit 1 on / circuit 2 off
11	1 0 1 1	Both circuits switched off
12	1 1 0 0	Configuration mode (power on / reset on the safety monitor)
13	1 1 0 1	Configuration mode (stop state, editing possible with asimon configuration program)
14	1 1 1 0	Configuration mode (reserved)
15	1 1 1 1	Configuration mode (fatal device error, reset on the safety monitor or replacement required)

Both circuits are switched off in configuration mode.

stateChannel1, stateChannel2

The data byte of **stateChannel1** describes the status of enabling circuit 1. The data byte of **stateChannel2** describes the status of enabling circuit 2. The values can be between 0 and 7. The meaning of the values is described in the following table.

Decimal value	Binary value (b3 b2 b1 b0)	Meaning	LED status on the monitor
0	0 0 0 0	Circuit is switched on	Green
1	0 0 0 1	Circuit is ready to be switched on, waiting for start condition	Yellow + red
2	0 0 1 0	Circuit is switched off	Red
3	0 0 1 1	Circuit is switched off, Service key required	Flashing red
4	0 1 0 0	Reserved	
5	0 1 0 1	Reserved	
6	0 1 1 0	Reserved	
7	0 1 1 1	Reserved	

chInfo (Struct_ASI_deviceInfo)

These 48 data bytes specify in which enabling circuit each device is configured. The meaning of the values is described in the following table.

Decimal value	Binary value (b3 b2 b1 b0)	Meaning
0	0 0 0 0	Device is contained in the preprocessing or not configured.
1	0 0 0 1	Device is contained in enabling circuit 1.

Decimal value	Binary value (b3 b2 b1 b0)	Meaning
2	0 0 1 0	Device is contained in enabling circuit 2.
3	0 0 1 1	Device is contained in both enabling circuits.

state (Struct_ASI_deviceInfo), stateMaxDeviceChannel1, stateMaxDeviceChannel2

These 48 data bytes describe the status of the individual devices in the enabling circuits. One **state** data byte exists for each device (m = 32..79).

It can be a value between 0 and 7. The meaning of the values is described in the following table.

Note

The value **status** = 2 is specified even when a device has been "frozen" because of the diagnosis stop function.

Decimal value	Binary value (b3 b2 b1 b0)	Meaning	Color display in the asi-mon configuration program
0	0 0 0 0	Device is switched on.	Green
1	0 0 0 1	Device is ON, shutdown timer started.	Flashing green
2	0 0 1 0	Device waiting for local acknowledgement or start condition.	Yellow
3	0 0 1 1	Device (two-channel dependent) has been actuated with single channel; test (OFF -> ON) required, also for "startup test".	Flashing yellow
4	0 1 0 0	Device has shut down (regular shutdown).	Red
5	0 1 0 1	Device (positive-action) has switched on with one channel, or error during contactor check. Service key required.	Flashing red
6	0 1 1 0	Device communication error between AS-Interface module and safety monitor.	Gray
7	0 1 1 1	ASIsafe safety monitor is in configuration mode	-

8.11.4.3 Call example for FB _ASI_rdAsiMonDiagnostic

Calling the function block

In order to be able to work with the function block in your user project, proceed as follows (the numbers shown in the following program segment correspond to the steps below):

1. Create the function block instance (see program segment).
2. Create variable of type **struct_ASI_diagAsiMon** and use in/out parameter **diagDataAsiMon** to transfer this to FB **_ASI_rdAsiMonDiagnostic**.

3. Select input bits 1..4 of the ASIsafe safety monitor from the input address area of the AS-Interface master.
4. Call the function block instance (see program segment).
5. Transfer the input parameters (see program segment).
6. The output parameters of the function block are accessed with <instance name of FB>.<name of output parameter> (see program segment).
7. The **periOut 0..3** data prepared by the FB is copied to the output address area of the AS-Interface master (see program segment).

Note

The program segment is an extract from the supplied application example.

The application example is contained on the "SIMOTION Utilities & Applications" CD-ROM and is available for various SIMOTION hardware platforms. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge and as part of the SIMOTION SCOUT scope of delivery.

If you wish to control several ASIsafe safety monitors, you must create a variable for the **Struct_ASI_diagAsiMon** data structure and an FB instance with a new name for each safety monitor used.

Program segment from the sample program:

```
UNIT E_AsiMon;

INTERFACE

VAR_GLOBAL
// ****************************************************
// Variables for FB_ASI_rdAsiMonDiagnostic
// ****************************************************

 myDataDiagAsiMon     : struct_ASI_diagAsiMon;    // variable of data structure        (2)
                                                  // struct_ASI_diagAsiMon
 myRdAsiMonDiagnostic : _ASI_rdAsiMonDiagnostic;  // instance of FB                    (1)
                                                  // _ASI_rdAsiMonDiagnostic

END_VAR
```

```
PROGRAM ExampleAsiMon;

END_INTERFACE

IMPLEMENTATION

PROGRAM ExampleAsiMon

  // copy input data byte 0 of Asi master CP343-2P
  myPeriInDataByte := myPeriInCP3432[0];

  // ASI address of monitor : 1 -> input byte 0 (bits 0..3)
  // select and copy bit 0..3 of input byte 0
  myInputBit1AsiMon:= ((myPeriInDataByte AND 16#01)<>0); // select/copy bit 0

                                        bit3  := myRdAsiMonDiagnostic.periOut3,
                                        bit4  := FALSE,
                                        bit5  := FALSE,
                                        bit6  := FALSE,
                                        bit7  := FALSE );
```

```
  // delete selective bit 0..3 in peripheral output byte 0
  // "(myPeriOutCP3432[0] AND 16#F0)" and copy output data for Asi monitor
  myPeriOutCP3432[0] := ((myPeriOutCP3432[0] AND 16#F0) OR myPeriOutDataByte);

END_PROGRAM

END_IMPLEMENTATION
```

8.11.5 Application examples

8.11.5.1 General

Task

The sample program for FB **_ASI_rdAsiMonDiagnostic** shows the call and the parameter supply of FB **_ASI_rdAsiMonDiagnostic**.

The application example contains the following preconfigured addresses:

- 256 for the AS-Interface master
- AS-Interface slave address 1 for the safety monitor
- Addresses 2 and 3 for the two safety-oriented slaves (K45F).

You can choose between two sample projects:

- Sample project for **FB _ASI_rdAsiMonDiagnostic** with the CP 343-2 P
- Sample project for **FB _ASI_rdAsiMonDiagnostic** with the Link 20E/Link Advanced

Note

For the IE/AS-Interface Link PN IO, you must make the following replacements in the sample project:

1. Replace "myPeriInDataByte := myPeriInCP3432[0];" with "myPeriInDateByte := myPeriInIEASILink;"
2. Replace "myPeriOutCP3432[0] := ((myPeriOutCP3432[0] AND 16#F0) OR myPeriOutDataByte);" with "myPeriOutIEASILink := ((myPeriOutIEASILink AND 16#F0) OR myPeriOutDataByte);"

The following addresses are preset for the sample projects:

Sample project with AS-Interface master CP 343-2 P:	256
Sample project with AS-Interface Master Link 20E/Link Advanced:	0 (process image)

The following slave modules are used on the AS-Interface slave addresses 1..3 in the sample projects:

AS-Interface slave address	AS-Interface slave
1	Safety monitor
2	K45F (safety-oriented slave)
3	K45F (safety-oriented slave)

Requirement

The addressing of the AS-Interface slaves and the configuration of the AS-Interface must have been completed. The safety monitor must have a valid configuration.

A sample configuration is contained in the scope of delivery for the configuration of the safety monitor. This must be loaded with the asimon configuration program to the safety monitor.

Note

You can find out how to load a configuration to the safety monitor in the *"asimon AS-Interface Safety Monitor Configuration Software for Microsoft® Windows®"* software manual.

Hardware platform

The application example is available for various SIMOTION hardware platforms.

Note

If the application example is not available for your hardware platform, you have to adapt the hardware configuration.

Calling the application example

The application example can be found on the "SIMOTION Utilities & Applications" CD-ROM. This CD-ROM is provided free of charge and is part of the SIMOTION SCOUT scope of delivery.

1. Dearchive and open the project containing the application example.
2. Check the hardware configuration.
3. If required, adapt the sample project.
4. Save and compile the example project. You can then download the sample to the SIMOTION device and switch to **RUN** mode.

Adapting the application example

The configuration in the example must be adapted to your existing hardware. The following options are available:

- You can adapt the configuration of the example to the available hardware.
- You can adapt the configuration of the hardware to the example.

Adapting the configuration of the example to the available hardware:

The assigned AS-Interface slave address of the safety monitor or the address of the AS-Interface master is decisive for the correct sequence of the read out of the diagnostic information from the safety monitor. The AS-Interface slave address of the safety monitor determines the assignment in the address area of the AS-Interface master. You can adapt the address of the AS-Interface master in the **HW Config**.

Information on addressing for a safety monitor with AS-Interface slave address 1 and address 256 of the AS-Interface master can be found in Chapter Programming (Page 6511).

You must make the following changes in the I/O address for a safety monitor with, for example, AS-Interface slave address 2 and address 272 of the AS-Interface master:

	Name	I/O address	Read only	Data type	Field length
1	⊞ myperiincp3432	PIB 272		Array	16
2	⊞ myperioutcp3432	PQB 272	☐	Array	16

Figure 8-73 Changing the address of the I/O variable for access to the AS-Interface slaves in the CP 343-2 P address area at address 272

This results in the following assignment for the ASIsafe safety monitor with AS-Interface slave address 2 in the CP 343-2 P address area (corresponds to the table titled "Binary addressing of the AS-Interface slaves in the AS-Interface master CP 343-2 P", in Chapter Addressing the AS-Interface master (CP 343-2 P, DP/AS-Interface Link 20E/Link Advanced) (Page 6512)):

Bits **4..7** in input byte **1** with address 272 → myPeriInCP3432[**1**]
Bits **4..7** in output byte **1** with address 272 → myPeriOutCP3432[**1**]

Adaptation of the transfer of the input and output data to FB **_ASI_rdAsiMonDiagnostic**:

```
myRdAsiMonDiagnostic (.......
        periIn0 := ((myPeriInCP3432[1] AND 16#10)<>0),        // Bit 4
        periIn1 := ((myPeriInCP3432[1] AND 16#20)<>0),        // Bit 5
        periIn2 := ((myPeriInCP3432[1] AND 16#40)<>0),        // Bit 6
        periIn3 := ((myPeriInCP3432[1] AND 16#80)<>0),        // Bit 7
        .......
        );
```

```
// Selective deletion of bits 4..7 in output byte 1
myPeriOut_cp343_2[1]:= myPeriOut_cp343_2[1] AND 16#0F;
myPeriOut_cp343_2[1]:= myPeriOut_cp343_2[1] OR
SHL(myRdAsiMonDiagnostic.periOut0,4);                    // Bit 4
myPeriOut_cp343_2[1]:= myPeriOut_cp343_2[1] OR
SHL(myRdAsiMonDiagnostic.periOut1,5);                    // Bit 5
myPeriOut_cp343_2[1]:= myPeriOut_cp343_2[1] OR
SHL(myRdAsiMonDiagnostic.periOut2,6);                    // Bit 6
myPeriOut_cp343_2[1]:= myPeriOut_cp343_2[1] OR
SHL(myRdAsiMonDiagnostic.periOut3,7);                    // Bit 7
```

If AS-Interface slave addresses other than the preset addresses 2 and 3 are used for the safety-oriented AS-Interface slaves, you must adapt the configuration of the safety monitors with the asimon configuration program and reload it to the safety monitor.

8.11.5.2 Sequence of the sample program

The sample program is ready to start with the preset addresses or after an adaptation of the addresses. You can check this on the cyclic change of the output parameters **done**/**busy**. The data in the data structure **Struct_ASI_diagAsiMon** must indicate the status of the enabling circuits and the status of the configured devices.

8.11.6 Appendix

8.11.6.1 SIMOTION and SIMATIC names

The following table contains a comparison of the SIMOTION and the SIMATIC names.

Table 8-153 SIMOTION and SIMATIC names

Name in the SIMOTION system as of V4.0 (command library in SCOUT)	Name in the SIMATIC system
Function block parameters	
IN	
enable	-
reset	reset
periIn0	-
periIn1	-
periIn2	-
periIn3	-
allDevices	DataSelect_All_Devices
asiSlaveError	ASi_Slave_Fault
asiPowerError	ASi_Power_Fault
profibusError	Profibus_Fault

Name in the SIMOTION system as of V4.0 (command library in SCOUT)	**Name in the SIMATIC system**
diagStop	ASIMON_diag_stop_active
diagStopInvert	ASIMON_diag_stop_invert
freezeAuto	freeze_ASIMON_automat
freezeManual	freeze_ASIMON_manual
unfreezeIfCh1Off	unfreeze_if_chann_1_off
unfreezeIfCh2Off	unfreeze_if_chann_2_off
unfreezeIfDeviceWait	unfreeze_if_device_wait
OUT	
busy	-

chInfo	device [xx].channel_info

state	device [xx].status
infoMaxDeviceChannel1	max_device_in_channel [1].index
stateMaxDeviceChannel1	max_device_in_channel [1].status
infoMaxDeviceChannel2	max_device_in_channel [2].index
stateMaxDeviceChannel2	max_device_in_channel [2].status
infoBits	info_bits
actTime	DT: actual_time Current time in the function block
timeCh1Off	DT: OSSD_1_off Time of the last shutdown of enabling circuit 1
timeCh1On	DT: OSSD_1_on Time of the last switch on of enabling circuit 1
timeCh2Off	DT: OSSD_2_off Time of the last shutdown of enabling circuit 2
timeCh2On	DT: OSSD_2_on Time of the last switch on of enabling circuit 2
timeConfig	DT: Config_Mode_asimon Time of the last switchover to the configuration mode (no ramp-up)
timeStartupAsiMonitor	DT: Startup_Phase_asimon Time of the last ramp-up of the safety monitor
timeError	DT: Fault_or_Error_FB Time of the last communication failure
timeStartupFb	DT: Startup_Diagnosis_FB Time of the last restart of the function block

8.11.6.2 List of abbreviations

Table 8-154 Abbreviations

Abbreviation	Meaning
AS	Actor sensor
ASI	Actor sensor interface
CP	Communications processor
DP	Decentralized peripherals
FB	Function block
IE	Industrial Ethernet
IN	Input parameter
IN/OUT	In/out parameter
LAD	Ladder diagram
OUT	Output parameter
PN	PROFINET

8.12 Standard Functions for RFID Systems

Preface

Contents of the function manual

This **document** is part of the **SIMOTION Programming - References documentation package**.

Function block

The function blocks **_PIB_001KB**, **_PIB_016KB** , and **_PIB_032KB** are part of the command library of the "SIMOTION SCOUT" engineering system.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.5:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

8.12.1 Fundamental safety instructions

8.12.1.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life caused by machine malfunctions caused by incorrect or changed parameterization

Incorrect or changed parameterization can cause malfunctions on machines that can result in injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

8.12.1.2 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

8.12.1.3 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

8.12.2 Description

8.12.2.1 General

This documentation describes data exchange between the SIMOTION system and standard profile RFID systems (PIB = Proxy Ident Block) using the function blocks (FB):

- **_PIB_001KB**
- **_PIB_016KB**
- **_PIB_032KB**

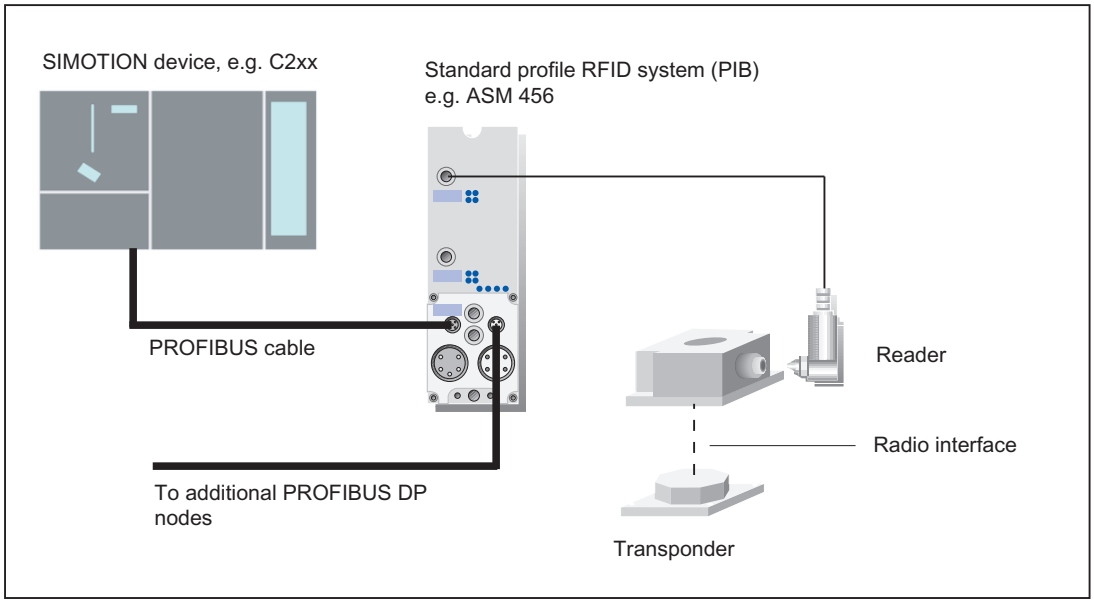

Figure 8-74 System overview

Components

The most important components of a SIMOTION application for writing to and reading from transponders are listed below along with their functions.

Table 8-155 Components

Component	Function
SIMOTION device	Motion control module with integrated function block for data exchange with standard profile RFID systems.
Standard profile RFID systems	Communication modules acting as an interface between the reader and the SIMOTION device.
Reader	Device for communication with transponders and for serial interfacing with standard profile RFID systems.
Transponder	Data memory mounted on the product or its transport or packaging unit that can be written, modified, and read using a contactless reader.

Note

This document describes only the operation of function blocks **_PIB_001KB**, **_PIB_016KB**, and **PIB_032KB**. For data exchange between the SIMOTION System and the standard profile RFID systems (PIB), you need the following documentation:

- SIMOTION SCOUT configuration manual
  This document is shipped with SIMOTION SCOUT in electronic form.
- Documentation of the corresponding standard profile RFID system (e.g. ASM 456, available on CD, Article No. 6GT2080-2AA10)
  - Hardware Description
  - Software Description

Requirements

The requirements for the standard functions described in this documentation are as follows:

- SIMOTION SCOUT V4.0 or higher
- SIMOTION Kernel V4.0 or higher
- Standard profile RFID system (PIB), e.g. ASM 456 V3.0 or higher, Article No. 6GT2002-0ED00

Note

The ASM 456 is integrated in the SIMOTION Motion Control System by means of a GSD file. The GSD file (device master file) contains all the properties specific to a slave. The format of a GSD file is defined in IEC 61784-1:2002 Ed1 CP 3/1.

For the current GSD file, go to:

http://support.automation.siemens.com/WW/view/en/22511087

Installing GSD files

1. In the STEP 7 "Hardware catalog", select the menu command **Options > Install GSD Files**.
2. In the dialog box that appears, open the drive/directory with the corresponding GSD file.
   Result: The DP slave is listed in the "Hardware catalog" window (only in the "Standard" catalog profile!) under "PROFIBUS DP\Additional Field Devices\Identsystems\MOBY\ASM456" and is available there for configuration.

Note

For further information about installing GSD files, refer to the STEP 7 Online Help.

8.12.2.2 Product description

The function blocks act as the communication interface between a standard profile RFID system (e.g. ASM 456) and the user program. The function blocks (FBs) support the following functions:

- Configuration
- Command processing
- Reading and writing of data
- Diagnostics

8.12.3 Programming

8.12.3.1 Integrating the function blocks in the user project

Creating the instance of the FBs in the user project

The function blocks are part of the command library of the "SIMOTION SCOUT" engineering system. To work with the Ident Unit, an instance of the function block must first be created in the user project.

The Ident Unit comprises the following components:

- Standard profile RFID system
- Reader

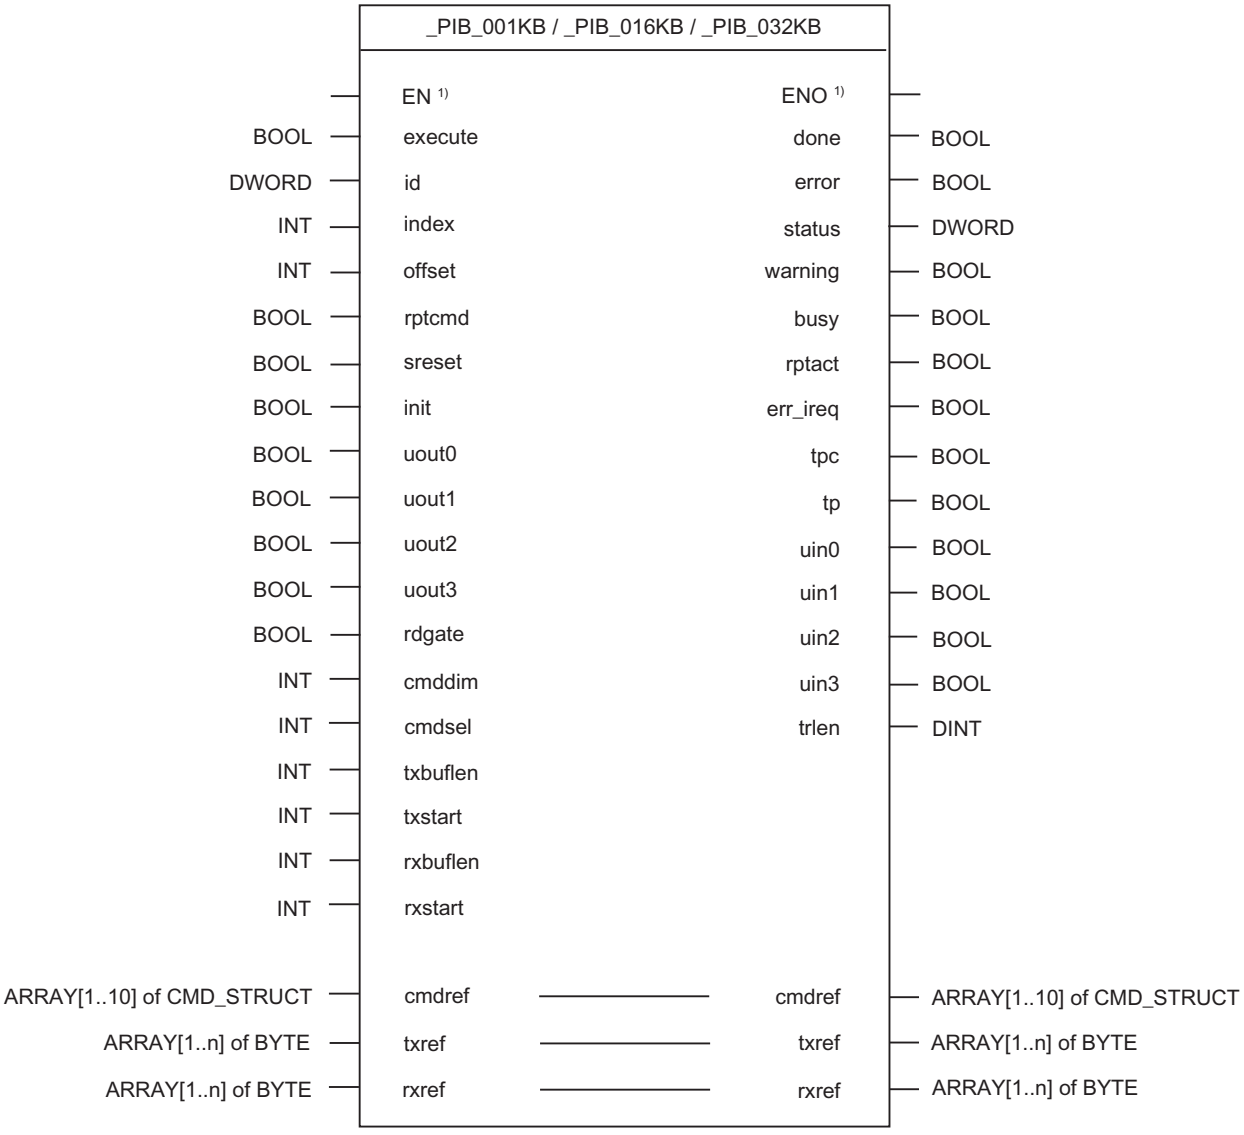
Note

For multi-channel Ident Units, one instance per channel must be created.

Example:

```
VAR_GLOBAL
    myFbPib001KB    : _PIB_001KB;    // instance of FB _PIB_001KB
END_VAR
```

Call (LAD representation)



The following values apply for n:

Function block	Value (in bytes)
_PIB_001KB	n := 1024
_PIB_016KB	n := 16384
_PIB_032KB	n := 32767

1) LAD-specific parameters

Application example

The application example is included on the "SIMOTION Utilities & Applications" CD-ROM and is available for various SIMOTION hardware platforms. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge with SIMOTION SCOUT.

8.12.3.2 Addressing the field devices

Overview

The SIMOTION device and the Ident Unit communicate via the PROFIBUS DP. Addresses starting at 256 are recommended for the standard profile RFID system (e.g. ASM 456), whereby I/O variables are used for read- and write-accessing the I/O.

Creating I/O variables

In the SIMOTION user project, two I/O variables with the addresses taken from **HW Config** must be created for reading and writing of cyclic data.

The parameters must be assigned in the Symbol Browser (refer to the following example).

Example for the ASM 456

Determining the addresses from **HW Config**:

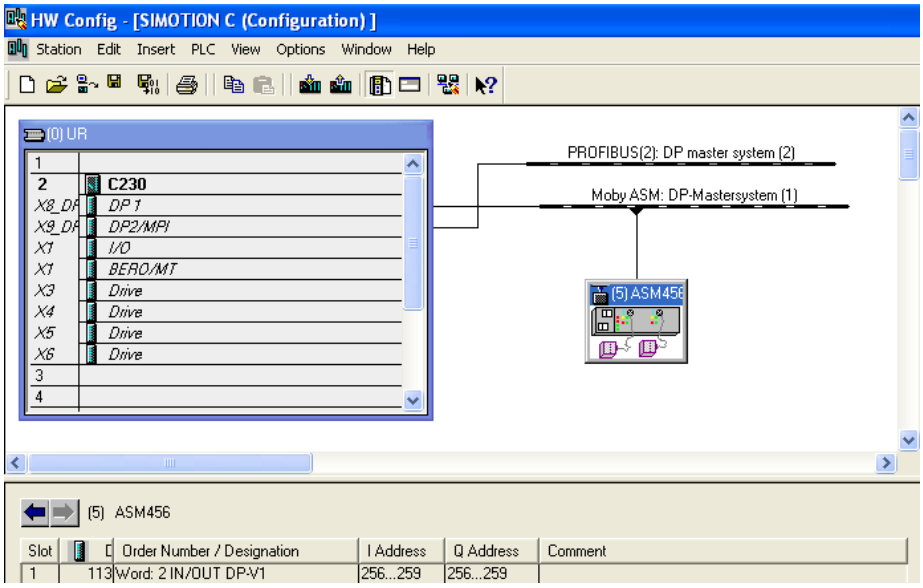


Figure 8-75 Addresses in HW Config

The ASM 456 provides two read/write channels. Each channel communicates cyclically with the controller by means of a control word (direction: controller to ASM 456) and a status word (direction: ASM 456 to the controller). The addresses of both the status words (ZSW) and the control word (STW) are specified via the start addresses of the ZSW/STW of the first channel. The start addresses of the ZSW/STW of the second channel are connected directly.

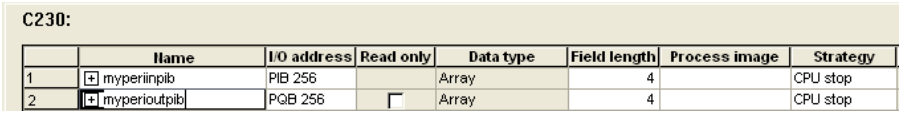
The start addresses of the input and output address range must be identical. In the example, the start address is 256.

This results in the following addresses for the ZSW/STW:

- ZSW/STW of ASM 456 channel X1 are located on addresses 256/257
- ZSW/STW of ASM 456 channel X2 are located on addresses 258/259

The I/O variables must be created for each module.

Creating the I/O Variables in the Symbol Browser:



C230:

	Name	I/O address	Read only	Data type	Field length	Process image	Strategy
1	myperiinpib	PIB 256		Array	4		CPU stop
2	myperioutpib	PQB 256		Array	4		CPU stop

Figure 8-76 Addressing with I/O variables

Notice: The I/O addresses in the Symbol Browser shown in the figure have the following meanings:

- "PIB" = Peripheral Input: Byte
- "PQB" = Peripheral Output: Byte

Parameter transfer

The above-indicated addresses of the status and command words are passed to the input parameter **id** of the corresponding function block instance.

Note

For additional information, refer to:

- *SIMOTION SCOUT* online help
- Programming Manual of the corresponding programming language, e.g.:
  - *SIMOTION ST, Structured Text* Programming Manual
  - *SIMOTION MCC, Motion Control Chart* Programming Manual
  - *SIMOTION LAD/FBD, Ladder Diagram and Function Block Diagram* Programming Manual

These documents are shipped with SIMOTION SCOUT in electronic form.

8.12.4 Parameter assignment

8.12.4.1 Function blocks _PIB_001KB / _PIB_016KB / _PIB_032KB

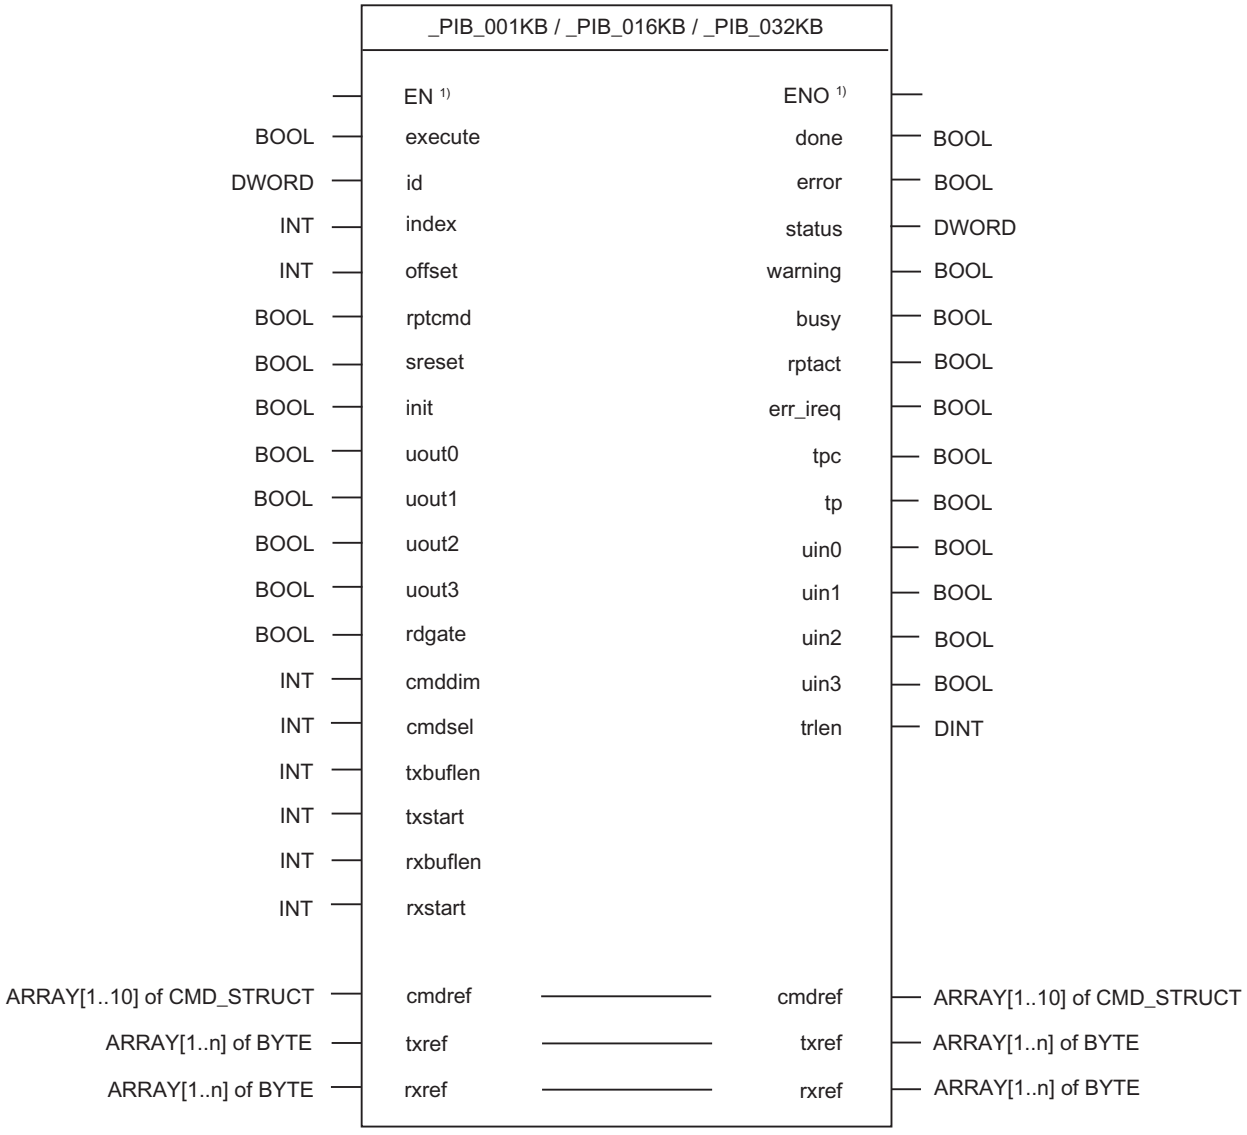
Introduction

With the function blocks **_PIB_001KB**, **_PIB_016KB** , and **_PIB_032KB** , data can be exchanged between SIMOTION and standard profile RFID systems.

Use of the FBs depends on the amount of data to be transferred. The following table contains an overview of the maximum amount of data that can be transferred with the FBs during a read/ write operation.

Function block	Maximum data amount per command call:
_PIB_001KB	1 KB
_PIB_016KB	16 KB
_PIB_032KB	32 KB

Call (LAD representation)



The following values apply for n:

Function block	Value (in bytes)
_PIB_001KB	n := 1024
_PIB_016KB	n := 16384
_PIB_032KB	n := 32767

1) LAD-specific parameters

Parameter description

The following table contains the parameters of FBs **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB**.

Note

For detailed information about the use of parameters, see the documentation for the standard profile RFID system, e.g. ASM 456.

Table 8-156 Parameters of function blocks _PIB_001KB / _PIB_016KB / _PIB_032KB

Name	Type	Data type	Default	Meaning
execute	IN	BOOL	FALSE	**TRUE** = Initiating a new request (command) with rising edge Before starting the block operation, the command and the corresponding parameters must be set by the user in the entry in the **cmdref** field selected with **cmdsel**.
id	IN	DWORD	0	Start address of the I/O device **Notice:** The start addresses of the in/out area must be identical. See figure "Addresses in HW Config".
index	IN	INT	0	Identification of the data of a channel: • Channel 1: 101/111 • Channel 2: 102/112 • Channel 3: 103/113 • Channel 4: 104/114 • Channel 5: 105/115 • Channel 6: 106/116 • Channel 7: 107/117 • Channel 8: 108/118 The 10th position of the **index** parameter has the following meanings: • 0 = Parameter assignment of channel • 1 = Data transfer for the channel
offset	IN	INT	0	Address offset from the base address (input parameter **id**) of the channel-related cyclic I/O data. • Channel 1: 0 • Channel 2: 2 • Channel 3: 4 • Channel 4: 6 • Channel 5: 8 • Channel 6: 10 • Channel 7: 12 • Channel 8: 14
rptcmd	IN	BOOL	FALSE	**TRUE** = Repeating the command currently being executed or the next command to be executed by the Ident Unit.

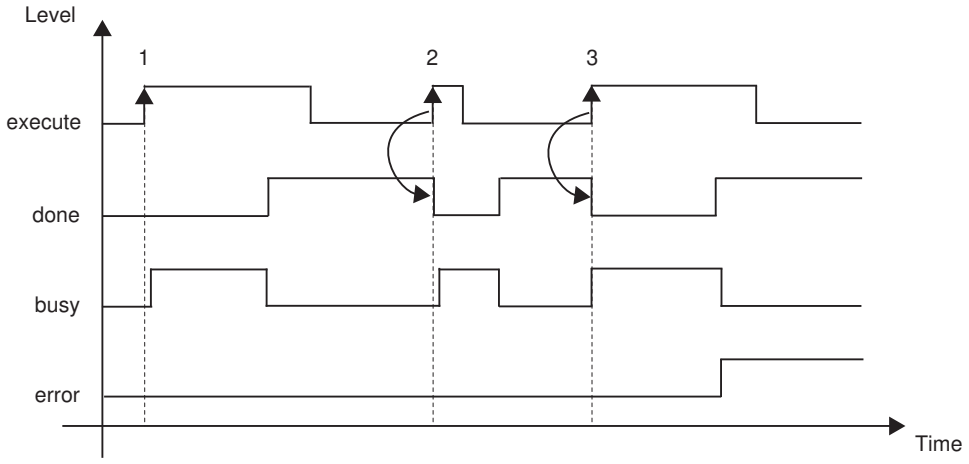
Name	Type	Data type	Default	Meaning
sreset	IN	BOOL	FALSE	**TRUE** = Aborting the command currently being processed in the Ident Unit.
init	IN	BOOL	FALSE	**TRUE** = Ident Unit is restarting operation
uout0	IN	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
uout1	IN	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
uout2	IN	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
uout3	IN	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
rdgate	IN	BOOL	FALSE	**TRUE** = Activating read gate
cmddim	IN	INT	0	Number of commands in parameter **cmdref**
cmdsel	IN	INT	0	Selection of command to be executed
txbuflen	IN	INT	0	Number of bytes used by this instance of the FB to store data to be sent.
txstart	IN	INT	0	Relative position of the send data buffer (TXBUF) within the global memory area to which the **txref** parameter refers.
rxbuflen	IN	INT	0	Number of bytes used by this instance of the FB to store data received.
rxstart	IN	INT	0	Relative position of the receive data buffer (RXBUF) within the global memory area to which the **rxref** parameter refers.
cmdref	IN/OUT	ARRAY[1..10] of CMD_STRUCT		Array that can accept 10 commands The commands are complex variables of type **CMD_STRUCT** (for a detailed description, see section "Commands of function blocks").
txref	IN/OUT	ARRAY[1..n] of BYTE		Transmit data Reference to a global memory area used by several blocks. The instance of the FB can share the memory with several other instances. The following values apply for n, according to the FBs: • n := 1024 (FB **_PIB_001KB**) • n := 16384 (FB **_PIB_016KB**) • n := 32767 (FB **_PIB_032KB**)
rxref	IN/OUT	ARRAY[1..n] of BYTE		Receive data Reference to a global memory area used by several blocks. The instance of the FB can share the memory with several other instances. The following values apply for n, according to the FBs: • n := 1024 (FB **_PIB_001KB**) • n := 16384 (FB **_PIB_016KB**) • n := 32767 (FB **_PIB_032KB**)
done	OUT	BOOL	FALSE	**TRUE** = Command was executed successfully
error	OUT	BOOL	FALSE	**TRUE** = Error has been detected, specification of error in parameter **status**
status	OUT	DWORD	16#00	Warning and error specification For **error** = **TRUE** or **warning** = **TRUE**, the **status** parameter contains the error or warning information (see "Error messages")
warning	OUT	BOOL	FALSE	**TRUE** = Warning has been detected, specification of warning in parameter **status**
busy	OUT	BOOL	FALSE	**TRUE** = FB is in use, and other commands are ignored (except for **init** and **sreset**)

Name	Type	Data type	Default	Meaning
rptact	OUT	BOOL	FALSE	**TRUE** = Request to repeat the current command was accepted by the RFID system. This parameter is identical to the "Repeat_Command_Active" signal bit from the cyclic control word of the RFID system and remains **TRUE** the same as this bit. As long as parameter **rptact** is set to **TRUE**, the RFID system supplies result data of the command execution, which the user must read.
err_ireq	OUT	BOOL	FALSE	**TRUE** = A fatal error has been detected by the RFID system. This parameter is identical to the "Error_Flag" signal bit from the cyclic control word of the RFID system and remains **TRUE** the same as this bit. The RFID system remains in the current state until a device status command is issued or the **err_ireq** parameter is reset by the user with **init** = **TRUE**.
tpc	OUT	BOOL	FALSE	**TRUE** = A new transponder is within range of Ident Unit or a transponder has left the range. The parameter is set to **FALSE** when the next "Inventory" command is successfully executed.
tp	OUT	BOOL	FALSE	**TRUE** = A transponder is within the range of the Ident Unit **Note**: This parameter is not used for barcode readers.
uin0	OUT	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
uin1	OUT	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
uin2	OUT	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
uin3	OUT	BOOL	FALSE	This bit can be assigned by the vendor of the RFID system.
trlen	OUT	DINT	0	Display of number of data elements received after successful execution of the command.

Description of functions

The function blocks **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB** implemented according to the PNO standard provide an interface by means of which the SIMOTION application can communicate with the corresponding Ident Units. Communication with the transponders is command-controlled.

Graphic overview of the functionality



Case 1: The execute input parameter remains TRUE until the FB call is complete. The execute input parameter must be reset after the done parameter has reached TRUE.

Case 2: The execute input parameter is only clocked for one call. The query is not aborted.

Case 3: Same as case 1; however, an error occurs.

Figure 8-77 Signal sequence diagram

Task integration (call)

The FBs **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB** are provided for calling in a cyclical task and must be called in this task.during each task cycle. The execution of a job can take several cycles. The FBs **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB** can be called in any cyclic tasks. There are no restrictions placed on the functionality of the FBs **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB**. A fixed time frame (e.g. **IPOSynchronousTask**) is not required for the processing.

Error messages and warnings

The error and warning concept can be found in section "Error messages".

Error and warning concept (Page 6583)

8.12.4.2 Calling function blocks

Procedure

In order to be able to work with function blocks **_PIB_001KB**, **_PIB_016KB** and **_PIB_032KB** in your user project, proceed as follows (the numbers shown in the following program segment correspond to the steps below):

1. Create an array for the in/out parameters of the FB.
2. Create the function block instance (e.g. instance for FB **_PIB_032KB**).
3. Initialize function block.
4. Call instance of the function block.
5. Transfer input parameters.
6. The output parameters of the function block are accessed with <instance name of FB>.<name of output parameter>.

Note

The program segment is an extract from the supplied application example.

The application example is included on the "SIMOTION Utilities & Applications" CD-ROM and is available for various SIMOTION platforms. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge with SIMOTION SCOUT.

For multi-channel Ident Units, one instance per channel must be created.

Call example

```
UNIT E_PIB032;

INTERFACE

8.12.4.3 Commands of function blocks

Overview of commands

This section describes the commands that are supported by the function blocks **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB** along with the associated parameters.

Note that the commands must also be supported by the corresponding Ident Unit. For a list of commands supported by the RFID system, consult the standard profile RFID system (e.g. ASM 456) documentation.

Commands

The following overview shows all commands supported by the standard profile. Different commands are available, depending on the connected reader and the settings in **HW Config** via the GSD file.

Table 8-157 Overview of commands

Command	Command code		Parameters used
Clear	16#63	'c'	UID, FileName
Create	16#68	'h'	UID, FileName, length, attributes, FileType
Delete	16#64	'd'	UID, FileName

Command	Command code		Parameters used
Dev status	16#74	't'	Attributes, OffsetBuffer
Format	16#66	'f'	OffsetBuffer, UID, Length
Get	16#62	'b'	OffsetBuffer, Length
Get attribute	16#6B	'k'	UID, FileName
Get directory	16#6D	'm'	OffsetBuffer, UID, FileType
Inventory	16#69	'i'	Attributes, OffsetBuffer
Mem status	16#73	's'	UID, attributes, OffsetBuffer
Next	16#6E	'n'	UID, NextMode
Physical read	16#70	'p'	OffsetBuffer, UID, length, StartAddress
Physical write	16#71	'q'	OffsetBuffer, UID, length, StartAddress
Put	16#65	'e'	OffsetBuffer, Length
Read	16#72	'r'	OffsetBuffer, UID, FileName, offset, length
Read BarCode	16#76	'v'	OffsetBuffer, TimeOut, ObjectNumber
Read config	16#61	'a'	OffsetBuffer
Set attribute	16#6F	'o'	UID, FileName, attributes, FileType
Update	16#75	'u'	OffsetBuffer, UID, FileName, length
Write	16#77	'w'	OffsetBuffer, UID, FileName, offset, length
Write config	16#78	'x'	OffsetBuffer, length, config

Table 8-158 Overview of command codes

Command code		Command	Parameters used
16#61	'a'	Read config	OffsetBuffer
16#62	'b'	Get	OffsetBuffer, Length
16#63	'c'	Clear	UID, FileName
16#64	'd'	Delete	UID, FileName
16#65	'e'	Put	OffsetBuffer, Length
16#66	'f'	Format	OffsetBuffer, UID, Length
16#68	'h'	Create	UID, FileName, length, attributes, FileType
16#69	'i'	Inventory	Attributes, OffsetBuffer
16#6B	'k'	Get attribute	UID, FileName
16#6D	'm'	Get directory	OffsetBuffer, UID, FileType
16#6E	'n'	Next	UID, NextMode
16#6F	'o'	Set attribute	UID, FileName, attributes, FileType
16#70	'p'	Physical read	OffsetBuffer, UID, length, StartAddress
16#71	'q'	Physical write	OffsetBuffer, UID, length, StartAddress
16#72	'r'	Read	OffsetBuffer, UID, FileName, offset, length
16#73	's'	Mem status	UID, attributes, OffsetBuffer
16#74	't'	Dev status	Attributes, OffsetBuffer
16#75	'u'	Update	OffsetBuffer, UID, FileName, length
16#76	'v'	Read BarCode	OffsetBuffer, TimeOut, ObjectNumber

Command code		Command	Parameters used
16#77	'w'	Write	OffsetBuffer, UID, FileName, offset, length
16#78	'x'	Write config	OffsetBuffer, length, config

General information

The following restrictions relate to the use of commands:

- The input parameters **init** and **sreset** interrupt the command execution within the Ident Unit.
- After the commands **init** and **sreset** are sent, the subsequent change of the output parameter **done** relates to the commands **init** or **sreset** and not to the command that was interrupted by the input parameters **init** or **sreset**.
- The input parameter **init** resets the communication (cyclic control and status flow, acyclic commands) between FB and Ident Unit. Afterwards, the FB automatically executes the "Write config" command. This assumes that the user enters the "Write config" command in the first element of the in/out parameter **cmdref** and sets the input parameter **cmdsel** to "1". Any configuration data to be written must be in place at the location in the send data buffer indicated by the input parameter **txref**, to which the command parameters **OffsetBuffer** and **Length** refer.
- The "Write config" command resets all functions within the Ident Unit, except the communication.
- The **sreset** parameter cancels the last command. The execution of **sreset** is considerably faster than that of **init**.

Data structure CMD_STRUCT

The data structure CMD_STRUCT contains the parameters of the command. The data types of the parameters are defined in the following program excerpt.

```
TYPE
    CMD_STRUCT
        STRUCT
            CMD          : BYTE;
            Config       : BYTE;
            OffsetBuffer : INT;
            UID          : ARRAY[1..8] OF BYTE;
            FileName     : ARRAY[1..8] OF BYTE;
            Offset       : DINT;
            Length       : INT;
            StartAddress : DINT;
            Attributes   : BYTE;
            NextMode     : BYTE;
            Timeout      : INT;
            ObjectNumber : INT;
            FileType     : WORD;
        END_STRUCT;
END_TYPE
```

Note

Not every command occupies every structure element.

Clear

Description

The "Clear" command resets the content of a file. All elements are set to "16#00".

Command code of the command

```
CMD : BYTE := 16#63;
```

Parameters

The following table lists the parameters of the "Clear" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be accessed.

Create

Description

The "Create" command creates a new file on a formatted transponder.

Command code of the command

```
CMD : BYTE := 16#68;
```

Parameters

The following table lists the parameters of the "Create" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be generated
Length	This parameter indicates the length of the file to be created. **Length** = 0: A file with dynamic length is created.
Attributes	Valid values: • Unlimited read/write = bit 0,1 not set • Read only = bit 0 set • Single read = bit 1 set • Defined size = bit 2 set (the file length cannot be changed by a command)
FileType	Classification/grouping of the files according to user-specific criteria. Files with the same characteristics are assigned to the same group. Accordingly, these files are of the same file type that is displayed with the same value of the **FileType** parameter. If the parameter is not used, all bytes must be set to "16#20".

Delete

Description

The "Delete" command deletes a file from the transponder. Depending on the supported file system, the file disappears from the directory or the file length and the used length are set to zero.

Command code of the command

```
CMD : BYTE := 16#64;
```

Parameters

The following table lists the parameters of the "Delete" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be accessed

Dev status

Description

The "Dev status" command is used to read out the status of an Ident Unit. The status data are stored in RXBUF. Status data are vendor-specific. The output parameter **trlen** of the FB indicates the number of received bytes.

Command code of the command

```
CMD : BYTE := 16#74;
```

Parameters

The following table lists the parameters of the "Dev status" command.

Parameters	Description
Attributes	Information class to be read Valid values: • 16#00 → reserved • 16#01 → warning detail (vendor-specific details) • 16#02 → error history (vendor-specific details) • 16#03 → command history (vendor-specific details) • 16#04 → channel-specific identification and maintenance information (I&M information) (data recording I&M0) • 16#05 → channel-specific I&M information (data recording I&M1) • 16#06 → channel-specific I&M information (data recording I&M2) • 16#07 → channel-specific I&M information (data recording I&M3) • 16#08 → channel-specific I&M information (data recording I&M4) • 16#09 to 16#7F → reserved • 16#80 to 16#FF → vendor-specific
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the data to be read is to be stored.

Format

Description

The "Format" command initializes the transponder. After formatting, the transponder is ready for use.

A Security_Code (STRING[8]) must be set at the beginning of the TXBUF. This code is a vendor-specific code for defining the transponder name and protecting against formatting with

incorrect parameters and arbitrary formatting. TXBUF is used as a vendor-specific area for parameter data that are required for formatting. For more information, see the Ident Unit documentation.

Command code of the command

```
CMD : BYTE := 16#66;
```

Parameters

The following table lists the parameters of the "Format" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the Security_Code to be sent is to be stored. Other data follow consecutively.
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
Length	Number of bytes to be sent to the Ident Unit The start address is designated by the command parameter **OffsetBuffer**. This parameter contains the 8 bytes of the Security_Code and a variable number of formatting parameters. The range of values is: 8...226.

Get

Description

The "Get" command reads out vendor-specific data located on the Ident Unit. TXBUF is used as the vendor-specific area for parameter data (optional send data). Received data are stored from the start of RXBUF. The output parameter **trlen** of the FB indicates the number of received bytes.

For the precise meaning of the data, refer to the Ident Unit documentation.

Command code of the command

```
CMD : BYTE := 16#62;
```

Parameters

The following table lists the parameters of the "Get" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the parameter data to be sent is to be stored. Other parameter data follow consecutively.
Length	Number of bytes to be sent to the Ident Unit The start address is designated by the command parameter **OffsetBuffer**. The range of values is: 0...226.

Get attribute

Description

The "Get attribute" command reads out attributes associated with a file. The attributes (attributes and file type) are stored in the directory.

Command code of the command

```
CMD : BYTE := 16#6B;
```

Parameters

The following table lists the parameters of the "Get attribute" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be accessed.

The following table lists all subparameters that are passed with the response:

Parameter	Description
Attributes	Valid values: • Unlimited read/write = bit 0,1 not set • Read only = bit 0 set • Single read = bit 1 set • Defined size = bit 2 set (the file length cannot be changed with a command)
FileType	Classification/grouping of the files according to user-specific criteria. Files with the same characteristics are assigned to the same group. Accordingly, these files are of the same file type that is displayed with the same value of the **FileType** command parameter. If the parameter is not used, all bytes must be set to "16#20".

Get directory

Description

The "Get directory" command reads out the directory of the transponder. File names and associated attributes are passed. The **FileType** command parameter is used to indicate files of a specific type to be passed. The response data of this command are supplied in a structure within the RXBUF as follows:

```
TYPE
    DIRELEMENTS_STRUCT
        STRUCT
            FileName : ARRAY [1..8] OF BYTE;
            UsedLength   : DINT;
            Attributes : BYTE;
            FileLength   : DINT;
            FileType : WORD;
        END_STRUCT;
END_TYPE

TYPE
    DIRLIST_STRUCT
        STRUCT
            UID1         : ARRAY [1..8] OF BYTE;
            TagName      : ARRAY [1..8] OF BYTE;
            FreeUserMem DINT;
            CheckSum     : WORD;
            FileCount    : INT;
            FileList     : ARRAY [1..FileCount] OF DIRELEMENTS_STRUCT;
        END_STRUCT;
END_TYPE
```

The **trlen** parameter of the FB indicates the number of received bytes.

Command code of the command

```
CMD : BYTE := 16#6D;
```

Parameters

The following table lists the parameters of the "Get directory" command.

Parameter	Description
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the received data is to be stored.
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileType	Classification/grouping of the files according to user-specific criteria. Files with the same characteristics are assigned to the same group. Accordingly, these files are of the same file type that is displayed with the same value of the **FileType** command parameter. If the parameter is not used, all bytes must be set to "16#20". "?" (16#3F) is used as a placeholder. "?,?" (16#3F, 16#3F) means all files.

The following table lists all subparameters that are passed with the response:

Parameter	Description
UID1	Identification of an individual transponder **UID1** = 0 indicates that the transponder does not contain a UID. If **UID** = 0 was to have been passed to the transponder within the command, then **UID1** supplies the **UID** of the present transponder.
TagName	This parameter indicates the name of the transponder.
FreeUserMem	This parameter indicates the unused memory on the transponder.
CheckSum	Checksum of the directory on the transponder If not used, all bytes are returned with "16#00".
FileCount	Number of directory entries that are available on the transponder and supplied by the **Get directory** command.
FileList	This parameter supplies the list of directory entries.
FileName	File name
UsedLength	Memory occupied by command parameter **FileLength**
Attributes	Valid values: • Unlimited read/write = bit 0,1 not set • Read only = bit 0 set • Single read = bit 1 set • Defined size = bit 2 set (the file length cannot be changed by a command)

Parameter	Description
FileLength	Maximum file length In the case of a dynamic file system, **FileLength** and **UsedLength** are identical. If **FileLength** = 0, then the file has been deleted.
FileType	Classification/grouping of the files according to user-specific criteria. Files with the same characteristics are assigned to the same group. Accordingly, these files are of the same file type that is displayed with the same value of the **FileType** command parameter. If the parameter is not used, all bytes must be set to "16#20".

Inventory

Description

The "Inventory" command is used to request a list of all currently accessible transponders within the antenna range. Additional information can be passed, depending on the specific vendor. Thus, in addition to the UIDs, user data can be read at the same time.

Note

The "Inventory" command causes the Ident Unit to reset the **tpc** output parameter. As soon as a transponder leaves the antenna range or another transponder enters into the antenna range, the output parameter **tpc** is set again. The "Inventory" command must be executed in order to determine how many transponders are located within the antenna range.

RXBUF is structured as follows:

```
// RXBUF:
//
// |     |     | | | ... | |  | | | ... | |  | | | ... | |  | | | ... | |  |
// | ON  | OL  |    UID       |     Data     |     UID      |    Data      | ...
// | INT | INT | ARRAY 8 Byte | ARRAY n Byte | ARRAY 8 Byte | ARRAY n Byte |
//               \_____________________________/   \_____________________________/
//                ObjectLength of Object 1      ObjectLength of Object 2     ...
// ON : ObjectNumber
// OL : ObjectLength, OL >= 8

TYPE
    ObjectNumber    : INT;
    ObjectLength     : INT;                                                    (1)
END_TYPE

TYPE
    UID_STRUCT
        STRUCT
            UID1    : ARRAY [1..8] OF BYTE;
            Data    : ARRAY [1..(ObjectLength-8)] OF BYTE;                    (2)
        END_STRUCT;
END_TYPE
```

```
TYPE
    UidList    : ARRAY [1..ObjectNumber] OF UID_STRUCT;
END_TYPE
```

Note

If the object length signalized by the RFID system under **(1)** is >8, a data array of length (ObjectLength - 8) must be declared in **(2)**. This length is dependent on the hardware you are using and can also assume the value "0".

Command code of the command

```
CMD : BYTE := 16#69;
```

Parameters

The following table lists the parameters of the "Inventory" command.

Parameter	Description
Attributes	Specification of the information to be read Valid values: • 16#00 → all UIDs are read • 16#01 to 16#7F → reserved • 16#80 to 16#FF → vendor-specific
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the data read is to be stored.

The following table lists all subparameters that are passed with the response:

Parameter	Description
ObjectNumber	Number of UIDs passed within the acknowledgement.
ObjectLength	Number of bytes connected to a single UID (size of UID and additional data). If **Attributes** = 16#00, then **ObjectLength** = 8 is set.
UidList	Data field with elements of the type **UID_Struct**. If **Attributes** = 16#00, only UIDs are stored, and no vendor-specific information is stored.

Mem status

Description

The "Mem status" command is used to read out the status of a transponder (battery status, memory, type of transponder, available capacity). The status data are stored in RXBUF. Status data are vendor-specific. The output parameter **trlen** of the FB indicates the number of received bytes.

Command code of the command

```
CMD : BYTE := 16#73;
```

Parameters

The following table lists the parameters of the "Mem status" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
Attributes	Specification of the information class to be read. Valid values: • 16#00 → reserved • 16#01 → warning detail • 16#02 → reserved • 16#03 → reserved • 16#04 → physical status information (vendor-specific details) • 16#05 → status information relating to the file system (vendor-specific details) • 16#06 to 16#7F → reserved • 16#80 to 16#FF → vendor-specific
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the data to be read is to be stored.

Next

Description

The "Next" command does not permit any further operations on a transponder. The subsequent command is not executed until the next transponder is detected/displayed.

Command code of the command

```
CMD : BYTE := 16#6E;
```

Parameters

The following table lists the parameters of the "Next" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is locked when this command is processed.
NextMode	Valid values: • **NextMode** = 0 (each transponder, irrespective of the current transponder, is processed) • **NextMode** = 1 (only another transponder is processed)

Physical read

Description

The "Physical read" command reads out data from a transponder by using the physical start address and the length of the data to be read. The output parameter **trlen** of the FB indicates the number of received bytes.

Command code of the command

```
CMD : BYTE := 16#70;
```

Parameters

The following table lists the parameters of the "Physical read" command.

Parameter	Description
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the received data must be saved. All subsequent bytes must be stored in ascending addresses.
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.

Parameter	Description
Length	Number of bytes to be read by the transponder, beginning with the address identified by the **StartAddress** parameter.
StartAddress	This parameter indicates a physical address within the transponder.

Physical write

Description

The "Physical write" command writes data to a transponder using the physical start address and the length of the data to be written.

Command code of the command

```
CMD : BYTE := 16#71;
```

Parameters

The following table lists the parameters of the "Physical write" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the first address within the memory area where the first byte of the data to be sent is to be stored. Other data follow consecutively.
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
Length	Number of bytes to be sent to the Ident Unit The target address is designated by the command parameter **StartAddress**.
StartAddress	Physical address within the transponder starting from which the data are written.

Put

Description

The "Put" command writes vendor-specific data to the Ident Unit.

For the precise meaning of the data, refer to the Ident Unit documentation.

Command code of the command

```
CMD : BYTE := 16#65;
```

Parameters

The following table lists the parameters of the "Put" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the data to be sent is to be stored. Other data follow consecutively.
Length	Number of bytes to be sent to the Ident Unit The start address is designated by the command parameter **OffsetBuffer**.

Read

Description

The "Read" command reads data of a file from the Ident Unit. After successful execution of the command, the data are saved in RXBUF. The output parameter **trlen** of the FB indicates the number of received bytes.

Command code of the command

```
CMD : BYTE := 16#72;
```

Parameters

The following table lists the parameters of the "Read" command.

Parameter	Description
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the received data must be saved. All subsequent bytes must be stored in ascending addresses.
UID	Identification of a transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	This parameter indicates the file to be accessed.
Offset	Relative offset within the indicated file from which the data are to be read. This parameter indicates the start address within the file from which the data are to be read.
Length	Number of bytes to be read. Length = -1: complete file is read

Read BarCode

Description

The "Read BarCode" command reads the barcode data.

After this command is sent, the barcode reader waits for a reading gate. Depending on the operating mode of the barcode reader, the reading gate is activated by a local input on the barcode reader or by the **rdgate** input parameter of the FB.

Likewise, the end of the read operation depends on the operating mode of the barcode reader. It can be initiated by the gate signal, a local timer, or the receipt of the expected barcode data (timer).

The output parameter **done** is activated by the function block once the barcode reader has finished reading and the result of the read operation has been stored in RXBUF.

The command parameter **ObjectNumber** can be used to send an object identifier to the barcode reader. The barcode reader can place this identifier in a specific position in the data string of the read result, which makes the link between the object and the barcode data more easily recognized by the user.

If the "Read BarCode" parameter is repeated by activation of the input parameter **rptcmd** of the FB, the command parameter **ObjectNumber** is incremented.

Command code of the command

```
CMD : BYTE := 16#76;
```

Parameters

The following table lists the parameters of the "Read BarCode" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the data to be sent is to be stored.
Timeout	Maximum time for a read operation before a timeout is generated. If the value of the command parameter **Timeout** is set to "0", time monitoring does not occur. The basic setting for this parameter is 10 ms.
ObjectNumber	Linking of an object with its barcode information The barcode reader can set this number in its read result message frame. If the input parameter **rptcmd** of the FB is active, the **ObjectNumber** is incremented with each read operation. Value range of the parameter: 0...1023 After the value 1023 has been exceeded, the counting begins with "0".

Read config

Description

The "Read Config" command is used to read out configuration data from the Ident Unit. RXBUF is used as an area for configuration data. Configuration data are vendor-specific. The output parameter **trlen** of the FB indicates the number of received bytes.

Command code of the command

```
CMD : BYTE := 16#61;
```

Parameters

The following table lists the parameters of the "Read Config" command.

Parameter	Description
OffsetBuffer	Relative offset within the RXBUF This parameter indicates the address within the memory area where the first byte of the data to be read is to be stored.

Set attribute

Description

The "Set attribute" command sets/changes the attributes associated with a file. These attributes are stored in the directory on the transponder.

Command code of the command

```
CMD : BYTE := 16#6F;
```

Parameters

The following table lists the parameters of the "Set attribute" command.

Parameter	Description
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be accessed.

Parameter	Description
Attributes	Valid values: • Unlimited read/write = bit 0,1 not set • Read only = bit 0 set • Single read = bit 1 set • Defined size = bit 2 set (the file length cannot be changed with a command)
FileType	Classification/grouping of the files according to user-specific criteria. Files with the same characteristics are assigned to the same group. Accordingly, these files are of the same file type that is displayed with the same value of the **FileType** command parameter. If the parameter is not used, all bytes must be set to "16#20".

Update

Description

The "Update" command writes data to a file located on the transponder. The file length is updated exactly to the number of written data. This command always refers to the entire file.

Command code of the command

```
CMD : BYTE := 16#75;
```

Parameters

The following table lists the parameters of the "Update" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the data to be sent is to be stored.
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be accessed.
Length	Number of bytes to be written to the file

Write

Description

The "Write" command writes data to a file located on the transponder. If the number of bytes to be written is smaller than the file length, bytes that are not overwritten remain unchanged.

Command code of the command

```
CMD : BYTE := 16#77;
```

Parameters

The following table lists the parameters of the "Write" command.

Parameters	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the data to be sent is to be stored.
UID	Identification of an individual transponder **UID** = 0: Any random transponder The transponder currently located in the Ident Unit is read.
FileName	File to be accessed.
Offset	Relative offset within the indicated file to which the data are to be written. • **Offset** = 0: data begin at file start • **Offset** = -1: data are added to the file
Length	Number of bytes to be written to the file

Write config

Description

The "Write config" command is used to modify operation of the Ident Unit, except for interruption of the communication. It is possible to send new parameters to the Ident Unit (configuration data). A reset can also be initiated to prompt the Ident Unit to restart operation ("Restart"). TXBUF is used as an area for configuration data. Configuration data are vendor-specific.

Refer to the documentation of the relevant standard profile RFID system to learn which values the **Config** parameter can accept.

Note

The "Write config" command must always be in the first position in the command buffer (**cmdref** [1]). When the input parameter **init** is executed, the "Write config" command is automatically executed. The data are automatically retrieved from the first buffer. **Cmdsel** must be set to 1. If the "Write config" command is started with **execute**, the input parameter **cmdsel** must be set accordingly.

Command code of the command

```
CMD : BYTE := 16#78;
```

Parameters

The following table lists the parameters of the "Write config" command.

Parameter	Description
OffsetBuffer	Relative offset within the TXBUF This parameter indicates the address within the memory area where the first byte of the data to be sent is to be stored.
Length	Number of configuration data bytes to be written to the Ident Unit
Config	• **Config** = 0 → not permitted • **Config** = 1 → reset, no configuration data • **Config** = 2 → no reset, configuration data to be sent • **Config** = 3 → reset, configuration data to be sent • **Config** > 3 → reserved

8.12.4.4 Error messages

Overview

This chapter covers the error and warning concept of the function blocks **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB**.

If an error occurs, the output parameter **error** = **TRUE** is set. If a warning occurs, the output parameter **warning** = **TRUE** is set. More details about the error or warning are provided in output parameter **status**. In the event of an error, the relevant error number is displayed in this output parameter. If no errors or warnings have occurred, **status** has a value of "16#00".

Note

The **status** parameter is **not** reset when the next command is called and is available until the next error message. Evaluate the **status** parameter only when **error** = **TRUE**.

The **status** output parameter consists of a compact array (ARRAY) of 4 bytes. Bit 4 of byte 0 distinguishes between an error message and a warning:

- Bit 4 = 0 → error message pending
- Bit 4 = 1 → warning pending

Error and warning concept

The function blocks **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB** indicate that the requested command has been executed successfully. The error messages have the following functions:

1. Controlling of program execution
2. Output of error messages via the user program or the control system

status

In the event of an error, the corresponding error number is displayed in the **status** output parameter. If no errors or warnings have occurred, **status** has a value of "16#00". The **status** parameter is not reset when the next command is called and is available until the next error message.

The error number in the **status** output parameter consists of a compact array (ARRAY) of 4 bytes, which are described in the table below.

Table 8-159 Structure of 'status' output parameter

Byte	Name	Type	Definition
0	**Function_Num**	Byte	Grouping in error messages and warnings, see "Function_Num"
1	**Error_Decode**	Byte	Definition of the meaning of **Function_Num**, **Error_Code_**1, and **Error_Code_2**, see "Error_Decode"
2	**Error_Code_1**	Byte	Contains warning and error numbers, see "Error_Code_1"
3	**Error_Code_2**	Byte	Warnings or vendor-specific errors, see "Error_Code_2"

The following figure shows the structure of the **status** output parameter.

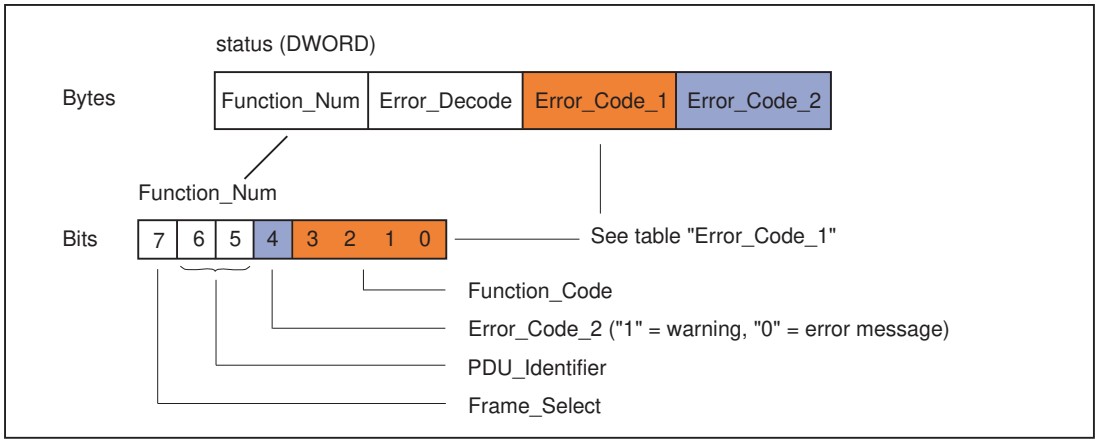

Figure 8-78 Output parameter 'status'

These bytes are described in detail below.

Note

See section "Examples for reading out error numbers" to learn how to read out error messages and warnings from the **status** parameter.

Function_Num

The **Function_Num** byte of the **status** output parameter consists of 8 bits. They are defined as follows:

Bit 0 to 3	Function_Code / Error_Code
Bit 4	Error_Code_2 (error/warning)
Bit 5 to 6	PDU_Identifier
Bit 7	Frame_Select

The following table contains the values that can be assumed by the **Function_Num** byte.

Table 8-160 Function_Num

Frame_Select (Bit 7)	PDU_Identifier (Bits 6 to 5)	Error_Code_2 (Bit 4)	Function_Code / Error_Code (Bits 3 to 0)	Description according to profile
0	0..3	0/1	0..15	No error
1	0, 1	0/1	0..15	Error does not relate to the PROFIBUS DP protocol and is not defined for this profile.
1	2	0/1	0..15	Error message relating to PROFIBUS DP protocol
1	3	0/1	0	Vendor-specific code of Error_Code_1 and Error_Code_2
1	3	0/1	1	Error_Code_1 provides error information relating to the transponder Vendor-specific code of Error_Code_2
1	3	0/1	2	Error_Code_1 provides error information relating to the radio interface Vendor-specific code of Error_Code_2
1	3	0/1	3	Error_Code_1 provides error information relating to the file system Vendor-specific code of Error_Code_2
1	3	0/1	4	Error_Code_1 provides error information relating to the Ident Unit (interrogator/barcode reader) Vendor-specific code of Error_Code_2
1	3	0/1	5	Error_Code_1 provides error information relating to communication between FB and Ident Unit (except for PROFIBUS DP errors) Vendor-specific code of Error_Code_2

Frame_Select (Bit 7)	PDU_Identifier (Bits 6 to 5)	Error_Code_2 (Bit 4)	Function_Code / Error_Code (Bits 3 to 0)	Description according to profile
1	3	0/1	6	Error_Code_1 provides command-specific error information Vendor-specific code of Error_Code_2
1	3	0/1	7	Error_Code_1 provides error information generated internally by the FB
1	3	0/1	8..15	Not defined

Error_Decode

The **Error_Decode** byte contains the meaning of the bytes **Function_Num**, **Error_Code_1**, and **Error_Code_2**.

The following table contains the values that can be assumed by the **Error_Decode** byte.

Table 8-161 Error_Decode

Error_Decode	Source	Meaning
16#00	Control	Not a warning, not an error
16#01 to 16#7F	Control	Warning (not used for this profile)
16#80	DPV1	Error report in accordance with IEC 61158-6
16#81 to 16#8F	Control	Error report matching the nth parameter of the call of the communication FB. The exact definition of the communication FB is provided in the following documentation: PROFIBUS Communication and Proxy Function Blocks acc. to IEC 61131-3, Version 1.2, July 2001
16#90 to 16#FD	-	Reserved
16#FE	Profile (FB, Ident Unit)	Profile-specific error
16#FF	Profile (FB, Ident Unit)	Reserved for future use

Error_Code_1

The **Error_Code_1** byte supplies a number that assigns the error message or warning. In the following table, the value "16#FE" is specified for the **Error_Decode** byte. Bits 0 to 3 correspond to bits 0 to 3 of the **Function_Num** byte.

Table 8-162 Error_Code_1

Function_Code / Error_Code	Error_Code_1 (decimal)	Indexed by	Meaning
Errors and warnings relating to the transponder			
1	1	Ident Unit	Memory error of the transponder
1	2	Ident Unit	Presence error - transponder is no longer within the transmission window

Function_Code / Error_Code	Error_Code_1 (decimal)	Indexed by	Meaning
1	3	Ident Unit	Address or command does not match the transponder characteristics (memory capacity).
1	4	Ident Unit	Transponder defective Transponder or batteries must be replaced.
1	5	Ident Unit	Transponder capacity is exceeded.
1	6	Ident Unit	Unformatted transponder
1	7	Ident Unit	Incompatible data structure of transponder The transponder must be reformatted.
1	8	Ident Unit	The transponder in the transmission window does not have the expected UID.
1	9	Ident Unit	Command is not supported by the transponder
1	10	Ident Unit	Access error (e.g. block locked), see ISO 18000-x
1	11...127	Ident Unit	Reserved for future profile use
1	128...255	Ident Unit	Vendor-specific
Errors and warnings relating to the radio interface			
2	1	Ident Unit	Time limit exceeded for communication via radio interface
2	2	Ident Unit	There are more transponders in the transmission window than is permitted.
2	3...127	Ident Unit	Reserved for future profile use
2	128...255	Ident Unit	Vendor-specific
Errors and warnings relating to the file system			
3	1	Ident Unit	Error in file name
3	2	Ident Unit	File not available
3	3	Ident Unit	The type of transponder is incorrect or inappropriate for the selected operating mode. A file system cannot be accessed on the transponder.
3	4	Ident Unit	Command is being created No further directory entries are available.
3	5	Ident Unit	Command is being created The directory already contains this file.
3	6	Ident Unit	Error relating to access rights
3	7	Ident Unit	File length exceeded
3	8	Ident Unit	File cannot be accessed or is damaged
3	9...127	Ident Unit	Reserved for future profile use
3	128...255	Ident Unit	Vendor-specific
Errors and warnings relating to the Ident Unit			
4	1	Ident Unit	Power supply failure
4	2	Ident Unit	Hardware fault in the Ident Unit
4	3	Ident Unit	Antenna not operating; e.g., switched off or disconnected from system
4	4	Ident Unit	Capacity of command buffer in the Ident Unit is exceeded.
4	5	Ident Unit	Capacity of data buffer in the Ident Unit is exceeded.

Function_Code / Error_Code	Error_Code_1 (decimal)	Indexed by	Meaning
4	6	Ident Unit	Command is not supported by the Ident Unit in this mode.
4	7	Ident Unit	Ident Unit is returning a non-specific error message that was indexed by the cyclic status word (e.g. antenna does not work, etc.). This error message does not relate to a specific command.
4	8...127	Ident Unit	Reserved for future profile use
4	128...255	Ident Unit	Vendor-specific
Errors and warning relating to the communication between the FB and the Ident Unit			
5	1	Ident Unit	Incorrect sequence number (SN)
5	2	FB	Incorrect sequence number (SN)
5	4	Ident Unit	Invalid data block number (DBN)
5	5	FB	Invalid DBN
5	6	Ident Unit	Invalid data block length (DBL)
5	7	FB	Invalid DBL
5	8	Ident Unit	Command of another user is being processed
5	9	FB	The Ident Unit is performing a hardware reset (Init_Active is set to "1"), and the **init** input parameter (bit 15 in cyclic control word) is expected by the FB.
5	10	FB	The "CMD" command signal and the relevant acknowledgement do not match. This is a software or synchronization error that does not occur during normal operation.
5	11	FB	Incorrect sequence of acknowledgement message frame (TDB/DBN)
5	12	FB	Synchronization error (increment of AC_H/AC_L and CC_H/CC_L in cyclic control word is incorrect). The **init** input parameter of the FB is required for execution.
5	13...127	Ident Unit	Reserved for future profile use
5	128...255	Ident Unit	Vendor-specific
Command-specific errors and warnings			
6	1	Ident Unit	Invalid "CMD" command signal
6	2	Ident Unit	Invalid command index (CI)
6	3	Ident Unit	Invalid command parameter (e.g. data area)
6	4	Ident Unit	Object detection error Error in synchronization between user program and transponder An expected command is missing.
6	5	Ident Unit	In this state, only the "Write config" command is permitted.
6	6	FB	Starting time expired
6	7...127	Ident Unit	Reserved for future profile use
6	128...255	FB	Vendor-specific
Error information generated internally by the FB			
7	1	FB	In this state, only the **init** parameter of the FB is permitted.
7	2	FB	"CMD" command signal is not permitted

Function_Code / Error_Code	Error_Code_1 (decimal)	Indexed by	Meaning
7	3	FB	The **Length** parameter of the command is too long for the global data reserved in RXBUF.
7	4	FB	Capacity of RXBUF exceeded (more data were received than memory available in the RXBUF).
7	5	FB	Only the **init** parameter of the FB is permitted as the next command. All other commands are rejected.
7	6	FB	Wrong index (outside of permissible range of 101 to 108)
7	7	FB	Ident Unit is not responding to the **init** input parameter (Init_Active is expected in the cyclic status communication).
7	8	FB	Time exceeded during **init**
7	9...127	FB	Reserved for future profile use
7	128...255	FB	Vendor-specific

Error_Code_2

If bit 4 of the **Function_Num** byte is set to "1", then the **Error_Code_2** byte contains more information.

The figure below shows the coding of warnings. Here, the value "16#FE" is specified for the **Error_Decode** byte, and the source of the warnings is always the Ident Unit.

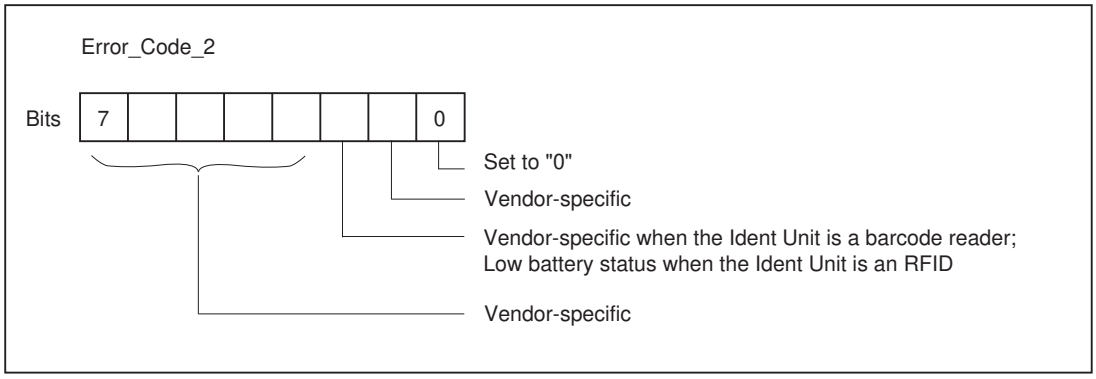

Figure 8-79 Error_Code_2

If the warning bit is set to "0", the **Error_Code_2** byte can contain vendor-specific information.

The warnings are displayed by the acyclic acknowledgement message frame in byte 5.

Error in acyclic and cyclic data transfer

In addition to the error messages supplied by the Ident Unit and the function blocks, the following error messages and warnings are specified by the SIMOTION System in the **status** output parameter:

Table 8-163 Error messages and warnings during acyclic data transfer: Writing data

Error number	Meaning
16#C0845700	Error: Data length
16#C0835700	Error: Index value
16#D080D1xx	Warning: Data transfer aborted by user: "ABORT_CURRENT_COMMAND"
16#C080D3xx	Error: too many job repetitions
16#C080D5xx	Error: indexed by return value of **_writeRecord** system function
16#C080D7xx	Error: unknown return value of**_writeRecord** system function

xx: least significant byte of return value of **_writeRecord** system function

Table 8-164 Error messages and warnings during acyclic data transfer: Reading data

Error number	Meaning
16#C0845200	Error: Data length
16#C0835200	Error: Index value
16#D080D0xx	Warning: Data transfer aborted by user: "ABORT_CURRENT_COMMAND"
16#C080D2xx	Error: too many job repetitions
16#C080D4xx	Error: indexed by return value of **_readRecord** system function
16#C080D6xx	Error: unknown return value of **_readRecord** system function

xx: least significant byte of return value of **_readRecord** system function

Note

For a description of the system functions **_writeRecord** and **_readRecord**, see

SIMOTION C2xx / P350 / D4xx System Function/Variables Parameter Manual.

These documents are included in the SIMOTION SCOUT scope of delivery as electronic documentation.

Table 8-165 Error messages during cyclic data transfer Reading data

Error number	Meaning
16#DF80B200	Invalid slot (**id**), or I/O variables for the RFID device do not exist or are invalid (data type: BYTE)
16#DF80B600	I/O access failed
16#DF80B700	Invalid area (**offset**)

Table 8-166 Error messages during cyclic data transfer Writing data

Error number	Meaning
16#DE80B200	Invalid slot (**id**), or I/O variables for the RFID device do not exist or are invalid (data type: BYTE)
16#DE80B600	I/O access failed
16#DE80B700	Invalid area (**offset**)

Examples of reading out error numbers

The following examples show you how to read out the meaning of the warnings and error messages from an error number of the **status** output parameter.

Example 1

The **error** output parameter is set to **TRUE** by the function block **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB**. The error number **16#E3FE0700** is displayed in the **status** output parameter.

This error number can be broken down as follows:

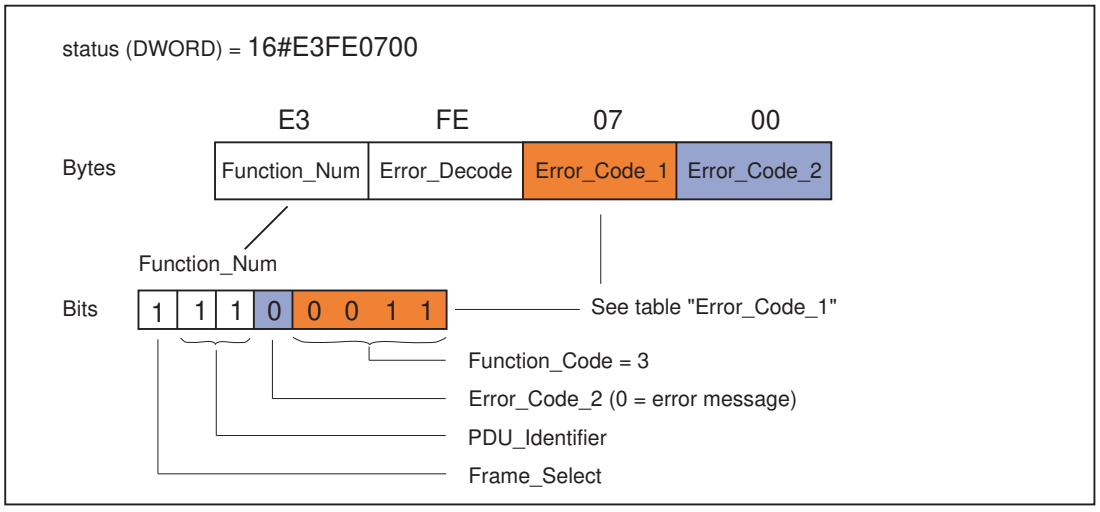

Figure 8-80 Error message: Example 1

From the **Function_Num** byte, **Bit 4** = 0 indicates that an error message is present. From the table "Function_Num", you receive the following meaning for **Function_Code** = 3:

Frame_Select (bit 7)	PDU_Identifier (bits 6 to 5)	Error_Code_2 (bit 4)	Function_Code / Error_Code (Bit 3 to 0)	Description according to profile
1	3	0/1	**3**	Error_Code_1 provides error information relating to the file system; Vendor-specific code of Error_Code_2

You can find the meaning for **Error_Code_1** = 7 in the table "Error_Code_1":

Function_Code / Error_Code	Error_Code_1 (decimal)	Indexed by	Meaning
3	**7**	Ident Unit	File length exceeded

For error number **status** = 16#E3FE0700, this results in the error message that the previous command has attempted to transfer too large a file.

Example 2

The **error** output parameter is set to **TRUE** by the function block **_PIB_001KB** / **_PIB_016KB** / **_PIB_032KB**. The error number **16#C080D5A1** is displayed in the **status** output parameter.

This error number can be broken down as follows:

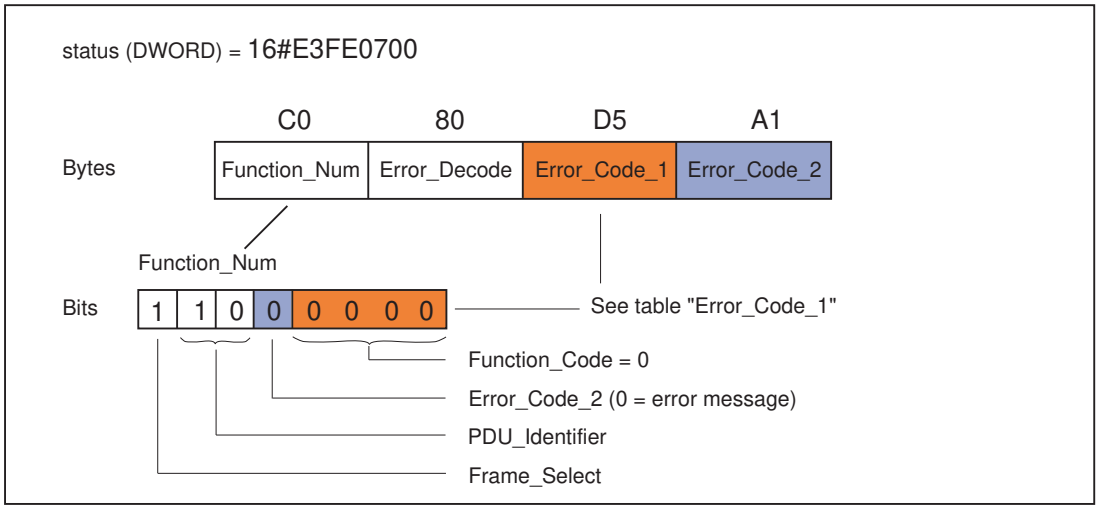

Figure 8-81 Error message: Example 2

From the **Function_Num** byte, **Bit 4** = 0 indicates that an error message is present. From the table "Function_Num", you receive the following meaning for **Function_Code** = 0:

Frame_Select (bit 7)	PDU_Identifier (bits 6 to 5)	Error_Code_2 (bit 4)	Function_Code / Error_Code (Bit 3 to 0)	Description according to profile
1	2	0/1	**0**	Error message relating to PROFIBUS DP protocol

Errors of this category are not profile-specific errors and are therefore addressed in section "Errors during acyclic and cyclic data transfer". In table "Error messages and warnings during acyclic data transfer: writing data", you will find the meaning of error number **1616#C080D5A1**:

Error code	Meaning
16#C080D5xx	Error: indexed by return value of **_writeRecord** system function

xx: least significant byte of return value of **_writeRecord** system function

In the *SIMOTION C230-2 System Functions/Variables* list manual, you will find the following entry under **_writeRecord** :

16#FFFF80A1 Error during data set transfer, job aborted. Negative acknowledgment when writing to module:
- Module removed during write operation
- Module defective

For error number **status** = 16#C080D5A1, this results in the error message that the error is module-specific and the module may have to be replaced.

8.12.5 Application example

8.12.5.1 General information on the application example

Introduction

The "E_PIB032" application example shows you how to exchange data between the SIMOTION system and the RFID system ASM 456 using the **_PIB_001KB**, **_PIB_016KB**, and **_PIB_032KB** function blocks. The following commands are provided in the application example for data exchange:

- Initialize the Ident Unit (Write config)
- Format the transponder (Format)
- Create a new file on a formatted transponder (Create)
- Write data to a transponder file (Write)
- Read out the transponder directory (Get directory)

Requirements

The application example is available for the RFID system ASM 456 (type: MOBY I-Filehandler) and a transponder for a maximum data amount of 32 KB.

The following requirements must be met:

- You have installed the GSD file in your language. You need the GSD file in order to insert the ASM 456 into the device catalog where you can select it in **HW Config**.
- You need a transponder for a maximum data amount of 32 KB.
- Vendor-specific data are needed in the example for the "Write config" and "Format" commands. The vendor-specific data can be found in the user documentation for the RFID system ASM 456.

Hardware platform

The application example is available for various SIMOTION hardware platforms.

Note

If the application example is not available for your hardware platform, you must adapt the hardware configuration.

Calling the application example

The application example can be found on the "SIMOTION Utilities & Applications" CD-ROM. The "SIMOTION Utilities & Applications" CD-ROM is provided free of charge with SIMOTION SCOUT.

1. Dearchive and open the project containing the application example.
2. Check the axis configuration: PROFIBUS DP addresses.
3. **Save** and **compile** the example project. Then, you can download the example to the SIMOTION device and switch to RUN mode.

Adapting the application example

The configuration in the example and its available hardware must be adapted.

The following options are available:

1. You can adapt the configuration of the example to the available hardware.
2. You can adapt the configuration of the hardware to the example.

Adapting the configuration of the example to the available hardware

You have assigned a module address <> 256 in **HW Config**.

1. Open the **DP Slave Properties** dialog box in **HW Config** by double-clicking the ASM456 module. Then select the **Parameter Assignment** tab.
2. In the **Parameter Assignment** tab, open the **Station parameters** folder and the **Device-specific parameters** subfolder. Set the device-specific parameters as follows:
   - USER-Mode = RFID standard profile.
   - MOBY-Mode = MOBY I-Filehandler

   Acknowledge the entry with **OK**.

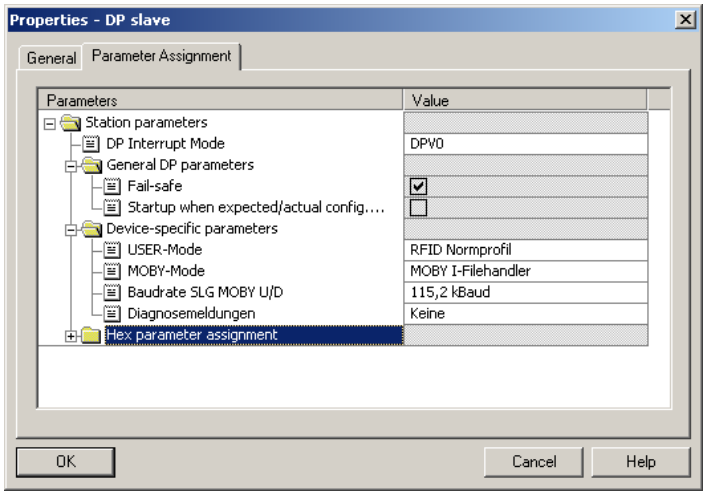

Figure 8-82 Setting device-specific parameters

3. Set the start address of the input and output address area to the value that you have assigned in **HW Config** (e.g. 256).
4. This results in the following addresses for the ZSW/STW, for example:
   - pibfhzswin : PIB 256 : Array 4 ("PIB" = Peripheral Input: Byte)
   - pibfhstwout : PQB 256 : Array 4 ("PQB" = Peripheral Output: Byte)

   Create these I/O addresses in the Symbol Browser.

In the application example, you need vendor-specific data for the "Write config" and "Format" commands. You obtain the following settings from the user documentation of the ASM 456, which you must adapt in the application example.

- Vendor-specific data for the "Write config" command:

```
ASM456_I_FH_WC_LEN : INT := 14;
ASM456_I_FH_WC_DAT : ARRAY [1..ASM456_I_FH_WC_LEN] OF BYTE
                   := [4,0,0,0,0,8,16#42,16#34,16#30,16#FF,16#FF,0,0,1];
```

- Vendor-specific data for the "Format" command:

```
ASM456_I_FH_FM_LEN      : INT := 21;
ASM456_I_FH_FM_DAT_8    : ARRAY [1..ASM456_I_FH_FM_LEN] OF BYTE
                        := [8(0),16#0C,4(16#41,16#31),05,01,16#4C,0];
ASM456_I_FH_FM_DAT_32   : ARRAY [1..ASM456_I_FH_FM_LEN] OF BYTE
                        := [8(0),16#0C,4(16#41,16#31),06,01,16#4C,0];
```

Note

When another transponder is used (e.g. for maximum data amount of 1 KB), you must adapt the following in the application example:

- Adapt the **myMdsSize** parameter as well as the CONFIG and FORMAT arrays to your transponder as appropriate.
- Set the **myFbPIB** parameter: **_PIB_001KB**.
- Adapt the array length of in/out parameters **txref** and **rxref** to the utilized FB as appropriate.

8.12.5.2 Sequence of the application example

Command processing

Proceed as follows to initiate the command processing in the example program:

1. Open the Symbol Browser in SIMOTION SCOUT.
2. To select a command, set the **myCommand** parameter in the Symbol Browser to the command to be executed.

   Note

   You must always set the **myCommand** parameter to the **cmdInit** command to initialize the Ident Unit at the beginning of command processing.

3. Start the selected command by setting the **myExecuteCmd** parameter to **TRUE**.
4. Wait for the indication that the command processing was completed without errors, i.e. **done** = **TRUE**, **error** = **TRUE** and **warning** = **TRUE** at the output parameters of the utilized FB. An error or a warning during command processing is indicated with **error** = **TRUE** or **warning** = **TRUE**.
5. Once the command has been processed successfully, you can start additional commands.

Example: Initializing Ident Unit

Vendor-specific configuration data of the ASM456 must be transferred to the transmit data buffer (TXBUF) of the Ident Unit for initialization of the Ident Unit. The "Write config" command initializes the Ident Unit and must always be first in the command buffer.

In the example, the "Init" command (cmdInit) is implemented such that all relevant parameters are set to the required values in Step 1. Proceed as follows to execute the "Init" command (as well as the implicitly associated "Write-Config" command:

1. In the Symbol Browser, set parameter **myCommand** = **cmdInit**.
2. Start the command with **myExecuteCmd** = **TRUE**.
3. Wait for the indication that the command processing was completed without errors, i.e. **done** = **TRUE**, **error** = **TRUE** and **warning** = **TRUE** at the output parameters of the utilized FB.
   Once the command has been processed successfully, you can start additional commands.

Example: Formatting the transponder

The "Format" command initializes the transponder. After formatting, the transponder is ready for use. Vendor-specific data of the ASM456 must be transferred to the transmit data buffer (TXBUF) of the Ident Unit for definition of the transponder name. Proceed as follows to execute the "Format" command:

1. In the Symbol Browser, set parameter **myCommand** = **cmdFormat**.
2. Start the command with **myExecuteCmd** = **TRUE**.
3. Error-free command execution is indicated in the utilized FB with **done** = **TRUE**, **error** = **TRUE** and **warning** = **TRUE**. The transponder is formatted and ready for use in the application.

Example: Creating a (read-only) file on the formatted transponder

The "Create" command is used to create a new file on the formatted transponder. This file is read-only. Proceed as follows to execute the "Create" command:

1. In the Symbol Browser, set parameter **myCommand** = **cmdCreate**.
2. Start the command with **myExecuteCmd** = **TRUE**.
3. Error-free command execution is indicated in the utilized FB with **done** = **TRUE**, **error** = **TRUE** and **warning** = **TRUE**. The file has been created on the transponder.

Example: Writing data to a transponder file

You can use the "Write" command to write data to a file that you previously created on the transponder. Proceed as follows to execute the "Write" command:

1. In the Symbol Browser, set parameter **myCommand** = **cmdWrite**.
2. Assign the data that are to be written to the transponder file to the **FileName** command parameter.
3. Start the command with **myExecuteCmd** = **TRUE**.
4. Error-free command execution is indicated in the utilized FB with **done** = **TRUE**, **error** = **TRUE** and **warning** = **TRUE**. The data have been transferred to the transponder file.

Example: Reading out the transponder directory

You can use the "Get directory" command to read out the directory of the transponder. File names and associated attributes are passed by the transponder. Proceed as follows to execute the "Get directory" command:

1. In the Symbol Browser, set parameter **myCommand** = **cmdGetDirectory**.
2. Start the command with **myExecuteCmd** = **TRUE**.
3. Error-free command execution is indicated in the utilized FB with **done** = **TRUE**, **error** = **TRUE** and **warning** = **TRUE**.
   The read out data are displayed in the output parameters of the "Get directory" command (see parameter description in "Get Directory").

8.12.6 Appendix

8.12.6.1 List of abbreviations

Table 8-167 Abbreviations

Abbreviation	Meaning
ASM	Interface modules
CI	Command index
DBL	Data block length
DBN	Data block number
DP	Distributed I/O
DPV1	Short term for expanded DP functions in PROFIBUS-DP (IEC 61158)
FB	Function block
GSD	Device data file
IN	Input parameters
I&M	Identification and maintenance functions
IN/OUT	In/out parameter
MOBY	Mobile identification system
OUT	Output parameters
PIB	Proxy Ident Block
PNO	PROFIBUS User Organization
RFID	Radio Frequency Identification
RXBUF	Receive data buffer indicated by the **rxref** input parameter of the FB
SN	Sequence number
ST	Structured text
STW	Control word
TDB	Total number of data blocks
TXBUF	Transmit data buffer indicated by the **txref** input parameter of the FB
UID	Unique Identifier (identification of a transponder)
ZSW	Status word

8.13 PLCopen Blocks

Preface

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

http://www.siemens.com/mdm

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

8.13.1 Fundamental safety instructions

8.13.1.1 General safety instructions

⚠ WARNING

Risk of death if the safety instructions and remaining risks are not carefully observed

If the safety instructions and residual risks are not observed in the associated hardware documentation, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life or malfunctions of the machine as a result of incorrect or changed parameterization

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

8.13.1.2 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

8.13.2 Introduction

The PLCopen blocks are designed for use in cyclic programs/tasks and enable motion control programming in a PLC environment. If preferred, they can be used in the LAD/FBD programming language.

PLCopen blocks are available as standard functions (directly from the command library).

The motion control functions meet the PLCopen specifications in terms of interfaces, functions and sequence, and are certified according to "PLCopen Compliance Procedure for Motion Control Library V1.1".

References

More detailed information on technology objects and the effect of PLCopen block input parameters on these TOs can be found in the following Function Manuals:

- TO Axis Electric / Hydraulic, External Encoder
- Technology Objects Synchronous Operation, Cam

8.13.3 Description

8.13.3.1 Description of PLCopen blocks

In SIMOTION, the following list of blocks, which are certified according to "PLCopen Compliance Procedure for Motion Control Library V1.1", can be used in cyclic programs/tasks.

If preferred, they can be used in the LAD/FBD programming language. PLCopen blocks are available as standard functions (directly from the command library).

Table 8-168 SingleAxis functions for the axis

Function	Description
_MC_Power()	Enabling/disabling axis
_MC_Stop()	Stopping the axis
_MC_Home()	Homing axis/clearing absolute value encoder offset
_MC_MoveAbsolute()	Absolutely positioning axis
_MC_MoveRelative()	Relatively positioning axis
_MC_MoveVelocity()	Traversing axis at defined velocity
_MC_MoveAdditive()	Positioning relative to current target position (traversing axis using an additional, defined path, relative to current position setpoint)
_MC_MoveSuperimposed()	Superimposed positioning (traversing axis relative to current motion)
_MC_PositionProfile()	Traveling through position/time profile (traversing axis along a predefined, fixed position/time profile)
_MC_VelocityProfile()	Traveling through velocity/time profile (traversing axis along a predefined, fixed velocity/time profile)
Basic functions	
_MC_Reset()	Resetting errors/alarms on the axis or triggering a restart
_MC_ReadActualPosition()	Reading the actual position of axis
_MC_ReadStatus()	Reading the status of an axis
_MC_ReadAxisError()	Reading the error of an axis
_MC_ReadParameter()	Reading axis parameter and outputting in data type LREAL
_MC_ReadBoolParameter()	Reading axis parameter and outputting in data type BOOL
_MC_WriteParameter()	Writing axis parameter of data type LREAL
_MC_WriteBoolParameter()	Writing axis parameter of data type BOOL

Function	Description
Apart from the standard PLCopen functions, the following additional standard axis function is included:	
_MC_Jog()	Continuous or incremental jogging

Table 8-169 MultiAxis functions for the axis

Function	Description
_MC_GearIn()	Starting gearing (synchronizing master and slave axis while taking into account a positional relationship described by a fixed gear ratio)
_MC_GearOut()	Terminating gearing (desynchronizing master and slave axis)
_MC_CamIn()	Starting camming (synchronizing master and slave axis while taking into account a positional relationship described by a cam)
_MC_CamOut()	Terminating camming (desynchronizing master and slave axis)
_MC_Phasing()	Changing phase shift between the leading axis and following axis

Table 8-170 Functions for external encoder

Function	Description
_MC_Power()	Enabling external encoder
_MC_Reset()	Resetting external encoder
_MC_Home()	Homing external encoder
_MC_ReadActualPosition()	Reading actual position of external encoder
_MC_ReadStatus()	Reading external encoder status
_MC_ReadAxisError()	Reading external encoder error
_MC_ReadParameter()	Reading external encoder parameter and outputting in data type LREAL
_MC_ReadBoolParameter()	Reading external encoder parameter and outputting in data type BOOL

Other blocks

On the "Utilities & Applications" CD (included in SIMOTION SCOUT scope of delivery) you will also find a versatile block that can be used for axis control purposes (under Applications > Converting > Versatile Block for Axis Control).

The **FBLineAxis** function block serves a wide range of application cases and is, therefore, classified as versatile. It enables the user to not only control individual axis motions, but also

define axis groups using master/slave relationships, e.g. as a setpoint cascade with closed-loop position-controlled axes.

Note

No liability assumed when using FBLineAxis

Siemens AG assumes no liability for any problems or errors which may arise from using FBLineAxis.

8.13.3.2 General rules for the PLCopen FB interface

Description

The following applies in accordance with the PLCopen specification "Technical Specification, PLCopen - Technical Committee 2 – Task Force, Function blocks for motion control, Version 1.1":

Exclusiveness of output parameters

The output parameters "Busy", "Done", "Error" and "CommandAborted" are mutually exclusive: At each FB, only one of these output parameters can be set to TRUE. If "Execute" is TRUE, one of these output parameters must also be TRUE.

Only one of the output parameters "Active", "Error", "Done" and "CommandAborted" is set.

Status of the output parameters

The output parameters "Done", "InGear", "InSync", "InVelocity", "Error", "ErrorID" and "CommandAborted" are reset with the falling edge of "Execute". The falling edge of "Execute" stops, but does not however influence the execution of the actual FB. The corresponding output parameters are set for a minimum of one cycle if this situation occurs, even if "Execute" has been reset prior to completing the execution of the FB.

If an FB instance receives a new "Execute" parameter prior to the execution being completed (as a series of commands for the same instance), the FB does not output any feedback for the previous action such as "Done" or "CommandAborted".

Input parameters

The parameters are used with the rising edge of the "Execute" input parameter. For all parameters to be modified, it is essential that the input parameter(s) are changed and the processing/traversing is re-triggered.

Missing input parameters

In accordance with IEC 61131-3, if any parameters of a function block input are missing (open), the value from the previous call of this instance is used. The initialization value is used during the first call.

"Position" in comparison with "Distance"

"Position" is a value that is defined within a coordinate system. "Distance" is a relative value that relates to technical units. "Distance" is the difference between two positions.

Sign rules

The "Velocity", "Acceleration", "Deceleration" and "Jerk" parameters always have positive values. "Position" and "Distance" can be both positive and negative.

Error processing response

All blocks contain two output parameters, which process errors that may occur during the execution of the respective function block. These output parameters are defined as follows:

- "Error"
  The rising edge of "Error" indicates that an error occurred during the execution of a function block.
- "ErrorID"
  Error code

"Done", "InVelocity", "InGear" and "InSync" indicate that the execution has been completed successfully, these signals and "Error" are therefore logically mutually exclusive.

Error types:

- Function blocks (e.g. parameters outside the range, fault of the sequence control)
- Communication
- Drive

Instance errors do not always lead to an axis error (which brings the axis to a "standstill").

The error outputs of the respective FB are reset with the falling edge of "Execute".

Response of the "Done" output parameter

The "Done" output parameter (as well as the "InGear", "InSync", output parameters, among others) are set if the required action has been completed successfully.

The following applies for several function blocks, which work in a sequence on the same axis:

If a motion on an axis is interrupted by another motion on the same axis, without the final target being reached, the "Done" output parameter of the first FB is not set.

Response of the "CommandAborted" output parameter

"CommandAborted" is activated if a requested traversing is interrupted by another traversing command.

The Reset response of "CommandAborted" corresponds to that of "Done". If "CommandAborted" occurs, other output signals are reset such as "InVelocity".

Input parameters that exceed application limits

1. The parameter violates the parameter-related absolute upper/lower limits (the limits in place on the related limit data):
   If an FB is controlled with parameters that violate the application limits, the instance of the FB generates an error. The consequences of this error for the axis are application-specific and should therefore be processed by the application program.
2. The parameter is located in these upper/lower limits, but not in the "application limit", i.e. it exceeds the TO limit values:
   depending on the input parameter and the general "SIMOTION" rules.
   As a general rule, only the parameter is limited; these limits lead to an alarm/warning, resulting in a stop response -> the FB is then also switched to the error state with ErrorID: Abort by pending error response.

8.13.4 Blocks

8.13.4.1 Handling PLCopen blocks

Block instances

In order to use PLCopen blocks, you must create one block instance for each being used.

The data type of the instance corresponds to the block name.

Example

Below you can see how a block instance is structured, using the _MC_MoveAbsolute block in an ST program by way of example. Optional parameters are converted to comments.

Table 8-171 Block instance for _MC_MoveAbsolute

```
VAR
myinst_moveAbsolute : _mc_moveabsolute;
END_VAR

myinst_moveAbsolute(
axis := Hour
// ,execute := 0
// ,position := 0.0
// ,velocity := -1.0
// ,acceleration := -1.0
// ,deceleration := -1.0
// ,jerk := -1.0
// ,direction := USER_DEFAULT
// ,done =>
```

```
// ,busy =>
// ,active =>
// ,commandaborted =>
// ,error =>
// ,errorid =>
);
```

Upgrading a PLCopen library from V3.2 to V4.2

Up until SIMOTION SCOUT V3.2 SP1, the PLCopen blocks formed part of the SIMOTION Function Library (provided on a separate CD).

With SIMOTION SCOUT V4.0 and higher, the PLCopen blocks are included in the SIMOTION SCOUT command library as standard functions ("PLCopen" command group). As part of this, they have been modified and considerably extended (to include PLCopen multiaxis functions, for example).

Note

Incompatibility errors during compilation

After upgrading a PLCopen library from V3.2 to V4.2, an LAD/FBD incompatibility error occurs if you have integrated the new library using a namespace. The operations with the parameters can no longer be compiled without errors.

As an example, the namespace in this case should be called "L_SAxis".
During compilation, the relevant PLCopen blocks are downloaded to the namespace using the USELIB L_SAxis AS ns_L_SAxis operation. Therefore, all of the corresponding data types are also in this namespace. Versions of SIMOTION SCOUT up to V4.0 were fault-tolerant in the event of a faulty operation occurring without a namespace having been specified (e.g. Direction := POSITIVE_DIRECTION). However, SIMOTION SCOUT V4.1 and higher is no longer fault-tolerant and produces a compilation error.

Manual intervention is required when this occurs: **all** incomplete operations must be completed using the namespace extension "ns_L_SAxis".
From V4.1, the correct operation for the example above must be as follows:
Direction := ns_L_SAxis.POSITIVE_DIRECTION or
Direction := ns_L_SAxis.mc_direction#POSITIVE_DIRECTION

8.13.4.2 SingleAxis

_MC_Power - Enabling/disabling axis

Overview

Schematic diagram

Schematic diagram

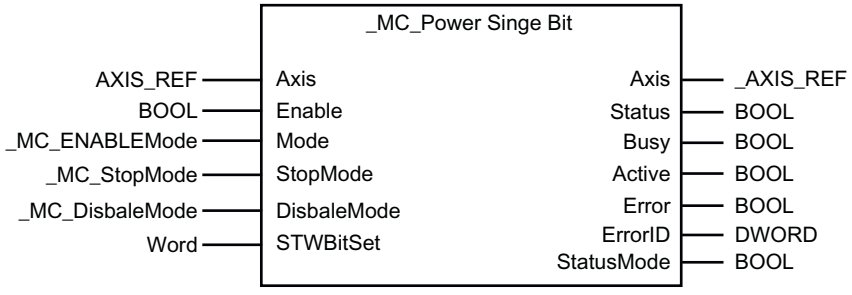

Figure 8-83 _MC_Power Schematic diagram

Purpose

Purpose

The **_MC_Power** function block enables or disables an Axis technology object or an External Encoder technology object.

If an active braking is possible before an axis is disabled, it is stopped with the set stop mode. The parameter **StopMode** specifies a stop mode for the axis. The stop mode is taken over with a falling edge at the **Enable** input.

_MC_Power with individual bits (as of V4.2)

The bits of the PROFIdrive protocol can be set and reset with _enableAxis and _disableAxis. This functionality is also enabled in the **_MC_Power** function block. For this purpose, it is extended by the STWBitSet input parameter. The STWBitSet parameter is only evaluated if the value BY_STW_BIT is transferred in parameter mode.

In the STWBitSet parameter, the values of Bit 0 - Bit 6 that are set in the PROFIdrive protocol are specified. In the case of enable=TRUE, the bits specified in the control word are set, whereas in the case of enable=FALSE, the specified bits are reset.

See also AUTOHOTSPOT.

Applicable for

Applications

Drive axes

Positioning axes

Following axes

Path axes

External Encoders

Note

This block can only enable or disable electrical standard axes. The block does not function for axes with force or pressure control.

Requirements

Requirements

No alarms preventing the enable may be present on the TO.

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Enable	BOOL	FALSE	Function block enable The axis is enabled with a rising edge at this input. If this is not possible, the attempt to set the enables is repeated as long as **Enable** is set. The axis is stopped with a falling edge at this input. The axis is disabled after reaching standstill.
Mode	_MC_EnableMode	ALL	Specification of the axis enables to be set Not effective for external encoders. ALL: Set all enables and deactivate follow-up mode DRIVE: Only set drive enable BY_STW_BIT setting of the bits specified in the STWBitSet parameter in the PROFIdrive protocol

Parameter	Data type	Initial value	Description
StopMode	_MC_StopMode	WITH_COMMAND_VALUE_ZERO	Specification of the stop mode Not effective for external encoders. WITH_COMMAND_VALUE_ZERO: The axis is stopped with emergency stop in the STOP_WITH_COMMAND_VALUE_ZERO mode. It is stopped via the emergency stop ramp in the controller. The ramp is set during axis configuration. WITH_MAXIMAL_DECELERATION: The axis is stopped with emergency stop in the STOP_WITH_MAXIMAL_DECELERATION mode. It is stopped according to interpolation with the maximum dynamic values of the axis. IN_DEFINED_TIME: The axis is stopped with emergency stop in the STOP_IN_DEFINED_TIME mode. The default setting for the stop time defined in the system variable userDefaultDynamics.stopTime is used. The specified time is adhered to irrespective of the starting velocity. DISABLE_DRIVE_IMMEDIATELY: The POWER enable is removed directly from the axis. The drive coasts to a standstill.
DisableMode	_MC_DisableMode	ALL	Operating mode of axis ALL; Remove all enables and Follow-up operation on CONTROL; Remove axis enable in the control and set axis in follow-up mode, the drive remains active, it is not switched off; BY_STW_BIT; reset of the bits specified in the STWBit-Set parameter in the PROFIdrive protocol
STWBitSet	WORD	0	Bit0 - ON Bit1 - No coast stop (no OFF2) Bit2 - No quick stop (no OFF3) Bit3 - Enable operation Bit4 - Enable ramp generator Bit5 - Unfreeze ramp generator Bit6 - Enable setpoint See also AUTOHOTSPOT.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Status	BOOL	FALSE	Display of the enable status of the axis With TRUE, the axis is activated and motion commands can be executed. With FALSE, the axis is not (completely) activated, no motion commands can be executed on the axis.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Section ErrorIDs (Page 6611)).
StatusMode	Bool	FALSE	State of the actual enables in comparison with the setpoint enables; indicates that the enables specified in 'mode' or 'DisableMode' have been reached.

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

See also

Troubleshooting - PLCopen Blocks (Page 6733)

Example

The axis is traversed with velocity 50 after the enable. After an error has occurred resulting in the removal of the axis enable, the error is corrected with **_MC_Reset**. The axis is enabled again. The axis is then traversed again with velocity 50 and the enable is removed. The axis brakes with the ramp set in the **StopMode** parameter.

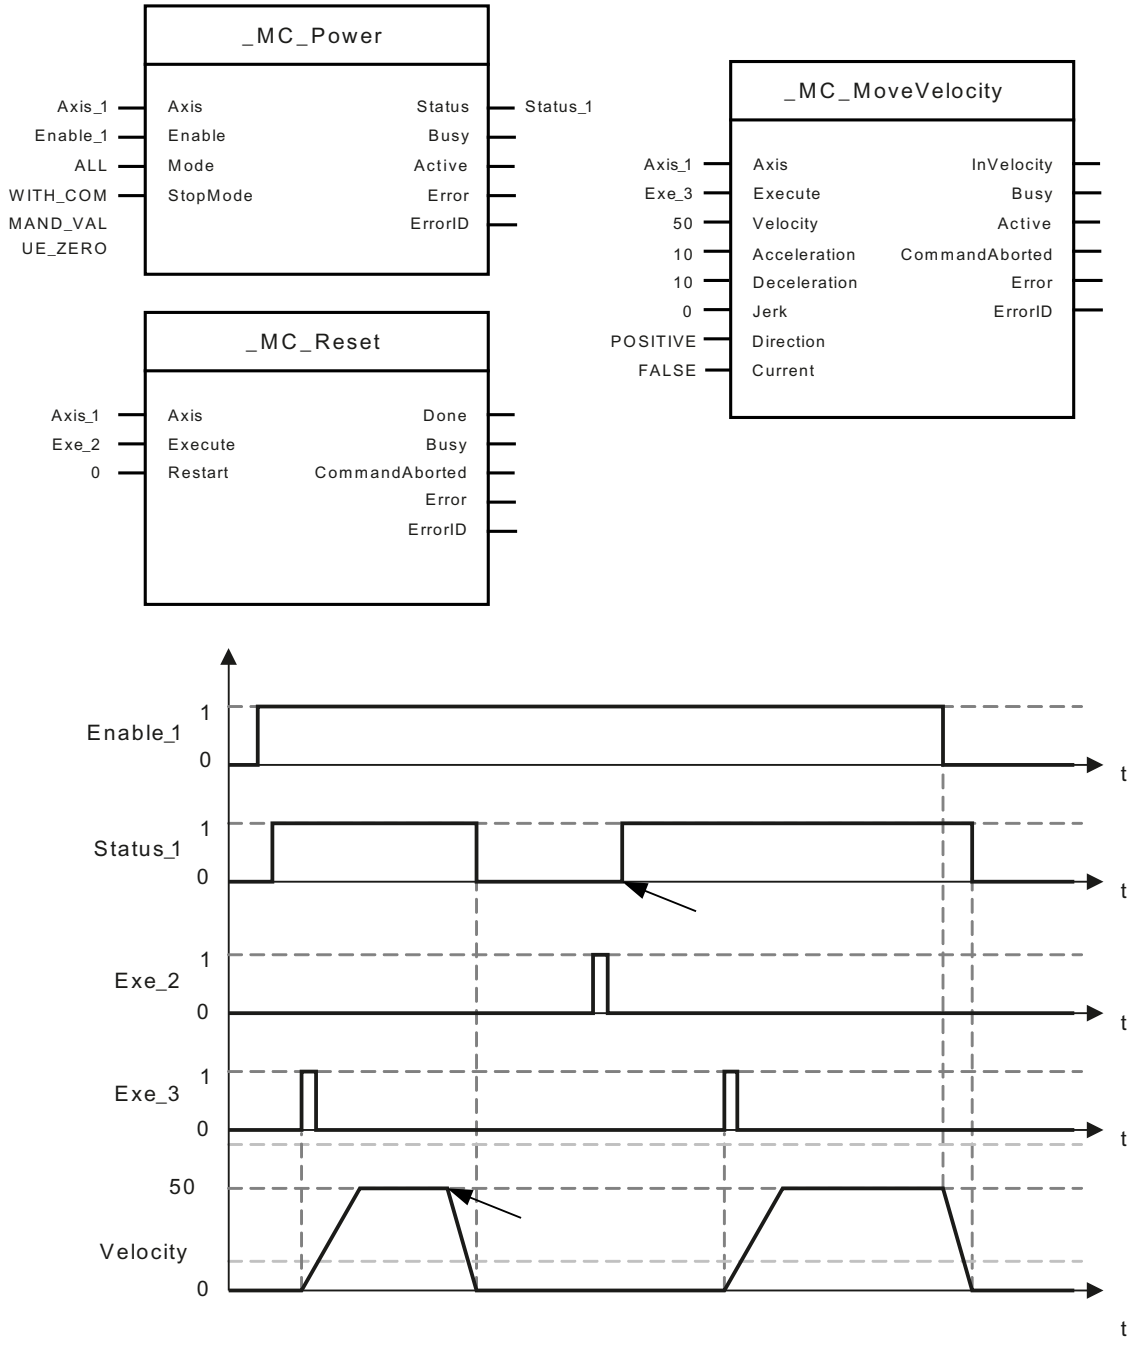

Figure 8-84 _MC_Power Example

_MC_Stop - Stopping axis

Overview

Schematic diagram

Schematic diagram

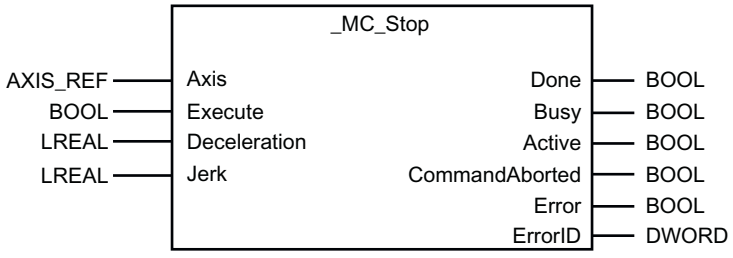

Figure 8-85 _MC_Stop Schematic diagram

Purpose

Purpose

The function block **_MC_Stop** terminates all active motion commands on an axis and decelerates it down to standstill. The function block can be overrided or aborted by another motion command, i.e. it is not possible to start a motion command.

The function block is terminated (**Done** equals **TRUE**) when the axis is stationary and the input **Execute** is reset to **FALSE**. It is then possible again to start a motion command on the axis.

The input parameters **Deceleration** and **Jerk** define the dynamic response of the stop procedure.

Applicable for

Applications

Drive axes

Positioning axes

Following axes

Path axes

Requirements

Requirements

Axis enabled and not in follow-up mode

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type)
Execute	BOOL	FALSE	Function block enable The axis stops with a rising edge at this input.

Parameter	Data type	Initial value	Description
Deceleration	LREAL	-1.0	Specification of the maximum deceleration (decreasing energy in the motor) Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.negativeaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Jerk	LREAL	-1.0	Specification of maximum jerk in conjunction with velocity profile definition Value > 0: Acceleration-constant velocity profile (SMOOTH); specified jerk is used Value = 0: Trapezoidal velocity profile (TRAPEZOIDAL) Value < 0: Type of velocity profile results from setting of axis system variable userdefaultdynamics.profile In the case of an effective, acceleration-constant velocity profile (SMOOTH), the preset values in the userdefaultdynamics.positiveaccelstartjerk, userdefaultdynamics.positiveaccelendjerk, userdefaultdynamics.negativeaccelstartjerk, and userdefaultdynamics.negativeaccelendjerk system variables are used. For information on the effects these have, refer to the "TO Axis Electric / Hydraulic, External Encoder" Function Manual; Command variable calculation > Velocity profiles.

⚠ WARNING

If the function block **_MC_Stop** is started with a jerk specification not equal to zero during the acceleration phase of an axis, its velocity can increase to the configured maximum velocity of the drive in an extreme situation. The axis is only decelerated once acceleration has been reduced by the jerk.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Display of the completion of the function block The axis is at standstill and the disable for the motion commands has been removed (**Execute** equals **FALSE**). This output is only set for one cycle.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.

Parameter	Data type	Initial value	Description
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6616)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

See also

Troubleshooting - PLCopen Blocks (Page 6733)

Example

The axis is started with velocity 50 and then decelerated to velocity 0 with **_MC_Stop**. A further call of **_MC_MoveVelocity** results in an error as the **Execute** input is set on the **_MC_Stop**. After the **Execute** input on the **_MC_Stop** is reset, the **_MC_MoveVelocity** can be executed again.

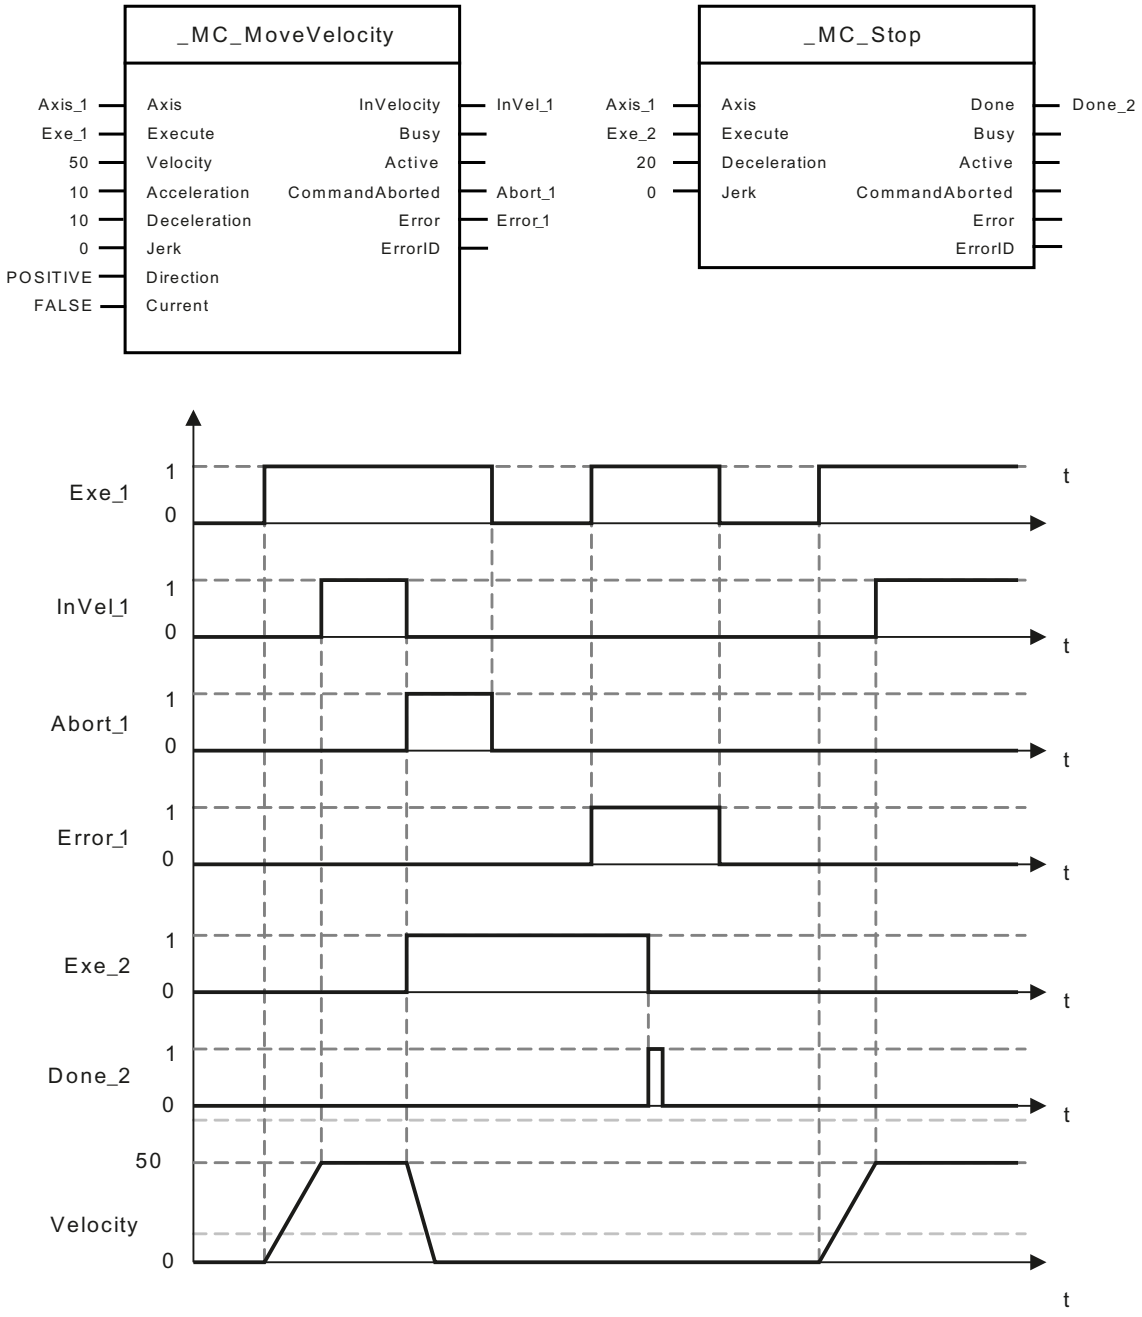

Figure 8-86 _MC_Stop Example

_MC_Home - Homing axis/clearing absolute value encoder offset

Overview

Schematic diagram

Schematic diagram

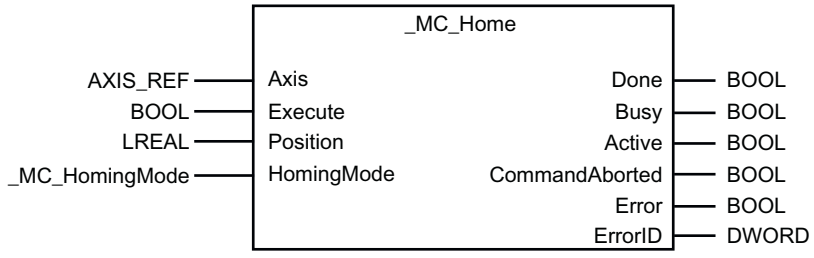

Figure 8-87 _MC_Home Schematic diagram

Purpose

Purpose

The function block **_MC_Home** establishes a positional relationship between the control and the mechanical system via a measuring system.

The following are supported:

- Active and passive homing of an axis
  The homing mode is defined at the function block. Parameters for the other data are set in the "Homing" axis dialog.
- Setting a position value
- Relative correction/shift of the actual value
- Absolute encoder adjustment

Applicable for

Applications

Positioning axes

Following axes

Path axes

External encoders

Restrictions

The parameter **HomingMode** of the function block **_MC_Home** only defines the homing mode. The homing procedure itself is performed in accordance with the configuration of the encoder on the axis.

Homing mode	Virtual axis	Real axis with incremental encoder	Real axis with absolute encoder	External Encoders
ACTIVE_HOMING		X [1)]		
PASSIVE_HOMING		X		X
DIRECT_HOMING	X	X	X	X
DIRECT_HOMING_ RELATIVE	X	X	X	X
ENABLE_OFFSET_OF_ ABSOLUTE_ENCODER			X [2)]	X [2)]

1) If homing mode **MODE_NO_REFERENCE** is set in the configuration of the **TypeOfAxis.NumberOfEncoders.Encoder_<n>.IncHomingEncoder.HomingMode** encoder, then the homing mode **ACTIVE_HOMING** is not possible at the function block.

2) In homing mode **ENABLE_OFFSET_OF_ABSOLUTE_ENCODER**, the value transferred with input parameter **Position** is not effective.
For this mode you must enter the required offset in the encoder configuration before calling the **_MC_Home** function block. Enter the offset value in the configuration data under **TypeOfAxis.NumberOfEncoders.Encoder_<n>.absHomingEncoder.absShift** and select **absolute** or **relative**.
If ENABLE_OFFSET_OF_ABSOLUTE_ENCODER (**absolute**) is selected, the axis is set to the specified offset value. If DIRECT_HOMING_RELATIVE (**relative**)is selected, the specified offset value is added to the current axis position and the axis is set to this "total" value.

Requirements

Requirements

Enabling axes or external encoders

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoder-Type data type)
Execute	BOOL	FALSE	Function block enable The homing procedure starts with a rising edge at this input.
Position	LREAL	0.0	Specification of the position at the reference point or the position setting value or the position offset value
HomingMode	_MC_HomingMode	ACTIVE_HOMING	Specification of the homing mode: ACTIVE_HOMING: Active homing PASSIVE_HOMING: On-the-fly homing DIRECT_HOMING: Setting current position as reference point DIRECT_HOMING_RELATIVE: Direct homing (the actual position of the axis is added to the value specified in the parameter **Position** as position difference). ENABLE_OFFSET_OF_ABSOLUTE_ENCODER: Absolute encoder adjustment

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Display of the completion of the function block With TRUE, the programmed target position has been reached.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.

Parameter	Data type	Initial value	Description
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6621)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Troubleshooting - PLCopen Blocks (Page 6733)

Examples

Example: Active homing

Sequence for active homing:

- Phase 1:
  Approach of the home position switch (BERO).
  The axis traverses with the homing approach velocity V_{app} (approach velocity).
- Phase 2:
  Synchronization with the zero mark.
  The axis traverses with the homing reduced velocity V_{red} (reduced velocity).
- Phase 3:
  Travel to the home position coordinate.
  The axis traverses with the homing entry velocity V_{ent} (entry velocity).

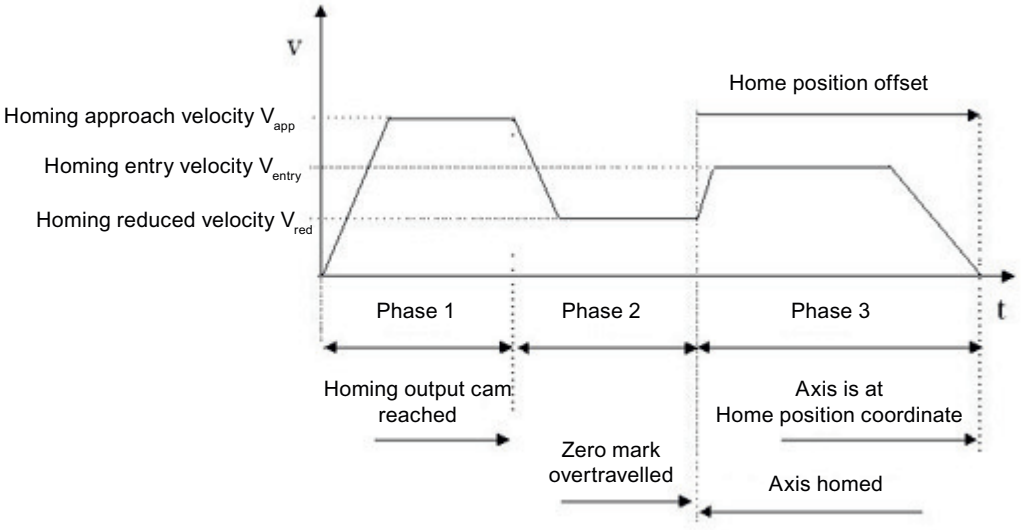

Figure 8-88 _MC_Home Example: Active homing

Example: Direct homing

The new absolute position is set in the next interpolator cycle after the call of the function block with the set Execute input. When calling the function block from a task which is not synchronous with the interpolator, the setting procedure is only recommended for axes at standstill.

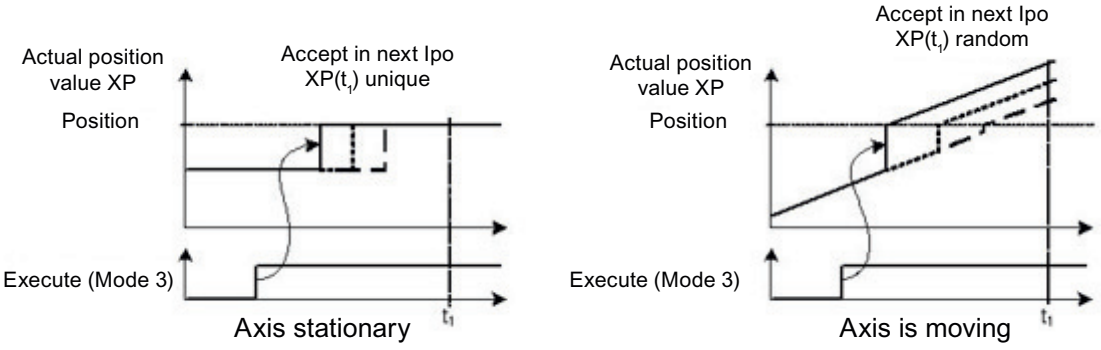

Figure 8-89 _MC_Home Example: Direct homing

Example: Passive homing

The axis is traversed at the velocity 50. Then the passive homing with zero mark is triggered. At the next zero pulse, the actual position of the axis is set to 90.

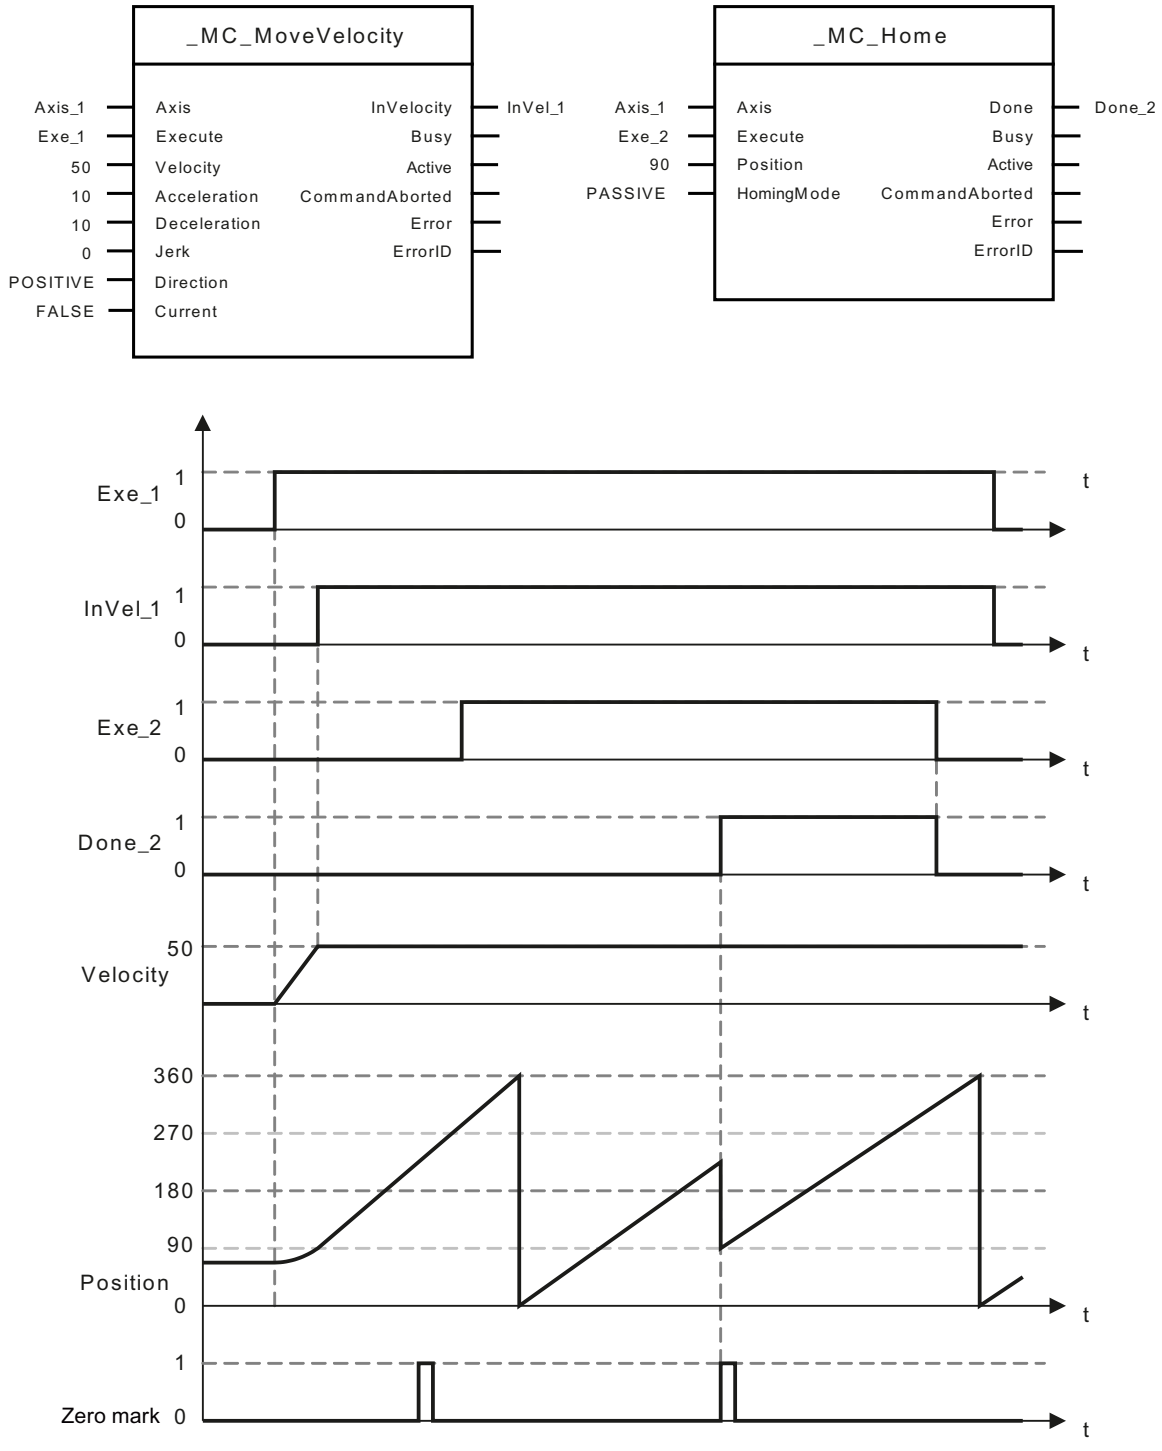

Figure 8-90 _MC_Home Example: Passive homing

_MC_MoveAbsolute - Absolute positioning of axis

Overview

Schematic diagram

Schematic diagram

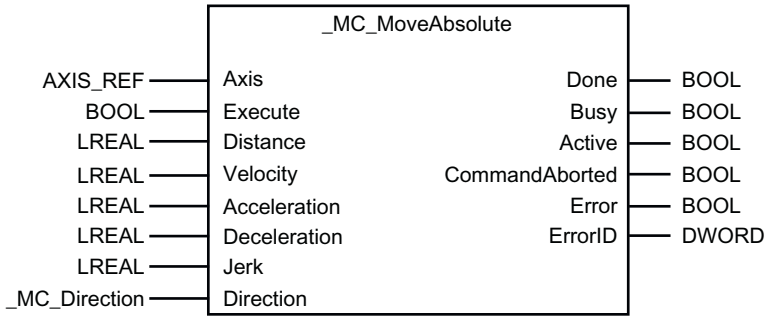

Figure 8-91 _MC_MoveAbsolute Schematic diagram

Purpose

Purpose

The function block **_MC_MoveAbsolute** starts a positioning motion of an axis to an absolute position.

The dynamic response parameters **Velocity**, **Acceleration**, **Deceleration** and **Jerk** define the dynamic response of the motion procedure.

The axis stops after completion of the positioning motion.

An active motion command is overridden by the function block.

With modulo axes, **SHORTEST_WAY** can be specified as an additional direction of motion.

Note

The state of the "DONE" output depends on the system variable motionstatedata.motionstate.

Troubleshooting - PLCopen Blocks (Page 6733)

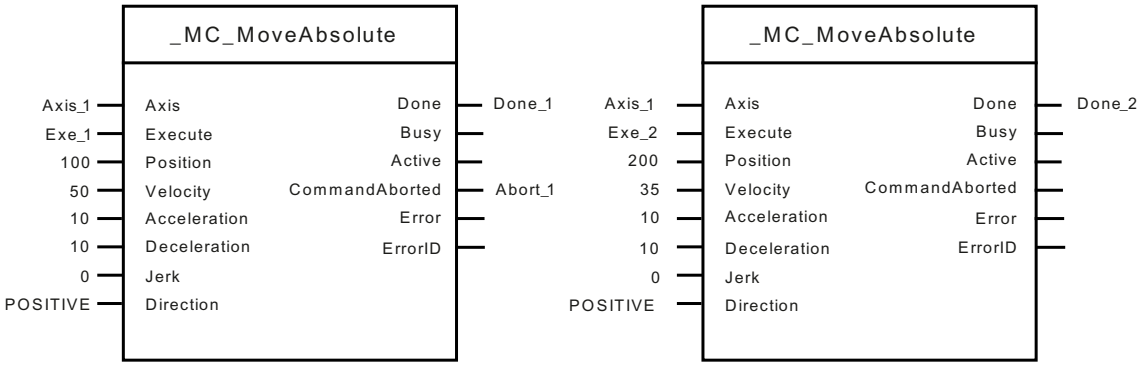
Example

Case A:

Two _MC_MoveAbsolute blocks are started in succession.

Case B:

The second _MC_MoveAbsolute cancels the first _MC_MoveAbsolute block. The target position results relatively from the position at the start of the second block.



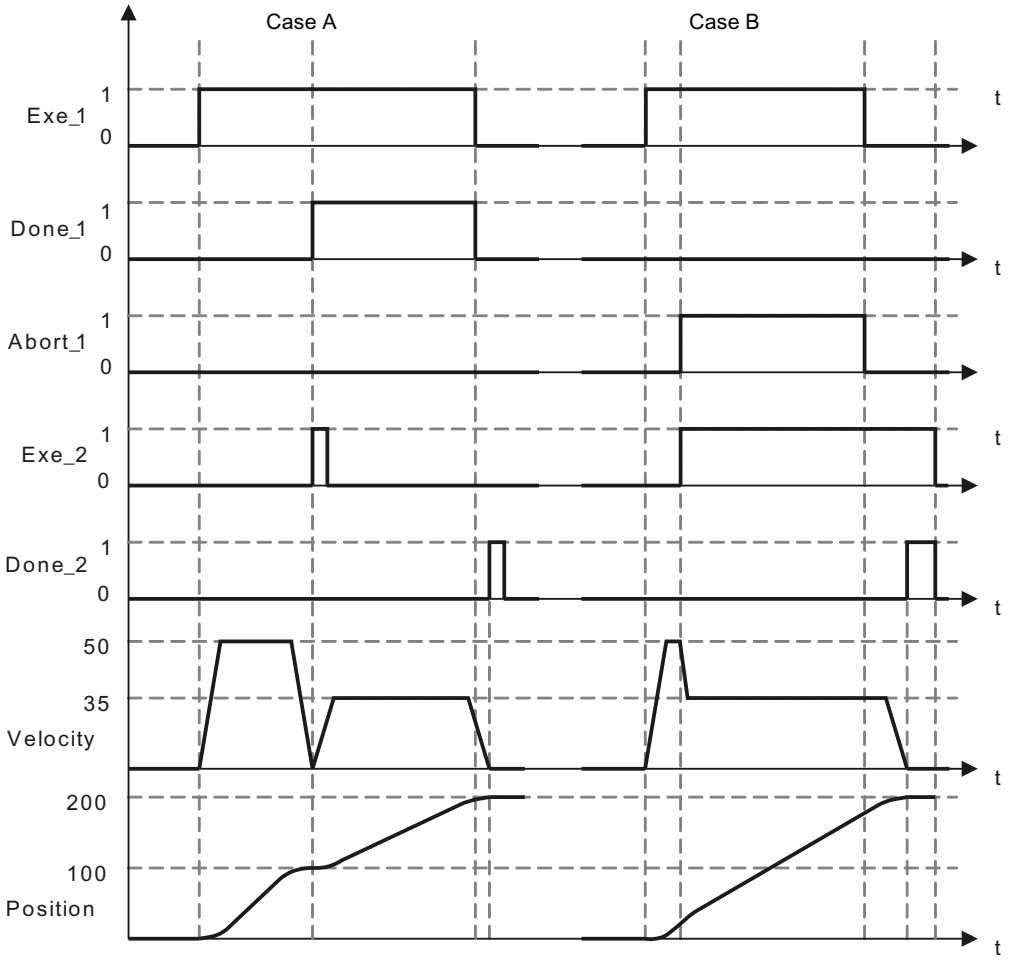


Figure 8-92 _MC_MoveAbsolute Example

_MC_MoveRelative - Relative positioning of axis

Overview

Schematic diagram

Schematic diagram

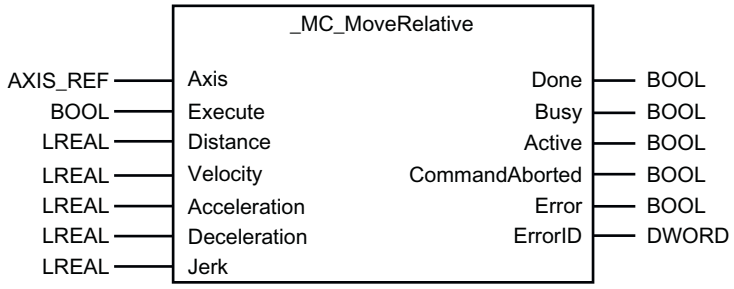

Figure 8-93 _MC_MoveRelative Schematic diagram

Purpose

Purpose

The function block **_MC_MoveRelative** positions an axis relative to the actual position of the axis. If the axis is already in motion when the job is started, the position that is present in the system at the start of the job processing is used as the start position. It must be taken into account that there is a response time between the processing of the function block and the execution of the motion, which depends on the user task in which the function block was programmed and on the set interpolation cycle clock.

The dynamic response parameters **Velocity**, **Acceleration**, **Deceleration** and **Jerk** define the dynamic response of the motion procedure.

The axis stops after completion of the positioning motion.

An active motion command is overridden by the function block.

Note

The state of the "DONE" output depends on the system variable motionstatedata.motionstate.

Deceleration	LREAL	-1.0	Specification of the maximum deceleration (decreasing energy in the motor) Value > 0: The specified value is used. Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.negativeaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Jerk	LREAL	-1.0	Specification of maximum jerk in conjunction with velocity profile definition Value > 0: Acceleration-constant velocity profile (SMOOTH); specified jerk is used Value = 0: Trapezoidal velocity profile (TRAPEZOIDAL) Value < 0: Type of velocity profile results from setting of axis system variable userdefaultdynamics.profile In the case of an effective, acceleration-constant velocity profile (SMOOTH), the preset values in the userdefaultdynamics.positiveaccelstartjerk, userdefaultdynamics.positiveaccelendjerk, userdefaultdynamics.negativeaccelstartjerk, and userdefaultdynamics.negativeaccelendjerk system variables are used. For information on the effects these have, refer to the "TO Axis Electric / Hydraulic, External Encoder" Function Manual; Command variable calculation > Velocity profiles.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Display of the completion of the function block With TRUE, the programmed target position has been reached.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.

Parameter	Data type	Initial value	Description
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6634)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

_MC_MoveVelocity - Traversing axis at a specified velocity

Overview

Schematic diagram

Purpose

Applicable for

Requirements

Input parameters

Output parameters

ErrorIDs

Example

Schematic diagram

Schematic diagram

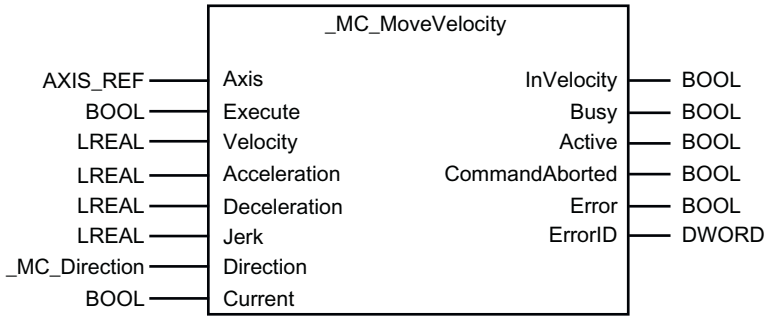

Figure 8-95 _MC_MoveAdditive Schematic diagram

Purpose

Purpose

The technology function **_MC_MoveVelocity** accelerates or decelerates an axis to a set velocity.

The dynamic response parameters **Acceleration**, **Deceleration** and **Jerk** define the dynamic response of the motion procedure.

If a velocity override is in effect, then the end velocity is calculated under consideration of the override. You must take this behavior into account in the user program.

Note

The state of the "DONE" output depends on the system variable motionstatedata.motionstate.

Note

With **_MC_MoveVelocity**, the axis is traversed in position-controlled mode instead of speed-controlled mode

Applicable for

Applications

Drive axes

Positioning axes

Following axes

Path axes

Requirements

Requirements

Axis enabled

No **_MC_Stop** active

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type)
Execute	BOOL	FALSE	Function block enable The axis accelerates or decelerates to the programmed set velocity with a rising edge at this input.
Velocity	LREAL	-1.0	Specification of the set velocity Value ≥ 0: The specified value is used. Value < 0: The preset value in the userdefaultdynamics.velocity system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Acceleration	LREAL	-1.0	Specification of the maximum acceleration (increasing energy in the motor) Value > 0: The specified value is used. Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.positiveaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).

Parameter	Data type	Initial value	Description
Deceleration	LREAL	-1.0	Specification of the maximum deceleration (decreasing energy in the motor) Value > 0: The specified value is used. Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.negativeaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Jerk	LREAL	-1.0	Specification of maximum jerk in conjunction with velocity profile definition Value > 0: Acceleration-constant velocity profile (SMOOTH); specified jerk is used Value = 0: Trapezoidal velocity profile (TRAPEZOIDAL) Value < 0: Type of velocity profile results from setting of axis system variable userdefaultdynamics.profile In the case of an effective, acceleration-constant velocity profile (SMOOTH), the preset values in the userdefaultdynamics.positiveaccelstartjerk, userdefaultdynamics.positiveaccelendjerk, userdefaultdynamics.negativeaccelstartjerk, and userdefaultdynamics.negativeaccelendjerk system variables are used. For information on the effects these have, refer to the "TO Axis Electric / Hydraulic, External Encoder" Function Manual; Command variable calculation > Velocity profiles.
Direction	_MC_Direction	USER_DEFAULT	Specification of the direction of motion: USER_DEFAULT: Default value from axis configuration POSITIVE: Direction of rotation/motion positive NEGATIVE: Direction of rotation/motion negative EFFECTIVE: Last programmed direction of rotation/motion
Current	BOOL	FALSE	Type of velocity specification With TRUE, the actual velocity of the axis is taken over as programmed set velocity. With FALSE, the set velocity programmed on the **Velocity** input is used.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
InVelocity	BOOL	FALSE	Indicates termination of the function block. With TRUE, the axis has reached the programmed setpoint velocity. Until the abort of the function block or until the input Execute = FALSE, the output remains unchanged irrespective of the subsequent characteristic of the axis velocity.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.

Parameter	Data type	Initial value	Description
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6639)).

Note

When speed setpoint = zero (Velocity = 0.0), the following applies:

InVelocity is set when the axis has reached a standstill, and remains set as long as **Execute = 1**.

As soon as **InVelocity** is set, the command is terminated, i.e. **Busy = FALSE**. This means that neither **CommandAborted** nor **Error** can be signaled by the function block.

Note

The behavior of the outputs depends on the task in which the block is processed. The display is only refreshed when the task, in which the block is to be processed, is executed. If the block is called in a non-cyclic task (e.g. MotionTask), then the BUSY parameter may be set to TRUE, but the ACTIVE/INVELOCITY parameters may still display FALSE, because the block, e.g. on the axis, may not be effective yet. Only when the MotionTask is executed does the display change from ACTIVE to TRUE. In a cyclic task such as the BackgroundTask, the blocks are processed cyclically and therefore the BUSY and ACTIVE parameters both display TRUE.

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Troubleshooting - PLCopen Blocks (Page 6733)

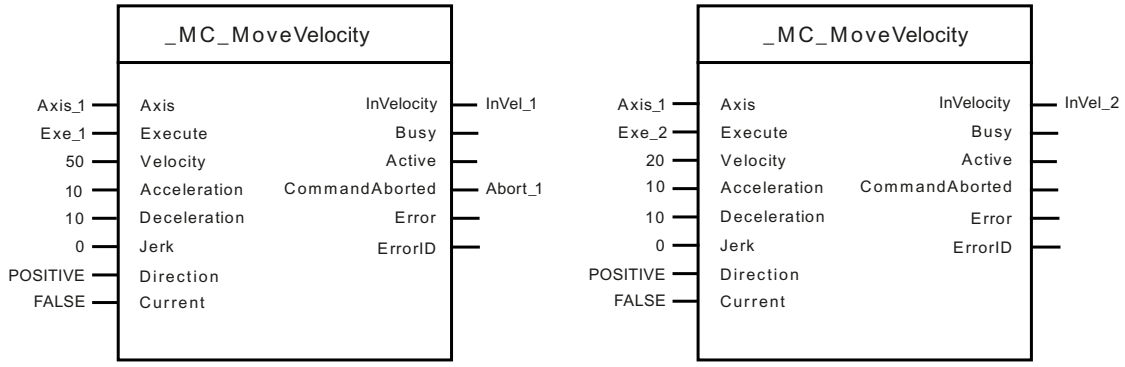
Example

Case A:

An _MC_MoveVelocity block is overridden by another _MC_MoveVelocity block after the end velocity has been reached (**InVelocity = TRUE**).

Case B:

An _MC_MoveVelocity block is overridden by another _MC_MoveVelocity block before the end velocity has been reached (**InVelocity = FALSE**).



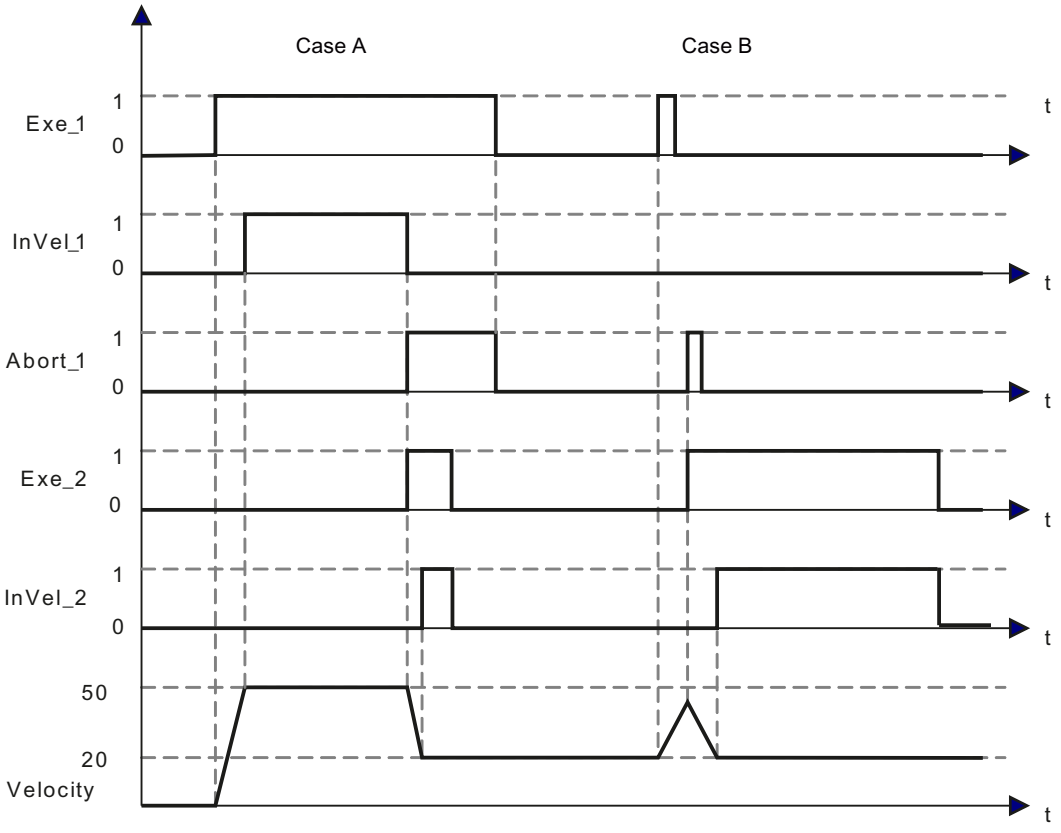


Figure 8-96 _MC_MoveVelocity Example

_MC_MoveAdditive - Relative positioning to current target position

Overview

Schematic diagram

Schematic diagram

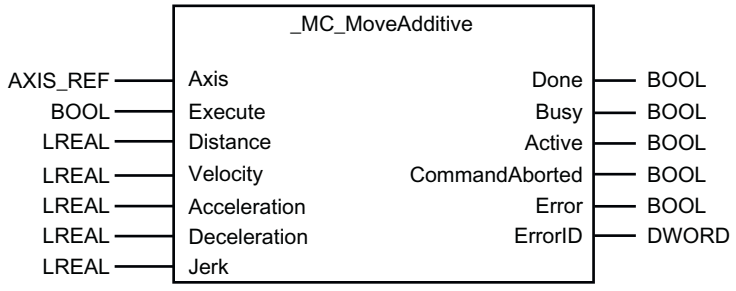

Figure 8-97 _MC_MoveAdditive Schematic diagram

Purpose

Purpose

The function block **_MC_MoveAdditive** positions an axis relative to the target position of the active positioning command. The function block enables a correction of the target position of the previous positioning command by a distance specified at the Distance input.

The dynamic response parameters **Velocity**, **Acceleration**, **Deceleration** and **Jerk** define the dynamic response of the motion procedure.

The axis stops after completion of the positioning motion.

An active motion command is overridden by the function block.

Note

The state of the "DONE" output depends on the system variable motionstatedata.motionstate.

Applicable for

Applications

Positioning axes

Following axes

Path axes

Requirements

Requirements

Axis enabled

No **_MC_Stop** active

The axis must be homed if the TypeOfAxis.Homing.referencingNecessary axis configuration data item has been set to YES (homing required), and

- the axis is in motion, or
- **_MC_MoveAdditive** overrides an active motion command (exception: **_MC_MoveVelocity**).

Note

The function block **_MC_MoveAdditive** behaves like a **_MC_MoveRelative** function block, if

- The axis is stationary at the start of the job or
- An active motion command without defined target position is overridden by the function block. The target position then depends on the position of the axis at the time of the override and the additional distance to be traversed.

Input parameters

Input parameters

Parameters	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type)
Execute	BOOL	FALSE	Function block enable The positioning operation starts with a rising edge at this input.
Distance	LREAL	0.0	Specification of the additional distance difference to be traversed
Velocity	LREAL	-1.0	Specification of the maximum velocity The velocity is reached depending on the set values for traversing distance, acceleration and jerk. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.velocity system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Acceleration	LREAL	-1.0	Specification of the maximum acceleration (increasing energy in the motor) Value > 0: The specified value is used. Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.positiveaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).

Parameters	Data type	Initial value	Description
Deceleration	LREAL	-1.0	Specification of the maximum deceleration (decreasing energy in the motor) Value > 0: The specified value is used. Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.negativeaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Jerk	LREAL	-1.0	Specification of maximum jerk in conjunction with velocity profile definition Value > 0: Acceleration-constant velocity profile (SMOOTH); specified jerk is used Value = 0: Trapezoidal velocity profile (TRAPEZOIDAL) Value < 0: Type of velocity profile results from setting of axis system variable userdefaultdynamics.profile In the case of an effective, acceleration-constant velocity profile (SMOOTH), the preset values in the userdefaultdynamics.positiveaccelstartjerk, userdefaultdynamics.positiveaccelendjerk, userdefaultdynamics.negativeaccelstartjerk, and userdefaultdynamics.negativeaccelendjerk system variables are used. For information on the effects these have, refer to the "TO Axis Electric / Hydraulic, External Encoder" Function Manual; Command variable calculation > Velocity profiles.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Display of the completion of the function block With TRUE, the axis is at the resulting position setpoint.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6646)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Case B:

The second _MC_MoveAdditive cancels the first _MC_MoveAdditive block. The target position results from the target position of the first block.

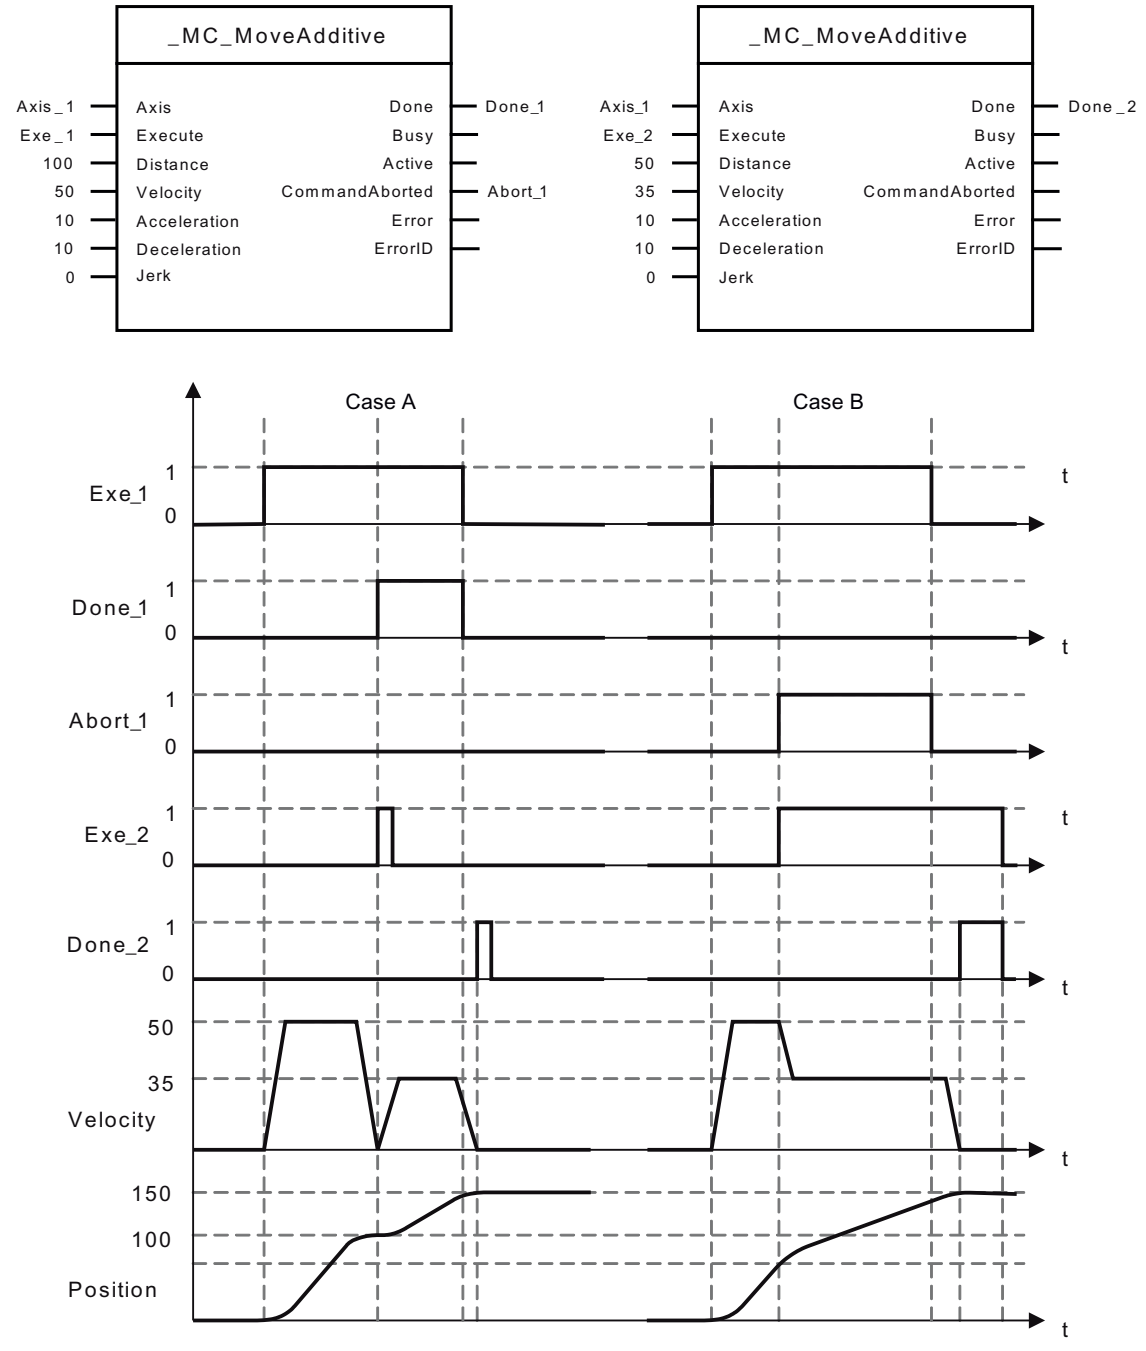

Figure 8-98 _MC_MoveAdditive Example

_MC_MoveSuperimposed - Superimposed positioning

Overview

Schematic diagram

Schematic diagram

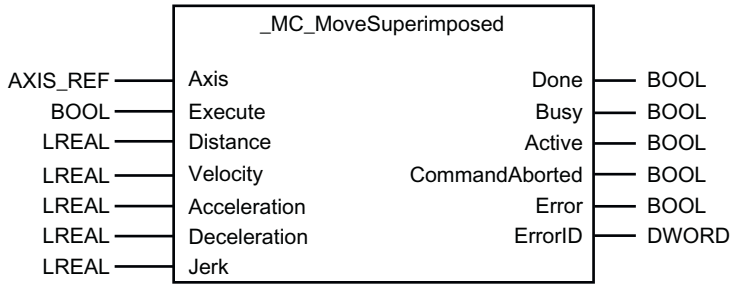

Figure 8-99 _MC_MoveSuperimposed Schematic diagram

Purpose

Purpose

The function block **_MC_MoveSuperImposed** starts a positioning motion relative to the active positioning motion of an axis. This enables a superimposed positioning of an axis, e.g. for the print-mark correction.

The dynamic response parameters **VelocityDiff**, **Acceleration**, **Deceleration** and **Jerk** define the dynamic response of the motion procedure.

An active motion command (main motion) is not overridden by the function block.

An active superimposed positioning motion is overridden by a restart of the function block **_MC_MoveSuperImposed**. The remaining distance-to-go of the overridden superimposed positioning motion is lost.

Note

The state of the "DONE" output depends on the system variable motionstatedata.motionstate.

Applicable for

Applications

Positioning axes

Following axes

Path axes

Requirements

Requirements

Axis enabled

No **_MC_Stop** active

The axis velocity is increased for the superimposed positioning operation. Therefore, the basic motion of the axis should not be performed with the maximum permissible velocity.

Input parameters

Input parameters

Parameters	Data type	Initial value	Description

_MC_Reset - Resetting errors/alarms on the axis or triggering a restart

Overview

Schematic diagram

Schematic diagram

Schematic diagram

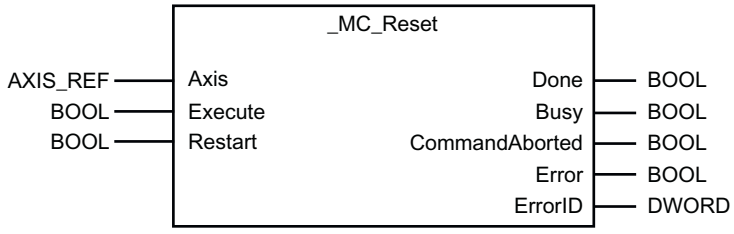

Figure 8-105 _MC_Reset Schematic diagram

Purpose

Purpose

The function block **_MC_Reset** resets all errors on an axis or external encoder that can be acknowledged by means of the software. Fatal errors can be acknowledged via Power off/on or reloading of the project to the module.

If the **Restart** input is set, the transferred technology object is re-initialized via **_MC_Reset**. Axes that are operated with incremental encoders return to the **Not homed** mode.

Applicable for

Applications

Drive axes
Positioning axes
Following axes
Path axes
External Encoders

Requirements

Requirements

The restart of an axis depends on the condition set with configuration data item **restartAxisCondition**.

Note

- Set the input **Restart** to **FALSE**, only when the errors present on the transferred technology object are to be acknowledged.
- No variables of the technology object are updated during the restart operation!

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Execute	BOOL	FALSE	Function block enable With a rising edge at this input, the function block acknowledges the errors present on the transferred technology object or optionally triggers a restart.
Restart	BOOL	FALSE	Specification of the reset type With TRUE, the transferred technology object is restarted and modified configuration data are accepted. With FALSE, the alarms pending on the transferred technology object are acknowledged.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Display of the completion of the function block The alarms have been acknowledged or a restart performed.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.

Parameter	Data type	Initial value	Description
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6665)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Example

Case A:

The _MC_Reset block resets active errors/alarms at the axis transferred on input parameter **Axis**.

Case B:

The _MC_Reset block triggers a restart at the axis transferred on input parameter **Axis**.

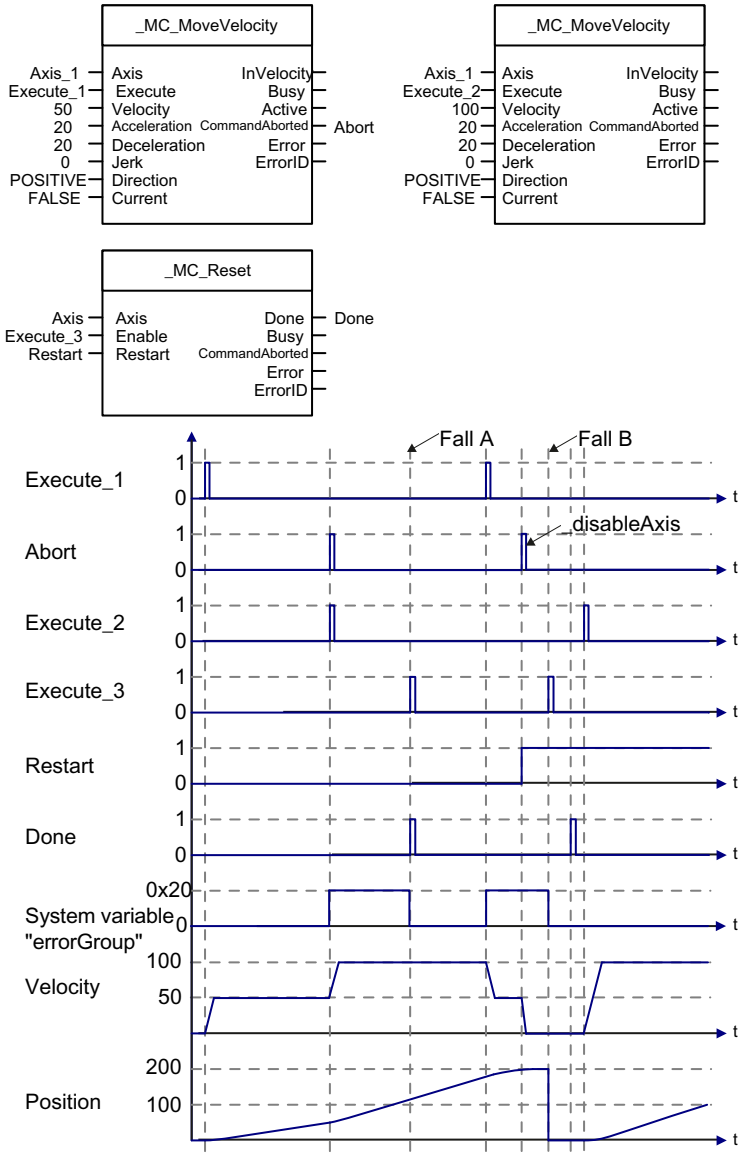

Figure 8-106 _MC_Reset example

_MC_ReadActualPosition - Reading actual position of axis

Overview

Schematic diagram

Purpose

Applicable for

Schematic diagram

Schematic diagram

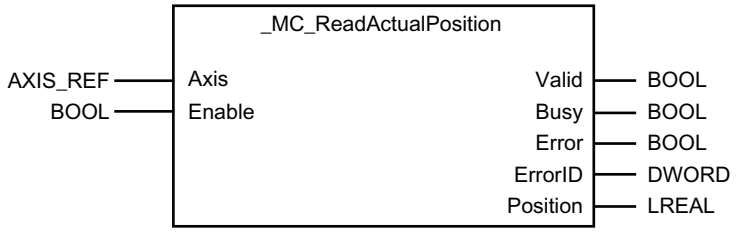

Figure 8-107 _MC_ReadActualPosition Schematic diagram

Purpose

Purpose

The function block **_MC_ReadActualPosition** reads the actual position of an axis or an external encoder.

As an output value, the block supplies:

- The value for the **positioningState.actualPosition** system variable, in the case of axes
- The value for the **motionState.position** system variable, in the case of external encoders

Applicable for

Applications

Positioning axes
Following axes
Path axes
External encoders

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Enable	BOOL	FALSE	Function block enable The value at output **Position** is updated as long as **Enable** equals **TRUE**.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Valid	BOOL	FALSE	Display of the validity of the value which can be read at output **Position**.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6668)).
Position	LREAL	0.0	Displays the actual position of the axis or external encoder

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Purpose

Purpose

The function block **_MC_ReadStatus** reads various states of an axis or an external encoder.

Applicable for

Applications

Drive axes

Positioning axes

Following axes

Path axes

External encoders

Input parameters

Input parameters

Parameters	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Enable	BOOL	FALSE	Function block enable The values at the status outputs are updated as long as **Enable** equals **TRUE**.

Output parameter

Output parameter

Table 8-172 Generally applicable output parameter

Parameter	Data type	Initial value	Description
Valid	BOOL	FALSE	Display of the validity of the values that can be read at the status outputs
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6672)).

Table 8-173 Output parameters for axes

Parameter	Data type	Initial value	Description
ErrorStop	BOOL	FALSE	Display of an active axis stop triggered by an error
Disabled	BOOL	FALSE	Display of no enable of the axis
Stopping	BOOL	FALSE	Display of an active regular axis stop
StandStill	BOOL	FALSE	Display of the standstill signal of the axis
DiscreteMotion	BOOL	FALSE	Display of an active single axis motion with discrete target position
ContinuousMotion	BOOL	FALSE	Display of an active single axis motion without a discrete target position

Parameter	Data type	Initial value	Description
SynchronizedMotion	BOOL	FALSE	Display of an active synchronous operation on the axis
Homing	BOOL	FALSE	Display of an active homing procedure on the axis
ConstantVelocity	BOOL	FALSE	Display of traversing the axis with a constant velocity
Accelerating	BOOL	FALSE	Display of traversing the axis with an accelerating velocity
Decelerating	BOOL	FALSE	Display of traversing the axis with a decelerating velocity

Table 8-174 Output parameter for external encoders

Parameter	Data type	Initial value	Description
ErrorStop	BOOL	FALSE	Display of an error on the external encoder
Disabled	BOOL	FALSE	Display of no enable of the external encoder
StandStill	BOOL	FALSE	Display of the standstill signal of the external encoder
Homing	BOOL	FALSE	Display of an active homing procedure on the external encoder
ConstantVelocity	BOOL	FALSE	Display of a constant velocity that is measured/determined by the external encoder
Accelerating	BOOL	FALSE	Display of an accelerating velocity that is measured/determined by the external encoder
Decelerating	BOOL	FALSE	Display of a decelerating velocity that is measured/determined by the external encoder

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Example

The _MC_ReadStatus block reads the motion statuses of the axis transferred on the **Axis** input parameter during an active positioning command.

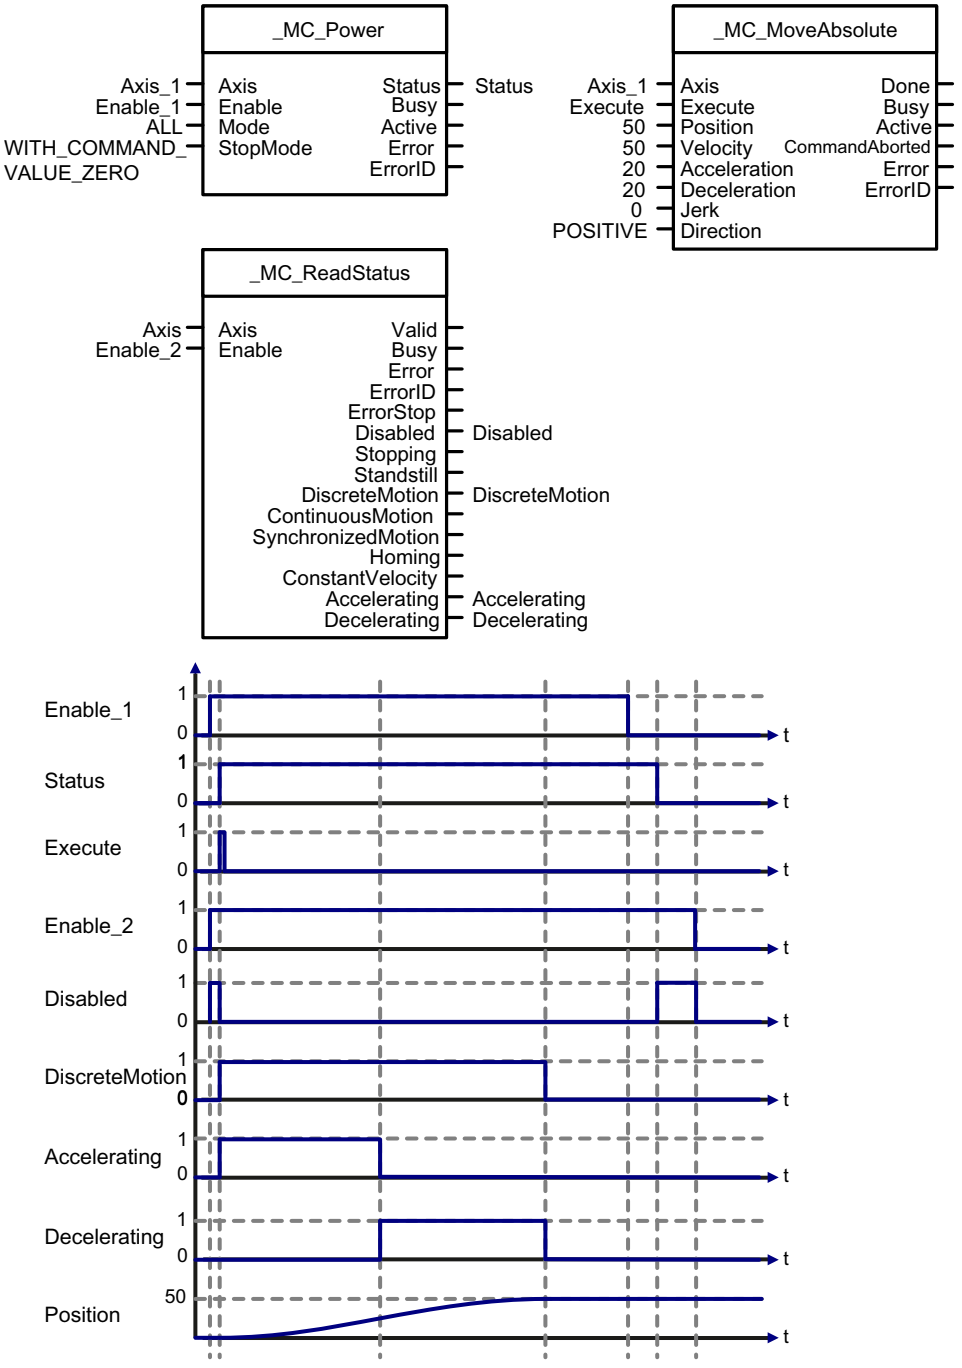

Figure 8-110 _MC_ReadStatus example

_MC_ReadAxisError - Reading an axis error

Overview

Schematic diagram

Schematic diagram

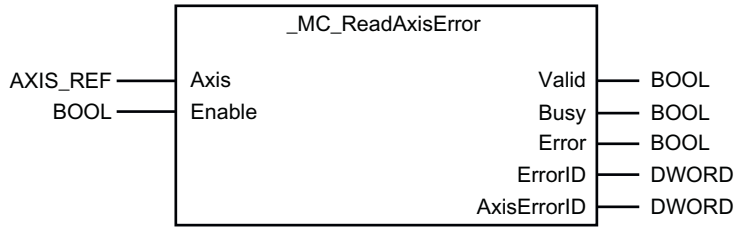

Figure 8-111 _MC_ReadAxisError Schematic diagram

Purpose

Purpose

The function block **_MC_ReadAxisError** reads the error status of an axis or an external encoder. The error status is a 32-bit representation of all alarms present on the technology object.

Applicable for

Applications

Drive axes
Positioning axes
Following axes
Path axes
External encoders

Input parameters

Input parameters

Parameters	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Enable	BOOL	FALSE	Function block enable The value at output **AxisErrorID** is updated as long as **Enable** equals **TRUE**.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Valid	BOOL	FALSE	Display of the validity of the value which can be read at output **AxisErrorID**.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6675)).
AxisErrorID	DWORD	0	Displays the error status of the axis or external encoder For more information, refer to the section Query of general errors with the _MC_ReadAxisError function block (Page 6737).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Generally, the following is valid:

- The **ErrorID** on the **_MC_...** function blocks refer to special block-related errors and to errors on the axis
- The **AxisErrorID** on the **_MC_ReadAxisError** function block refers to errors on the axis

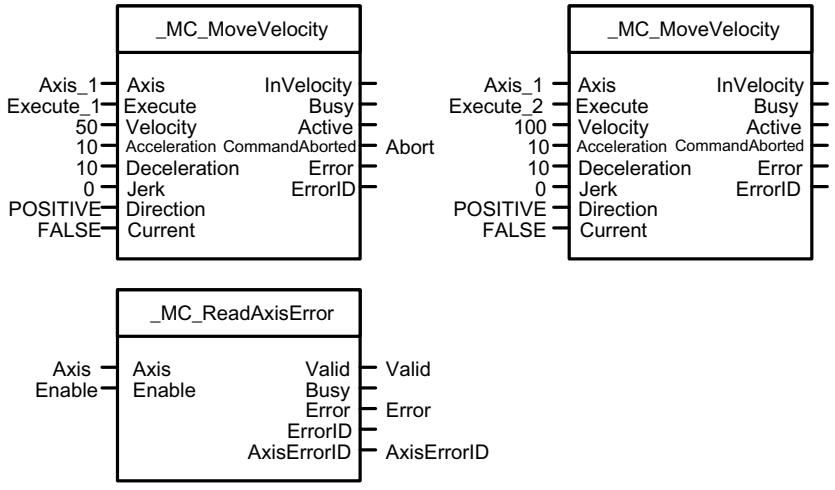
Query of general errors with the _MC_ReadAxisError function block (Page 6737)

Example

The _MC_ReadAxisError block reads the group error bit string ("errorGroup" system variable) value of the axis transferred on the **Axis** input parameter.



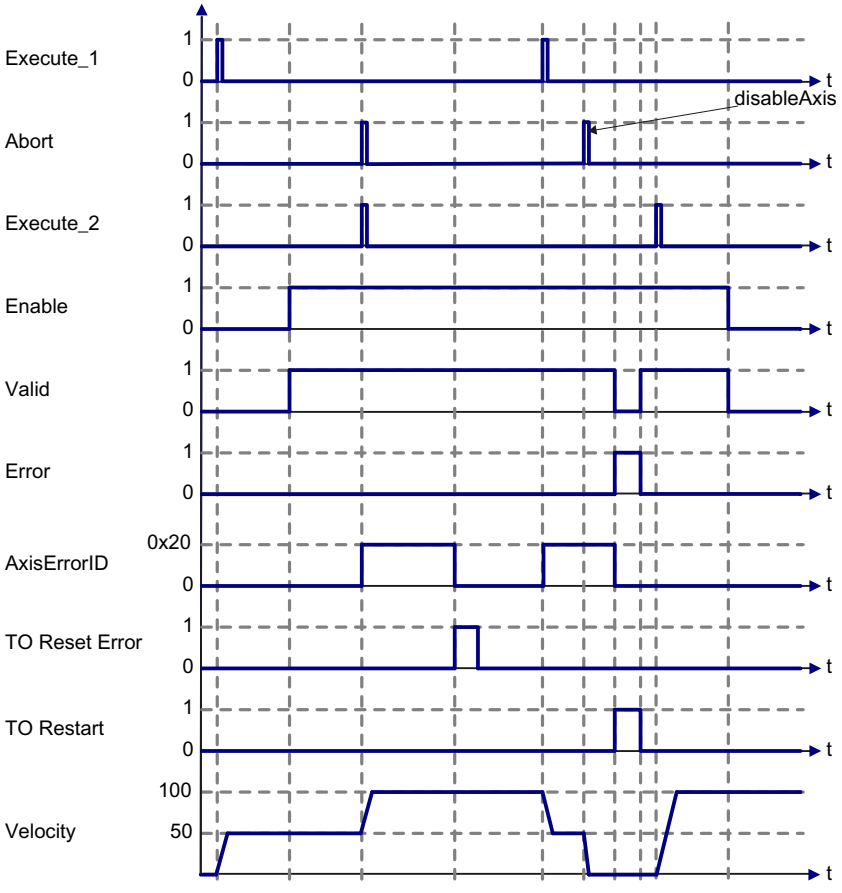


Figure 8-112 _MC_ReadAxisError example

_MC_ReadParameter - Reading axis parameter and outputting in data type LREAL

Overview

Schematic diagram

Schematic diagram

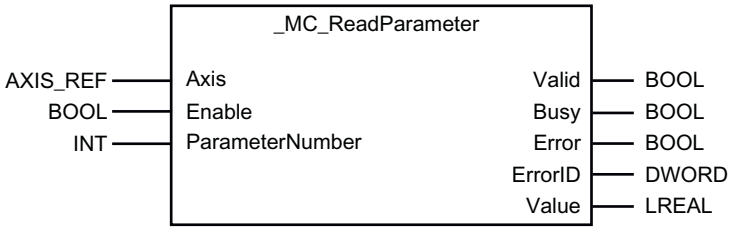

Figure 8-113 _MC_ReadParameter Schematic diagram

Purpose

Purpose

The function block **_MC_ReadParameter** reads values of various parameters of an axis or external encoder. Each parameter is specified by a number.

Applicable for

Applications

Drive axes
Positioning axes
Following axes
Path axes
External encoders

Input parameters

Input parameters

Parameters	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Enable	BOOL	FALSE	Function block enable The value at output **Value** is updated as long as **Enable** equals **TRUE**.
ParameterNumber	INT	0	Specification of the number of the parameter to be read (see table below).

Parameter description for input ParameterNumber

Table 8-175 Input ParameterNumber for axes

Parameter	Data type	Access	Description
1	LREAL	Read	**positioningstate.commandposition**: Axis position setpoint
2	LREAL	Read/Write	**swlimit.plusposition**: Position of the positive software limit switch (10^12 is output with inactive limit switch.)
3	LREAL	Read/Write	**swlimit.minusposition**: Position of the negative software limit switch (-10^12 is output with inactive limit switch.)
7 [1)]	LREAL	Read/Write	**typeofaxis.numberofdatasets.dataset_x.dynamicfollowing.minpositiontolerance**: Minimum permissible following error
8	LREAL	Read/Write	**typeofaxis.maxvelocity.maximum**: Maximum permissible velocity
10	LREAL	Read	**motionstatedata.actualvelocity:** Actual axis velocity (A value is only displayed if an encoder was configured on the axis. For drive axes, the encoder must be configured for the setpoint acceptance if applicable.)
11	LREAL	Read	**motionstatedata.commandvelocity**: Axis velocity setpoint
12	LREAL	Read/Write	**typeofaxis.maxacceleration.maximum**: Maximum permissible acceleration
16	LREAL	Read/Write	**typeofaxis.maxjerk.maximum**: Maximum permissible jerk

[1)] The "x" in the name "dataset_x" stands for the active data set.

Table 8-176 Input ParameterNumber for external encoders

Parameter	Data type	Access	Description
10	LREAL	Read	**motionState.velocity:** Actual velocity measured by the external encoder

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Valid	BOOL	FALSE	Indicates the validity of the value that can be read at output **Value**
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6680)).
Value	LREAL	0.0	Display of the parameter value

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Example

The _MC_ReadParameter block reads the actual velocity of the axis transferred on the **Axis** input parameter.

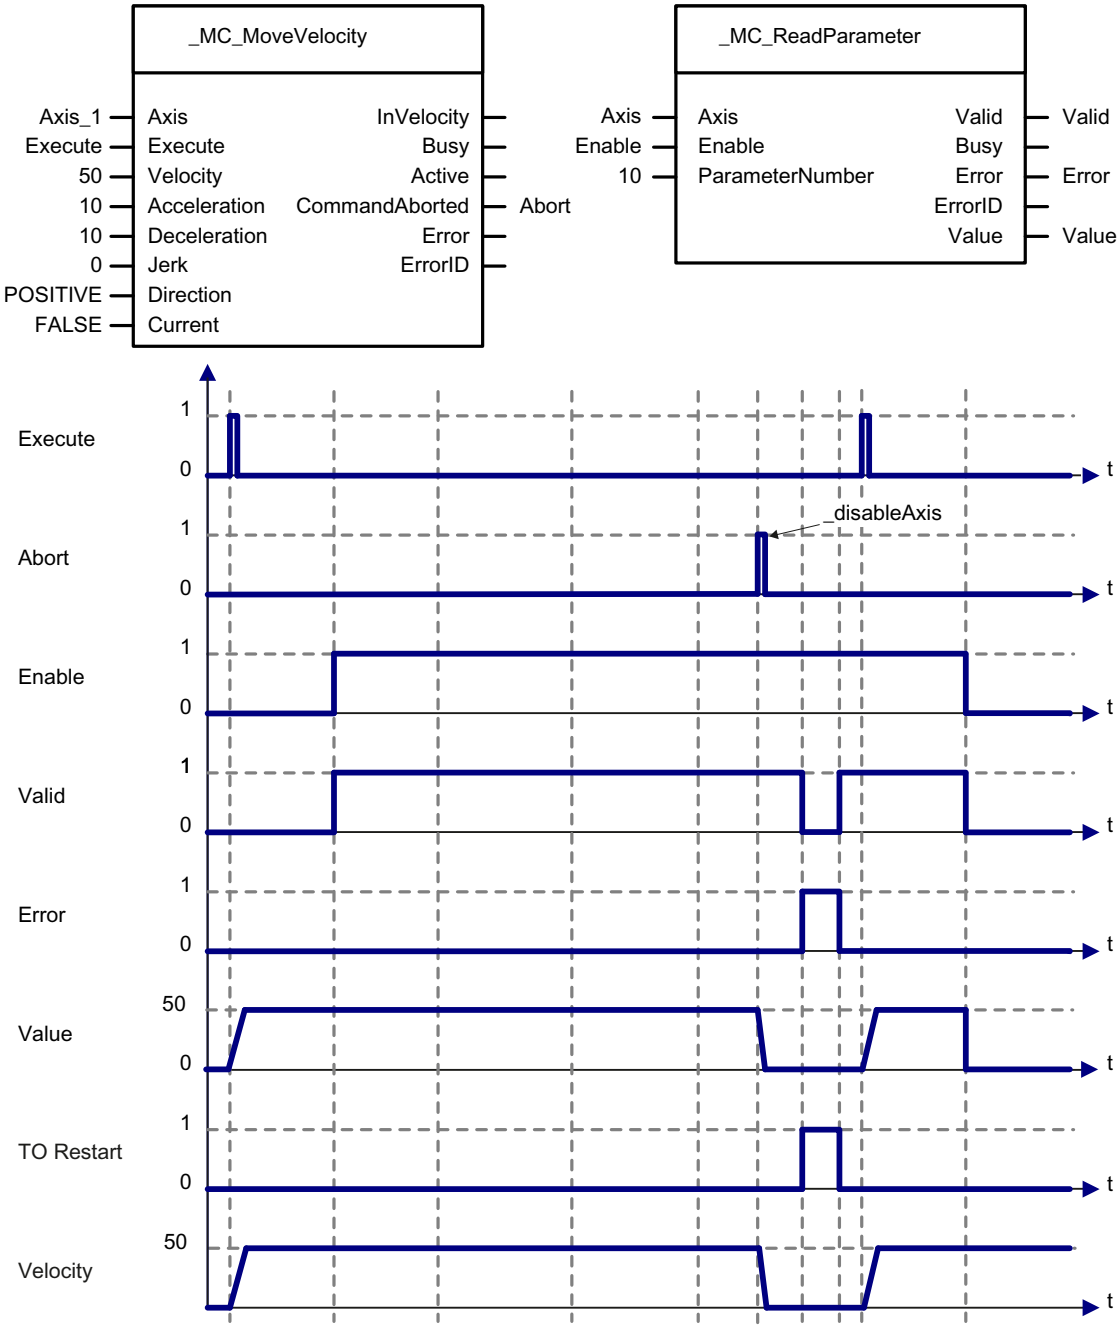

Figure 8-114 _MC_ReadParameter example

_MC_ReadBoolParameter - Reading axis parameter and outputting in data type BOOL

Overview

Schematic diagram

Schematic diagram

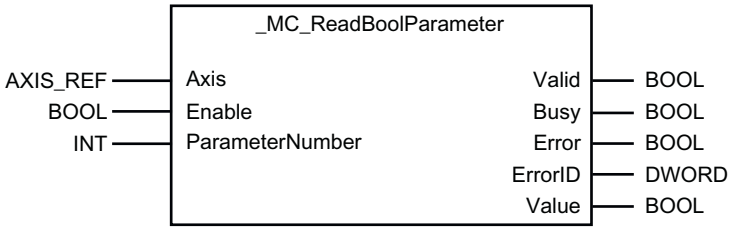

Figure 8-115 _MC_ReadBoolParameter Schematic diagram

Purpose

Purpose

The function block **_MC_ReadBoolParameter** reads values of various parameters of an axis or external encoder. Each parameter is specified by a number. The return value of the parameter is converted to the data type of the function block (BOOL), i.e. values that are not of the data type BOOL are converted to FALSE when they are exactly 0 and to TRUE in all other cases.

Applicable for

Applications

Drive axes
Positioning axes
Following axes
Path axes

Input parameters

Input parameters

Parameters	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Drive axis (driveAxis data type) • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Enable	BOOL	FALSE	Function block enable The value at output **Value** is updated as long as **Enable** equals **TRUE**.
ParameterNumber	INT	0	Specification of the number of the parameter to be read (see table below).

Parameter description for input ParameterNumber

Table 8-177 Input ParameterNumber for axes

Parameter	Data type	Description
4	BOOL	**swlimit.state**: Activation state of the two software limit switches (The limit switches are always activated or deactivated together.)
6 [1)]	BOOL	**typeofaxis.numberofdatasets.dataset_x.dynamicfollowing.enable**: Activation state of the following error monitoring

[1)] The "x" in the name "dataset_x" stands for the active data set.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Valid	BOOL	FALSE	Indicates the validity of the value that can be read at output **Value**
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.

Parameter	Data type	Initial value	Description
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6684)).
Value	BOOL	FALSE	Display of the parameter value

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

_MC_GearIn - Starting gearing

Overview

Schematic diagram

Purpose

Applicable for

Requirements

Input parameters

Output parameters

ErrorIDs

Examples

Schematic diagram

Schematic diagram

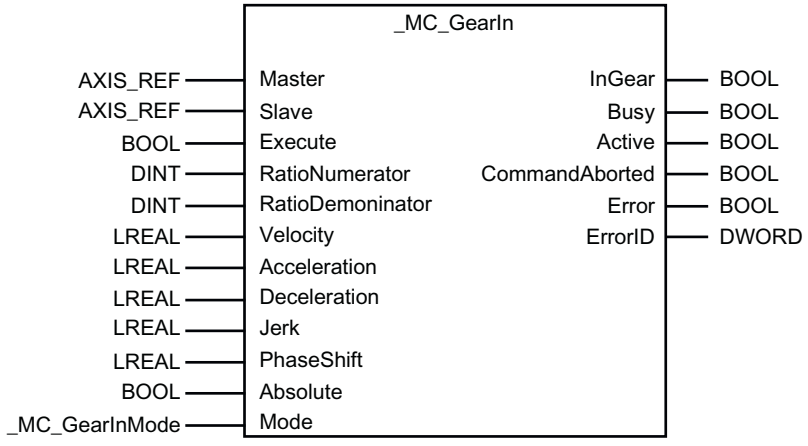

Figure 8-121 _MC_GearIn Schematic diagram

Purpose

Purpose

The function block **_MC_GearIn** starts a gearing between a master and a slave axis.

The dynamic response parameters **Velocity**, **Acceleration**, **Deceleration**, and **Jerk** define the dynamic response of the slave axis during synchronization in accordance with time.

The gear ratio is specified as a fraction.

Synchronous operation may be:

- relative to the start position or synchronization position
- absolute, in relation to the axis zero

By transmitting a new _MC_GearIn command, the gear ratio can be changed during operation. This operation does not require the master or slave axis to be stopped. Transitions are executed according to specified acceleration or deceleration values.

The function block can be started when the leading axis is at a standstill, or when it is in motion.

Applicable for

Applications

Master:

- Positioning axes
- Following axes
- Path axes
- External Encoders
- ...

Slave:

- Following axes
- Path axes with synchronous operation activated

Requirements

Requirements

The master is set for use as a potential master value at the synchronous object of the slave axis.

Master and slave axes are enabled.

No **_MC_Stop** active on the slave axis

Input parameters

Input parameters

Parameters	Data type	Initial value	Description
Master	AXIS_REF	0	Specification of reference to the master (name of TO) The following technology objects can be homed: • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Slave	AXIS_REF	0	Specification of reference to the slave axis (name of TO) The following technology objects can be homed: • Following axis (followingAxis data type) • Path axis with synchronous operation activated (_pathAxis data type)
Execute	BOOL	FALSE	Function block enable The slave axis is synchronized with the interconnected master with a rising edge on this input.
RatioNumerator	DINT	1	Specification of the numerator of the gear ratio
RatioDenominator	DINT	1	Specification of the denominator of the gear ratio
Velocity	LREAL	-1.0	Specification of the maximum synchronization velocity The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.velocity system variable of the interconnected synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Acceleration	LREAL	-1.0	Specification of the maximum synchronization acceleration The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.positiveaccel system variable of the interconnected synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).

Parameters	Data type	Initial value	Description
Deceleration	LREAL	-1.0	Specification of the maximum synchronization deceleration The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.neagtiveaccel system variable of the interconnected synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Jerk	LREAL	-1.0	Specification of the maximum synchronization jerk The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. To activate the jerk limitation, the configuration data **SyncingMotion.smoothAbsoluteSynchronization** on the interconnected synchronous object must be set to **YES**. Otherwise the parameter specification for **Jerk** is ignored and a trapezoidal velocity profile is always used. Value > 0: The specified value is used Value = 0: Use trapezoidal velocity profile Value < 0: The preset values in the system variables userdefault.syncdynamics.positiveaccelstartjerk, userdefault.syncdynamics.positiveaccelendjerk, userdefault.syncdynamics.negativeaccelstartjerk, and userdefault.syncdynamics.negativeaccelendjerk of the interconnected synchronous object are used (see "Preassignment > Dynamic Response" dialog at synchronous object).
PhaseShift	LREAL	0.0	Specification of the master value-related phase shift during synchronous operation The phase shift is absolute when synchronous operation is reached if **Absolute** = TRUE. The specified phase shift is added to the phase offset determined by the relative relationship if **Absolute** = FALSE. Value ≠ 0: The specified value is used Value = 0: No phase shift Slave value = gear ratio x (master value − PhaseShift)

Parameters	Data type	Initial value	Description
Absolute	BOOL	TRUE	Specification of the gearing type With TRUE, gearing is absolute in relation to the axis zero for the relevant axes. A phase shift can be set via the parameter **PhaseShift**. With FALSE, gearing is relative to the start position or synchronization position. A phase shift at the **PhaseShift** input during synchronization does not result in any additional shifting of the slave position in relation to the master. However, the phase shift is accepted as an absolute shift between the master and slave (system variable gearingadjustments.master.offset).
Mode	_MC_GearInMode	USER_DEFAULT	Specification of the synchronization mode / engage mode USER_DEFAULT: With the exception of the values set at the block inputs • Absolute (userDefault.gearingSettings.typeOfGearing), • RatioNumerator (userDefault.gearingSettings.defineMode, userDefault.gearingSettings.numerator), and • RatioDenominator (userDefault.gearingSettings.defineMode, userDefault.gearingSettings.denominator) the synchronization parameters preset at the synchronous object in the "Preassignment > Gearing" (→ system variables under userdefault.gearingsettings...) and "Preassignment > Dynamic Response" (→ system variables under userdefault.syncdynamics...) dialogs are accepted. IMMEDIATELY_BY_TIME_PROFILE: Synchronization is performed immediately by time, taking account of the dynamic response values set on the function block. Synchronous operation is operated using the synchronous object settings • "Time-related synchronization" profile specification from the "Preassignment > Dynamic Response" dialog (userDefault.syncprofile.syncprofilereference parameter equals RELATE_SYNC_PROFILE_TO_TIME), • Synchronization "with immediate effect" from the "Preassignment > Gear Synchronization" dialog (parameter userDefault.gearingsettings.synchronizingmode equals IMMEDIATELY), and • "Compatibility mode" synchronization direction (userDefault.gearingsettings.synchronizingdirection parameter equals SYSTEM_DEFINED [1]).

[1] SYSTEM_DEFINED corresponds to the **shortest distance** setting, although the direction of motion is maintained while the axis is in motion.

Note

The gearing direction is preassigned by userDefault.GearingSettings.direction (Preassignment > Gearing > Direction). The direction can also be inverted, e.g. for synchronous operation in the opposite direction.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
InGear	BOOL	FALSE	Display of the synchronism of the master and slave axis With TRUE, the slave axis is in synchronous operation with the master.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6699)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

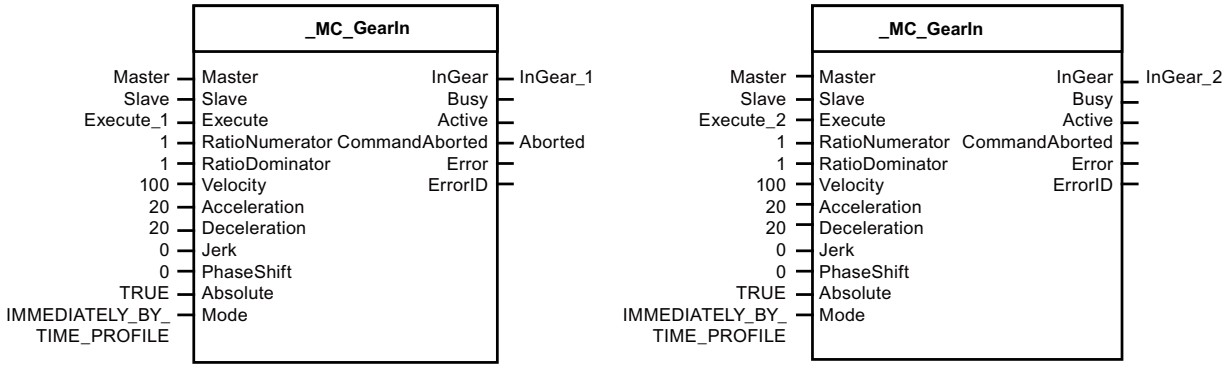
Examples

Example: Gearing

At the master axis, a positioning command is active at 100 mm. Two mutually overriding _MC_GearIn blocks with different gear ratios establish the gearing between the axes transferred on the **master** and **slave** input parameters.



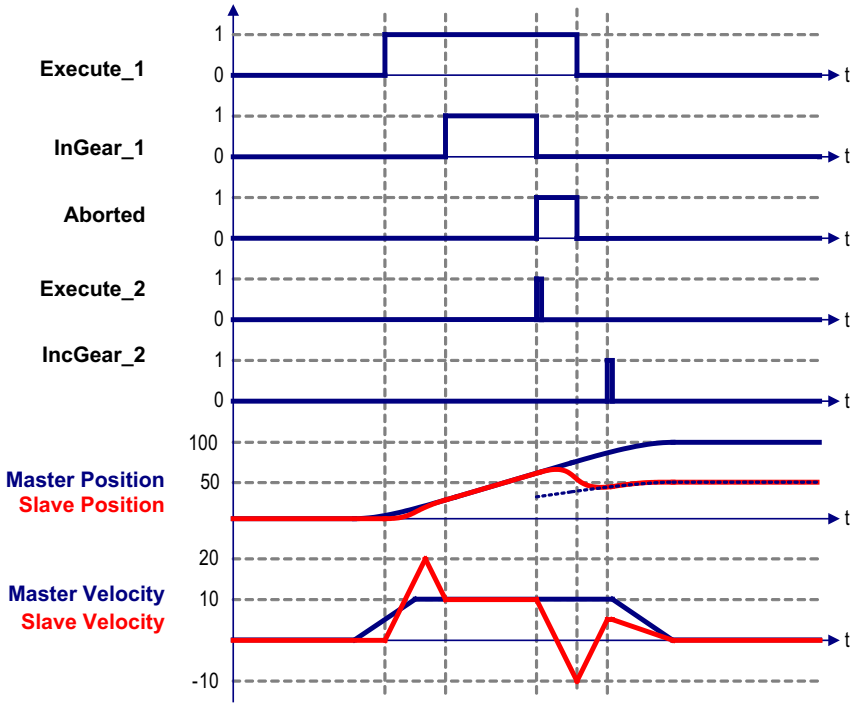


Figure 8-122 _MC_GearIn example: Gearing

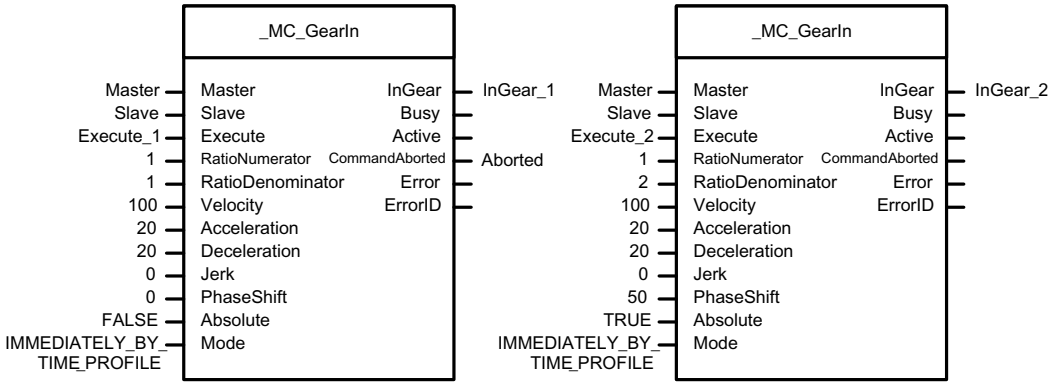
Example: Gearing with gear ratio

At the master axis, a positioning command is active at 100 mm. Two mutually overriding _MC_GearIn blocks with different gear ratios establish the gearing between the axes transferred on the **master** and **slave** input parameters. While the first block is being executed, the slave position changes relative to the master position. While the second block is being executed, the slave position changes absolutely in relation to the master position, i.e. the slave position is the same as the master position evaluated using the gear ratio (RatioNumerator = 1, RatioDenominator = 2).



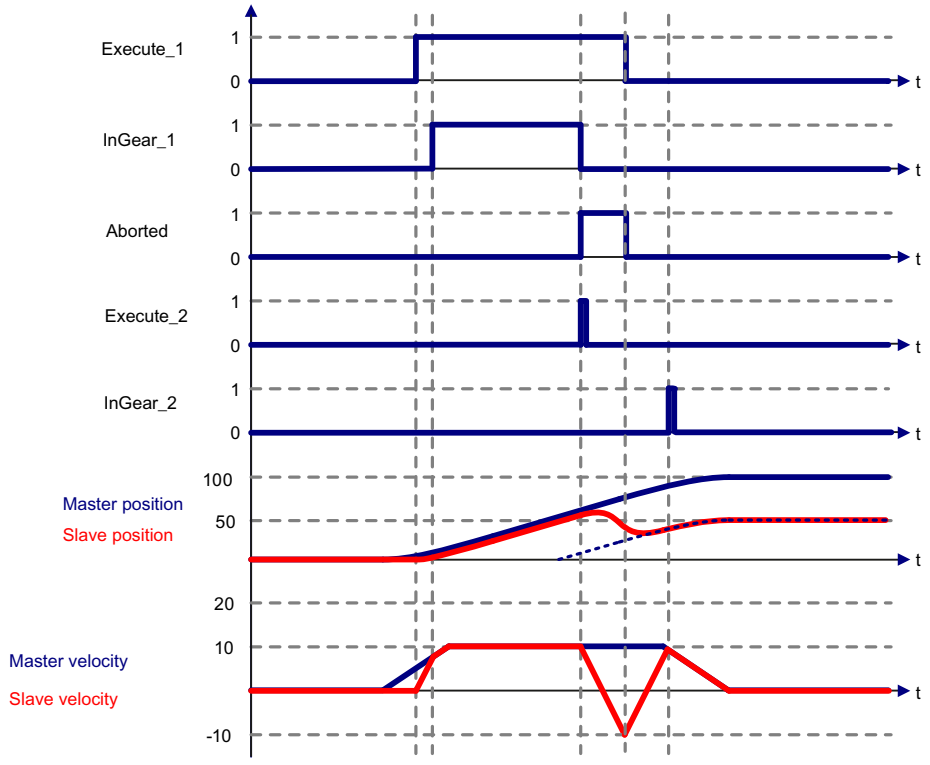


Figure 8-123 _MC_GearIn example: Gearing with gear ratio

_MC_GearOut - Terminating gearing

Overview

Schematic diagram

Schematic diagram

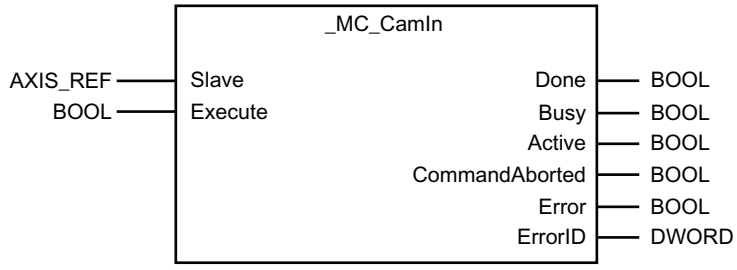

Figure 8-124 _MC_GearOut Schematic diagram

Purpose

Purpose

The function block **_MC_GearOut** terminates a gearing and stops the slave axis. The slave axis is desynchronized in accordance with the presettings at the synchronous object in the "Preassignment > Gearing" (→ system variables under **userdefault.gearingsettings...**) and "Preassignment > Dynamic Response" (→ system variables under **userdefault.syncdynamics...**) dialogs.

Recommendation

Use the function block when the shutdown procedure is to depend on the position of the master and/or the slave axis. You can also remove the slave axis from the synchronous operation with the technology functions **_MC_Stop**, **_MC_MoveRelative**, **_MC_MoveAdditive**, **_MC_MoveAbsolute** or **_MC_MoveVelocity**.

Applicable for

Applications

Following axes

Path axes with synchronous operation activated

Requirements

Requirements

A gearing must be active on the slave axis. If no synchronous operation is active, the function block is aborted.

No **_MC_Stop** active on the slave axis.

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Slave	AXIS_REF	0	Specification of reference to the slave axis (name of TO) The following technology objects can be homed: • Following axis (followingAxis data type) • Path axis with synchronous operation activated (_pathAxis data type)
Execute	BOOL	FALSE	Function block enable The synchronous operation of the slave axis with the interconnected master is terminated with a rising edge on this input.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Display of the completion of the function block With TRUE, the slave axis has been desynchronized from the interconnected master.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.

Parameter	Data type	Initial value	Description
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6704)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

_MC_CamIn - Starting camming

Overview

Schematic diagram

Purpose

Applicable for

Requirements

Input parameters

Output parameters

ErrorIDs

Examples

Schematic diagram

Schematic diagram

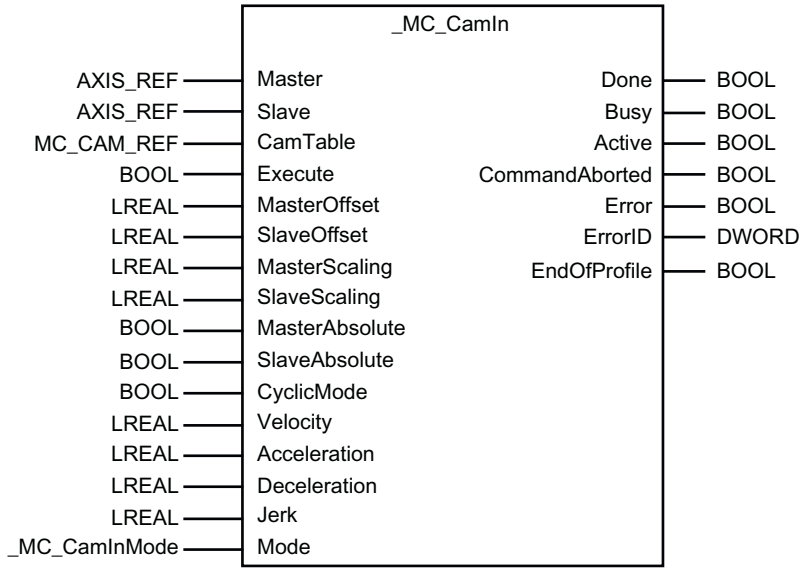

Figure 8-126 _MC_CamIn Schematic diagram

Purpose

Purpose

The function block **_MC_CamIn** starts a camming between a master and a slave axis.

The dynamic response parameters **Velocity**, **Acceleration**, **Deceleration**, and **Jerk** define the dynamic response of the slave axis during synchronization in accordance with time.

The cam profile can be scaled and/or the position offset.

The specified cam can optionally be run through once or periodically.

Camming can be relative or absolute.

Applicable for

Applications

Master:

- Positioning axes
- Following axes
- Path axes
- External Encoders
- ...

Slave:

- Following axes
- Path axes with synchronous operation activated

Requirements

Requirements

When configuring the synchronous object of the slave axis, you must have selected the required cam and master as potential interconnection objects.

Master and slave axes are enabled.

No **_MC_Stop** active on the slave axis

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Master	AXIS_REF	0	Specification of reference to the master (name of TO) The following technology objects can be homed: • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type) • External encoder (externalEncoderType data type)
Slave	AXIS_REF	0	Specification of reference to the slave axis (name of TO) The following technology objects can be homed: • Following axis (followingAxis data type) • Path axis with synchronous operation activated (_pathAxis data type)
CamTable	MC_CAM_REF	0	Specification of the cam (name)

Parameter	Data type	Initial value	Description
Execute	BOOL	FALSE	Function block enable The slave axis is synchronized with the interconnected master with a rising edge on this input.
MasterOffset	LREAL	0.0	Specification of the offset of the master values in the master coordinates.
SlaveOffset	LREAL	0.0	Specification of the offset of the slave values in the slave coordinates.
MasterScaling	LREAL	1.0	Specification of the scaling for the master values in the master coordinates.
SlaveScaling	LREAL	1.0	Specification of the scaling for the slave values in the slave coordinates.
MasterAbsolute	BOOL	TRUE	Specification of the evaluation method of the master values With TRUE, the master values are applied as absolute values in the domain of the cam. With FALSE, the master values are evaluated relative to the start value of the cam.
SlaveAbsolute	BOOL	TRUE	Specification of the evaluation method of the slave values With TRUE, the slave values are applied as absolute values in the range of the cam. With FALSE, the slave values are applied relative to the start value of the cam. During synchronization, the slave axis also travels the path difference between the start of the cam and the cam start value.
CyclicMode	BOOL	TRUE	Specification of the cam mode With TRUE, the cam repeats after reaching its end point. With FALSE, the function block is terminated after one cycle of the cam.
Velocity	LREAL	-1.0	Specification of the maximum synchronization velocity The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.velocity system variable of the interconnected synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Acceleration	LREAL	-1.0	Specification of the maximum synchronization acceleration The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.positiveaccel system variable of the interconnected synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).

Parameter	Data type	Initial value	Description
Deceleration	LREAL	-1.0	Specification of the maximum synchronization deceleration The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.negativeaccel system variable of the interconnected synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).

Parameter	Data type	Initial value	Description
Jerk	LREAL	-1.0	Specification of the maximum synchronization jerk The parameter is only taken into account with **Mode** equals **IMMEDIATELY_BY_TIME_PROFILE**. To activate the jerk limitation, the configuration data **SyncingMotion.smoothAbsoluteSynchronization** on the interconnected synchronous object must be set to **YES**. Otherwise the parameter specification for **Jerk** is ignored and a trapezoidal velocity profile is always used. Value > 0: The specified value is used Value = 0: Use trapezoidal velocity profile Value < 0: The preset values in the system variables userdefault.syncdynamics.positiveaccelstartjerk, userdefault.syncdynamics.positiveaccelendjerk, userdefault.syncdynamics.negativeaccelstartjerk, and userdefault.syncdynamics.negativeaccelendjerk of the interconnected synchronous object are used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Mode	_MC_CamInMode	USER_DEFAULT	Specification of the synchronization mode / engage mode USER_DEFAULT: With the exception of the values set at the block inputs • MasterAbsolute (userDefault.cammingSettings.masterMode), • SlaveAbsolute (userDefault.cammingSettings.slaveMode) and • CyclicMode (userDefault.cammingSettings.cammingMode) the synchronization parameters preset at the synchronous object in the "Preassignment > Camming" (→ system variables under userdefault.cammingsettings...) and "Preassignment > Dynamic Response" (→ system variables under userdefault.syncdynamics...) dialogs are accepted. IMMEDIATELY_BY_TIME_PROFILE: Synchronization is performed immediately according to time taking into account the dynamic response values set on the function block. Synchronous operation is performed using the synchronous object settings • "Time-related synchronization" profile specification from the "Preassignment > Dynamic Response" dialog (userDefault.syncprofile.syncprofilereference parameter equals RELATE_SYNC_PROFILE_TO_TIME), • Synchronization "with immediate effect" from the "Preassignment > Cam Synchronization" dialog (parameter userDefault.cammingsettings.synchronizingmode equals IMMEDIATELY), and • "Compatibility mode" synchronization direction (userDefault.cammingsettings.synchronizingdirection parameter equals SYSTEM_DEFINED [1]).

[1] SYSTEM_DEFINED corresponds to the **shortest distance** setting, although the direction of motion is maintained while the axis is in motion.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
InSync	BOOL	FALSE	Display of the synchronism of the master and slave axis With TRUE, the slave axis is in synchronous operation with the master.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Section ErrorIDs (Page 6711)).
EndOfProfile	Bool	FALSE	Indicates the end of the cam profile. The parameter is reset after being read out once.

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Examples

Example: Camming

At the master axis, a positioning command is active at 100 mm. Two mutually overriding _MC_CamIn blocks with different cam profiles establish the camming between the axes transferred on the **master** and **slave** input parameters.

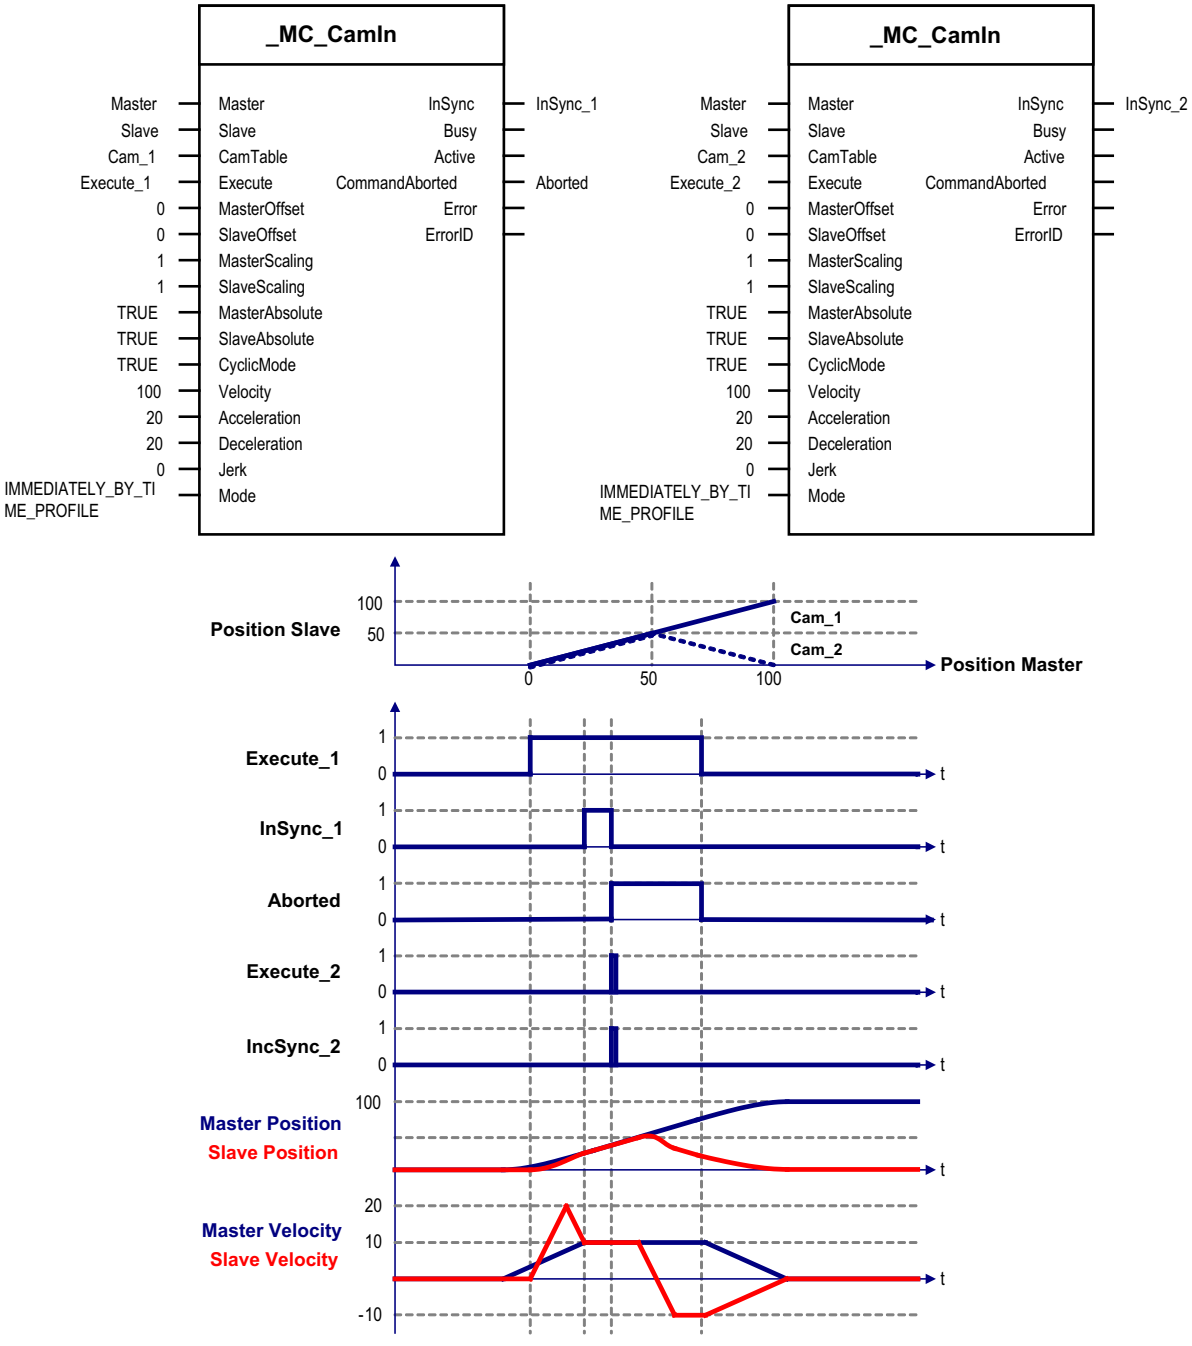

Figure 8-127 _MC_CamIn example: Camming

Example: Camming with offset

At the master axis, a positioning command is active at 100 mm. Two mutually overriding _MC_CamIn blocks with different cam profiles establish the camming between the axes transferred on the **master** and **slave** input parameters. While the first block is being executed, the master position shifts by 10 mm in relation to the slave position (MasterOffset). While the second block is being executed, the slave position shifts by 10 mm in relation to the master position (SlaveOffset).

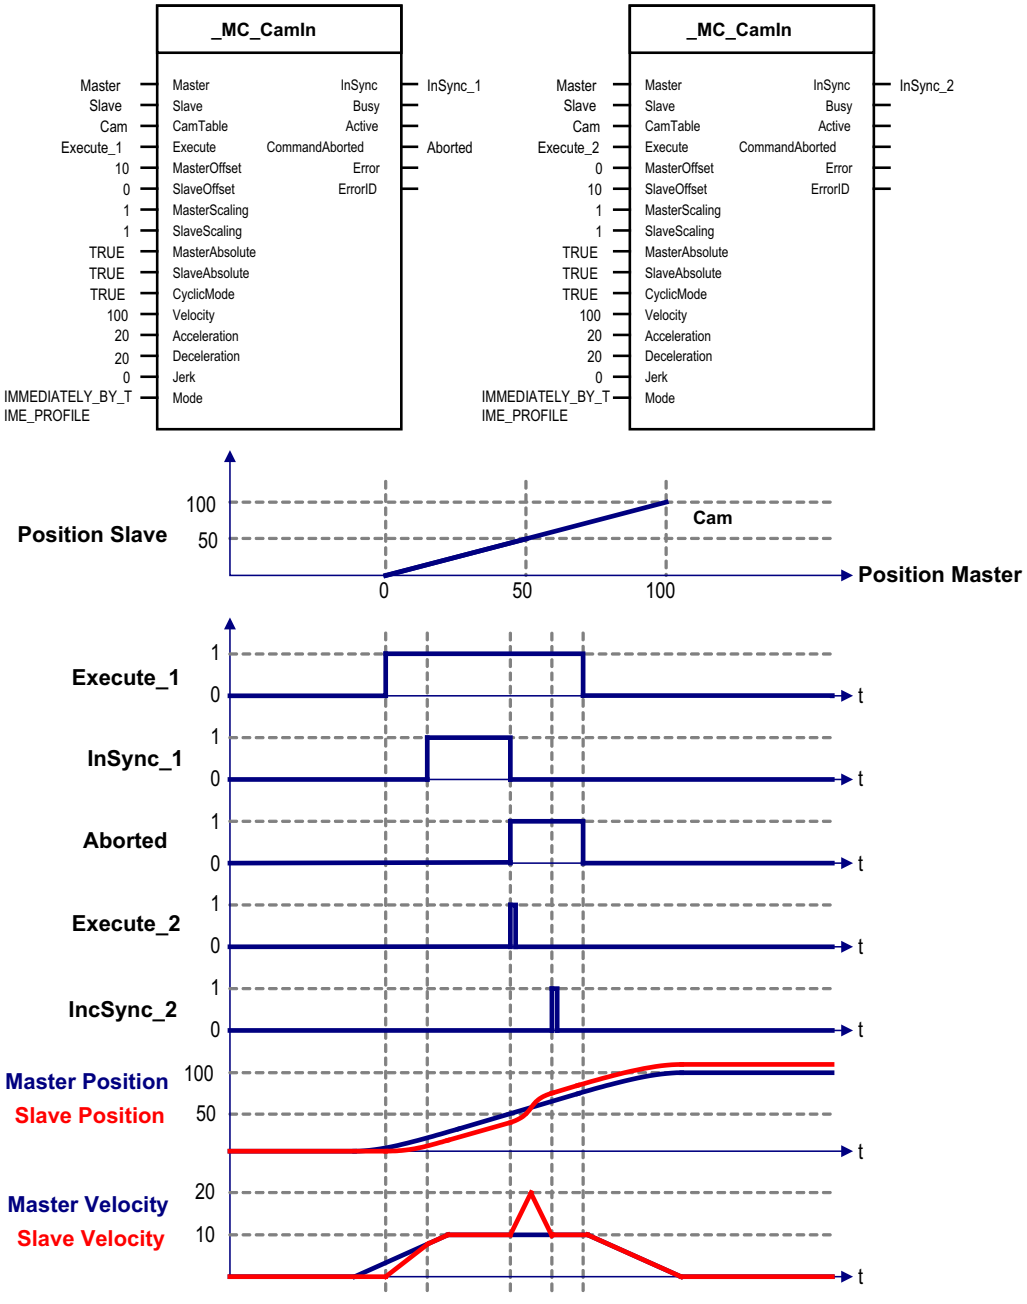

Figure 8-128 _MC_CamIn example: Camming with offset

Example: Camming with scaling

At the master axis, a positioning command is active at 100 mm. Two mutually overriding _MC_CamIn blocks with different cam profiles establish the camming between the axes transferred on the **master** and **slave** input parameters. While the first block is being executed, the cam is scaled by a factor of 2 in relation to the master position (MasterScaling). While the second block is being executed, the cam is scaled by a factor of 2 in relation to the slave position (SlaveScaling).

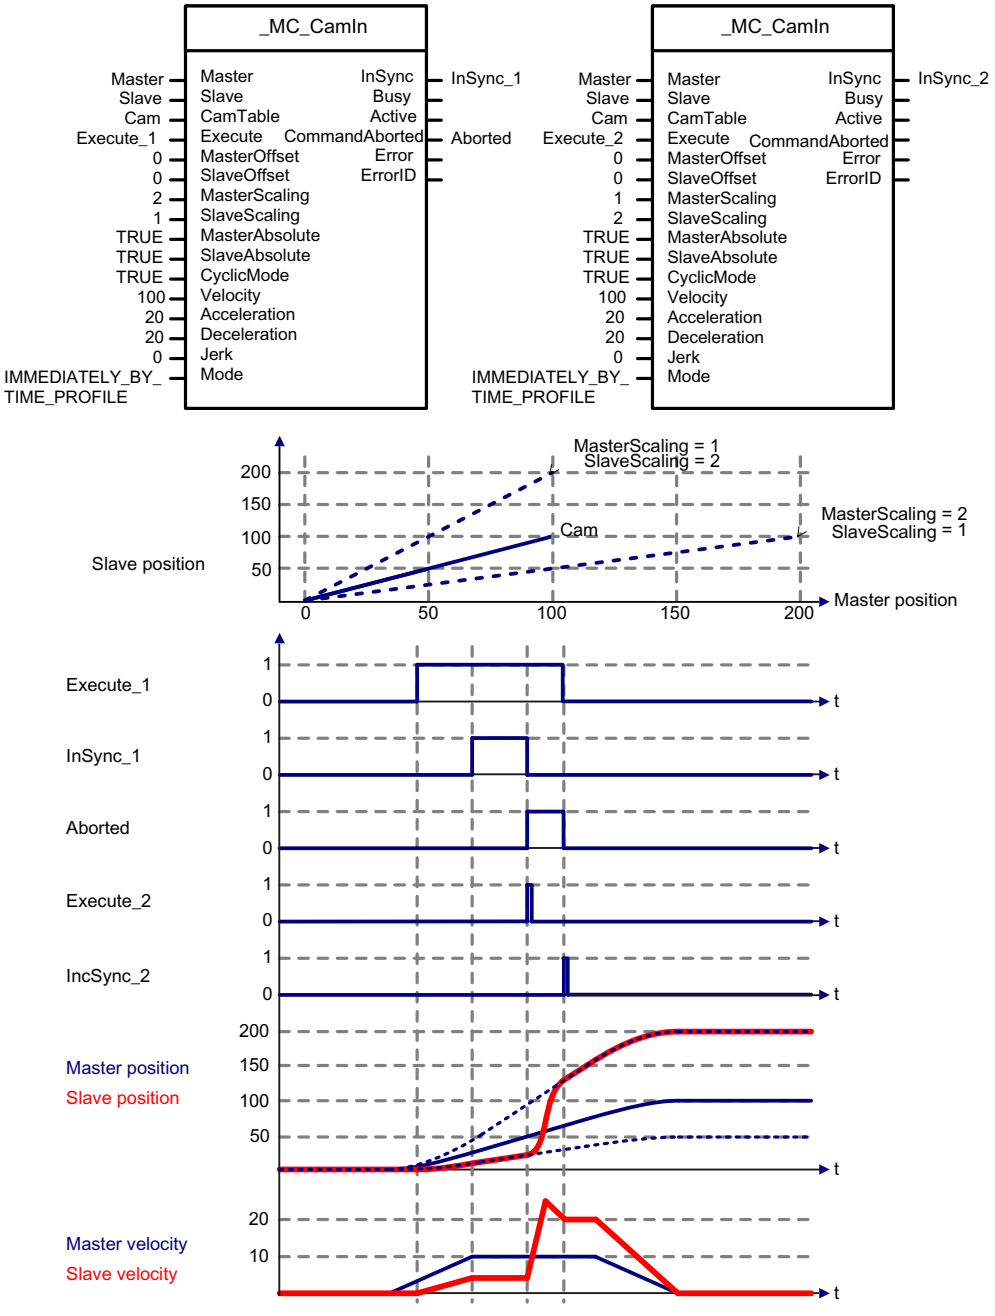

Figure 8-129 _MC_CamIn example: Camming with scaling

Example: Camming with starting point shift to actual position of slave axis

At the master axis, a positioning command is active at 100 mm. When the first block starts (Execute_1 = TRUE), the slave axis synchronizes to the master axis in accordance with the positional relationship $Pos_{Slave} = Pos_{Master}$ and then follows this axis.

When the second block starts (Execute_2 = TRUE), the cam starting point is shifted to the actual position of the slave axis (Pos_{Slave} = 48 mm) (→ interpretation of slave position relative to cam starting point). The cam does not change in relation to the master position (→ interpretation of master position is absolute in the cam's range of values). Therefore, for the second block the equation $Pos_{Slave} = Pos_{Master}$ + 48 mm applies as the positional relationship.

In the figure below, in accordance with this positional relationship the position setpoint of the slave axis is shifted by 48 mm in relation to the master position. Once the master position setpoint of 100 mm has been reached, the result is a position setpoint of 148 mm (100 mm + 48 mm = 148 mm) for the slave axis.

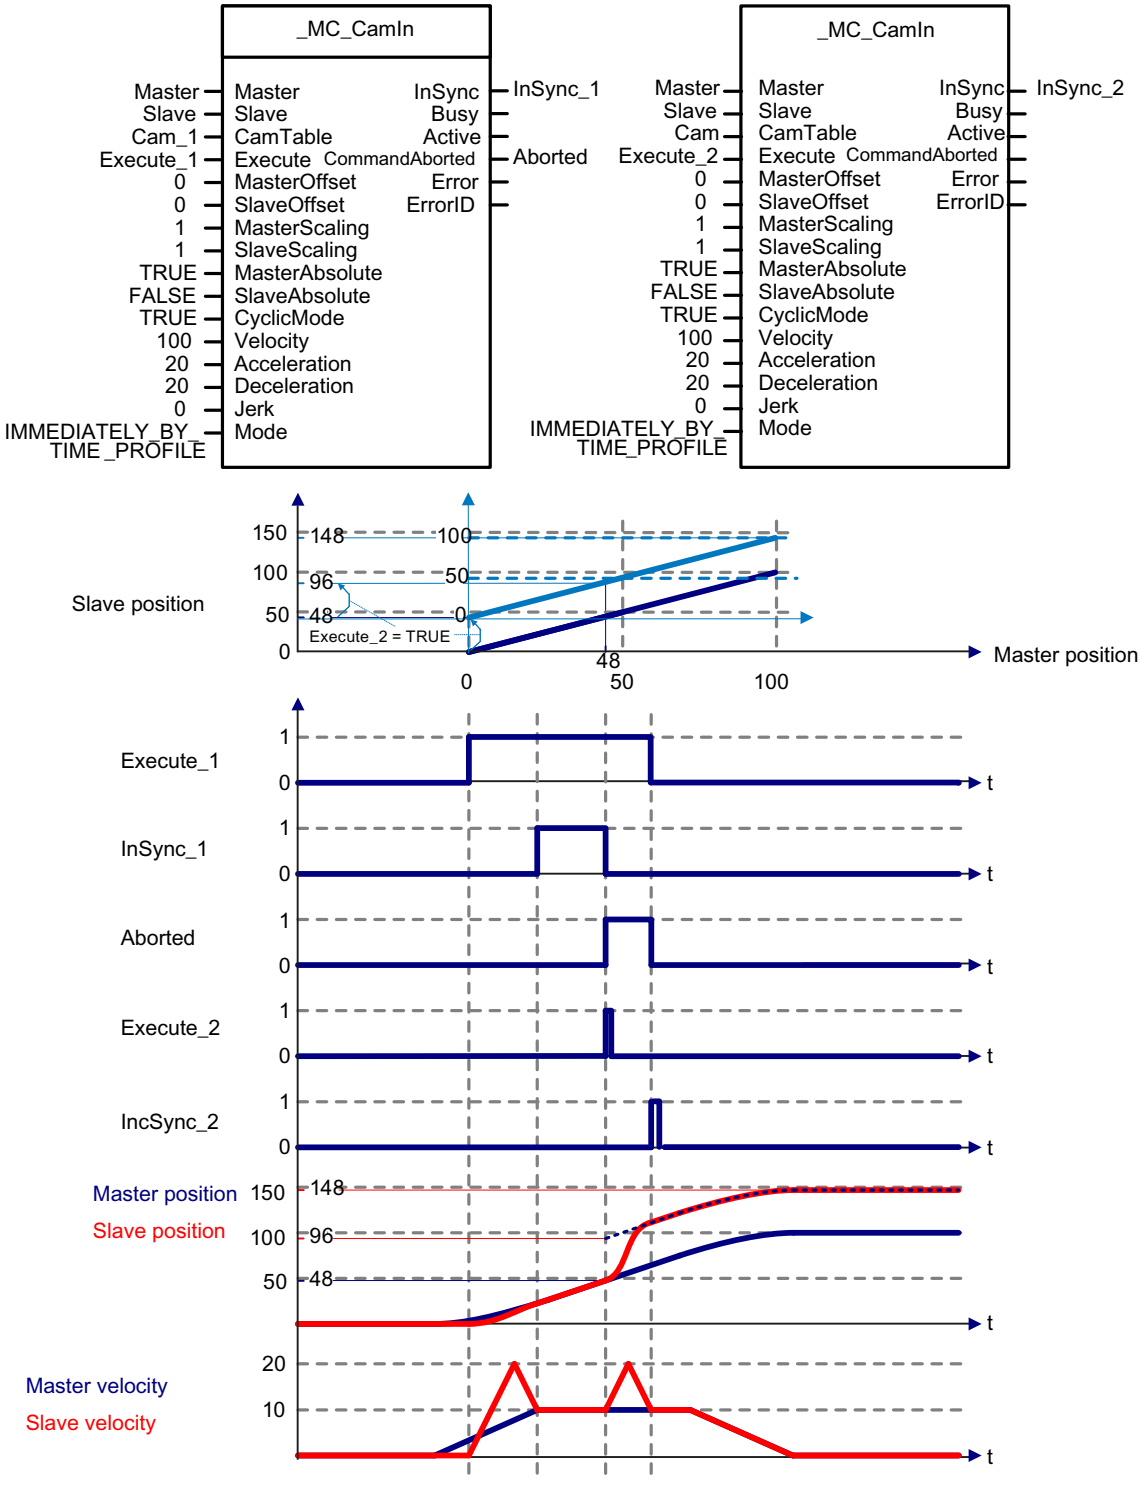

Figure 8-130 _MC_CamIn example: Camming with starting point shift to actual position of slave axis

Example: Camming with starting point shift to actual position of master axis

At the master axis, a positioning command is active at 100 mm. When the first block starts (Execute_1 = TRUE), the cam starting point is shifted to the actual position of the master axis (Pos_{Master} = 2 mm) (→ interpretation of master position relative to cam starting point). For this reason, the positional relationship between the slave and master positions must be corrected as follows:
(PosSlave = PosMaster) ⇒ $Pos_{Slave} = Pos_{Master} – 2$ mm.

This results in a 2 mm shift of the slave position in relation to the master position that is permanent pending further notice.

When the second block is started (Execute_2 = TRUE), the cam starting point is shifted repeatedly to the actual position of the master axis (Pos_{Master} = 48 mm). Therefore, the following equation applies for the second block:
($Pos_{Slave} = Pos_{Master} – 2$ mm) ⇒ $Pos_{Slave} = Pos_{Master} – 48$ mm

In accordance with the positional relationship the position setpoint of the slave axis reset to zero, and in the figure below, is shifted by 48 mm in relation to the master position. Once the master position setpoint of 100 mm has been reached, the result is a position setpoint of 52 mm (100 mm – 48 mm = 52 mm) for the slave axis.

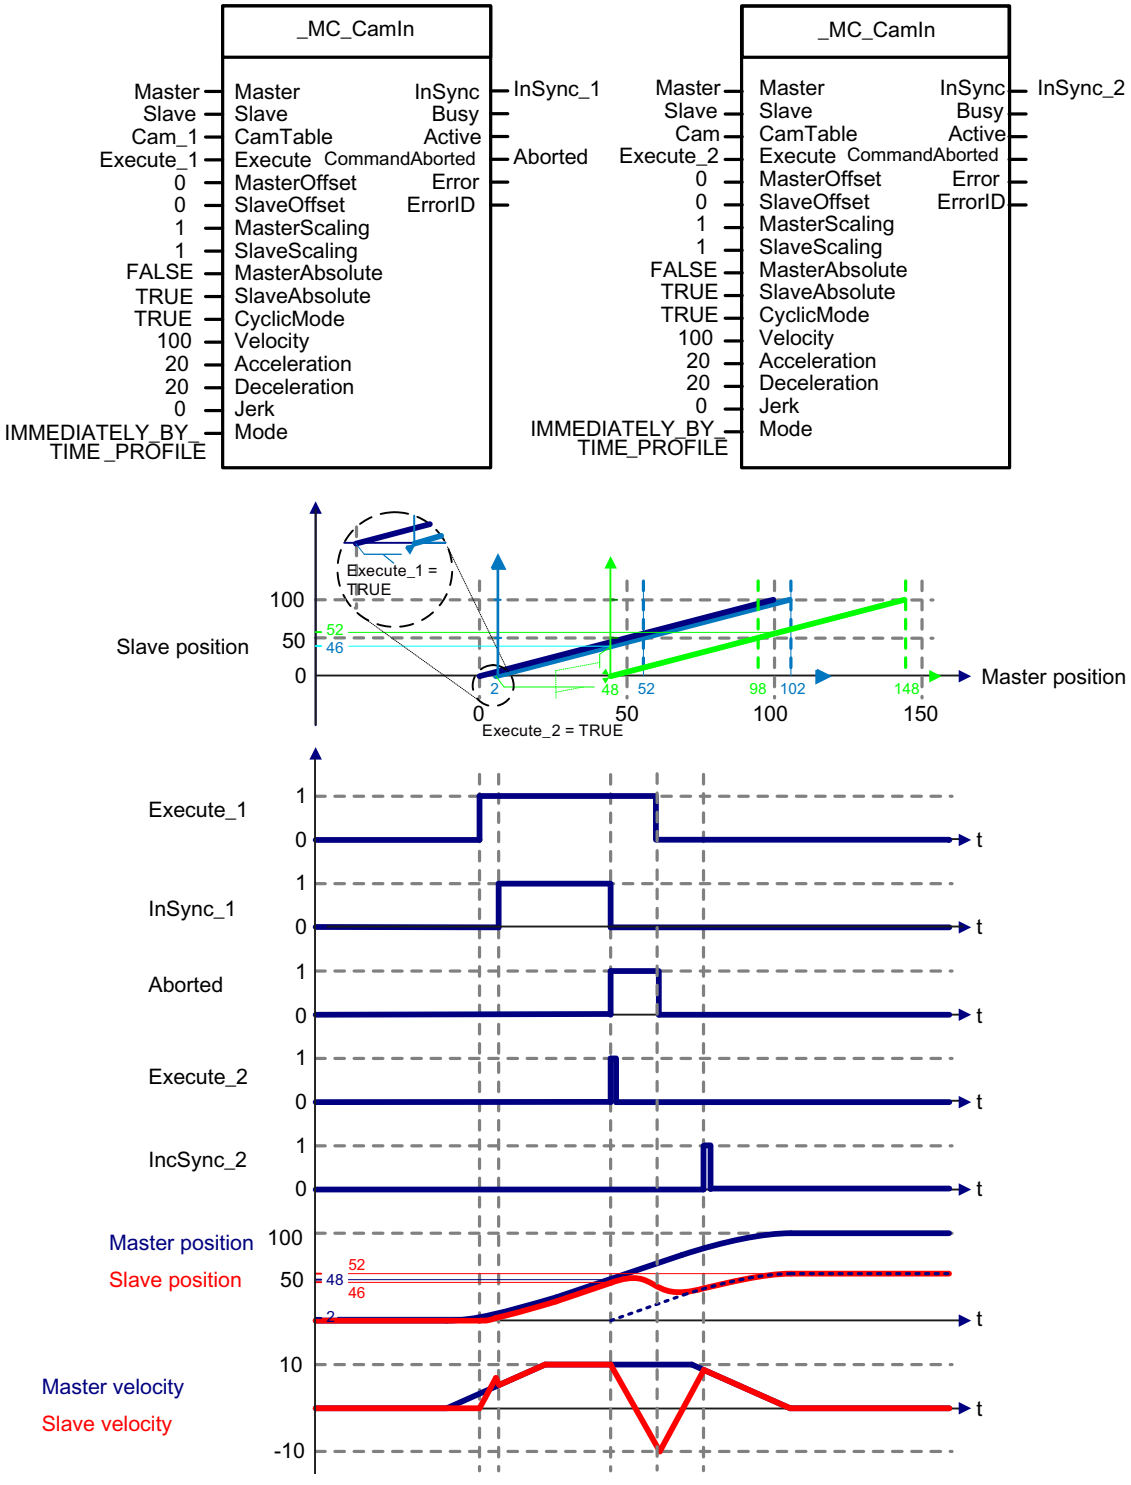

Figure 8-131 _MC_CamIn example: Camming with starting point shift to actual position of master axis

_MC_CamOut - Terminating camming

Overview

Schematic diagram

Schematic diagram

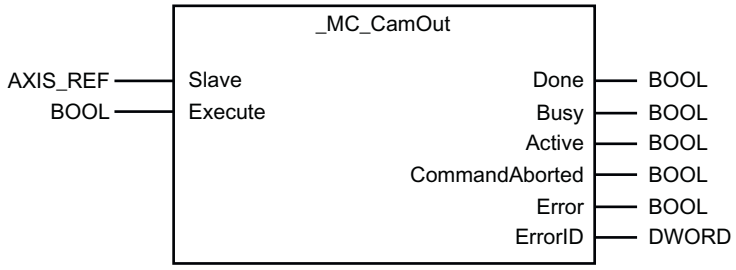

Figure 8-132 _MC_CamOut Schematic diagram

Purpose

Purpose

The function block **_MC_CamOut** terminates a camming and stops the slave axis. The slave axis is desynchronized in accordance with the presettings at the synchronous object in the "Preassignment > Camming" (→ system variables under **userdefault.cammingsettings...**) and "Preassignment > Dynamic Response" (→ system variables under **userdefault.syncdynamics...**) dialogs.

Recommendation

Use the function block when the shutdown procedure is to depend on the position of the master and/or the slave axis. You can also remove the slave axis from the synchronous operation with the technology functions **_MC_Stop**, **_MC_MoveRelative**, **_MC_MoveAdditive**, **_MC_MoveAbsolute** or **_MC_MoveVelocity**.

Applicable for

Applications

Following axes

Path axes with synchronous operation activated

Requirements

Requirements

A camming must be active on the slave axis. If no synchronous operation is active, the function block is aborted.

No **_MC_Stop** active on the slave axis

Input parameters

Input parameters

_MC_Phasing - Changing phase shift between the leading axis and following axis

Overview

Schematic diagram

Schematic diagram

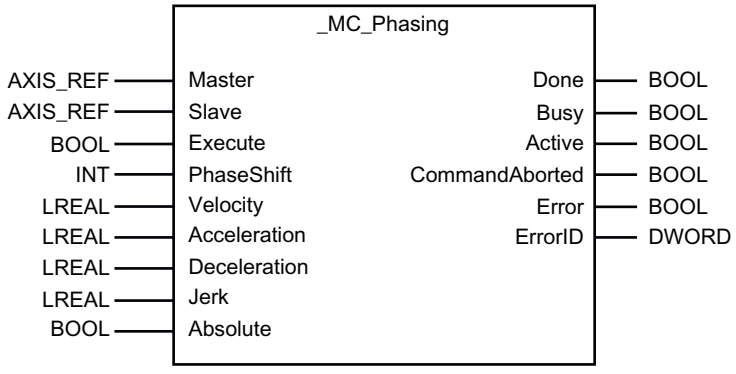

Figure 8-134 _MC_Phasing Schematic diagram

Purpose

Purpose

The function block **_MC_Phasing** shifts the position of the slave axis with respect to the master.

The effect on a following axis during camming equates to a horizontal cam shift.

The shift can be absolute or relative to the existing offsets.

The dynamic response parameters **Velocity**, **Acceleration**, **Deceleration** and **Jerk** define the dynamic response of the motion procedure.

Applicable for

Applications

Following axes operating during camming or gearing

Path axes with synchronous operation activated during camming or gearing

Requirements

Requirements

No **_MC_Stop** active on the slave axis

A camming or gearing must be active on the slave axis.

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Master	AXIS_REF	0	Specification of reference to the master (name of TO) This parameter presently has no function. The slave axis is always offset with respect to the current master of the active synchronous operation.
Slave	AXIS_REF	0	Specification of reference to the slave axis (name of TO) The following technology objects can be homed: • Following axis (followingAxis data type) • Path axis with synchronous operation activated (_pathAxis data type)
Execute	BOOL	FALSE	Function block enable With a rising edge on this input, the position of the slave axis is offset with respect to the position of the master.
PhaseShift	LREAL	1.0	Specification of the phase shift
Velocity	LREAL	-1.0	Specification of the maximum velocity Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.velocity system variable of the synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Acceleration	LREAL	-1.0	Specification of the maximum acceleration Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.positiveaccel system variable of the synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).

Parameter	Data type	Initial value	Description
Deceleration	LREAL	-1.0	Specification of the maximum deceleration Value > 0: The specified value is used Value = 0: Not permissible Value < 0: The preset value in the userdefault.syncdynamics.negativeaccel system variable of the synchronous object is used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Jerk	LREAL	-1.0	Specification of the maximum jerk Value > 0: The specified value is used Value = 0: Use trapezoidal velocity profile Value < 0: The preset values in the system variables userdefault.syncdynamics.positiveaccelstartjerk, userdefault.syncdynamics.positiveaccelendjerk, userdefault.syncdynamics.negativeaccelstartjerk, and userdefault.syncdynamics.negativeaccelendjerk of the synchronous object are used (see "Preassignment > Dynamic Response" dialog at synchronous object).
Absolute	BOOL	TRUE	Indicates the type of phase shift With TRUE, the phase shift is taken over as an absolute value. With FALSE, the phase shift is added to an existing offset.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Indicates termination of the function block. With TRUE, the master and slave axis have been displaced with respect to one another by the absolute value of the phase shift.
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started.
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is processed by the command execution, i.e. the function block has active control over the axis / technology object. The command is processed in the interpolator.
CommandAborted	BOOL	FALSE	Display of the abort of the function block With TRUE, the function block has been aborted because of another overriding function block or TO command.
Error	BOOL	FALSE	Display of an error in the function block In the case of TRUE, an error occurred during parameterization or execution of the function block. The function block is terminated. The error description can be read at the ErrorID output.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **Error** output (see Chapter ErrorIDs (Page 6726)).

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Purpose

The function block **_MC_Jog** implements a continuous or incremental jogging of an axis.

Applicable for

Applications

Positioning axes

Following axes

Path axes

Requirements

Requirements

Axis enabled

No **_MC_Stop** active

Input parameters

Input parameters

Parameter	Data type	Initial value	Description
Axis	AXIS_REF	0	Specification of axis reference (name of TO) The following technology objects can be homed: • Positioning axis (posAxis data type) • Following axis (followingAxis data type) • Path axis (_pathAxis data type)
Enable	BOOL	FALSE	Function block enable
Forward	BOOL	FALSE	Start of the traversing motion in positive direction with positive edge Stop of the traversing motion with negative edge TRUE = motion in positive direction as long as **Forward** is set
Backward	BOOL	FALSE	Start of the traversing motion in negative direction with positive edge Stop of the traversing motion with negative edge TRUE = motion in negative direction as long as **Backward** is set
ModeInc	BOOL	FALSE	FALSE = continuous jogging TRUE = incremental jogging Each status change on the **ModeInc** results in an axis stop and deletion of the distance-to-go
Increment	LREAL	0.0	Value for incremental jogging
Velocity	LREAL	-1.0	Maximum velocity that is reached depending on the set traversing distance, acceleration and jerk (is not always reached) Value > 0: Use the specified value Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.velocity system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).

Parameter	Data type	Initial value	Description
Acceleration	LREAL	-1.0	Acceleration (increasing energy in the motor): Value > 0: Use the specified value Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.positiveaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Deceleration	LREAL	-1.0	Deceleration (decreasing energy in the motor): Value > 0: Use the specified value Value = 0: Not permissible Value < 0: The preset value in the userdefaultdynamics.negativeaccel system variable of the axis is used (see "Preassignment > Dynamic Response" axis dialog).
Jerk	LREAL	-1.0	Specification of maximum jerk in conjunction with velocity profile definition Value > 0: Acceleration-constant velocity profile (SMOOTH); specified jerk is used Value = 0: Trapezoidal velocity profile (TRAPEZOIDAL) Value < 0: Type of velocity profile results from setting of axis system variable userdefaultdynamics.profile In the case of an effective, acceleration-constant velocity profile (SMOOTH), the preset values in the userdefaultdynamics.positiveaccelstartjerk, userdefaultdynamics.positiveaccelendjerk, userdefaultdynamics.negativeaccelstartjerk, and userdefaultdynamics.negativeaccelendjerk system variables are used. For information on the effects these have, refer to the "TO Axis Electric / Hydraulic, External Encoder" Function Manual; Command variable calculation > Velocity profiles.

Output parameter

Output parameter

Parameter	Data type	Initial value	Description
Done	BOOL	FALSE	Incremental or continuous jogging finished, the axis has been stopped
Busy	BOOL	FALSE	Display of the activity of the function block With TRUE, the function block has been started, distance-to-go pending
Active	BOOL	FALSE	Display of the command activity in the function block With TRUE, the command is being processed by the command processing, i.e., the function block has active control of the axis.
CommandAborted	BOOL	FALSE	Command has been aborted by another command or by an error during the command processing.
Error	BOOL	FALSE	Indicates an error **An error** has occurred during the command execution. The cause can be found in the **ErrorID**.
ErrorID	DWORD	0	Display of a function block error code The error code is always output in conjunction with the **CommandAborted** or **Error** output (see Chapter ErrorIDs (Page 6733)).

Function

Function

The function block traverses the axis with the parameterized dynamic response values either continuously or incrementally in a positive or negative direction.

A positive edge at the input parameters **Forward** or **Backward** starts the traversing motion; it is stopped with the negative edge.

When incremental jogging is selected, the axis is stopped by the function block after traversing the parameterized distance. If the axle is stopped before reaching the parameterized distance, a restart of the motion completes the residual distance.

When incremental jogging is selected, the direction can only be changed when there is no remaining distance to be traversed.

- **Enable**
  - **Enable = TRUE**: Functionality of the block is processed and traversing motions are possible; with the transition FALSE/TRUE at Enable, all output parameters are reset and the distance-to-go is deleted.
    Note: Busy is only set with an action.
  - **Enable = FALSE**: Stop of the traversing motion - traversing motions no longer possible; with the transition from Enable = TRUE to Enable = FALSE, the **_MC_Stop** is always called internally, irrespective of whether the axis is in motion or not.
- **Busy/Active**
  - Incremental jogging:
    Busy = TRUE / Active = TRUE: Axis moves, distance-to-go != 0
    Busy = TRUE / Active = FALSE: Intermediate stop - the axis is stationary, distance-to-go != 0
  - Continuous jogging:
    After a positive edge at the input parameter **Forward** or **Backward**, **Busy = TRUE** is output in the same cycle. **Active** is only output in the interpolator after activation of the motion command. This may occur several cycles later.
- **Continuous jogging**
  - The jogging is started with a positive edge at **Forward** or **Backward**. The axis traverses with continuous jogging as long as the level on one of the two parameters is TRUE. The motion is stopped with the falling edge.
  - If the two inputs **Forward** and **Backward** are set to TRUE at the same time, no axis motion is started (**Active** = FALSE, **Busy** = FALSE, **Done** = FALSE), the distance-to-go is deleted and no error message is generated.
  - If the input parameter for the opposite direction is also set during the traversing motion, the traversing motion is stopped, the distance-to-go is deleted and also no error message is generated.
  - A positive edge at **Forward** and a negative edge at **Backward** in the same cycle results in a change of direction. The same applies for the reverse situation.

- **Incremental jogging**
  - With incremental jogging, the traversing motion is stopped when the distance parameterized in the input parameter **Increment** is reached. If a falling edge is detected at the input parameter **Forward** (or **Backward**) before this, the traversing motion is also stopped.
  - Behavior with distance-to-go present:
    If a distance-to-go is present, i.e., the traversing motion was stopped before reaching the distance parameterized at the input parameter **Increment** by a falling edge at **Forward** or **Backward**, this state is signaled with **Busy** = TRUE, **Done** = FALSE, **Active** = FALSE.
    With another positive edge in the same direction of motion, the present distance-to-go is traversed.
    Incremental jogging in the opposite direction with a stopped axis and distance-to-go present is not possible. To do this, the distance-to-go present must be deleted with selection of continuous jogging or **Enable** = 0/1 and incremental jogging selected again.
  - Behavior when distance-to-go is zero:
    The transition **Busy** = TRUE to FALSE, **Active** = TRUE to FALSE and **Done** = FALSE to TRUE signals the complete traversing of the selected increment. The distance-to-go is 0.
- **Switchover from incremental / continuous jogging**
  A change of **ModeInc** during traversing with an active traversing motion results in an axis stop without error message. If the input parameter **ModeInc** is changed to continuous jogging (**ModeInc**=FALSE), the distance-to-go is deleted.
- **Override**
  If the **Override** = 0 with active, started traversing motion, then there is no traversing motion and **Active** is TRUE.
- **Parameter acceptance**
  The parameter acceptance of the distances/**Increment** and the dynamic response parameters (**Velocity**, **Acceleration**, ...) is performed with a rising edge of **Forward**/**Backward**, i.e., a change of **Increment**, **Velocity**, **Acceleration**, **Deceleration** or **Jerk** has no effect during traversing.
- **Axis not in position control**
  If jogging is issued and the axis is not in position control, the corresponding error message of the used PLCopen FB is output.

ErrorIDs

ErrorIDs

The error code contains the number and, when available, the associated reason for the error that has occurred in the function block. The error number occupies the lower 16 bits of the error code (see Error codes of the errorID (LOW word) (Page 6734)). The error reason, when available, is also coded as a number and occupies the upper 16 bits of the error code (see Command abort reason of the errorID (HIGH word) (Page 6736)).

Note

ErrorIDs from other blocks possible

During execution of the function block **_MC_Jog**, the function blocks **_MC_MoveVelocity**, **_MC_MoveRelative** and **_MC_Stop** are called internally.
If the **_MC_Jog** is aborted, errorIDs can therefore also be reported from these three function blocks.

See also

Troubleshooting - PLCopen Blocks (Page 6733)

8.13.5 Troubleshooting PLCopen blocks

8.13.5.1 Troubleshooting - PLCopen Blocks

The function blocks display errors that occurred at the output parameters Error and ErrorID , in the case of CommandAborted the execution was terminated prematurely.

Errors at output parameters Error or ErrorID

If output parameter **Error** = TRUE, this means that the function block was unable to initiate the command. The cause of the error is indicated by the value at output parameter **ErrorID**.

The error codes of the function blocks (errorID) have been taken over from the return values of the ST commands in SIMOTION and from the command abort reason. The return value of the ST commands is written to the LOW word of the errorID. The command abort reason is in the HIGH word of the errorID.

If the function block indicates an **Error due to incorrect parameterization**, you need to call it either using the correct parameters or at a different time (provided that this function is permitted).

It is neither required nor possible to acknowledge the errors or warnings. The error remains active until the input parameters Enable or Execute have been reset.

If **Error with abort function due to an error in the technology object** is displayed at the function block, the TO error must be acknowledged prior to calling the function block again.

The error remains active until the Execute input parameters have been reset.

Warnings and notes at the technology object, which do not cause the function to abort are not displayed at the Error and ErrorID output.

Errors at the technology object can be determined via the TO system variables error and errorGroup. In addition, the error status of the technology object can be queried via the _MC_ReadAxisError function block (see section "Query of general errors with the _MC_ReadAxisError function block").

Example - error handing in the case of following error:

Axis motion is started by means of the _MC_MoveAbsolute function block.

- The Busy and Active output parameters are TRUE

A following error is detected in the technology object.

- The TO error 50102 is output (default error response RELEASE_DISABLE)
- The Busy and Active output parameters are FALSE
- The Error output parameter is TRUE
- Output parameter ErrorID = 16#00050003
  displays "Command aborted" with the cause "Abort by a pending error response"
- The Error system variable is TRUE and Bit 8 is set in ErrorGroup (FollowingError)

Indications at output parameter CommandAborted

If the function block was aborted by another overriding command (function block or TO command), this is displayed at the CommandAborted output parameter.

Acknowledging errors at the technology object

1. Acknowledge all errors.
   To do this, first remove the causes of the errors and then acknowledge them using **_MC_Reset** (**Restart** = FALSE).
2. You can then re-enable the technology object using the **_MC_Power** function.

8.13.5.2 Error codes of the errorID (LOW word)

Error codes of the errorID (LOW word)

Error code		Description
Hex	dec	
0	0	No error
1	1	Illegal command parameter

Error code		Description
2	2	Illegal range specification in command parameters
3	3	Command aborted
4	4	Unknown command
5	5	Command cannot be executed due to current object state
6	6	Command aborted due to termination of user task
7	7	Command rejected due to suspension of command interpretation of the addressed technology object
8	8	Command aborted due to full command buffer
9	9	Insufficient memory
A	10	A connection to a technology object required for this operation does not exist
B	11	No object configuration
C	12	The error to be reset cannot be reset due to its configuration
D	13	Axis is not homed
E	14	Measuring job on virtual axis not possible
F	15	Ambiguous **commandId**
10	16	Command not implemented
11	17	Read access denied
12	18	Write access denied
13	19	Command argument not supported
14	20	The cam has already been interpolated and cannot be manipulated
15	21	The interpolation condition was violated
16	22	The programmed jerk is 0
17	23	The alarm to be deleted is not pending
18	24	Command not possible on a virtual axis
19	25	A synchronized start of this command is not possible
1a	26	Superimposed command has been aborted as it is not permitted by the active command
1b	27	Time-out during communication with the drive
1c	28	Actual values are not valid
1d	29	The command cannot be executed when velocity control is active
1e	30	The command cannot be executed when position control is active
1f	31	The command cannot be executed in torque-reduced operation or during travel to fixed end stop
20	32	The command can only be executed when force or pressure control is active
21	33	The command cannot be executed when force/pressure control is active
22	34	The command can only be executed when pressure limiting is active
23	35	Master values are not valid
24	36	Slave values are not valid
25	37	No slave value can be defined for a master value
26	38	No master value can be defined for a slave value
27	39	The command cannot be executed when synchronous operation is inactive
28	40	The command cannot be executed with non-synchronous operation
29	41	The command cannot be executed when gearing or camming is active

Error code		Description
2a	42	The command cannot be executed when camming is inactive
2b	43	This command can only be used for an interpolated cam
2c	44	The command can only not be executed when pressure limiting is active
2d	45	Insufficient interpolation points are available to interpolate the cam
2e	46	The specified path point cannot be reached due to restrictions of the kinematics
2f	47	Path axis values are not valid
30	48	Reserved memory is full
2710	10000	(Greater than or equal to) internal error

8.13.5.3 Command abort reason of the errorID (HIGH word)

Command abort reason of the errorID (HIGH word)

Command abort reason		Description
Hex	dec	
0	0	No abort reason
1	1	Reset of the command buffer
2	2	Abort by another command
3	3	Abort by a stop
4	4	Abort by a higher-order stop
5	5	Abort by a pending error response
6	6	Abort due to ambiguous **commandId**
7	7	Acknowledgement delay
8	8	No actual value for axis (e.g., encoder or data bus not ready)
9	9	Abort due to abort of a dependent command
a	10	Abort due to active synchronous operation
b	11	Abort due to active superimposed motion
c	12	Abort due to active speed-controlled controller mode
d	13	Abort due to active position-controlled controller mode
e	14	Abort due to active travel to fixed end stop
f	15	Axis is not in pressure-limiting operation
10	16	Abort due to active pressure-controlled operation
11	17	Abort due to inactive pressure-controlled operation
12	18	Superimposed command is not permitted
13	19	Abort due to error during cam access
14	20	Slave is not ready for operation

Command abort reason		Description
15	21	Error in the slave synchronization
16	22	Abort by command on the slave
17	23	Abort by stop on the slave
18	24	Abort by a pending error response on the slave
19	25	No actual values for slave (e.g., encoder or data bus not ready)
1a	26	Abort by reset on the slave
1b	27	Master values are not valid
1c	28	Active command in recursive TO interconnection
1d	29	Abort due to error during synchronization
1e	30	Axis is in pressure-limiting operation
1f	31	Maximum number of active commands exceeded
20	32	Abort due to active correction command
21	33	Action only permissible in standstill
22	34	Path axis is not ready for operation
23	35	Error during synchronization with a path axis
24	36	Abort due to command on a path axis
25	37	Abort due to stop on a path axis
26	38	Abort due to a pending error response on a path axis
27	39	No actual values for path axis (e.g., encoder or data bus not ready)
28	40	Abort due to reset on a path axis
29	41	Command parameters became invalid during processing
2a	42	A required connection to a technology object does not exist
2b	43	Abort through user program

Troubleshooting - PLCopen Blocks (Page 6733)

8.13.5.4 Query of general errors with the _MC_ReadAxisError function block

General errors on the **axis**, **external encoder**, **synchronous object**, and **cam** can be queried using the **_MC_ReadAxisError** function block. The function block converts the alarms pending on the technology object into a 32-bit representation, which is output at the AxisErrorID parameter.
The alarm numbers of each technology object are assigned to specific alarm groups. In this respect, some alarm groups are defined for all technology objects, while others are TO-specific. A bit in the "errorGroup" system variable is assigned to each alarm group. If a bit is set here, an alarm from this group is pending at the technology object.

Note

Which alarm is assigned to which alarm group for a technology object is fixed and cannot be changed (reconfigured).

It is possible to use SIMOTION SCOUT in the execution system of a device in order to read which alarm group an individual alarm is assigned to. Pressing the "Alarm configuration" button produces the relevant information for each technology object that has been created, under "ExceptionFaultTask" (last column in window that appears).

The tables below indicate which bit numbers are assigned to which alarm groups for the individual technology objects.

Meaning of the bit numbers for the axis

Bit number	Meaning (alarm group)
0	System fault
1	Config fault
2	User fault
3	Peripheral fault
4	Function fault
5	Function aborted
6	Reset/restart fault
7	Distributed motion fault
8	Following error
9	Standstill positioning error
10	Dynamic limit
11	Clamping error
12	Software limit
13	Limit switch
14	Sensor fault
15	Reference not found
16	Output limit
17	Force dynamic limit
18	Additional sensor fault
19	Synchronous motion fault
20	Following object
21	Path synchronous motion fault
22	Path motion fault
23	Path object

Meaning of the bit numbers for the external encoder

Bit number	Meaning (alarm group)
0	System fault
1	Config fault
2	User fault
3	Peripheral fault
4	Function fault
5	Function aborted

Bit number	Meaning (alarm group)
6	Reset/restart fault
7	Distributed motion fault
9	Standstill positioning error
14	Sensor fault
15	Reference not found
19	Synchronous motion fault

Meaning of the bit numbers for the following object

Bit number	Meaning (alarm group)
0	System fault
1	Config fault
2	User fault
3	Peripheral fault
4	Function fault
5	Function aborted
6	Reset/restart fault
7	Distributed motion fault
8	Direct sync
9	Stability
10	Dynamic limit
11	Value ambiguous

Meaning of the bit numbers for the cam

Bit number	Meaning (alarm group)
0	System fault
1	Config fault
2	User fault
3	Peripheral fault
4	Function fault
5	Function aborted
6	Reset/restart fault
8	Value not valid
9	Interpolation fault

Alarms and, therefore, error states, which switch the controller to STOP mode (e.g. 20001 **Internal error**), can be evaluated by the **_MC_ReadAxisError** block in the shutdown task. In addition to the 32-bit error representation, the TO alarms are also output.

SIMOTION C 9

9.1 SIMOTION C

Preface

Contents of manual

This **document** is part of the **SIMOTION C documentation package**.

Sections in this manual

The following is a list of sections included in this manual along with a description of the information presented in each section.

- Description
  This section explains the purpose and potential applications of the module.
- Operation (hardware)
  This section describes the operator controls and how they are operated.
- Interfaces
  This section includes a description of the interfaces and their functions.
- Installing
  This section explains how to configure the mechanical design and how to install the SIMOTION C components.
- Connecting
  This section describes the wiring and networking of SIMOTION C.
- Addressing
  This section contains the information you will require to define the module start addresses for the modules you are using.
- Commissioning (hardware)
  This section describes how you commission the hardware components and what you must take into account.
- Service and maintenance
  This section describes how you replace the module and update the SIMOTION Kernel.
- Interrupt, error and system alarms
  This section provides information about the causes of alarms and the corrective actions you must take.
- Technical data
  This section describes the properties and features of the SIMOTION C.
- Dimension drawing
  This section contains the dimension drawing of SIMOTION C.

- Spare parts/accessories
  This section provides information on accessories and spare parts for SIMOTION C.
- Appendices with factual information for reference (for example, Standards and approvals, ESD, etc.)
- Index to locate information

Standards and approvals

Our products meet the requirements of EU Directive 89/336/EEC Electromagnetic Compatibility and the harmonized European Standards (EN) listed there.

You can find detailed information on approvals and standards in the appendix.

The current Declaration of Conformity is on the Internet at

http://support.automation.siemens.com/WW/view/de/15257461

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.2:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Product disposal

SIMOTION C is an environmentally friendly product. It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Marking of the plastic materials as per ISO 11469.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The product is to be disposed of in accordance with national regulations.

The product described in this manual can be recycled owing to its low pollutant content. For environmentally friendly recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

9.1.1 Fundamental safety instructions

9.1.1.1 Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

9.1.1.2 Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

9.1.1.3 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

9.1.1.4 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

9.1.1.5 Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

9.1.2 Description

9.1.2.1 System overview

	C230-2	C240	C240 PN

Diagnostics LED for PROFINET	-	-	X

What capabilities does the SIMOTION C have?

The SIMOTION C is a motion control module for the control of servo drives.

As of V3.2, stepper drives with a pulse-direction interface can be connected to the onboard drive interfaces.

The following configurations can be selected:

- C230-2 and C240: Up to four axes via the onboard drive interface or
- C230-2, C240 and C240 PN: Axes via PROFIBUS DP or
- C240 PN: Axes via PROFINET IO or
- Mixed operation with a maximum of four axes via the onboard drive interface (C230-2, C240) and additional axes via PROFIBUS DP

The number of operable axes on the PROFIBUS DP or PROFINET IO depends on the system cycle clock settings, i.e. more axes can be operated with longer cycle times.

The SIMOTION C controllers are powerful modules for positioning independent single axes or motions in an axis grouping.

Both rotary axes and linear axes can be operated.

The SIMOTION SCOUT engineering system (ES) is used to configure, parameterize, commission, program perform diagnostics for the SIMOTION C.

Where can the SIMOTION C be used?

The C230-2, C240 and C240 PN can be used both for positioning and synchronous operation (gearing, camming and path interpolation).

Typical areas in which the motion control module can be used are:

- Packaging industry
- Plastics industry
- Presses
- Textiles
- Printing industry
- Wood, glass, ceramic, stone

System integration

SIMOTION offers an optimized system platform for automation and drive solutions where priority is given to motion control applications and technological tasks.

The SIMOTION modular system consists of the SIMOTION SCOUT engineering system and a common runtime system for various hardware platforms.

The truly innovative aspect of SIMOTION is that it does away with the traditional separation between pure automation functions and motion functions.

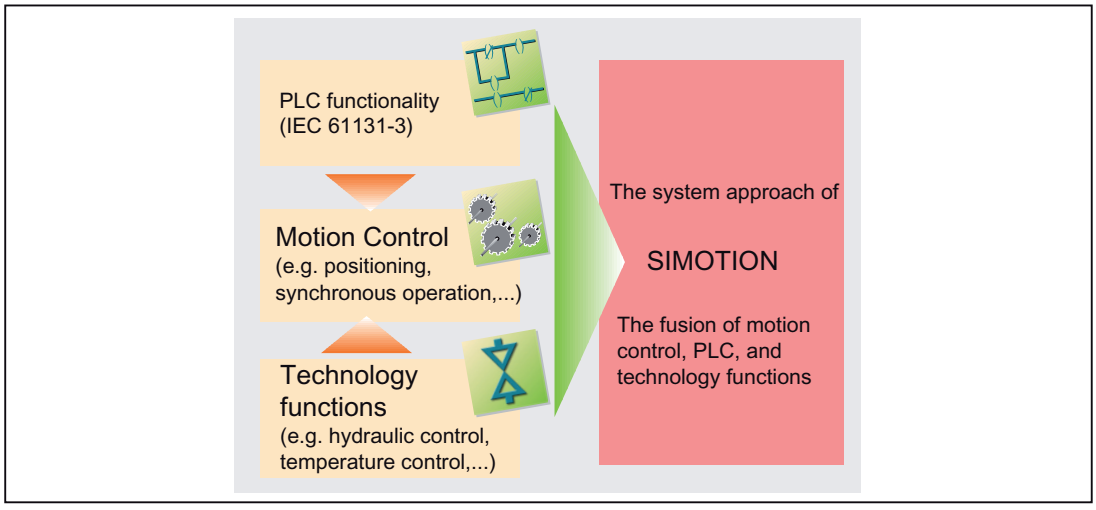

Figure 9-1 System solution for production machines

SIMOTION can be used with all machines with motion control tasks. The focus is on a simple and flexible solution to a wide variety of motion control tasks. In order to achieve this in the best way possible, a new system approach has been introduced:

Motion control has been combined with two other open-loop control functions found in most machines: PLC and technology functions.

This approach enables the motion control of axes and machine control within the same system. The same applies to technology functions, such as pressure control of a hydraulic axis. A seamless switch can be made from position-controlled positioning mode to pressure control.

Combining the three open-loop control functions of motion control, PLC and technology functions has the following benefits:

- Reduced engineering overhead and increased machine performance
- Time-critical interfaces between the individual components are no longer required
- Simple, uniform and transparent programming and diagnostics of the entire machine

The following figures show system configurations with SIMOTION C230-2, C240 and C240 PN.

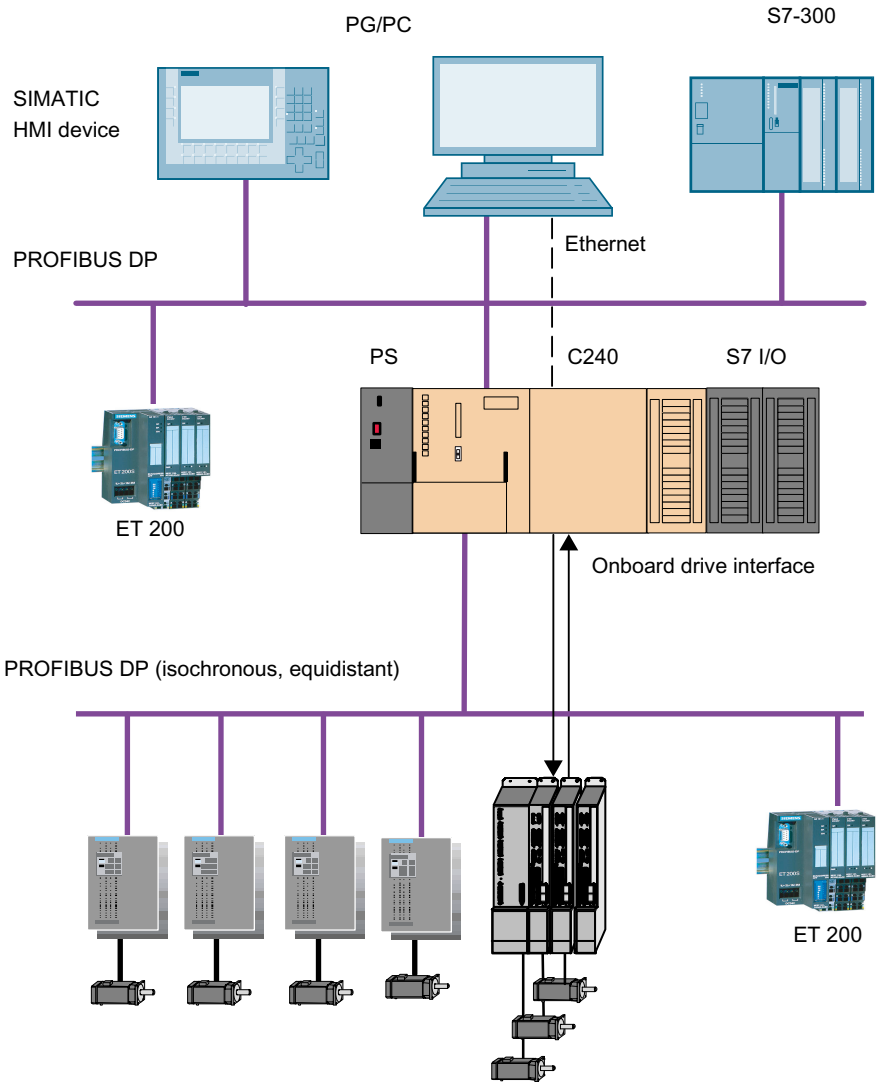

Figure 9-2 System overview of C240

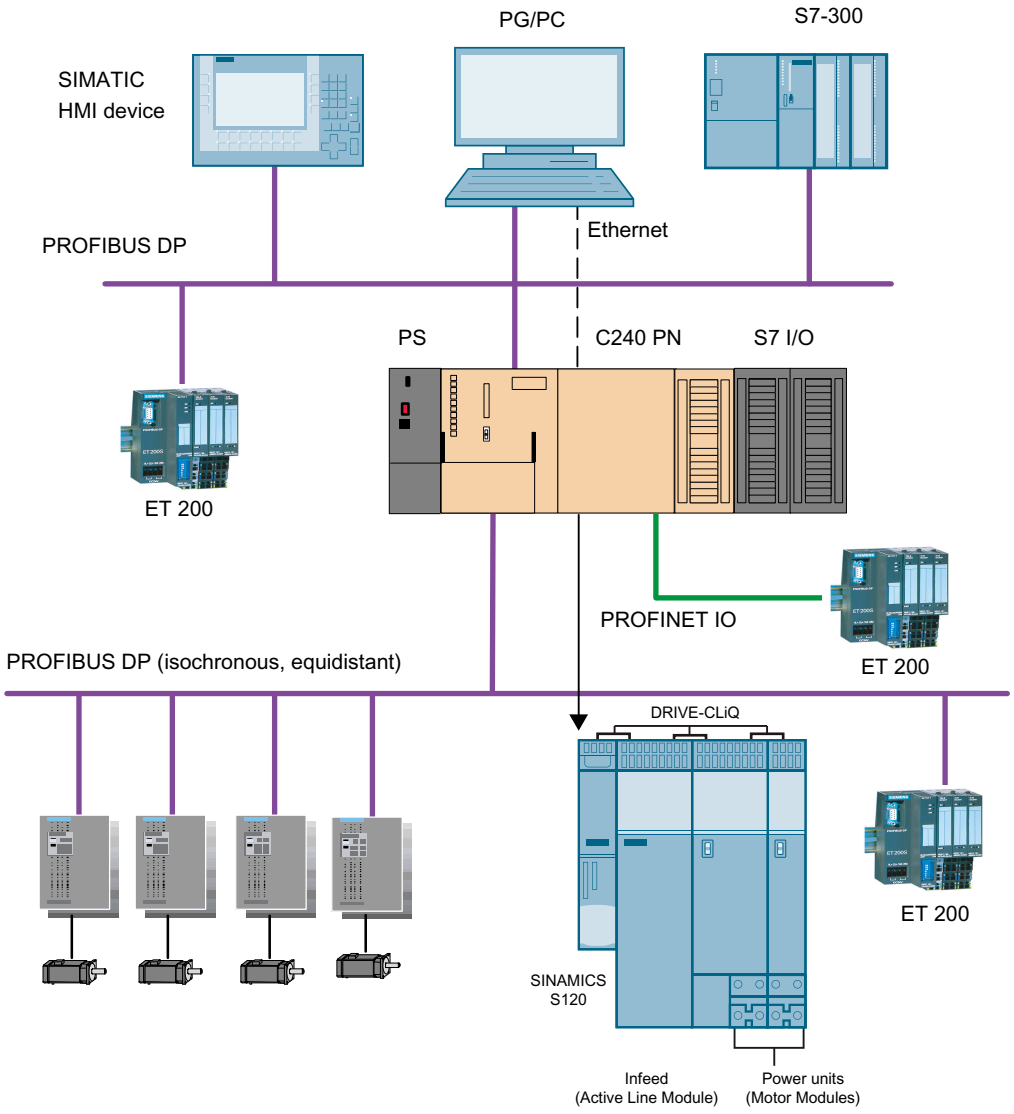

Figure 9-3 System overview of C240 PN

Components

The most important components of a SIMOTION application with SIMOTION C and their functions are listed below.

Note

The modules and devices approved for the SIMOTION C are listed in the *SIMOTION PM 21 Catalog*. This document is supplied in electronic format with SIMOTION SCOUT.

Centralized I/O

Table 9-1 SIMOTION C with centralized I/O

Component	Function
SIMOTION C	... is the motion control module. The SIMOTION C supplies the I/O bus with 5 V; communicates over the I/O bus (backplane bus) with the I/O modules. You can use the integrated fast digital inputs of the SIMOTION C as: • B1 to B4: As homing inputs (C230-2, C240) • M1 and M2: As inputs for measuring inputs - local measuring (C230-2, C240) • B1 to B4: As inputs for global measuring (C240, C240 PN) • Freely addressable process inputs You can use the integrated fast digital outputs as: • Fast output cams • Freely addressable process outputs Drive units with a ±10 V analog interface or stepper drives with a pulse/direction interface can be connected to the onboard drive interface (C230-2, C240). With the C240, the analog interfaces can also be used as available process outputs. Incremental encoders or absolute encoders can be connected to the measuring system interface (C230-2, C240). With the C240, free remaining encoder inputs of an axis channel can be used as the input for a 16-bit up/down counter.
Power supply (PS)	... converts the line voltage (120/230 V AC) into an operating voltage of 24 V DC to supply the SIMOTION C.
Signal modules (SM)	... adapt various process signal levels to the SIMOTION C (digital input/digital output modules and analog input/analog output modules). **Note:** All approved modules are listed in the *PM 21* Catalog and in chapter I/O modules approved for SIMOTION (Page 6753).
Function modules (FM)	... relieve the CPU of computation-intensive tasks, for example, counting. **Note:** All approved modules are listed in the *PM 21* Catalog and in chapter I/O modules approved for SIMOTION (Page 6753).
Communications processors (CP)	... for data exchange **Note:** All approved modules are listed in the *PM 21* Catalog and in chapter I/O modules approved for SIMOTION (Page 6753).

Distributed I/O

Table 9-2 SIMOTION C with distributed I/O

Component	Function
SIMOTION C	... is the motion control module. • Communicates via two PROFIBUS DP interfaces with: – Programming device (PG/PC) – SIMATIC HMI devices – SIMATIC S7 controllers with PROFIBUS DP interface – SIMATIC ET 200 I/O systems – Drive units – Other SIMOTION controllers • Communicates via an Ethernet interface with the programming device (PG/PC) • The C240 PN also communicates via the PROFINET IO interface with: – Programming device (PG/PC) via Ethernet – SIMATIC HMI devices – SIMATIC S7 controllers with PROFINET IO interface – SIMATIC ET 200 I/O systems with PROFINET IO interface – Drive units – Other SIMOTION controllers **Note:** All approved devices are listed in the *PM 21* Catalog and in chapter I/O modules approved for SIMOTION (Page 6753).

Table 9-3 Further components that can be connected to the SIMOTION C

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs and tests SIMOTION.
SIMATIC HMI device	... is used for operator control and monitoring functions. It is not an essential requirement for the operation of a SIMOTION C. **Note:** All approved devices are listed in the *PM 21* Catalog.
Drive units	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors. **Note:** All approved devices are listed in the *PM 21* Catalog.

9.1.2.2 I/O modules approved for SIMOTION

Approved I/O modules

Preferred peripherals for use with SIMOTION C:

- Centralized peripherals:
  SIMATIC S7-300 I/O modules
- Distributed I/O systems for PROFIBUS and PROFINET:
  - **SIMATIC ET 200M** (distributed implementation of SIMATIC S7-300 I/O modules):
    The modular I/O system for control cabinet installation and high channel density.
  - **SIMATIC ET 200S**:
    The bit-modular I/O system for control cabinet installation including motor starters, safety technology and individual grouping of load groups.
  - **SIMATIC ET 200eco (only for PROFIBUS)**:
    The compact, economical I/O system in IP 67 degree of protection for machine-level use without a control cabinet with flexible and fast ECOFAST or M12 connection system.
  - **SIMATIC ET 200pro**
    New modular I/O system in IP65/66/67 degree of protection for machine-level use without a control cabinet; with new features such as small frame size, integrated PROFIsafe safety technology, PROFINET connection and hot swapping of modules.
- Other PROFIBUS DP I/O:
  - **ADI 4 (Analog Drive Interface)**
    For the connection of drives with analog ±10 V setpoint interface.
  - **IM174 (interface module for 4 axes)**
    For the connection of drives with analog ±10 V setpoint interface, external encoders or the connection of stepper drives with pulse-direction interface.

Note

Please note that not all modules of the above-mentioned I/O or I/O systems are approved for SIMOTION. Moreover, system-related functional differences can come into play when these I/O or I/O systems are used on SIMOTION vs. on SIMATIC. For example, special process-control functions (e.g. insertion and removal under voltage, etc.) are not supported by SIMOTION for the SIMATIC ET 200M distributed I/O system.

A detailed, regularly updated list of the I/O modules approved for use with SIMOTION, as well as notes on their use, can be found on the Internet at:

http://support.automation.siemens.com/WW/view/de/11886029

In addition to the I/O modules approved for SIMOTION, all certified standard slaves can, in principle, be connected to SIMOTION if they support the following:

- Cyclic data traffic (DP-V0) and, possibly,
- Acyclic data traffic (DP-V1) or
- Isochronous data traffic (DP-V2)

These modules are integrated via the GSD file from the device manufacturer.

Note

Please note that in individual cases further boundary conditions must be fulfilled in order to integrate a standard slave into SIMOTION. Some modules need "driver blocks", e.g. in the form of function blocks, which make integration possible or much easier.

For modules approved for use with SIMOTION (e.g. S7-300 module FM 350-1, etc.), these driver blocks:

- Up to V3.2 SP1: SIMOTION Function Library
- As of V4.0: SCOUT command library

9.1.2.3 The fundamentals of motion control

Position-controlled motion control for servo axes via the onboard drive interface (C230-2, C240)

These enable position-controlled motion control of up to four axes. The C230-2/C240 provides one analog output per axis for the speed setpoint and one encoder input per axis for the cyclic measurement of the actual position value.

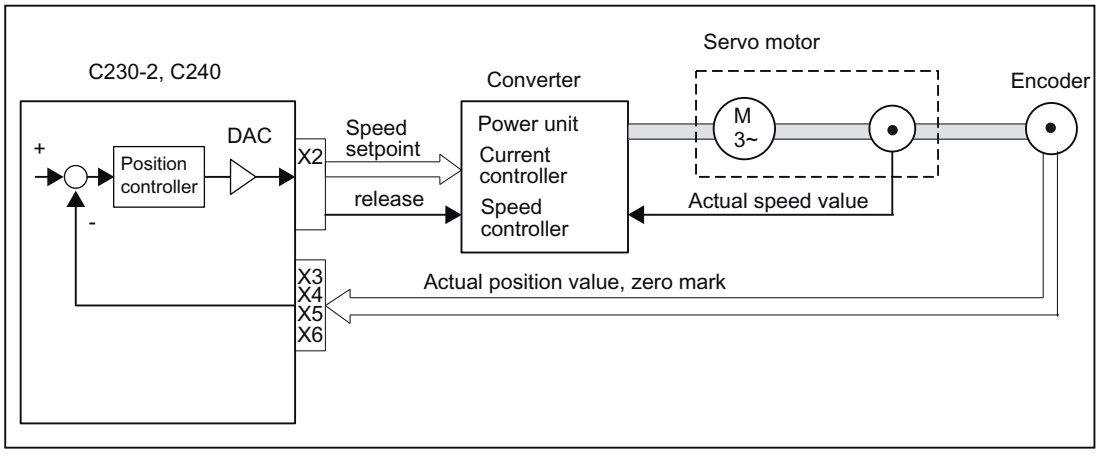

Figure 9-4 Servo system with converter, e.g. SIMODRIVE 611 universal, with built-in incremental encoder

Incremental encoder (C230-2, C240)

For position measurement, the encoders usually connected supply counting pulses according to their resolution for the distances traveled. These can be rotary encoders or linear scales. Homing is necessary to determine the absolute position reference.

Absolute encoder (SSI, C230-2, C240)

Instead of conventional incremental encoders, which supply only a relative dimension for the distance traveled, absolute encoders with a serial interface can be connected. No homing operation need be performed for these encoders as they always supply the absolute position as an actual value.

A one-time adjustment is required for an axis with an absolute encoder when the machine is initially commissioned.

Encoder emulation (C230-2, C240)

Modern motor/converter systems often have a high-resolution motor measuring system (rotor position encoder) connected at the converter. Here the converter provides the position information via an interface that emulates an incremental encoder (e.g. incremental shaft encoder (WSG) interface with SIMODRIVE). A separate position measuring system is not required in this case.

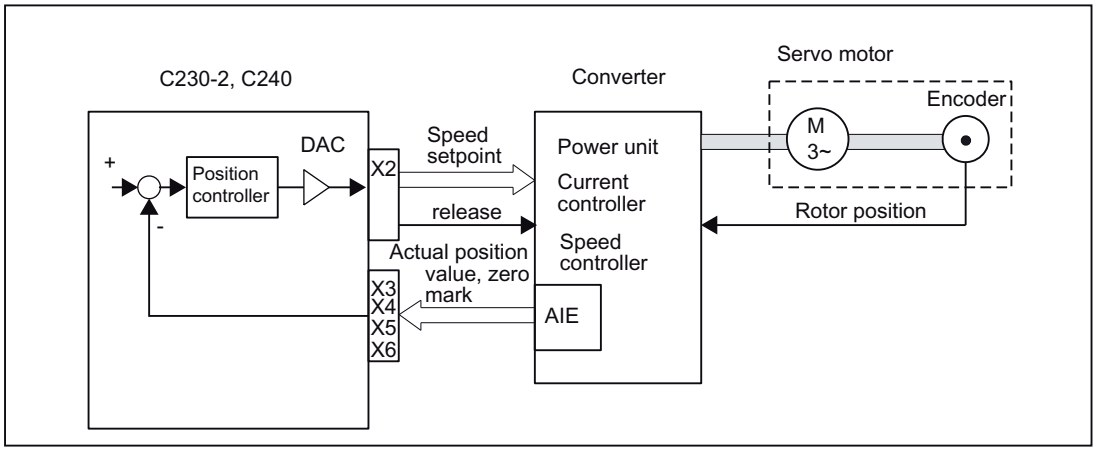

Figure 9-5 Servo system with converter, e.g. SIMODRIVE 611 universal, with incremental encoder

Position-controlled motion control for servo axes (PROFIBUS DP)

SIMOTION C enables position-controlled motion control of axes via PROFIBUS DP.

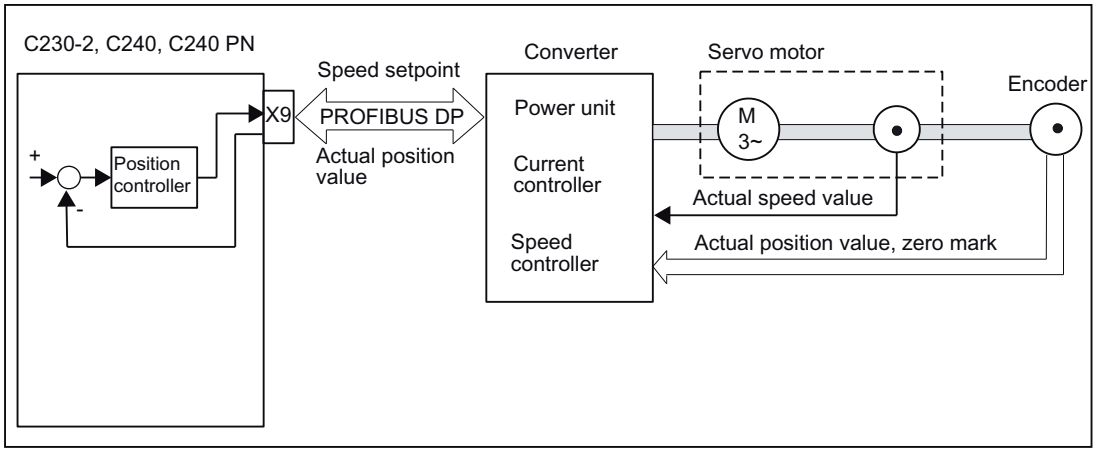

Figure 9-6 Servo system with converter, for example SIMODRIVE 611 Universal

Stepper motor control (C230-2, C240)

In addition to the analog setpoint outputs, the C230-2/C240 has pulse outputs for up to four stepper motor axes. The stepper motor is controlled by means of cycle clocks, the number of which determines the position and the frequency of which determines the rotational speed (velocity). The actual position value is not measured during controlled operation; the position controller takes the number of pulses output (position setpoint) as the actual value. With this type of control circuit, the motor cannot lose any steps in order to enable exact positioning.

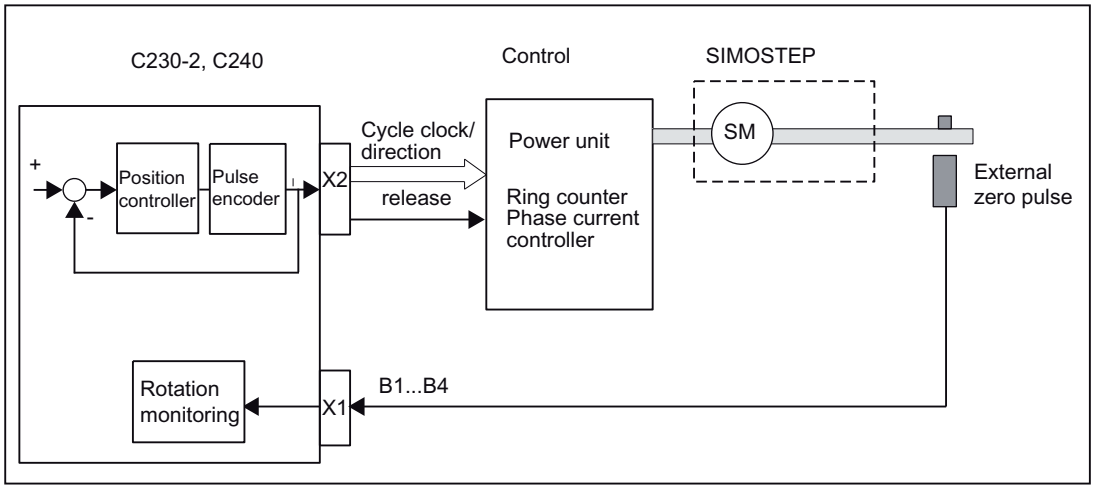

Figure 9-7 Controlled stepper motor system with control circuit

Position-controlled stepper motor control (C230-2, C240)

The C230-2, C240 also provide the option of using one encoder input per axis to operate stepper motors in closed-loop position control as a servo axis.

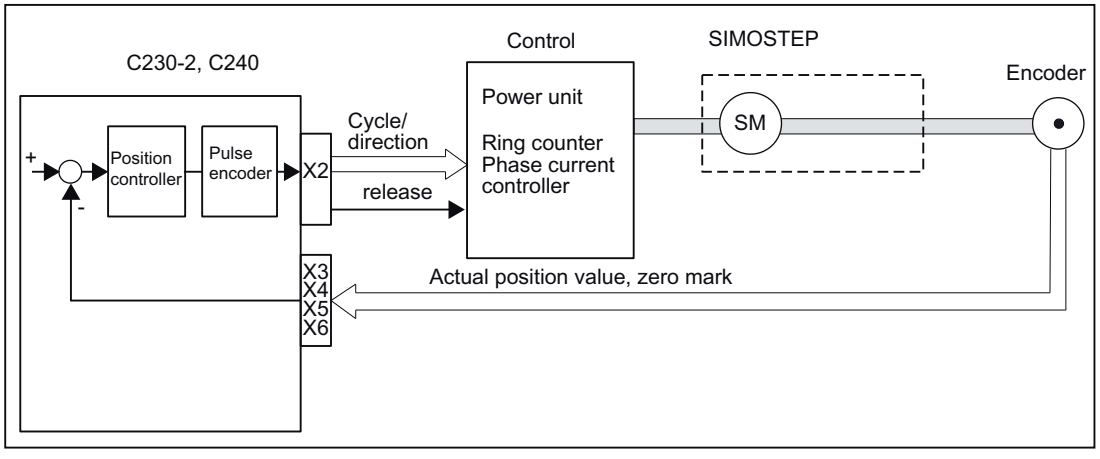

Figure 9-8 Position-controlled stepper motor system with control circuit

Position-controlled motion control for servo axes (C240 PN, PROFINET IO)

The C240 PN enables position-controlled motion control of axes via PROFINET IO.

9.1.2.6 Versions of SIMOTION C

There are three different versions of the SIMOTION C: The previous C230-2, a more powerful C240 and a C240 PN with PROFINET interface. The C240 and C240 PN also have functional improvements, as compared to the C230-2.

Compared to the C230-2, the C240 and C240 PN have:

- A larger working memory
- A larger memory for retain data
- Higher performance

Instead of the onboard drive and measuring system interfaces, the C240 PN has a PROFINET interface with three ports (X11 P1, X11 P2, X11 P3).

The following table lists the differences between the individual motion controllers:

Table 9-4 Differences between C230-2, C240 and C240 PN

	C230-2	**C240**	**C240 PN**
Article No. of the module	6AU1 230-2AA01-0AA0	6AU1 240-1AA00-0AA0	6AU1 240-1AB00-0AA0
Article No. of the Micro Memory Card (MMC)	6AU1 700-0AA02-0AA0	6AU1 720-1KA00-0AA0 **Note**: The MMC of the C240 and the C240 PN are identical.	
	Note: The MMC of the C240 / C240 PN cannot be operated in the C230-2 and vice-versa.		
Uses of the analog drive interface (X2)	• For analog drives • For stepper drives	• For analog drives • For stepper drives • For standard outputs (analog/digital outputs)	• Not available
Filter time for analog outputs	• With filter (C230-2-compatible)	• With filter (C230-2-compatible) • Without filter	• Not available
Repeatability when using the outputs as fast output cams (X1)	140 µs	70 µs	70 µs
Use of the inputs (X1: B1... B4)	• As digital inputs • For external zero mark signals	• As digital inputs • For external zero mark signals • Measuring pulses for global measuring (in addition to inputs M1 and M2 for local measuring)	• As digital inputs • Measuring pulses for global measuring
Use of measuring system interface (X3 to X6)	• Encoder connection	• Encoder connection • Counter input	• Not available
Mode selector (hardware)	Key-operated switch Switch positions: • RUN • STOPU • STOP • MRES	Toggle switch Switch positions: • RUN • STOP • MRES	Toggle switch Switch positions: • RUN • STOP • MRES
PROFINET interface (X11)	Not available	Not available	3x PROFINET X11 P1, X11 P2, X11 P3

Note

In order to take the different versions into account, the product will be referred to in this manual as "SIMOTION C". Specific product designations will be used for information that applies only to one product version, e.g. for SIMOTION C230-2, C240 or C240 PN.

9.1.3 Operator control (hardware)

9.1.3.1 Control Elements

Mode selector

Certain operating modes can be selected using the mode selector.

Mode selector positions

The mode selector positions are explained in the order in which they are arranged on the SIMOTION C.

Table 9-5 Modes and switch settings

Operating mode	Explanations
RUN	SIMOTION C executes the user program (UP) and the associated system functions: • Reading process image of inputs • Execution of the user programs assigned to the execution system • Writing process image of outputs The technology packages are active in this state. They can execute commands from the user program. **Note:** With the C230-2, the key cannot be removed in this position.
STOPU	SIMOTION C does not execute a user program. • The technology packages are active. Test and commissioning functions can be executed. The user program is not active. • The I/O modules (SMs) are in a safe state. With the C230-2, the key can be removed in this position so that no unauthorized person can change the operating modes. **Note:** The toggle switch of the C240 / C240 PN does **not** have the "STOPU" switch setting. You can switch to "STOPU" mode **only** via the SIMOTION SCOUT engineering system. In SIMOTION SCOUT, you can switch from the hardware settings "STOP" and "RUN" to "STOPU" mode.

Operating mode	Explanations
STOP	SIMOTION C does not execute a user program. • It is possible to load a complete user program. • All system services (communications, etc.) are active. • The I/O modules (SMs) are in a safe state. • The technology packages are inactive, i.e. all enables are deleted. No axis motions can be executed. **Note:** With the C230-2, the key can be removed in this position so that no unauthorized person can change the operating modes.
MRES (memory reset)	Pushbutton position for memory reset on the SIMOTION C. A memory reset by means of a mode selector requires a specific sequence of operation, see chapter SIMOTION C memory reset (Page 6869).

Micro Memory Card (MMC)

SIMOTION C230-2 micro memory card

The following micro memory card is available:

Article No.: 6AU1 700-0AA02-0AA0

The micro memory card for SIMOTION C230-2 can be used to save the SIMOTION Kernel in order to run an update. See chapter SIMOTION kernel update (Page 6872).

The SIMOTION Kernel should always be stored on the micro memory card.

As of SIMOTION V2.1, the SIMOTION Kernel is automatically copied to the micro memory card during power-up if it does not already contain one.

The micro memory card is also needed to save the technology packages and user data (programs, configuration data, parameterizations).

⚠ CAUTION
The micro memory card may only be inserted or removed when the control unit is disconnected from the power supply.

Micro memory card for SIMOTION C240 / C240 PN

The following micro memory card is available:

Article No.: 6AU1 720-1KA00-0AA0

The micro memory card is **mandatory** for operating the SIMOTION C240 / C240 PN.

The micro memory card is supplied in a bootable format with the latest SIMOTION Kernel. It is **not** supplied with the SIMOTION C240 / C240 PN and must be ordered as a separate component.

Note: The SIMOTION C240 / C240 PN does not contain any firmware.

The micro memory card for the SIMOTION C240 / C240 PN can be used to save the SIMOTION Kernel.

The micro memory card is also needed to save the technology packages and user data (programs, configuration data, parameterizations).

⚠ CAUTION
The micro memory card may only be inserted or removed when the control unit is disconnected from the power supply.

Memory module slot

The micro memory card is inserted in the memory module slot.

9.1.3.2 Display elements

LED displays

The following LED displays are on the front panel of the SIMOTION C. This table describes the LEDs and their function.

Table 9-6 Status and error displays

LED	Meaning
SF (red)	This LED indicates a fault on the SIMOTION C.
5 VDC (green)	This LED indicates that the power supply for the electronics is ready.
RUN (green) - SIMOTION C in RUN mode	This LED indicates that the user program is running.
STOPU (yellow) - SIMOTION C in STOP user program mode	This LED indicates that the technology packages (for example, synchronous operation and cam) are active. The user program is not active.
STOP (yellow) - SIMOTION C in STOP mode	This LED indicates that no user program is running. The technology packages are not active.
BUS1F (red) - Group fault	This LED indicates a fault on the SIMOTION C PROFIBUS DP1 interface **(X8)**.
BUS2F (red) - Group fault	This LED indicates a fault on the SIMOTION C PROFIBUS DP2/MPI interface **(X9)**.
Q0 to Q7 , I0 to I11 , B1 to B4, M1, M2 (green) - Digital inputs/digital outputs	These LEDs show the status of the digital inputs/outputs.

The following LED displays are arranged the front cover of the SIMOTION C240 PN. This table describes the LEDs and their function.

Table 9-7 Status and fault displays behind the front cover (C240 PN)

LED	Meaning
Ethernet link (X7) (green)	This LED indicates a physical connection of the Ethernet interface.
Ethernet activity (X7) (yellow)	This LED indicates a data transfer via the Ethernet interface.
PROFINET link (X11 Px) (green)	This LED indicates a physical connection of the PROFINET interface at port x.
PROFINET activity (X11 Px) (yellow)	This LED indicates a data transfer via the PROFINET interface at port x.
PROFINET fault (X11) (red)	This LED indicates a fault at the PROFINET interface.
PROFINET sync (X11) (green)	This LED indicates synchronization status of the PROFINET interface.

Diagnosis using the LEDs (Page 6877)

9.1.4 Interfaces

9.1.4.1 SIMOTION C interfaces

The interfaces and their meaning are described in following table.

Table 9-8 Interfaces

Interfaces	Description
Bus connector	Rear-mounted connector for connecting to other S7 modules via the I/O bus
Drive interface (onboard) (C230-2, C240)	50-pin Sub-D connector **X2** for the analog connection of analog and stepper drives (max. 4 axes)
Measuring system interface (onboard) (C230-2, C240)	15-pin Sub-D sockets **X3** to **X6** for connection of encoders (max. 4)
I/O interface	40-pin front connectors **X1** for connecting the fast digital inputs/digital outputs including measuring inputs and external zero mark and for wiring the READY relay
Power supply connection	4-pin screw-type terminal connection **X10** for connecting the 24 V load power supply
Memory module slot	Slot for micro memory card (MMC)
PROFIBUS DP1 interface	9-pin Sub-D socket **X8** for connection to the PROFIBUS DP. This interface can be used for isochronous operation
PROFIBUS DP2/MPI interface	9-pin Sub-D socket **X9** for connection to PROFIBUS DP (factory setting) or an MPI bus This interface can be used for isochronous operation.

Interfaces	Description
Ethernet interface	8-pin RJ45 socket **X7** for connection to an Industrial Ethernet
PROFINET interface with three ports (C240 PN)	3 x 8-pin RJ45 sockets **X11 P1, X11 P2** and **X11 P3** for connecting to PROFINET subnets

9.1.4.2 Ethernet interface

Definition

Interface for connecting an Industrial Ethernet.

Industrial Ethernet is a communication network with a transmission rate of 10/100 Mbit/s.

The SIMOTION C provides the following functions via the Ethernet interface:

- Communication with STEP 7 and SIMOTION SCOUT
- Communication with distributed I/O (e.g. SIMATIC HMI)
- Communication between SIMOTION and SIMATIC NET OPC
  The "SIMATIC NET SOFTNET S7 (S7 OPC server)"
  software must be installed on the PG/PC for this function.
  Note:
  SOFTNET-S7 is a superset of SOFTNET-PG, i.e. SOFTNET-S7 contains Protocol TPC/IP RFC 1006 as well.

For more information about the software packages, see *SIMOTION Motion Control System*, PM 21 Catalog. This documentation is supplied in electronic format with SIMOTION SCOUT.

Connectable devices

A PG/PC can be connected to the Ethernet interface via a Fast Ethernet network. The PG must be equipped with an Ethernet card and the corresponding software must be available.

Interface position

The following figures show the installation position and the designation of the interface on the C230-2, C240 and C240 PN modules.

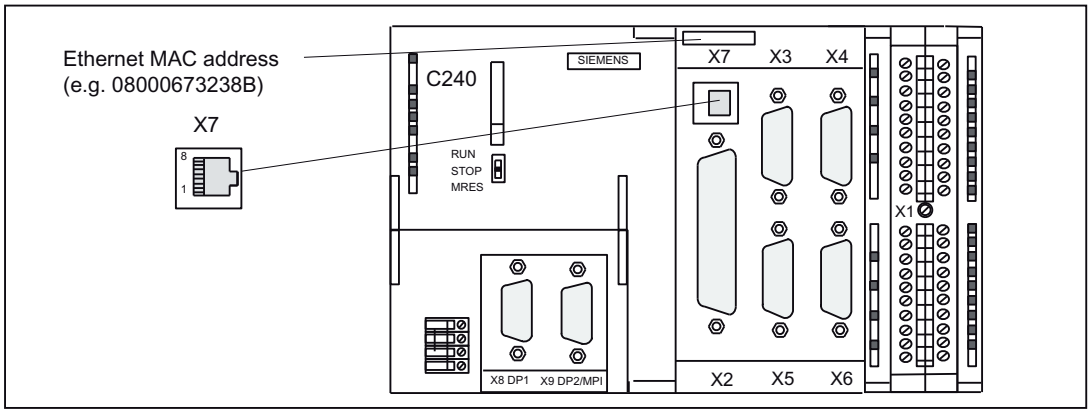

Figure 9-22 X7 interface position (C230-2, C240)

4	Not assigned		8	Not assigned	

Signal names

RDP, RDM - Receive Data +/-
TDP, TDM - Transmit Data +/-

Signal type

I - signal input
O - signal output

Note

You will find additional information about Ethernet in the *SIMOTION SCOUT Communication* System Manual.

9.1.4.3 PROFINET interface (C240 PN)

Definition

A SIMOTION C240 PN provides an interface for connecting to PROFINET IO with three ports (X11 P1, X11 P2, X11 P3) with a transmission rate of 100 Mbit/s. The PROFINET interface supports the parallel operation of:

- IRT with the "high flexibility" and "high performance" options - isochronous real-time communication:
  - Equidistant transmission of input/output data between an IO controller and its IO devices with high stability for time-critical applications (e.g. motion control). The required bandwidth is in the bandwidth reserved for cyclic data. For "high flexibility", a fixed bandwidth of the transmission resources is reserved for the real-time communication. The "high flexibility" enables simple planning and expansion of the system. For "high performance", a fixed bandwidth of the transmission resources is also reserved for the real-time communication. The data traffic is further optimized and accelerated through an additional topology planning. The "high performance" option always requires a configuration of the topology.
  - With the aid of IRT "high performance", IO devices (I/O modules and drive units) that support IRT can be operated isochronously on PROFINET IO and data can be exchanged between the SIMOTION devices via the controller-controller data exchange broadcast.
- RT - real-time communication: Transmission of input/output data between an IO controller and its IO devices in prioritized Ethernet message frames, but not isochronously. The required bandwidth is in the bandwidth of PROFINET IO reserved for cyclic data.
- Standard Ethernet communication such as TCP/IP, UDP, HTTP, FTP, etc. as well as communication with STEP 7 / SIMOTION SCOUT and communication with SIMATIC NET OPC: The required bandwidth is in the free bandwidth of PROFINET IO.

A SIMOTION C240 PN can be used as IO controller or I device. PROFINET IO differentiates between an IO controller and the IO devices assigned to it. IO controller and IO devices form a PROFINET IO system, comparable to a master-slave system on PROFIBUS DP.

Connectable devices

The following devices can be connected to the PROFINET interface:

- PG/PC programming device
- SIMATIC HMI devices
- SIMATIC S7 controllers with PROFINET interface
- Distributed I/O (e.g. SIMATIC ET 200M) with PROFINET interface
- Drive units with PROFINET interface
- SIMOTION devices with PROFINET interface according to PROFIdrive profiles / IEC61800-7

- Teleservice adapter
- Gateways

Note

All released modules and devices are listed in the PM 21 Catalog and in chapter I/O modules approved for SIMOTION (Page 6753). This documentation is supplied in electronic format with SIMOTION SCOUT. Take note of the documentation on the individual modules or devices!

Interface position

The following figure shows the mounting position and the designation of the PROFINET IO interface on the module.

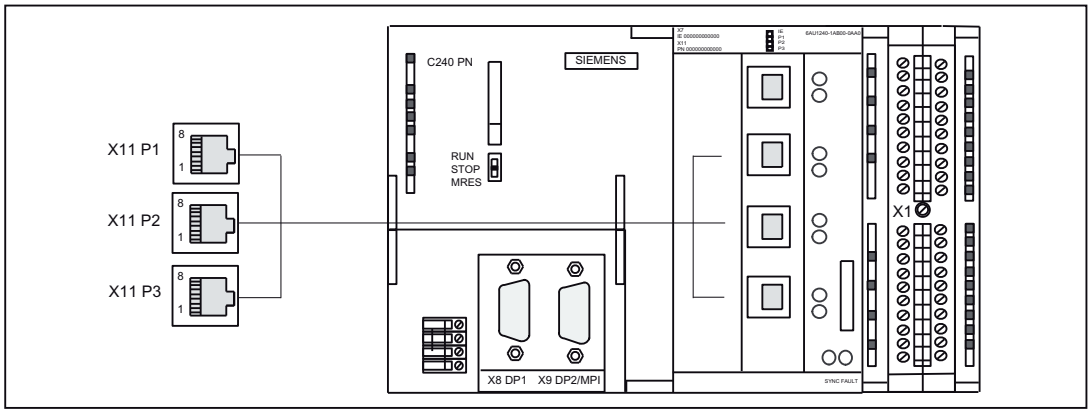

Figure 9-24 X11 interface position (C240 PN), three ports P1, P2, P3

The following LED displays are arranged behind the front cover of the SIMOTION C240 PN. For a description of the LED displays, see section Display elements (Page 6769).

Interface assignment

Designation: X11 (PROFINET), three ports P1, P2, P3

Type: 8-pin RJ45 socket

Table 9-10 X11 interface assignment (ports P1, P2, P3)

Signal names

RDP, RDM - Receive Data +/-

TDP, TDM - Transmit Data +/-

Signal type

I - signal input

O - signal output

Note

You will find additional information about PROFINET in the *SIMOTION SCOUT Communication* System Manual.

9.1.4.4 PROFIBUS DP interfaces

PROFIBUS DP interfaces (X8, X9)

The SIMOTION C provides two interfaces for connection to the PROFIBUS DP. Baud rates up to 12 Mbits/s are possible. Both interfaces can be operated isochronously.

If both interfaces (X8, X9) are to be operated isochronously, then they must both be configured with the same DP cycle clock.

Alternatively, the X9 interface can be used as an MPI interface with a transmission rate up to 12 Mbits/s.

Connectable devices

The following devices can be connected to the PROFIBUS DP interfaces:

- PG/PC
- SIMATIC HMI devices
- SIMATIC S7 controllers with PROFIBUS DP interface
- Distributed I/O (e.g. SIMATIC ET 200M)
  The digital inputs/digital outputs are updated in the position control cycle clock.
- SIMOTION controller
- Teleservice adapter
- Drive units with PROFIBUS DP interface (e.g. SIMODRIVE 611 universal) according to PROFIdrive profiles / IEC61800-7.

Note

A teleservice adapter can only be connected to **one** of the two interfaces.

All released modules and devices are listed in the *PM 21* Catalog and in chapter I/O modules approved for SIMOTION (Page 6753). This document is supplied in electronic format with SIMOTION SCOUT.

Take note of the documentation on the individual modules or devices!

Interface positions

The following figure shows the mounting position and the designation of the interfaces on the module.

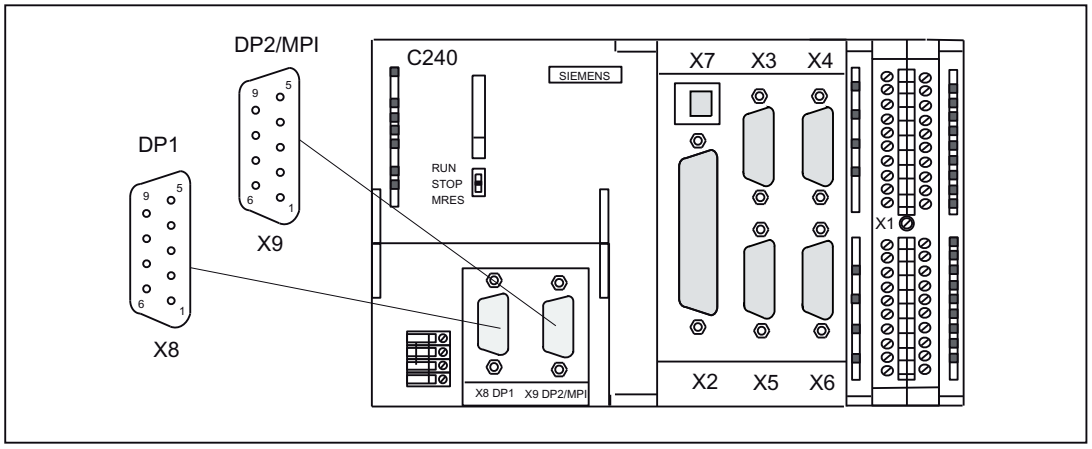

Figure 9-25 Position of connectors X8, X9

Interface assignments

Designation: **X8, X9** DP1, DP2/MPI Type: 9-pin Sub-D socket connector

Table 9-11 X8, X9 interface assignments

5	M5	VO			

Signal names

Table 9-12 Signal names

Signal name	Meaning
A, B	Data input/output (RS485)
RTS	Transmission request
P5	5 V power supply 60 mA, short-circuit-proof
M5	5 V reference potential
P24	24 V supply 150 mA, short-circuit-proof, not isolated
M24	24 V reference potential

Signal type

O - signal output
I/O - signal input/output
VO - voltage output

9.1.4.5 Onboard drive interface (C230-2, C240)

Connector to drive unit

Drive units with an analog interface (±10 V) or stepper motor power units with at least one clock pulse input and direction input can be connected to the 50-pin Sub-D socket X2. Any hybrid configuration can be used for up to four drives.

In addition, the C230-2 and C240 provide one enable signal per axis.

With the C240, this interface (X2) can also be used for standard outputs:

- 4 analog outputs
- 4 digital outputs

Position of the connector

The following figure shows the installation position and the designation of the connector on the module.

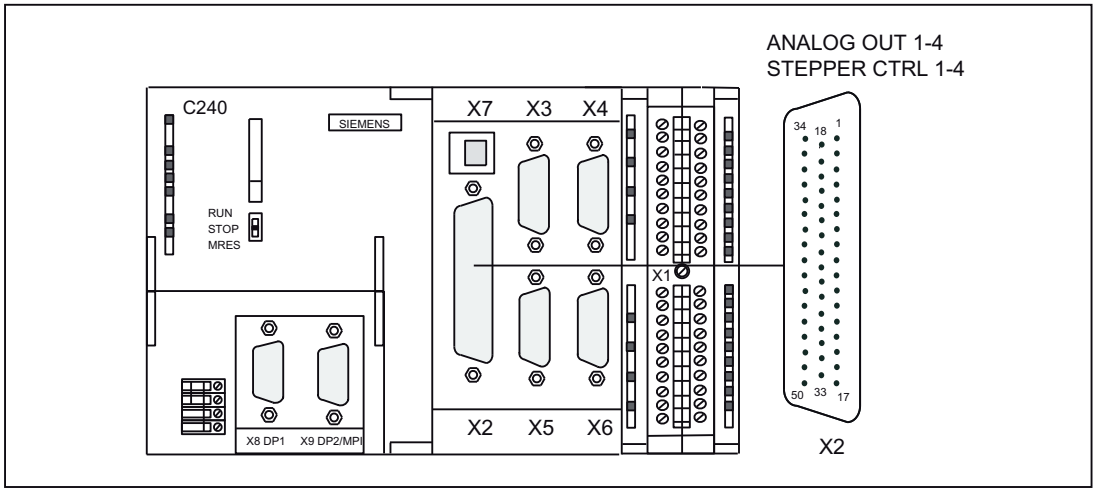

Figure 9-26 Position of the X2 connector

17	CTREN4.1	C				50	CTREN4.2	C

Signal names

Table 9-14 Signal names for drives with analog interface

Signal name	Meaning
SETP[1 to 4]	Setpoint
REFPOT[1 to 4]	Reference potential for setpoint (analog ground)
CTREN[1.1 to 4.1], CTREN[1.2 to 4.2]	Controller-enable contact

Table 9-15 Signal names for stepper drives:

Signal name	Meaning
PULS[1 to 4], PULS[1 to 4]_N	Clock pulse is inverted and not inverted
DIR[1 to 4], DIR[1 to 4]_N	Clock pulse inverted and non-inverted
ENABLE[1 to 4], ENABLE[1 to 4]_N	Controller enable inverted and non-inverted
GND	Signal ground

Signal type

O - signal output
VO - voltage output
K - switching contact

Drives with analog interface

Signals:

One voltage signal and one enable signal are provided per axis.

- **Setpoint (SETP)**
  Analog voltage signal in the ±10 V range for the output of a speed setpoint.
- **Reference potential (REFPOT**)
  Reference potential (analog ground) for the setpoint signal, connected internally to logic ground.
- **Controller enable (CTREN)**
  Contact assembly mated set (NO contact), used for axis-specific enabling of the drive, e.g. a SIMODRIVE drive unit. The RF signal to the drive is set as soon as the controller enable is signaled by the user program.

Note: When used as a digital output, the contact must be supplied with voltage.

⚠ **WARNING**
Brief voltage peaks may occur at the analog outputs when the supply voltage is switched on or off. For this reason, it is important to make sure that the enable signals are wired correctly and that the necessary safety regulations are met.

Stepper drives

Signals:

One clock pulse signal, direction signal, and enable signal is provided as a true and negated signal.

- **Setpoint (PULS)**
  The clock pulses control the motor. The motor performs one step for each rising pulse edge. Thus, the number of pulses output determines the angle of rotation, i.e. the distance to be traversed.
  The pulse frequency determines the rotational speed, i.e. the traversing speed.

  ⚠ CAUTION

  If your drive unit responds to falling pulse edges, you must replace the true pulse signal with the negated pulse signal when performing the wiring; failure to do so can cause deviations to occur between the position calculated by the controller and the actual position.

- **Direction signal (DIR)**
  The output signal level determines the direction of rotation of the motor.
  Signal ON: "Rotation to the left"
  Signal OFF: "Rotation to the right"

  Note

  If the direction of rotation of the motor is different, you can change the direction of rotation by means of the "Reversal of traversing direction" configuration data element. Refer to the technical documentation of your drive unit for the correct assignment of the signal levels to the direction of rotation.

- **Enable signal (ENABLE)**
  This signal is activated when the axis enable is set in RUN mode by the user program.
  Signal ON: Power control circuit enabled
  Signal OFF: Depending on the power unit, one or more of the following responses can occur:
  - Disable pulse input
  - Deenergize motor
  - Reset ring counter
  - Delete error messages

  Note

  The ENABLE signal is output at the same time with controller enable contact RF. Alternatively, you can also use the relay contacts.

Signal parameters

All signals for stepper drives are output by means of differential signal line drivers in accordance with the RS422 standard. For optimal reliability, the power unit should have differential signal

receivers or optical coupler inputs to enable symmetrical signal transmission. An asymmetrical transmission is also possible, however, the maximum cable length in this case is limited to 10 m.

Note

Because of the wide range of non-standardized input circuits of the drive units during asymmetrical transmission, no responsibility can be taken for this function. In particular, cable lengths and the limit frequency depend on the properties of the input circuit and the cable being used. In addition, the GND reference potential should be isolated to prevent electrical interference.

All outputs are electronically protected against short-circuit and thermal overload.

The following figure shows different possibilities for protective signal circuits.

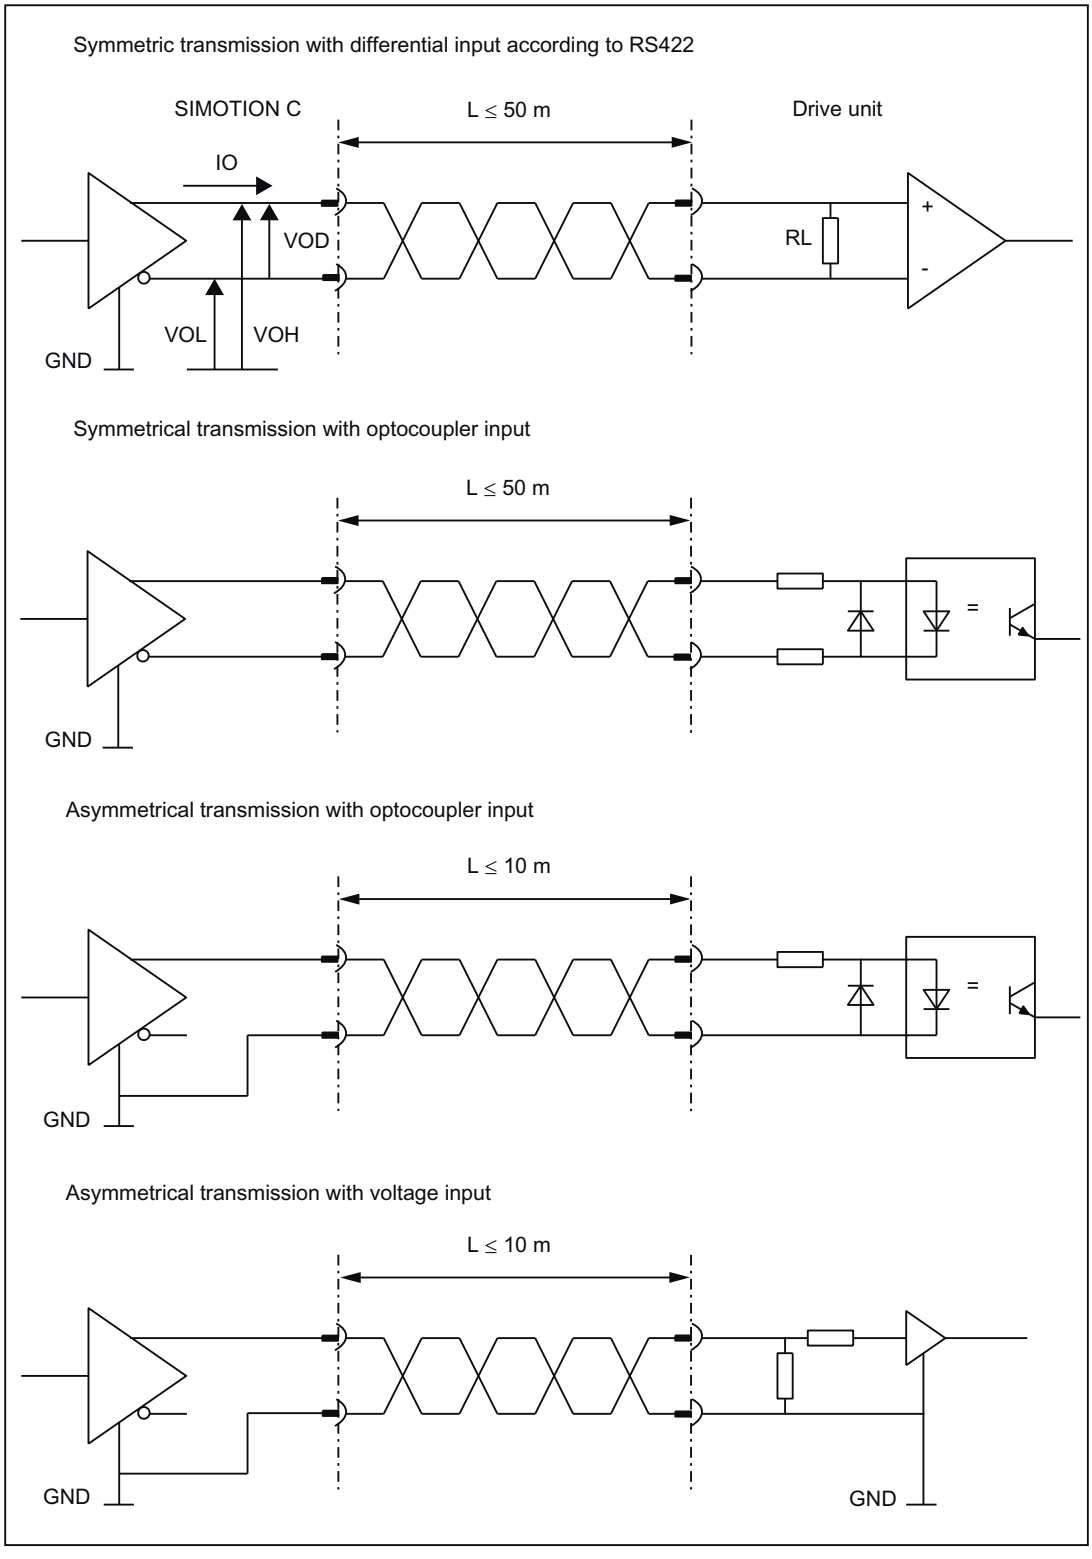

Figure 9-27 Possible protective signal circuits for the stepper motor interface

Use as standard outputs (analog/digital output) for C240

The setpoint signals (connector X2, SETP1 to 4) can also be used on the C240 as four analog outputs. The analog output (X2) has a filter that can be switched off.

The default setting is "with filter (C230-2-compatible)". This setting is active regardless of whether the four outputs are used (actuating signal for axis of analog output). Output values are interpolated linearly via the servo cycle clock.

Procedure:

1. Select the **C240** in the rack.
2. Select the menu command **Edit > Object Properties** to open the **Properties C240 - (R0/S2)** dialog.
3. You can set the filter time in the **Onboard I/O** tab.

The controller enable contacts (connector X2, CTREN1 to 4) can also be used on the C240 as four digital outputs. These digital outputs are isolated relay contacts (NO).

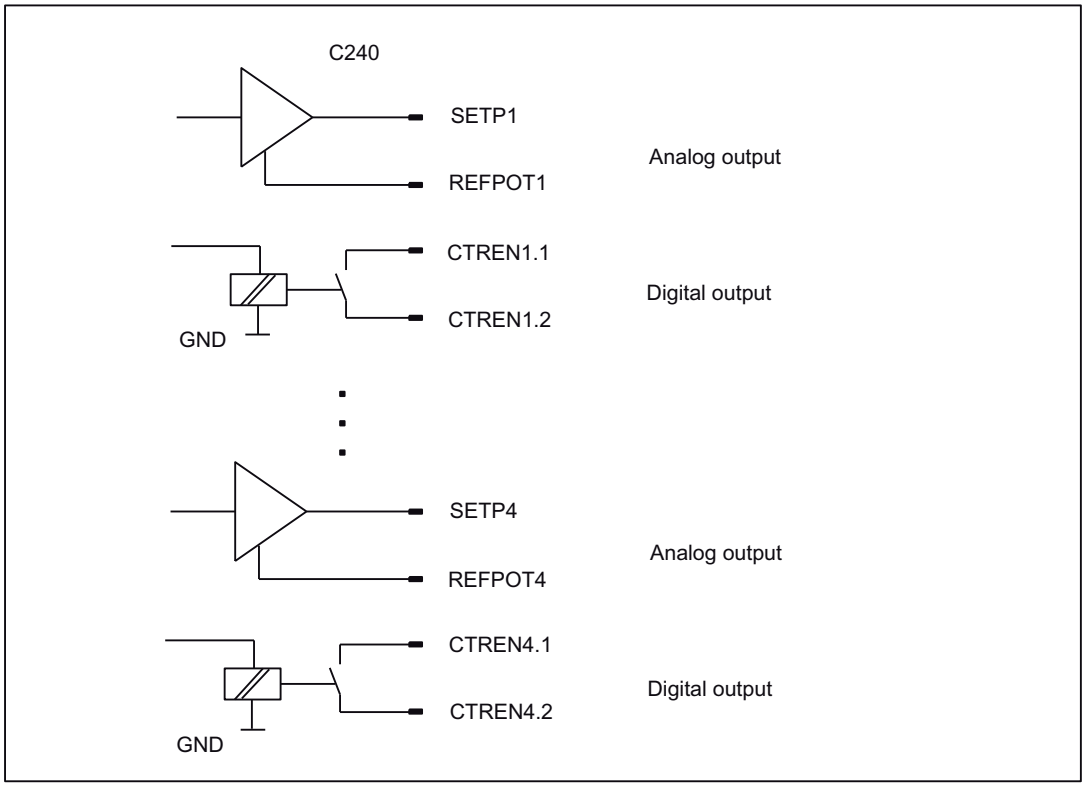

Figure 9-28 Use as standard outputs

9.1.4.6 Onboard measuring system interface (C230-2, C240)

Connectors to the encoder

A 15-pin Sub-D socket for the connection of incremental or absolute encoders (SSI) is provided for each axis.

With the C240, this interface (X3 to X6) can also be used as a counter input.

Position of connectors

This figure shows the mounting position and the designation of the connector on the module.

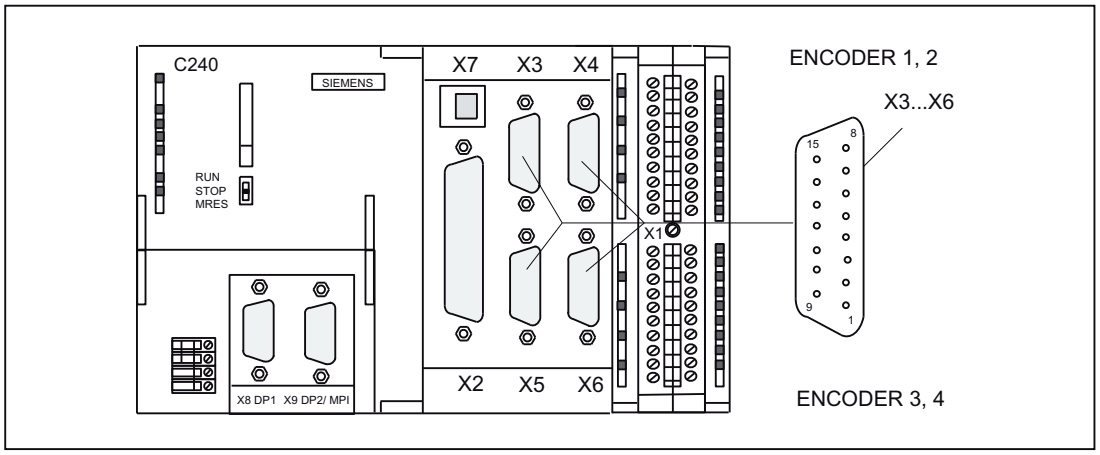

Figure 9-29 Position of connectors X3 to X6

Connector pin assignment

Designation:

X3, X4, X5, X6 - ENCODER 1 to 4
Assignment of ENCODER - axis channel:

X3 - axis channel 1
X4 - axis channel 2
X5 - axis channel 3
X6 - axis channel 4

Type: 15-pin Sub-D socket connector

Table 9-16 Assignment of connectors X3 to X6

Pin	Encoder		Type	Pin	Encoder		Type
	Incremental	Absolute			Incremental	Absolute	
1	Not assigned			9	MEXT		VO
2		CLS	O	10	Z		I
3		CLS_N	O	11	Z_N		I
4	P5EXT		VO	12	B_N		I

Pin	Encoder	Type	Pin	Encoder		Type
5	P24EXT	VO	13	B		I
6	P5EXT	VO	14	A_N	DATA_N	I
7	MEXT	VO	15	A	DATA	I
8	Not assigned					

Signal names

Table 9-17 Measuring system interface signal names

Signal name	Meaning
A, A_N	Track A non-inverted and inverted (incremental encoder)
B, B_N	Track B non-inverted and inverted (incremental encoder)
Z, Z_N	Zero mark non-inverted and inverted (incremental encoder)
CLS, CLS_N	SSI clock shift non-inverted and inverted (absolute encoder)
DATA, DATA_N	SSI data non-inverted and inverted (absolute encoder)
P5EXT	+5 V supply
P24EXT	+24 V supply
MEXT	Supply ground

Signal type

VO - voltage output (supply)
O - output (5 V signal)
I - input (5 V signal)

Types of encoder that can be connected

Both rotary (shaft encoders, angle measurement systems) and linear (linear encoder, linear measurement systems) measuring systems can be used. These can be built on the machine/system (incremental encoder) or integrated in the motor (rotor shaft angle encoder).

The following table gives you an overview of the encoders that can be connected and what you should take into account here.

Table 9-18 Encoders which can be connected

Encoder	Connection to X3 to X6 of the C230-2/C240
Rotary encoders • Incremental encoders with 5 V encoder power supply and TTL/RS422 interface • Incremental encoders with 24 V encoder power supply and TTL/RS422 interface • Absolute encoders (single/multi-turn) with 24 V encoder power supply and SSI interface • Shaft position encoders with 5 V encoder power supply and TTL/RS422 interface • Rotor position encoder with SINE signals • Resolver	• Direct • Direct • Direct • Direct • Via SIMODRIVE drive control using incremental shaft encoder (WSG) interface • Via SIMODRIVE resolver control using incremental shaft encoder (WSG) interface
Linear encoders • Length measurement systems with 5 V encoder power supply and TTL/RS422 interface • Linear encoders with SINUSOIDAL signals	• Direct • Via EXE (external pulse shaper electronics)

Note

If you operate drives via the PROFIBUS DP, you do not need to connect any encoders to this interface. The encoders are connected directly to the drive.

Encoder emulation (incremental shaft encoder (WSG) interface)

If the drive unit is equipped with encoder emulation, this can be connected instead of an encoder. The drive control analyzes the information from a rotor shaft angle encoder and provides information on the actual position to this interface by emulating the signals of an incremental encoder.

Note

Please note the drive manufacturer's wiring specifications. As the encoder interface of the C230-2, C240 is non-isolated, it may be necessary to take special measures for EMC on a case-by-case basis.

Encoder properties

Incremental encoder

Table 9-19 Incremental encoder properties

Property	Condition
Transmission procedure:	Differential transmission using 5 V rectangular signals (as in RS422 standard)
Output signals:	Track A as non-inverted and inverted signal (U_{a1}, $\overline{U_{a1}}$)
	Track B as non-inverted and inverted signal (U_{a2}, $\overline{U_{a2}}$)
	Zero signal Z as non-inverted and inverted signal (U_{a0}, $\overline{U_{a0}}$)
Max. output frequency:	1 MHz
Phase shift of Track A to Track B:	90° ± 30°
Current consumption:	max. 300 mA

Signal forms of incremental encoders

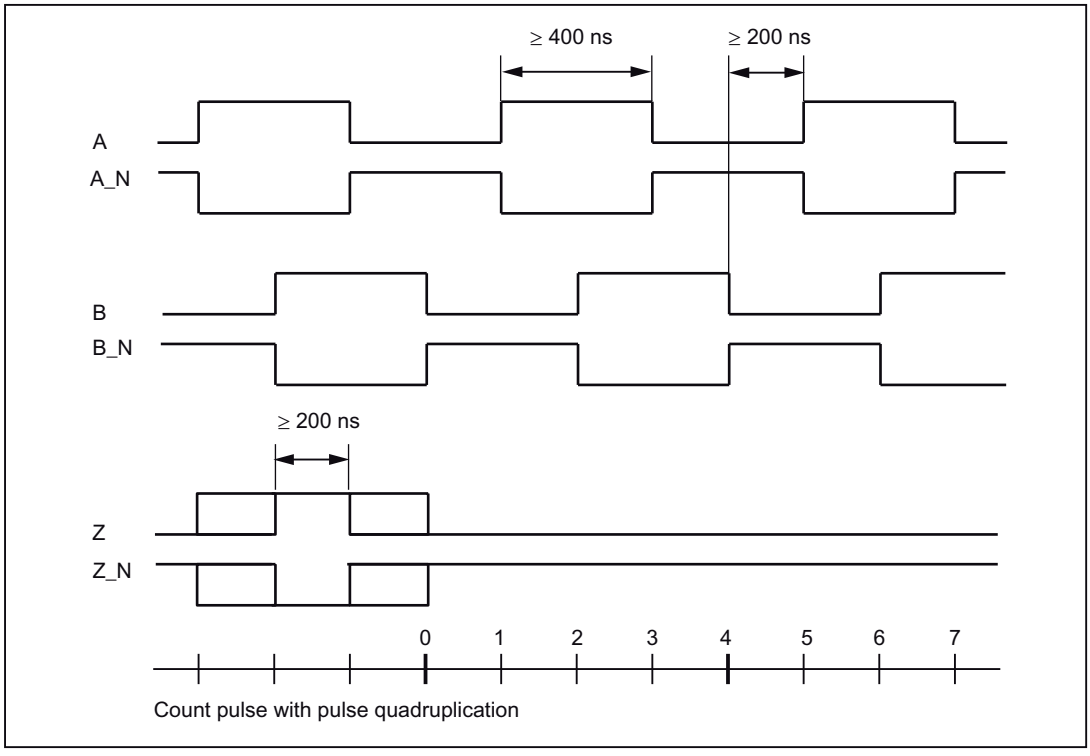

Figure 9-30 Signal forms of incremental encoders

Note

If you want to connect incremental encoders without zero signals, then you must connect the corresponding pins in the connector with the encoder power supply:

Pin 10 with Pin 7 or 9 (MEXT)
Pin 11 with Pin 4 or 6 (P5EXT)

Encoder connection via EXE

Encoders or EXEs (external pulse shaper electronics - for the connection of linear position encoders) that can be connected directly must fulfill the above conditions:

Absolute encoder (SSI)

Table 9-20 Properties of absolute encoders (SSI)

Property	Features
Transmission procedure:	Synchronous serial interface (SSI) with 5 V differential signal transmission (as in RS422 standard)
Output signal:	Data as non-inverted and inverted signal
Input signal:	Clock shift as non-inverted and inverted signal
Format:	Single/multi-turn
Resolution:	max. 25 bits
Max. transmission rate:	1.5 Mbits/s
Current consumption:	max. 300 mA

Configuration of absolute value encoders (SSI)

The configuration data of the TO axis and/or TO external encoder must perfectly match the parameters of the SSI encoder. Encoders which transmit a greater number of data bits than are to be read in the set SIMOTION C message length cannot be connected. The configuration data can be set within the range of the maximum values specified in the following message profiles (fir tree or right-justified).

Fir tree profile

The encoder always transmits the number of revolutions with the first 12 cycles. The configured encoder pulses per revolution is monitored by the encoder driver for the configured message length less these 12 cycles. The maximum configurable data width is monitored for the number of bit digits needed for representation of the configured encoder pulses per revolution in the telegram plus these 12 cycles.

Configuration data:

Message length:	13/21/25 cycles can be selected (asymmetric fir tree profile)
Encoder pulses per revolution:	≤ $2^{(\text{message length } -12)}$
Data width:	≤ 12 + (log encoder pulses per revolution / log 2)
	Note: The number of bit digits needed for representation of the encoder pulses per revolution is calculated using (log encoder pulses per revolution / log 2).

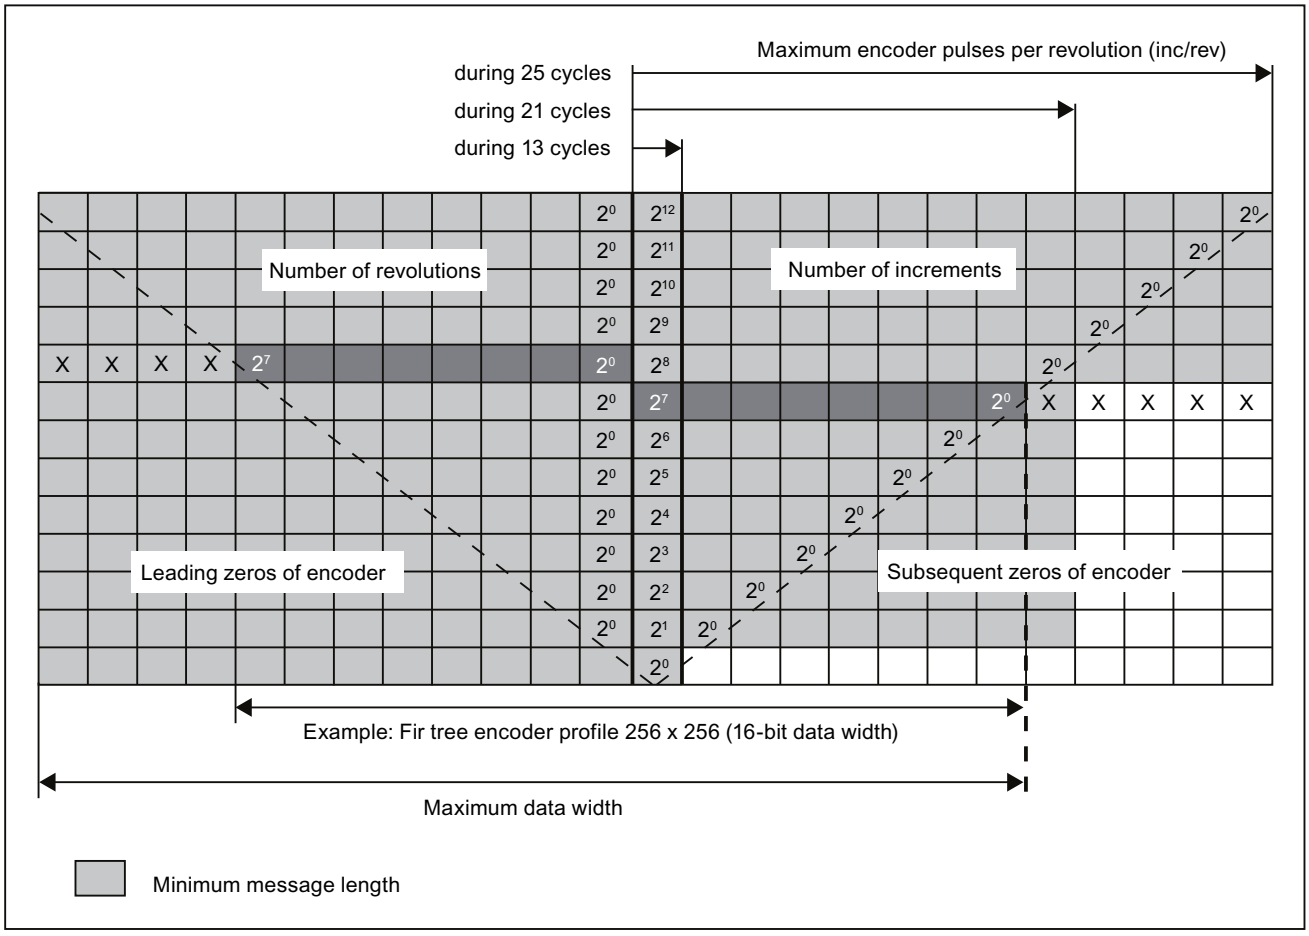

Figure 9-31 Fir tree profile

Note

Please note the following:

- Bit 2^0 of the number of revolutions is fixed on the 12th cycle, followed on the 13th cycle by the most significant bit of the number of increments/revolution.
- The leading and subsequent data bits transmitted by the encoder (or zeros) are not evaluated by SIMOTION C.
- The encoder used in the example should be configured as follows:
  - Encoder pulses per revolution: 256
  - Data width: 16
  - Message length: 21 bits (or 25 bits)
  - Message profile: Fir tree

Right-justified profile

The most significant data bit is transmitted by the encoder with the first cycle. The configured data width is monitored by the encoder driver depending on the configured message length. The maximum encoder pulses per revolution is monitored depending on the data width configured.

Configuration data:

Message length:	13/21/25 cycles can be selected
Encoder pulses per revolution:	$\leq 2^{(\text{Data width})}$
Data width:	≤ message length

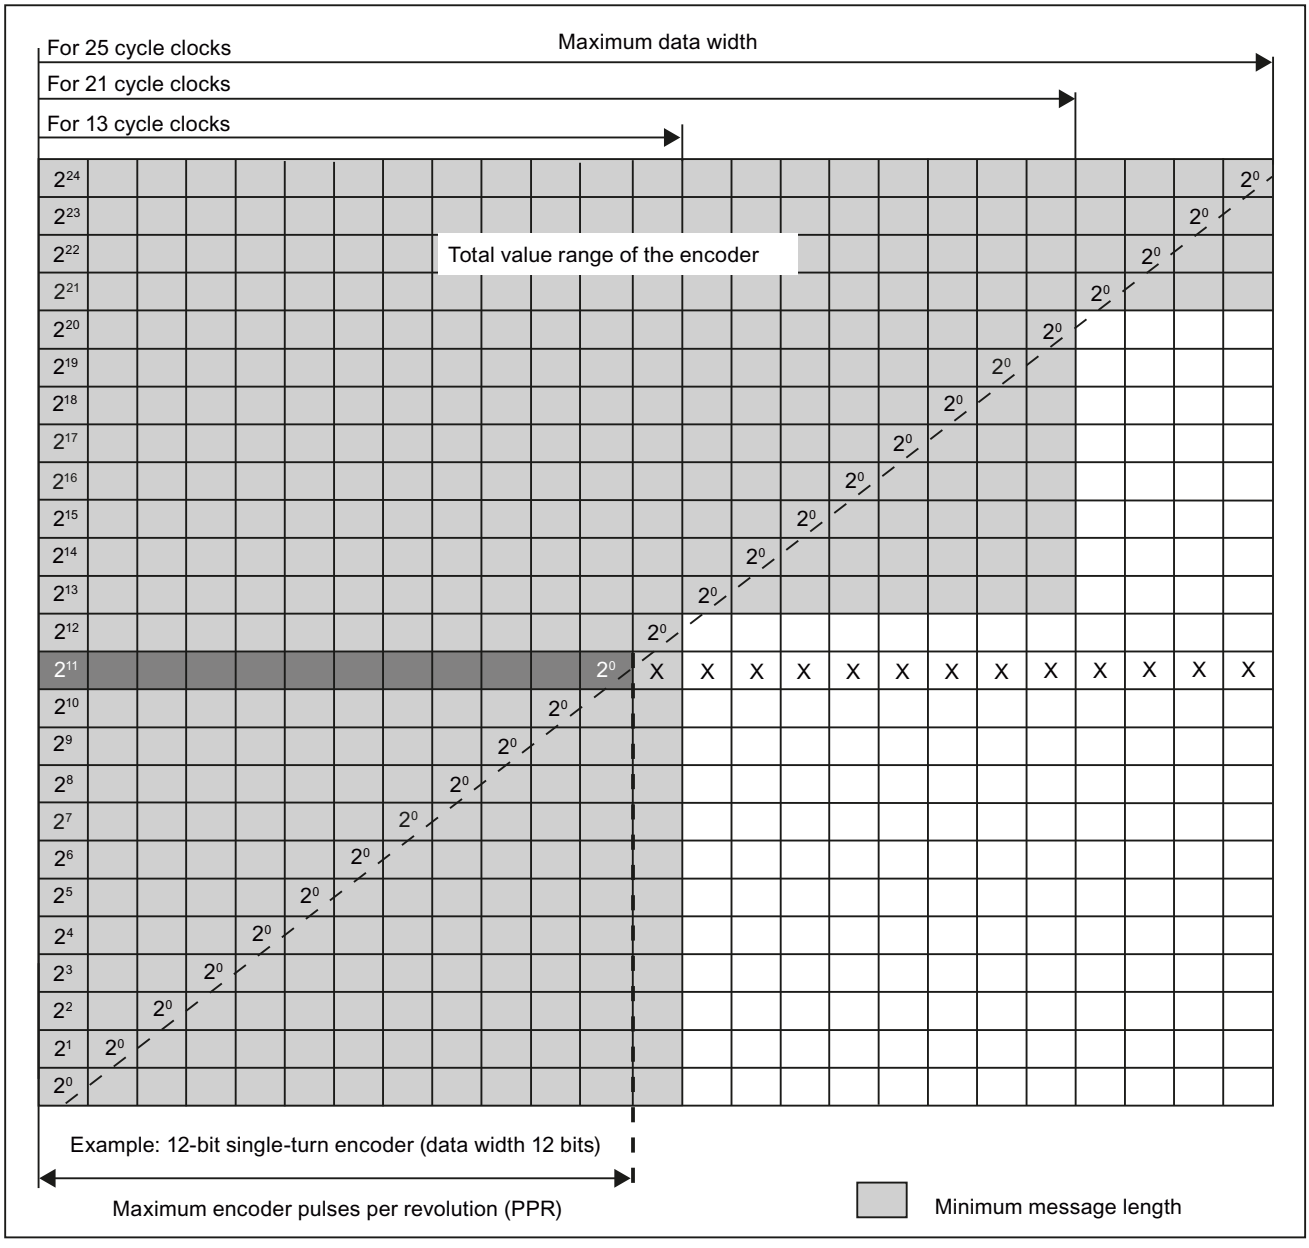

Figure 9-32 Right-justified profile

Note

Please note the following:

- The most significant data bit for the encoder's entire range of values is transmitted by the encoder with the first cycle.
- Subsequent data bits transmitted by the encoder (or zeros) are not evaluated by SIMOTION C.
- The encoder used in the example should be configured as follows:
  - Encoder pulses per revolution: 4096
  - Data width: 12
  - Message length: 13 bits (or 21 bits or 25 bits)
  - Message profile: Right-justified

Encoder supply 5 V

The 5 V supply voltage for the encoders is generated inside the module and is therefore present at the Sub-D socket. This means you can supply the encoders via the connecting cable without the need for additional wiring. The voltage supplied is protected electronically against short circuits and thermal overload, and it is monitored. The encoder supply is not isolated from the load power supply to the module.

Encoder supply 24 V

For encoders with an operating voltage of 24 V, the 24 VDC power is supplied to the Sub-D sockets. This means you can supply the encoders via the connecting cable without the need for additional wiring. The voltage supplied is protected electronically against short circuits and thermal overload, and it is monitored. The encoder supply is not isolated from the load power supply to the module.

Behavior of the integrated measurement electronics

Pulses from connected incremental encoders are quadrupled (for pulse quadruplication, see figure "Signal shapes of incremental encoders").

The actual encoder values are latched servo-synchronously in the C230-2/C240.

Note

With certain selected set values for the position control cycle clock, the measured value sampling in the C240 takes place at time Ti before the position control cycle clock time, see "Actual value latch time" table, in chapter Technical data (Page 6882). This behavior is similar to that of PROFIBUS DP encoders.

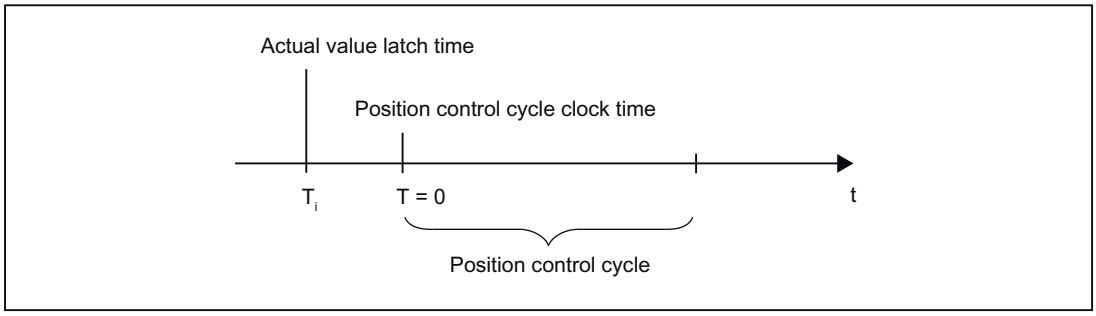

Figure 9-33 Position control cycle

Connecting cable to the encoder

The maximum cable length depends on the specification for the encoder supply and the baud rate. For problem-free operation, you must not exceed the following values when using SIEMENS preassembled connecting cables (see *Catalogs PM 21/NC 60/ST 70*):

Table 9-21 Maximum cable lengths, depending on the encoder power supply

Supply voltage	Encoder supply voltage range	Current consumption	Max. cable length
5 VDC	4.75 V to 5.25 V	< 300 mA	25 m
5 VDC	4.75 V to 5.25 V	< 210 mA	35 m
24 VDC	20.4 V to 28.8 V	< 300 mA	100 m
24 VDC	10 V to 30 V	< 300 mA	250 m

Table 9-22 Maximum cable lengths, depending on the baud rate

Encoder type	Frequency°	Max. cable length
Incremental encoder	1 MHz	10 m
	500 kHz	35 m
	300 kHz	100 m
Absolute encoder (SSI)	1.5 Mbits/s	10 m
	187.5 Kbyte/s	250 m

9.1.4.7 Possible uses of onboard drive and measuring system interface in the application (C230-2, C240)

Overview

The onboard drive interface and the measuring system interface can be used in the application for the technology objects **TO axis** and **TO externalEncoder**, and for **I/O variable**.

The table below lists the combination possibilities for the C230-2/C240.

Table 9-23 Combination possibilities for the C230-2/C240

Application	Axis channel	
	Output (X2)	Input (X3 to X6)
Position axis	x	x
Drive axis	x	-
External encoder	-	x
Also for C240:		
Standard output (I/O variables) • Analog output (PQW) • Digital output (PQ)	 x x	 - -
Standard input (I/O variables) [1] • Counter input (PIW)	 -	 x

[1] The incremental encoder used must not have a zero pulse

Note

A standard output and a drive **cannot** be used simultaneously on one axis channel.

The input (X3 to X6) used as a counter input cannot be used simultaneously as an encoder input.

When a project is created and when a project is downloaded, a consistency check of the permitted combinations per axis channel is automatically performed.

This results in the following possibilities in the application for the C240, for example:

- Configuration of hydraulic axes on the onboard resources of the C240
- Use of unassigned axis channels of the C240 as I/O variable for the user program
- Use of the analog outputs of the C240 as unassigned process outputs
  Note: The resolution and the characteristic curve of the analog output of the C240 differ from those of a SIMATIC S7 controller. The following table lists the digital values and their associated analog values (characteristic curve).

Digital value (WORD data type)	Analog value
16#7FFF ≙ 32767	+10 V
16#0000 ≙ 0	0 V
16#8000 ≙ 32768	-10 V

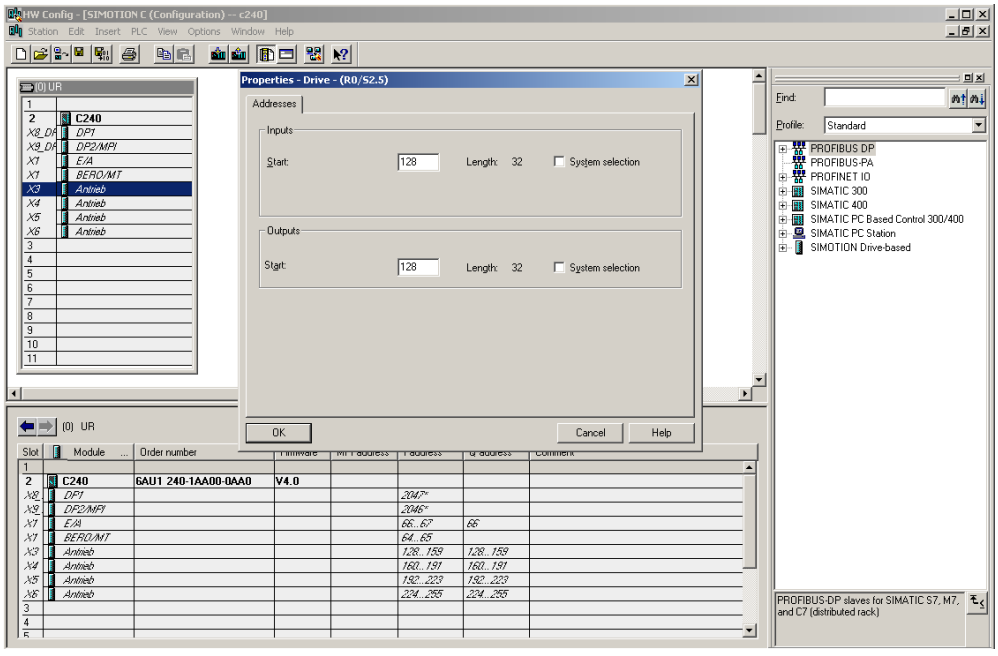
Connecting the drive units (Page 6827)

Configuration examples for C240:

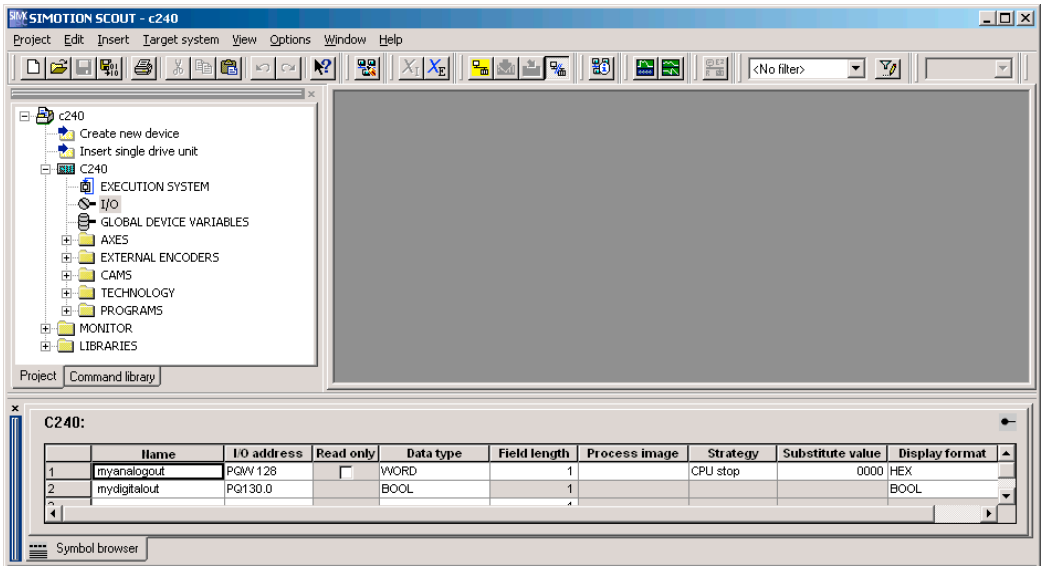
Use as standard output on X2

Configuration procedure in SIMOTION SCOUT:

1. Start address is specified in the **hardware configuration**



2. Specification of standard output (16-bit analog and 1-bit digital)

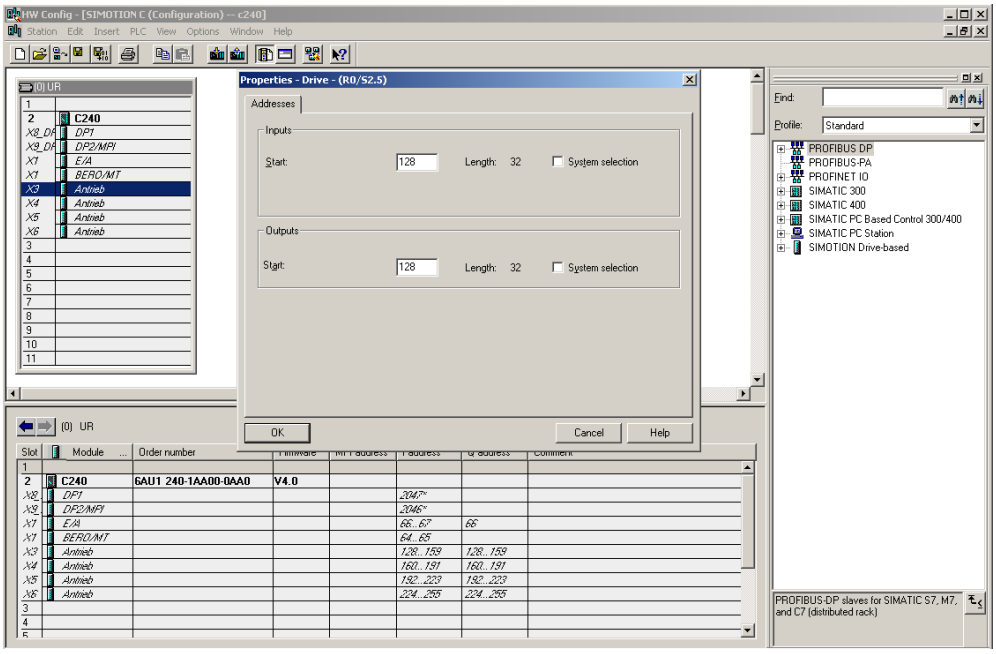


Use as counter input on X3 to X6

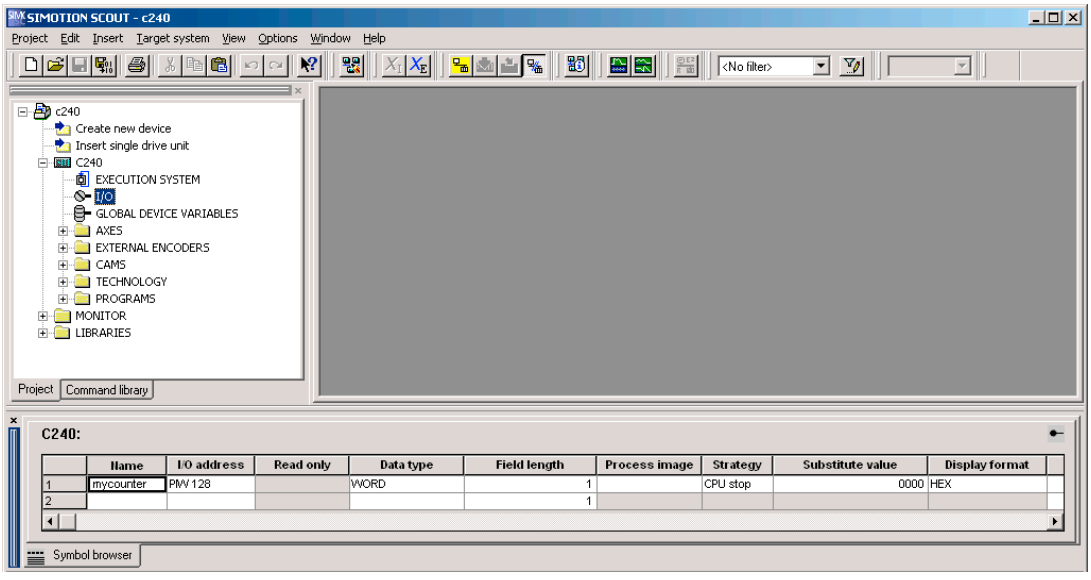
An available encoder input of an axis channel (e.g. for a speed-controlled axis) can be used as an input for a 16-bit up/down counter (90-degree pulse train of a connected TTL encoder, zero pulse not required). The counter value can be accessed by means of an I/O variable.

Configuration procedure in SIMOTION SCOUT:

1. Specification of start address in the **hardware configuration**.



2. Use of the available encoder input as an additional counter using an incremental encoder.



Note

Use of the drive and encoder interfaces as standard outputs and counter inputs is only possible via their direct I/O address. Symbolic assignment is not available for this application.

9.1.4.8 I/O interface

Front connector

Various encoders and actuators can be connected via digital inputs/outputs to the 40-pin front connector X1 with single-wire connection.

Position of the connector

The following figure shows the position of the front connector.

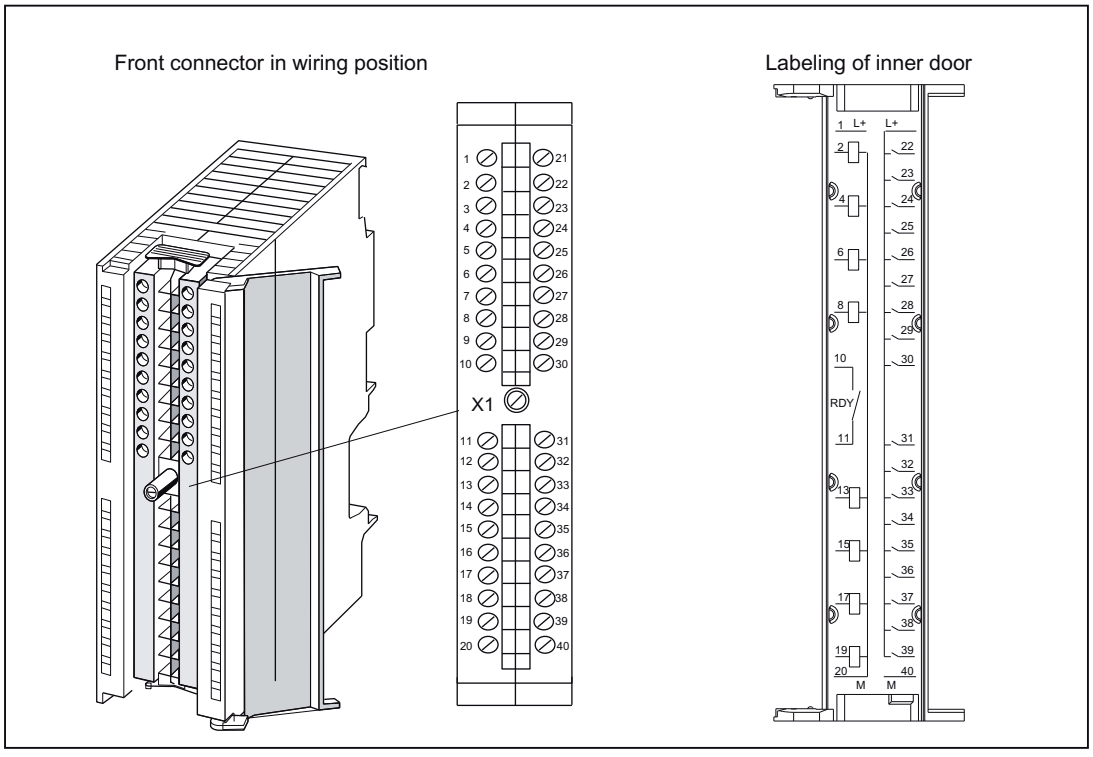


Figure 9-34 Position of connector X1

Wiring diagram and block diagram

The following figure shows the terminal diagram and block diagram for digital inputs/outputs on the SIMOTION C.

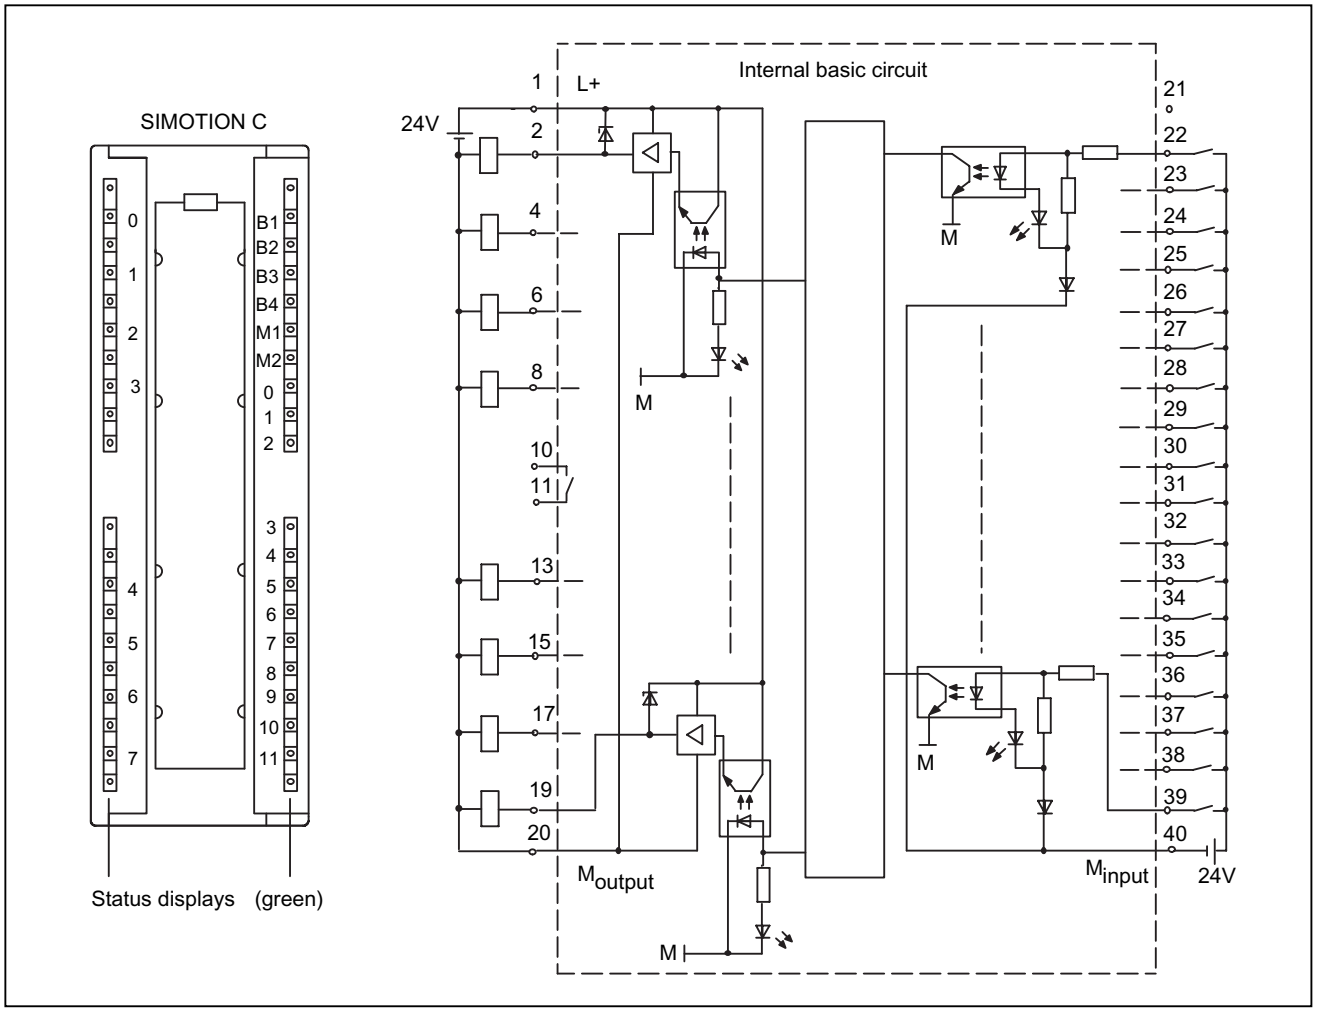

Figure 9-35 Terminal and block diagram of digital inputs/outputs on the SIMOTION C

Connector pin assignment

Connector designation: X1

Connector type: 40-pin S7 front connector for single-wire connection

Table 9-24 Front connector X1 pin assignment

Pin	Name	Type		Pin	Name	Type
1	L+	VI		21	Unassigned	
2	Q0	DO		22	B1	DI
3	Unassigned			23	B2	DI
4	Q1	DO		24	B3	DI

Pin	Name	Type		Pin	Name	Type
5	Unassigned			25	B4	DI
6	Q2	DO		26	M1	DI
7	Unassigned			27	M2	DI
8	Q3	DO		28	I0	DI
9	Unassigned			29	I1	DI
10	RDY.1	C		30	I2	DI
11	RDY.2	C		31	I3	DI
12	Unassigned			32	I4	DI
13	Q4	DO		33	I5	DI
14	Unassigned			34	I6	DI
15	Q5	DO		35	I7	DI
16	Unassigned			36	I8	DI
17	Q6	DO		37	I9	DI
18	Unassigned			38	I10	DI
19	Q7	DO		39	I11	DI
20	M_{output}	VI		40	M_{input}	VI

Signal names

Table 9-25 Signal names of the I/O interface

Signal name	Meaning
RDY.1 to 2	Ready (READY contact 1 to 2)
B1 to B4	• Inputs B1 to B4 for external zero mark signals (C230-2/C240) or • Measuring pulse inputs B1 to B4 for global measuring (C240/C240 PN) or • Digital inputs B1 to B4
M1, M2	• Measuring pulse inputs M1 and M2 for local measuring (C230-2/C240) or • Digital inputs M1 and M2
I0 to I11	Digital inputs 0 to 11
Q0 to Q7	Digital outputs 0 to 7
L+	Supply for digital outputs
M_{output}	Reference potential for digital outputs
M_{input}	Reference potential for digital inputs

Signal type

DI - digital input (24 V signal)
DO - digital output (24 V signal)
K - switching contact
VI - voltage input

⚠ DANGER

The 24 V power supply is to be designed as functional extra-low voltage with protective separation in accordance with EN60204-1, Section 6.4, PELV (with G ground).

Note

The connecting cable between the voltage source and the load current supply connector L+ and the associated reference potential M should not exceed a maximum length of 10 m.

Digital inputs (onboard)

The SIMOTION C has 18 digital inputs. These can also be interconnected via symbolic assignment using variables as of SIMOTION V4.2 for C240 and C240 PN.

Switches or proximity encoders (2- or 3-wire encoders) can be connected. Addresses are allocated in the hardware configuration.

The digital inputs can be used as:

- User-addressable process inputs (I0 to I11). The inputs are subject to a signal delay (see Technical data (Page 6882)) and are sampled in a cycle of 125 µs.

The following inputs can be used for special functions:

- C230-2, C240: As inputs for measuring pulses for local measuring (M1, M2)
  With a signal edge at the relevant input, the current actual values of one or more encoders connected to X3 to X6 are measured with positioning accuracy to determine lengths or distances.
  The assignment of inputs is **not** fixed; the special use is activated in the SCOUT engineering system during configuration of the Measuring Input TO via the measuring input number.
- C230-2, C240: As inputs for external zero mark signals (B1...B4)
  With a signal edge at the relevant input, the current encoder value of the associated axis is acquired with positioning accuracy in order to record the reference coordinates.
  The assignment of the inputs to the encoders is fixed, and the special use is activated in the SIMOTION SCOUT engineering system.
  - B1 → axis 1 (encoder at X3)
  - B2 → axis 2 (encoder at X4)
  - B3 → axis 3 (Encoder at X5)
  - B4 → axis 4 (encoder at X6)
- As inputs for measuring pulses for global measuring (B1 to B4) on the C240/C240 PN
  Alternatively to the "external zero mark signals" function, these inputs can be used on the C240 / C240 PN for global measuring.
  Note: The inputs for global measurement (B1 to B4) can be used in addition to the inputs for local measurement (M1, M2).
  With a signal edge at the relevant input, the current actual values of one or more encoders are measured with positioning accuracy in order to provide information for determining lengths or distances (possible with any encoders included in the project).
  The assignment of inputs is **not** fixed; the special use is activated in the SCOUT engineering system during configuration of the Measuring Input TO (see the configuration example below for global measuring).
  Up to two edges can be measured for each position-control cycle clock of the Measuring Input TO.
  The measured values must be read from the user program before they can be overwritten by a new measurement.
  Global measuring can be used for the following applications:
  - Several Measuring Input TOs on one axis/encoder where they can be active simultaneously
  - Several Measuring Input TOs are assigned to one measuring input (where one Measuring Input TO is interconnected to one measuring input and the remaining Measuring Input TOs are configured as listening measuring inputs)
    This functionality enables one measuring input to act on several Measuring Input TOs and thus on several axes / external encoders.
  - In addition to **single measuring**, **cyclic measuring** is also supported

– Measuring on virtual axes

Note

Local measuring (onboard) on SIMOTION C

A measurement is only undertaken when there are at least two servo cycles between the _enableMeasuringInput command being called and the real switching signal expected on the measuring input (positive/negative flank).

In order to reliably guarantee time-critical processes, the programming should be undertaken in a synchronous task, e.g. IPO-synchronous task. It may take up to two servo cycles for the measurement to be available in Messtaster.counterMeasuredValue1 after the status change in Messtaster.actualInputState (POSITIVE => NEGATIVE or vice versa).

When the measurement result is received, the measurement position is stored. Once the measurement has been taken, the state variable is set to TRIGGER_OCCURED, and the measured values can be evaluated using the measuredValue1 and measuredValue2 variables for two measured edges.

The counterMeasuredValue1 and counterMeasuredValue2 counter variables are defined for the measuredValue1 and measuredValue2 system variables and are automatically incremented by a value of one for each measurement input. New results can be traced immediately and can also be read from non-IPO-synchronous tasks.

You will find detailed information on this subject in the SIMOTION Function Manual *Output Cams and Measuring Inputs*.

Configuration example for global measuring

Configuration procedure in SIMOTION SCOUT:

The measuring input must be configured as follows:

1. Activate global measuring.
2. Assign to the input e.g. PI 64.0 or use symbolic assignment (e.g. C240.B1 [B1, X1.22]).

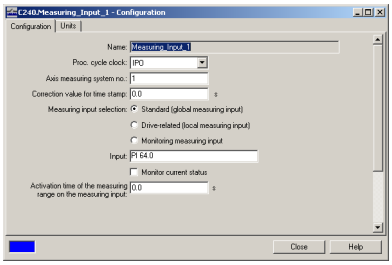

Figure 9-36 Configuration example for global measuring (without symbolic assignment)

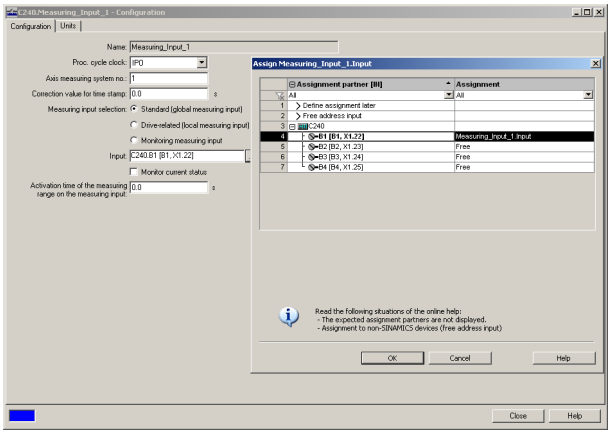

Figure 9-37 Configuration example for global measuring (symbolic assignment)

With a signal edge at the measurement input, the current actual value of the assigned encoder is recorded with an exact position.

Digital outputs (onboard)

Eight digital outputs (Q0 to Q7) are provided on the SIMOTION C. These can also be interconnected via symbolic assignment using variables as of SIMOTION V4.2 for C240 and C240 PN.

These fast outputs (onboard) can be used as freely addressable process outputs or as "fast output cams" (position switching signals). Addresses are allocated in the hardware configuration. The outputs are subject to a signal delay, see Technical data (Page 6882).

For repeat accuracy when using the outputs as fast output cams, see Versions of SIMOTION C (Page 6765).

READY output

The ready signal (RDY.1, RDY.2) is an isolated contact assembly (make contact).

The contact can be used for the safe shutdown of parts of the system, for example, through integration in the EMERGENCY STOP circuit.

The following table describes the states of the enables and outputs in the respective SIMOTION C operating states with an open or closed READY contact.

Table 9-26 States of enable signals and outputs:

Status of the READY contact	SIMOTION C	Status of enable signals and outputs:
Open	• During ramp-up • During memory reset • With fault condition • In STOP state • In STOPU state	• Controller enable deactivated • Analog outputs at 0 V • Digital outputs deactivated
Closed	• in RUN state	Enable signals and outputs controlled by user program and technology

Additional references

You can find information about TO outputCam and TO measuringInput in the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

9.1.5 Configuring and installing

9.1.5.1 General requirements

Overview

In this chapter we will explain how to design the mechanical configuration, prepare the SIMOTION components for installation and install them.

During the installation of SIMOTION C modules, you must pay attention to the electrical configuration. Therefore, also refer to the chapter Wiring (Page 6815).

Open equipment

These modules are open equipment. This means they may only be installed in housings, cabinets or in electrical service rooms that can be entered or accessed exclusively by means of a key or tool. Housings, cabinets or electrical service rooms may only be accessed by trained or authorized personnel.

9.1.5.2 Configuring an installation using SIMOTION C modules

Horizontal and vertical configuration

Design

You can install the rack either horizontally or vertically. The horizontal configuration should be used if possible.

Permissible ambient temperature

- Horizontal installation: 0 °C to 55 °C
- Vertical installation: 0 °C to 40 °C

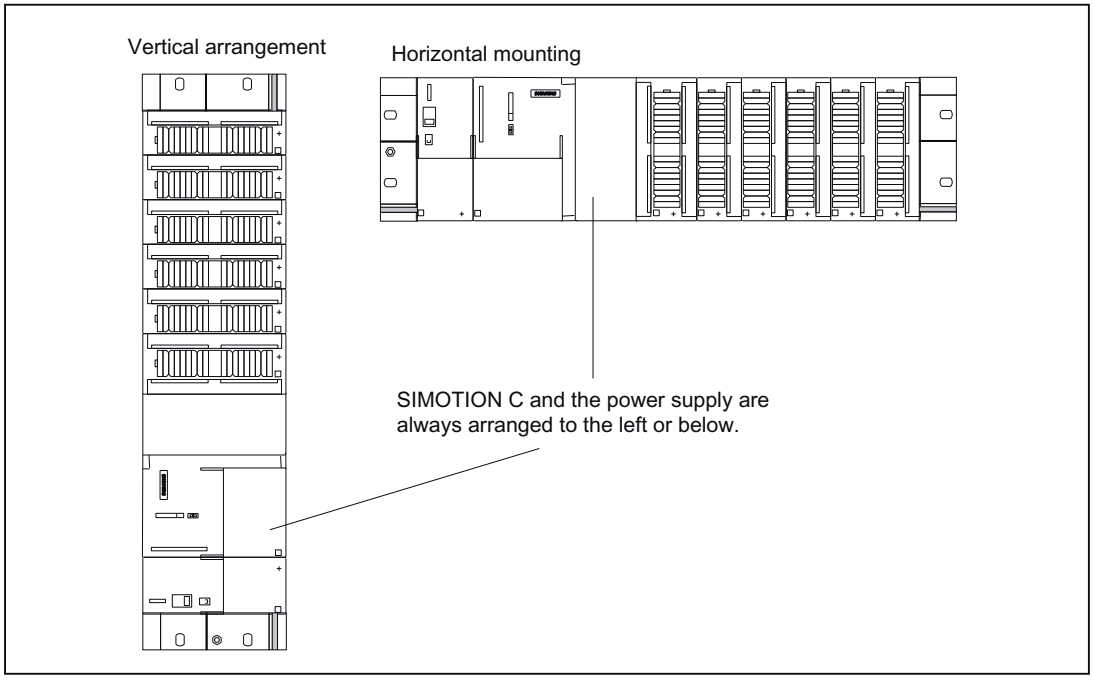

Figure 9-38 Horizontal and vertical configuration

Clearances

Rules

If you comply with the minimum clearances, you will:

- Ensure heat is dissipated from the modules
- Provide space to fit and remove modules

- Provide space to lay wiring
- Increase the mounting height of the rack to 205 mm!
  To guarantee the functionality, clearances of 40 mm must be maintained.

Note

If you use a shield connecting element, the dimensions stated are measured from the lower edge of the shield connecting element.

Clearances

The following figure shows the clearances between the individual racks and the clearance to adjacent equipment, cable ducts, cabinet walls, etc.

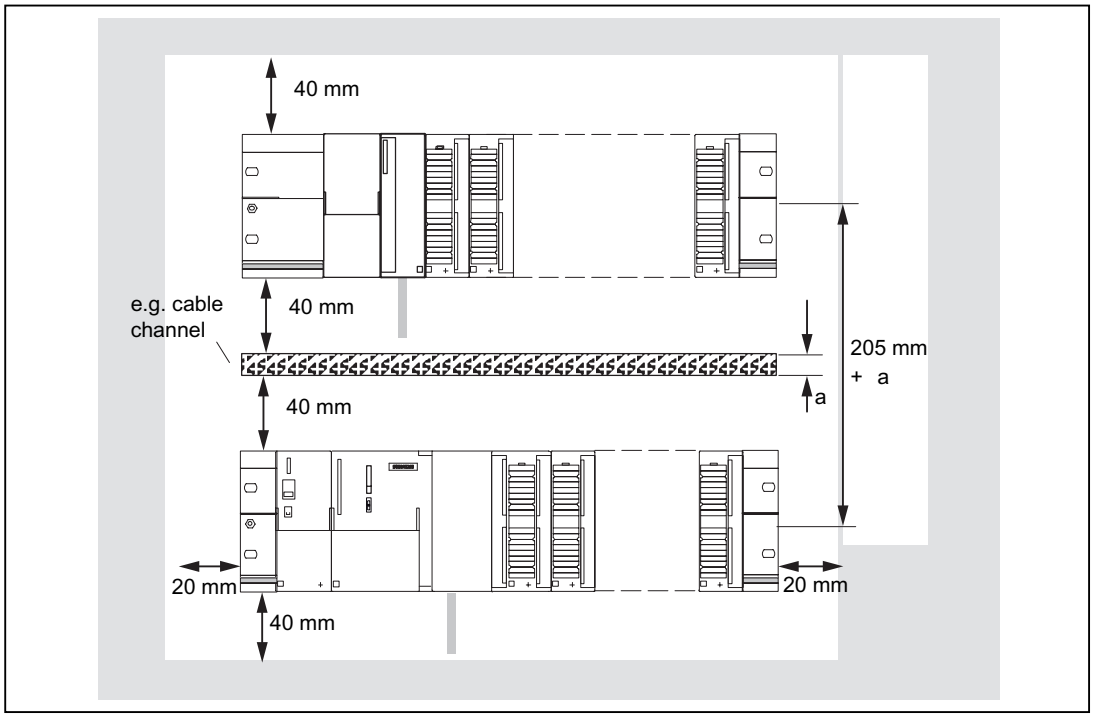

Figure 9-39 Clearances

Mounting dimensions of modules

Overview of mounting dimensions

The following table shows the mounting dimensions of modules.

Table 9-27 Mounting dimensions of modules

Modules	Module width	Module height	Maximum mounting depth
Power supply PS 307, 2 A	50 mm	125 mm, 185 mm with shield connecting element	130 mm or 180 mm with an open front cover of the SIMOTION C
Power supply PS 307, 5 A	80 mm		
Power supply PS 307, 10 A	200 mm		
SIMOTION C	200 mm		
Signal modules (SMs)	40 mm		
Function modules (FM)	40 mm or 80 mm		
Communications processors (CP)	40 mm		

Mounting rail lengths

Depending on the configuration you have chosen, you can use the following mounting rails:

Table 9-28 Mounting rails

Mounting rail	Usable length for modules	Comments
160 mm	120 mm	Mounting holes are provided
482.6 mm	450 mm	Mounting holes are provided
530 mm	480 mm	Mounting holes are provided
830 mm	780 mm	Mounting holes are provided
2,000 mm	Cut to required length	Mounting holes must be drilled

Layout of modules on a rack

Rules

The following rules apply with respect to the layout of the modules on a rack:

- Up to eight modules can be inserted to the right of the SIMOTION C.
- The number of plug-in modules is also limited by their power consumption from the backplane bus (see Technical data table for the individual modules in the *S7-300 Automation Systems, M7-300 Module Data* Manual).
  The total power consumption from the backplane bus of all modules that are mounted on a rack must not exceed 1.2 A.

This figure shows the order of the modules in an installation with eight I/O modules.

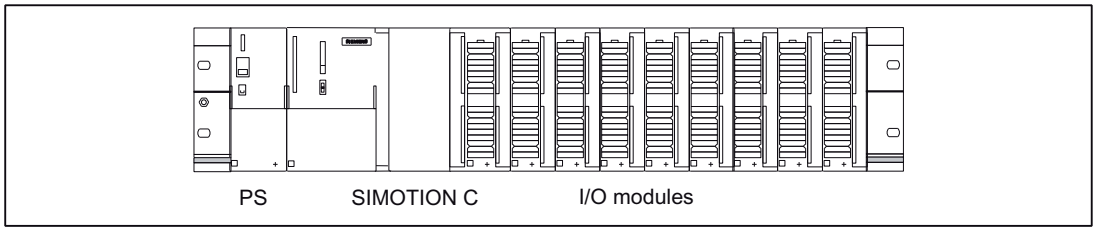

Figure 9-40 Layout of modules on a rack

Installation of FM STEPDRIVE

The FM STEPDRIVE modules can be installed, in addition to the eight SMs. They have no connection to the backplane bus and must therefore only be taken into consideration with regard to the module width. In order to prevent the backplane bus from being interrupted, the FM STEPDRIVE modules must always be configured as the last modules on the module rack.

Layout of modules on several racks

Overview

With the SIMOTION C, a 2-tier layout is possible.

Interface modules

Interface modules are required for the 2-tier layout which route the backplane bus from one rack to the other. The SIMOTION C is always located on rack 0.

Table 9-29 Interface modules

Interface module	Usable for ...	Article number
IM 365 SEND	Rack 0	6ES7 365-0BA01-0AA0
IM 365 RECEIVE	Rack 1	

IM 365 interface modules

The two IM 365 interface modules have a fixed connection via a 1-meter long connecting cable.

The total power consumption of the inserted I/O modules of both racks must not exceed 1.2 A; the power consumption from rack 1 is limited to 800 mA.

Rules

The following rules apply with respect to the layout of the modules on two racks:

- The interface module always occupies Slot 3 and is always left of the first signal module.
- No more than eight modules may be inserted per rack. These modules are always to the right of the interface modules.
- The number of inserted modules is limited by the permissible power consumption from the backplane bus. Total power consumption must not exceed 1.2 A (see Technical data table for each module in the manual *S7-300 Automation System, M7-300 Module Data*).

2-tier layout

The figure below shows the 2-tier layout with SIMOTION C.

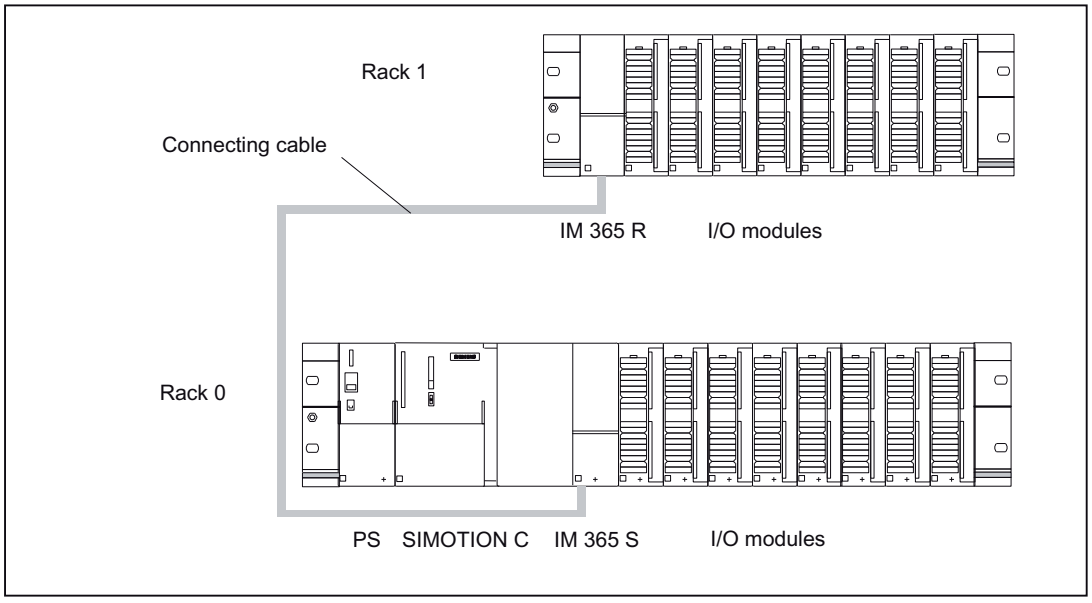

Figure 9-41 Layout of modules on two racks

9.1.5.3 Installing

Installing mounting rails

Installing a 2-meter mounting rail

You must prepare the 2-meter mounting rail for installation. Proceed as follows:

1. Shorten the 2-meter mounting rail to the required dimension.
2. Mark in
   - Four holes for mounting screws (dimensions: see table below)
   - One hole for a protective conductor mounting screw.

3. Is the mounting rail longer than 830 mm?
   If so: you must drill additional holes for more mounting screws to stabilize the mounting rail.
   Mark out these holes along the groove in the middle section of the rail (see the figure below).
   These additional holes should be spaced approximately every 500 mm.
   If not: no additional work required.
4. Drill the $6.5^{+0.2}$mm-diameter holes where marked for M6-size screws.
5. Fit an M6 screw to secure the protective conductor.

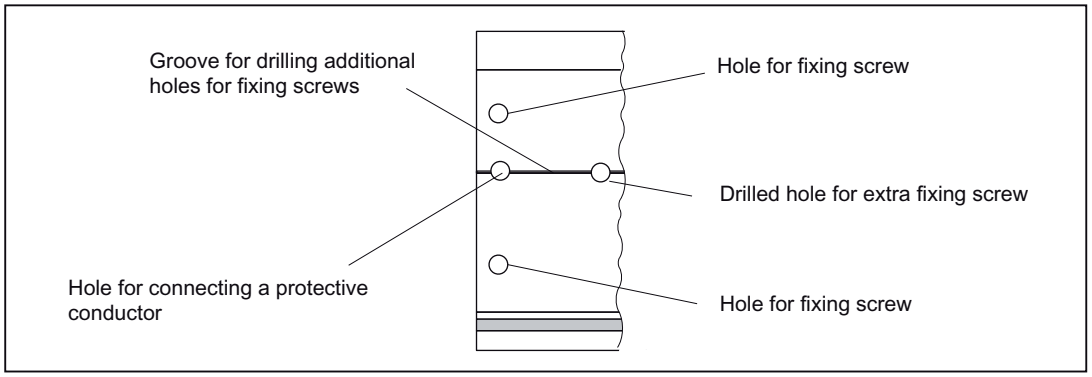

Figure 9-42 Mounting holes in a 2-meter mounting rail

Dimension drawing for mounting holes

The mounting hole dimensions for the mounting rail are shown in the table below.

Table 9-30 Mounting holes for rails

"Standard" mounting rail			2-meter mounting rail
			Mounting rail length	**Distance a**	**Distance b**	-
160 mm	10 mm	140 mm	
482.6 mm	8.3 mm	466 mm	
530 mm	15 mm	500 mm	
830 mm	15 mm	800 mm	

Mounting screws

Choose one of the following types of screw to mount the mounting rail:

Table 9-31 Mounting screws

For	you can use...	Explanation
Outer mounting screws	M6 cylinder-head screw per ISO 1207/ISO 1580 (DIN 84/DIN 85)	Select a screw length that is appropriate to your configuration You also need 6.4 mm washers per ISO 7092 (DIN 433)
	M6 hexagonal screw per ISO 4017 (DIN 4017)	
Additional mounting screw (2-meter mounting rail only)	M6 cylinder-head screw to ISO 1207/ISO 1580 (DIN 84/DIN 85)	

Installing mounting rails

Install the mounting rails as follows:

1. Fit the mounting rail in a position that will allow enough room for the modules to be installed and for the heat to dissipate (a minimum of 40 mm above and below the mounting rail; see Figure "Clearance distances").
2. Screw the mounting rail onto the surface where it is to be affixed (screw size: M6). Is this substrate a grounded metal plate or a grounded equipment mounting plate?
   If so: make sure that there is a low-resistance connection between the mounting rail and the substrate. Use suitable electro-lubricant or contact washers with painted and anodized metals, for example.
   If not: no special action required.
3. Connect the mounting rail with the protective conductor. An M6 protective conductor screw is provided on the mounting rail for this purpose.
   Minimum cross-section of protective conductor line: 10 mm^2.

Note

Always make sure that there is a low-resistance connection to the protective conductor (see figure below). If the rack is mounted on a movable frame, for example, make sure that the line to the protective conductor is flexible.

PE connection

The figure below shows the proper way of connecting the protective conductor to the mounting rail.

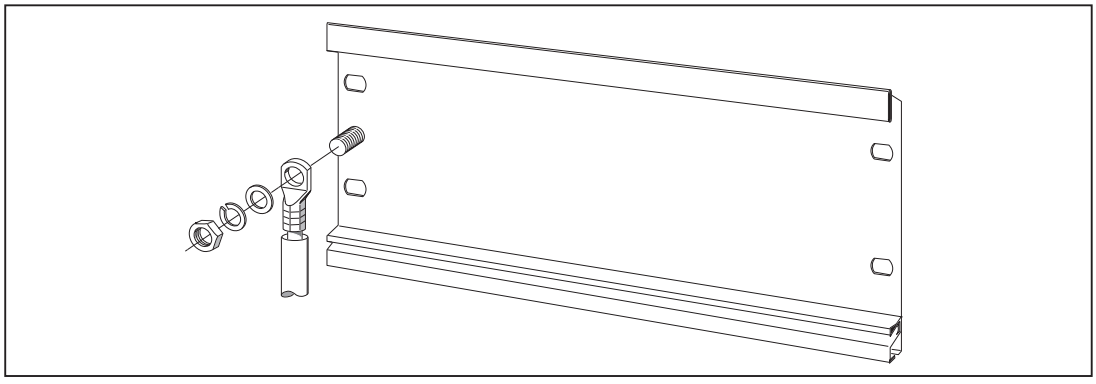

Figure 9-43 Protective conductor connection on the mounting rail

Fitting modules on the mounting rail

Accessories

Any accessories you need for installation are in the pack with the modules. Chapter Spare parts and accessories (Page 6892) contains a list of accessories and spare parts together with the corresponding Article Nos.

Table 9-32 Module accessories

Module	Accessories supplied	Explanation
SIMOTION C	One slot number plate	For the assignment of slot numbers
	Two keys (C230-2)	The key is used to operate the mode selector for the C230-2.
	One labeling plate	For labeling of integrated inputs and outputs of the SIMOTION C
Signal module (SM)	One bus connector	To provide the electrical connections between the modules
	One labeling plate	To label the inputs and outputs on the module

Sequence in which modules are affixed to the mounting rail

1. Power supply module
2. SIMOTION C
3. Signal module(s)

Installation sequence

The individual steps for the installation of the modules are described below:

1. Except for the SIMOTION C, each signal module is supplied with a bus connector. When plugging in the bus connectors, always start with the SIMOTION C.
   Take the bus connector from the next module and plug it into the bus connector of the SIMOTION C. (The bus connector is located on the rear side, see Figure "Position of interfaces and front panel elements").
   You must not plug a bus connector into the "last" module in the row.
2. Fit the modules by hooking them into position, push them against the left-hand module and lower them down into position.
3. Screw down the modules, applying a torque of 0.8 to 1.1 Nm.

After installation

Inserting the key (C230-2)

Once the C230-2 has been mounted on the mounting rail, you can insert the key in the STOP or STOPU position on the C230-2.

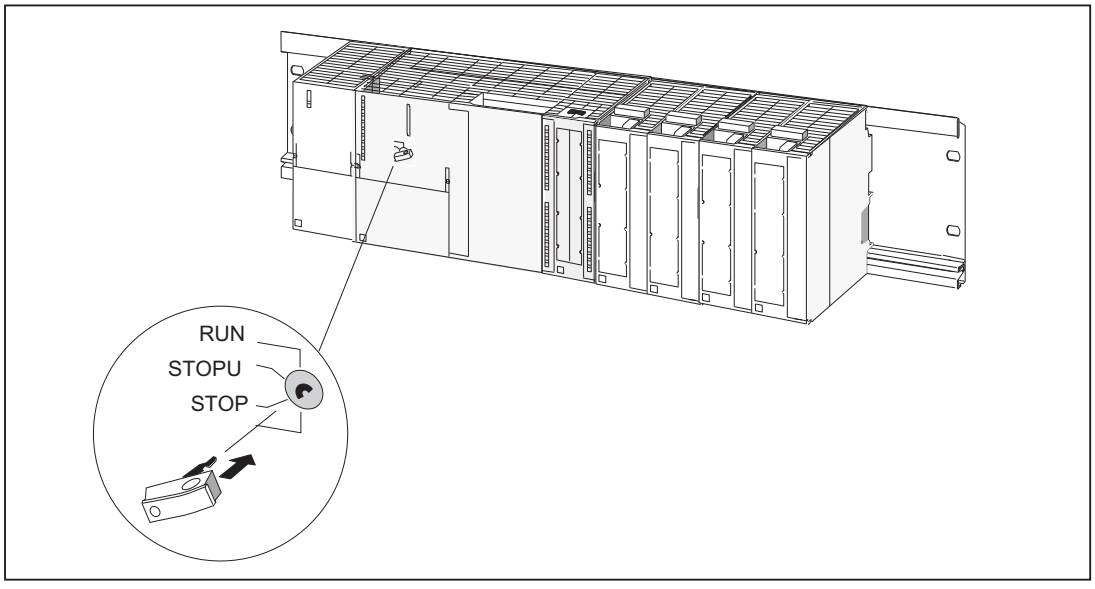

Figure 9-44 Inserting the key in the C230-2

Assigning the slot numbers

After mounting, you can assign each module a slot number. This eases the assignment of the modules to the configuration table in the *Engineering System*. The table below shows the slot number assignment.

Table 9-33 Slot numbers for S7 modules and SIMOTION C

Slot no.	Module	Comments
1	Power supply (PS)	-
2	SIMOTION C	-
3	Reserved	-
4	1. I/O module	To the right of SIMOTION C
5	2. I/O module	-
6	3. I/O module	-
7	4. I/O module	-
8	5. I/O module	-
9	6. I/O module	-
10	7. I/O module	-
11	8. I/O module	-

Inserting slot numbers

This figure shows the proper way of inserting the slot numbers. The slot number labels are included with the SIMOTION C.

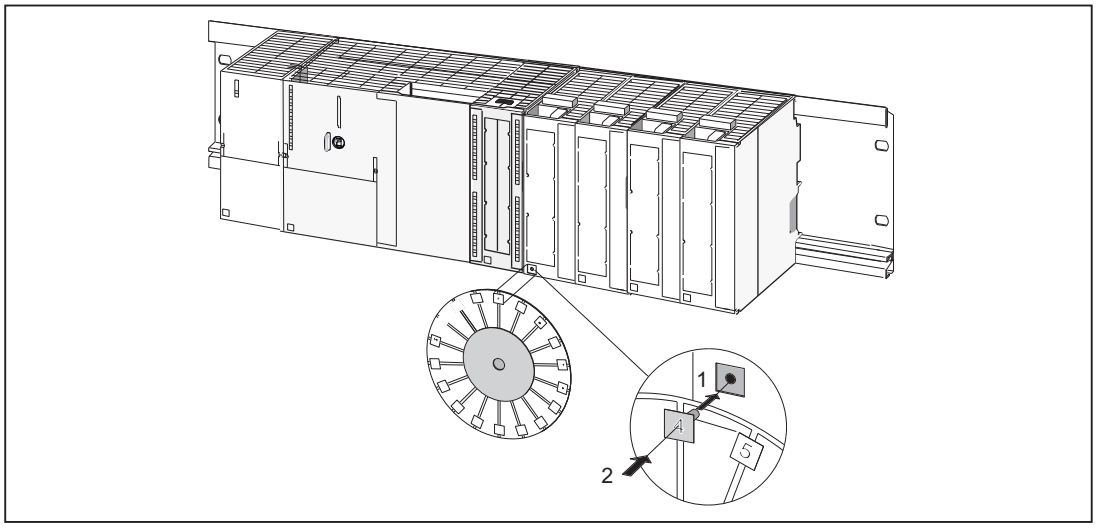

Figure 9-45 Inserting slot numbers on the modules

9.1.6 Connecting

9.1.6.1 Wiring

General requirements for wiring

Basic rules

Because of the wide range of uses of a SIMOTION C, only the basic rules for electrical installation can be included in this section. At a minimum, you must comply with these basic rules to ensure problem-free operation.

Safety regulations

In order to ensure safe operation of your equipment, implement the following measures, adapting them to suit your conditions:

- An EMERGENCY OFF concept in accordance with the generally accepted rules of current engineering practice (e.g. European standards EN 60204, EN 418, and similar).
- Additional measures for end position limiting of axes (e.g. hardware limit switches).
- Equipment and measures for protection of motors and power electronics in accordance with the installation guidelines of the used drive units.

In addition, in order to identify hazards, we recommend that a risk analysis be conducted on the entire system in accordance with the basic safety requirements set out in Appendix 1 of EU Machinery Directive 89/392/EEC.

Additional references

Please also note the information in the following sections of this manual:

- Guidelines on Handling Electrostatic Sensitive Devices (ESD guidelines)
- For additional information on installing a system containing S7-300 process I/O, refer to the "Wiring" section of the *S7-300 Automation System, Hardware and Installation, CPU Data* Manual.

Standards and specifications

When wiring the SIMOTION C, you must observe the appropriate VDE guidelines, in particular VDE 0100 and VDE 0113 for tripping devices and short-circuit and overload protection.

Configuring the electrical installation

General rules for operating a SIMOTION C

You must observe the following primary rules for integrating a SIMOTION C in an automation system or plant.

System startup after certain events

The following table identifies considerations required for startup of a system following certain events.

Table 9-34 System startup

If there is ...	Then ...
Startup after voltage drop or power failure	All hazardous operating conditions must be avoided. If necessary, force an EMERGENCY STOP.
Startup after releasing the EMERGENCY STOP apparatus	must always be controlled and defined.

Supply voltage

The following table identifies the considerations required for the supply voltage.

Table 9-35 Supply voltage

Scope	Requirement
Stationary systems without all-pole power disconnect switches	A power disconnect switch or a fuse must be provided in the electrical installation for the building.
Load power supply, power supply modules	The set rated voltage range corresponds to the local supply voltage.
All electric circuits	The fluctuation/deviation of the supply voltage from the rated value must be within the permissible tolerance (see Technical data for S7-300 modules).

24 VDC supply

The following table identifies the considerations required for the 24 V supply.

Table 9-36 24 V supply

Scope	Requirement	
buildings	external lightning protection.	Take lightning protection measures
24 V DC supply lines, signal lines	internal lightning protection	(e.g. lightning conductors).
24 V supply	Safe (electrical) isolation of extra-low voltage	

Protection from external electrical influences

The following table identifies the considerations required for protection against external electrical phenomena or faults.

Table 9-37 Protection against external electrical phenomena

Scope	Requirement
All plants or systems in which the SIMOTION C or S7-300 is installed	The equipment or system is connected to a protective conductor to discharge electromagnetic interference.
Supply, signal, and bus lines	The wiring arrangement and installation complies with EMC regulations.
Signal and bus lines	A wire or conductor strand break must not cause any undefined installation or system states.

Rules for current consumption and heat loss in a central configuration

The I/O modules on the I/O bus take the current required for their operation from the I/O bus as well as, when necessary, from an external load power supply.

- The current consumption of all I/O modules from the I/O bus must not exceed 1.2 A. This is the current that the SIMOTION C can supply on the I/O bus.
- PS 307 power supply modules are available for different loads (2 A, 5 A, 10 A). The selection of the appropriate power supply depends on the sum of the current consumption of the SIMOTION C, the connected I/O modules and any other connected loads fed by the load power supply.
- The power loss of all components used in a cabinet must not exceed the maximum amount that can be dissipated from the cabinet.
  Tip: When selecting the cabinet design, make sure that the temperature in the cabinet will not exceed the permissible ambient temperature for the installed components, even if the outside temperatures are high.

You will find information on the current consumption and heat loss of a module in the technical data of the corresponding modules.

⚠ DANGER

All interfaces of the SIMOTION C must operate only on circuits with safety extra-low voltage (SELV).

Pulling out and inserting I/O-bus I/O

I/O-bus I/O must not be pulled out or inserted during operation.

Note

The I/O bus will not work if I/O-bus I/O are pulled out during operation. The SIMOTION must be switched off and back on again when these are reinserted.

Overview of wiring diagram

C230-2/C240 with servo drive (analog connection)

The figure below shows how the individual components are connected to the C230-2/C240 and the servo drive (analog connection).

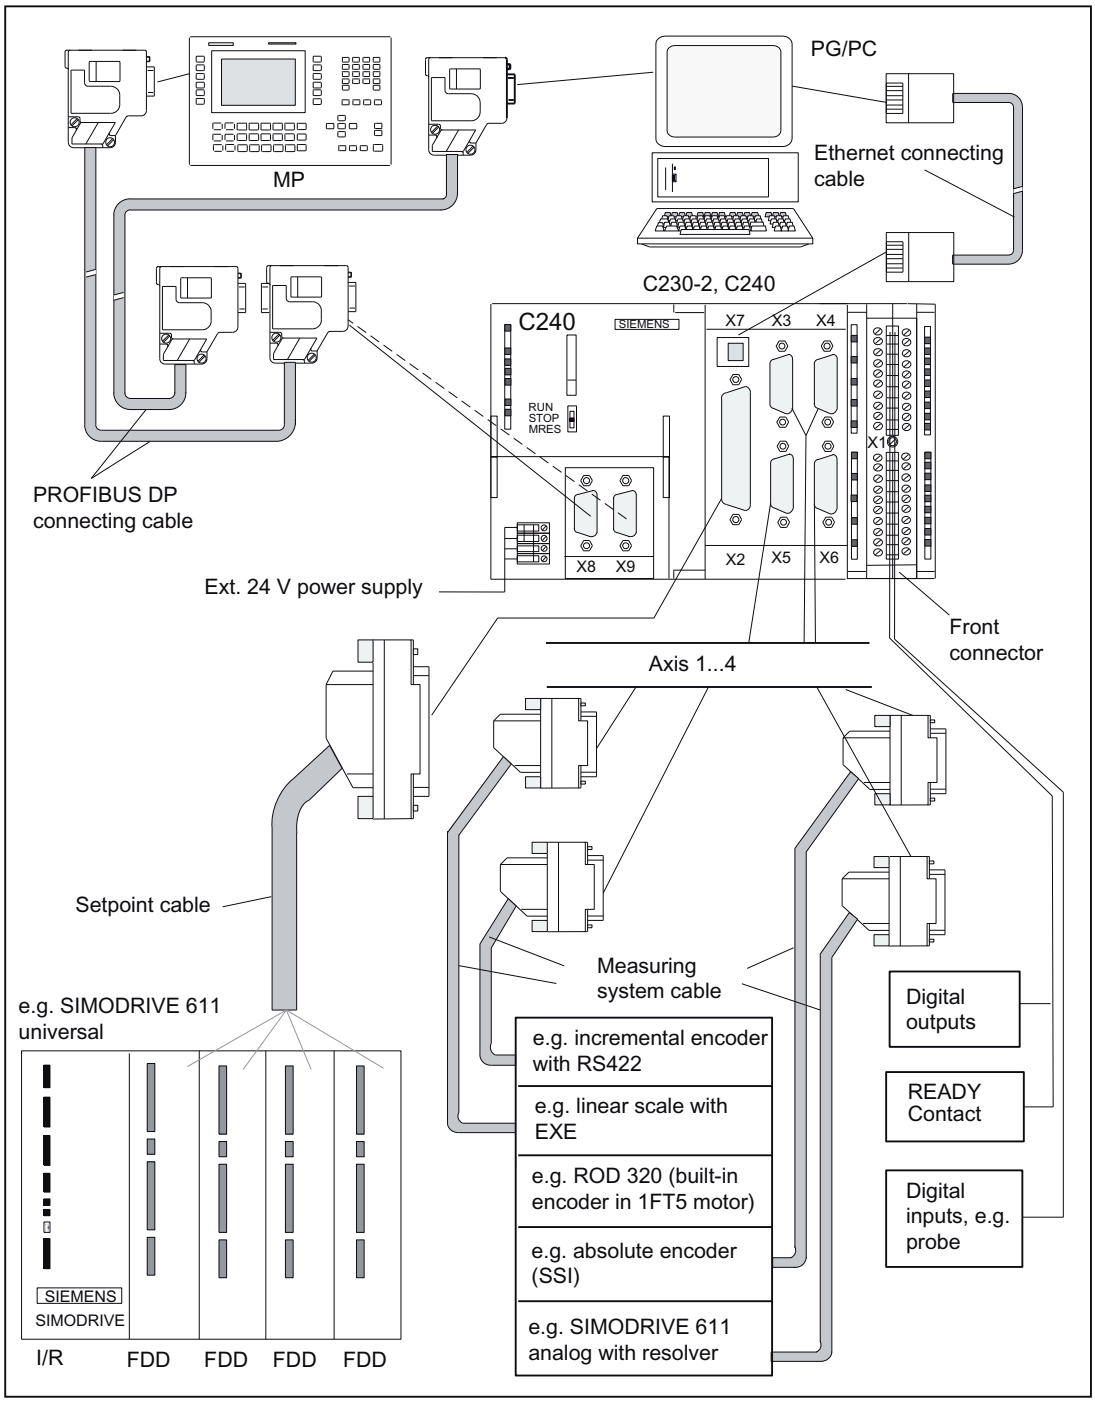

Figure 9-46 Overview of the cable connecting the C230-2/C240 to the servo drive (analog coupling) - example

SIMOTION C with servo drive (digital connection) via PROFIBUS DP

The figure below shows how the individual components are connected to the SIMOTION C and the servo drive (digital connection).

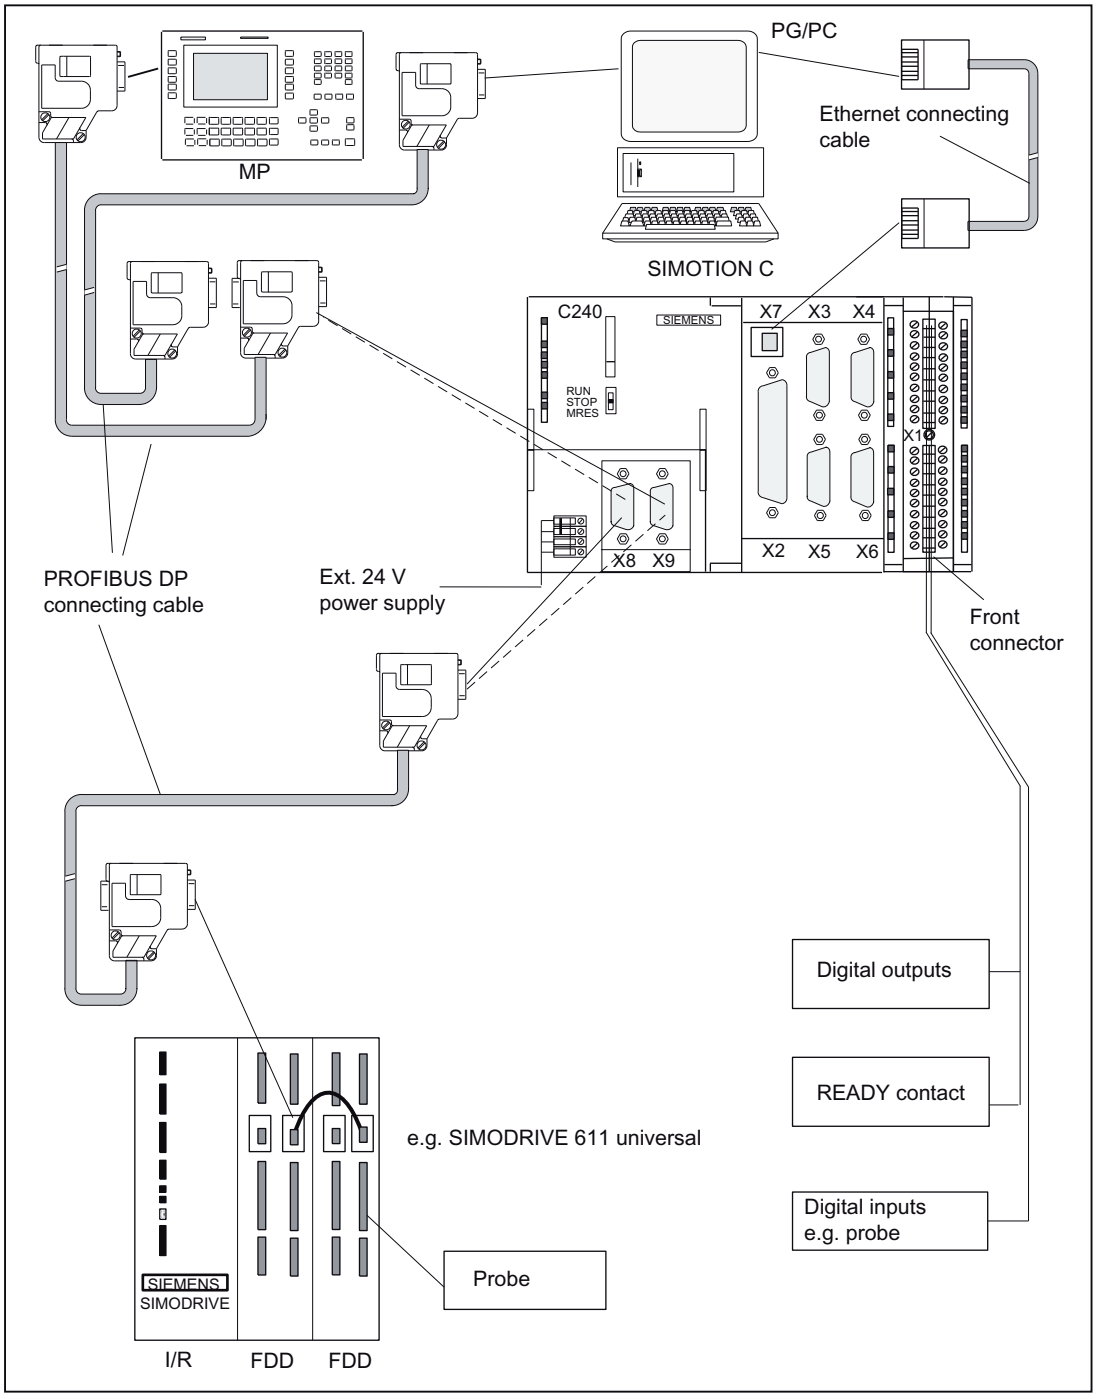

Figure 9-47 Overview of the cable connecting the SIMOTION C to the servo drive (digital connection) - example

C240 PN with servo drive (digital connection) via PROFINET IO

The figure below shows how the individual components are connected to the C240 PN and the servo drive (digital connection).

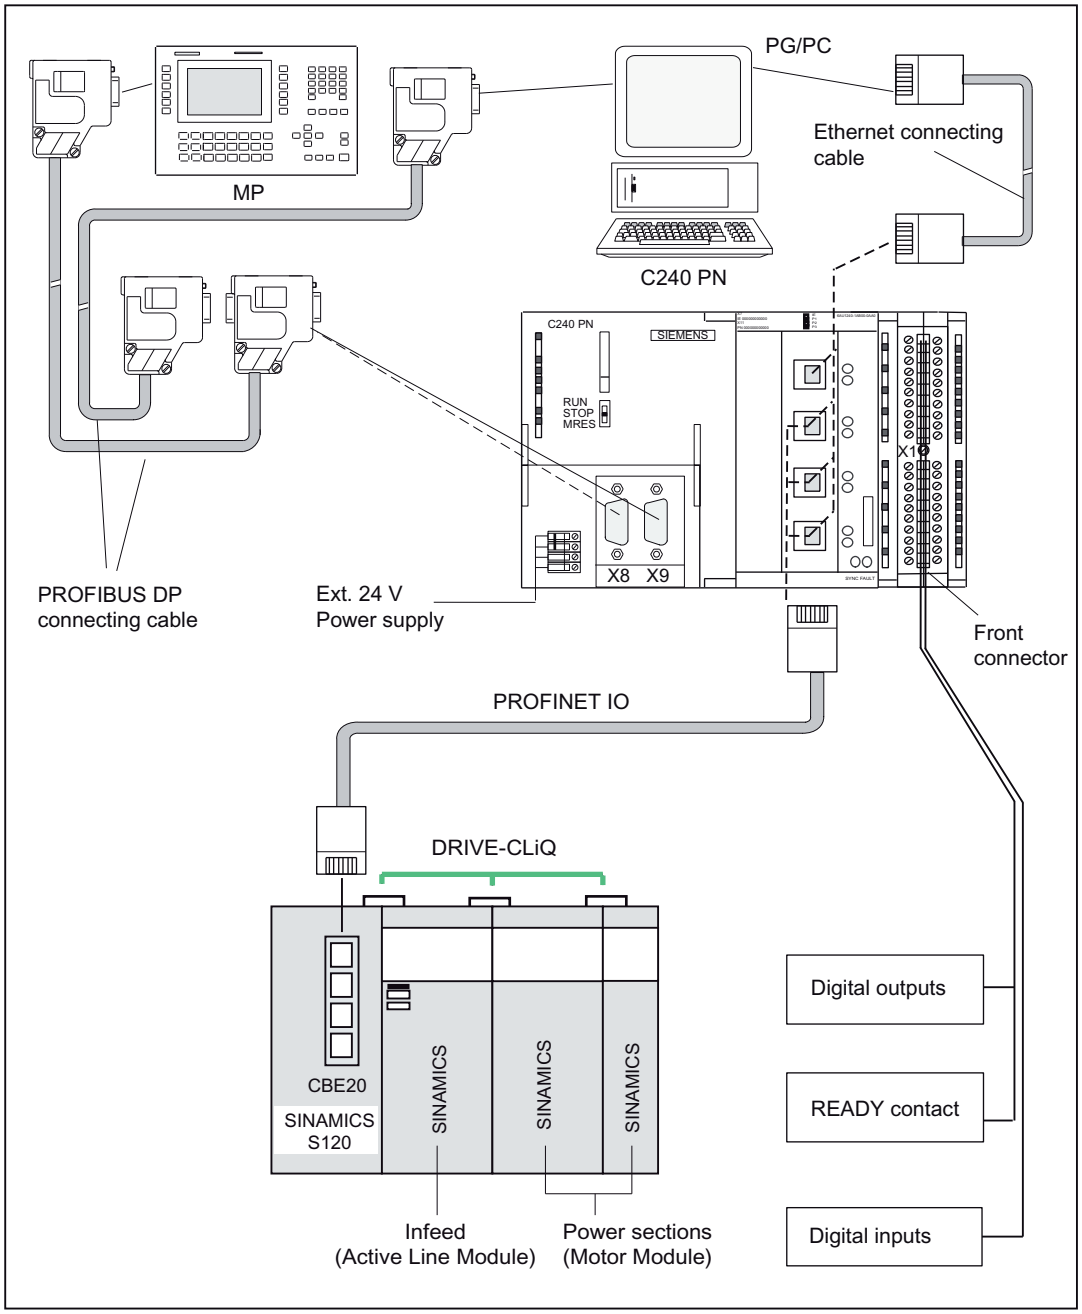

Figure 9-48 Overview of the cable connecting the C240 PN to the servo drive (digital connection) - example

C230-2, C240 with stepper drive

The figure below shows how the individual components of the multi-axis controller are connected to the C230-2, C240 and stepper drive.

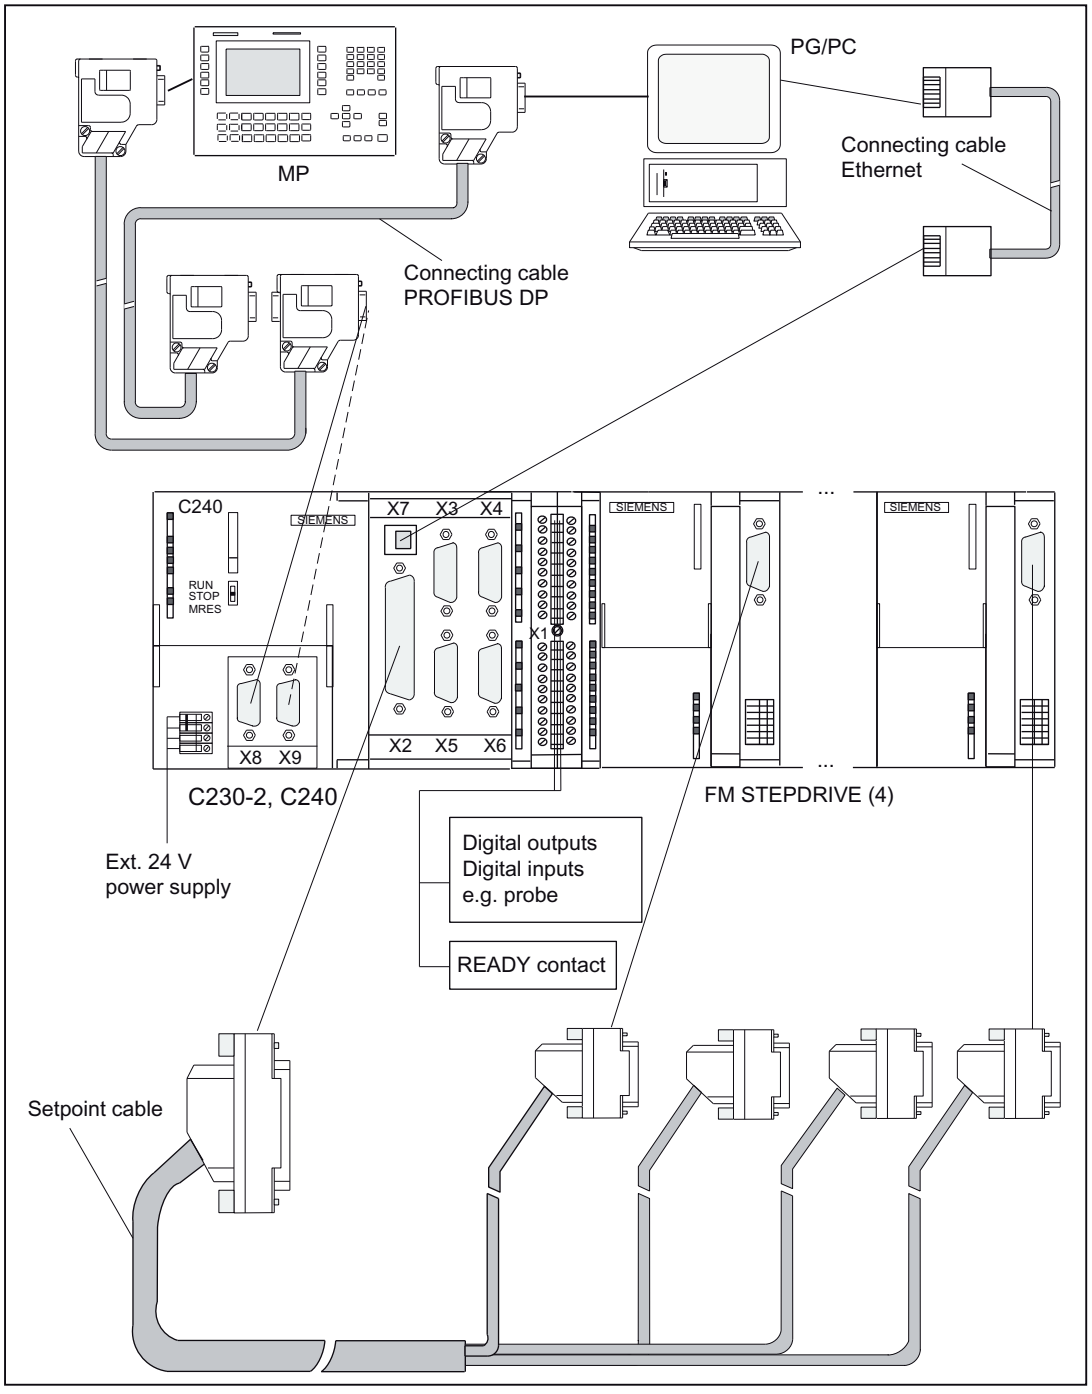

Figure 9-49 Overview of the cable connecting the C230-2/C240 to the stepper drive - example

Overview of connections - connecting cable

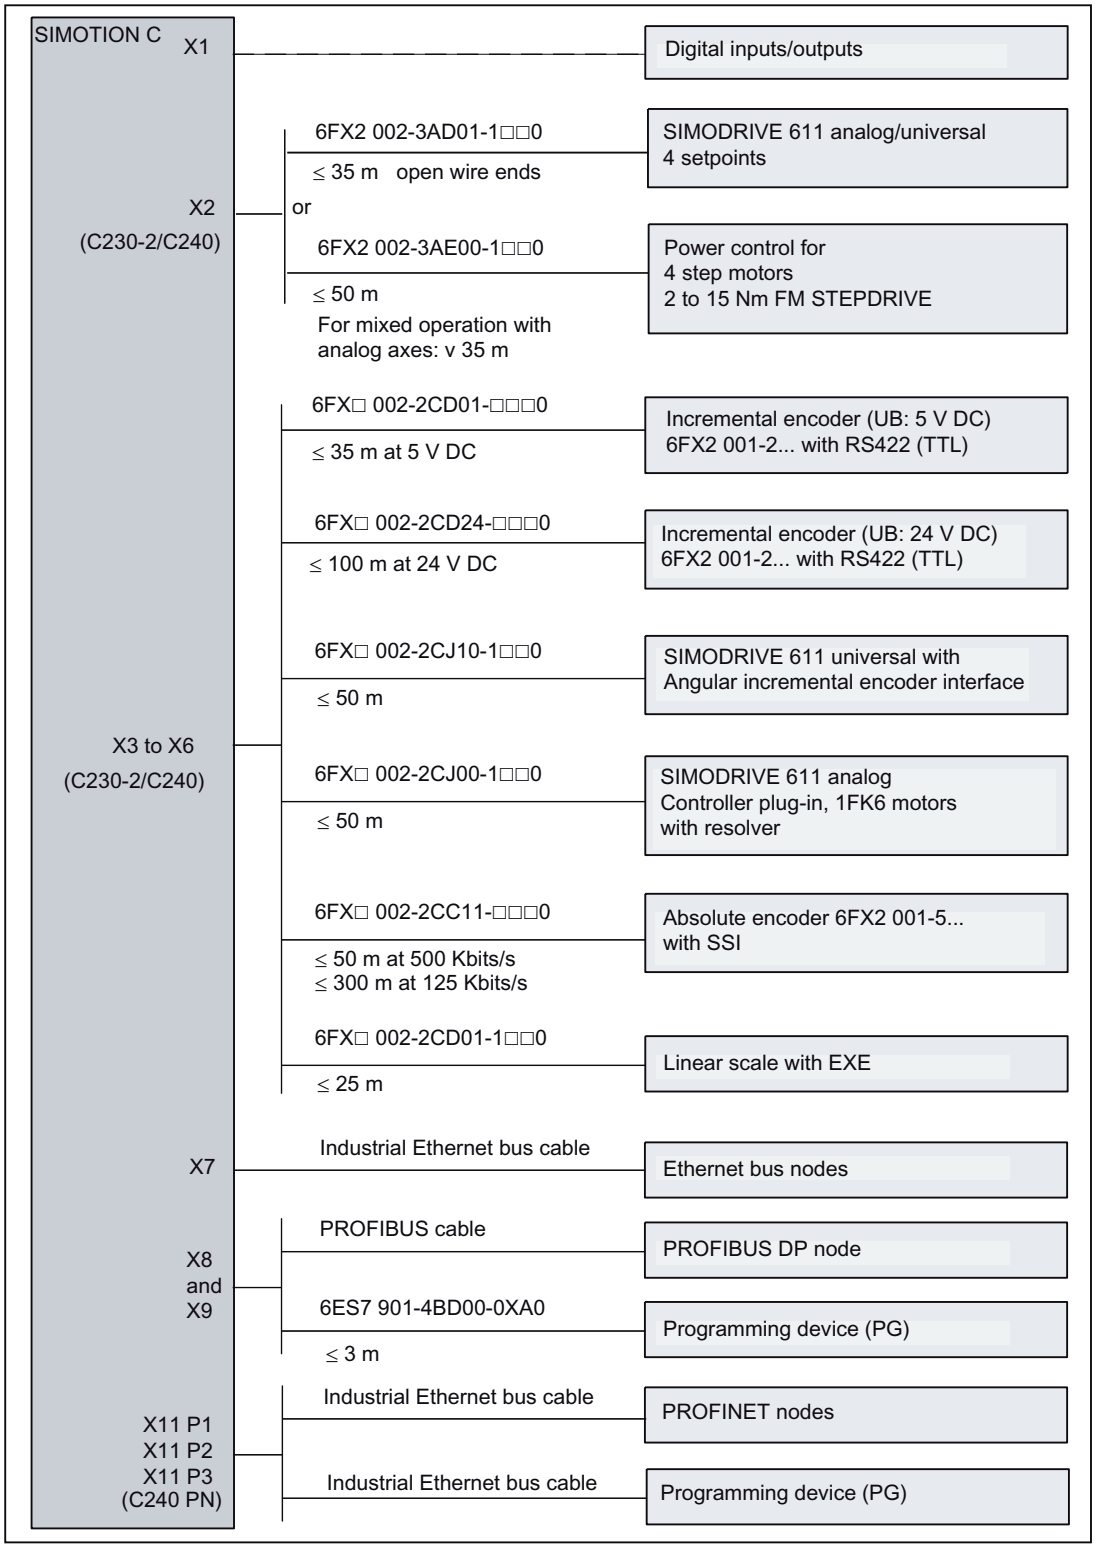

Figure 9-50 Overview of SIMOTION C connections

The setpoint and measuring system cables (see figure "Overview of connections") are available in various lengths.

See *PM 21 Catalog* / *NC 60 Catalog* / *ST 70 Catalog* / *CA 01 Catalog*

For information about the PROFIBUS cable or Ethernet bus cable, see chapter Networking (Page 6842).

For additional information about PROFIBUS DP, PROFINET IO and Ethernet, see *IK PI Catalog*

Front connector

For the wiring of the digital inputs/digital outputs, you need a 40-pole front connector (screw type or spring tension type). This must be ordered separately.

Article No.: Screw type 6ES7 392-1AM00-0AA0
Spring type 6ES7 392-1BM01-0AA0

See *ST 70 catalog/NC 60 catalog*

Connecting the power supply

Screw-type terminal block

The required 24 VDC load power supply is connected at the screw-type terminal block.

Properties of the load power supply

⚠ DANGER
The 24 VDC should be configured as functional extra-low voltage with safe isolation.

Note

The connecting cable between the voltage source and the load current supply connector L+ and the associated reference potential M should **not** exceed a maximum length of 10 m.

Table 9-38 Electrical parameters of load power supply

Parameters	min	max	Unit	Conditions
Voltage range - mean value	20,4	28,8	V	
Ripple		3,6	Vpp	
Transient overvoltage	35	35	V	500 ms duration 50 s recovery time
Rated current consumption		2,2	A	see "Connection values" table in chapter Technical data (Page 6882)
Starting current		8	A	

Pin assignment

The table below shows the pin connections on the screw-type terminal block.

Table 9-39 Assignment of the screw-type terminal block

Terminal	Pin assignment
⏚	Functional ground
M	Ground
L+	24 V DC
M	Ground

If you want to ground the reference potential, you must **not** remove the jumper between terminals M and functional ground on the SIMOTION C.

Line buffering

The PS 307 load current supplies from the S7-300 system guarantee mains buffering for 20 ms.

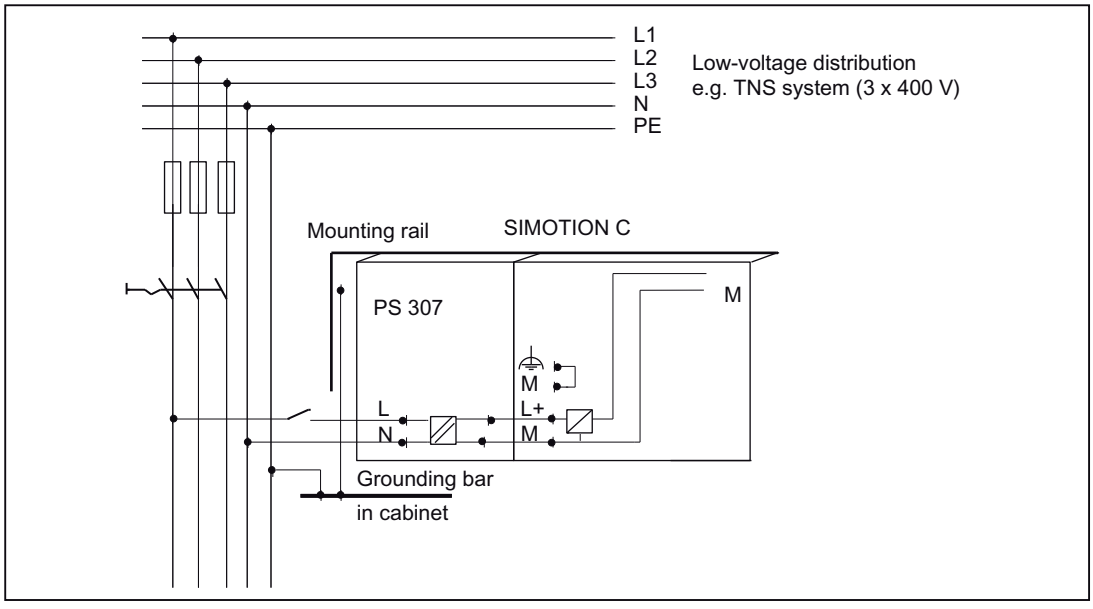

Figure 9-51 Module supply options

Supply system lines

Use flexible cables with a cross-section of 0.25 to 2.5 mm^2 (or AWG 18 to AWG 14) for wiring the power supply.

If you only use one wire per connection, a ferrule is not required.

You can use ferrules without an insulating collar in accordance with DIN 46228, Form A long version.

Connecting comb

You can also use a connecting comb to connect the PS 307 power supply module to the SIMOTION C. You will find the Article Nos. of the connecting comb required in chapter Spare parts and accessories (Page 6892).

Other 24 V connections

On the PS 307 power supply, there are 24 V connections available via the connecting comb for connecting the supply of the I/O modules.

Wiring with the connecting comb

Proceed as follows to wire the PS 307 power supply module and the SIMOTION C.

⚠ WARNING

You could come into contact with live wires if the power supply module and any additional load power supplies are switched on.

Ensure that the system is de-energized when you wire the system!

1. Open the front doors of the PS 307 and the SIMOTION C.
2. Release the clip for the cable strain relief on the PS 307.
3. Strip the power supply cable (230 V/120 V) (stripped length of 12 mm) and connect it to the PS 307.
4. Tighten the clip for the cable strain relief.

5. Insert the connecting comb and tighten it.
6. Close the front doors

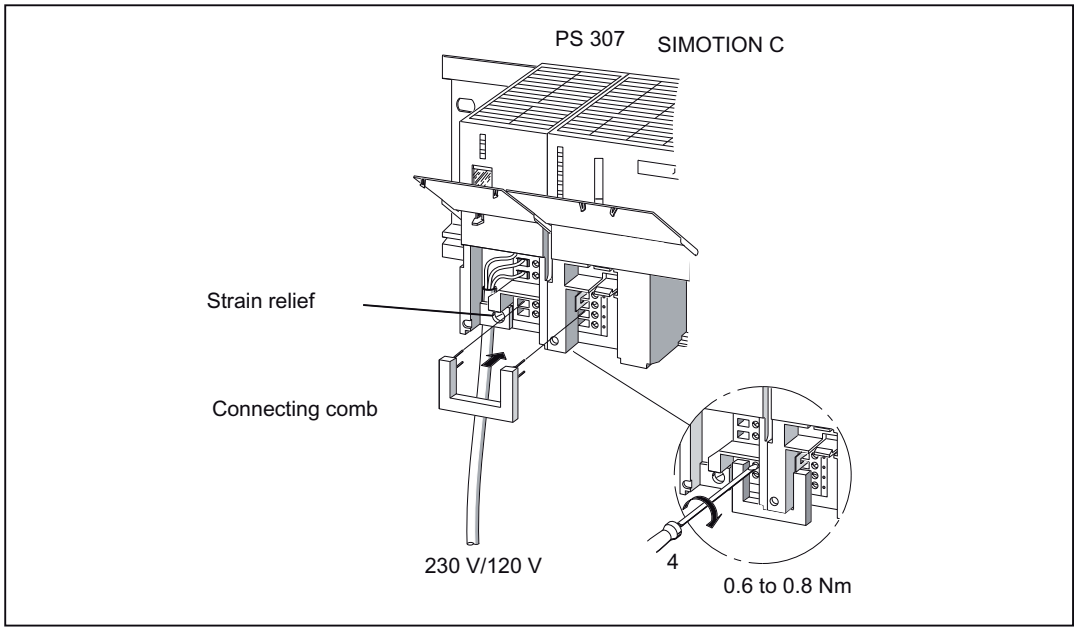

Figure 9-52 Connect power supply module and SIMOTION C with connecting comb

Setting power supply to the required supply voltage

Check whether the supply voltage selection switch is set correctly for your supply voltage. The basic setting on the PS 307 is always 230 V. Proceed as follows to change the setting for the supply voltage:

1. Remove the covering cap using a screwdriver.
2. Set the switch to the available supply voltage.
3. Refit the covering cap over the switch opening.

Reverse polarity protection

If the connection is correct and the power supply is switched on, the "5 VDC" LED is illuminated green.

Note

Your module will not work in the case of reverse polarity. However, a built-in reverse polarity protection will protect the electronics against damage.

Fuse

If a fault is present on the module, a built-in fuse protects the electronics against consequential damage (e.g. fire). In this case, the module must be replaced.

Connecting the drive units

Connecting the connecting cable

Note the following:

Note

Only use shielded, twisted pair cables; the shield must be connected to the metallic or metalized connector housing on the controller side. We recommend that you do not ground the shield on the drive side. This is to separate low-frequency interferences from the analog setpoint signal.

The pre-assembled cable available as an accessory provides the best possible immunity to interference.

Connection of drives (e.g. SIMODRIVE 611 universal with analog setpoint interface) to the onboard drive interface (C230-2, C240)

The figure below shows the connection of the C230-2, C240 to SIMODRIVE 611 universal drive units.

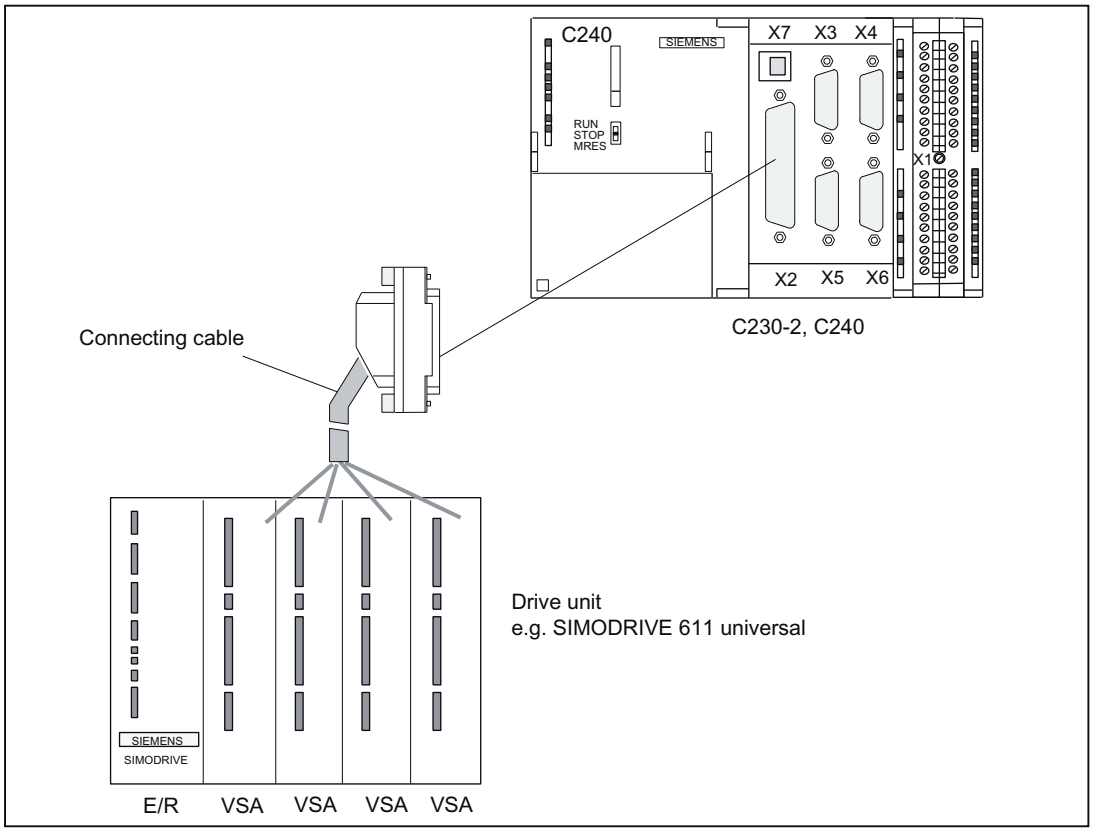

Figure 9-53 Connection of a SIMODRIVE 611 universal drive unit

Procedure:

1. Wire the free cable end of the connecting cable to the terminals on the drive unit. (The terminal markings on the cable ends indicate the corresponding terminals for SIMODRIVE devices.)
2. Open the front cover of the C230-2/C240 and connect the Sub-D socket (50-pin) to the X2 connector.
3. Lock the connector using the finger screws. Close the front cover.

Connecting cable

The connecting cable is a pre-assembled cable for four axes with an analog interface and terminal designation for SIMODRIVE drive units.

The connecting cable is available in a choice of lengths.

See *Catalog PM 21, NC 60, or ST 70*

Wiring diagram

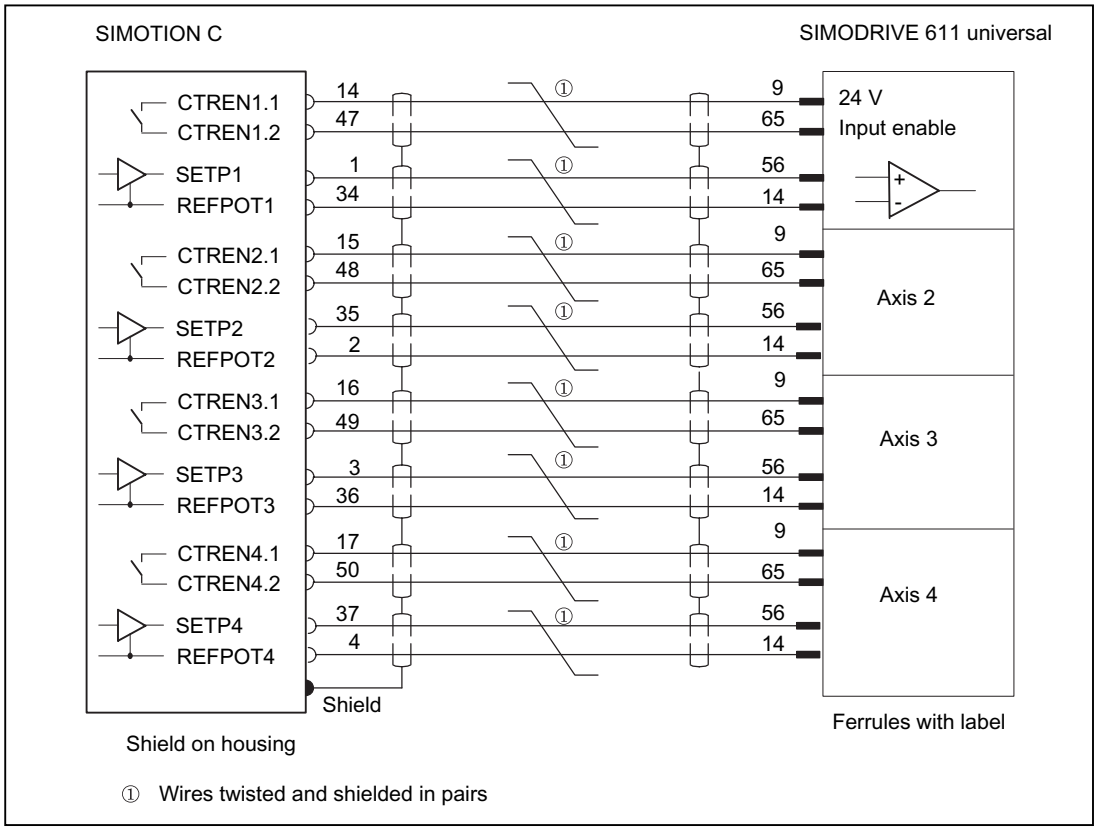

Figure 9-54 Terminal diagram for C230-2/C240 and SIMODRIVE 611 universal with analog setpoint interface

Setpoint assignment

The assignment of the setpoints for axes 1 to 4 is fixed.

Setpoint output signals (X2) for **drives with analog interface:**

- SW1, BS1, RF1.1, RF1.2 for axis 1
- SW2, BS2, RF2.1, RF2.2 for axis 2
- SW3, BS3, RF3.1, RF3.2 for axis 3
- SW4, BS4, RF4.1, RF4.2 for axis 4

Note

When using the drive interface for standard outputs (C240 only), proceed as described in chapter Onboard drive interface (C230-2, C240) (Page 6777). Wire the free ends of the connecting cable according to your application.

Connection of stepper drives (e.g. FM STEPDRIVE) to the onboard drive interface (C230-2, C240)

The figure below shows the connection of the C230-2, C240 to FM STEPDRIVE drive units.

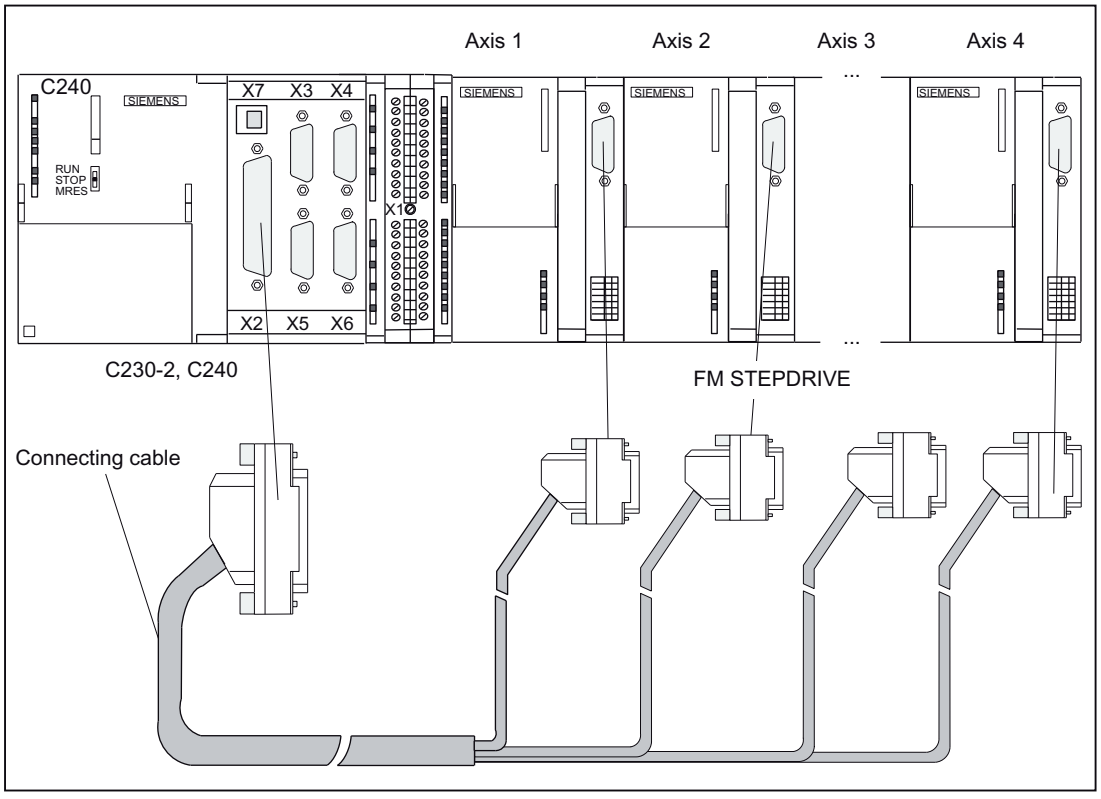

Figure 9-55 Connection of FM STEPDRIVE drive units

Procedure:

1. Insert the Sub-D socket (15-pin) in the FM STEPDRIVE module.
2. Open the front cover of the C230-2/C240 and connect the Sub-D socket (50-pin) to the X2 connector.
3. Lock the connector using the finger screws. Close the front cover.

Connecting cable

The connecting cable is a preassembled cable for four FM STEPDRIVE stepper motor drive units.

See *Catalog PM 21, NC 60.1, or ST 70*

Wiring diagram

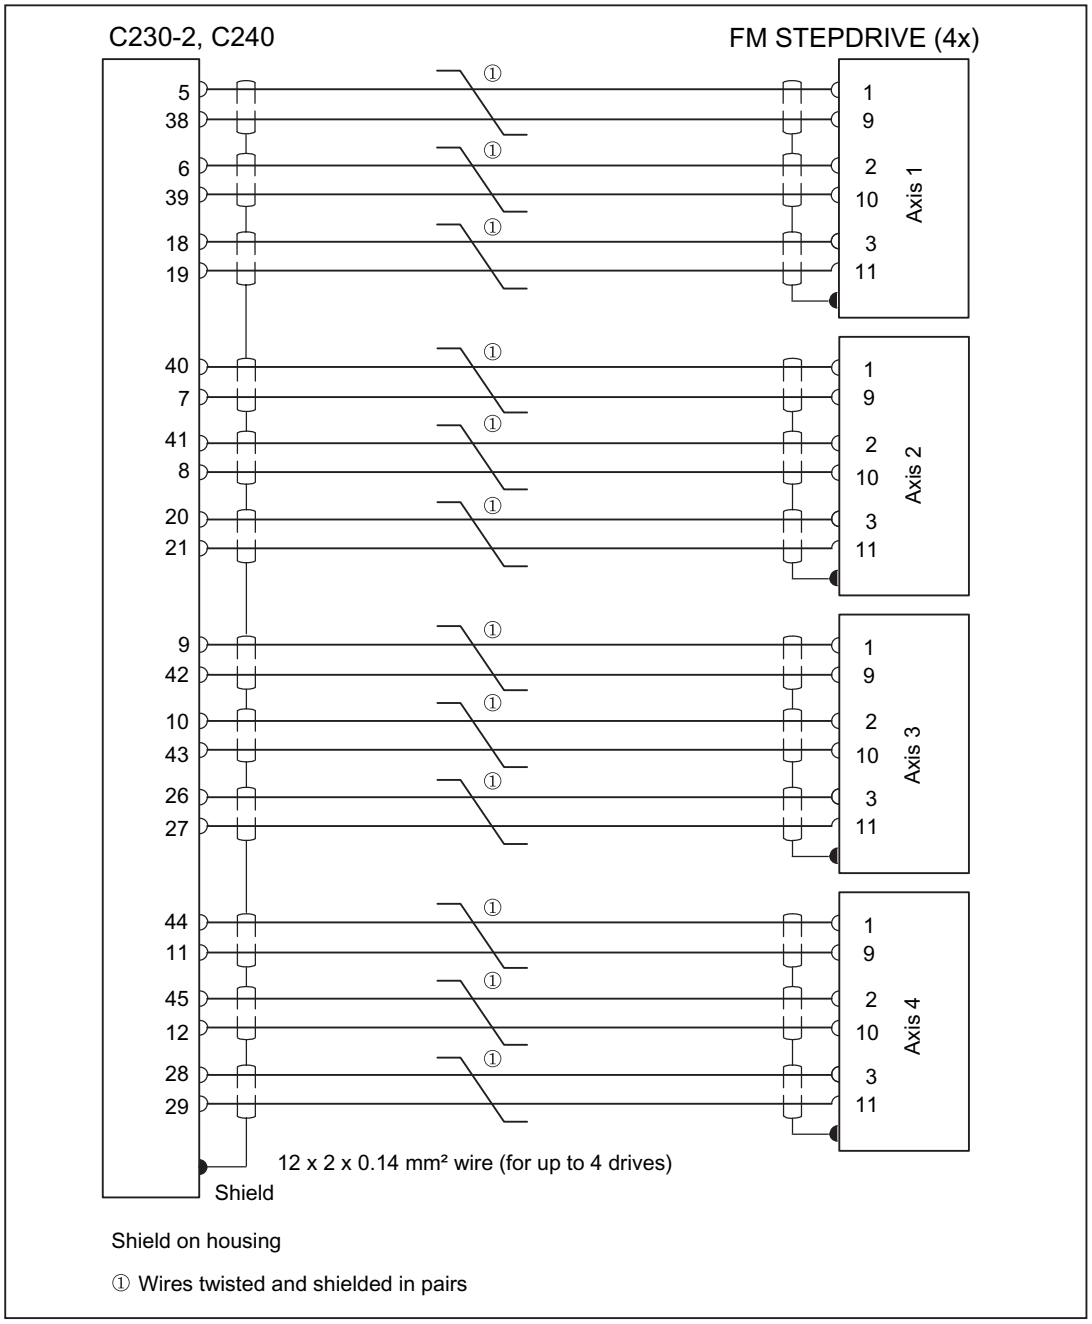

Figure 9-56 Wiring diagram for C230-2/C240 and FM STEPDRIVE

Setpoint assignment

The assignment of the setpoints for axes 1 to 4 is fixed.

Setpoint output signals (X2) for **stepper drive**:

- PULSE1, PULSE1_N, DIR1, DIR1_N, ENABLE1, ENABLE1_N for axis 1
- PULSE2, PULSE2_N, DIR2, DIR2_N, ENABLE2, ENABLE2_N for axis 2
- PULSE3, PULSE3_N, DIR3, DIR3_N, ENABLE3, ENABLE3_N for axis 3
- PULSE4, PULSE4_N, DIR4, DIR4_N, ENABLE4, ENABLE4_N for axis 4

Connection of drives (e.g. SIMODRIVE 611 universal) to the PROFIBUS DP

The figure below shows the connection of the SIMOTION C to a SIMODRIVE 611 universal drive unit.

Note that the "Motion Control with PROFIBUS DP" module must be fitted on the control unit of your drive unit.

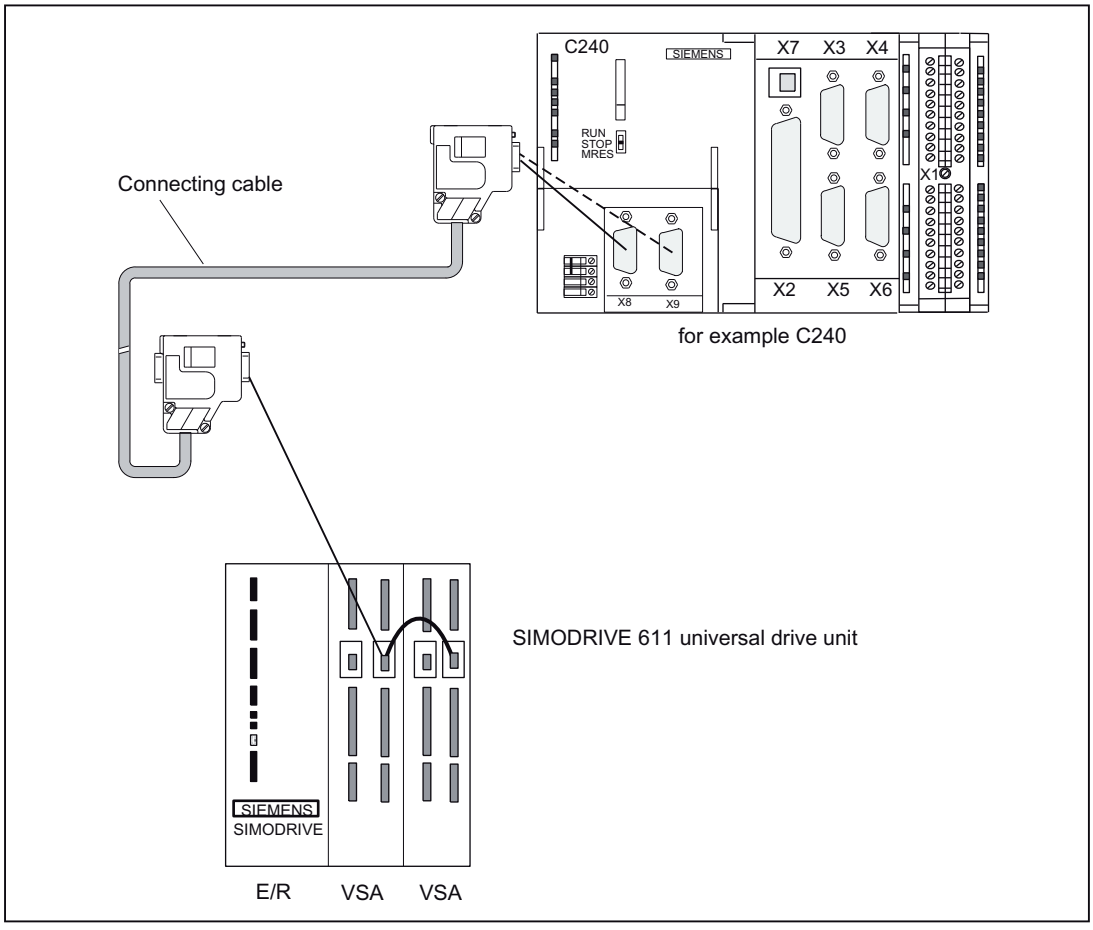

Figure 9-57 Connection of SIMODRIVE 611 universal drive unit to PROFIBUS DP

Procedure:

1. Insert the Sub-D connector (9-pin) into the drive unit.
2. Open the front door of the SIMOTION C and insert the Sub-D connector (9-pin) into the X8/X9 socket.
3. Lock the connector using the finger screws. Close the front cover.

Connecting cable

Details about the bus cable, bus connector and installation can be found in chapter Networking (Page 6842).

Note

The maximum cable length is 100 m.

The terminating resistor must be switched in (switch position "On") at the beginning and end of the bus segment. See figure "Bus connector (6ES7 ...): Terminating resistor connected and disconnected" in chapter Network components for a PROFIBUS subnet (Page 6845)

Connection of drives (e.g. SINAMICS S120) to PROFINET IO (C240 PN)

The figure below shows the connection of the C240 PN to a SINAMICS S120 drive unit.

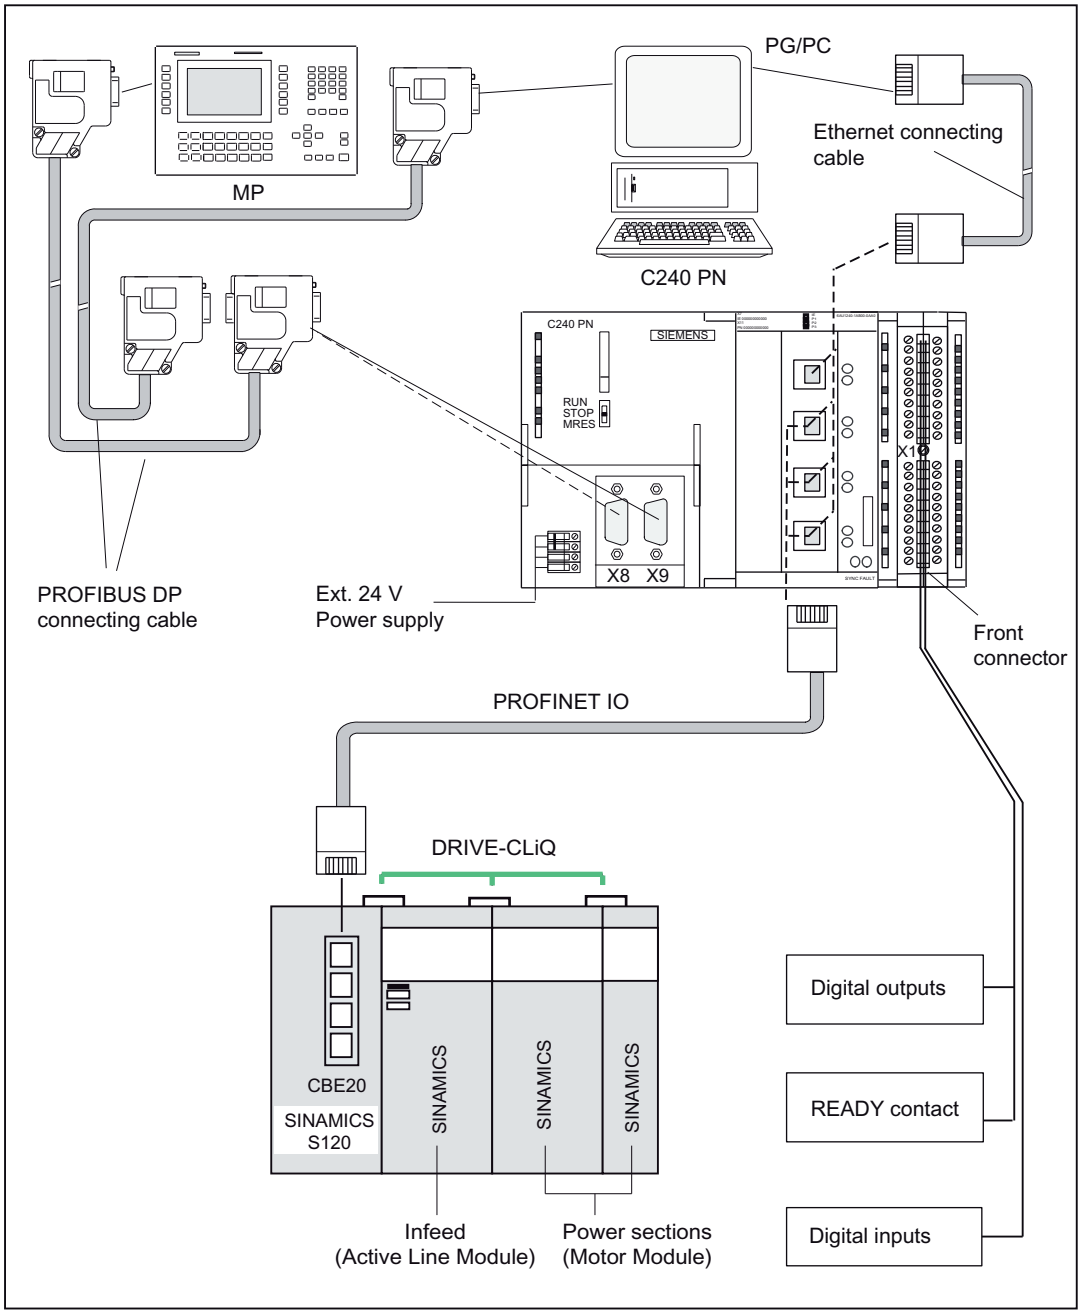

Figure 9-58 Connection of a SINAMICS S120 drive unit on the PROFINET IO

Procedure:

1. Insert the PROFINET connector into the drive unit.
2. Open the front door of the C240 PN and insert the PROFINET connector into the X11 P1, X11 P2 or X11 P3 socket.

Note

The strain relief provided for the PROFINET cable must be used in particular for vibrating machines. The cables should be secured close to the controller to achieve high vibration strength.

Figure 9-59 Strain relief

Connecting cable

Details about the bus cable, bus connector and installation can be found in chapter Networking (Page 6842).

Note

The maximum cable length is 100 m.

Mixed operation of analog drives and stepper drives (C230-2, C240)

Connecting cables for your configuration are available on request.

Follow the procedure outlined for connecting analog drives or stepper drives. The design conditions determine whether you install a terminal block or perform the wiring directly with pre-assembled cables.

Note

Ensure that the polarity assignment of the signals is correct. Refer to the technical documentation for your drive unit (e. g. *FM STEPDRIVE, Function Description* manual) and chapter Onboard drive interface (C230-2, C240) (Page 6777) of these operating instructions to ensure that the interconnection is correct.

Mixed operation of drives on the onboard drive interface and PROFIBUS DP

Drives with analog and digital connections and stepper drives can be operated together.

Proceed as described for the connection of drives to the onboard drive interface or PROFIBUS DP.

Mixed operation of drives on the onboard drive interface and use as standard output (C240 only)

Follow the procedure outlined for connecting analog drives.

Mixed operation of drives on the PROFIBUS DP and drives on the PROFINET IO (C240 PN)

Drives can be used in mixed operation.

Proceed as described for the connection of drives on the PROFIBUS DP or on the PROFINET IO.

Overview (Page 6793)

Connecting the encoders (C230-2, C240)

Connecting the connecting cable

Note the following:

Note

Always use shielded data cables. The shielding must be connected with the metallic or metallized connector housing.

The pre-assembled cable available as an accessory provides the best possible immunity to interference and adequately dimensioned cross-sections for the power supply to the encoders.

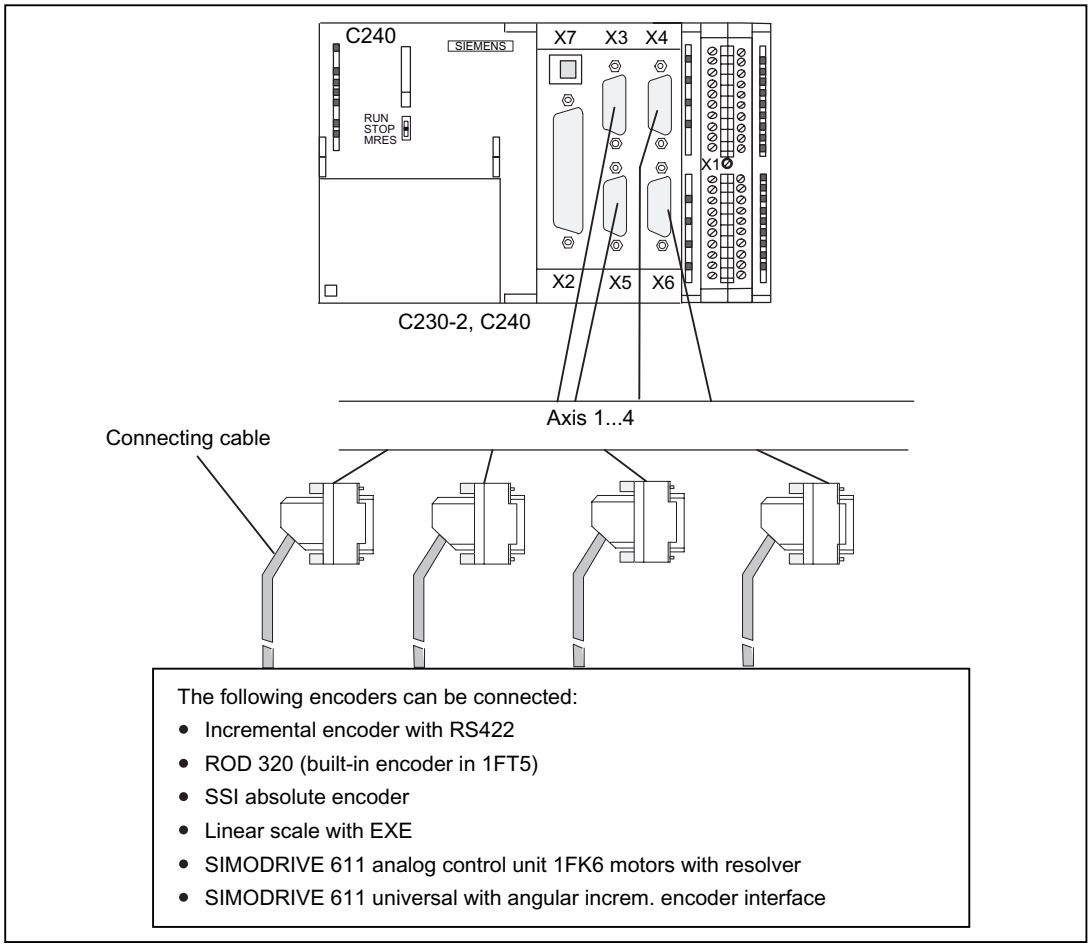

Figure 9-60 Encoder connections

Procedure for connecting encoders

Proceed as follows to connect the encoders:

1. Connect the cable to the encoders.
2. Open the front cover of the C230-2, C240 and insert the Sub-D connectors (15-pin) into sockets X3 to X6.
3. Lock the connector using the finger screws. Close the front cover.

Connecting cables available for encoders

The following connecting cables are available (see figure "Overview of connections"):

- Pre-assembled cable for external encoder or EXEs (for the connection of linear position encoders)
- Pre-assembled cable for built-in encoder with 17-pin round connector
- Pre-assembled cable for absolute encoders (SSI)

- Pre-assembled cable for SIMODRIVE 611 analog closed-loop control module 1FK6 motors with resolver
- Pre-assembled cable for SIMODRIVE 611 universal with incremental shaft encoder interface
  The incremental shaft encoder interface is used to emulate an incremental encoder. For this, the actual position value is measured by the encoder connected to the drive unit and transmitted to the C230-2, C240 as an incremental counting pulse.
  The encoder supply provided on the C230-2 and C240 is not used. Make sure there is a good ground connection between the controller and drive unit.

The connecting cables are available in a choice of lengths.

See *Catalog PM 21, NC 60, or ST 70*

Actual value assignment

Actual value assignment in the SIMOTION SCOUT axis wizard:

The assignment of actual values is only permanent for position axes with an encoderless stepper motor. The corresponding encoder channel is required for actual value simulation in the hardware.

Example:

For a position axis with an encoderless stepper motor on drive 2, encoder channel 2 is used within the hardware for actual value simulation.

For stepper motors with an encoder or for analog axes, the assignment of encoder channels is subject to no restrictions.

Connection options for encoders on the C230 or C240:

Encoders must be connected to actual value inputs X3 to X6.

The assignment between the drive and encoder channel is subject to no restrictions.

Connection example:

- The encoder for axis 1 is connected to actual value input X3
- The encoder for axis 2 is connected to actual value input X4
- The encoder for axis 3 is connected to actual value input X5
- The encoder for axis 4 is connected to actual value input X6

Note

The assignment between the drive and encoder channel is permanent for position axes with an encoderless stepper motor as a result of the actual value simulation required in the hardware.

Wiring the front connector

The following figure shows how the cables are routed to the front connector and how to suppress line interference through the use of the shield connecting element.

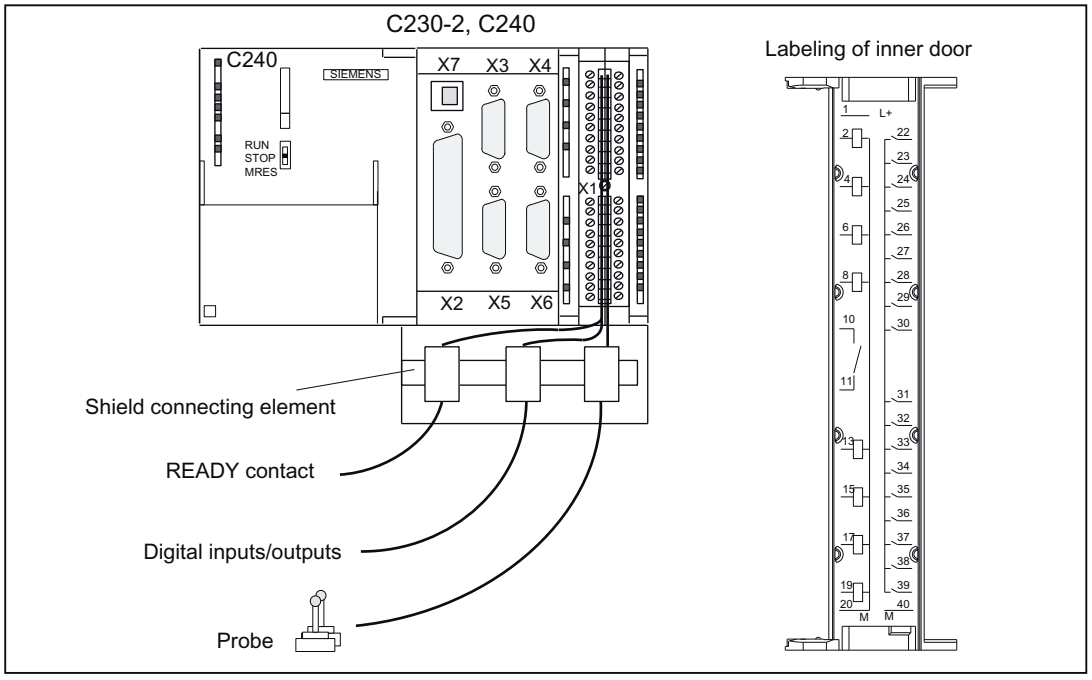

Figure 9-61 Wiring the front connector

Connecting cables

Flexible cable, cross-section 0.25 to 1.5 mm^2

Ferrules are not required.

You can use ferrules without an insulating collar in accordance with DIN 46228, Form A long version.

You can connect two cables of 0.25 to 0.75 mm^2 each in one ferrule.

Note

To achieve optimum interference suppression, a shielded cable must be used for connection of measuring inputs or external zero mark.

Required Tools

3.5-mm screwdriver or power screwdriver

Procedure for front connector wiring

Proceed as follows for the terminal strip:

1. Strip 6 mm of insulation off the cable. It may be necessary to fit a connector sleeve.
2. Open the front cover. Move the front connector into position for wiring.
   To do this, push the front connector into the module until it locks into position. In this position the front connector will still protrude from the module.
   The connector is locked in position, without electrical contact to the module.
3. If you route the wires out downwards, start the wiring at the bottom. If this is not the case, start at the top. Also screw in terminals that are not assigned.
   The tightening torque is 0.4 to 0.7 Nm.
4. Fit the cable strain relief provided around the wiring loom and the front connector.
5. Tighten the strain relief for the cable harness. Push in the strain relief to the left to increase cable space.
6. Tighten the mounting screw to move the front connector into operating position.
   Note: When the front connector is moved into operating position, a front connector keying engages in the front connector. The front connector will then fit only this module type.
7. Close the front cover.
8. You can fill out the labeling field provided and insert it in the front cover.

Shielded cables

If a shielded cable is used, the following additional actions are required:

1. Attach the cable shield to a grounded shielding bus immediately after the cable entry point in the cabinet (strip the insulation off the cable for this purpose).
   You can use the shield connecting element. This is mounted on the rail and can accommodate up to eight shielding terminals.
2. Continue routing the shielded cable as far as the module but do not make a connection to the shield there.

Shield connecting element

This element can be inserted in the mounting rail to provide screening for shielded cables. It can accommodate up to eight shielding terminals.

See chapter Connecting shielded cables via a shield connecting element (Page 6840).

Connection of measuring inputs or proximity sensors (external zero mark)

Procedure:

1. Wire the power supply for the encoders. This must meet the same criteria as the load power supply for the SIMOTION C.
2. Connect the shielded signal line to the encoders.

3. Remove a sufficient length of the cable sheath at the control end so that you can connect the shield to the shield connecting element and the free cable ends to the front connector.
4. Wire the signal line to the front connector.

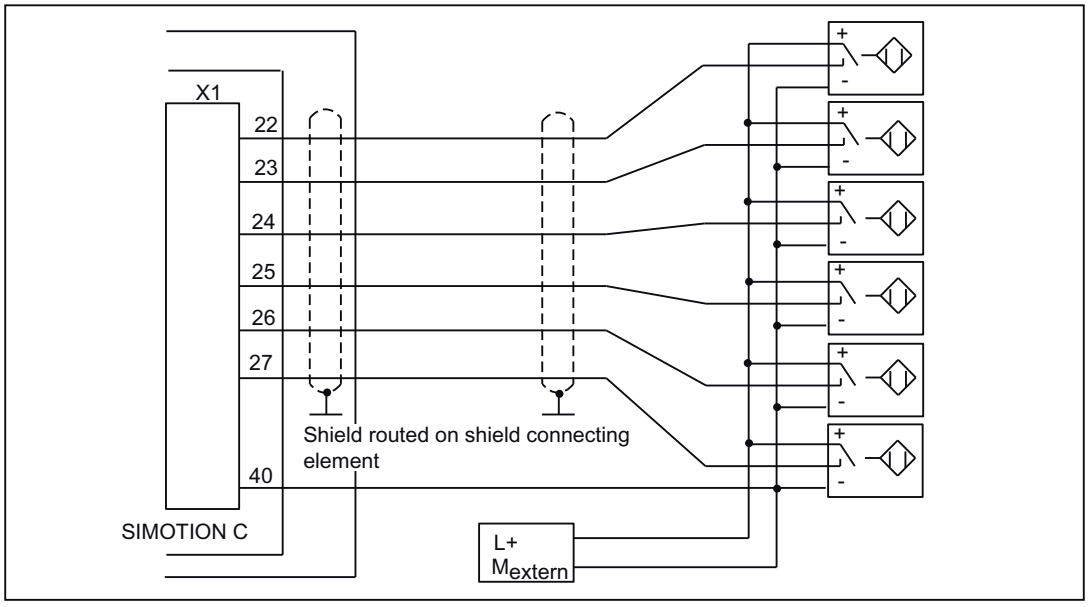

Figure 9-62 Overview of connections for measuring inputs or proximity encoders

Note

For the assignment of the front connector and the description of the I/O interface, refer to chapter I/O interface (Page 6797).

Connection of additional actuators/encoders

If you wish to connect additional actuators/encoders to the SMs on the I/O bus, proceed in the same way as for connecting digital inputs/digital outputs to the SIMATIC S7-300.

See the *S7-300, M7-300 Automation Systems, Module Data* Manual.

The digital inputs/digital outputs on the central I/O system are recorded/output at a refresh rate of approx. 1 ms.

Connecting shielded cables via a shield connecting element

Application

With the shield connecting element, you can easily connect all the shielded wires of the SIMOTION C or S7 modules to ground by directly connecting the shield connecting element with the mounting rail.

Design of the shield connecting element

The shield connecting element consists of:

- Retaining bracket with two screw bolts to mount the shield connecting element on the mounting rail (Article No.: 6ES5 390-5AA00-0AA0)
- The shielding terminals

You must use the following shielding terminal, depending on the cable cross-section used:

Table 9-40 Assignment of cable cross-sections and shielding terminals

Wire with shield diameter	Shielding terminal Article No. :
2 cables, each with 2 to 6 mm shield diameter	6ES7 390-5AB00-0AA0
1 cable with 3 to 8 mm shield diameter	6ES7 390-5BA00-0AA0
1 cable with 4 to 13 mm shield diameter	6ES7 390-5CA00-0AA0

The shield connecting element is 80 mm wide and provides space for two rows, each with four shielding terminals.

Fitting the shield connecting element

Fit the shield connecting element as follows:

1. Push the two threaded studs for the retaining bracket into the guide on the underside of the rail. Position the retaining bracket under the modules to be wired.
2. Screw the retaining bracket tight on the mounting rail.
3. The bottom of the shield connection terminal consists of a web interrupted by a slot. Place this part of the shielding terminal on edge a of the retaining bracket (see the following figure). Press the shielding terminals down and pivot them into the required position. You can fit a maximum of four shield terminals on each of the two rows.

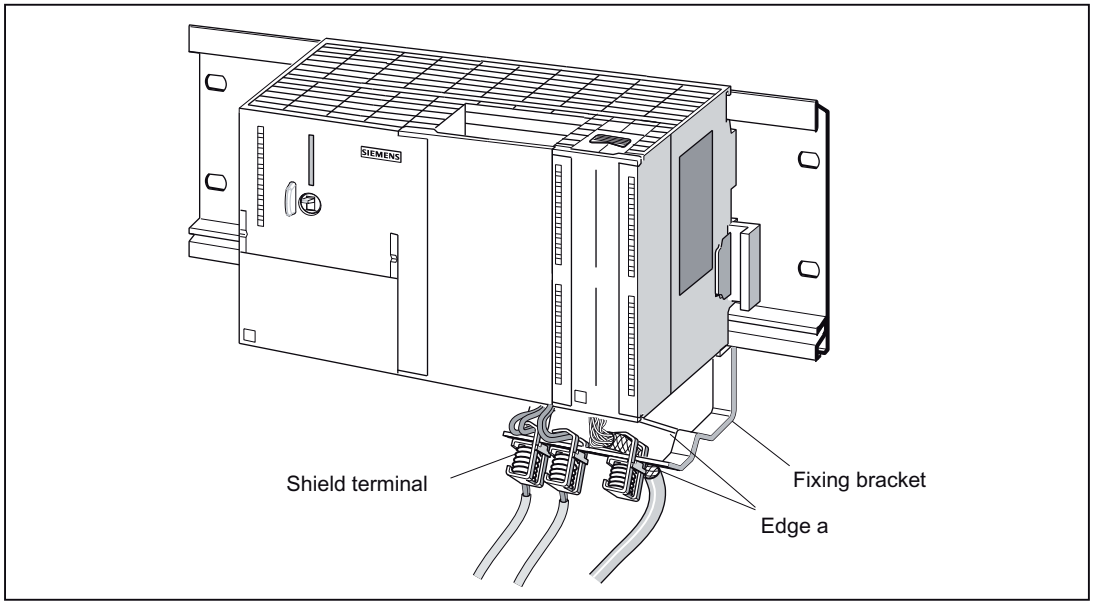

Figure 9-63 Fitting the shield connecting element

Laying the cables

Only one or two shielded cables can be attached per shielding terminal (see table "Assignment of cable cross-sections and shielding terminals"). Attach the cable to the stripped cable shield. The stripped section of cable shield must have a minimum length of 20 mm. If you require more than four shielding terminals, start the wiring on the back row of the shield connecting element.

Tip: Make sure you allow a sufficient length of cable between the shielding terminal and the front connector. This will, for example, ensure that if a repair is required, you can unplug the front connector without also having to remove the shield terminal.

9.1.6.2 Networking

Configuring

The *SIMOTION SCOUT* online help shows you how to design and configure a PROFIBUS or Ethernet subnet for your application.

Configuring a PROFIBUS subnet

device = node

Convention: All devices connected in a subnet will be referred to hereafter as nodes.

PROFIBUS addresses

In order for all nodes to communicate with each other, you must assign a 'PROFIBUS-address" to each node **before** connecting them:

You set the PROFIBUS addresses for each node individually using the programming device or PC (also by a switch on the slave for some PROFIBUS DP slaves).

The factory settings on the SIMOTION C are **address 2** and **baud rate 1.5 Mbit/s** for both PROFIBUS DP interfaces X8 and X9.

Tip: Mark the set address on the housing of all nodes in a subnet. You can then always see which address is assigned to which node in your plant.

The "highest PROFIBUS addresses" are preset for each PROFIBUS subnet. You can change these default settings.

Rules for PROFIBUS addresses

Before assigning PROFIBUS addresses, note the following rules:

- All PROFIBUS addresses in a subnet must be unique.
- The highest PROFIBUS address in a subnet must be ≥ the largest actual PROFIBUS node address in this subnet.

Recommendation for PROFIBUS addresses

Reserve PROFIBUS address "0" for a service programming device and "1" for a service SIMATIC HMI device, which will be connected to the subnet if required.

Recommendation for the PROFIBUS address of the SIMOTION C in case of replacement or service:

Reserve address "2" for a SIMOTION C. This prevents duplicate addresses when installing a SIMOTION C with factory setting on the subnet (e.g. when a SIMOTION C is replaced). You should therefore assign addresses greater than "2" to additional nodes in the subnet.

Segment

A segment is a bus cable between two terminating resistors. A segment with SIMOTION C as the master can contain up to 64 slaves. In addition, a segment is limited by the permitted cable length according to the baud rate (see chapter Onboard measuring system interface (C230-2, C240) (Page 6784)).

Rules for connecting nodes in a subnet

- Connect all nodes in a subnet "in series". In addition, integrate the programming devices and SIMATIC HMI devices for commissioning or servicing in the subnet in series.
- If you are operating more than 32 nodes in one subnet, you must use RS 485 repeaters to connect the bus segments (see also the description of the RS 485 repeater in the *S7-300 Automation Systems, M7-300, Module Data* Manual).
  In a PROFIBUS subnet, all bus segments combined must have at least one DP master and one DP slave.
- Use RS 485 repeaters to connect ungrounded bus segments and grounded bus segments.
- The maximum number of nodes per bus segment decreases with each RS 485 repeater. That is, if a bus segment contains one RS 485 repeater, the bus segment can contain no more than 31 additional nodes. However, the number of RS 485 repeaters does not affect the maximum number of nodes on the bus.
  Up to ten segments can be connected in series.
- Switch on the terminating resistor at the first and last node of a segment.

Components

Connect the individual nodes using bus connectors and the PROFIBUS cable, also refer to chapter Network components for a PROFIBUS subnet (Page 6845). Remember to provide a bus connector with a programming device socket at the ends of the subnet. This will give you the option of expanding the subnet if required (for example, for a programming device or SIMATIC HMI device).

Use RS 485 repeaters for the connection between segments and for extending the cable.

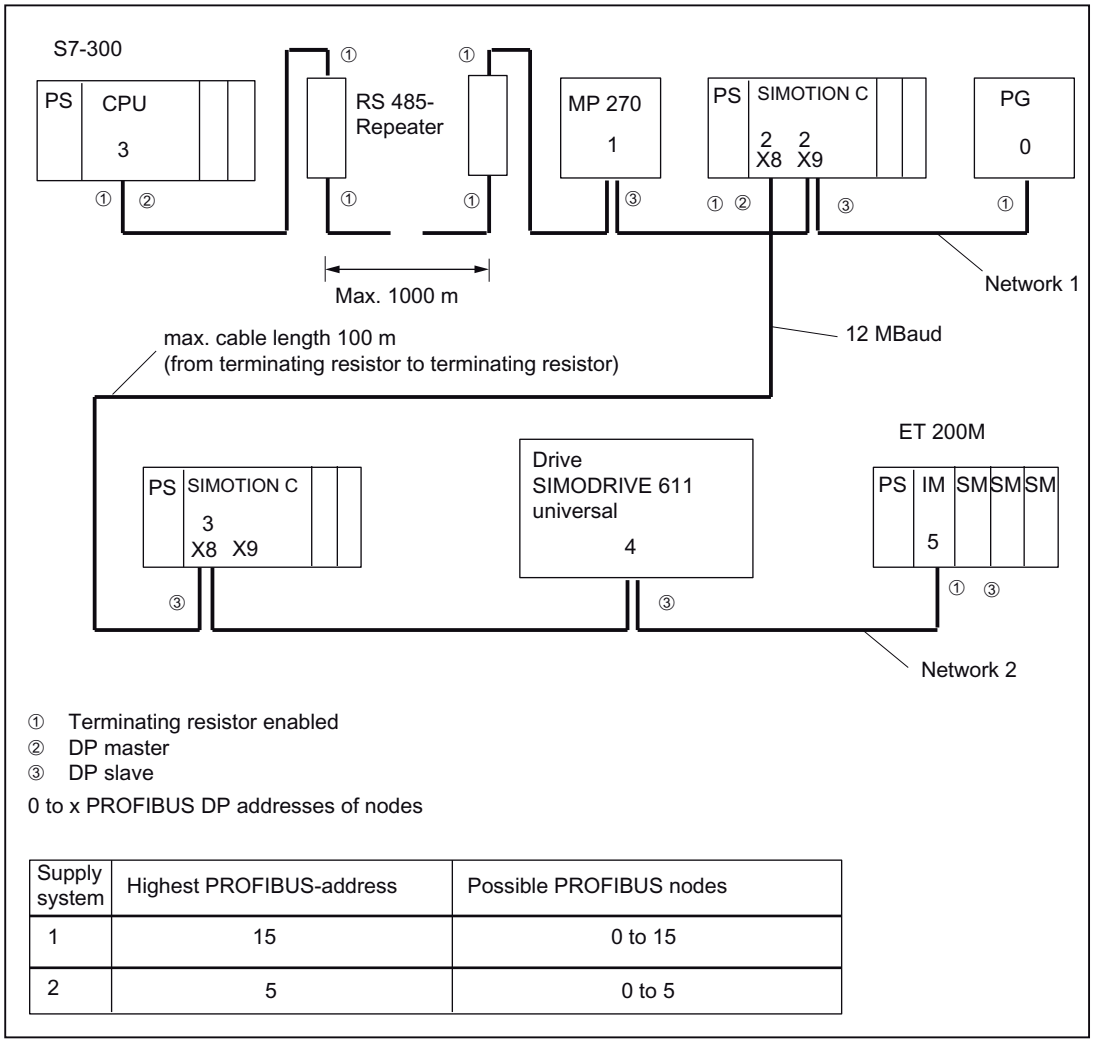
Terminating resistor

A cable must be terminated with its own surge impedance to prevent line disturbances caused by reflections. To this end, activate the terminating resistor at the first and last node of a subnet or segment (see figure "Bus connector (6ES7...): Terminating resistor connected and disconnected" in chapter Network components for a PROFIBUS subnet (Page 6845)

Make sure that the nodes to which the terminating resistor is connected are always supplied with voltage during power-up and operation.

Example

The following figure shows an example configuration of a subnet with SIMOTION C.



Supply system	Highest PROFIBUS-address	Possible PROFIBUS nodes
1	15	0 to 15
2	5	0 to 5

Figure 9-64 Networking example

Segment in subnet

The baud rate determines the cable length of a subnet segment (see the following table).

Table 9-41 Permitted cable lengths of a subnet segment for specific baud rates

Baud rate	Max. cable length of a segment (in m)
9.6 to 187.5 bits/s	1000[1)]
500 Kbits/s	400
1.5 Mbit/s	200
3 to 12 Mbits/s	100

[1)] With isolated interface

Greater cable lengths

You need to install RS485 repeaters for segments requiring cable lengths longer than the allowed length. The maximum possible cable length between two RS 485 repeaters corresponds to the cable length of a segment (see the previous table). You can connect up to nine RS 485 repeaters in series.

Note that an RS 485 repeater must be counted as a subnet node when determining the total number of nodes to be connected. This is true even if the RS 485 repeater is not assigned its own PROFIBUS address.

Network components for a PROFIBUS subnet

PROFIBUS cable

We can offer you e.g. the following PROFIBUS cables:

Table 9-42 PROFIBUS cable

Cables	Article No.
PROFIBUS cable	6XV1 830-0EH10
PROFIBUS direct-buried cable	6XV1 830-3FH10
PROFIBUS drum cable	6XV1 830-3EH10

Properties of the PROFIBUS cable

The PROFIBUS cable is a two-core, twisted, and shielded cable with the following features:

Table 9-43 Properties of the PROFIBUS cable

Features	Values
Characteristic impedance	Approx. 135 to 160 Ω (f = 3 to 20 MHz)
Loop resistance	≦ 115 Ω/km
Effective capacitance	30 nF/km
Attenuation	0.9 dB/100 m (f = 200 kHz)

Features	Values
Permissible conductor cross-section	0.3 mm^2 to 0.5 mm^2
Permitted cable diameter	8 mm ± 0.5 mm

Rules for cable installation

PROFIBUS cables must not be twisted, stretched, or compressed.

When installing the indoor bus cable, you must also keep within the following supplementary conditions (d_A = outer diameter of the cable):

Table 9-44 Supplementary conditions with indoor routing of bus cable

Features	Supplementary conditions
Bending radius for a single bend	≥ 80 mm (10 x d_A)
Bend radius for multiple bends	≥ 160 mm (20 x d_A)
Permissible temperature range for installation	- 40° C to + 60° C
Shelf and static operating temperature range	- 40° C to + 60° C

Bus connector

The bus connector is used to connect the PROFIBUS cable to the PROFIBUS DP interfaces (X8, X9), thus establishing a connection to additional nodes.

The following bus connectors are available:

- Up to 12 Mbits/s, cable outlet 90°
  - Without PG socket (6ES7 972-0BA12-0XA0 or 6ES7 972-0BA50-0XA0)
  - With PG socket (6ES7 972-0BB12-0XA0 or 6ES7 972-0BB50-0XA0)
- Up to 12 Mbits/s, canted cable turn
  - Without PG socket (6ES7 972-0BA41-0XA0)
  - With PG socket (6ES7 972-0BB41-0XA0)

Inserting a bus connector in a module

Proceed as follows to connect the bus connector:

1. Plug the bus connector into the module.
2. Screw the bus connector tightly onto the module.
3. If the bus connector is located at the start or the end of a segment, you must connect the terminating resistor ("ON" switch setting) (refer to the following figure).

Make sure that the nodes at which the terminating resistor is located are always supplied with voltage during startup and operation.

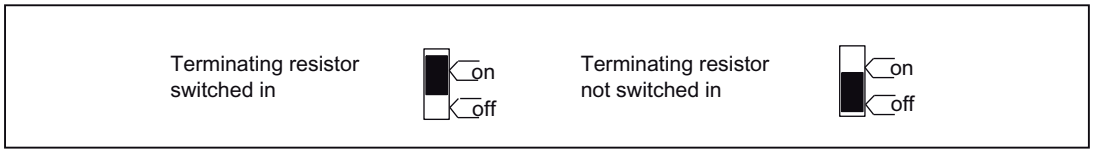


Figure 9-65 Bus connector (6ES7 ...): terminating resistor switched on and off

Unplugging a bus connector

You can unplug a bus connector with a looped-through bus cable at any time from the PROFIBUS DP interface without interrupting data exchange on the bus.

⚠ WARNING

Data traffic error might occur on the bus!

A bus segment must always be terminated at both ends with the terminating resistor. This is not the case if the last bus connector node is de-energized, for example. Because the bus connector takes its voltage from the station, this terminating resistor is ineffective.

Please make sure that power is always supplied to stations on which the terminating resistor is active.

Configuring an Ethernet subnet on the Ethernet interface

Overview

You can connect an Industrial Ethernet to the 8-pin RJ45 **X7** socket, see Figure "Overview of the cable connecting the SIMOTION C to the servo drive (digital connection) - example" in chapter Overview of wiring diagram (Page 6818).

Industrial Ethernet is a communication network with a transmission rate of 10/100 Mbits/s.

Communication between SIMOTION C, the PG/PC (e.g. STEP 7, SIMOTION SCOUT, SIMATIC NET OPC), and the I/O devices provided for this purpose is supported by the Ethernet.

A shielded twisted pair cable is used for the networking in this case. For additional information, refer to the *SIMATIC NET, Industrial Twisted Pair and Fiber Optic Networks* Manual. This document is supplied with SIMOTION SCOUT in electronic form.

The following connecting cables are recommended:

- SIMATIC NET, Ind. Ethernet TP XP CORD RJ45/RJ45, TP cable assembled with 2 RJ45 plugs, send and receive cables crossed
  Article No.: 6XV1870-3R□□□ (□□□ - length code)
- SIMATIC NET, Ind. Ethernet TP CORD RJ45/RJ45, TP cable assembled with 2 RJ45 plugs
  Article No.: 6XV1870-3Q□□□ (□□□ - length code)

You can obtain additional information about the different cable systems for Ethernet from your SIEMENS contact.

Note

A crossover cable should be used for the direct connection of the controller to a PG/PC.

Loading the Ethernet configuration via PROFIBUS DP (loading of the IP address)

For configuration using Industrial Ethernet, the SIMOTION C must be provided with an IP address, the subnet mask and the router address.

To configure the Ethernet addresses and transfer them to the SIMOTION C, proceed as follows:

1. Open your project.
2. Open HW Config. Double-click the SIMOTION C module to open the "Properties - C2xx" dialog box.
3. On the "General" tab, click the "Properties" button of the Ethernet interface. The "Properties - C2xx Ethernet Interface" dialog is displayed.
4. In this dialog, click "New". The "New Industrial Ethernet" subnet dialog is displayed. In this dialog box, you can change the name of the new subnet or confirm the factory setting with "OK".
5. The newly created Ethernet subnet is now shown under Subnet in the "Properties - C2xx Ethernet Interface" dialog and must be selected.
6. In this dialog box, enter the required addresses for IP address and subnet dialog box. Under Router, choose whether a router is to be used. If using a router, enter the router address.
7. Confirm this dialog box with "OK".
8. Close the "Properties - C2xx" dialog with "OK".
9. Save and compile the modified hardware configuration.
10. Load the new hardware configuration to the SIMOTION C via PROFIBUS DP.

Loading the Ethernet configuration via Ethernet (loading of the IP address)

If a PROFIBUS DP is not available for the initial loading of the IP address, the following procedure starting from Windows 2000 can be used: The "Automatically Assign IP Address" setting must be enabled in the TCP/IP configuration of the PC.

1. Connecting a Windows PC and C2xx directly via RJ45 crossover cable.
2. Boot the Windows PC. The PC does not find a DHCP server and automatically selects an IP address from the APIPA subnet (Automatic Private IP Addressing) 169.254.0.0.
3. Load the new hardware configuration with the new IP address via Ethernet to IP address 169.254.11.22 (default IP address for the C2xx upon delivery).

Note

You can also write the user project and/or configuration with SIMOTION SCOUT and the menu command "Load to file system" directly from the PC to the memory card (micro memory card). To do this, select the device in the project navigator and execute the "Load to file system" command in the context menu.

Configuring an Ethernet subnet on the PROFINET interface (C240 PN)

Overview

You can connect a PROFINET node to the 8-pin RJ45 X11 P1, X11 P2 and X11 P3 sockets, see Figure "Overview of the cable connecting the C240 PN to the servo drive (digital connection) - example" in chapter Overview of wiring diagram (Page 6818).

PROFINET is a communication network with a transmission rate of 100 Mbit/s.

You can use a PG/PC to communicate with STEP 7, SIMOTION SCOUT, and SIMATIC NET OPC.

A shielded twisted pair cable is used for the networking in this case. For additional information, refer to the *SIMATIC NET, Industrial Twisted Pair and Fiber Optic Networks* Manual. This document is supplied with SIMOTION SCOUT in electronic form.

All ports of the PROFINET interface support auto-MDI(X) in contrast to the Ethernet interface. A crossover cable is therefore not required for a direct connection to the PG/PC.

The following connecting cables are recommended:

- SIMATIC NET, Ind. Ethernet FC TP standard cable GP
  Article No.: 6XV1840-2AH10 (sold by the meter)
- SIMATIC NET, Ind. Ethernet FC TP trailing cable GP
  Article No.: 6XV1870-2D (sold by the meter)
- SIMATIC NET, Ind. Ethernet TP XP CORD RJ45/RJ45, TP cable assembled with two RJ45 plugs, send and receive cables crossed
  Article No.: 6XV1870-3R□□□ (□□□ - length code)
- SIMATIC NET, Ind. Ethernet TP CORD RJ45/RJ45, TP cable assembled with two RJ45 plugs
  Article No.: 6XV1870-3Q□□□ (□□□ - length code)

The following bus connectors can be used with the C240 PN:

- SIMATIC NET, Ind. Ethernet FC RJ45 plug 145
  Article No.: 6GK1901-1BB30-0AA0 (1 item)
  Article No.: 6GK1901-1BB30-0AB0 (10 items)

You can obtain additional information about the different cable systems for PROFINET and Ethernet from your SIEMENS contact.

Loading the PROFINET configuration via PROFIBUS DP (loading of the IP address)

For configuration using PROFINET, the SIMOTION C must be provided with an IP address, the subnet mask and the router address.

To configure and transfer PROFINET addresses to the C240 PN, proceed as follows:

1. Open your project.
2. Open HW Config. Double-click the X11 "PNxIO" slot of the C240 PN module to open the "Properties - PNxIO" dialog box.
3. Click the "Properties" button of the Ethernet interface. The "Properties - PNxIO Ethernet Interface" dialog box is displayed.
4. In this dialog, click "New". The "New Industrial Ethernet" subnet dialog is displayed. In this dialog box, you can change the name of the new subnet or confirm the factory setting with "OK".
5. The newly created Ethernet subnet is now shown under Subnet in the "Properties - Ethernet Interface" dialog box and must be selected.
6. In this dialog box, enter the required addresses for IP address and subnet dialog box. Under Router, choose whether a router is to be used. If using a router, enter the router address.
7. Confirm this dialog box with "OK".
8. Close the "Properties - PNxIO" dialog box with "OK".
9. Save and compile the modified hardware configuration.
10. Load the new hardware configuration to the C240 PN via PROFIBUS DP.

Loading the PROFINET configuration via Ethernet (loading of the IP address)

If a PROFIBUS DP is not available for the initial loading of the IP address, the following procedure starting from Windows 2000 can be used: The "Automatically Assign IP Address" setting must be enabled in the TCP/IP configuration of the PC.

1. Connecting a Windows PC and C240 PN directly via RJ45 crossover cable
2. Boot the Windows PC. The PC does not find a DHCP server and automatically selects an IP address from the APIPA subnet (Automatic Private IP Addressing) 169.254.0.0.
3. Load the new hardware configuration with the new IP address via Ethernet to IP address 169.254.11.22 (default IP address of the SIMOTION C as delivered)

Note

You can also write the user project and/or configuration with SIMOTION SCOUT and the menu command "Load to file system" directly from the PC to the memory card (micro memory card). To do this, select the device in the project navigator and execute the "Load to file system" command in the context menu.

Factory setting

After resetting the SIMOTION C to the factory setting (see chapter Setting SIMOTION C to factory settings (Page 6872)) or when the module is delivered, the following addresses are set:

- Baud rate = 1.5 Mbit/s
- PROFIBUS address for the interfaces X8 = 2 and X9 = 2
- Ethernet interface:
  IP address = 169.254.11.22
  Subnet mask = 255.255.0.0
  Router address = do not use a router
- PROFINET interface X11 (C240 PN)
  IP address = no valid address
  Subnet mask = no valid address
  Router: Do not use a router

MPI subnet

An MPI subnet has the same basic configuration as a PROFIBUS subnet. The installation rules, stated in the chapter Configuring a PROFIBUS subnet (Page 6842), therefore apply.

9.1.7 Addressing

9.1.7.1 Slot-oriented address allocation for modules (default addresses for centralized I/O)

Introduction

In the case of addressing based on the slot (default addressing), a module start address is assigned to every slot number. Depending on the type of module, these are different addresses for digital, analog, FM and CP modules (see table below). In this section we will show you which module start address is assigned to which slot number. You need this information to determine the module start addresses of the modules used.

Maximum configuration

The following figure shows a configuration of a rack and the possible slots. A 2-tier layout with IM 365 is possible with SIMOTION C.

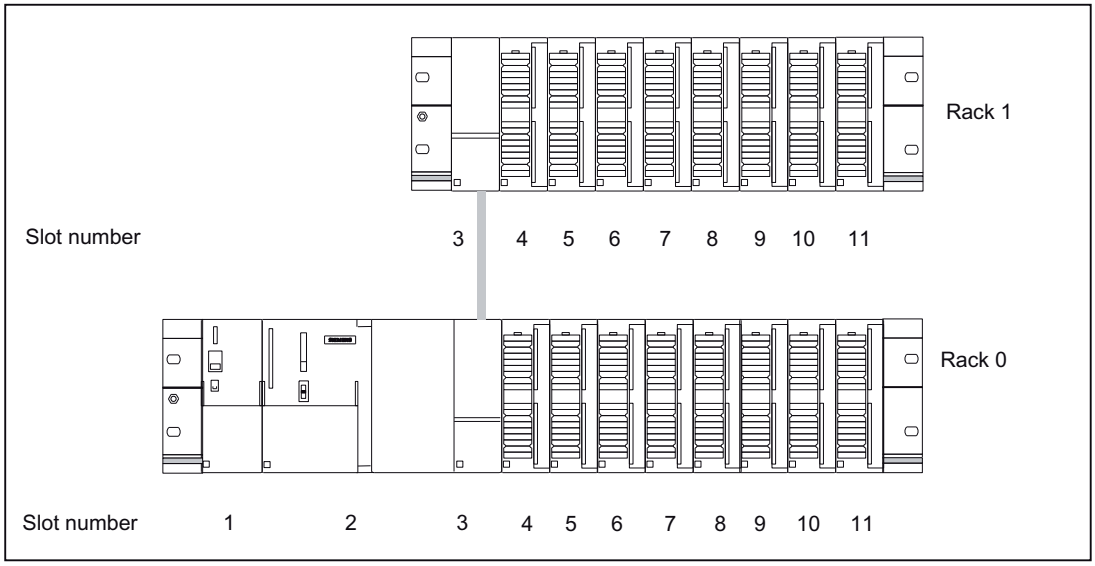

Figure 9-66 Slots for modules on rack (centralized I/O)

Module start addresses

The following table shows the assignment of module start addresses to slot numbers and racks.

In the case of input/output modules, the input addresses and output addresses start from the same module start address.

Table 9-45 Module start addresses of signal modules

Module carrier	Module start addresses	Slot number										
		1	2	3	4	5	6	7	8	9	10	11

0	Digital Analog [1]	PS	SIMOTION C	IM 365 S	0 256	4 272	8 288	12 304	16 320	20 336	24 352	28 368
1	Digital Analog [1]	-	-	IM 365 R	32 384	36 400	40 416	44 432	48 448	52 464	56 480	60 496

[1] The FM and CP modules are assigned to the analog address range.

Note

Do not insert any non-configured modules centrally. Modules that are installed but not configured are repeatedly addressed via the I/O bus. This requires additional computing time.

9.1.7.2 User-assignable addressing on the SIMOTION C (centralized and distributed I/O)

User-assignable addressing

User-assignable addressing means you can assign an address of your choice to each module or slot, for example, integrated inputs/outputs, drives. You make this assignment in the **hardware configuration** (see *SIMOTION SCOUT* online help). Here you specify the module start address on which all further module addresses will then be based.

advantages

Advantages of user-definable addressing:

- You can make the best possible use of the available address spaces because there are no "address gaps" between the modules.
- When creating standard software, you can specify addresses which are independent of the respective configuration of the SIMOTION modules.

9.1.7.3 Addressing signal modules

Introduction

The following section describes signal module addressing in the default setting. You need the information so that you can address the signal module channels in the user program.

Addresses of digital modules

The address of an input or output of a digital module is made up of the byte address and the bit address.

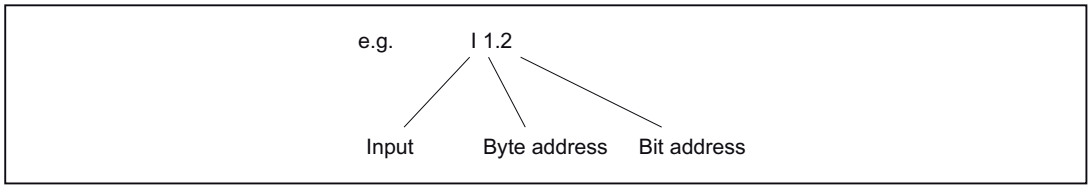

Figure 9-67 Address of an input of a digital module - example

The byte address is governed by the module start address.

You can note the bit address on the module.

The figure below shows you the scheme by which the addresses of the individual channels of the digital module are obtained.

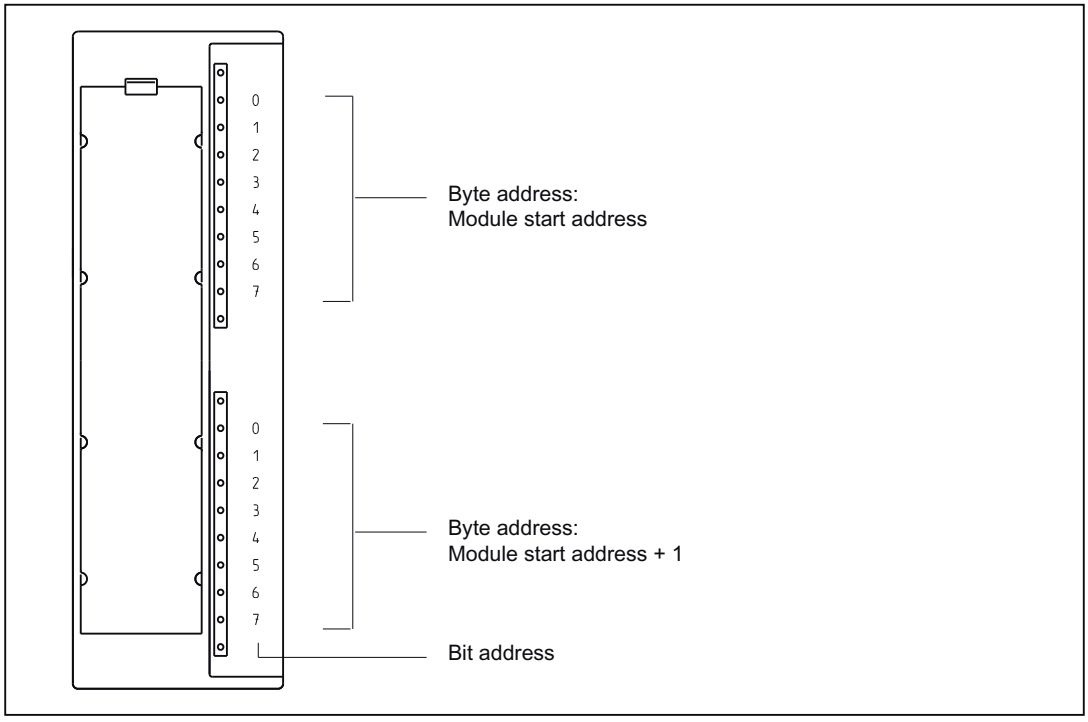

Figure 9-68 Addresses for the inputs and outputs of digital modules

Example of digital modules

The example in the figure below shows which default addresses are derived when a digital module is located in slot 4 (that is, when the module start address is 0).

Slot number 3 is reserved as no interconnection module is present in the example.

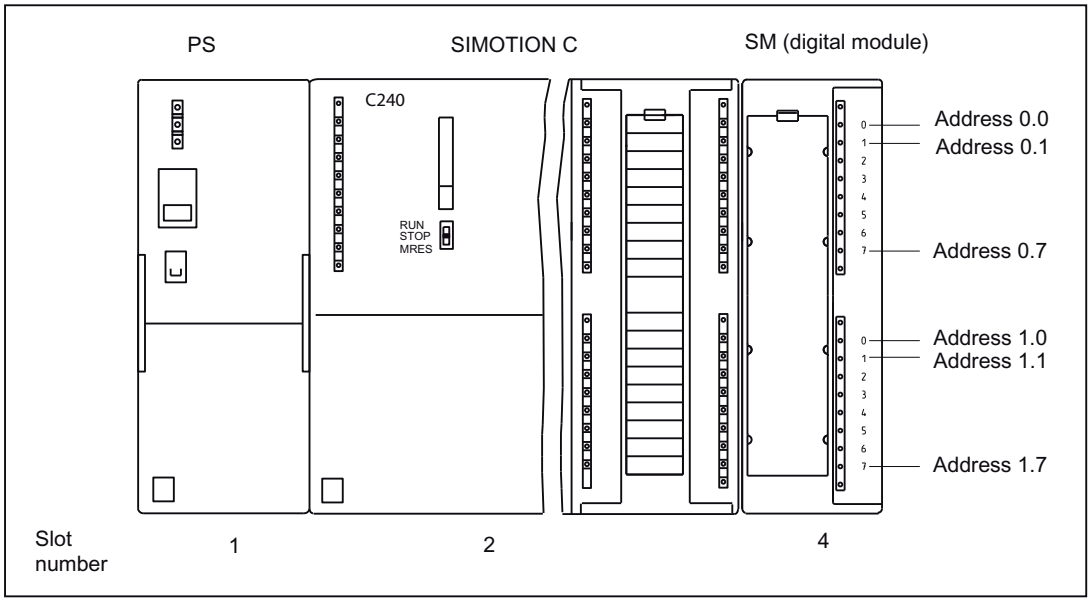

Figure 9-69 Addresses for the inputs and outputs of the digital module in slot 4

Addresses of analog modules

The address of an analog input or analog output channel is always an even address.

The channel address is based on the module start address.

If the first analog module is in slot 4, then it has the default start address 256. The start address of each additional analog module is raised per slot by 16 (see table "Slots for modules on rack (centralized I/O)").

An analog input/analog output module has the same start addresses for the analog input and analog output channels.

Example for analog modules

The example in the figure below shows you which default channel addresses are obtained for an analog module located at slot 4. You will see that in the case of an analog input/analog output module, the analog input and analog output channels are addressed from the same address, the module start address.

Slot number 3 is reserved as no interconnection module is present in the example.

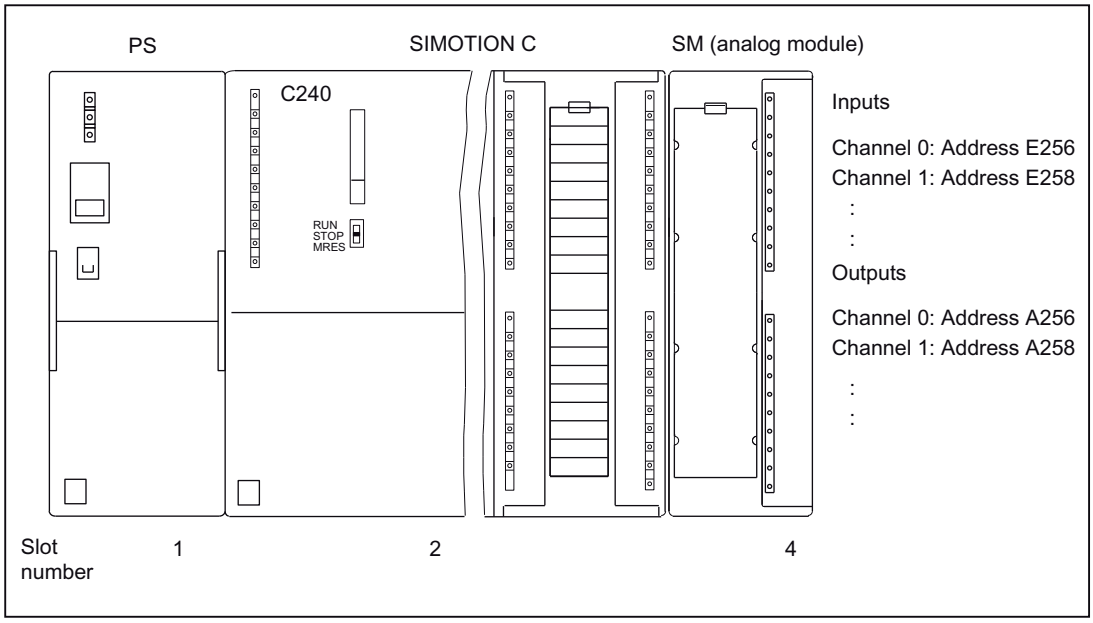

Figure 9-70 Addresses for the inputs and outputs of the analog module in slot 4

Addresses of the FM and CP modules

The FM and CP modules are assigned to the analog address range. In addition, the FM and CP modules have extended interfaces (data sets). For a detailed description, see the corresponding module's manual.

9.1.7.4 Addressing the onboard digital inputs and outputs of the SIMOTION C

The following figure shows the default start addresses of the onboard digital inputs/outputs.

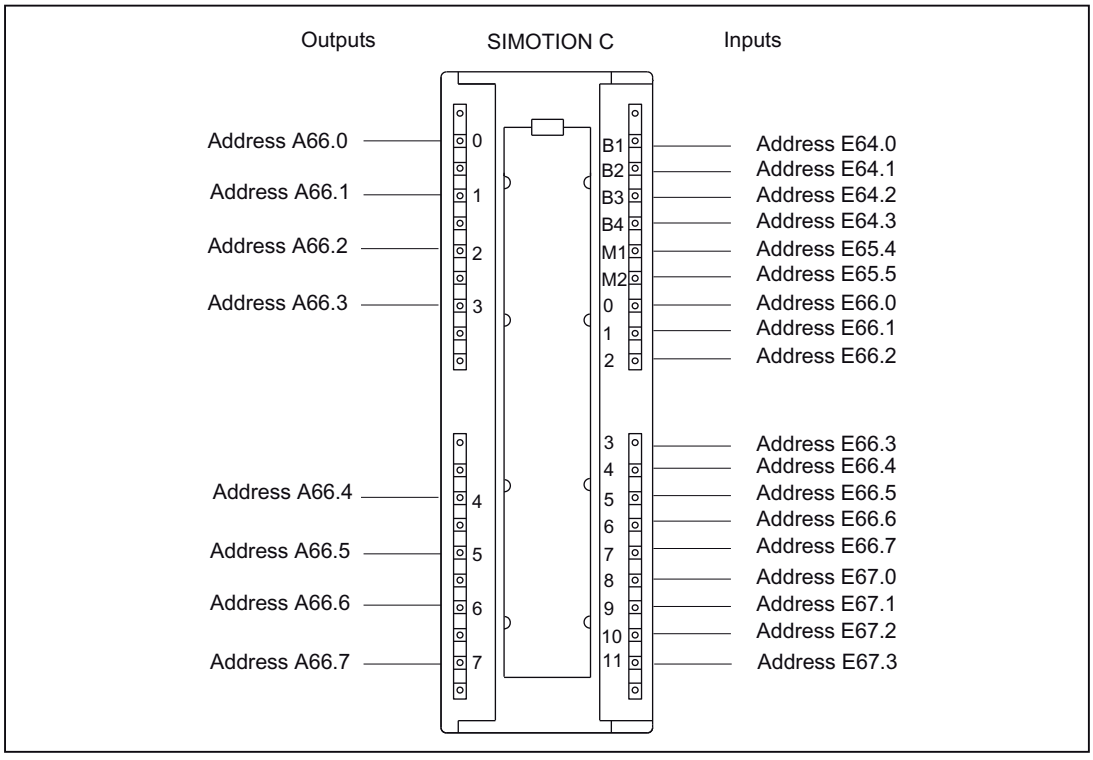

Figure 9-71 Addressing the onboard digital inputs/outputs

Note

These addresses can be modified by the user in the *hardware configuration* (see **SIMOTION SCOUT** online help).

When used by a TO (e.g. measuring input/output cam), the address must be ≥ 64.

All start addresses/signal bits (64.4...64.7, 65.0...65.3, 65.6, 65.7, 67.4...67.7) not listed do not have any defined values and consequently may not be used for evaluation.

As of SIMOTION V4.2, the onboard digital inputs/outputs of the C240 and C240 PN cannot only be interconnected with variables via their direct addresses, by also by means of symbolic assignment.

9.1.7.5 Addressing the onboard drive and measuring system interface of the C230-2, C240

Use as a standard output is only possible by means of an I/O variable. The I/O variables must be created on the addresses of the corresponding axis channel specified via the **hardware configuration** (relating to the default start address).

Symbolic assignment is not available for this application.

The following figure shows the default start addresses of the onboard drive interface of the C230-2/C240.

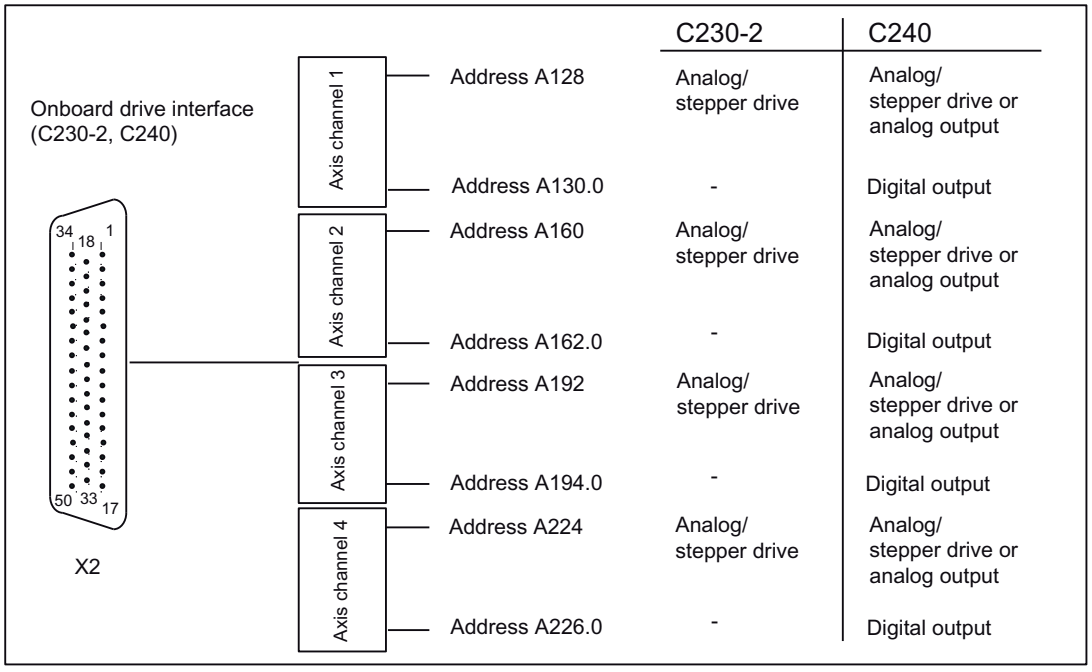

Figure 9-72 Addressing the onboard drive interface

An available encoder input of an axis channel (e.g. for a speed-controlled axis) can be used as an input for a 16-bit up/down counter (90-degree pulse train of a connected TTL encoder, zero pulse not required). The counter value can be accessed by means of an I/O variable (default start address of the axis channel). Symbolic assignment is not available for this application.

The following figure shows the default start addresses of the onboard measuring system interface of the C230-2/C240.

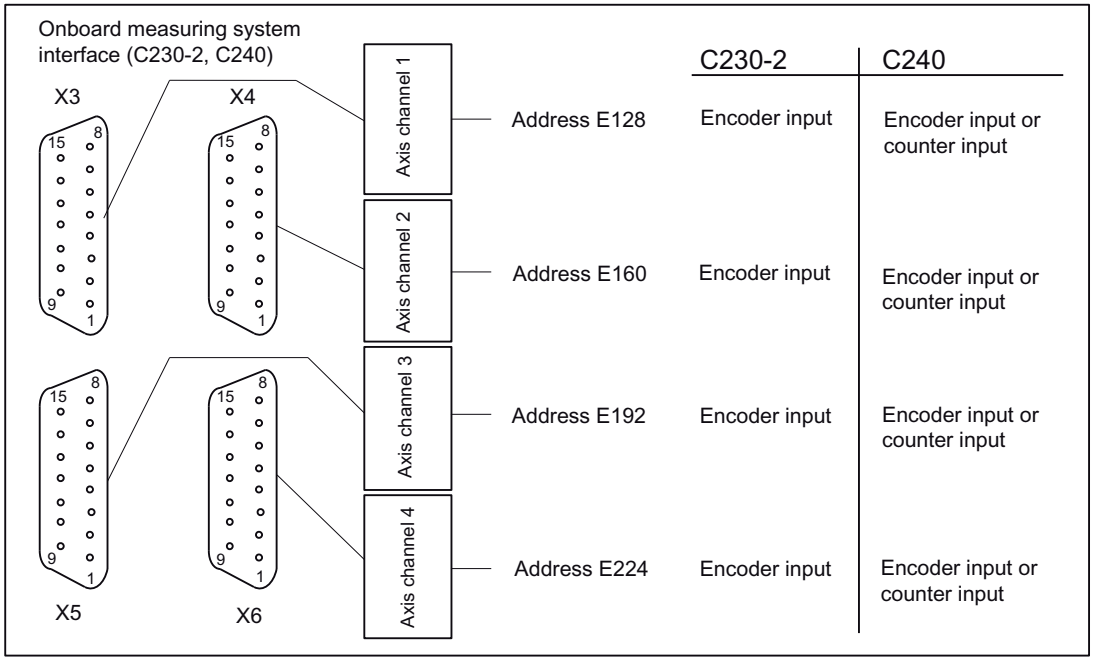

Figure 9-73 Addressing the onboard measuring system interface

9.1.8 Commissioning

9.1.8.1 Requirements for commissioning

Requirements

Table 9-46 Requirements

Prerequisite action	See ...
Your system with SIMOTION C is installed.	ChapterInstalling (Page 6809)
Your system with SIMOTION C is wired.	ChapterWiring (Page 6815)
For networking via PROFIBUS DP • The PROFIBUS addresses of the bus nodes with which the SIMOTION C communicates, are set. • The terminating resistors are switched on (at segment ends).	ChapterNetworking (Page 6842)
When networking via the Ethernet, the IP address / subnet mask of the bus nodes with which the SIMOTION C communicates, are set.	ChapterConfiguring an Ethernet subnet on the Ethernet interface (Page 6847)
When networking via PROFINET IO, the PROFINET device names of the bus nodes with which the C240 PN communicates, are set	ChapterConfiguring an Ethernet subnet on the PROFINET interface (C240 PN) (Page 6849)

System requirements

Note

The readme file for the software version you are using provides information about the hardware and software requirements.

Please take note of the information on the current CD for "SIMOTION SCOUT"!

For online operation, a connection must be established between the PG/PC and the SIMOTION C via PROFIBUS DP, Ethernet or PROFINET (C240 PN), see chapter Overview of wiring diagram (Page 6818).

The programming device must be equipped with a PROFIBUS or Ethernet card.

You need an MMC adapter to write to the micro memory card (SIMOTION Kernel update) on the PG/PC, see chapter Writing, formatting and erasing the Micro Memory Card (Page 6862).

Connecting a PG/PC to a SIMOTION C

You can interconnect the programming device / PC

- with the PROFIBUS of SIMOTION C (connector X8 and/or X9) using a connecting cable (see chapter Network components for a PROFIBUS subnet (Page 6845)).
  Information on the respective cable lengths for PROFIBUS DP can be found in chapter Onboard measuring system interface (C230-2, C240) (Page 6784).
- to the Ethernet of the SIMOTION C (connector X7) with a shielded twisted pair cable.
  For information about cabling the Ethernet subnet, refer to chapter Configuring an Ethernet subnet on the Ethernet interface (Page 6847).
- to the PROFINET interface X11 (port P1, P2 or P3) of the C240 PN with a shielded twisted pair cable.
  For information about cabling the PROFINET subnet, refer to chapter Configuring an Ethernet subnet on the PROFINET interface (C240 PN) (Page 6849).

9.1.8.2 Inserting and changing the Micro Memory Card

Procedure:

1. Switch off the power supply module.
2. Is a micro memory card inserted? If yes: remove the memory card.
   An ejector is located on the frame of the module receptacle to enable you to remove the micro memory card.
   Press the ejector and remove the micro memory card.

3. Applying slight pressure, insert the ("new") micro memory card into the slot of the SIMOTION C until it snaps into place. Make sure the beveled edge of the micro memory card faces the ejector (see the following figure).
4. Switch the power supply module on again.

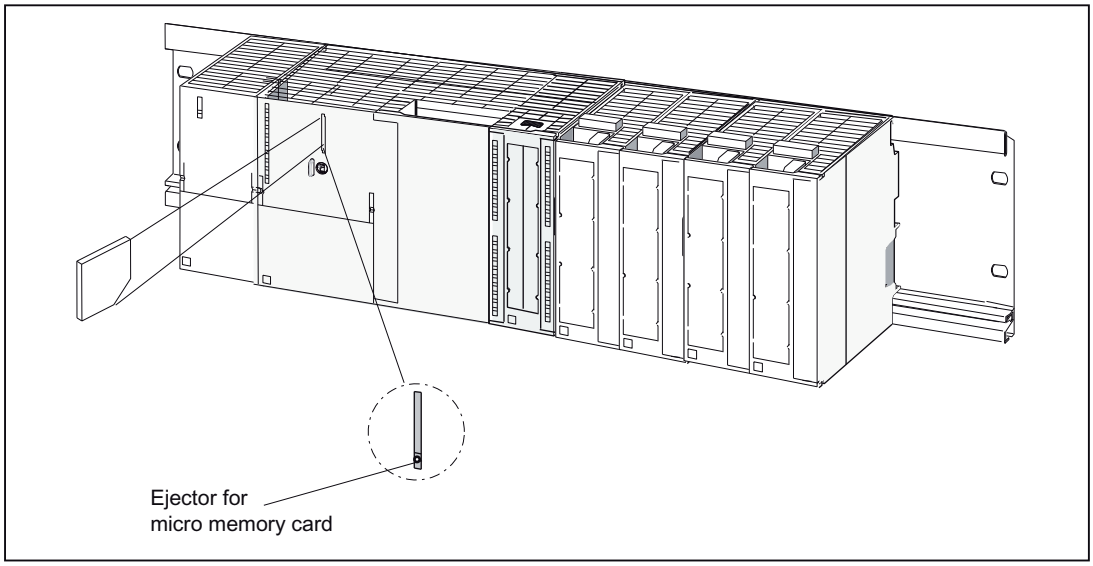

Figure 9-74 Inserting the micro memory card into the SIMOTION C

Note

With the **SIMOTION C240 / C240 PN**, the micro memory card must **always** be inserted for operation.

For the purpose of data backup, the contents of the micro memory card can be copied to the hard drive of a PG/PC with an MMC card reader.

9.1.8.3 Initial Power ON

Requirements

- You have completed installation and the wiring of your system with SIMOTION C.
- The micro memory card is inserted.
- The mode selector must be set to STOP!

Initial Power ON

Switch on the power supply module.

- The 24 VDC LED on the power supply module is illuminated.
- On the SIMOTION C:
  - The 5 VDC LED illuminates.
  - All other LEDs light up briefly (approx. 2 seconds).

Note

For C230-2

With an empty micro memory card, the SIMOTION Kernel on the C230-2 is copied to the micro memory card during power-up. This increases the duration of the power-up by about 1.5 minutes.

For C240 / C240 PN

If a micro memory card is not inserted in the C240 or if the micro memory card does not contain a SIMOTION Kernel, all LEDs except the RUN LED are illuminated on the SIMOTION C240.

9.1.8.4 Writing, formatting and erasing the Micro Memory Card

Writing the micro memory card of SIMOTION C

You can write to the micro memory card as follows:

- Micro memory card is inserted in the SIMOTION C and is written with the "Copy RAM to ROM" menu command (there must be a connection between the programming device and SIMOTION C).
  You can store the technology packages and user data (programs, configuration data, parameter assignments) on the micro memory card (see *SIMOTION SCOUT* online help).
- Write to the micro memory card on the PG or PC.
  You can write to the micro memory card directly via a PC using a suitable memory card adapter.
  This function is required for updating the SIMOTION C.

You can write the user project with SIMOTION SCOUT and the menu command "Load to file system" directly from the PC to the memory card (micro memory card). To do this, select the device in the project navigator and execute the "Load to file system" command in the context menu.

Note the following information when handling a micro memory card.

Note

The micro memory card always comes formatted! With the **C240 / C240 PN**, the SIMOTION Kernel is located on the micro memory card.

In order to ensure error-free functioning of the micro memory card in the SIMOTION C, the card must **not** be repartitioned.

Using Windows media to modify or delete files on the micro memory card that were written with "Copy RAM to ROM" can destroy the project.

With the **C230-2**, the following information must also be noted.

Note

The micro memory card for the C230-2 can only be formatted in the "SIMOTION SCOUT" engineering system.

As of Kernel Version 3.1, you will **no longer** be able to format the micro memory card by means of the C230-2 mode selector.

The card must **not** be formatted with the PC.

Any saved license keys are also deleted during formatting. The license key must then be reentered via SIMOTION SCOUT.

The micro memory card can be formatted by calling this function in "SIMOTION SCOUT" (see *SIMOTION SCOUT* online help).

Note

As of Kernel Version 2.1 in the C230-2 and micro memory card 6AU1 700-0AA02-0AA0, the C230-2 transfers its stored kernel to the micro memory card after formatting **only** after the C230-2 has been restarted. When the kernel is transferred, all LEDs on the C230-2 flash. If a specific kernel version is required, it must be placed on the micro memory card manually.

If the C230-2 is switched off or de-energized during commissioning, this could damage the file system on the micro memory card (data on the card can no longer be read). If this occurs, the micro memory card **must** be reformatted.

The micro memory card must **not** be removed when energized.

Repairing the micro memory card

You can repair the micro memory card, for example, if it is faulty. The MMC card can be inserted in a USB Flash card reader and formatted by means of Windows (FAT file system). After it is formatted, the boot sector of the card must be rewritten to by means of SCOUT ("Options" > "Write to Boot Sector...").

With the micro memory card for the C240, the SIMOTION Kernel must be copied to the micro memory card again, see chapter Kernel update for SIMOTION C240 / C240 PN (Page 6874).

9.1.8.5 User memory concept

SIMOTION C memory model

The following figure provides an overview of the SIMOTION C memory model.

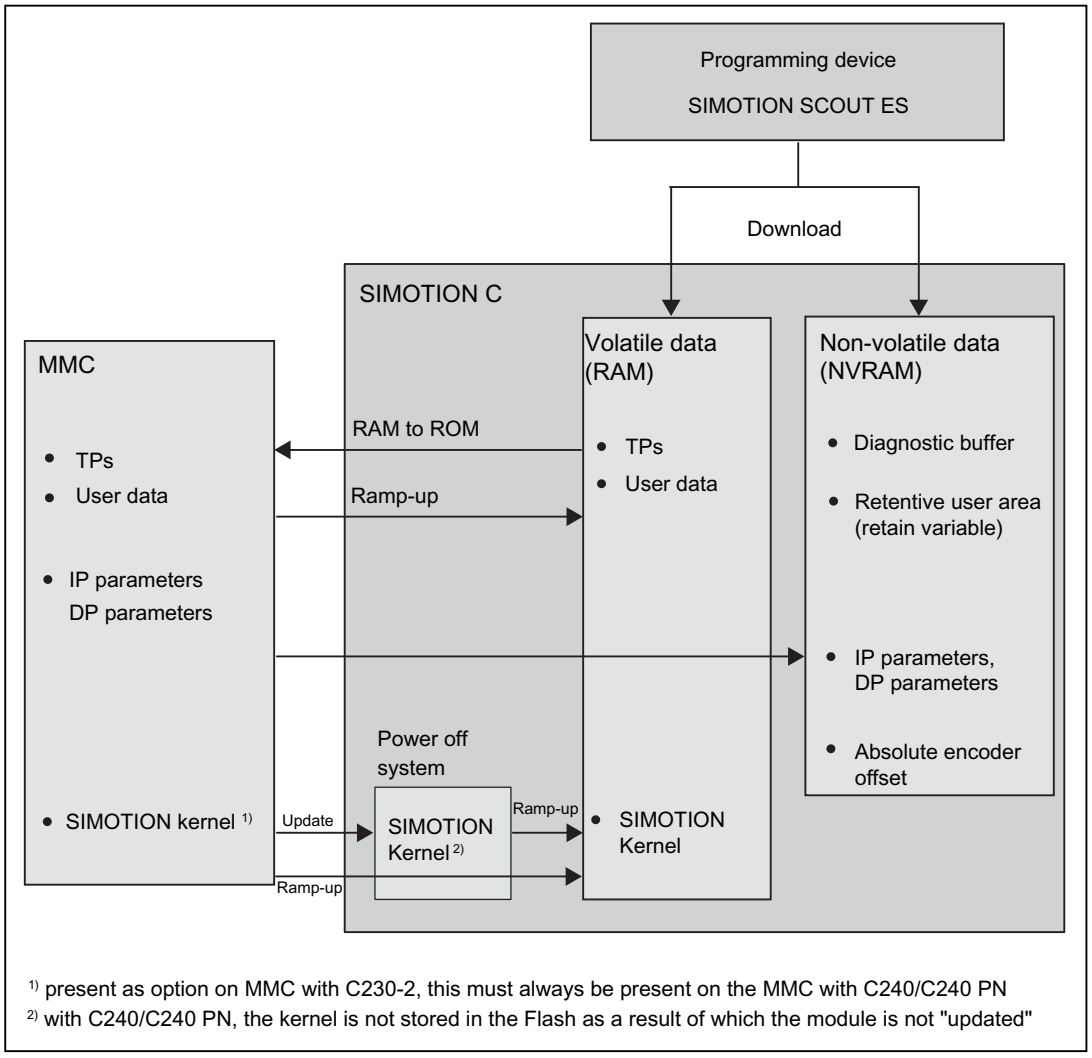

Figure 9-75 SIMOTION C memory model

In the following sections, you will learn information about the user memories and the steps involved in certain operations.

See also

Overview of data deletion (Page 6868)

Properties of the user memory

Non-volatile data (NVRAM)

Non-volatile data is used with the objective of retaining user- and system-relevant data when the SIMOTION C is de-energized. You will find information about the area that can be used for non-volatile data in the SIMOTION SCOUT Configuration Manual.

The following non-volatile data is available in a SIMOTION C:

Table 9-47 Content of non-volatile data

Non-volatile data	Content
Kernel data	• Last operating state • IP parameters (IP address, subnet mask, router address) • DP parameters (DP addresses, baud rate) • Diagnostic buffer
Retain variables	• Variables in the interface or implementation section of a UNIT declared with **VAR_GLOBAL RETAIN** • Global device variables set with the "**RETAIN**" attribute
Retain TO	• Absolute encoder offset

The non-volatile data of a SIMOTION C has the following properties:

Table 9-48 Properties of non-volatile data

Property	Meaning
Location	In the NVRAM of the SIMOTION C, no back-up battery required
Backup time	Unlimited

Note

IP and DP parameters in non-volatile data

If there is a configuration on the MMC, the IP and DP parameters are loaded from the MMC during ramp-up, written to the non-volatile data and used by the SIMOTION C. The SIMOTION C uses the addresses defined in these parameters to go online. The IP and DP parameters in the non-volatile data are retained and used by the SIMOTION C if a ramp-up is performed with an MMC that does not contain a configuration.

A SIMOTION C can therefore always go online if a configuration has been loaded at least once with the SIMOTION SCOUT, or if the SIMOTION C has been ramped up once with an MMC.

Volatile data (RAM)

Definition of the properties of volatile data:

- The volatile data is located in the RAM memory of the SIMOTION C.
- The download data of SIMOTION SCOUT are written to this memory.
- This data is lost when the SIMOTION C is shut down.
- Contents of the "volatile data" area:
  - SIMOTION Kernel
  - Technology packages (TP)
  - User data (programs, configuration data, parameterizations, task configuration)

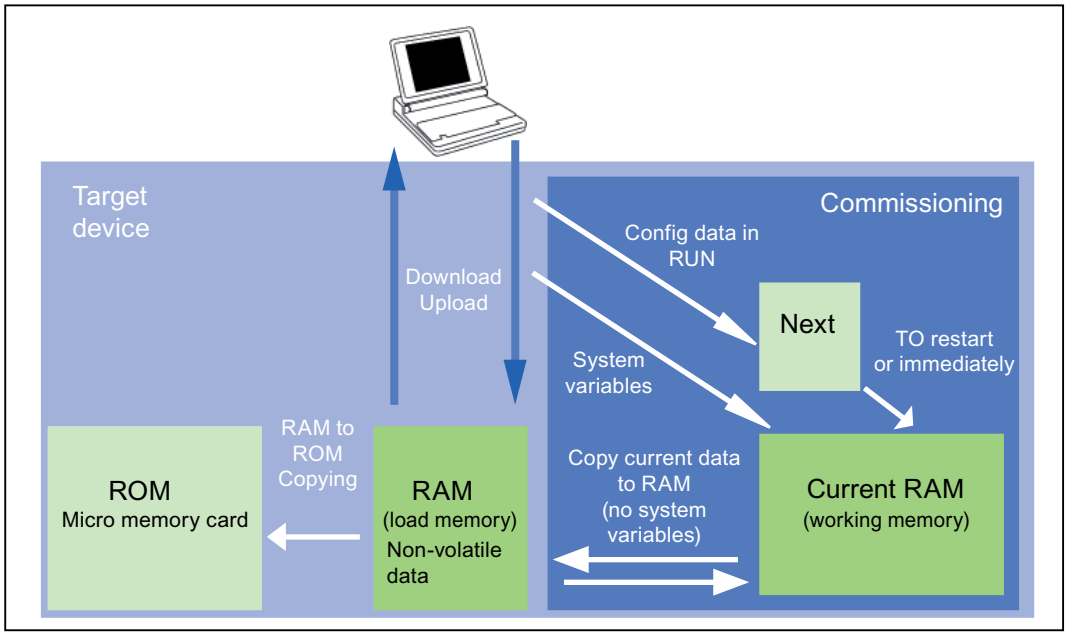

Figure 9-76 Configuration data and system variables on volatile memory

Non-volatile system

With the SIMOTION C230-2, the SIMOTION Kernel is stored as non-volatile data in a flash memory. A C230-2 can therefore also ramp up without a memory card.

MMC memory card

The MMC contains the following data:

- SIMOTION Kernel
- Technology packages (TP)
- User data (programs, configuration data, parameterizations, task configuration)
- IP parameters (IP address, subnet mask, router address)
- DP parameters (DP addresses, baud rate)

Operations and their effect on the user memory

The next section describes the operations identified in the "SIMOTION C memory model" figure by arrows and their effect on the user memory.

SIMOTION SCOUT download

The "Download" command transfers the following data from the engineering system to the "volatile data" area:

- User data (programs, configuration data, parameterizations, task configuration)
- Technology packages

The IP and DP parameters are also saved to the "non-volatile data". Depending on the setting in SIMOTION SCOUT, the retain variables are set to their initial values.

The "volatile data" is lost if the SIMOTION C is switched off after a download without having performed a "Copy RAM to ROM".

Copy RAM to ROM

The "Copy RAM to ROM" command is used on the engineering system to save the following data to the MMC:

- Technology packages and user data (programs, configuration data, parameterizations, task configuration) of the "volatile data" area
- Depending on the setting in SIMOTION SCOUT, actual values can be copied to the "volatile data" area before copying the data from RAM to ROM.

Note

The "Copy RAM to ROM" command does not save the actual values of the retain variables to the MMC.

SIMOTION C ramp-up

During ramp-up, the SIMOTION Kernel is loaded to the "volatile data" area. A C230-2 loads the kernel from the "non-volatile system" (integrated flash in the device), a C240/C240PN loads the kernel from the MMC.

The following data is also loaded from the MMC during ramp-up:

- Technology packages and user data to the "volatile data"
- IP and DP parameters to the "non-volatile data"

SIMOTION Kernel update (only valid for SIMOTION C230-2)

An update writes the SIMOTION Kernel from the micro memory card to the "non-volatile system". If a newer or an older version of the SIMOTION Kernel is to be installed, an update can be performed with a micro memory card that contains the appropriate SIMOTION Kernel.

Backup of non-volatile data

The "_savePersistentMemoryData" system function is used to save the contents of "non-volatile data" to the MMC. This backup prevents the retain variables and the absolute encoder position from being lost if a component is replaced.

The backup copy is saved to the "PMEMORY.XML" backup file in the "USER/SIMOTION" folder. On the system side, this system function ensures that a consistent overall image of the non-volatile data is always available the next time the unit is powered on, even if there is a power failure during backup. An already existing backup file is renamed to "PMEMORY.BAK" before a new backup file is generated. If the backup to this new file fails (for example, due to insufficient storage capacity of the memory card), the existing backup file is used in the next attempt to restore the content of the "non-volatile data". The backup file is deleted if the new file was successfully created.

Note

If you do not save the "non-volatile data" to the MMC, it is lost when a spare part is used (in the event of a module defect).

If an absolute encoder overflow occurs after **_savePersistentMemoryData**, the actual position value is no longer correct after the non-volatile data is restored. In this case, homing (absolute encoder adjustment) must be repeated.

Power failure

The "non-volatile data" is saved to the NVRAM of the SIMOTION C during a power failure. The "non-volatile data" is available again at the next ramp-up. Thus, the SIMOTION C is immediately ready for operation without data loss.

9.1.8.6 Deleting data

Overview of data deletion

You can define the scope of data to be deleted from SIMOTION C memory described in the "user memory concept". This enables you to determine whether data in your system should be deleted completely or partially.

You have the following options for deleting SIMOTION C data:

- SIMOTION C memory reset
- Deleting user data from the micro memory card
- Setting SIMOTION C to factory settings

See also

SIMOTION C memory model (Page 6864)

SIMOTION C memory reset

Introduction

During the memory reset, the "volatile data" in the RAM of the SIMOTION C and the "non-volatile data" in the NVRAM, except for the communication configuration (baud rates, network addresses, etc.), is deleted. The data on the MMC is retained during the memory reset.

You must perform a memory reset of the SIMOTION C:

- When you want to undo changes you have made to your user data (programs, configuration data, parameter assignments) that you have not backed up with the "Copy RAM to ROM" menu command.
- If the SIMOTION C requests a memory reset with a flashing STOP LED (slow flashing) (e.g. micro memory card has been removed).
- The "non-volatile data" does not match the project on the MMC and therefore an error occurs.

You can perform the memory reset online via SIMOTION SCOUT or offline via the mode selector on the SIMOTION C.

Data deleted on memory reset

The following data is deleted during a memory reset:

- User data (programs, configuration data, parameterizations, task configuration)
- Technology packages
- Retain TO (absolute encoder adjustment)
- Retain variables
  Retain variables are variables in the interface or implementation section of a UNIT that are declared with VAR_GLOBAL RETAIN, or global device variables with the RETAIN attribute.

Note

Absolute encoder data is deleted during a memory reset operation and must therefore be readjusted after the memory reset.

Reset-proof data

The following data is retained during a memory reset:

- TCP/IP and DP parameters
- Diagnostic buffer
- Data saved with the_savePersistentMemoryData, _saveUnitDataSet, exportUnitDataSet and RAMtoROM commands
  If backup files (PMEMORY.XML/PMEMORY.BAK) have been backed up with _savePersistentMemoryData, the data in these files is backed up again to the non-volatile data after the memory reset. Users can therefore force the restoration of non-volatile data by means of memory reset.
- Licenses

The technology packages and user data (configuration data, programs, parameterizations) that were previously backed up to the micro memory card using the "Copy RAM to ROM" menu command will be transferred to the "non-volatile data" area of the SIMOTION C during the next ramp-up. **Thus, an existing configuration on the MMC is loaded to the SIMOTION device following the memory reset.**

Memory reset by means of SIMOTION SCOUT

The SIMOTION device for which overall reset is to be carried out must be online.

1. In SIMOTION SCOUT, open the Control Operating State dialog: Select the Target system > Control Operating State menu command. Or click on Control Operating State in the toolbar.
2. Switch the SIMOTION device for which overall reset is to be carried out to STOP in the Control Operating State dialog.
3. Select the SIMOTION device under Overall reset (MRES). Click the Execute switch. Confirm the command by clicking "Yes".
   The memory reset will now be performed.

Memory reset with the mode selector

Note

The operation for the memory reset with the toggle switch is described below. The operation with the key-operated switch of the C230-2 is similar to the operation with the toggle switch.

Proceed as follows (see following figure):

1. Set the mode selector to STOP.
2. Move the switch to MRES and hold the switch in this position until the STOP LED changes from flashing to steady illumination.
3. Within 3 seconds, you must release the switch and return it to the MRES position. The memory reset will now be performed. The SIMOTION C completed the memory reset when the STOP LED lights up permanently.

The SIMOTION C has reset the memory.

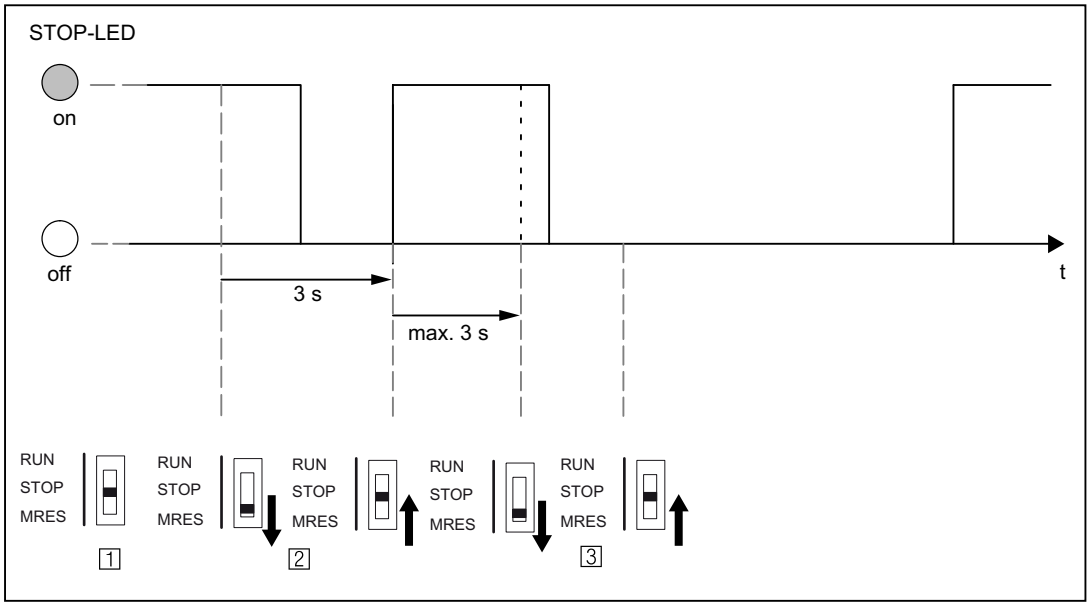

Figure 9-77 Mode selector operation sequence for the memory reset

Deleting user data from Micro Memory Card

Requirement

You can delete user data with SIMOTION SCOUT. To do so, you must be online on the SIMOTION C. The following data is deleted during this operation:

- User data in the volatile data
- Non-volatile data, except for the IP and DP parameters
- User data on the MMC (user directories)

You can thus continue to go online to the SIMOTION C with your PG/PC. The licenses on the MMC are retained.

Deleting user data

1. In SIMOTION SCOUT, open the project you want to modify.
2. Go online with the SIMOTION C.
3. Select the "Delete user data on card" option in the "Target system" menu.
4. Confirm the "Delete User Data from Card" prompt with "OK".
   The user data are deleted.

Setting SIMOTION C to factory settings

Overview

SIMOTION C is supplied with preset parameters, such as the transmission rate or PROFIBUS addresses. You can restore the factory settings with the mode selector. The following data is deleted during this operation:

- "Non-volatile data" in the SIMOTION device
- The backup (PMEMORY.XML/PMEMORY.BAK) of the non-volatile data on the MMC
- User data in the "volatile data" and on the MMC
- The communication configuration (IP and DP parameters) is set to the factory settings

The licenses on the micro memory card are retained.

Operations on the mode selector

Proceed as follows:

1. Switch off the power supply for SIMOTION C.
2. The micro memory card is inserted in the SIMOTION C.
3. Switch the mode selector to the MRES position. Keep this position selected and switch the power supply for the SIMOTION C on. When the STOP LED display lights up statically, switch the mode selector switch back to the STOP position.

Note

After switching on the power supply, it takes approx. one minute until the SIMOTION C deletes the "permanent power off" data, performs a restart and has reached the STOP state.

Note

The communication configuration is now reset to the factory settings. The communication configuration for the SIMOTION C must be repeated.

Factory setting (Page 6851)

9.1.9 Maintenance and servicing

9.1.9.1 SIMOTION kernel update

Kernel update for SIMOTION C230-2

Each C230-2 always contains the latest version of the SIMOTION Kernel when it is delivered. The user can install newer or older versions via an update.

The corresponding SIMOTION Kernel version is included on the respective SIMOTION SCOUT Add-On CD-ROM. (Proceed in the same way with a SIMOTION SCOUT DVD)

Note:
The SIMOTION Kernel and the technology packages must always have the same software version. To avoid incompatibilities when replacing the C230-2, it is recommended that the SIMOTION Kernel version of the current configuration is stored on the micro memory card.

You can use a PG/PC with the appropriate micro memory card adapter to copy the SIMOTION Kernel to the micro memory card.

Proceed as follows:

1. Connect the SC card / MMC adapter to your PG/PC and insert the micro memory card in the module slot of the adapter.
2. Insert the CD ROM containing the SIMOTION Kernel in the CD drive of your PG/PC.
3. Open Windows Explorer.
   Note
   The micro memory card must be visible as a drive with an arbitrary letter in the Windows Explorer.
4. Delete all files and folders from the MMC except for the complete KEYS folder. The KEYS.TXT file in this folder contains the license key and must be retained.
5. Unpack the firmware contained in the ZIP file (\3_C2xx\Firmware_C230\V....\c230_2fw.zip) on the CD-ROM and copy the c230_2fw.bin file using the Windows Explorer to the root directory of the micro memory card.
6. Remove the micro memory card from the PG/PC.
7. Switch off the power supply for the C230-2.
8. Insert the prepared micro memory card into the C230-2.
9. Switch on the power supply for the C230-2.
   The C230-2 compares the version of the SIMOTION Kernel on the micro memory card with that on the C230-2 and automatically carries out an update.
   - First, the version of the SIMOTION Kernel stored in the C230-2 is deleted. The "RUN", "STOP" and "BUS2F" LEDs flash.
   - Then the new version of the SIMOTION Kernel is transferred from the micro memory card to the C230-2. During the data transfer, the "SF", "RUN", "STOPU", "STOP", "BUS1F" and "BUS2F" LEDs illuminate in sequence.

   Note: The C230-2 must **not** be switched off during this phase.
   - After completing the SIMOTION Kernel update, the C230-2 performs a restart and goes into the STOP mode.

The C230-2 can then be operated with the new SIMOTION Kernel.

Note

Following an update, if problems occur during restart, the "SF" LED will illuminate or the "STOPU", "STOP", "BUS1F", and "BUS2F" LEDs will flicker. This means that the update was not completed correctly.

To remedy this error, proceed as follows:

- Power OFF/ON
- Check whether the restart is being performed correctly

If the error occurs again, repeat the update or replace the module.

Kernel update for SIMOTION C240 / C240 PN

The C240 / C240 PN does not contain any firmware.

The Micro Memory Card of the C240 / C240 PN always contains the latest version of the SIMOTION Kernel on delivery. The user can install newer or older versions via an update.

The corresponding SIMOTION Kernel version is included on the respective SIMOTION SCOUT Add-On CD-ROM. (Proceed in the same way with a SIMOTION SCOUT DVD)

Note:
The SIMOTION Kernel and the technology packages must always have the same software version.

You can use a PG/PC with the appropriate Micro Memory Card adapter to copy the SIMOTION Kernel to the Micro Memory Card.

Proceed as follows:

1. Connect the SD card / MMC adapter to your PG/PC and insert the Micro Memory Card in the slot of the adapter.
2. Insert the CD ROM containing the SIMOTION Kernel in the CD drive of your PG/PC.
3. Open Windows Explorer.
   Note
   The Micro Memory Card must be visible as a removable data carrier with an arbitrary drive letter in the Windows Explorer.
4. Delete all files and folders from the MMC except for the complete KEYS folder. The KEYS.TXT file in this folder contains the license key and must be retained.

5. Unpack the firmware contained in the ZIP file (\3_C2xx\Firmware_C240\V...\c240_fw.zip) on the CD-ROM and copy the following files and folders to the root directory of the Micro Memory Card using Windows Explorer.
   - **c240_fw1.bin**
   - **c240_fw2.bin**
   - **c240_fw.bin**
   - **startup.txt**
   - **toc.txt**
   - **SIEMENS\SIMOTION\cbe30.ufw**
6. Remove the Micro Memory Card from the PG/PC.
7. Switch off the power supply to the C240 / C240 PN.
8. Insert the prepared Micro Memory Card into the C240 / C240 PN.
9. Switch on the power supply to the C240 / C240 PN.

The C240 / C240 PN can then be operated with the new SIMOTION Kernel.

Note

If the Micro Memory Card does not contain a SIMOTION Kernel, all LEDs on the SIMOTION C240 / C240 PN except the RUN LED are illuminated.

Firmware compatibility as of V4.5

A SIMOTION Kernel as of V4.5 can only be used in conjunction with a SIMOTION C240 / C240 PN controller as of production version G.

9.1.9.2 Removal and replacement of the SIMOTION C

Overview

You can only replace SIMOTION C as a complete unit.

⚠ WARNING

The SIMOTION C can only be replaced when the load power supply is switched off.
You must therefore switch off the power supply, e.g. by means of the on/off switch on the PS module.

Removing a faulty module

To remove the SIMOTION C, proceed as follows:

1. Switch off the power supply.
2. Remove the micro memory card.
3. Open the front door panels. If necessary, remove the labeling strips.
4. Undo the connections on the terminal strip for the power supply.
5. Depending on the controller used, disconnect the encoders (X3...X6), the drive unit (X2), the PROFIBUS DP interfaces (X8, X9) as well as the Ethernet (X7) and PROFINET interfaces (X11 P1 to X11 P3).
6. Loosen the mounting screw in the middle of the front connector (X1) and then pull out the front connector, holding it at the gripping points provided.
7. Unscrew the module's mounting screws and swing it upwards and out.

Installing a new module

Procedure:

1. Remove the upper part of the front connector coding from the new module.
2. Insert a module of the same type, swing it down and screw it in tightly.
3. Insert the front connector and then tighten the mounting screw.
4. Depending on the controller used, connect the encoders (X3...X6), the drive unit (X2), the PROFIBUS DP interfaces (X8, X9) as well as the Ethernet (X7) and PROFINET interfaces (X11 P1 to X11 P3).
5. Connect the load power supply on the terminal strip.
6. Close the front panel doors and put in the labeling strips.
   The controller is once again ready for operation and can be commissioned.
7. Insert the micro memory card.
8. Switch on the power supply.

9.1.9.3 Module replacement without programming device or PC

Overview

If a defective SIMOTION C has to be replaced without using a PG/PC, you can transfer the data of the defective module to the new module by simply inserting the micro memory card of the defective module in the new module.

Requirement

When you commissioned your project, you must have used the menu command "Copy RAM to ROM" of the SIMOTION SCOUT to save your project to the micro memory card, as described in the chapter "User memory concept".

The following data are on the micro memory card and can be transferred to the new module:

- Technology packages (TP)
- User data (programs, configuration data, parameterizations, task configuration)
- DP parameters (DP addresses, baud rate)
- IP parameters (IP address, subnet mask, router address)

As the non-volatile data is in a memory within the module, it is lost when the module is replaced.

If the non-volatile data is to be transferred to the new module, it must first be backed up on the micro memory card of the module to be replaced. The restoration of the non-volatile data must be triggered via a memory reset on the new module.

Note

If the non-volatile data is not restored, the retain variables are set to their initial values and the diagnostics buffer with the history from the old module is no longer available.

9.1.10 Alarm, error, and system messages

9.1.10.1 Diagnosis using the LEDs

Diagnostic LEDs

The LEDs are explained in the order in which they are positioned on the SIMOTION C.

Table 9-49 Diagnostics LEDs of the SIMOTION C

Display	Meaning	Explanations
SF (red)	**System fault**	**This LED indicates a fault on the SIMOTION C.**
LED - ON		An event which can be acknowledged is present (alarm, message, note). (see documentation package *SIMOTION System and Function Descriptions*)
LED - flashing (0.5 Hz)		No license exists for technology/optional objects under license. Technology/option objects under license include, for example: • Cam (synchronous axes with connected cam) • Ethernet (Ethernet interface) • TControl (Temperature Control)
LED - OFF		SIMOTION C is operating without error.
5 VDC (green)	**Power supply for the electronics**	**This LED indicates that the power supply is ready.**
LED - ON		The power supply of the SIMOTION C is operating without error.

Display	Meaning	Explanations
LED - OFF		If this is not illuminated, the reason may be: • No connected or switched-on network • No specified load power supply connected • Module not connected correctly • Module defective
RUN (green)	**SIMOTION C in RUN mode**	**This LED indicates that the user program is running.**
LED - ON		See RUN (green)
LED - flashing (2 Hz)		The time between selection of "RUN" mode until this mode has been attained is indicated by the LED flashing.
STOPU (yellow)	**SIMOTION C in STOP user program mode**	**This LED indicates that the technology packages are active. A user program is not being executed.**
LED - ON		See STOPU (yellow)
LED - flashing (2 Hz)		The time from when the "STOPU" operating mode is selected until this operating mode has been attained is indicated by the LED flashing.
LED - "flickering"		Formatting the micro memory card
STOP (yellow)	**SIMOTION C in STOP mode**	**This LED indicates that a user program is not running. The technology packages are inactive.**
LED - ON		See STOP (yellow)
LED - flashing (2 Hz)		The time from when the "STOP" operating mode is selected until this operating mode has been attained is indicated by the LED flashing.
LED - flashing (0.5 Hz)		A memory reset request is indicated by slow flashing, see chapter SIMOTION C memory reset (Page 6869).
BUS1F (X8) (red) or BUS2F (X9) (red)	**Fault on interface**	**This LED indicates a fault on the PROFIBUS DP interface.**
LED - ON		*Interface configured as slave:* Bus fault Search for baud rate
LED - flashing (0.5 Hz)		Parameterization error No cyclic data exchange
LED - OFF		Cyclic data exchange
LED - ON		*Interface configured as master:* Bus fault (bus short circuit)
LED - flashing (0.5 Hz)		Bus fault (slaves have failed or cable faulty)
LED - OFF		No fault or no interface configured

Table 9-50 Status and fault displays behind the front cover

Display	Meaning	Explanations
Link X7 (green)	**Link status of Ethernet interface**	**This LED indicates a physical connection of the Ethernet interface X7.**
LED - ON		A device is connected and there is a physical connection to this device.
LED - OFF		A device is not connected and there is no physical connection.

Display	Meaning	Explanations
Activity X7 (yellow)	**Activity status of Ethernet interface**	**This LED indicates a data transfer via the Ethernet interface X7.**
LED - flashing		Data is being received or transmitted.
LED - OFF		Data is not being received or transmitted.
Link X11 Px (green)	**Link status of PROFINET interface**	**This LED indicates a physical connection of the PROFINET interface X11 at port x (1 to 3).**
LED - ON		A device is connected and there is a physical connection to this device.
LED - OFF		A device is not connected and there is no physical connection.
Activity X11 Px (yellow)	**Activity status of PROFINET interface**	**This LED indicates a data transfer via the PROFINET interface X11 at port x (1 to 3).**
LED flashing or LED ON		Data is being received or transmitted.
LED - OFF		Data is not being received or transmitted.
Fault X11 (red)	**Fault status of PROFINET interface**	**This LED indicates a fault at the PROFINET interface X11.**
LED - OFF		PROFINET interface is operating without error; the data exchange to all configured I/O devices is running.
LED - flashing (2 Hz)[1)]		Bus fault • Failure of a connected I/O device. • At least one of the assigned I/O devices cannot be addressed • Incorrect or no configuration
Sync X11 (green)[2)]	**Sync status of PROFINET interface**	**This LED indicates the synchronization status of the PROFINET interface X11.**
LED - OFF		The PROFINET interface has not synchronized yet to the send cycle of IRT or PROFINET with IRT has not been configured (e.g. only RT or TCP/IP operation). If no PROFINET IO with IRT has been configured, then generally there is no synchronization of the PROFINET interface. If isochronous data has been configured for the SIMOTION device, the PROFINET interface generates a local substitute cycle of the same size as the configured send cycle of IRT, as long as no synchronization has been performed to the send cycle of IRT: • The task system of SIMOTION has synchronized to the local substitute cycle of the PROFINET interface. • DP interfaces, if configured as isochronous, are synchronized to the local substitute cycle of the PROFINET interface.

Display	Meaning	Explanations
LED - flashing (2 Hz)		The PROFINET interface has synchronized to the send cycle of IRT. If isochronous data has been configured for SIMOTION, then the following applies: • The task system of SIMOTION has synchronized to the send cycle of IRT. • DP interfaces, if configured as isochronous, have not synchronized yet to the send cycle of IRT.
LED - ON		The PROFINET interface has synchronized to the send cycle of IRT. If isochronous data has been configured, then the following applies: • The task system of SIMOTION has synchronized to the send cycle of IRT. • DP interfaces, if configured as isochronous, are synchronized to the send cycle of IRT. If no isochronous data has been configured for SIMOTION, this state indicates that only the PROFINET interface has synchronized to the send cycle of IRT. The PROFINET interface is then used to forward the data. Isochronous data means that data is exchanged with a further device on PROFINET with configured RT class IRT and isochronous application/device.

1) Minimum flashing duration 3 s

2) If no PROFINET IO with IRT has been configured, then generally no synchronization will be made to the send cycle.

Note

During ramp-up of the SIMOTION C, the LEDs on the housing front are briefly illuminated.

You can carry out a detailed diagnosis with a programming device or PC and the engineering aystem.

Projects cannot be downloaded in **STOPU** mode.

9.1.10.2 Combinations of LED displays

Combination of LED displays

The following table provides an overview of all permissible and/or required LED display combinations.

The meaning of the displays used in the table is as follows:

1	LED on
0	LED off
0.5/1	LED flashing (0.5 Hz)
2/1	LED flashing (2 Hz)
☆	LED flickers
→	Running light
x	LED may light up

Table 9-51 Summary of LED displays

Meaning	LED displays						
	SF (red)	5 VDC (green)	RUN (green)	STOPU (yellow)	STOP (yellow)	BUS1F (red)	BUS2F (red)
Ramp-up (C230-2)	1 0 0	1 1 1	1 0 0	1 ☆ 0	1 0 2/1	1 0 0	1 0 0
Ramp-up (C240 / C240 PN) Ramp-up (C240 product version < G as of V4.5) SF (rot) flickers (5 Hz)	1 0 0 0 0	1 1 1 1 1	1 ☆ 0 0 0	1 0 ☆ → 0	1 0 0 → 2/1	1 0 0 0 0	1 0 0 0 0
STOPU → RUN	x	1	2/1	1	0	x	x
RUN	x	1	1	0	0	x	x
RUN → STOPU	x	1	1	2/1	0	x	x
STOPU	x	1	0	1	0	x	x
STOPU → STOP	x	1	0	1	2/1	x	x

9.1.11 Technical data

9.1.11.1 Technical data

Memory for system data

Table 9-52 Memory for system data

Data	Memory size		
	C230-2	C240	C240 PN
Diagnostic buffer	200 messages		
RAM (Random Access Memory)	20 MB	40 MB	
RAM disk (load memory)	23 MB	23 MB	
Retentive memory	13 KB	107 KB	

For information about user data, refer to chapter Properties of the user memory (Page 6865).

Table 9-53 Memory for system data (as of hardware version or FS "G")

Data	Memory size	
	C240	C240 PN
Diagnostic buffer	200 messages	
RAM (Random Access Memory)	67 MB	
RAM disk (load memory)	29 MB	
Retentive memory	107 KB	

Note

If the C240/C240 PN is used as of software version V4.4 and as of a hardware version or FS "G", you will have a RAM disk (load memory) of 29 MB and a RAM (Random Access Memory) of 67 MB.

If the C240/C240 PN as of a hardware version or FS "G" is operated as a spare part with older SW versions, the previous values set for the corresponding SW version shall apply.

System clocks

Table 9-54 System clocks

System clocks	C230-2	C240	C240 PN
Basic cycle clock (isochronous bus cycle not activated)	1.5 ms to 8 ms	0.5 to 8 ms	
DP cycle clock (isochronous bus cycle activated)	1.5 ms to 8 ms	1.0 to 8 ms	
Position control cycle clock (servo cycle clock)	≥ 1.5 ms	≥ 0.5 ms	
Interpolator cycle clock (IPO cycle clock)	≥ 1.5 ms	≥ 0.5 ms	
Send cycle of PROFINET (C240 PN)	-	-	0.5 to 4 ms

A modification can be made in the engineering system.

For system cycle clock settings, refer to the SIMOTION SCOUT online help.

Note

With the SIMOTION C, errors can occur during **Download** or during the transition from **STOP** to **RUN** if I/O bus modules and a system cycle clock > 8 ms (only with equidistant bus cycle) are used. If an error occurs, set the system cycle clock ≤ 8 ms.

DP slave connections

Table 9-55 Number of DP slave connections

Number of DP slave connections	Max. 64

PROFINET device connections

Table 9-56 Number of PROFINET device connections

Number of PROFINET device connections	Max. 64

Address areas

Table 9-57 Address areas

Input address area, total	• 2 Kbytes for C230-2 • 4 Kbytes for C240 / C240 PN
Output address area, total	• 2 Kbytes for C230-2 • 4 Kbytes for C240 / C240 PN
Process image inputs	64 bytes
Process image outputs	64 bytes

Connection values

Table 9-58 Connection values

Supply voltage	24 V DC (permissible range: 20.4 to 28.8 V)
Power consumption from 24 V	• typically 0.9 A (inputs/outputs open) • typically 1.2 A (with 4 encoders, 5 V) • typically 1.9 A (with 4 encoders, 24 V)
Power loss	15 W
Starting current	8 A
Encoder supply 5 V max. output current	1.2 A
Encoder supply 24 V max. output current	1.2 A

Dimensions and weight

Table 9-59 Dimensions and weight

Dimensions W x H x D [mm]	200 x 125 x 118
Weight [g]	Approximately 1 150

Onboard drive interface (C230-2, C240)

Analog

Table 9-60 Onboard drive interface

Setpoint signal (analog output)	
Number	4
Rated voltage range	-10.5 to 10.5 V
Output current	-3 to 3 mA
Electrically isolated	No
Load impedance	≥ 3 kOhm
Resolution	• 16-bit, including sign (with filter) • 12-bit, including sign (without filter)
Filter time • C230-2 • C240	 • With filter (C230-2-compatible) • With filter (C230-2 compatible) or without filter (can be switched in **HW Config**)
Basic error limit (at 25° C) • 0 V to 10 V • -10 V to 0 V	 • -2 to +6 % (typically +3 %) • -6 to +2 % (typically -3 %)

Relay contact controller enable	
Number	4
Switching voltage	max. 50 V
Switching current	Max. 1 A
Switching capacity	Max. 30 VA
Mechanical service life Electrical service life	Usually 10^9 switching cycles Typically $3 \cdot 10^6$ switching cycles at 24 V / 1 A

Cable length: Max. 35 m

Stepper drive (C230-2, C240)

Table 9-61 Stepper drive

5 V output signals according to RS422 standard		
Differential output voltage	V_{OD}	Min. 2 V (R_L = 100 Ω)
Output voltage "1"	V_{OH}	3.7 V (I_O = -20 mA) 4.5 V (I_O = -100 µA)
Output voltage "0"	V_{OL}	Max. 1 V (I_O = 20 mA)
Load impedance	R_L:	min. 55 Ω
Output current	I_O	max. ±60 mA
Pulse frequency	f_P	Max. 750 kHz

Cable length: Max. 50 m

- For mixed operation with analog axes, cable length: 35 m
- For asymmetrical transmission, cable length: 10 m

Actual value latch time

The following table shows the different latch times Ti of the actual encoder values depending on the position control cycle clock.

Onboard measuring system interface (C230-2, C240)

Table 9-63 Onboard measuring system interface

Position measuring	• Incremental • Absolute (SSI)
Signal voltages	Inputs: 5 V as per RS422
Supply voltage and current consumption per encoder	• 5 V/300 mA • 24 V/300 mA
Input frequency for incremental encoder	Max. 1 MHz
Baud rate for absolute encoder (SSI)	• 187.5 / 375 / 750 Kbits/s • 1.5 Mbit/s
Cable length for incremental encoder • 5 V encoder supply (tolerance 4.75 to 5.25 V) • 24 V encoder supply (tolerance 10 to 30 V)	• Max. 10 m at 1 MHz • Max. 25 m at 500 kHz and max. 300 mA • Max. 35 m at 500 kHz and max. 210 mA • Max. 100 m at 300 kHz and max. 300 mA
Cable length for absolute encoder (SSI) 24 V encoder supply (tolerance 10 to 30 V)	• Max. 250 m at 187.5 Kbits/s • Max. 10 m at 1.5 Mbit/s
Electrically isolated	No
Monitoring	Short-circuit in encoder supply and faulty wire

Digital inputs

Table 9-64 Digital inputs

Number of inputs	18
Supply voltage	24 V DC (permissible range: 20.4 to 28.8 V)
Input voltage	• 0 signal: -3...5 V • 1 signal: 11 to 30 V
Input current	• 0 signal: 15 mA • 1 signal: 6 to 30 mA (typically 8 mA)
Input delay (I0 to I11, B1 to B4, M1 to M2)	• 0 → 1 signal: 15 µs (typically 6 µs) • 1 → 0 signal: 150 µs (typically 40 µs)
Connection of a 2-wire encoder Permissible quiescent current	Supported 2 mA
Electrical isolation between inputs	No
Electrical isolation between inputs and logic	Yes
Insulation	500 V DC
Length of cable	Max. 30 m

Digital outputs

Table 9-65 Digital outputs

Number of outputs	8
Supply voltage	24 V DC (permissible range: V_L = 20.4 to 28.8 V)
Output voltage	1 signal: From V_L [1)] - 0.8 V to V_L [1)] V
Max. output current	1 signal: 5 mA. to 0.6 A (via supply voltage)
Total current of the outputs	• max. 4 A (at 0 to 40° C) • max. 2 A (at 40 to 55° C)
Extinguishing energy per output	400 mJ (not simultaneous)
Lamp load	5 W
Switching rate	• 100 Hz (with resistive load) • 2 Hz (with inductive load)
Short-circuit protection Max. leakage current	Yes 0 signal: 2 mA
Output delay (Q0...Q7)	• 0 → 1 signal: 500 µs (typically 150 µs) with RL = 60 Ohm • 1 → 0 signal: 500 µs (typically 150 µs) with RL = 60 Ohm
Electrical isolation between outputs Electrical isolation between outputs and logic Insulation	No Yes 500 V DC
Length of cable	Max. 30 m
1) V_L - Supply voltage of outputs	

Note

The connecting cable between the voltage source and the load current supply connector L+ and the associated reference potential M should **not** exceed a maximum length of 10 m.

READY output (RDY)

Table 9-66 Electrical parameters of RDY relay contact

RDY relay contact	
Switching voltage DC	max. 50 V
Switching current	Max. 1 A
Switching capacity	Max. 30 VA
Mechanical service life	Usually 10^9 switching cycles
Electrical service life	Typically $3 \cdot 10^6$ switching cycles at 24 V / 1 A

9.1.11.2 Real-time clock

Properties and functions of the clock

This table lists the properties and functions of the SIMOTION C clock.

Table 9-67 Properties of the SIMOTION C clock

Properties	C230-2	C240 / C240 PN
Type	Hardware clock (integrated "realtime clock")	
Factory setting upon delivery	DT#1992-01-01-00:00:00	
Backup	Permanently installed accumulator (maintenance-free goldcap)	
Accuracy • With supply voltage on 0 to 55° C • With supply voltage off 25° C -20° C to 70° C	Max. deviation per day: ±9 s ±2 s +2 s to -9 s	 -12 s to +4 s -1 s to +4 s -9 s to +4 s
Backup time	Typically 4 weeks (at 0 to 25° C)	
Charging time	1 h	

With POWER OFF

The SIMOTION C clock continues to operate after POWER OFF for the battery backup time (excluding software clock). The battery is recharged during POWER ON.

No error message is output if the backup function is defective. With POWER ON, the clock resumes at the time at which POWER OFF occurred.

When the SIMOTION C is reset to the factory setting, the clock is also reset to the "factory setting as delivered".

9.1.11.3 Transportation and storage conditions for SIMOTION C

With regard to transportation and storage conditions, the SIMOTION C surpasses the requirements specified in IEC 1131, Part 2. The following conditions apply to modules that are transported and stored in the original packaging.

Table 9-68 Transportation and storage conditions for SIMOTION C

Type of condition	Permissible range
Free fall	≤ 1 m
Temperature (transport)	From - 40° C to + 70° C
Atmospheric pressure	1,060 to 700 hPa (corresponds to an altitude of up to 3000 m)
Relative humidity (transport)	5% to 95%, without condensation

9.1.11.4 Mechanical and climatic environmental conditions for operation of the SIMOTION C

Use conditions

The SIMOTION C is designed for use in a stationary, weather-protected installation.

The SIMOTION C satisfies the operating conditions for Class 3C2 in accordance with DIN EN 60721 3-3 (operating locations with high traffic densities and in the immediate vicinity of industrial equipment with chemical emissions).

The SIMOTION C must not be used in the following locations without additional measures being taken:

- Locations with a high percentage of ionizing radiation
- Locations with severe operating conditions, e.g. due to:
  - Dust accumulation
  - Corrosive vapors or gases
- Installations requiring special monitoring, such as:
  - Elevator installations
  - Electrical installations in highly sensitive areas

An additional measure for the use of the SIMOTION C could be installation in a cabinet, for example.

Climatic environmental conditions

The SIMOTION C may be used under the following climatic environmental conditions:

Table 9-69 Climatic environmental conditions

Environmental conditions	Range of application	Comments
Temperature: Horizontal mounting: Vertical mounting	 From 0 to 55° C From 0 to 40° C	-
Relative humidity	From 5% to 95%	Without condensation, corresponds to relative humidity (RH) severity level 2 in accordance with IEC 1131-2
Atmospheric pressure	1,060 to 700 hPa	Corresponds to an altitude of mean sea level to 3,000 m
Contaminant concentration	 SO_2: < 0.5 ppm; Relative humidity <60%, no condensation H_2S: < 0.1 ppm; Relative humidity <60%, no condensation	Test: 10 ppm; 4 days 1 ppm; 4 days
Moisture condensation and ice formation	Not permitted	

Mechanical environmental conditions

The mechanical environmental conditions for the SIMOTION C are specified in the following table in terms of sinusoidal vibrations.

Table 9-70 Mechanical environmental conditions

Mechanical environmental conditions	Operation	Transport (in packaging)
Vibration tested in accordance with DIN EN 60068-2-68	10 to 58 Hz: 0.35 mm 58 to 200 Hz: 50 m/s²	5 to 9 Hz: 3.5 mm 9 to 200 Hz: 10 m/s²
Shock resistance tested in accordance with DIN EN 60068-2-27	10 g peak value, 6 ms duration 100 shocks in each of the 3 axes vertical to one another	10 g peak value, 6 ms duration 100 shocks in each of the 3 axes vertical to one another

Reduction of vibration

If the SIMOTION C is subjected to greater shocks or vibrations, you must take appropriate measures to reduce the acceleration or the amplitude.
Installation on damping material (e.g. rubber-bonded metals) is recommended.

9.1.11.5 Specifications for dielectric tests, safety class and degree of protection

Test Voltages

During the routine test, the insulation resistance is tested at the following test voltage in accordance with IEC 1131 Part 2:

Table 9-71 Test Voltages

Circuits with rated voltage U_e relative to other circuits or ground	Test voltage
$0 V < U_e \leq 50 V$	500 VDC

Safety class

Safety class I in accordance with IEC 536 (VDE 0106, Part 1), i.e. a protective-conductor terminal is required on the mounting rail!

Protection against the ingress of foreign matter and water

IP 20 degree of protection in accordance with IEC 529, i. e. protection against contact with standard probes.

Also: Protection against ingress of solid foreign bodies with diameters greater than 12.5 mm.

No special protection against ingress of water.

9.1.12 Dimension drawing, spare parts, and accessories

9.1.12.1 Dimension drawing

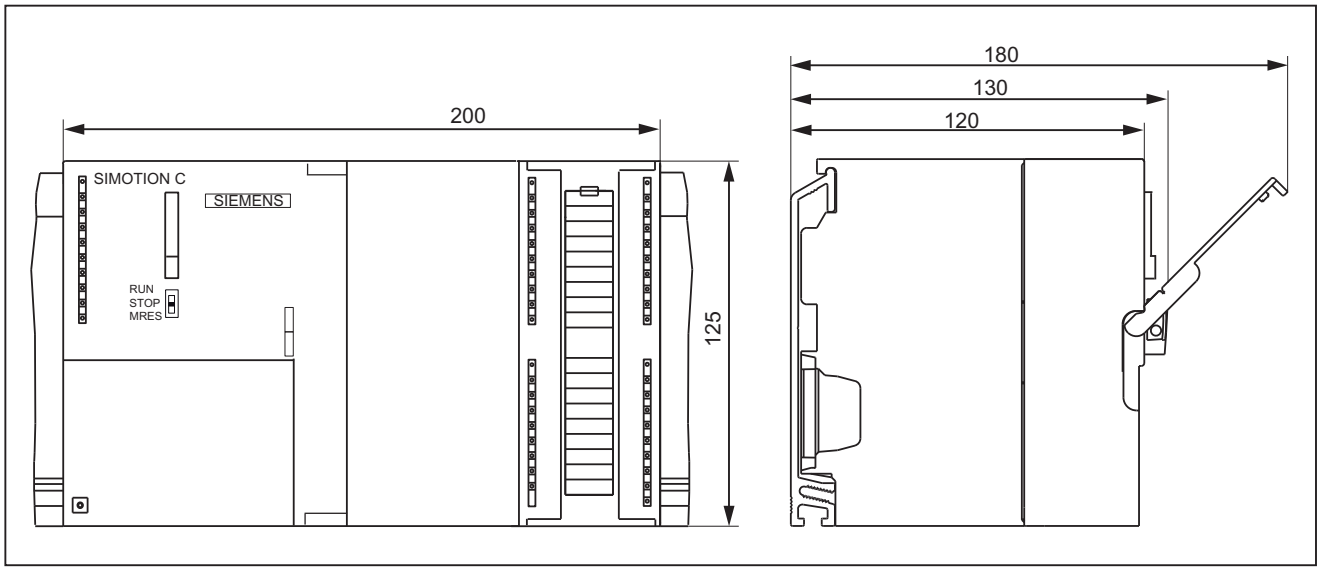

Figure 9-78 SIMOTION C dimension drawing

9.1.12.2 Spare parts and accessories

Table 9-72 Spare parts and accessories

Parts for SIMOTION C	Article number	Accesso-ries	Spare parts
Bus connector	6ES7 390-0AA00-0AA0	-	X
Connecting comb between power supply and SIMOTION C	6ES7 390-7BA00-0AA0	X	-

9.1.13 Standards, Certificates and Approvals

9.1.13.1 General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

Korea certification

KC	KC registration number: KCC-REM-S49-SIMOTION Note that this device complies with limit class A with regard to the emission of radio frequency interference. This device can be used in all areas except residential areas. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (https://support.industry.siemens.com/cs/ww/en/ps/14506/cert).

RCM (C-Tick)

AUSTRALIA	
	This product meets the requirements of the AS/NZS CISPR 22.

9.1.13.2 Residual risks of power drive systems

Residual risks of power drive systems

The control and drive components of a drive system are approved for industrial and commercial use in industrial line supplies. Their use in public grids requires a different configuration and/or additional measures.

These components may only be operated in closed housings or in higher-level control cabinets with protective covers that are closed, and when all of the protective devices are used.

These components may only be handled by qualified and trained technical personnel who are knowledgeable and observe all of the safety instructions on the components and in the associated technical user documentation.

When assessing the machine's risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer must take into account the following residual risks emanating from the controller and drive components of a drive system:

1. Unintentional movements of driven machine components during commissioning, operation, maintenance, and repairs caused by, for example:
   - Hardware faults and/or software errors in sensors, controllers, actuators, and connection systems
   - Response times of the controller and drive
   - Operating and/or ambient conditions not within the scope of the specification
   - Condensation / conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of radio devices / cellular phones in the immediate vicinity of the controller
   - External influences/damage
2. In the event of a fault, exceptionally high temperatures, including open fire, as well as emissions of light, noise, particles, gases, etc. can occur inside and outside the converter, e.g.:
   - Component malfunctions
   - Software errors
   - Operating and/or ambient conditions not within the scope of the specification
   - External influences/damage

   Inverters of the Open Type/IP20 degree of protection must be installed in a metal control cabinet (or protected by another equivalent measure) such that the contact with fire inside and outside the inverter is not possible.
3. Hazardous shock voltages caused by, for example:
   - Component malfunctions
   - Influence of electrostatic charging
   - Induction of voltages in moving motors
   - Operating and/or ambient conditions not within the scope of the specification
   - Condensation / conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc. if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

Note

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

For more information about residual risks of the components in a drive system, see the relevant chapters in the technical user documentation.

9.1.14 ESD guidelines

9.1.14.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

9.1.14.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

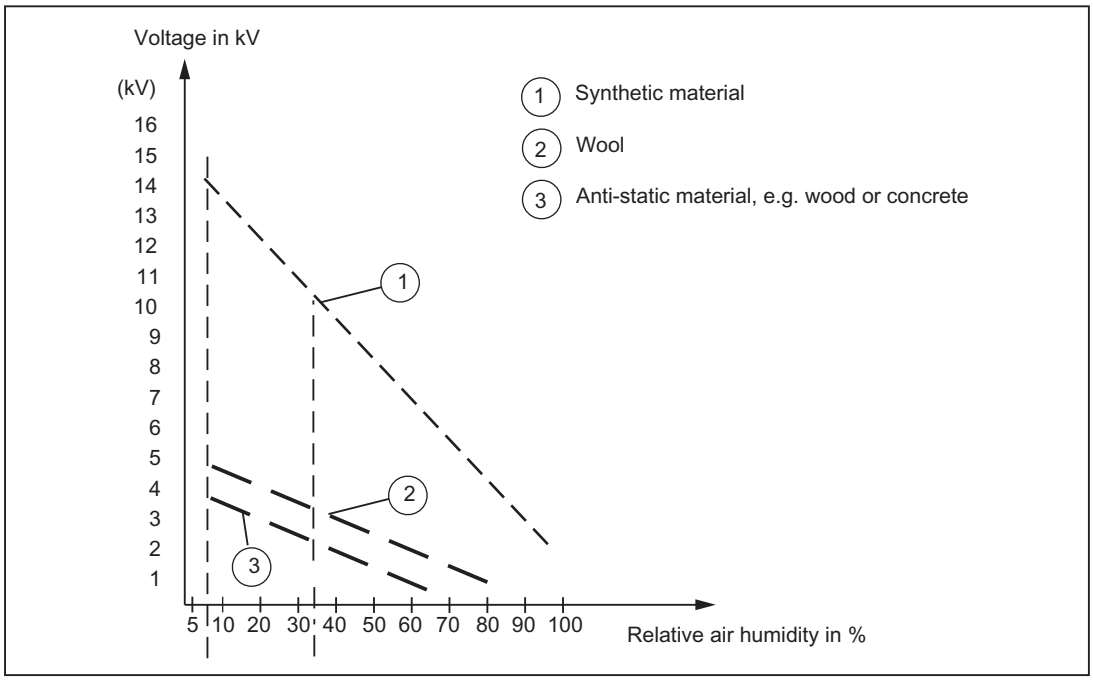

Figure 9-79 Electrostatic voltage that can accumulate on operating personnel

9.1.14.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

SIMOTION D 10

10.1 Commissioning Manual

10.1.1 SIMOTION D4x5-2

Preface

Contents of this commissioning and hardware installation Manual

This **document** is part of the **SIMOTION D documentation package**.

Scope

The SIMOTION D4x5-2 Commissioning and Hardware Installation Manual is valid for the SIMOTION D4x5-2 control units as well as for the CX32-2, CBE30-2 and TB30 supplementary system components.

A separate *SIMOTION D4x5* Commissioning and Hardware Installation Manual is available for the SIMOTION D425, SIMOTION D435 and SIMOTION D445/D445-1 devices including the CX32, CBE30 and TB30 system components.

The software configuration is described in this manual based on SIMOTION SCOUT and SIMATIC STEP 7 Version V5.x.

Information of configuration of the SIMOTION D Control Units in the Engineering Framework Totally Integrated Automation Portal (SCOUT in the TIA Portal), you will find in the configuration manual *SIMOTION SCOUT TIA*.

The TIA Portal requires at least SIMOTION SCOUT V4.4 and SIMOTION D4xx-2 Control Units as of firmware V4.3.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Information in this manual

The following is a description of the purpose and use of this Commissioning and Hardware Installation Manual:

- Description
  Provides information about the SIMOTION system and its integration in the automation environment.
- Installing
  Provides information on the various installation options for the device.
- Connecting
  Provides information about connecting and cabling the various devices, and about communications interfaces.
- Commissioning (hardware)
  Provides information on commissioning the device.
- Parameter assignment / addressing
  Provides information on configuring and parameterizing the various bus systems.
- Commissioning (software)
  Provides information on configuring and commissioning the system.
- Service and maintenance
  Provides information about service and maintenance procedures that must be performed on the device.
- Diagnostics
  Provides information about the available diagnostic information, how to interpret it, and its meaning.
- Appendices with factual information for reference (e.g. standards, approvals, and ESD guidelines).

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P

- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Disposal and recycling of the device

SIMOTION D is an environmentally friendly product. It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Identification of plastic materials in accordance with ISO 11469.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The disposal of the products described in this manual should be performed in compliance with the valid national regulations.

The products can be largely recycled owing to their low pollutant content. For environmentally friendly recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner/index.asp

Further information / FAQs

You can find further information on this manual at the following FAQ:

https://support.industry.siemens.com/cs/ww/de/view/27585482

The following information sources are also available:

- SIMOTION Utilities & Applications: SIMOTION Utilities & Applications will be included in the SIMOTION SCOUT scope of delivery and, along with FAQs, also contain free utilities (e.g. calculation tools, optimization tools, etc.) as well as application examples (ready-to-apply solutions such as winders, cross cutters or handling)
- The latest SIMOTION FAQs at https://support.industry.siemens.com/cs/ww/de/ps/14505/faq
- SIMOTION SCOUT online help
- For additional documentation, see the *Overview of SIMOTION documentation* (separate document)

Open source software

Third-party software - License conditions and copyright notes

Copyright notes for the third-party software contained in this product, in particular the open source software, as well as the applicable license conditions, can be found in the READ_OSS.ZIP file on the SIMOTION D CF card or in the corresponding firmware files.

Special note for resellers

The notes and the license conditions contained in the READ_OSS.ZIP file must be passed on to the purchaser in order to avoid the reseller and purchaser from violating the license conditions.

Source code availability

Some license terms of third-party software components used in this product may require us to provide you with the source code and other information for those components. You can find this information directly on or with the product (e.g. on mass storage devices, DVD). If this is not possible for technical reasons, Siemens will be happy to send you this OSS source code in exchange for reimbursement of the processing costs. Please contact the address provided at the end of this section.

10.1.1.1 Safety instructions

Fundamental safety instructions

General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following six steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Electric shock if there is no ground connection

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply

When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage

Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Spread of fire from built-in devices

In the event of fire outbreak, the enclosures of built-in devices cannot prevent the escape of fire and smoke. This can result in serious personal injury or property damage.

- Install built-in units in a suitable metal cabinet in such a way that personnel are protected against fire and smoke, or take other appropriate measures to protect personnel.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Unexpected movement of machines caused by radio devices or mobile phones

The use of radio devices or mobile telephones in the immediate vicinity of the components can result in equipment malfunction. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- If you come closer than around 2 m to such components, switch off any radios or mobile phones.
- Use the "SIEMENS Industry Online Support app" only on equipment that has already been switched off.

⚠ WARNING

Fire due to inadequate ventilation clearances

Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position

The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

⚠ WARNING

Unrecognized dangers due to missing or illegible warning labels

Dangers might not be recognized if warning labels are missing or illegible. Unrecognized dangers may cause accidents resulting in serious injury or death.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, where necessary in the national language.
- Replace illegible warning labels.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions

Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for Safety Integrated functions

If you want to use Safety Integrated functions, you must observe the safety notices in the Safety Integrated manuals.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Specific safety information for SIMOTION D4x5-2

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Only safety extra low voltage in accordance with EN/IEC 60950-1 may be connected at all connectors and terminals.

⚠ WARNING

Danger to life from electric shock due to insufficient safety isolation

Employing protection against direct contact using DVC A (PELV) is only permissible in areas with equipotential bonding and in dry rooms indoors.

Use other protective measures against electric shock, such as touch protection, if the specified conditions are not met.

⚠ WARNING

Danger to life from unexpected movement of machines on automatic restart

An automatic restart can be programmed for SIMOTION controllers. When the power returns, the axes start automatically.

Make sure this presents no hazard to personnel or property.

NOTICE

Damage to option boards caused by electric fields or electrostatic discharge

Option boards are ESD-sensitive components.

De-energize the SIMOTION D4x5-2 device before inserting or removing the option board. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.

Comply with the ESD rules.

NOTICE

Damage to the CompactFlash card from electrical fields or electrostatic discharge

The CompactFlash card is an ESD-sensitive component.

De-energize the SIMOTION D4x5-2 device before inserting or removing the CompactFlash card. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.

Comply with the ESD rules.

NOTICE

Higher operating temperature if ventilation clearances are too small

The 80 mm clearances above and below the components must be observed.

The unit protects itself from overheating by shutting down.

The ventilation clearance is measured from the lower edge of the module, i.e. the fan/battery module is not included in the dimension.

10.1.1.2 Description

System overview

Overview

SIMOTION D is a drive-based version of SIMOTION based on the SINAMICS S120 drive family.

With SIMOTION D, the SIMOTION PLC and motion control functionalities as well as the SINAMICS S120 drive software run on shared control hardware.

SIMOTION D is available in two versions:

- SIMOTION D410-2 is a compact Control Unit predestined for single-axis applications. The Control Unit is snapped directly on to the SINAMICS Power Module in blocksize format and has an integrated drive control for either one servo, one vector or one *V/f* axis.
- SIMOTION D4x5-2 is a Control Unit for multi-axis applications in SINAMICS S120 booksize format. The following performance versions are offered:
  - SIMOTION D425-2 (BASIC performance) Control Unit for up to 16 axes
  - SIMOTION D435-2 (STANDARD performance) Control Unit for up to 32 axes
  - SIMOTION D445-2 (HIGH performance) Control Unit for up to 64 axes
  - SIMOTION D455-2 (ULTRA-HIGH performance) Control Unit for up to 128 axes or applications with very short control cycles

The SIMOTION D4x5 2 is described in this manual. Separate manuals are available for the SIMOTION D410-2 and the D4x5/D410 predecessor modules.

Like SINAMICS S120, SIMOTION D also follows the Totally Integrated Automation (TIA) concept. TIA is characterized by integrated data management, configuration, and communication for all products and systems. Thus, an extensive toolbox of automation modules is also available for SIMOTION D.

Note

In order to cover all versions of SIMOTION D for multi-axis applications, the product will be referred to as "D4x5-2". Specific product designations will be used for information that applies only to one product version, e.g. D445-2 DP/PN.

SIMOTION D4x5-2 DP describes all PROFIBUS versions, and SIMOTION D4x5-2 DP/PN all PROFIBUS/PROFINET versions of the SIMOTION D4x5-2 Control Units.

Application

The SIMOTION D4x5-2 is ideally suited to applications with many coordinated axes with high clock-pulse rates.

Typical applications include:

- Compact multiple-axis machines
- High-performance applications with short machine cycles
- Compact machines
  - Including the complete machine control in the drive
  - With extensive connection possibilities for communication, HMI and I/O
- Distributed drive concepts
  - Applications with many axes
  - Synchronization of several SIMOTION D Control Units using distributed synchronous operation

Versions

The Control Units are available in the versions SIMOTION D425-2 (BASIC performance), SIMOTION D435-2 (STANDARD performance), SIMOTION D445-2 DP/PN (HIGH performance) and SIMOTION D455-2 DP/PN (ULTRA-HIGH performance). The versions differ in their PLC performance and in their motion control performance. The main distinguishing features are:

Table 10-1 Device versions and features

	SIMOTION D425-2	**SIMOTION D435-2**	**SIMOTION D445-2**	**SIMOTION D455-2**
Maximum number of axes	16	32	64	128
Minimum servo/interpolator cycle clock	0.5 ms	D435-2 DP: 0.5 ms D435-2 DP/PN: 0.25 ms	0.25 ms	0.25 ms 0.125 ms [1]
DRIVE-CLiQ interfaces	4	6	6	6

[1] Only with ET 200SP, SCOUT TIA and Servo_fast / IPO_fast

The Control Units feature PLC and motion control performance (open-loop control and motion control) for up to 16, 32, 64 or 128 axes, as required.

The integrated drive computing performance of the Control Units allows up to 6 servo, 6 vector or 12 *V/f* axes on each D4x5-2 Control Unit (drive control based on CU320-2, firmware version ≥ V4.x).

The drive control supports servo control (for a highly dynamic response), vector control (for maximum torque accuracy) and *V/f* control.

SIMOTION D435-2 DP/PN and D455-2 DP/PN are also available as SIPLUS version for use under extremely harsh environmental conditions, e.g. in toxic atmospheres (for details refer to technical specifications). As BasedOn products, the SIPLUS versions have the same functionality as the standard modules and are configured in the same way.

The SIMOTION D4x5-2 Control Units and their CX32-2, CBE30-2 and TB30 supplementary system components are described in the following.

Note

With the SIZER configuration tool, you can easily configure the SINAMICS S110/120 drive family including SIMOTION.

It provides you with support for selecting and dimensioning the components required for a Motion Control task.

You can also determine the possible number of axes and the resulting load with SIZER in accordance with your performance requirements.

Hardware components

As the central hardware, SIMOTION D uses the SIMOTION D4x5-2 as Control Unit consisting of the SIMOTION runtime system and the SINAMICS drive control. The Control Unit uses the SINAMICS Integrated drive with various SINAMICS S120 drive modules (Line and Motor Modules) to perform open-loop and closed-loop control of the axis grouping. A range of additional SINAMICS S120 components, such as SMx encoder systems or Terminal Modules can also be connected via DRIVE-CLiQ. With a few exceptions (e.g. no basic positioner EPOS, no Basic Operator Panel BOP20, etc.), the drive control integrated in SIMOTION D has the same control characteristics and performance features as the SINAMICS S120 CU320-2 Control Unit. The EPOS functionality is provided by the SIMOTION technology functions. The functionality of SIMOTION D can be expanded with distributed I/O via PROFIBUS or PROFINET IO.
The following figure shows a typical SIMOTION D axis grouping.

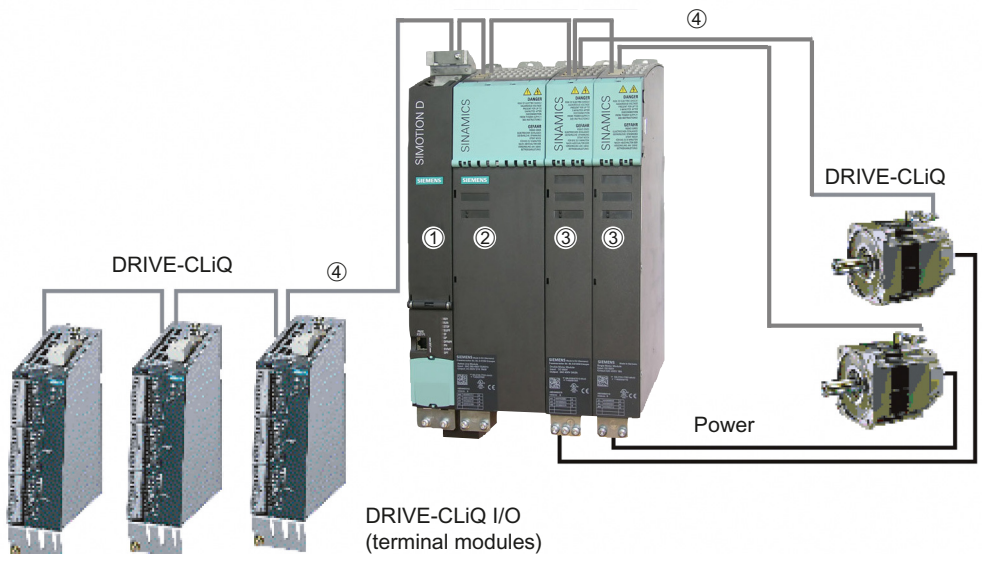

Figure 10-1 Example of an axis grouping with SIMOTION D4x5-2

A SIMOTION D axis grouping generally consists of the following elements:

- **SIMOTION D** (Control Unit) (1)
  This unit contains the programmable runtime system of SIMOTION and the drive software of SINAMICS S120. In principle, SIMOTION D is capable of controlling multiple axes/drives.
- One **SINAMICS infeed** (Line Module) (2)
  This module generates a DC link from the supply system.
- **SINAMICS power units** (Motor Modules) (3)
  These modules are used to control motors.
  It is also possible to operate SINAMICS Power Modules in blocksize format with the SINAMICS Control Unit Adapter (CUA). A separate infeed is then unnecessary.
- **DRIVE-CLiQ components** (4)
  In SINAMICS S120 / SIMOTION D, the individual components of the drive system communicate with each other via DRIVE-CLiQ. In addition to power components, it is also possible to link encoder systems and special DRIVE-CLiQ I/O devices via DRIVE-CLiQ.

Extension of the drive computing performance

The motion control performance of a SIMOTION D4x5-2 can be utilized in full by expanding the computing performance at the drive in two different ways:

- SINAMICS S/G Control Units (e.g. CU320-2, CU310-2, CU305, CU250S-2, etc.) together with further drive components can be connected via PROFIBUS or PROFINET.
- With SIMOTION D4x5-2, the CX32-2 Controller Extension can be connected via DRIVE-CLiQ. This module is extremely compact, does not require a separate CompactFlash card and can control up to 6 servo, 6 vector or 12 *V/f* axes.

Software components

The basic functionality of SIMOTION D is supplied on a CompactFlash card containing the following:

The SIMOTION runtime system with the following functions:

- Freely programmable runtime system (IEC 61131)
- Various runtime levels (tasks)
- PLC and arithmetic functionality
- Motion control functions
- Communication functions

The SINAMICS S120 drive control with the following functions:

- Closed-loop current and torque control
- Closed-loop speed control
- Closed-loop infeed

System components

Central components

SIMOTION D4x5-2 communicates with automation components via the following interfaces:

- PROFIBUS DP
- Ethernet
- PROFINET IO
- DRIVE-CLiQ (DRIVE Component Link with IQ)

SIMOTION D features a SINAMICS Integrated drive element. The communication with the SINAMICS Integrated is performed via PROFIBUS mechanisms (DP Integrated), i.e. the communication is handled, for example, via PROFIdrive telegrams.

Shorter cycle times and greater numbers of addresses for each node are achieved with the "DP Integrated" compared to the "external PROFIBUS DP".

The most important components of the system and their functions are shown below.

Table 10-2 Central components

Component	Function
SIMOTION D4x5-2 controller	... is the central motion control module. This module contains the programmable SIMOTION runtime for the SIMOTION D4x5-2 and the SINAMICS S120 drive software. You can use the integrated high-speed digital I/Os as: • User-addressable process I/Os • Homing inputs • Inputs for measuring inputs • Outputs for fast output cams The measuring sockets can output any analog signals.
System software	The basic functionality of SIMOTION D is supplied on a CompactFlash card containing the following: • SIMOTION runtime (kernel) • Drive software of SINAMICS S120 - implements all drive functions
Power supply	... provides the electronics power supply for SIMOTION D, e.g. via the SITOP power supply.

PROFIBUS DP

The Control Unit can communicate with the following components via the PROFIBUS DP interfaces:

Table 10-3 Components on PROFIBUS DP

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs, and tests with the "SIMOTION SCOUT" engineering system (ES)
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200S	Finely scalable I/O system for cabinet configuration and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.

Component	Function
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related applications with no cabinet; with features such as compact designs, integrated PROFIsafe safety technology, PROFINET connection and live module replacement.
SIMATIC ET 200eco	I/O system with IP65/67 degree of protection for machine-related applications with no cabinet, and with flexible and fast ECOFAST or M12 connection methods.
Other PROFIBUS I/O	
Gateways	• DP/AS-Interface link 20E and DP/AS-Interface link Advanced for the PROFIBUS DP gateway to AS-Interface • DP/DP coupler for connecting two PROFIBUS DP networks
Drive interfaces	• ADI4 (Analog Drive Interface for 4 axes) for connection of drives with analog ± 10 V setpoint interface or for external encoders • IM174 (Interface Module for 4 axes) for connection of drives with analog ± 10 V setpoint interface, for external sensors, or for connection of stepper drives with pulse-direction interface
Drive units with PROFIBUS DP interface (e.g. SINAMICS S120)	... convert speed setpoints into signals for controlling the motors and supply the power required to operate the motors. Also can be operated as an isochronous slave on PROFIBUS DP.
Teleservice adapter	Remote diagnostics

Ethernet

The Control Unit can communicate with the following components via the Ethernet interfaces or be embedded in an automation environment:

Table 10-4 Components on the Ethernet

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs, and tests with the "SIMOTION SCOUT" engineering system (ES)
Master computer	... communicates with other devices via UDP, TCP/IP
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit.

PROFINET IO

The D4x5-2 DP/PN can communicate with the following components via the onboard PROFINET IO interface or via the Ethernet communication board (CBE30-2).

Table 10-5 Components on the PROFINET IO

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs and tests with the "SIMOTION SCOUT" engineering system (ES).
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit.
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Master computer	... communicates with other devices via UDP, TCP/IP
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data. With the time-based I/Os, signals can be recorded or output to the precise µs.
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety. With the time-based I/Os, signals can be recorded or output to the precise µs.
SIMATIC ET 200S	Finely scalable I/O system for cabinet configuration and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related applications with no cabinet; with features such as compact designs, integrated PROFIsafe safety technology, PROFINET IO connection and live module replacement.
SIMATIC ET 200eco PN	Compact block I/O with IP65/66/67 degree of protection for machine-related applications with no cabinet, and with M12 connection method. Very rugged and resistant encapsulated metal enclosure.
Other PROFINET IO I/O devices	
Drive units with PROFINET IO interface	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors.
Gateways	• IE/AS-Interface link PN IO for the PROFINET IO gateway to AS-Interface • PN/PN coupler for connecting two PROFINET IO networks

DRIVE-CLiQ

The DRIVE-CLiQ interfaces permit a fast connection to the SINAMICS drive components.

DRIVE-CLiQ offers the following advantages within the DRIVE-CLiQ topology rules:

- Expandability of components
- Automatic detection of components by the Control Unit
- Standardized interfaces to all components
- Uniform diagnostics down to the components
- Uniform service through to the components
- Simple mechanical handling

The controller can communicate with the following components via DRIVE-CLiQ:

Table 10-6 Components connected to DRIVE-CLiQ

Component	Function
Control Unit (SINAMICS S110/ S120)	Central control module in which the open- and closed-loop control functions for the drive are implemented.
Line Module (SINAMICS S120)	... generates a DC link from the supply system.
Motor Module (SINAMICS S120)	... controls motors (DC/AC inverters, booksize).
Power Module (SINAMICS S110/ S120)	... controls motors (AC/AC converters, blocksize).
CX32-2 Controller Extension	... enables additional axes to be connected for SIMOTION D4x5-2.
CUA31/CUA32 Control Unit Adapter	... enables a Power Module in blocksize format to be connected to a booksize D4x5-2, CX32-2 or CU320-2 Control Unit.
TM15, TM17 High Feature Terminal Modules	The TM15 and TM17 High Feature Terminal Modules are used to implement inputs of measuring inputs and outputs of output cams. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times.
TM31 Terminal Module	... enables a terminal expansion via DRIVE-CLiQ (additional analog and digital I/Os).
TM41 Terminal Module	... enables a terminal expansion (analog and digital I/Os) and encoder emulation.
TM54F Terminal Module	... enables terminal expansion (fail-safe digital I/Os) for controlling the safe motion monitoring functions of the integrated drives.
TM120 Terminal Module	Four temperature sensors (KTY84-130 or PTC) can be evaluated via the TM120 Terminal Module. The temperature sensor inputs are safely electrically separated from the evaluation electronics in the TM120 Temperature Module and are suitable for evaluating the temperature of special motors, e.g. 1FN linear motors and 1FW6 built-in torque motors.
TM150 Terminal Module	The TM150 Terminal Module can be used to evaluate temperature sensors (KTY, PT100, PT1000, PTC, and bimetal normally closed contact). This means, for example, that other temperatures from the process can be measured in addition to the motor temperature. Temperature sensors can be evaluated using a 2, 3 or 4-wire system. Twelve temperature sensors can be evaluated with 2-wire evaluation and six temperature sensors with 3 and 4-wire evaluation.

Component	Function
SMx Sensor Modules	... enable acquisition of encoder data from connected motors via DRIVE-CLiQ.
Motors with DRIVE-CLiQ interface	... enable simplified commissioning and diagnostics, as the motor and encoder type are identified automatically.
DMC20/DME20 DRIVE-CLiQ hub	... enables the number of DRIVE-CLiQ interfaces to be increased and the creation of a point-to-point topology.

Power Modules via CUA31/32

The following Power Modules are supported:

- PM340
- PM240-2 (as of SIMOTION V4.4 / SINAMICS V4.7)

The mixed operation of a PM240-2 with booksize modules and/or PM340 blocksize modules on a CU320-2/D4x5-2/CX32-2 is possible as of SINAMICS V4.7 HF12 or SIMOTION V4.4 HF6 (SINAMICS Integrated V4.7 HF12).

Note

You will find detailed information on components of the SINAMICS S110/S120 product family in the SINAMICS S110/S120 manuals.

It is possible that older DRIVE-CLiQ components can no longer be used with SIMOTION D4x5-2/CX32-2. You will find detailed information on this topic in the SIMOTION D4x5-2 Commissioning and Hardware Installation Manual at "Migration of D4x5 to D4x5-2" in Section "Permissible combinations".

Optional components

The functionality of the D4x5-2 Control Unit can be expanded with the following components:

Table 10-7 Optional components

Component	Function	D4x5-2 DP	D4x5-2 DP/PN
CBE30-2 Ethernet communication board	Communication via PROFINET IO with IRT and PROFINET IO with RT	No	Yes
TB30 Terminal Board	Terminal expansion, i.e. additional analog and digital I/Os	Yes	Yes

The components are plugged into the option slot of the Control Unit.

I/O integration

Note

Note that not all modules in the ET 200 I/O family are approved for SIMOTION. Moreover, system-related functional differences can come into play when these I/Os or I/O systems are used on SIMOTION vs. on SIMATIC. For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

A detailed, regularly updated list of the I/O modules approved for use with SIMOTION, as well as notes on their use, can be found on the Internet at: (https://support.industry.siemens.com/cs/ww/en/view/11886029)

In addition to the I/O modules enabled for SIMOTION, in principle all certified standard PROFIBUS slaves (DP-V0/DP-V1/DP-V2) and PROFINET IO devices with RT and IRT real-time classes may be connected to SIMOTION D4x5-2. These modules are integrated using the GSD file (PROFIBUS) or GSDML file (PROFINET) provided by the relevant device manufacturer.

Note

Please note that in individual cases further boundary conditions must be fulfilled in order to integrate a standard slave/standard device into SIMOTION. Thus, a few modules require "driver blocks" , e.g. in the form of function blocks, that permit (or simplify) integration.

For modules released with SIMOTION (e.g. SIMATIC S7-300 module FM 350-1, etc.), these driver blocks are part of the SIMOTION SCOUT engineering system command library.

Commissioning software

Requirement

To create and edit projects on your PG/PC, you need the SIMOTION SCOUT commissioning and configuration tool. For information on how to install SIMOTION SCOUT, see the *SIMOTION SCOUT* Configuration Manual.

Note

SIMOTION SCOUT contains the functionality of STARTER and SIMATIC S7-Technology.

Simultaneous operation of SIMOTION SCOUT, STARTER, and SIMATIC S7-Technology as a single installation on one PC/PG is not possible.

Integrated STARTER

You can insert a standalone drive (e.g. SINAMICS S120) with the "Insert single drive unit" element in the project navigator. It is commissioned using wizards in the working area of the workbench that contains the STARTER functionality.

SINAMICS Support Package (SSP)

The following SSPs are relevant for SIMOTION SCOUT:

- SSP "SINAMICS" for single drive units (e.g. CU3xx)
- "SIMOTION SINAMICS Integrated" SSP for the SINAMICS drives integrated into SIMOTION D.

You will find detailed information on the SSPs in the readme files and in the software compatibility list at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317).

Upgrading SIMOTION D4x5-2 projects and hardware

Projects that you have created for one SIMOTION D4x5-2 firmware version can also be converted for other firmware versions. You can also change the version of the SIMOTION D4x5-2. For example, a D445-2 DP/PN can be converted to a D455-2 DP/PN (and vice versa, to the extent that the performance and quantities allow this). See, for example, Section Adapting a project (Upgrading the project / Replacing the SIMOTION controller) (Page 7221).

SIMOTION IT web server

The SIMOTION D4x5-2 features an integrated Web server.

The web server supports the display of diagnostics and system data in standard Internet browsers, even in the absence of an engineering system, and the carrying out of project/ firmware updates.

As of firmware version V4.2, it is no longer necessary to purchase licenses for the web server (IT DIAG license) and for SIMOTION IT OPC XML-DA.

Additional references

You will find detailed information on working with projects in the *SIMOTION SCOUT* Configuration Manual.

You will find detailed information on SIMOTION IT web server in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

10.1.1.3 Installing

Installation notes

Open components

These modules are open components. This means they may only be installed in housings, cabinets, or in electrical equipment rooms that can only be entered or accessed with a key or tool. Housings, cabinets, or electrical equipment rooms may only be accessed by trained or authorized personnel. An external fire-protection housing is required.

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

Permitted mounting positions

The following mounting positions are permitted:

- vertical installation
  (preferred standard mounting position)
  For details on this, see
  - Section Installing the SIMOTION D4x5-2 (Page 6923)
  - Section Installing the CX32-2 (Page 6932)
- lying on back
  (e.g. for applications in which the installation situation makes a low installation height necessary)
  For details, see Section Alternative mounting position (Page 6939).

Installing the SIMOTION D4x5-2

Installing the SIMOTION D4x5-2

Requirement

The Control Unit is installed in a control cabinet along with the SINAMICS components.

The following requirements must be met for installing a Control Unit:

- The control cabinet has been installed and wired.
- The SINAMICS components should already have been installed and wired.
- Components and tools are available.

Note

The components must be protected against conductive contamination, e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12.

If conductive contamination can be excluded at the installation site, a lower degree of cabinet protection may be permitted.

Designs

A D4x5-2 Control Unit is designed similar to a SINAMICS S120 booksize unit. It is mounted directly on the wall of the control cabinet, whereby a distinction is made between the following designs.

- Mounting the SIMOTION D4x5-2 with spacers
- Mounting the SIMOTION D425-2 and D435-2 without spacers
- Mounting the SIMOTION D445-2 and D455-2 without spacers (external air cooling)

The D425-2 and D435-2 Control Units do not have any cooling fins on the rear side of the module so that the spacers can be removed if required.

As the D445-2 and D455-2 Control Units have cooling fins, the spacers can be removed when external air cooling is used.

With external air cooling, the cooling fins are outside of the control cabinet. A seal is required so that the Control Unit can be hermetically mounted in the rear cabinet panel.

The fan/battery module can be mounted or replaced without having to disassemble the Control Unit. As the Control Unit is similar to the SINAMICS S120 family with regard to installation, please also refer to the information in the SINAMICS manuals.

The same installation instructions apply for the SIMOTION D4x5-2/CX32-2 Control Units as for the SINAMICS S120 CU320-2 Control Units with regard to EMC.
For further information, see the SINAMICS manuals.

Mounting and installation aids

The Control Unit is designed for mounting in a control cabinet (IP20 degree of protection). All versions of SIMOTION D4x5-2 are supplied with pre-assembled spacers for installation on the wall of the control cabinet. The spacers can be removed if necessary.

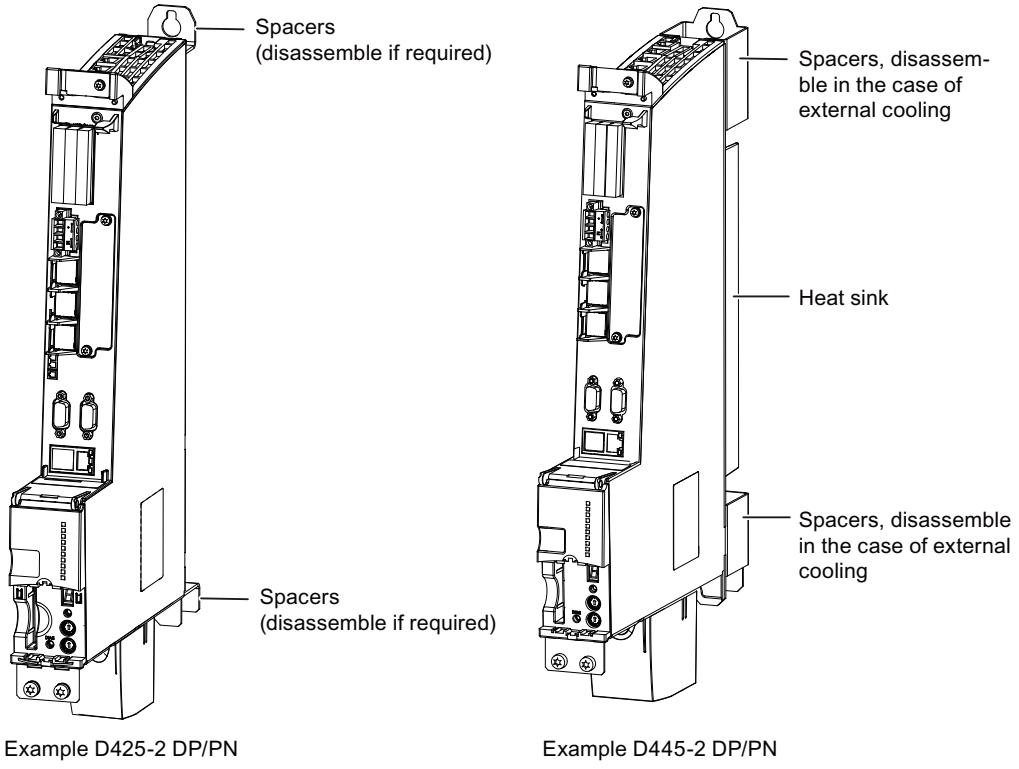

Figure 10-2 Mounting aids on the D425-2 DP/PN and D445-2 DP/PN

See also

Mounting the SIMOTION D4x5-2 with spacers (Page 6925)

Mounting the SIMOTION D4x5-2 with spacers

By using spacers, you can attach the control unit to a bare, metallic rear wall of a control cabinet with good electrical conductivity with two M6 screws.

Purpose of this type of installation

This type of mounting is needed if:

- The heat is to be dissipate within the control cabinet
- The mounting depth of the SINAMICS S120 booksize grouping is to be achieved

The spacers are included in the scope of delivery of a control unit and are preassembled.

Procedure

1. Mount the spacers on the control unit, if they have previously been removed.
2. Fasten the Control Unit to the control cabinet wall with two M6 screws (tightening torque 6 Nm or 53.1 lbf in).

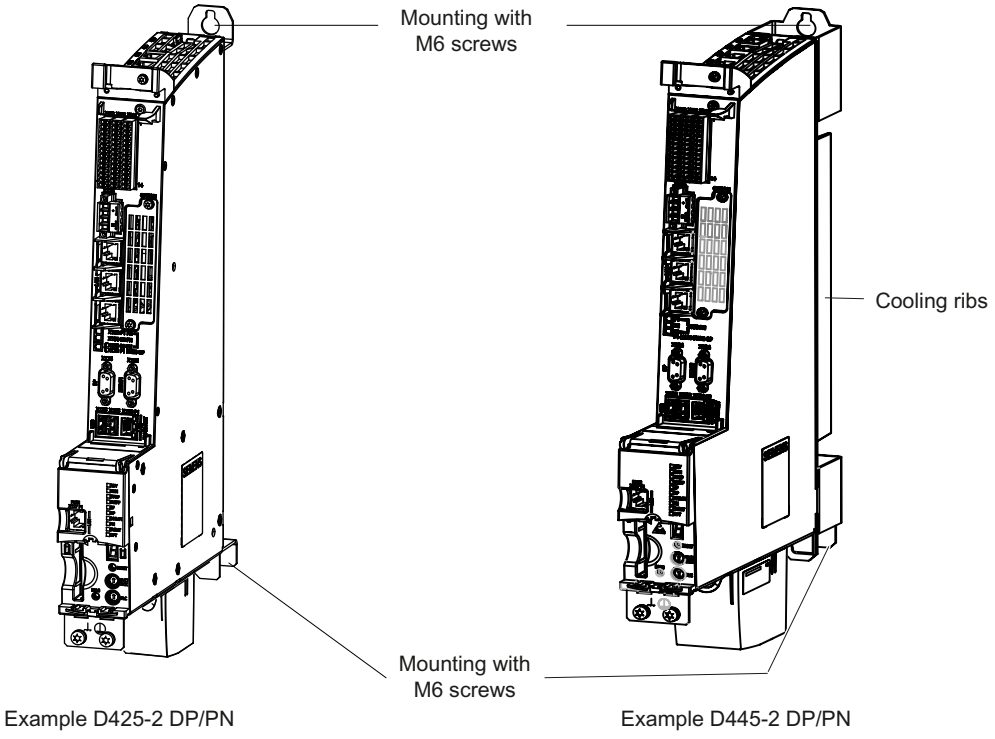

Figure 10-3 Mounting of the D425-2 DP/PN and D445-2 DP/PN with spacers

Result

The control unit is arranged flush with the grouping on the wall of the control cabinet.

Mounting the SIMOTION D425-2 and D435-2 without spacers

The control units are supplied with pre-assembled spacers. For mounting without spacers, proceed as follows:

1. Remove the upper and lower spacers (screws: M3, Torx T10)
2. There is a metal clip under the upper spacer; when shipped, the clip is pushed in and secured with three screws (M3, Torx T10) fixed. Loosen the screws and push the clip up until the upper hole extends beyond the housing.

3. Tighten the 3 screws on the clip again (tightening torque 0.8 Nm or 7.1 lbf in).
4. Mount the top and bottom of the control unit directly on the cabinet wall with two M6 screws (tightening torque 6 Nm or 53.1 lbf in).

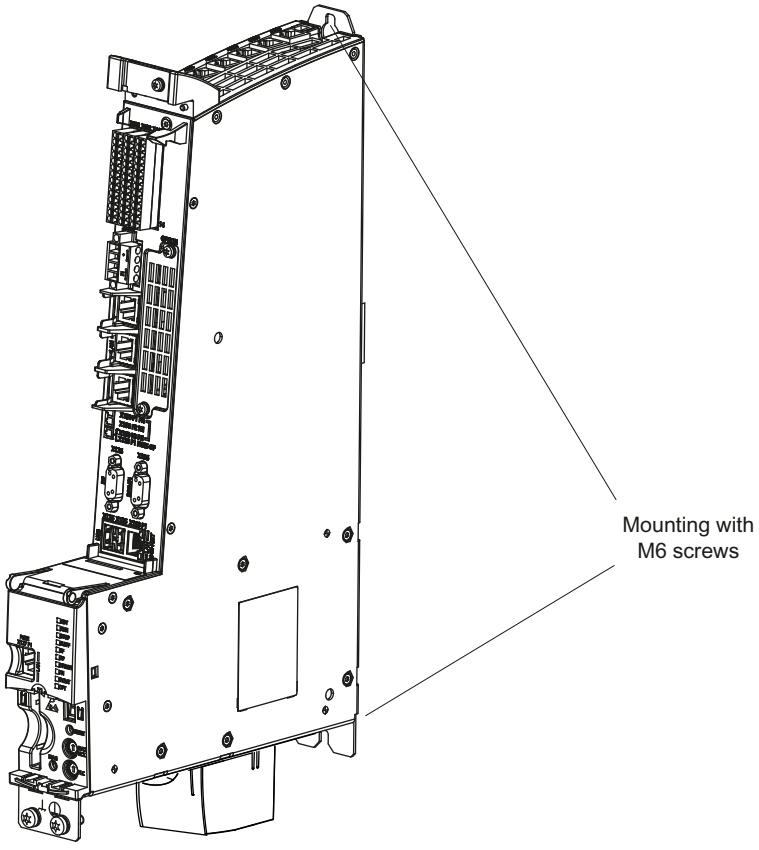

Figure 10-4 Mounting the control unit without spacers

Mounting the SIMOTION D445-2 and D455-2 without spacers (external air cooling)

Purpose of this type of installation

If you want to externally cool a Control Unit with cooling fins (D445-2 DP/PN and D455-2 DP/PN), it can be mounted directly on the rear wall of the control cabinet without spacers.

Requirements

- The bushing for the cooling fins (external heat sink) has been fitted in the rear wall of the control cabinet.
- Please ensure the area around the seal is both smooth and clean (② see "Panel cutout" figure).
- Seal available (for the article number, see the *SIMOTION D4x5-2* Manual, Section *Spare parts and accessories*)

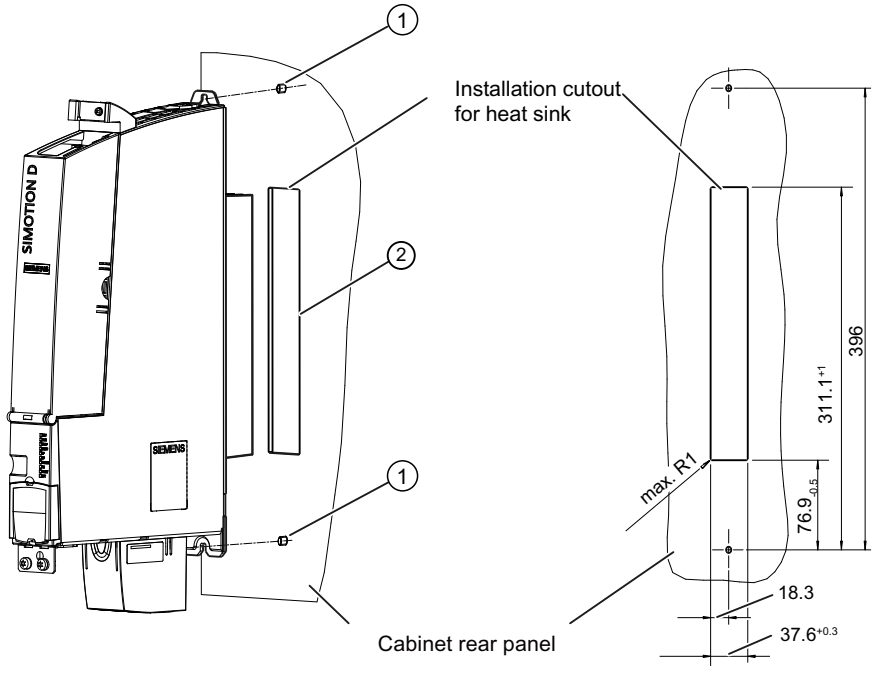

Figure 10-5 Panel cutout

Procedure

1. Remove the spacers (screws: M3, Torx T10).
2. Fit the seal around the cooling fins of the Control Unit.

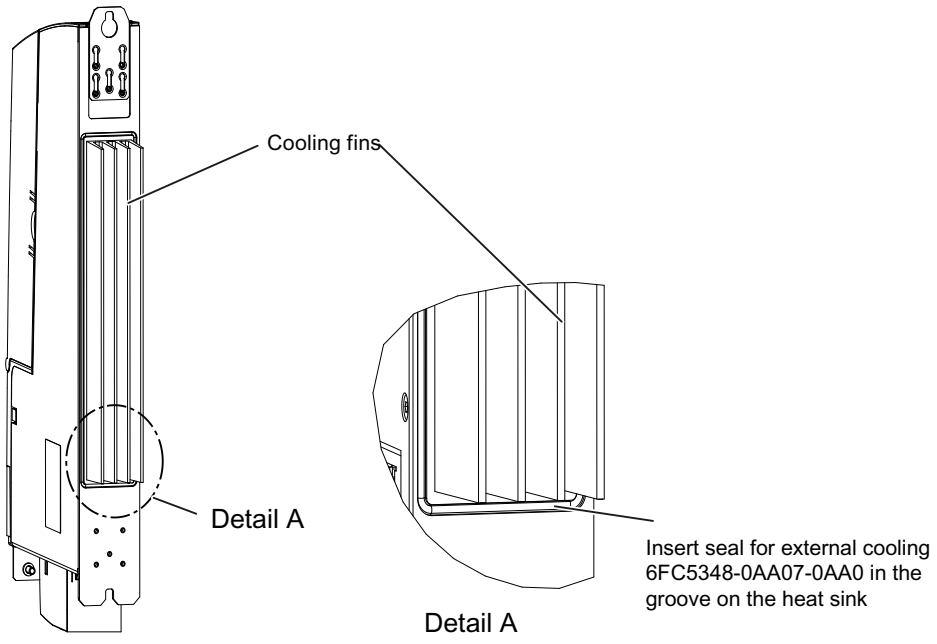

Figure 10-6 Mounting the seal

3. Loosen the three M3 screws (screws: M3, Torx T10) on the upper clip and push the clip up until the upper hole protrudes beyond the housing.
4. Tighten the 3 screws on the clip again (tightening torque 0.8 Nm or 7.1 lbf in).
5. Push the Control Unit with the heat sink through the panel cutout.
6. Fasten the Control Unit directly on the rear wall of the control cabinet with an M6 screw at the top and bottom, tightening torque: 6 Nm or 53.1 lbf in (see ① in the "Panel cutout" figure).

Fixing elements

The Controller Extension CX32-2 and the Control Unit CU320-2 can be mounted on the side wall of a SINAMICS S120 Line Module. The mounting elements required for this are included with the SINAMICS S120 Line Module and can be plugged if necessary.

- CU320-2: 3 mounting elements required
- CX32-2: 5 mounting elements required

Installation of the mounting elements

Table 10-8 Mounting the support brackets onto a Line Module in the booksize format

		Place the mount in the installation opening provided.	Use a suitable tool (such as a screwdriver) to push the mount in as far as it will go.	Installed mounts (3) (booksize compact format).

Removing the mounting elements

It is not possible to mount the D4x5-2 Control Units with lateral mounting elements.

If the mounting elements are already plugged in on the Line Module, we recommend removing these for flush mounting with the D4x5-2 Control Units.

Installing supplementary system components

Installing the TB30

Requirement

Note

The TB30 terminal board may only be inserted and removed when the D4x5-2 control unit and the terminal board are de-energized.

Procedure

The TB30 is installed in the option slot of the control unit.

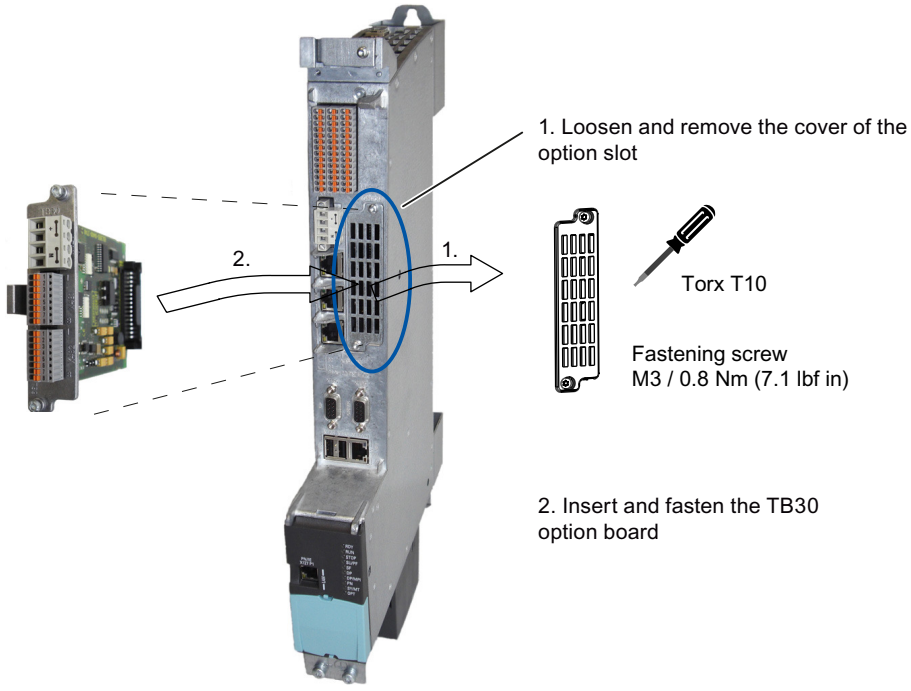

Figure 10-7 Installation of the TB30 terminal board using the D445-2 DP/PN as an example

Installing the CBE30-2

A second PROFINET interface can be implemented for the SIMOTION D4x5-2 DP/PN with the CBE30-2 Ethernet communication board.

The CBE30-2 cannot be used with the SIMOTION D4x5-2 DP.

Requirement

Note

The CBE30-2 Ethernet communication board may only be inserted and removed when the D4x5-2 DP/PN control unit and the CBE30-2 are de-energized.

Procedure

A CBE30-2 is installed in the option slot of the control unit.

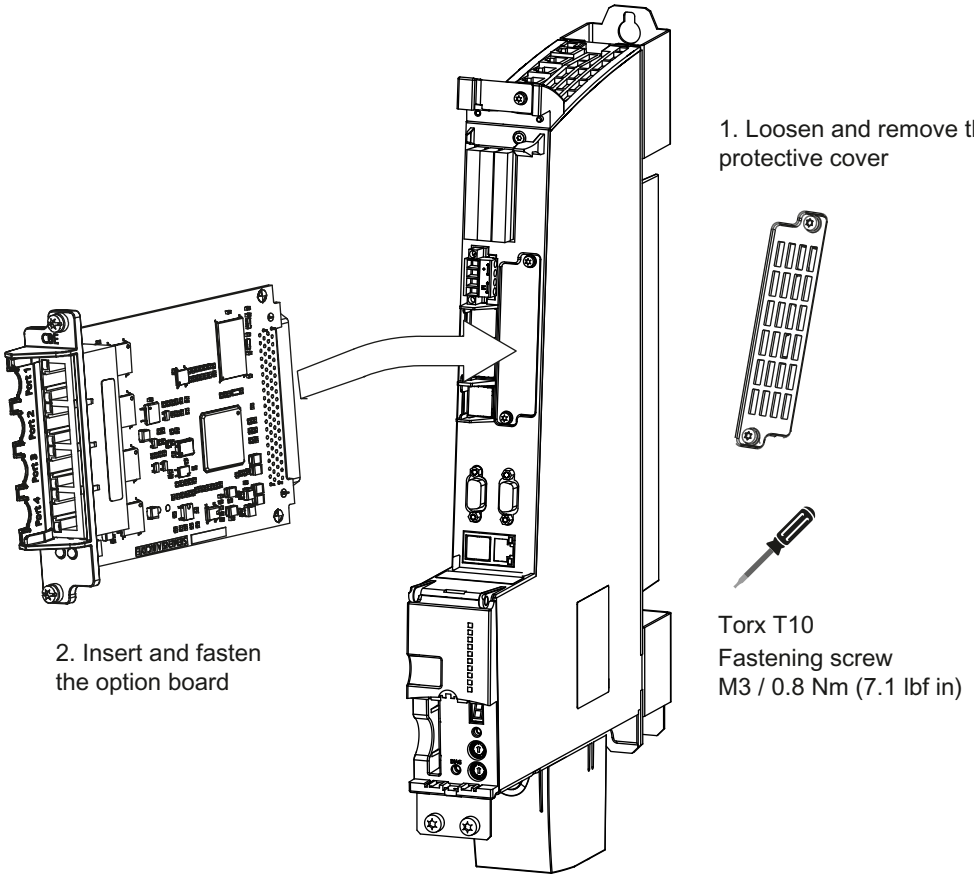

Figure 10-8 Installing the CBE30-2

Installing the CX32-2

Overview

The CX32-2 can be installed in several ways.

Mounting the CX32-2 directly on a Line Module in booksize format

The CX32-2 can be mounted on the side wall of a SINAMICS S120 Line Module. The mounting fixtures required for this are supplied with the SINAMICS S120 Line Module.

For more information on mounting the mounting elements, see also Section Fixing elements (Page 6929).

The SINAMICS S120 Line Module has five mounting fixtures on the left side. To mount the control unit, proceed as follows (the steps are shown in the figure):

1. Attach the CX32-2 to the left side of the SINAMICS S120 Line Module. Position the CX32-2 a few millimeters higher than the Line Module. The mounting fixtures fit exactly in the five cutouts on the module.
2. Push the two units together.
3. Press down on the module until the unit engages and is securely connected to the SINAMICS S120 Line Module.
   The module is now flush with the Line Module at the top and front.

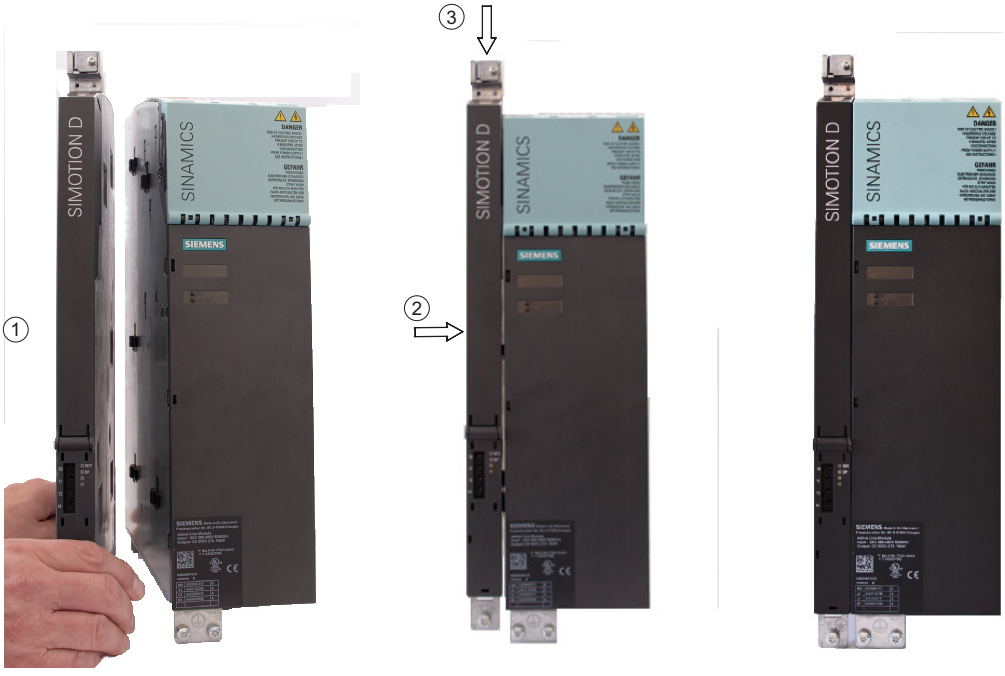

Figure 10-9 Steps in mounting the CX32-2 on a booksize Line Module

Mounting the CX32-2 on another CX32-2

A description with photos of opening the cover can be found in Section Removing the cover of the CX32-2 (Page 6938).

Table 10-9 Mounting a CX32-2 on another CX32-2

		
Opening the covers.	Unscrewing the screw (M3, Torx T10)	The bracket must be moved so that the pin is in the opening of the bracket. Tighten the screw (tightening torque 0.8 Nm or 7.1 lbf in).
		
Mounted bracket.	Closing the cover.	

Mounting the CX32-2 next to D4x5-2

If the CX32-2 is mounted next to a D4x5-2, the two modules can be mechanically connected with the bracket.

1. Loosen the screw (M3, Torx T10).
2. Disassemble the bracket at its original position.
3. Mount the bracket at the shield clamp, as shown in the following figure (tightening torque 0.8 Nm or 7.1 lbf in).

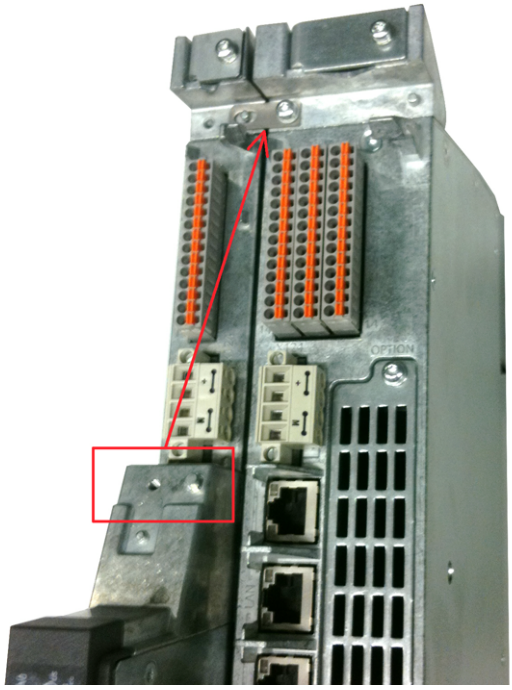

Figure 10-10 Mechanical connection CX32-2 with D4x5-2

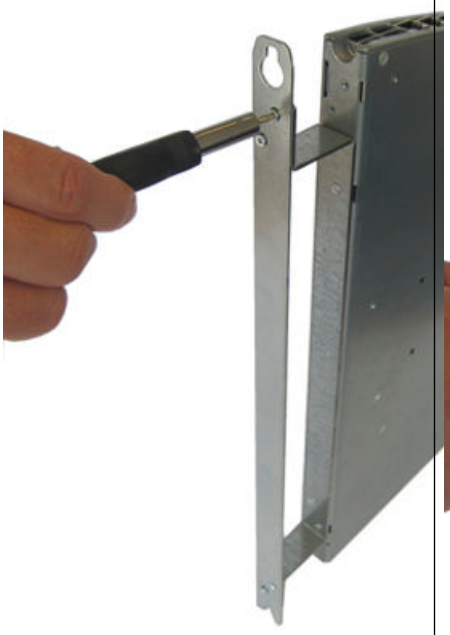
Mounting the CX32-2 directly on a mounting surface

A spacer is pre-assembled on the CX32-2. To mount the CX32-2 directly on a mounting surface, you must first disassemble the spacer as follows:

Table 10-10 Disassembling the CX32-2 spacer

Loosen the screws on the mounting rail (M3, Torx T10) and remove the rail.	Loosen the screws of the spacer (M3, Torx T10) and remove the spacer.	Fasten the mounting rail to the CX32-2 again without spacer (tightening torque 0.8 Nm or 7.1 lbf in).

The CX32-2 can now be mounted directly on a mounting surface, e.g. a wall of the control cabinet. Fasten it with 2 M6 screws / tightening torque 6 Nm or 53.1 lbf in.

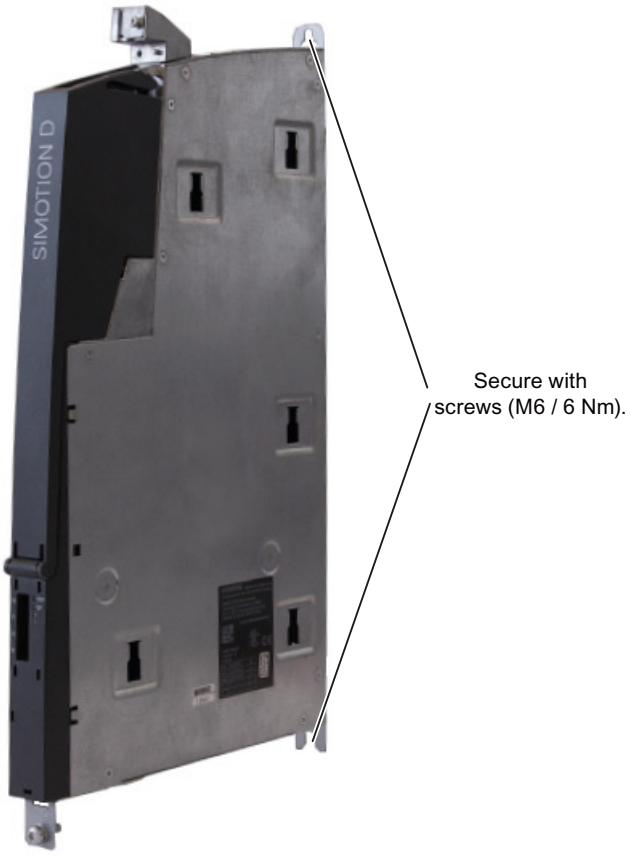


Figure 10-11 Mounting the CX32-2 on a mounting surface

CX32-2 with spacers on a mounting surface

To achieve the correct mounting depth for a booksize line-up with internal air cooling, a spacer is pre-assembled on the CX32-2. The spacer must then be fixed to the mounting surface.

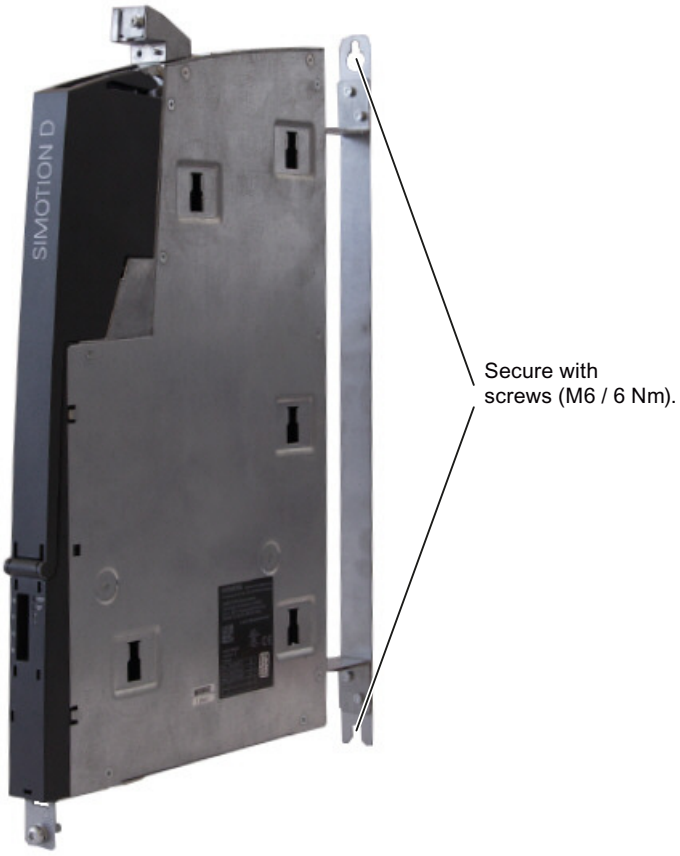

Figure 10-12 Mounting a CX32-2 with spacers

Removing the cover of the CX32-2

Actions to remove the cover of the CX32-2

Several steps are required to remove the cover:

- Release
- Swing open through approx. 45°
- Remove

Note that the cover can only be removed when it has been swung open through approx. 45°.

See also

Opening the front cover (Page 6949)

Alternative mounting position

Fundamentals

In applications in which a low overall height has to be achieved because of the mounting situation, the SIMOTION D4x5-2 control units together with the SIMOTION CX32-2 can be installed horizontally.

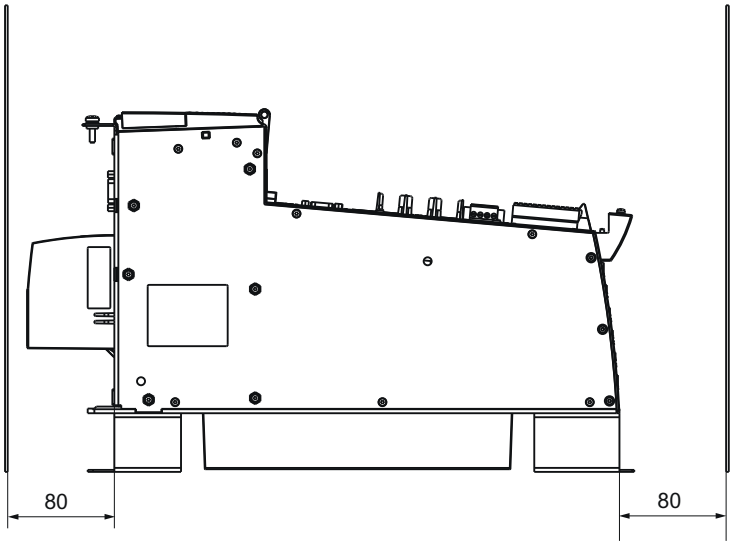

Figure 10-13 Installation of the SIMOTION D4x5-2 in a horizontal position

Requirements

Supported Control Units

The "horizontal" installation type has been released exclusively for the following Control Units:

Control Unit	Article number
SIMOTION D425-2 DP	6AU1425-2AA00-0AA0
SIMOTION D425-2 DP/PN	6AU1425-2AD00-0AA0
SIMOTION D435-2 DP	6AU1435-2AA00-0AA0
SIMOTION D435-2 DP/PN	6AU1435-2AD00-0AA0
SIMOTION D445-2 DP/PN	6AU1445-2AD00-0AA1 6AU1445-2AD00-0AA0
SIMOTION D455-2 DP/PN	6AU1455-2AD00-0AA0
SIMOTION CX32-2	6AU1432-2AA00-0AA0

Note

Mounting positions other than those described in this document are not permissible!

To achieve a low overall height with SINAMICS S120 power units, use SINAMICS S120 booksize compact power units or Power Modules in blocksize format connected via the CUA31/CUA32 Control Unit Adapter.

Heat dissipation

If SIMOTION D4x5-2 Control Units are mounted horizontally, a double fan / battery module is required as in the standard mounting position.

The double fan / battery module is always contained in the scope of delivery of the Control Unit for the SIMOTION D4x5-2.

⚠ CAUTION

Danger of injury or damage to property due to high surface temperature

SIMOTION D4x5-2 Control Units can have a high surface temperature particularly on the aluminum front and the top of the module especially with the "horizontal" installation type.

Perform a module and cable replacement only when the module has cooled down.

The ventilation spaces of 80 mm must be complied with, see Fig. "Installation of the SIMOTION D4x5-2 in a horizontal position". The control cabinet cooling concept must also ensure that the maximum air inlet temperature and the ambient temperature do not exceed 55° C.

Table 10-11 Requirements for the heat dissipation

Requirement	SIMOTION D4x5-2	SIMOTION CX32-2
Double fan/battery module	Always required	-
Clearances	80 mm (measured from the top or bottom edge of the module)	80 mm (measured from the top or bottom edge of the module)
Max. ambient temperature	55° C	55° C
Max. air inlet temperature	55° C	55° C

Mounting the D4x5-2 / CX32-2

The D4x5-2 / CX32-2 are fixed in the same way as in the standard "vertical installation" mounting position.

Requirements

If CX32-2 controller extensions are used, then to ensure mechanical stability

- the CX32-2 controller extensions and
- the CX32-2 controller extension with SIMOTION D4x5-2 control unit

must be connected to each other via a bracket.

Procedure

Like the standard "vertical installation on the control cabinet wall" mounting position, each module must be attached to a mechanically stable base via two M6 screws.

For the mechanical connection between two CX32-2, the screw (Torx 10) on the connection bracket must be loosened and the bracket turned so that the pin is in the opening of the bracket. The screw must then be tightened again with a torque of 0.8 Nm or 7.1 lbf in.

For the mechanical connection between the CX32-2 and the D4x5-2, the bracket must be disassembled from its original position and attached to the shield terminal.

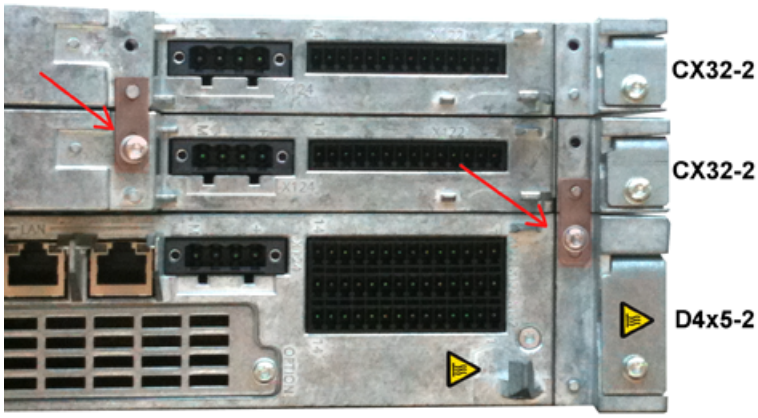

Figure 10-14 Mechanical connection of the CX32-2

Mounting without spacers

Like the standard "vertical installation" mounting position, mounting without spacers is also possible for the "horizontal" mounting position.

How spacers are removed is described in Section Installing the SIMOTION D4x5-2 (Page 6923).

Technical data / approvals / certifications

The same technical data, approvals and certifications apply for the "horizontal" mounting position as for the standard "vertical installation" mounting position.

The technical data can be found in the *SIMOTION D4x5-2* Manual.

10.1.1.4 Connecting

General Overview

Overview

The SIMOTION D4x5-2 has a number of interfaces that can be used for connecting the power supply and for communication with the other components of the system. To make these connections, the front cover of the SIMOTION D4x5-2 must be opened.

- The different SINAMICS components are interconnected via DRIVE-CLiQ.
- Actuators and sensors can be connected to the digital inputs/outputs.
- For communication purposes, the SIMOTION D4x5-2 can be connected to PROFIBUS DP, PROFINET IO with IRT/RT, MPI and Ethernet.

Overview of connections

The following overview shows examples of the various interfaces and their connection possibilities.

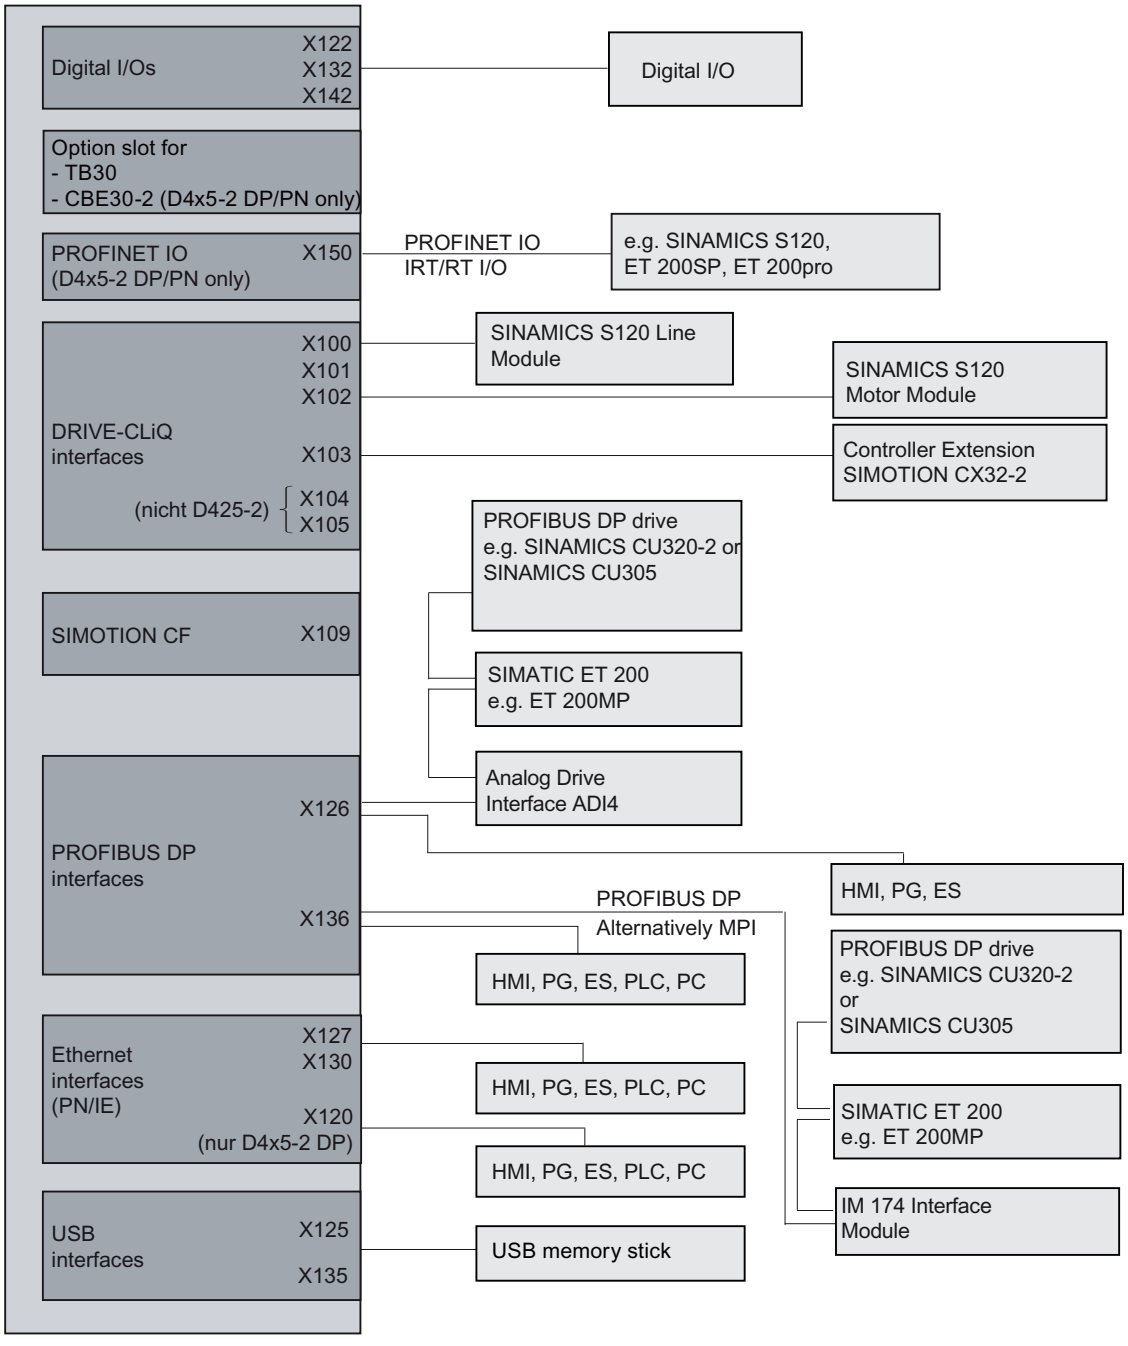

Figure 10-15 SIMOTION D4x5-2 DP and D4x5-2 DP/PN connection options

Electromagnetic compatibility

General

Electromagnetic compatibility (EMC) means that the devices function satisfactorily, without interfering with other devices and without being disrupted by other devices. The EMC requirements for "Variable-speed drive systems" (PDS, Power Drive System) are described in product standard IEC/EN 61800-3. A variable-speed drive system consists of a Control Unit, Line Module and Motor Module - as well as the associated electric motors, encoders and connecting cables. The driven machine is not part of the drive system.

Note

PDS as component of machines or systems

For the integration of PDS into machines or systems, additional measures may be required so that the product standards of these machines or systems are complied with. The machine or system builder is responsible for taking these measures.

Environments and categories

The EMC environments and categories are defined in the EMC Product Standard EN 61800-3, as follows:

Environments

IEC/EN 61800-3 differentiates between the first and second environments - and defines different requirements for these environments.

First environment

Residential buildings or locations at which the drive system is directly connected to a public low-voltage line supply without intermediate transformer.

Second environment

All locations outside residential areas. These are basically industrial areas which are supplied from the medium-voltage line supply via their own transformers.

Categories

IEC/EN 61800-3 differentiates between four drive system categories:

Category C1

Drive systems for rated voltages < 1000 V for unrestricted use in the first environment.

Category C2

Stationary drive systems for rated voltages < 1000 V for operation in the second environment.

The drive system must be installed by appropriately qualified and trained personnel. Additional measures are required for operation in the first environment.

Category C3

Drive systems for rated voltages < 1000 V - only for operation in the second environment.

Category C4

Drive systems for IT line supplies for operation in complex systems in the second environment. An EMC plan must be drawn up.

SIMOTION

SIMOTION D is designed for industrial use in accordance with Category C2.

Interference immunity

SIMOTION D and SINAMICS S120 are suitable for operation in the second environment. With regard to interference immunity, SIMOTION D and SINAMICS S120 can be used in the first and second environments.

Emitted interference

With regard to interference emission, to comply with the limit values in accordance with IEC/EN 61800-3 second environment, Category C2; in particular for the drive system, certain measures must be observed (EMC-conform installation by appropriately qualified and trained personnel, possibly required radio interference suppression filters, etc.) Observe the information on electromagnetic compatibility (EMC).

EMC notes

Note

Further notes can be found in the SINAMICS S120 Equipment Manuals for the Booksize and Blocksize power units in chapter "Control cabinet installation and EMC".

Note

Requirements for implementing EMC are listed in EN 61000-6-2, EN 61000-6-4, EN 61800-3, EN 60204-1 and in the "EMC Installation Guidelines" Configuration Manual. (https://support.industry.siemens.com/cs/ww/de/view/60612658)

Note

Conformance with the EMC Directive of the EC is ensured by following the measures described in the "EMC Installation Guideline" Configuration Manual.

Protective conductor connection and potential equalization

Requirement

You have mounted the Control Unit in the control cabinet.

The SIMOTION D4x5-2 Control Unit has a connection for the protective conductor and a connection for the equipotential bonding conductor:

- Screw M5, Torx T25
- Tightening torque: 3 Nm (26.6 lbf in)

Only one connection is available for the CX32-2 - this must be used both for the protective conductor and the equipotential bonding conductor.

Note

Requirements for functional safety for machines and systems; reliability and EMC are only guaranteed with original SIEMENS cables.

Note the following safety information:

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

Protective conductor connection

SIMOTION D and the SINAMICS S120 drive system are designed for use in cabinets with a protective conductor connection.

All system components and machine parts must be incorporated in the protection concept. The drive line-up must be arranged on a common bright mounting plate ① in order to comply with the EMC limit values. The connection ② establishes a low-impedance connection to the mounting plate.

The mounting plate must be connected to the protective conductor connection of the control cabinet. For this purpose, a connection ③ must be established to the protective conductor bar ④. The protective conductor bar ④ must be connected to the protective conductor ⑤.

The protective connection (PE connection) that is used for the motors ⑥ must be established through the motor cable.

For EMC reasons, the motor cable shield must be laid flat at both the Motor Module (MM) / Power Module (PM) and motor.

A protective connection ⑧ must also be established for components that are **not** connected with low impedance (e.g. control cabinet door via hinges ⑦).

Example: Booksize axis grouping comprising Control Unit (CU), Line Module (LM), and Motor Modules (MM) as well as drive in blocksize format comprising a Power Module (PM) with snapped on Control Unit (CU)

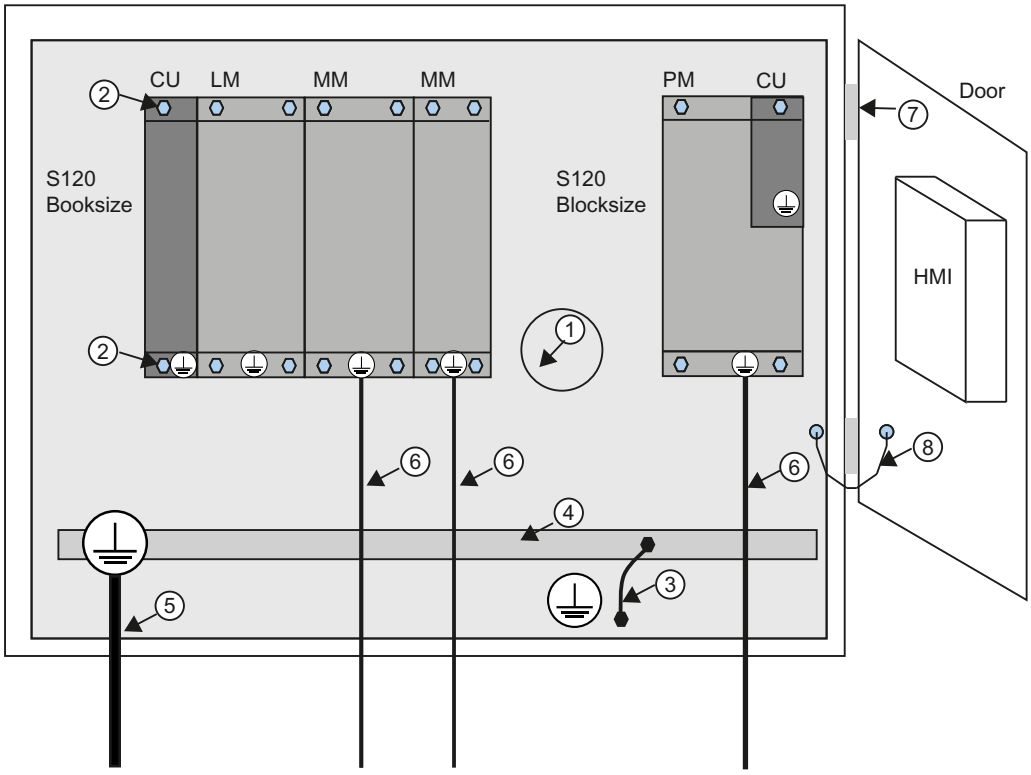

Figure 10-16 Protective conductor connection, cabinet with mounting plate / equipotential bonding surface

The protective conductor connections must be dimensioned as follows:

Table 10-12 Conductor cross-section for copper protective connections

Line supply cable in mm²	Copper protective connections in mm²
Up to 16 mm²	The same as the line supply cable
From 16 mm² to 35 mm²	16 mm²
From 35 mm²	0.5 x line supply cable

For materials other than copper, the cross-section should be increased so that as a minimum, the same conductivity is attained.

Equipotential bonding

A mounting plate serves simultaneously as an equipotential bonding surface. This means that no additional equipotential bonding is required within the drive line-up. If a common bright mounting plate is not available, then equally good equipotential bonding ⑨ must be established using cable cross-sections as listed in the table above or, as a minimum, with the same conductivity.

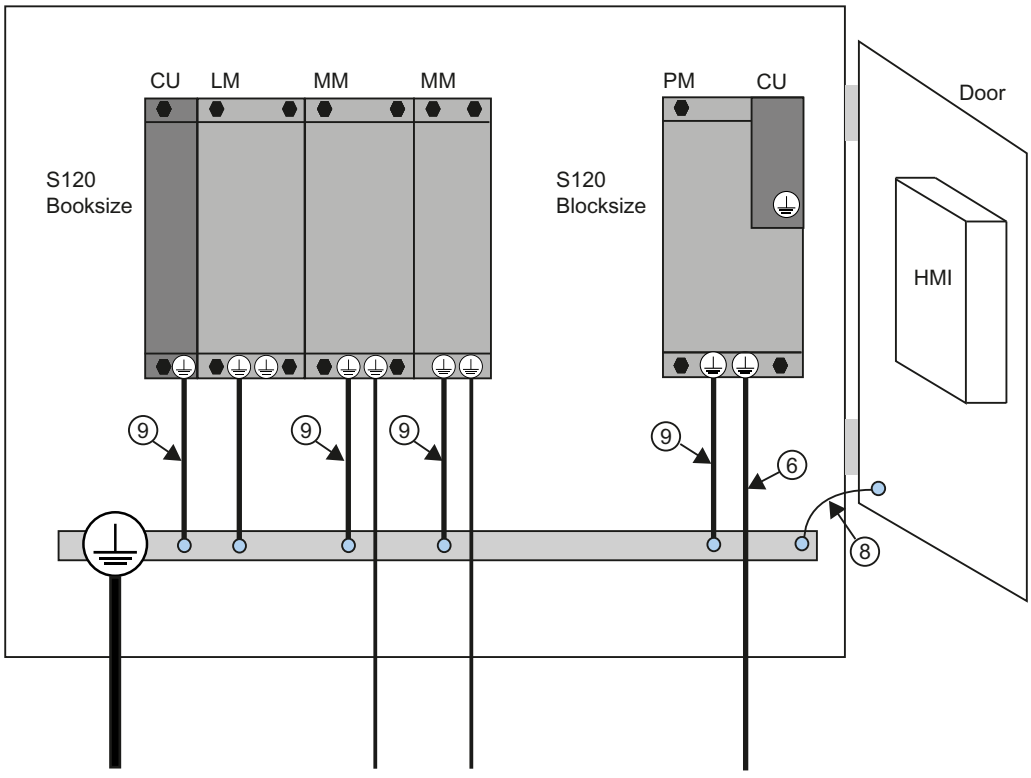

Figure 10-17 Protective conductor connection without equipotential bonding

Note

Ground potential and housing (PE) for the SIMOTION D4x5-2 and CX32-2 are connected internally with low impedance.

Communication links

Within the same control cabinet, no equipotential bonding conductor is required for fieldbus components if they installed as described above.

You have to ensure equipotential bonding for communication connections between remote components in a system (e.g. devices in different control cabinets) as well as between buildings or building sections.

If, for example, data cables (PROFIBUS, PROFINET, Ethernet or DRIVE-CLiQ) are routed through several control cabinets, equipotential bonding must be established with an equipotential bonding conductor. Install the equipotential bonding conductor together with the data cable.

The following minimum cross-sections are required according to IEC 60364-5-54:

- For copper, at least 6 mm²
- For aluminum, at least 16 mm²
- For steel, at least 50 mm²

NOTICE
Fault of the data link or device defect with missing equipotential bonding
Considerable leakage currents can flow via the data cable if equipotential bonding is not provided. Disturbance of the data link or device faults may result.
Install an equipotential bonding conductor together with the data cable.

Due to the maximum length of 100 m for PROFIBUS copper cable at 12 Mbit/s or for PROFINET copper cable and due to the electrical isolation, EMC protection and equipotential bonding aspects, it is recommended that fiber-optic cables be used for connections between buildings.

Additional information

Further information on the protective connection and equipotential bonding can be found in the following references:

- SINAMICS drive system: See the SINAMICS manuals
- PROFIBUS and PROFINET: See the following Internet address (http://www.profibus.com) (at Downloads)

Opening the front cover

Introduction

The interfaces on the front side of the D4x5-2 and the CX32-2 have a cover. This is opened by swinging the front cover down; the interface connections are then accessible and can be wired.

A hinge connects the front cover to the front of the housing. Once opened, the cover can be removed. The front cover is closed by swinging it up; it automatically locks by means of a hook at the top of the device housing.

Note

The cover of the D4x5-2 and CX32-2 can only be removed when it has been swung open through approx. 45°.

Procedure for D4x5-2 and CX32-2

1. Release the latch at the top on the inside of the front cover by pushing down the hook (see the following figure).
2. Remove the front cover with a forward motion.

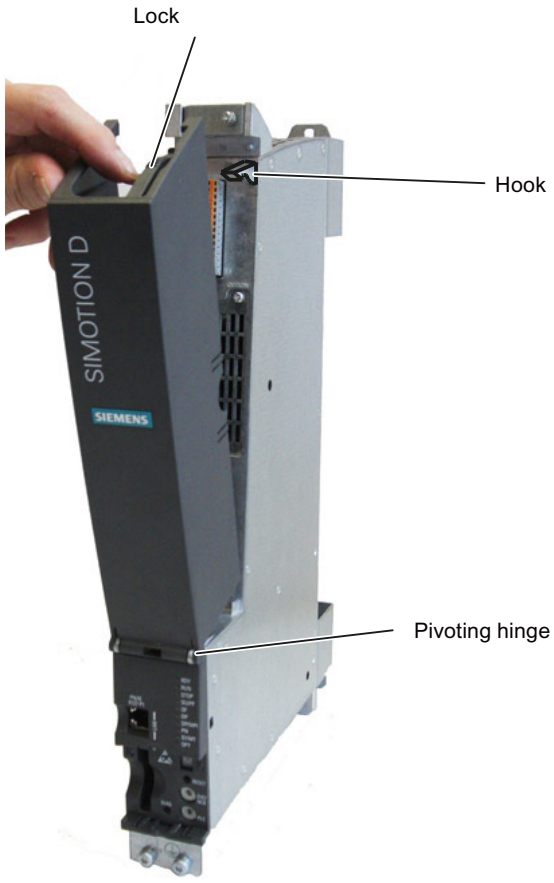

Figure 10-18 Opening the front cover using the D4x5-2 as an example

Note

All cables must be routed vertically upwards to the fullest extent possible so that the front cover can be closed. The front cover has an outlet for the upward routing of these cables.

Removing the cover of the CX32-2 (Page 6938)

Power supply

Safety rules

Basic rules

Because of the wide range of possible applications, only the basic rules for electrical installation are described in this section. At a minimum, you must comply with these basic rules to ensure problem-free operation.

Rules for safe operation

In order to ensure safe operation of your equipment, implement the following measures, adapting them to suit your conditions:

- An EMERGENCY STOP concept in accordance with the generally accepted rules of current engineering practice (e.g. European standards EN 60204, EN 418, and similar).
- Additional measures for end position limiting of axes (e.g. hardware limit switches).
- Equipment and measures for protection of motors and power electronics in accordance with the SINAMICS installation guidelines.
  To identify hazards, we also recommend that a risk analysis be conducted on the entire system in accordance with the basic safety requirements set out in Appendix 1 of the EU Machinery Directive.

Additional references

- Guidelines on Handling Electrostatically Sensitive Devices (ESD), see Appendix.
- For installing a system with SIMATIC ET 200 I/O (e.g. ET 200SP, ET 200MP, etc.), see the manuals for the relevant ET 200 I/O systems.
- As a further source of information on EMC, we recommend the *EMC Installation Guidelines / Basic System Requirements*Configuration Manual.
  Download: EMC (https://support.industry.siemens.com/cs/ww/en/view/60612658)

Standards and regulations

VDE guideline compliance

During wiring, you must observe the appropriate VDE guidelines, in particular VDE 0100 and VDE 0113 for tripping devices and short-circuit and overload protection.

System startup after certain events:

The following list identifies considerations required for startup of a system following certain events.

- If the system starts up again following a voltage drop or power failure, all hazardous operating states must be prevented from occurring. If necessary, force an EMERGENCY OFF.
- If the system starts up again after the EMERGENCY OFF apparatus is released, the startup must not be unchecked or undefined.

Mains voltage

Rules for the line voltage

The following list indicates what you must take into account for the line voltage:

- For stationary installations or systems that do not have all-pole line disconnect switches, the building installation must include a line disconnect switch or a fuse.
- For load power supplies and power supply modules, the rated voltage range set must correspond to the local line voltage.
- For all circuits, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance (see the technical data for the SIMOTION D and SINAMICS modules).

24 VDC supply

For...	Requirement	
Buildings	External lightning protection	Install lightning protection (e.g. lightning conductors).
24 VDC supply lines, signal lines	Internal lightning protection	
24 V supply	safe (electrical) isolation of the extra-low voltage	

Protection against external electrical interference

The table below shows how you must protect your system against electrical interference or faults.

Table 10-13 External electrical phenomena

For ...	Requirement
All plant or systems in which the component is installed	The plant or system is connected to a protective conductor for the discharge of electromagnetic interference.
Supply, signal, and bus lines	The wiring arrangement and installation complies with EMC regulations.
Signal and bus lines	A cable or wire break cannot lead to undefined states in the plant or system.

Additional references

The same installation instructions apply for the SIMOTION D4x5-2/CX32-2 control units as for the SINAMICS S120 CU320-2 control units with regard to EMC.
See the SINAMICS manuals.

Connecting the power supply

24 V DC power supply

Power is supplied by an external 24 V DC power supply. Power supplies from the SITOP family are suitable, for example.

The required 24 V DC load power supply is connected at the screw-type terminal block. The terminal block must be screwed on tightly using a flat-bladed screwdriver.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Implement the 24 V DC supply with safe separation as protective extra-low voltage.

When connecting an external 24 V DC power supply to the interfaces, it must meet the requirements of protective extra low voltage (PELV) according to UL 61010. A series fuse must also be used, which reliably trips within 120 seconds when a short-circuit occurs at an ambient temperature of 0 °C.

The contact gap of the fuse or the individual error-proof circuit must be ensured with 3.0 mm according to UL 61010 for a primary power supply from OVC III circuits up to 600 V AC (line-to-neutral voltage).

When using an external power supply, make sure that the fuse used has a tripping rating that corresponds to the maximum possible short-term short-circuit current of the power supply unit used.

Note

Ground potential and housing (PE) are connected internally with low impedance. Therefore, note the following:

- Insulation monitors in the 24 V power supply are not permitted.
- When using external power supplies (e.g. SITOP), you need to connect the ground potential to the protective conductor terminal (PELV).
- Sufficiently dimensioned equipotential bonding connections must be provided between the 24 V power supply and all grounded, locally separated loads. You can find information about equipotential bonding in the section Protective conductor connection and equipotential bonding (Page 6945).

Disconnecting 24 V plug-in connections during operation

Observe the following safety instructions when using SIMOTION D4x5-2/CX32-2:

⚠ WARNING

Personal injury and damage to property may occur

Personal injury and damage to property may occur if you disconnect 24 V plug-in connections during operation. Disconnecting 24 V plug-in connections is only permitted in a de-energized state.

Connecting the power supply

For the power supply wiring, use rigid or flexible cables with a conductor cross-section as stated in the *SIMOTION D4x5-2* Manual, Section "Interfaces... Power supply."

If you only use one wire per connection, a ferrule is not required.

You can use ferrules without an insulating collar in accordance with DIN 46228, Form A long version.

The following special requirements apply for the connection cables:

- The 24 V DC cable must be approved for temperatures up to 75 °C.
- The maximum permissible cable length is 10 m.
- Select the permitted conductor cross-section in accordance with the national regulations (NEC, VDE, etc.). The basis for this can be the output current of the 24 V DC supply or the overcurrent protection device used in the 24 V circuit. If the 24 V power supply unit that is used has a short-circuit current greater than 50 A, a corresponding overcurrent protection device, which limits to this value, must be used upstream of the product.
- The protective conductor must have a minimum cross-section according to EN 60204-1.
- Strip 7 mm of the cable for connection to the 24 V DC plug.
- Observe the permissible bending radius of the cables.
- Route all the cables so that they cannot be crushed or pinched.
- Route all of the cables in such a way that they do not come into contact with chafing edges.

Note

If power supply units with primary-side supplies up to 600 V AC (line-to-neutral voltage) have to be deployed, the transient voltages on the primary side of the power supply unit must be limited to 4000 V. Connect the device only to a 24 V DC power supply that is compliant with protective extra-low voltage (PELV) requirements according to UL 61010.

You can find information on the current consumption of SIMOTION D4x5-2 in the Power Supply section of the SIMOTION D4x5-2 Manual.

Pin assignments

For the pin assignment of the screw-type terminal block, see the *SIMOTION D4x5-2* Manual.

Connecting DRIVE-CLiQ components

DRIVE-CLiQ wiring

Introduction

The components of the SINAMICS S120 drive family and the SIMOTION D4x5-2 with CX32-2 are wired together by means of DRIVE-CLiQ. DRIVE-CLiQ is a communication system that enables the SIMOTION D4x5-2 to detect the connected components automatically. It provides a wiring tree whose topology can be visualized in SIMOTION SCOUT.

Note

For information on the number of DRIVE-CLiQ interfaces and their properties, refer to the *SIMOTION D4x5-2* Manual.

Rules for the DRIVE-CLiQ wiring

The following rules must be followed for DRIVE-CLiQ wiring:

- Ring wiring is not permitted
- Components must not be double-wired
- For a motor module, the power line for the motor and the associated motor encoder must be connected.

Further information on DRIVE-CLiQ wiring can be found

- In the *SINAMICS S120* Function Manual, Section *Rules for wiring with DRIVE-CLiQ*
- In the *SINAMICS S120 Control Units and Supplementary System Components* Manual

Example

The example in the following figure shows the rules for DRIVE-CLiQ wiring.

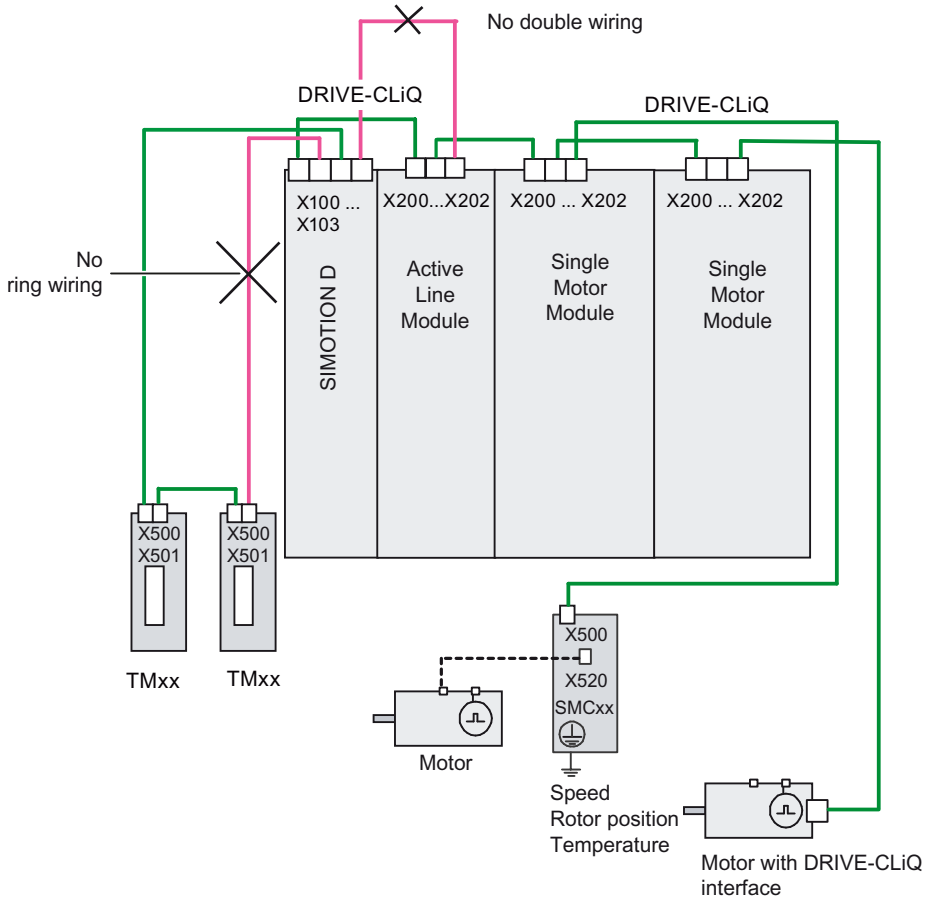

Figure 10-19 DRIVE-CLiQ wiring using the D425-2 as an example

Connectable DRIVE-CLiQ components

Components

As a general principle, all SINAMICS components approved for SIMOTION D can be connected directly to SIMOTION D or another DRIVE-CLiQ component using the DRIVE-CLiQ interface.

Table 10-14 DRIVE-CLiQ

Component	Description
CX32-2 controller extension	The CX32-2 enables scaling of the drive-side computing performance of the SIMOTION D4x5-2. Each CX32-2 can operate up to 6 additional servo, 6 vector or 12 *V/f* axes.
Line Module	Line modules (e.g. Active Line Modules) provide the DC-link voltage and can be connected via DRIVE-CLiQ depending on the module type.

Component	Description
Motor Module	Motor Modules are used to control motors. SMC modules for processing encoder signals, for example, can be connected to Motor Modules. Motor Modules are available in the version: • Single Motor Module (SMM) for connection of a motor • Double Motor Module (DMM) for connection of 2 motors
Motors with DRIVE-CLiQ interface	Motors with a DRIVE-CLiQ interface allow simplified commissioning and diagnostics, because the motor and encoder type are identified automatically.
SMx modules	SMx Sensor Modules allow the acquisition of encoder data from the connected motors via DRIVE-CLiQ.
TM15 and TM17 High Feature Terminal Modules	The TM15 and TM17 High Feature Terminal Modules are used to implement inputs for measuring inputs and outputs for cam outputs. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times. • TM15: 24 isolated bidirectional digital I/Os, with measuring input and output cam functionality • TM17 High Feature: 16 non-floating, bidirectional digital I/Os with measuring input and output cam functionality for the highest demands with respect to resolution, accuracy and short input delay times.
TM31 Terminal Module	TM31 provides 8 DI, 4 bidirectional digital I/Os, 2 relay outputs, 2 AI, 2 AO and 1 temperature sensor input (KTY84-130 or PTC).
TM41 Terminal Module	TM41 provides 4 DI, 4 bidirectional digital I/Os, 1 AI and 1 TTL encoder output.
TM54F Terminal Module	TM54F provides the following interfaces: 4 fail-safe DO (F-DO), 10 fail-safe DI (F-DI), 2 sensor power supplies with dynamic capability, 1 sensor power supply without dynamic capability and 4 DI to check the F-DO during a test stop.
DMC20/DME20	DRIVE-CLiQ hubs provide 4 more DRIVE-CLiQ interfaces. They can be used, for example, to establish point-to-point topologies. • DMC20 is the hub for the control cabinet configuration • DME20 is the hub for use without a control cabinet (IP67 degree of protection)
SINAMICS S120 Power Module (with CUA31/CUA32)	A SINAMICS Power Module in blocksize format can be connected using the CUA31/CUA32 control unit adapter. You will find more information on the CUA31/CUA32 in the *SINAMICS S120 AC Drive* Manual.

Example of axis grouping

The following figure shows a possible DRIVE-CLiQ wiring scheme for an axis grouping.

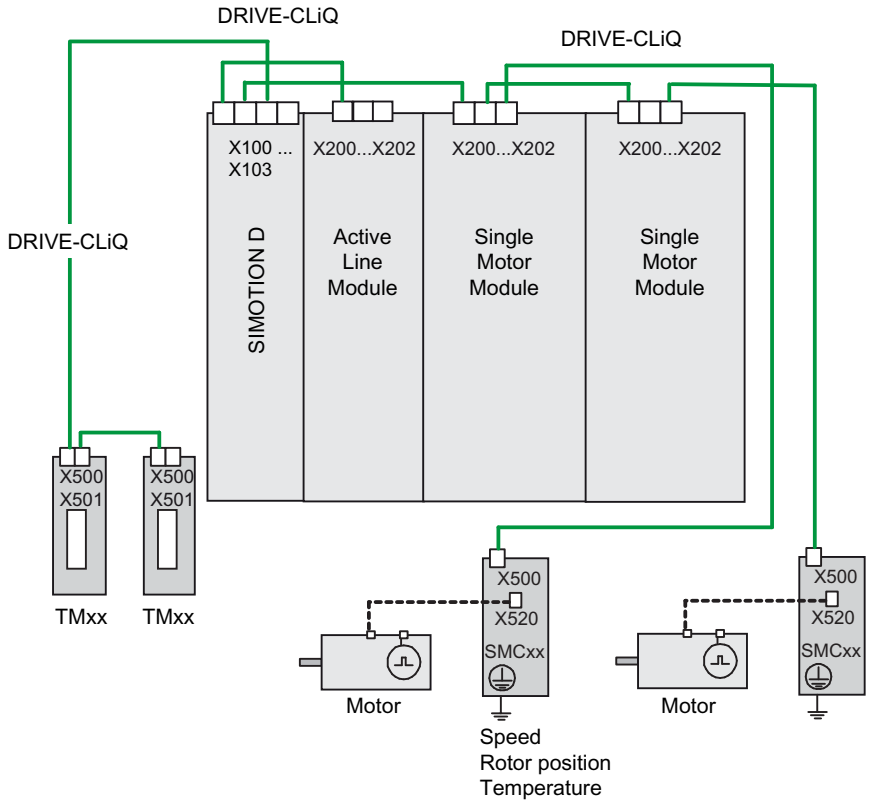

Figure 10-20 Axis grouping with DRIVE-CLiQ using the D425-2 as an example

Restrictions

Some "older" DRIVE-CLiQ components can no longer be used with the SIMOTION D4x5-2/ CX32-2. Refer to the Permissible combinations (Page 7206) for details.

Connecting the CX32-2

Installation/Mounting/Wiring

Information on installing, mounting and wiring the CX32-2 can be found in the *SIMOTION D4x5-2* Manual.

CX32-2 DRIVE-CLiQ topology

In contrast to other DRIVE-CLiQ components (e.g. terminal modules), special rules apply when wiring the CX32-2.

- Only a point-to-point topology is possible between the CX32-2 and SIMOTION D. Each CX32-2 needs its own DRIVE-CLiQ port on the SIMOTION D control unit.
- When a CX32-2 is inserted in an existing DRIVE-CLiQ connection (target port for CX32-2 is occupied, e.g. by a TM31), this connection is disconnected and replaced by the CX32-2 connection. The component that is freed up is moved to the component archive of the SINAMICS topology overview. A notice is displayed indicating that the component has been moved to the archive. The components must then be reassigned.
- A CX32-2 is inserted via **HW Config** (see Section Configuration of a CX32-2 (Page 7088)). Whereby the selection made for the PROFIBUS address automatically and permanently assigns the DRIVE-CLiQ port for connecting the CX32-2. Given that this assignment is permanent, the following points must be noted:
  - An inserted and configured CX32-2 cannot be connected to another DRIVE-CLiQ port without taking additional measures. Reconnecting a CX32-2 results in a discrepancy between the specified and actual topologies of the DRIVE-CLiQ components.
  - A cross-exchange of two occupied DRIVE-CLiQ ports is not permitted. Such an exchange results in inconsistencies in the specified-actual topologies.
  - Once it has been created in **HW Config**, the connecting port of a CX32-2 cannot be changed.
  - To change the connecting port of a CX32-2, the CX32-2 must be deleted from **HW Config** and recreated with another address.
  - To delete a CX32-2, it must be deleted from HW Config and then the configuration saved and compiled.
  - It is not possible to replace a control unit with six DRIVE-CLiQ ports (D435-2, D445-2 or D455-2) with a control unit with four DRIVE-CLiQ ports (D425-2) when a CX32-2 has been configured with address 14 or 15 (a control unit with four DRIVE-CLiQ ports does not have the DRIVE-CLiQ ports X104/X105 and consequently not the addresses 14 and 15).

– The previous CX32 version cannot be used on a D4x5-2, see Section Permissible combinations (Page 7206) in Migration of D4x5 to D4x5-2.

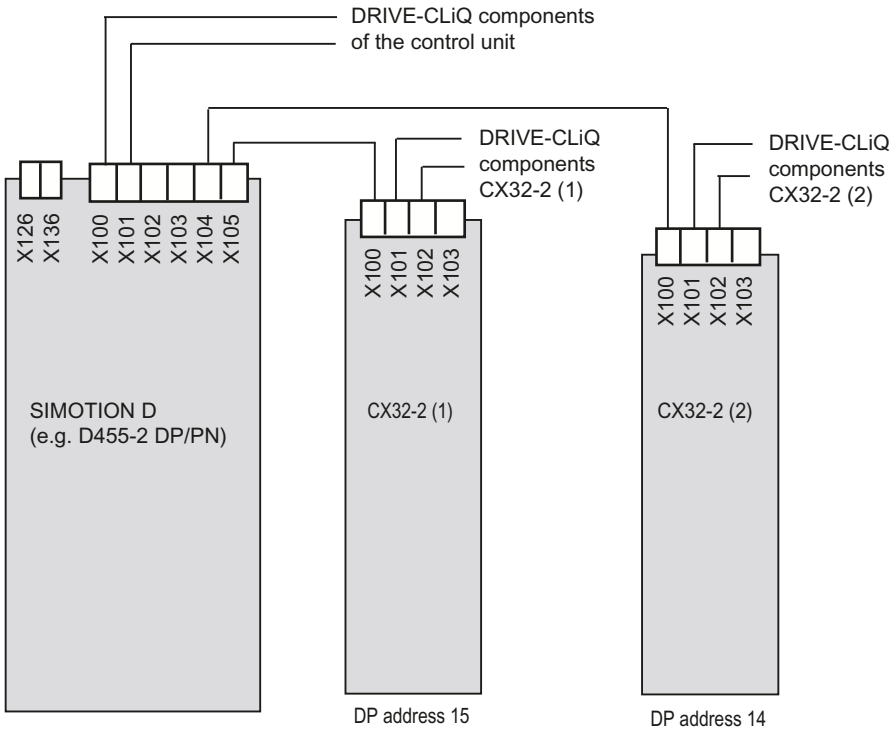

Figure 10-21 CX32-2 topology

See also

Quantity structures (Page 7199)

Additional references

Further information on the CX32-2 can be found in the *SIMOTION D4x5-2* Manual.

Connecting I/Os

Connection cables for the inputs/outputs of the D4x5-2, CX32-2, and TB30

For the input/output wiring, use rigid or flexible cables with a conductor cross-section as stated in the manual.

Ferrules are not mandatory.

You can use ferrules without an insulating collar in accordance with DIN 46228, Form A long version.

Note

To achieve optimum interference immunity, shielded cables must be used for connecting analog signals, measuring inputs or external zero marks.

Tools required

Screwdriver 0.4 x 2.0 mm

Wiring inputs/outputs

1. Strip back the cable insulation as stated in the manual, if necessary, press on a ferrule.
2. Wire the digital inputs and outputs for connection of the sensors and actuators.
3. Insert the cable into the appropriate spring-loaded terminal. This is easier when you use the screwdriver to push back the spring.

Additional references

For further information on cabling (e.g. use of rigid cables) and the pin assignment of the I/O -interfaces, see:

- *SIMOTION D4x5-2* Manual, Section "Digital inputs/outputs."
- *SIMOTION D4x5-2* Manual, Section "Controller Extension CX32-2."
- *SIMOTION D4x5-2* Manual, Section "Digital inputs/outputs."

Creating a shield connection

Using shielded cables

The following options are available for the shield connection when using shielded cables:

- A shield connection using a shielding bus supplied separately
- Shield connection via shield connecting element on the top of the SIMOTION D4x5-2/CX32-2 housing

Using a shielding bus

If a shielding bus is used, proceed as follows:

1. Attach the cable shield to a grounded shielding bus after the cable entry point in the cabinet. To do this, expose the cable shield of the cable.
2. Continue routing the shielded cable as far as the module, but do not make a connection to the shield there.

Using the shield connection on the D4x5-2/CX32-2

1. Unscrew the holding clamp of the shield connection at the top of the D4x5-2/CX32-2 until there is a space below the clamp (M3 screw, Torx T10).
2. Insert the cable. To do this, expose the cable shield first.
3. Tighten the fixing bracket so that the cable shield and cable are pressed against the shield connection (tightening torque 0.8 Nm or 7.1 lbf in).

This figure shows where to attach the cables to the front panel connector and where to apply the cable interference suppression using the shield connecting element.

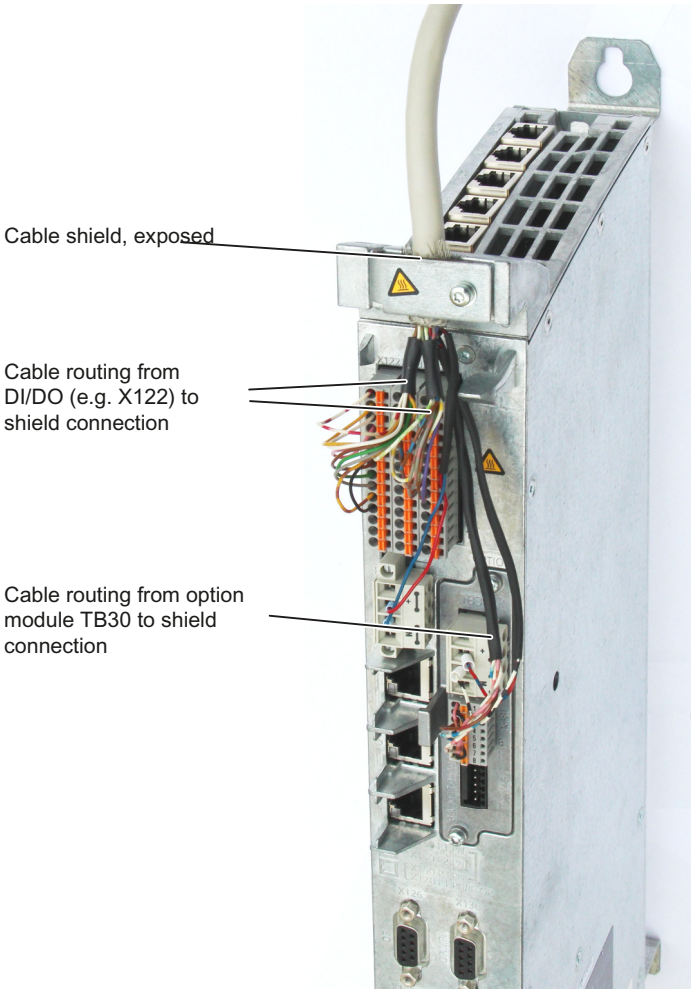

Figure 10-22 Shield connection using the D4x5-2 DP/PN as an example

Note

With a CX32-2, the shield is connected in the same way as the D4x5-2. A CX32-2 only has the X122 terminal block and the shield connection element is narrower on a CX32-2 than on a D4x5-2.

Connecting I/Os of the TB30

Pin assignment

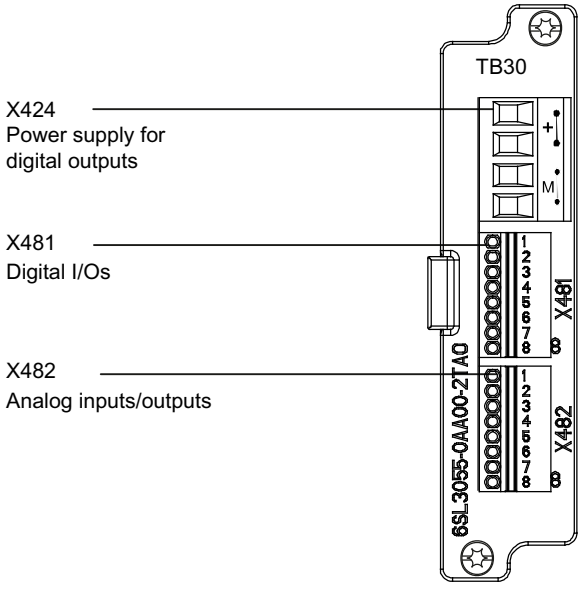

Figure 10-23 Interface arrangement on the TB30

Additional references

Detailed information about the pin assignment of the X424, X481 and X482 interfaces can be found in the *SIMOTION D4x5-2* Manual, Section "Supplementary system components".

Shield connection for TB30

The following figure shows the cable routing, cable connection and the connection of the I/Os on the TB30. The TB30 is inserted in a CU320-2 here.

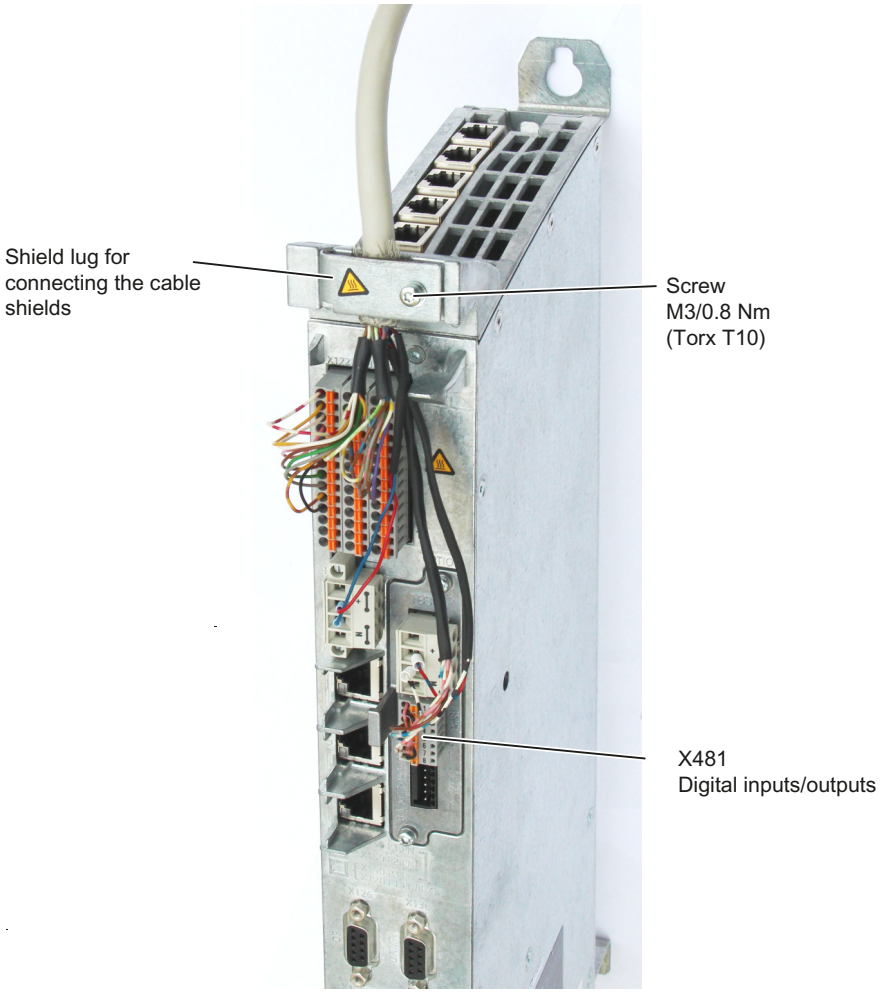

Figure 10-24 Shield connection for TB30 using the digital I/Os as an example

The arrangement is similar when inserted in a D4x5-2, see also Section Creating a shield connection (Page 6961) for more details.

The permissible bending radii for the cables must be maintained when the cables are being laid.

Connecting PROFIBUS/MPI

PROFIBUS connection components

Connection components

Individual nodes are connected by means of bus connectors and PROFIBUS cable. Remember to provide a bus connector with a programming port at the ends of the subnet. This will give you the option of expanding the subnet if required (for example, for a programming device or SIMATIC HMI device).

Use RS 485 repeaters for the connection between segments and to extend the cable.

Segments

A segment is a bus cable between two terminating resistors. A segment can contain up to 32 nodes. In addition, a segment is limited by the permissible cable length, which varies according to the transmission rate.

Terminating resistor

A cable must be terminated with its own surge impedance to prevent line disturbances caused by reflections. Activate the terminating resistor at the first and last node of a subnet or segment.

Make sure that the nodes to which the terminating resistor is connected are always supplied with voltage during power-up and operation.

PROFIBUS cables and connectors

Properties of PROFIBUS cables

The PROFIBUS cable is a two-core, twisted and shielded cable with defined properties:

Properties of the cables

Table 10-15 Properties of PROFIBUS cables

Characteristics	Values
Characteristic impedance	Approximately 135 to 160 Ω (f = 3 to 20 MHz)
Loop resistance	≤ 115 Ω/km
Effective capacitance	30 nF/km
Damping	0.9 dB/100 m (f = 200 kHz)
Permissible conductor cross-section	0.3 mm^2 to 0.5 mm^2
Permissible cable diameter	8 mm + 0.5 mm

Connector features

The bus connector is used to connect the PROFIBUS cable to the PROFIBUS DP interfaces (X126, X136), thus establishing a connection to additional nodes.

Only bus connectors with a 35° cable outlet should be used in order to ensure that the front cover can be closed.

See also

SIMOTION D4x5-2 Manual, Section "Spare parts and accessories which can be ordered"

Length of PROFIBUS cables

Cable lengths and baud rate

The baud rate determines the cable length of a subnet segment.

Table 10-16 Permitted cable length of a subnet segment for specific baud rates

Baud rate	Max. cable length of a segment (in m)
19.6 to 187.5 kbit/s	1000 [1]
500 kbit/s	400
1.5 Mbit/s	200
3 to 12 Mbit/s	100

[1] With isolated interface

Longer cable lengths

If you must implement longer cable lengths than permitted in one segment, you must use RS 485 repeaters. The maximum possible cable lengths between two RS 485 repeaters correspond to the cable length of a segment. You can connect up to nine RS 485 repeaters in series.

Note that an RS 485 repeater must be counted as a subnet node when determining the total number of nodes to be connected, even if it does not have its own PROFIBUS address.

Rules for the laying of PROFIBUS cables

Laying of bus cable

During laying of the PROFIBUS cable, you must:

- Not twist the cable
- Not stretch the cable
- Not squeeze the cable

Supplementary conditions

In addition, when laying a bus cable for indoor use, you must take into account the following supplementary conditions (dA = external cable diameter):

Table 10-17 Supplementary conditions for the laying of PROFIBUS cables

Characteristics	Supplementary conditions
Bending radius for a single bend	80 mm (10xdA)
Bending radius for multiple bends	160 mm (20xdA)
Permissible temperature range for cable routing	-5° C to +50° C
Temperature range for storage and stationary operation	-30° C to +65° C

Additional references

Length codes for prefabricated cables can be found in:

- Catalog *SIMOTION PM 21*
- *IK PI Industrial Communication* Catalog

Connecting PROFIBUS DP (interfaces X126 and X136)

PROFIBUS cables are connected to the corresponding interface via a bus connector.

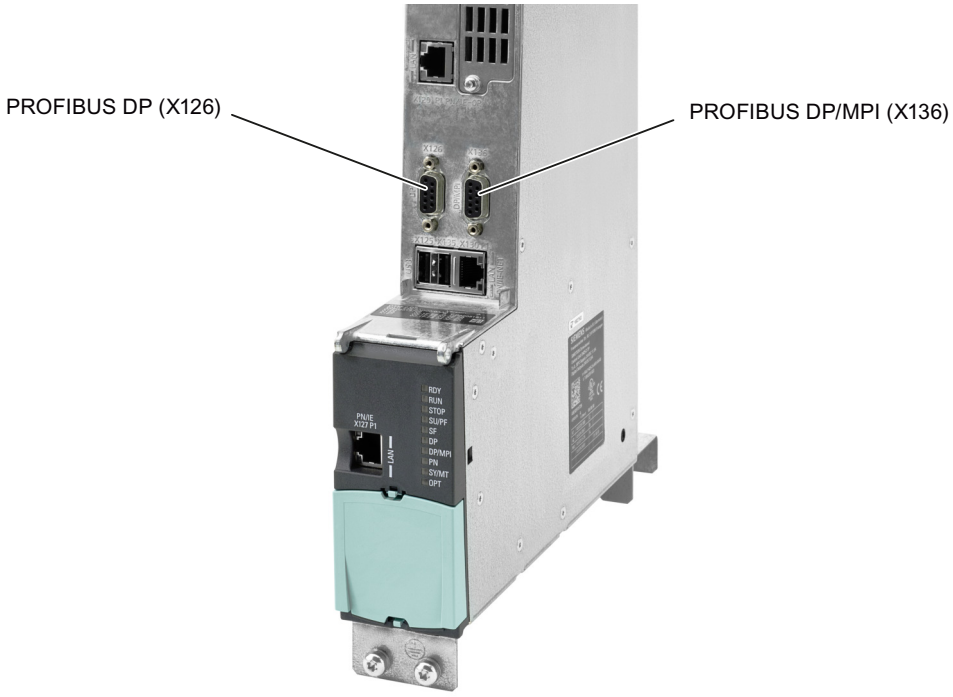

Figure 10-25 Connecting PROFIBUS DP

Connecting the bus connector

Proceed as follows to connect the bus connector:

1. Plug the bus connector into the corresponding interface of the Control Unit.
2. Screw the bus connector into place.
   If the Control Unit is located at the start or end of a segment, you must switch on the terminating resistor ("ON" switch setting).

Figure 10-26 Terminating resistor "switched on and off"

Note

Make sure that the nodes at which the terminating resistor is located are always supplied with voltage during startup and operation.

Removing the bus connector

You can remove the bus connector with a looped-through bus cable from the PROFIBUS DP interface at any time without interrupting data traffic on the bus.

NOTICE
Data communication disturbed because bus terminator missing
A bus segment must be terminated at both ends with a terminating resistor. This is not the case if the last bus connector node is de-energized, for example. Because the bus connector takes its voltage from the station, this terminating resistor is ineffective.
Make sure that the stations at which the terminating resistor is connected are always energized.

Adapter plug

An adapter plug (Article No. 6FX2003-0BB00) is required when the bus cable has to be looped through the PROFIBUS interface (X126; two PROFIBUS cables wired to the plug) and also

- Ethernet interface X120, in the case of D4x5-2 DP or
- PROFINET interface X150 for D4x5-2 DP/PN Port 3

has to be wired to a FastConnect plug.

When using the adapter plug, the PROFIBUS connector is higher, which creates extra wiring space.

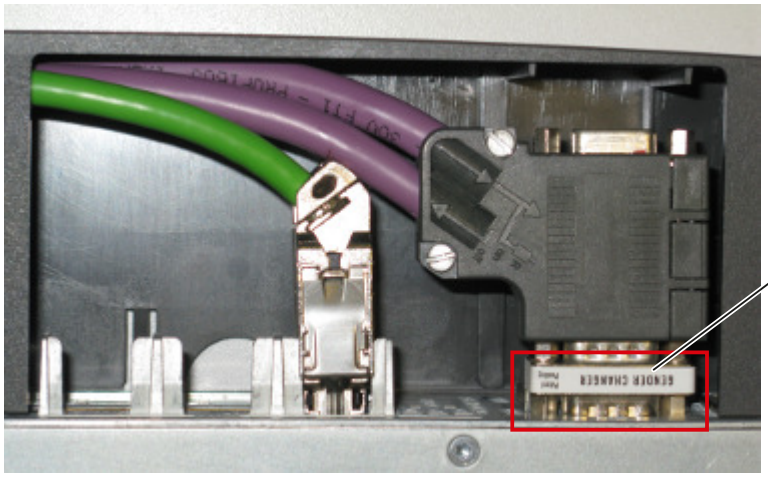

Figure 10-27 SIMOTION D4x5-2 DP/PN with adapter plug

PROFIBUS cables and connectors (Page 6965)

Length of PROFIBUS cables (Page 6966)

Connection rules in the PROFIBUS subnet

Introduction

There are a number of rules for configuring and installing cables for PROFIBUS networks to ensure seamless communication over PROFIBUS. These rules apply to both configuring and cabling as well as address assignment for the different network nodes.

Connection rules

- **Before** you interconnect individual nodes in a subnet, you must assign a unique PROFIBUS address to each node.
- Narrow down the number of nodes by limiting the PROFIBUS addresses to the highest address in the network.
  Tip: Mark the address on the housing of all nodes in a subnet. Then you can always see which address is assigned to which node in your system.
- Connect all nodes in a subnet "in series". No spur lines may be routed to the PROFIBUS DP. In addition, integrate the programming devices and SIMATIC HMI devices for commissioning or servicing in the subnet in series.
- If you operate more than 32 nodes on a subnet, you must use RS 485 repeaters to connect the bus segments. More detailed information can be found in the description of the RS 485 repeater, see the *S7-300 Automation Systems, Module Data* Manual.
  In a PROFIBUS subnet, all segments combined must have at least one DP master and one DP slave.
- Use RS 485 repeaters to connect ungrounded bus segments and grounded bus segments.

- The maximum number of nodes per bus segment decreases with each RS 485 repeater. This means that when a bus segment contains an RS 485 repeater, the bus segment can contain no more than 31 additional nodes. However, the number of RS 485 repeaters does not affect the maximum number of nodes on the bus.
- Up to 10 segments can be connected in a row (max. 9 repeaters).
- **At least** one terminator must be supplied with **5 V**.
  To accomplish this, the PROFIBUS DP connector with an activated terminating resistor must be connected to a device that is switched on.
- Before inserting a new node on the subnet, you must switch off its supply voltage.
  The station must be inserted **first** and then switched on.
  When a station is disconnected, the connection must **first** be deactivated and then the connector withdrawn.
- The bus line of a segment must be terminated at **both ends**. This is achieved by switching on the terminating resistor in the PROFIBUS DP connector at the first and last node and switching off the other terminating resistors.

Example

This illustration below shows an example configuration of a subnet with D4x5-2.

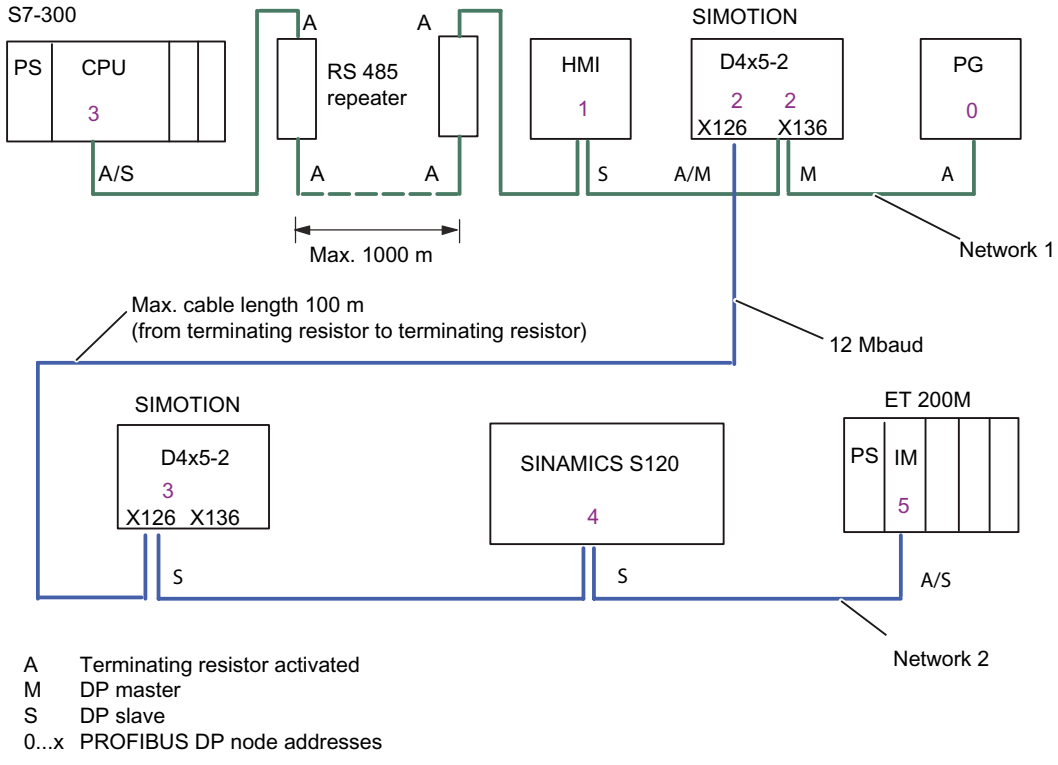

Figure 10-28 Networking example for a D4x5-2

Operating the X136 interface as MPI

Applications

The X136 interface can also be operated as an MPI interface instead of a PROFIBUS DP interface. The typical (default) baud rate is 187.5 Kbaud. A baud rate of up to 12 MBaud can be set for communication with other CPUs. It should be noted, however, that a rate of 12 MBaud is not supported by all CPUs (e.g. smaller SIMATIC S7 CPUs).

The following list provides examples of when using MPI (multi-point interface) may prove effective:

- If a PC/PG is being used with an MPI interface
- If an OP/TP only has an MPI interface
  (newer devices have PROFIBUS or PROFINET interfaces)
- If SIMOTION and SIMATIC CPUs are coupled via XSEND / XRECEIVE

When communicating with XSEND/XRECEIVE, there is no need to configure the connection in **NetPro**. XSEND/XRECEIVE can be used via PROFIBUS or MPI.

- Via PROFIBUS: For communication between SIMOTION devices
- Via MPI: For communication between SIMOTION and SIMATIC S7 devices
  The SIMOTION interface must be connected to the MPI interface of the SIMATIC S7 devices. Connection via PROFIBUS is not possible.
  The baud rate of the SIMATIC S7 device must be set at the SIMOTION interface (see documentation for the relevant SIMATIC S7 devices).

Operate MPI like PROFIBUS

The information on wiring the connector (terminating resistors) and the rules for routing of cables for PROFIBUS apply to this interface as well. When carrying out this procedure, consult the relevant references.

Connector features

The bus connector is used to connect the MPI bus cable to the MPI interface (X136). This enables you to establish connections to additional nodes (e.g. PG or SIMATIC S7-CPU). Only bus connectors with a 35° cable outlet should be used in order to ensure that the front cover can be closed.

Additional information

See *SIMOTION D4x5-2* Manual, Chapter *Available spare parts and accessories*.

MPI bus cable

The PROFIBUS cable specifications apply here as well;

Please note the relevant information on setting up an MPI network.

Setting up an MPI network

Keep in mind the following basic rules when setting up an MPI network:

- When using the interface as an MPI interface, it is not possible to arrange additional control for a drive in isochronous mode or to connect distributed I/Os to this interface.
- An MPI bus line must be terminated at both ends. This is achieved by activating the terminating resistor in the MPI connector in the first and last station and deactivating the other terminating resistors.
- At least one terminator must be supplied with 5 V.
  This means that an MPI connector with an activated terminating resistor must be connected to a device that is switched on.
- Spur lines (cables leading from the bus segment to the station) should be as short as possible, that is, < 5 m in length. Unused spur lines should be removed wherever possible.
- Every MPI station must be connected to the bus first and then activated.
  To disconnect the station, it must first be deactivated. Then, the station can be removed from the bus.
- Maximum cable lengths:
  - 200 m per bus segment
  - 2,000 m total length with RS 485 repeaters

Note

You can also use intelligent DP slave functionality for PROFIBUS communication between CPUs.

Connecting PROFINET IO components

Wiring PROFINET

Procedure

As standard, a SIMOTION D4x5-2 DP/PN has a PROFINET IO interface with three ports.

The SIMOTION D4x5-2 DP/PN control units can be expanded by an additional PROFINET IO interface with four ports. For this purpose, a CBE30-2 must be inserted in the option slot of the control unit.

Suitable PROFINET cables and connectors must be used for the PROFINET connection. The autocrossing functionality of the PROFINET interfaces means crossed as well as uncrossed cables can be used.

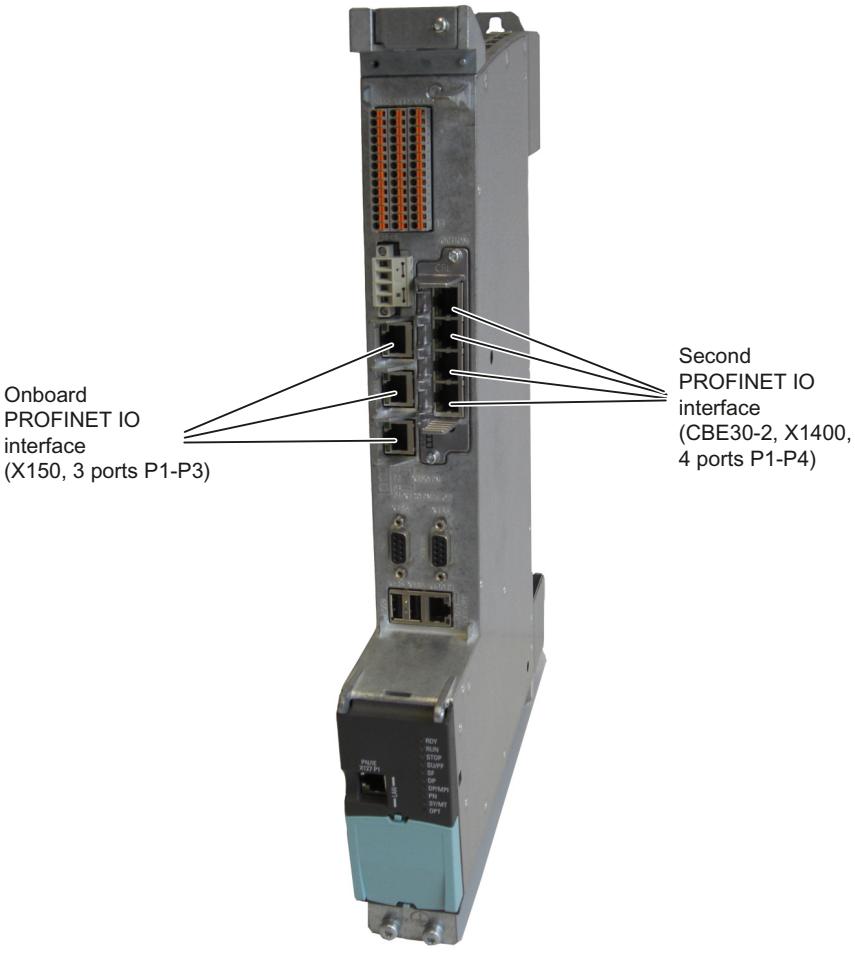

Figure 10-29 Connecting PROFINET IO

Mixed operation of IRT and RT

For mixed operation of IRT and RT, note that the IRT-capable devices must form a so-called IRT domain, i.e. there must not be any non-IRT devices on the data transmission link between the IRT devices.

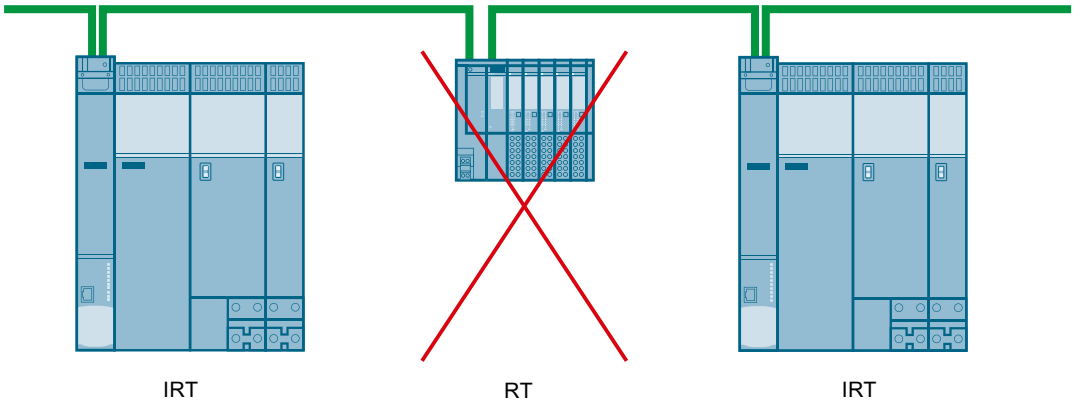

Figure 10-30 Mixed operation of IRT and RT

PROFINET cables and connectors

Cable and connector types

Note

For connecting PROFINET IO to D4x5-2, a connector with a 145° cable outlet is recommended (IE FC RJ45 plug 145).

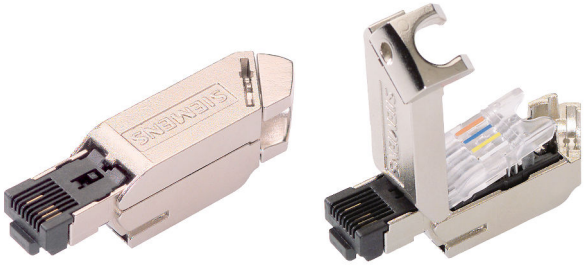

Figure 10-31 RJ45 PN connector with a 145° cable outlet

Additional references

For further information about the cables, connectors, and stripping tool, see

- Section "Spare parts and accessories" in the *SIMOTION D4x5-2* Manual
- Catalog *IK PI Industrial Communication*.

Connecting Ethernet

Wiring Ethernet

Procedure

To the 8-pin RJ45 sockets

- X127 P1
- X130 P1
- X120 P1 (only for D4x5-2 DP)

you can connect Industrial Ethernet.

The interfaces support a transmission rate of 10/100/1000 Mbit/s. Suitable Ethernet cables and connectors must be used for the Ethernet connection.

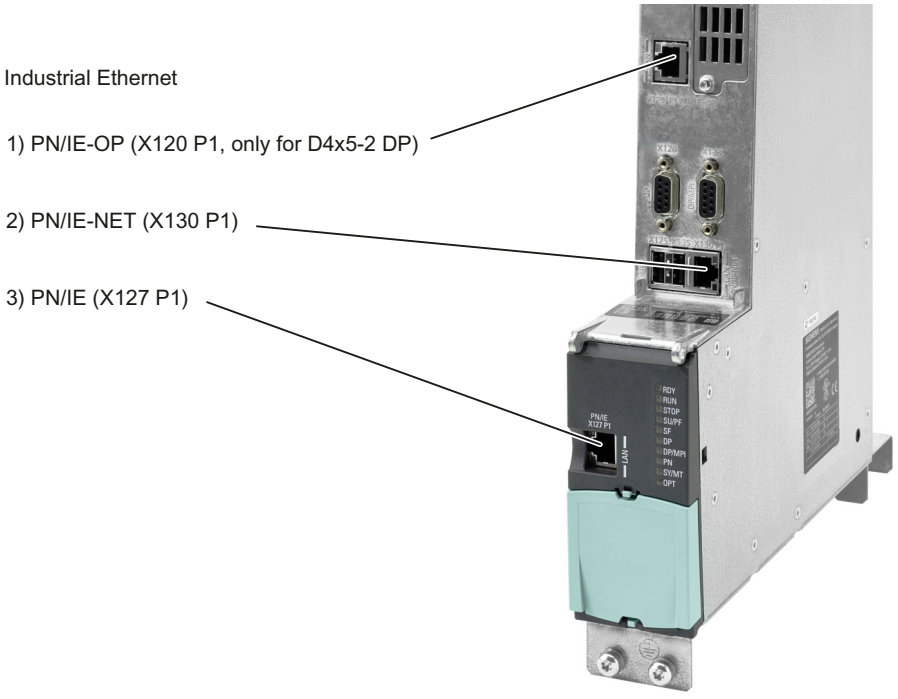

Figure 10-32 Connecting Industrial Ethernet

Note

As of V4.3, the three Ethernet interfaces support the PROFINET basic services - they therefore have the designation PN/IE-NET, PN/IE-OP or PN/IE.

These PROFINET basic services (e.g. DCP, LLDP, SNMP) provide uniform functions for the address assignment and diagnostics, but do not provide PROFINET IO communication for the connection of drives, I/O modules, etc.

Ethernet cables and connectors

Characteristics of the cables

A shielded twisted pair cable is used for the networking.
The transmission rate of the cable is determined as follows by the number of core pairs:

- 2 x 2 cores support 10/100 Mbit/s
- 4 x 2 cores support 10/100/1000 Mbit/s

Recommended connecting cables

The following cables are available:

- SIMATIC NET, Industrial Ethernet TP XP CORD RJ45/RJ45
  - TP cable prefabricated with 2xRJ45 connectors
  - Crossed send and receive cable
  - Article No.: 6XV1870-3R□□□ (□□□ - length code)
- SIMATIC NET, Industrial Ethernet TP CORD RJ45/RJ45
  - TP cable prefabricated with 2xRJ45 connectors
  - Uncrossed send and receive cable
  - Article No.: 6XV1870-3Q□□□ (□□□ - length code)

The autocrossing functionality of the Ethernet interfaces means crossed as well as uncrossed cables can be used.

Autocrossing

Per default, the Ethernet interfaces are set to "Automatic setting" in HW Config, so that autocrossing is available.

The settings can be found in the port properties (e.g. X127 P1) in the module rack of HW Config (SIMOTION < V4.3: Setting via HW Config "D4x5-2 Properties" > "Ethernet extended").

Autocrossing is deactivated with "Manual setting". As the Ethernet interfaces of the D4x5-2 are wired as Ethernet terminal, in this case you must use crossed cables for the networking with a PG/PC or another D4x5-2.

If the communication peer has autocrossing (e.g. PC, switch or hub), crossed and uncrossed cables can be used.

Additional references

For further information about the cables and connectors, see the *Industrial Communication IK PI* Catalog.

Routing

Routing describes the cross-network transfer of information from Network x to Network y.

Routing on SIMOTION D

Routing between the different interfaces

The Ethernet interfaces of the D4x5-2

- X127 P1 and X130 P1 (for D4x5-2 DP/PN) or
- X127 P1, X120 P1 and X130 P1 (for D4x5-2 DP)

each form a separate IP subnet.

The D4x5-2 DP/PN onboard PROFINET IO interface (X150, P1-P3) and the optional second PROFINET IO interface with CBE30-2 (X1400, P1-P4) also each form a separate IP subnet. All ports of a PROFINET IO interface always belong to the same IP subnet.

- IP routing from IP subnet to IP subnet is not supported. You can use an external IP router for this
- The S7 routing between PROFINET/Ethernet subnets and also to PROFIBUS is possible.

There are therefore the following options for connecting a PG/PC or HMI device to a SIMOTION D using S7 routing.

Engineering system / HMI to PROFINET

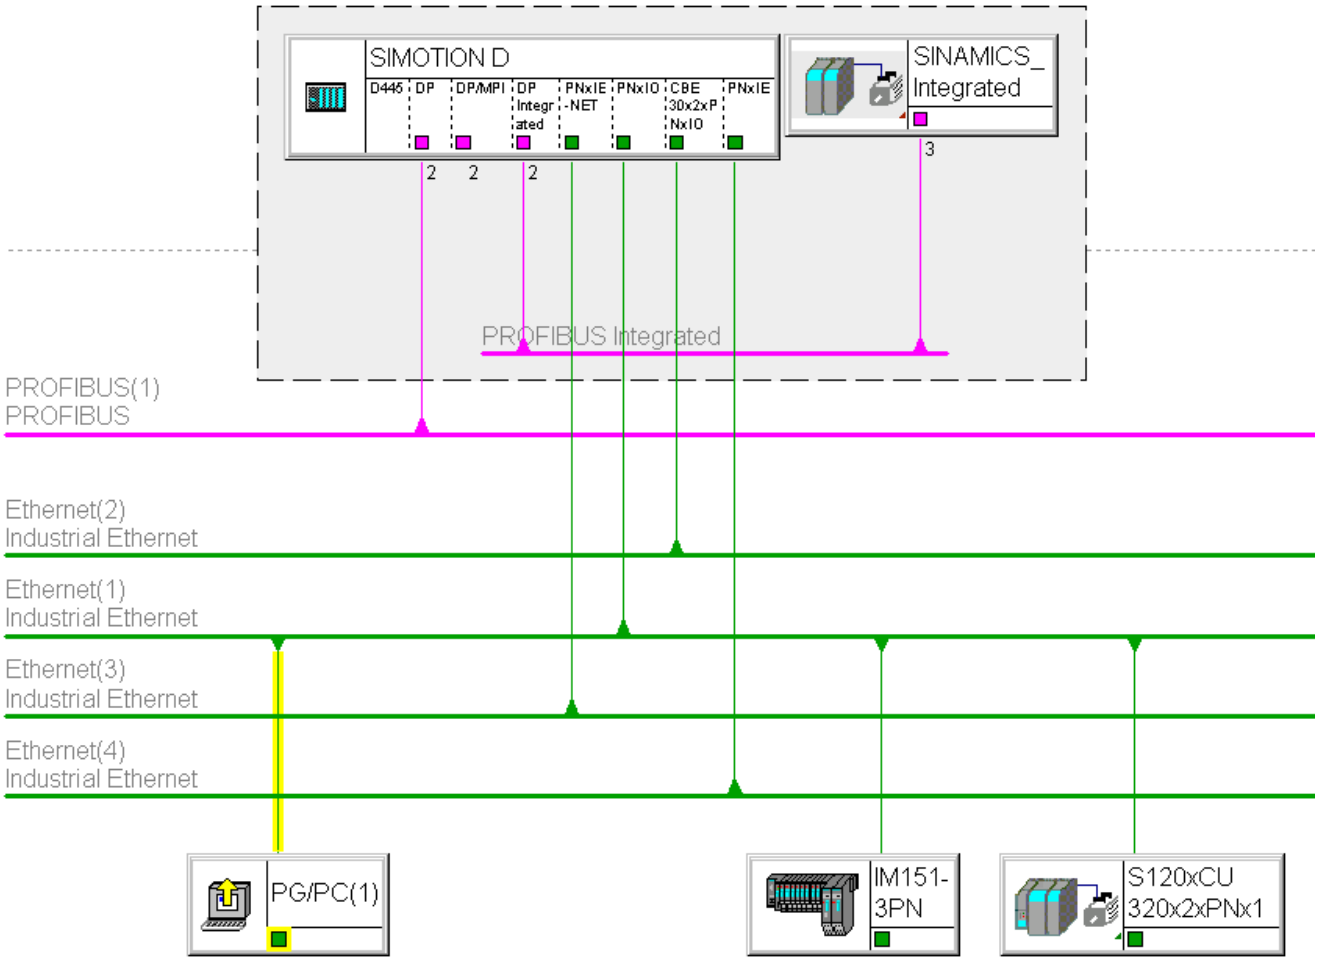

Figure 10-33 Example of PG/PC to PROFINET interface (PNxIO, X150)

- S7 routing to the (master) PROFIBUS interfaces (only if configured)
- S7 routing to the PROFIBUS Integrated
- S7 routing to the Ethernet interfaces PN/IE (X127 P1) and PN/IE-NET (X130 P1) (for D4x5-2 DP also to PN/IE-OP (X120 P1))

- S7 routing to the second PROFINET IO interface with CBE30-2 (X1400, P1-P4)
- Access to the components on the same subnet via the switch functionality of the PROFINET IO interface

Engineering system / HMI to PROFIBUS

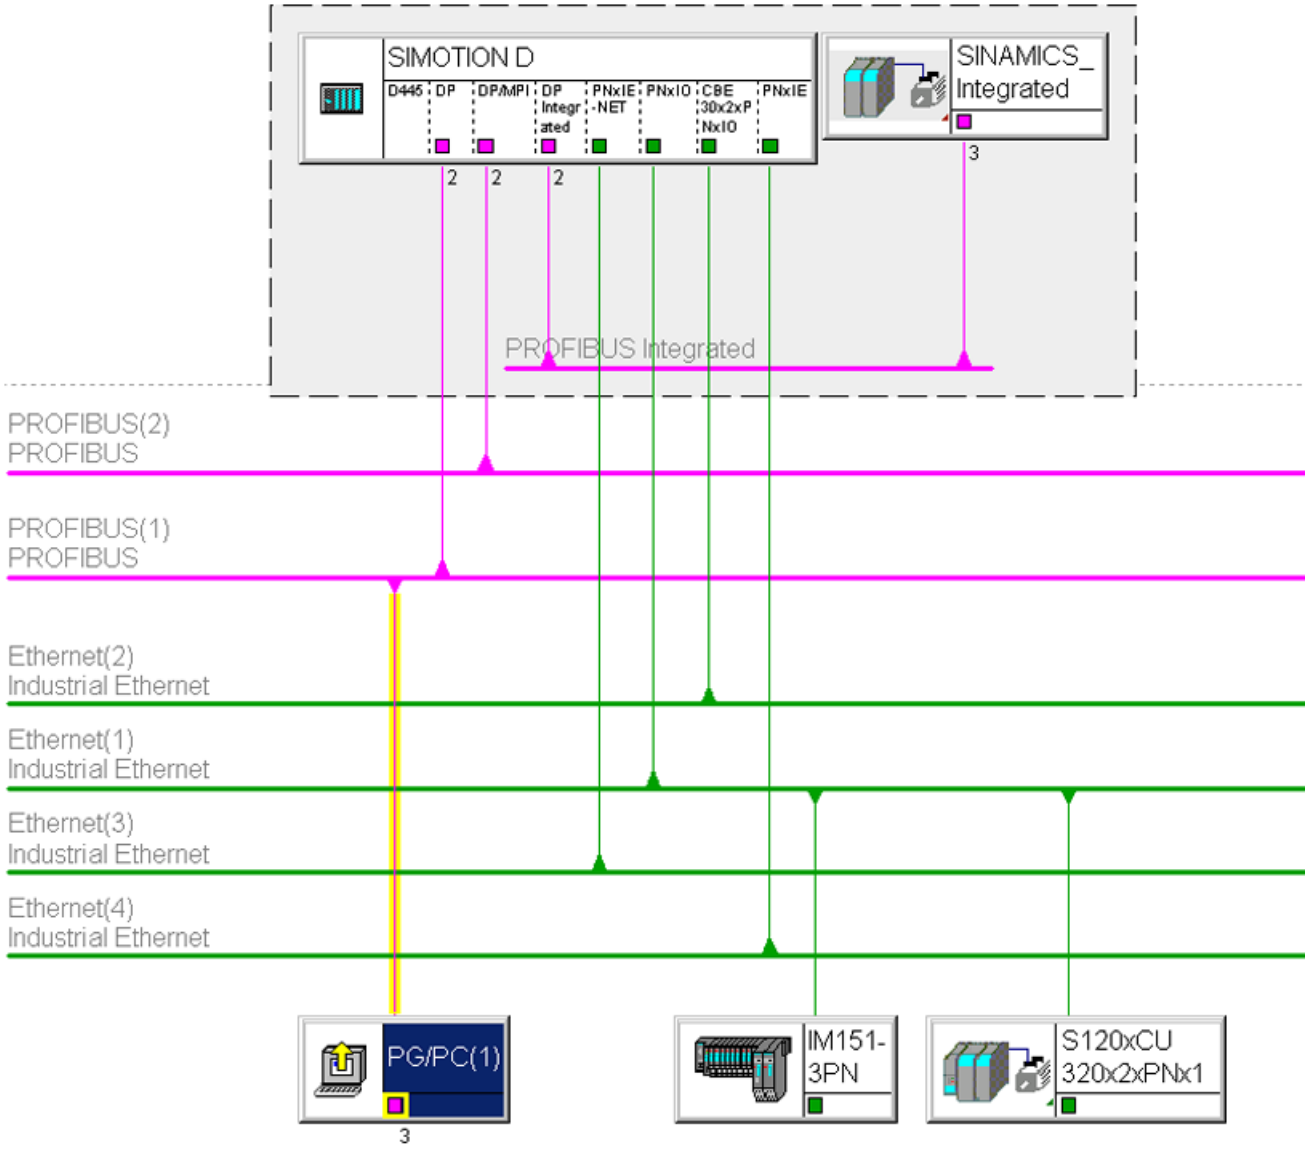

Figure 10-34 Example of PG/PC to PROFIBUS interface (DP, X126)

- S7 routing to the other (master) PROFIBUS interfaces (only if configured)
- S7 routing to the PROFIBUS Integrated
- S7 routing to the onboard PROFINET IO interface (X150, P1-P3)

- S7 routing to the second PROFINET IO interface with CBE30-2 (X1400, P1-P4)
- S7 routing to the Ethernet interfaces PN/IE (X127 P1) and PN/IE-NET (X130 P1) (for D4x5-2 DP also to PN/IE-OP (X120 P1))

Engineering system / HMI to Ethernet

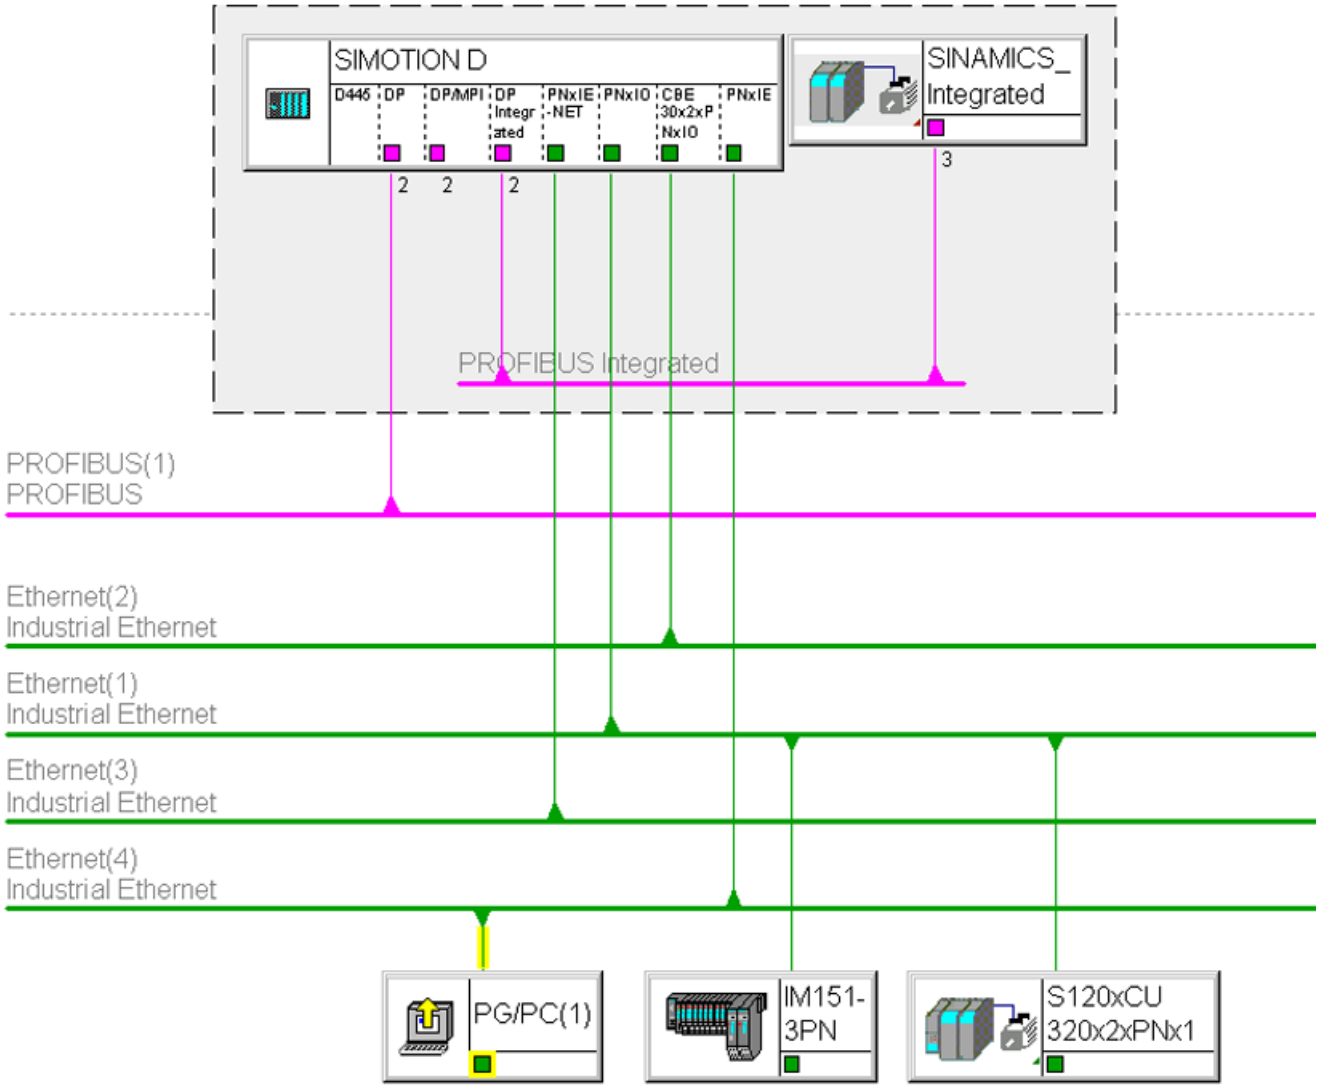

Figure 10-35 Example of PG/PC to Ethernet interface (PNxIE, X127)

- S7 routing to the other (master) PROFIBUS interfaces (only if configured)
- S7 routing to the PROFIBUS Integrated
- S7 routing to the onboard PROFINET IO interface (X150, P1-P3)

- S7 routing to the second PROFINET IO interface with CBE30-2 (X1400, P1-P4)
- S7 routing between the Ethernet interfaces

Routing on SIMOTION D (SINAMICS integrated)

S7 routing to the internal PROFIBUS on SINAMICS Integrated

All SIMOTION D have an integrated SINAMICS drive control. To be able to access drive parameters, the telegrams must be routed from the external SIMOTION D interfaces to the internal PROFIBUS DP. S7 routing can be used to access the integrated PROFIBUS. Here, the internal PROFIBUS DP forms a separate subnet. This must be especially taken into account for the communication to several routing nodes.

Additional references

You will find more information on routing and the differences between IP and S7 routing in the *SIMOTION Communication* System Manual.

10.1.1.5 Commissioning (hardware)

Requirements for commissioning

Requirements

The following requirements must be satisfied for the initial commissioning of the SIMOTION D4x5-2 and the SINAMICS S120 modules required for operation (SINAMICS S120 line modules and SINAMICS S120 motor modules):

- Your system with SIMOTION D4x5-2 has been installed and wired.
- Your PG/PC has been connected to the SIMOTION D4x5-2 via the PROFIBUS, Ethernet or PROFINET IO interface.

Commissioning steps

Commissioning the hardware involves the following steps:

1. Inserting the CompactFlash card (Page 6982)
2. Checking the system (Page 6984)
3. Switching on the power supply (Page 6984).

Additional references

For information on installing/mounting and commissioning the SINAMICS S120 components, refer to the *SINAMICS S120* Commissioning Manual.

Inserting the CompactFlash card

Characteristics of the CF card

The CF card is essential for operation of the SIMOTION D4x5-2. The SIMOTION Kernel (SIMOTION D firmware) and the software used to control the drives (SINAMICS firmware) are contained on the CF card.

To load the SIMOTION Kernel, the CF card must be inserted when the SIMOTION D4x5-2 is powered up.

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D4x5-2 device before inserting or removing the CompactFlash card. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Comply with the ESD rules.

Note

The ramp-up time of the SIMOTION D4x5-2 as well as the time behavior during CF card accesses depends on the type of memory card used. Take this into account in your application, as different memory card types are used for availability reasons.

Procedure

To insert the CF card, perform the following steps:

1. The direction of insertion of the CF card is indicated by an arrow located on both the plug-in slot and the CF card. Align the CF card with the arrows.
2. Gently insert the CF card into the empty plug-in slot of the SIMOTION D4x5-2 until it clicks into place.
   If correctly inserted, the CF card is flush with the housing.

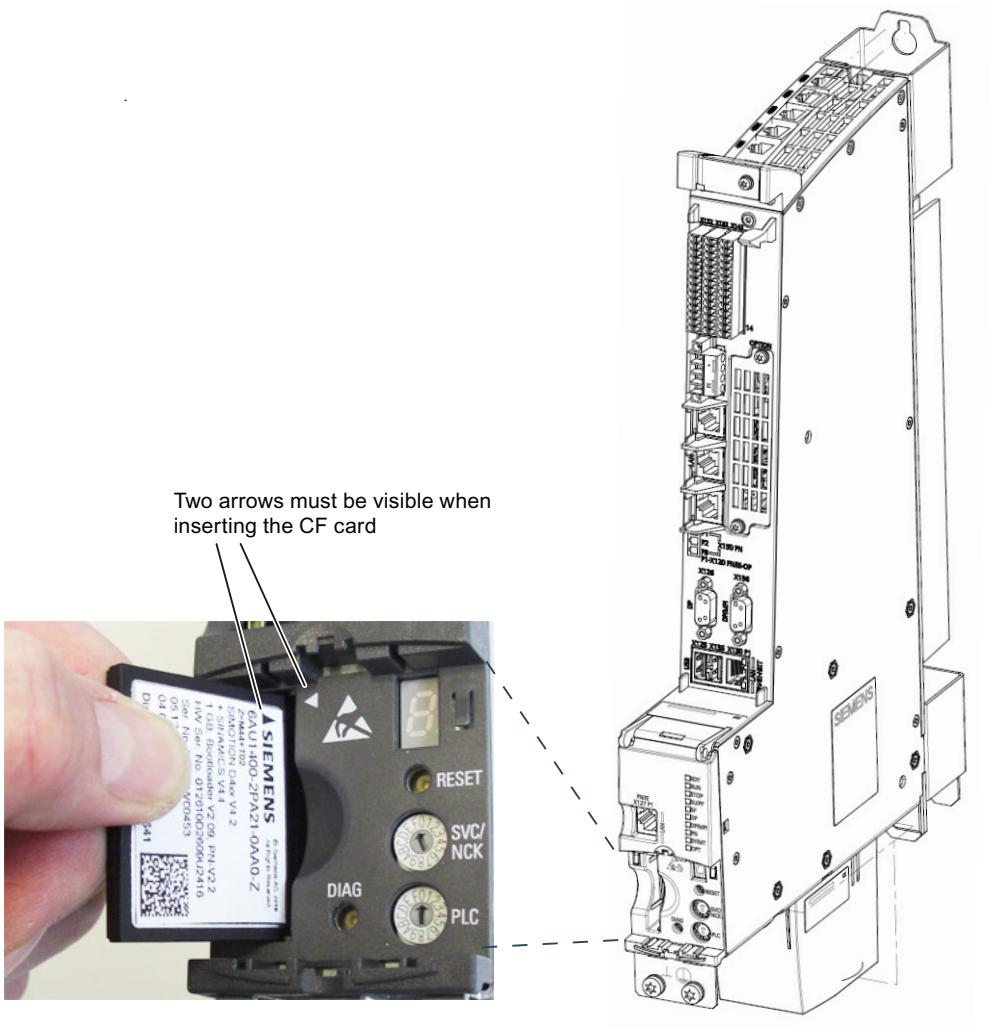

Figure 10-36 Inserting the CF card

Checking the system

Procedure

Check the final installed and wired system one more time before it is switched on, keeping in mind the safety points in the following check list:

- Have you observed all ESD measures when handling the components?
- Have all screws been tightened to their specified torque?
- Have all connectors been properly inserted and locked/screwed?
- Are all components grounded and have all shields been attached?
- Have you taken the load capacity of the central power supply into consideration?

Note

The SIMOTION D4x5-2 Control Units cannot be operated without a fan/battery module. The SIMOTION D4x5-2 Control Units will not power up without a fan/battery module.

Switching on the power supply

Switching on the external power supply

Power is supplied to the SIMOTION D4x5-2 via an external power supply unit, e.g. via a SITOP power supply.

Switch on this power supply.

NOTICE
SIMOTION D4x5-2 shuts down if the power supply is interrupted
It is essential to ensure that the external 24 VDC power supply to the D4x5-2 is not interrupted for longer than 3 ms. After a longer interruption, the SIMOTION D4x5-2 shuts down and can only be restarted with OFF/ON.
You will find further information in Section Properties of the user memory (Page 6987).

Power-up of Control Unit

Once the power supply has been switched on, the SIMOTION D4x5-2 begins to power up:

1. At the start of the power-up, all LEDs are briefly illuminated in yellow for a short LED test. The LEDs on the SIMOTION D4x5-2 enable you to track the progress of the power-up. Any errors are displayed.
2. Startup of the SIMOTION Kernel.

3. All DRIVE-CLiQ connections (e.g. with the SINAMICS S120 Active Line Module) are also detected automatically.

Note

As long as the RDY LED continues to flicker, power-up is not complete and it is not possible to go online.

During commissioning the firmware of the components is upgraded or downgraded automatically based on the firmware version on the CF card and the firmware version on the SINAMICS components (DRIVE-CLiQ components, TB30, CBE30-2, Power Modules, etc.).

The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

SIMOTION D4x5-2/CX32-2/DRIVE-CLiQ components:

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are also displayed by the yellow RDY LED on the SIMOTION D/CX32-2, and indicate that a firmware update is being performed on components connected to the SIMOTION D/CX32-2 or that all components have completed the firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

CBE30-2 option board:

During the firmware update, the OPT LED of the SIMOTION D module and the SYNC LED of the CBE30-2 flash green.

4. The first time it is switched on, the SIMOTION D4x5-2 goes to STOP operating state following power-up.

Following power-up, the SIMOTION D4x5-2 is in a state in which it can be configured.

Fan/battery module defective or not mounted properly on a SIMOTION D4x5-2

While the SIMOTION D4x5-2 is powering up, a test is performed to check whether the fan/battery module is functioning properly. If the fan/battery module is missing or faulty, the kernel is not loaded and the RDY LED flashes red/yellow (2 Hz). Switch off the power supply and correct the fault before switching on the power supply again.

NOTICE
Module enters the reset state If the SIMOTION D4x5-2 Control Unit needs to be cooled (thermostatically controlled fan) and this is not possible due to a fan/battery module having been removed or being faulty, the module state will change to reset after approximately 1 minute. This state can only be reset with a switch-off.

RESET button

Layout

The RESET button is located behind the blanking cover on the SIMOTION D4x5-2.

Performing a reset

A reset causes the entire system to be reset and forces the system to power up again. This operation is comparable with a "Power on Reset" but does not require the disconnection of the 24 V power supply (e.g. in order to exit the F state).

User memory concept

SIMOTION D4x5-2 memory model

The following figure provides an overview of the memory model of SIMOTION D4x5-2.

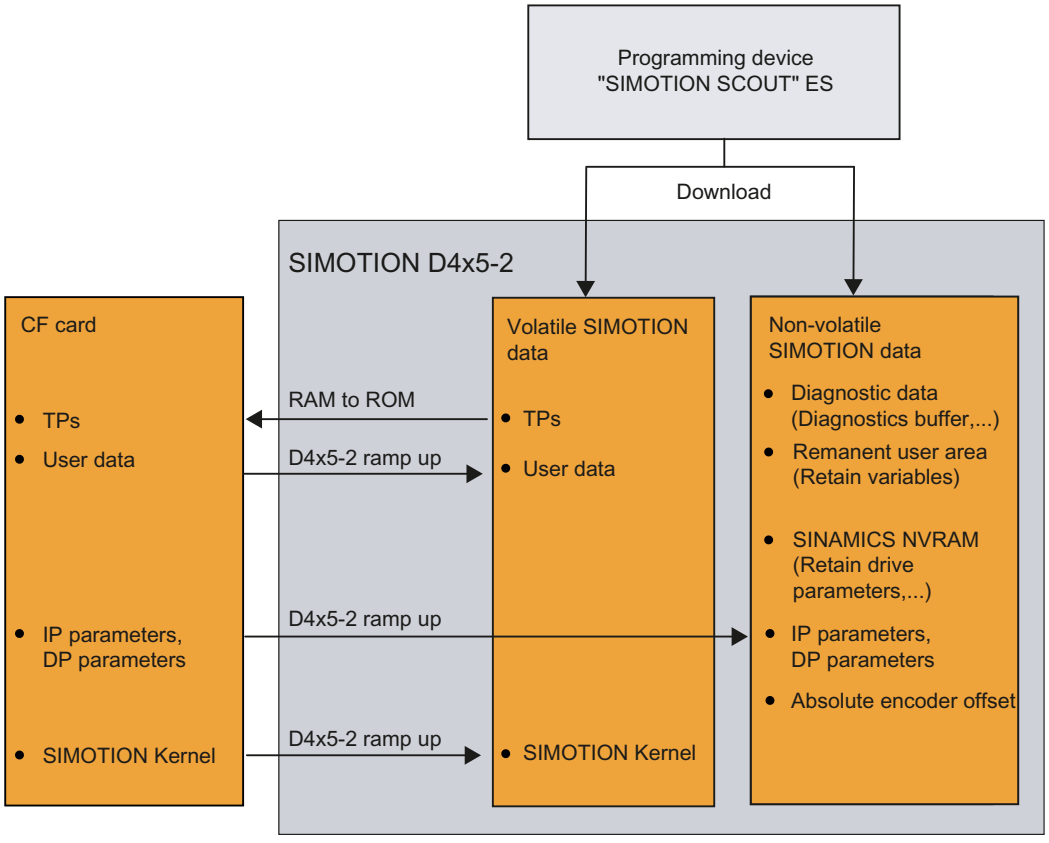

Figure 10-37 SIMOTION D4x5-2 memory model

The SIMOTION Kernel (SIMOTION D firmware, including SINAMICS Integrated Firmware) contains the functions required for virtually all applications, and essentially acts as a PLC with the command set in accordance with IEC 61131-3 as well as system functions for controlling various components, such as inputs and outputs.

The SIMOTION Kernel can be expanded by loading technology packages (TPs), e.g. for motion control or temperature controllers.

In the following sections, you will find information about the user memories and the steps involved in certain operations.

Properties of the user memory

Non-volatile data

Non-volatile data make it possible to retain relevant data for the user and the system even when the SIMOTION D4x5-2 has been switched off. Information about the area which can be used for non-volatile data is available in the *SIMOTION D4x5-2, Technical Data* Manual.

A SIMOTION device has the following non-volatile data:

Table 10-21 Non-volatile data contents

Non-volatile data	Content
Kernel data	• Last operating state • IP parameters (IP address, subnet mask, router address) • DP parameters (PROFIBUS DP address, baud rate) • Diagnostic data (diagnostics buffer,...)
Retain variables	• Variables in the interface or implementation section of a unit declared with VAR_GLOBAL RETAIN • Global device variables set with the "RETAIN" attribute
Retain TO	Absolute encoder offset
DCC blocks	SAV blocks and user-defined blocks with retain behavior ("SAV = SAVE", blocks for the non-volatile data backup).
NVRAM (SINAMICS)	For the SINAMICS Integrated, CX32-2 and SINAMICS S120 CU310-2/CU320-2, data protected against loss at power failure is called NVRAM data or non-volatile data.

Note

DCC SIMOTION blocks with retain behavior act like retain variables in terms of copying RAM to ROM, resetting memory, downloading, backing up non-volatile SIMOTION data (**_savePersistentMemoryData**) and backing up data.

For the SINAMICS Integrated and CX32-2, the data backup of the SINAMICS retain data (and therefore also for SINAMICS DCC) is performed via the NVRAM (D4x5-2) or the FRAM (CX32-2). SINAMICS data is not saved with **_savePersistentMemoryData**. The non-volatile SINAMICS data (NVRAM data) is backed up by setting the CU parameter p7775 to 1.

For further information on DCC, see the *DCC Programming* Programming Manual.

The non-volatile data of the SIMOTION D4x5-2 has the following properties:

Table 10-22 Non-volatile data and real-time clock properties

Properties	Non-volatile data	Real-time clock (RTC)
Location	The non-volatile data is located • For a D4x5-2 in an NVRAM • For a CX32-2 in an FRAM	The real-time clock is backed up maintenance-free via a SuperCap or a battery.
Back-up battery	No	Optional (for longer backup time)
Backup time	There is no maximum backup time	• SuperCap: At least 4 days • Battery: At least 3 years

If the buffer time is exceeded on the real-time clock, the time is reset.

Fan/battery module

If the backup time for the real-time clock (RTC) is not sufficient, a battery can be connected by means of an external fan/battery module. The backup time when a battery is used is at least 3 years.

A 3 V lithium SN: 575332 battery type (with cable tail and connector) is used. The battery can be replaced without data loss, because the real-time clock is backed up internally via the SuperCap.

A fan/battery module is always required for SIMOTION D4x5-2 and therefore is always supplied with the module (see the *SIMOTION D4x5-2* Manual).

CF card

The CF card contains the following data:

- SIMOTION Kernel (SIMOTION D firmware)
- Technology packages (TP)
- User data (units, configuration data, parameter settings, task configuration)
- IP parameters (IP address, subnet mask, router address)
- DP parameters (PROFIBUS DP address, baud rate)

It may also contain:

- User data saved with **_savePersistentMemoryData** and **_export/_saveUnitDataSet**
- SINAMICS non-volatile data (NVRAM data) of the SINAMICS Integrated or a CX32-2 backed up with CU parameter p7775 = 1
- Data from SIMOTION IT
- Archived SCOUT project

With the **_savePersistentMemoryData** system function, the user program can back up the contents of the non-volatile SIMOTION data to the CF card. This ensures that the retain variables and the absolute encoder position are backed up in the event that a spare part is used.

For the SINAMICS Integrated, CX32-2 and SINAMICS S120 CU310-2/CU320-2, the non-volatile SINAMICS data (NVRAM data) is backed up by setting the CU parameter p7775 to 1.

Note

IP and DP parameters in the non-volatile data

If the CF card contains a configuration, the IP and DP parameters are loaded from the CF card during ramp-up and used by the SIMOTION device. The SIMOTION D4x5-2 uses the addresses defined in these parameters to go online. During ramp-up, the IP and DP parameters on the CF card are also written to the non-volatile data. If the SIMOTION device is then powered up with a CF card with no configuration, the IP and DP parameters are retained in the non-volatile data and are used by the device. Thus, the SIMOTION device can continue to go online if a configuration was loaded with SIMOTION SCOUT at least once or if the SIMOTION device is powered up with a CF card containing a configuration.

Volatile SIMOTION data (RAM / current data RAM)

The volatile SIMOTION data is defined by the following properties:

- The volatile SIMOTION data is located in the RAM memory of the SIMOTION device.
- The download data of SIMOTION SCOUT is written to this memory.

- This data is lost when the SIMOTION D4x5-2 is switched off.
- The "volatile SIMOTION data" area contains the following data:
  - SIMOTION Kernel (D4x5-2 firmware)
  - Technology packages (TP)
  - User data (programs, configuration data, parameter settings)

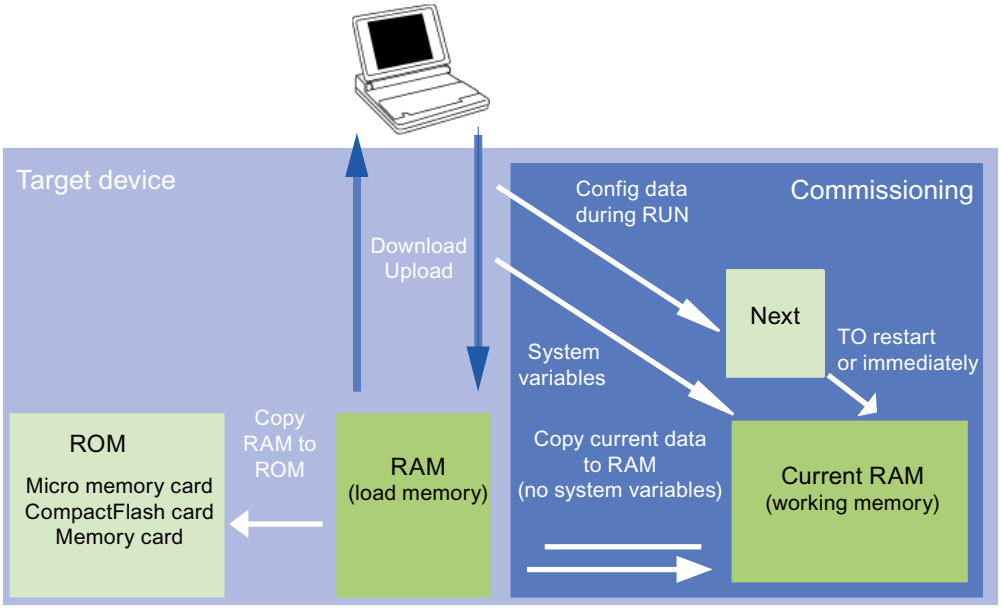

Figure 10-38 Configuration data and system variables in the volatile memory (memory concept, principle)

You can find additional information about memory management in SIMOTION in the *SIMOTION Runtime Basic Functions* Function Manual.

Operations and their effect on the user memory

The operations marked with arrows in the figures entitled "SIMOTION D4x5-2 memory model" and "Configuration data and system variables in the volatile memory" and their effects on the user memory are described below.

SIMOTION SCOUT download

The following data is transferred with "Download project to target system" or "Download CPU / drive unit to target device" from the engineering system to the "volatile SIMOTION data" area:

- User data (units, configuration data, parameter settings, task configuration)
- Technology packages (TPs)

In addition, the IP and DP parameters are saved to the "non-volatile SIMOTION data" area. The retain variables are set to their initial values, but this depends on the settings in SIMOTION SCOUT. If the SIMOTION D4x5-2 is switched off following the download, the volatile SIMOTION data is lost.

Copy RAM to ROM

The Copy RAM to ROM menu command saves the following data via the engineering system to the CF card:

- Technology packages and user data (units, configuration data, parameter assignments, task configuration) from the "volatile SIMOTION data" area
- Current values are copied to the "volatile SIMOTION data" area, depending on the settings in SIMOTION SCOUT.

Note

The "Copy RAM to ROM" menu command does not save the current values of the retain variables to the CF card. Use the system function **_savePersistentMemoryData** for this purpose.

Note

The "Copy RAM to ROM" function is also available for drive units and saves the volatile SINAMICS data to the non-volatile memory (CF card).

Current RAM

If you change the system variable values, these take immediate effect in the current RAM. New configuration data values are initially stored in the Next memory. Configuration data that takes immediate effect is automatically transferred to the current RAM. Configuration data that will only become active following a RESTART on the technology object (set the **restartactivation** system variable to value ACTIVATE_RESTART) is only written to the current RAM once the RESTART has taken place.

To save the configuration data changed online to the offline project, you must first transfer the content of the current data RAM to the RAM using the menu command "Target system" > "Copy current data to RAM".

Once you have done this, the configuration in SCOUT will no longer be consistent with the configuration in the target device, as a consistency check is performed on the RAM data. Read the data from the RAM using the menu command "Target system" > "Load" > "Load CPU / drive unit to PG" (for the configuration data only) to re-establish a consistent system state.

Use the "Target system" > "Copy RAM to ROM" menu command to save the configuration to the non-volatile memory on the CF card.

Note

The "Copy current data to RAM" command does not transfer the values of the system variables to the RAM memory. This means that "Save to memory card (Copy RAM to ROM)" or "Save in the engineering project (Load CPU / drive unit to PG)" is not possible.

In order to ensure that system variable values can also be saved to the engineering project and memory card, the system variable values must be changed OFFLINE and then downloaded to the target device and saved.

SIMOTION D4x5-2 power-up

During power-up of the SIMOTION D4x5-2, the SIMOTION Kernel is loaded from the CF card to the "volatile SIMOTION data" area.

When the SIMOTION D4x5-2 is switched off, the contents of the "volatile SIMOTION data" area are lost. When the unit is powered up again, the following data is loaded from the CF card:

- Technology packages and user data to the "volatile SIMOTION data" area
- IP and DP parameters to the "non-volatile SIMOTION data" area

Backing up non-volatile SIMOTION data

You have the following options for backing up non-volatile SIMOTION data on the CF card:

- In the user program:
  With the **_savePersistentMemoryData** system function, the user program can back up the non-volatile SIMOTION data content to the CF card. This ensures that the retain variables and the absolute encoder position are backed up in the event that a spare part is used. The contents are saved to the "PMEMORY.XML" backup file in the "USER\SIMOTION" directory.
- Via switch/button (service selector switch or DIAG button of the SIMOTION D4x5-2) or SIMOTION IT web server. See Section Backing up diagnostic data and non-volatile SIMOTION data (Page 7266). The contents are saved to the "PMEMORY.XML" backup file in the "USER\SIMOTION\HMI\SYSLOG\DIAG" directory.

On the system side, this system function ensures that a consistent overall image of the non-volatile SIMOTION data is always available the next time the unit is switched on, even if there is a power failure during backup. An already existing backup file is renamed to "PMEMORY.BAK" before a new backup file is generated. If the save operation to the new backup file fails (e.g. because the capacity of the CF card is insufficient), this backup copy of the backup file is used the next time an attempt is made to restore the non-volatile SIMOTION data content.

NOTICE
Loss of data due to failure to make backup copies Non-backed-up non-volatile SIMOTION data can be lost on hardware replacement (module defect), for example, if the current values of the retain variables have not been backed up and replaced by their initial values again. Back up the non-volatile SIMOTION data on the CF card.

NOTICE
Homing required again after absolute encoder overflow If an absolute encoder overflow occurs after **_savePersistentMemoryData**, the actual position value is no longer correct after the non-volatile SIMOTION data is restored. In this case, homing (absolute encoder adjustment) must be repeated.

With the SCOUT functions "Save variables" and "Restore variables," you also have the option to back up and restore data to your PC and restoring data that was changed during operation and only stored in the runtime system.

Restoring non-volatile SIMOTION data

SIMOTION data backed up on a CF card with **_savePersistentMemoryData** is restored in the following cases:

1. After a module replacement (spare part scenario), see Section Replacing modules in the spare part scenario (Page 6998)
2. After a general reset, see Section SIMOTION D4x5-2 general reset (Page 7186)
3. Via switch position, see Section Deleting/restoring non-volatile SIMOTION data (Page 7274).

Backing up / restoring non-volatile SINAMICS data

Requirement: As of SIMOTION V4.3 / SINAMICS V4.5

For the SINAMICS Integrated, CX32-2 and SINAMICS S120 CU310-2/CU320-2, as of SINAMICS firmware version V4.5, the non-volatile SINAMICS data (NVRAM data) is backed up by setting the CU parameter p7775 to 1.

Restoring

- Is performed automatically in the event of a module replacement
  A module replacement is detected on the basis of the serial number.
- Can be performed manually
  Restoring can be initiated manually by setting the CU parameter p7775 to 2.

For more information, see Section Backing up / restoring / deleting SINAMICS NVRAM data (Page 7110).

Power failure

With a power failure, the real-time clock is backed up by an internal SuperCap and, if available, a battery in the fan/battery module.

The non-volatile data is backed up on the D4x5-2 permanently and maintenance-free in an NVRAM. In this way, the Control Unit is immediately ready for operation without data loss after a power failure.

Power-up and non-volatile SIMOTION data

The table below lists the cases that can arise during power-up in conjunction with the non-volatile SIMOTION data and explains how they are handled.

Table 10-23 Power-up scenarios for non-volatile SIMOTION data

Case	Initial condition	Result
1	The non-volatile SIMOTION data is valid.	SIMOTION D4x5-2 powers up with the non-volatile SIMOTION data, i.e. with the PROFIBUS address in the non-volatile data.
2	The non-volatile SIMOTION data is invalid and there is no backup file (PMEMORY.XML) and no backup copy of the backup file (PMEMORY.BAK).	SIMOTION D4x5-2 copies the default settings to the non-volatile SIMOTION data and powers up with this data. In this case, for example, the default PROFIBUS address is used.

Case	Initial condition	Result
3	The non-volatile SIMOTION data is invalid, backup file (PMEMORY.XML) exists and is valid.	SIMOTION D4x5-2 copies the backup file contents to the non-volatile SIMOTION data and powers up with this data.
4	The non-volatile SIMOTION data is invalid, the backup file is invalid and there is no backup copy of the backup file (PMEMORY.BAK).	SIMOTION D4x5-2 copies the default settings to the non-volatile SIMOTION data and powers up with this data, in which case, for example, the default PROFIBUS address is used.
5	The non-volatile SIMOTION data is invalid; a backup file exists, but it is invalid; a backup copy of the backup file exists and is valid.	SIMOTION D4x5-2 copies the backup file contents to the non-volatile SIMOTION data and powers up with this data.

Non-volatile SIMOTION data diagnostics

The user can determine the state of the non-volatile SIMOTION data and the battery using the diagnostic buffer, system variables, and PeripheralFaultTask.

Evaluating via the diagnostic buffer

When they are issued, the following messages are entered once in the diagnostic buffer:

Table 10-24 Messages of the diagnostic buffer

Entry	Meaning	Remedy
Level 1 battery voltage warning [1)]	Battery voltage below prewarning level.	Replace battery in the fan/battery module
Level 2 battery voltage warning [1)]	The battery voltage is below the warning level, backup of real-time clock (RTC) can no longer be guaranteed.	Replace battery in the fan/battery module
Battery voltage for data backup in permissible range	The battery voltage is in the permissible range for the backup of the real-time clock (RTC).	
Non-volatile data memory voltage error	The buffer voltage of the SuperCap or the battery was too low after switching on. Possible data loss in the real-time clock.	Replace battery in the fan/battery module or charge the SuperCap over a longer period.
Non-volatile data loaded from a file (Persistent Data File Loading done)	Non-volatile SIMOTION data has been successfully restored from the backup file on the CF card.	-
Non-volatile data loaded from the backup file (Persistent Data Backup File Loading done)	Non-volatile SIMOTION data has been successfully restored from the backup copy of the backup file on the CF card.	-
Error while loading non-volatile data from a file (Persistent Data File Loading failure)	Backup file or backup copy could not be loaded. Possible causes: • Backup file or backup copy not available • Invalid data in backup file	Use the **_savePersistentMemoryData** system function to generate a backup file with valid contents.
Device with battery module	Fan/battery module is present.	-

Entry	Meaning	Remedy
Device without battery module	Fan/battery module is not present.	Connect fan/battery module
Module replacement detected - NVRAM has been initialized	A module replacement has been detected on the basis of the serial number. The non-volatile SIMOTION data on the controller will be deleted and the data from the CF card transferred to the controller.	-
Module replacement not detected - NVRAM has not been initialized	An error has occurred. The non-volatile SIMOTION data on the controller will not be deleted.	Possible causes: • Incorrect controller type • File system of the CF card corrupt

[1] These warnings are only signaled when the fan/battery module has been inserted.

Refer to the *SIMOTION SCOUT* Configuration Manual for how to read out the contents of the diagnostic buffer.

Evaluating via PeripheralFaultTask

Battery state changes in RUN are reported to the user program by calling PeripheralFaultTask. Changes can be evaluated there using Taskstartinfo:

- TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205)
- TSI#details = 16#00000040

If no battery is used during the transition of the operating state to RUN, no PeripheralFaultTask will be triggered (application case: D4x5-2 should generally be operated without a battery).

References

You will find detailed information on setting up Taskstartinfo (#TSI) in the *SIMOTION Runtime Basic Functions* Function Manual.

Evaluating via system variables

The system variables in the **device.persistentDataPowerMonitoring** structure indicate the state of the non-volatile SIMOTION data and the battery.

Table 10-25 State of the non-volatile SIMOTION data and battery

System variable	Designation	State	Updating
powerFailure	Buffer voltage (SuperCap or battery) too low, possible data loss of the real-time clock	NO (91) YES (173)	"YES" was set at too low a buffer voltage when powering up; status needs to be reset to "NO" via the application; the state remains even after power off/on.
rtcFailure (as of V4.3)	Indicates that the clock contents (RTC) are invalid (clock must be set again)	NO (91) YES (173)	Is updated once during power-up; status must be reset to "NO" via the application; the state is retained even after power off/on.
retainDataFailure (as of V4.3)	Indicates a checksum error of the non-volatile SIMOTION data; can be an indication of defective HW	NO (91) YES (173)	Is updated once during power-up; status must be reset to "NO" via the application; the state is retained even after power off/on.
persistentDataState	Reading the persistent data	See the table below, "State of non-volatile data following power-up."	During power-up
warningBatteryVoltage Level1 [1)]	Battery voltage below the pre-warning level	NO (91) YES (173)	During a state change, remains set if Level 2 is reached
warningBatteryVoltage Level2 [1)]	Battery voltage below the warning level	NO (91) YES (173)	During a state change

1) **Both** battery warning levels are set under the following conditions:
- The fan/battery module is present and the battery has been inserted, but the battery voltage is below warning level 2
- The fan/battery module is present, but no battery has been inserted
- The fan/battery module is not present (not permissible on D4x5-2)

The system variable **device.persistentDataPowerMonitoring.powerFailure = YES** indicates that the buffer voltage of the SuperCap or the battery was too low after switching on.
With .**powerFailure = YES** and **.persistentDataState = FROM_RAM**, only a possible data loss of the real-time clock displayed for the SIMOTION D4x5-2 (and not also a possible loss of the non-volatile SIMOTION data as for the SIMOTION D4x5). The non-volatile SIMOTION data is not lost, but the data from the NVRAM will still be used.

As of SIMOTION V4.3, a data loss of the real-time clock is signaled via the system variable **device.persistentDataPowerMonitoring.rtcFailure = YES**.

The system variable **device.persistentDataPowerMonitoring.persistentDataState** indicates the state of the non-volatile SIMOTION data after power-up.

Table 10-26 State of the non-volatile SIMOTION data after powering up (**persistentDataState** system variable)

State	Meaning
FROM_RAM (1)	Non-volatile SIMOTION data in the SIMOTION device is used
FROM_FILE (2)	Non-volatile SIMOTION data is restored from the backup file
FROM_BACKUP (3)	Non-volatile SIMOTION data is restored from the backup copy of the backup file
INVALID (4)	Data in the non-volatile SIMOTION data and in the backup file / backup copy of backup file is invalid or non-existent/deleted. The SIMOTION device has copied the default settings to the non-volatile SIMOTION data and used this data to power up.

Requirement/availability of the battery

System variables can be used to evaluate:

- Whether a battery is required for the operation of the device (or not)
- Whether a battery is available (or not)

Table 10-27 System variable batterynecessary/batteryexisting

System variable on the device	States	Description
fanbattery of data type StructDeviceFanBattery (the system variables are of the data type EnumFanBattery)		
.batterynecessary	MANDATORY	Battery is required for the backup of the non-volatile data and for the real-time clock (RTC) of the device. **.batteryexisting** can be used to query whether a battery is installed.
	OPTIONAL	The non-volatile data and the real-time clock (RTC) are backed up via SuperCap. A battery can be used as an option to extend the backup time. **.batteryexisting** can be used to query whether a battery is installed. **Example: D4x5**
	OPTIONAL_RTC [1)]	A battery is not required for backing up the non-volatile data. Only the real-time clock (RTC) is backed up via SuperCap. A battery can be used as an option to extend the backup time of the real-time clock. **.batteryexisting** can be used to query whether a battery is installed. **Example: D4x5-2**
	NOT_MANDATORY [1)]	A battery is not required for backing up the non-volatile data. The real-time clock (RTC) is backed up via SuperCap. **Example: D410-2**

System variable on the device	States	Description
.batteryexisting [2]	EXISTING	EXISTING is only displayed when **.batterynecessary** is set to: • MANDATORY or • OPTIONAL or • OPTIONAL_RTC and a battery is installed.
	NOT_EXISTING	Battery is not available.

[1] If the SuperCap is discharged, the contents of the real-time clock (RTC) are lost.

[2] The value for SIMOTION D4x5-2 is updated dynamically.

Replacing modules in the spare part scenario

SIMOTION module replacement

A module replacement is detected automatically as of SIMOTION V4.3.

During a module replacement, a CF card that contains the non-volatile SIMOTION data backed-up with **_savePersistentMemoryData**, is inserted in a new device of the same type.

A module replacement is detected by the SIMOTION D4x5-2 on the basis of the serial number. The data backed up on the CF card with **_savePersistentMemoryData** is then automatically transferred to the new device.

Note

As an additional option, you can back up the non-volatile data by setting the service selector switch, with the DIAG button or via SIMOTION IT web server, see Section diagnostic data and non-volatile SIMOTION data (Page 7266).

Initial power-up with the CF card

Requirement: CF card (no device serial number stored)

If the SIMOTION D4x5 2 powers up successfully with a new CF card, the serial number of the device is stored on the CF card. In this case, a module replacement cannot be detected.

Note

The serial number stored on the CF card remains unaffected by the following actions:

- Copy RAM to ROM
- Project download
- Writing the CF card via the SCOUT function "Load to file system"
- FW/project update via device update tool

If the CF card contents are copied to another CF card, the serial number is also copied.

A serial number stored on the CF card can only by removed by deleting the CF card contents.

SIMOTION D4x5-2 power-up with the CF card (no module replacement)

Requirement:

- The same CF card
- The same controller

If the device powers up successfully, the serial number stored on the CF card is compared with the serial number of the device.

If the **serial numbers are identical**, there has been no module replacement.

The device powers up. In the non-volatile SIMOTION data present in the device is valid, then this is used (for details, see Table 10-23 Power-up scenarios for non-volatile SIMOTION data (Page 6993)).

SIMOTION D4x5-2 power-up with the CF card (module replacement)

Requirement:

- The same CF card
- Different device (e.g. replacement because of fault)

If the device powers up successfully, the serial number stored on the CF card is compared with the serial number of the device.

If the **serial numbers are not identical**, there has been a module replacement.

This means:

- The serial number of the new module is stored on the CF card.
- The non-volatile SIMOTION data are deleted in the device.
- A diagnostic buffer entry is issued which signals that a module has been replaced.
- The non-volatile SIMOTION data stored "on the CF card" is transferred to the device (for details, see Table 10-23 Power-up scenarios for non-volatile SIMOTION data (Page 6993)).

NOTICE
Irrevocable data deletion due to incorrect CF card with stored device serial number
A module replacement is detected only on the basis of the changed serial number.
Inserting the wrong CF card with saved device serial number has the following consequences: • The non-volatile data on the device is permanently deleted. • The IP/DP address set in the device is deleted. You can no longer go online via the IP/DP address set originally.
Make sure that the correct CF card is inserted into the SIMOTION D4x5-2.

Error scenarios

In the event of an error, a diagnostic buffer entry signals that it was not possible to determine whether a module has been replaced.

Possible reasons are:

- The serial number of the device cannot be determined.
- The serial number saved on the CF card cannot be determined, for example, due to a corrupt file system.
- The controller has not powered up.
- The new serial number could not be transferred to the CF card, for example, due to a corrupt file system.

Restart after reloading

The system variable **device.startupData.operationMode** is used to define whether the SIMOTION D4x5-2 control unit goes into the RUN state or the last operating state after a power-on/restart.

Possible values of **device.startupData.operationMode**:
LAST_OPERATION_MODE [0] (default setting)
RUN [1]

With LAST_OPERATION_MODE [0], the module remains in the STOP state after reloading the non-volatile SIMOTION data and must be switched manually to the RUN state with SCOUT, the web server, or the mode selector.

With RUN [1], the module goes automatically into the RUN state after reloading.

SINAMICS module replacement

A module replacement is detected as of SINAMICS V4.5.

For the SINAMICS Integrated, CX32-2 and SINAMICS S120 CU310-2/CU320-2, a module replacement is also identified via the serial number. Non-volatile SINAMICS data (NVRAM data) backed up previously via the CU parameter p7775 on the CF card, is then automatically transferred to the control unit.

Fan

Cooling the SIMOTION D4x5-2

Overview

A fan/battery module is always required for cooling the SIMOTION D4x5-2 Control Unit.

Table 10-28 Fan/battery module for SIMOTION D4x5-2

Property	SIMOTION D425-2 DP SIMOTION D425-2 DP/PN	SIMOTION D435-2 DP SIMOTION D435-2 DP/PN	SIMOTION D445-2 DP/PN SIMOTION D455-2 DP/PN
Fan/battery module	Always required (double fan/ battery module included in the D425-2's scope of delivery)	Always required (double fan/ battery module included in the D435-2's scope of delivery)	Always required (double fan/ battery module included in the scope of delivery of the D445-2 DP/PN and D455-2 DP/PN)
Fan/battery module included in the D4x5-2 scope of delivery	Double fan/battery module 6FC5348-0AA02-0AA0	Double fan/battery module 6FC5348-0AA02-0AA0	Double fan/battery module 6FC5348-0AA02-0AA0
Usable fan/battery modules	Only type 6FC5348-0AA02-0AA0 (double fan)	Only type 6FC5348-0AA02-0AA0 (double fan)	Only type 6FC5348-0AA02-0AA0 (double fan)
Max. permissible supply air temperature	55° C	55℃	55° C
Fan control	Temperature-controlled fan unit will be switched on depending on supply air temperature and CPU load		

The fan/battery modules are usually supplied with a backup battery.

Fan faults

Fan faults are indicated as follows:

- Entry in diagnostics buffer
- In the event of fan failure (both fans in the double fan/battery module failed) the RDY LED flashes red/yellow at 2 Hz
- Indicated via system variable
- Call to the PeripheralFaultTask

For further information on the evaluation of fan faults, see Section Overview of the fan/battery module states (Page 7002).

Fan/battery module

A fan/battery module is always required for operation of the SIMOTION D4x5-2 Control Unit. A corresponding module including a backup battery is therefore included in the scope of delivery of the SIMOTION D4x5-2 Control Unit.

For increased availability a double fan/battery module is used as standard on SIMOTION D4x5-2.

The double fan/battery module also guarantees sufficient cooling with just one functional fan.

If one of the fans fails, the remaining fan continues under full load. The fan failure is signaled by the generation of an event in the PeripheralFaultTask. In this case it is strongly recommended that the double fan/battery module is replaced at the next available opportunity.

Checks are performed during power-up to determine whether the double fan/battery module on the SIMOTION D4x5-2 Control Unit is functioning correctly (i.e. at least one of the two fans is working). If a double fan/battery module is missing or faulty, the kernel is not downloaded and the RDY LED flashes red/yellow (2 Hz). Switch off the power supply and eliminate the fault. Then switch the power supply back on.

Note

If the SIMOTION D4x5-2 needs to be cooled (fan switches on with temperature control) and this is not possible due to a fan/battery module having been removed or being faulty, the module state will change to the RESET state after approximately 1 minute (7-segment display shows "8"). This state can only be reset with a switch-off.

If only one fan in the double fan/battery module fails, the module is still regarded as functional, although it should be replaced as soon as possible. If neither of the fans is working, the double fan/battery module is identified as defective.

Fan test

Fan faults can only be detected by the control unit if the double fan is switched on (fan not turning or turning too slowly).

To detect failure of a fan in good time, the Control Unit performs a fan test:

- The Control Unit runs a fan test on power-on (short switch-on of the double fan)
- During operation, the double fan is switched on briefly at cyclic intervals (even if not necessitated by the temperature).

Overview of states, fan/battery module

The states that can occur during operation are described in the following.

Table 10-29 Overview of states

State	Fan [4]	PeripheralFaultTask Diagnostic buffer entry	System variables [3]	
			_cpuDataRW. fanWarning	_cpuDataRW. redundantfanWarning [2]
Failure of one fan during STOP, then RUN	Single fan	PeripheralFaultTask: Is not called Diagnostic buffer entry: Fan on the module is defective	= YES	= NO
	Double fan	PeripheralFaultTask: Is not called Diagnostic buffer entry: There is no redundant fan available	= NO	= YES

State	Fan [4]	PeripheralFaultTask Diagnostic buffer entry	System variables [3]	
			_cpuDataRW. fanWarning	_cpuDataRW. redundantfanWarning [2]
Failure of both fans during STOP, then RUN	Double fan	PeripheralFaultTask: Is not called Diagnostic buffer entry: Fan on the module is defective	= YES [1]	= NO
Failure of one fan during RUN	Single fan	PeripheralFaultTask: TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205) TSI#details = 16#00000080 Diagnostic buffer entry: Fan on the module is defective	= YES	= NO
	Double fan	PeripheralFaultTask: TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205) TSI#details = 16#00004000 Diagnostic buffer entry: There is no redundant fan available	= NO	= YES
Failure of both fans during RUN	Double fan	PeripheralFaultTask: TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205) TSI#details = 16#00000080 Diagnostic buffer entry: Fan on the module is defective	= YES [1]	= NO

1) SIMOTION D4x5-2 switches to the RESET state after approximately 1 minute.

2) Maintenance: Replace double fan/battery module at the next available opportunity.

3) The "YES" value must be reset to "NO" by the application.

4) Single fans are only supported by SIMOTION D4x5 and D410-2.

Fan faults are detected if through

- A cyclic fan test
- Or when the fan is switched on

a malfunction is detected (fan does not turn or fan turns at too low a speed).

Note

If the "redundant fan" is already defective in a double fan/battery module when the system is powered up, this is detected as a single fan/battery module depending on the type of defect (e.g. a wire breakage).

You should therefore also set the **.fanexisting** system variable to the "SINGLE" state to alert the personnel operating the machine to the fact that **no is redundancy available**.

Diagnostic buffer entry

The diagnostic buffer entries have the following meanings:

- Fan on the module is defective
  All of the fans in a fan/battery module have failed
- There is no redundant fan available
  This message only occurs in the case of modules that support double fan/battery modules with a redundant fan.
  The message occurs:
  - If it is only the redundant fan that has failed on a double fan/battery module or
  - If a single fan/battery module is connected but the module also supports a double fan/battery module in principle (this is only the case for D445-1; with D4x5-2, only double fan/battery modules are permitted)

Requirement for/presence of a fan

System variables can be used to evaluate:

- Whether a fan is required for the operation of the device (or not)
- Whether a fan is installed (or not)

Table 10-30 System variable fannecessary/fanexisting

System variable on the device	States	Description
fanbattery of data type StructDeviceFanBattery (the system variables are of the data type EnumFanBattery)		
.fannecessary	**MANDATORY**	Fan is required for operation of the device. **.fanexisting** can be used to query whether a fan is installed. **Examples: D410-2, D4x5-2**
	OPTIONAL	Fan can be used optionally. **.fanexisting** can be used to query whether a fan is installed. **Examples: D425, D435**
	NOT_MANDATORY	Fan is not required for operation of the device.
.fanexisting [1]	**SINGLE**	Single fan is available. **Examples: D410-2**
	REDUNDANT	Double fan is available. **Examples: D4x5-2**
	NOT_EXISTING	No fan available. **Example: D425 and D435 without optional fan**

[1] Value for SIMOTION D4x5-2 is updated dynamically

References

You will find detailed information on setting up Taskstartinfo (#TSI) in the *SIMOTION Runtime Basic Functions* Function Manual.

Response to overtemperature

Operation at overtemperature reduces the module service life and can result in damage to the module.

Causes

Cause of problems in the heat dissipation of the module can be, for example:

- Violation of the maximum permissible air intake temperature
- Free convection is not ensured (clearances are not maintained, pollution, convection is prevented by cables)
- Impermissible mounting position of the module

Temperature thresholds

The internal module temperature is monitored via two module-specific temperature thresholds:

- Overtemperature is signaled when the first (lower) temperature threshold is exceeded.
- When the temperature falls below the first temperature threshold again (minus a hysteresis of approx. 5° C), "Normal temperature" is signaled.
- When the second (higher) temperature threshold is exceeded, the module shuts down in order to protect itself.

The internal module temperature is available in system variable **_cpuData.moduletemperature** as of V4.4.

Response to overtemperature

Table 10-31 Response of the temperature monitoring

Temperature...	Response
... exceeds the 1st temperature threshold (overtemperature)	Call of the PeripheralFaultTask: • TSI#InterruptI = _SC_PC_INTERNAL_FAILURE (= 205) • TSI#details = 16#00000002 Diagnostic buffer entry: "Temperature exceeded in the housing"
... falls below the 1st temperature threshold minus a hysteresis of approx. 5° C	Call of the PeripheralFaultTask: • TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205) • TSI#details = 16#00000004 Diagnostic buffer entry: "Temperature in the housing has returned to normal"
... exceeds the 2nd temperature threshold	Module goes into permanent RESET to protect itself (7-segment display shows "8", RDY LED flashes red/yellow at 2 Hz). Diagnostic buffer entry (as of V4.3): "Temperature in the housing too high, self-protection function of the module activated"

10.1.1.6 Parameter assignment / addressing

Software requirements

SIMOTION SCOUT engineering system

The following SCOUT Version must be must be installed on your PG/PC for the commissioning of the SIMOTION D4x5-2:

- As of V4.2 for the SIMOTION D445-2/D455-2/CX32-2
- As of V4.3 for the SIMOTION D425-2/D435-2/CBE30-2

Please note the information on the latest *SIMOTION SCOUT* DVD.

For information on how to install SIMOTION SCOUT on your PG/PC, see the *SIMOTION SCOUT* Configuration Manual.

Note

The software configuration is described in this manual based on SIMOTION SCOUT and SIMATIC STEP 7 Version V5.x.

Information of configuration of the SIMOTION D Control Units in the Engineering Framework Totally Integrated Automation Portal (SCOUT in the TIA Portal), you will find in the configuration manual *SIMOTION SCOUT TIA*.

The TIA Portal requires at least SIMOTION SCOUT V4.4 and SIMOTION D4xx-2 Control Units as of firmware V4.3.

Creating a project and configuring the communication

Creating a SIMOTION project and inserting a D4x5-2

Procedure

Proceed as follows to create a new project in SIMOTION SCOUT and insert a SIMOTION D4x5-2:

1. Select the Project > New... menu command.
2. In the "New Project" dialog box, assign a name and confirm with "OK."
   A new folder with the name of the project will be created in the project navigator.
3. In the project navigator, double-click "Insert SIMOTION device". The "Insert SIMOTION Device" dialog box is opened.

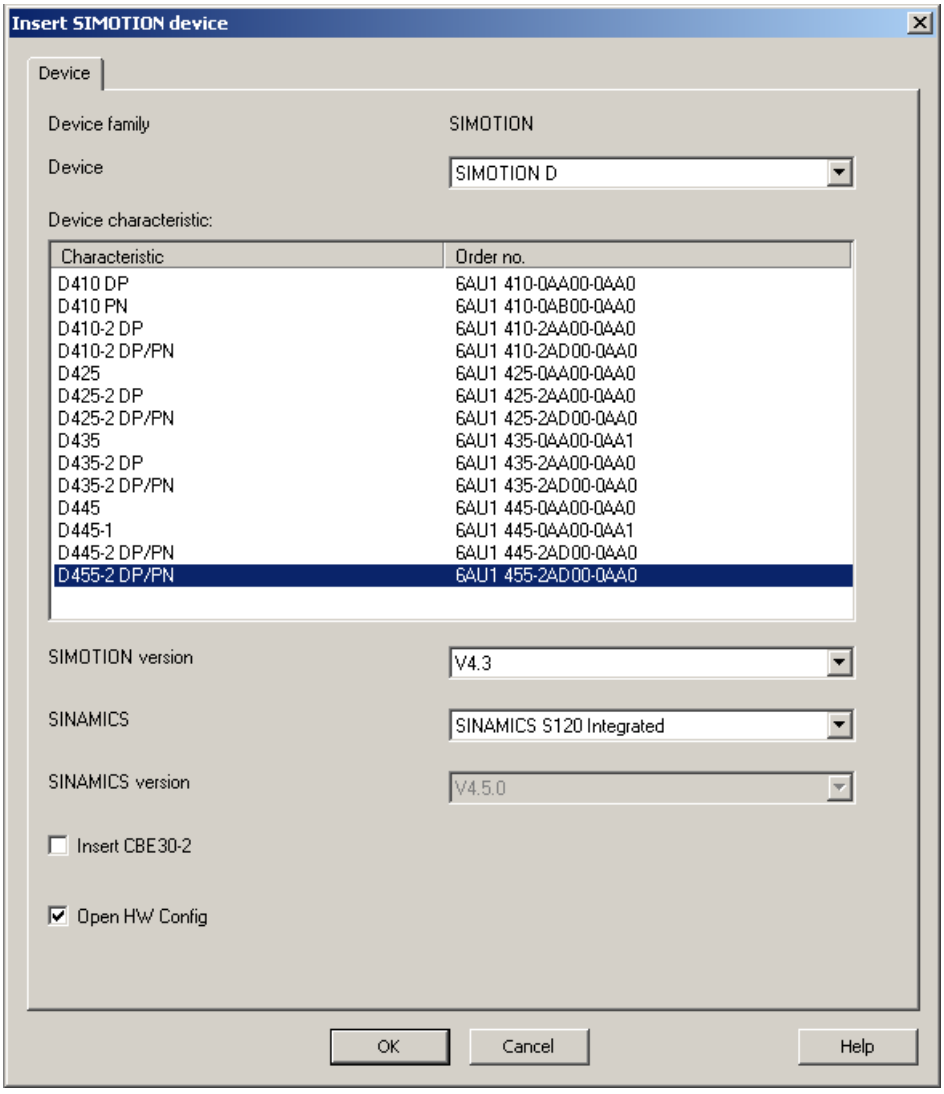

Figure 10-39 Insert SIMOTION device

4. In the "Insert SIMOTION Device" dialog box, select the device, its version and the SIMOTION version.
5. If required, make further settings:
   - SINAMICS: Select either a "SINAMICS S120 Integrated" or a "SINAMICS SM150 Integrated" (only for D445/D445-1/D455-2)
   - SINAMICS version: Select the SINAMICS Integrated version if several drive versions are available for a SIMOTION version
   - Insert a CBE30-2: Selection of a CBE30-2 (only for D4x5-2 DP/PN)
6. The "Open HW Config" option can be used to select whether HW Config should be opened in the next step (e.g. in order to insert a CX32-2 controller extension).
7. Confirm the "Insert SIMOTION Device" dialog with "OK".

SINAMICS Integrated type

The following selection options are available for SIMOTION D445/D445-1/D455-2:

- SINAMICS S120 Integrated
- SINAMICS SM150 Integrated for applications with medium-voltage converters

A separate SIMOTION D firmware is available for each of the two versions.

Version of the SINAMICS Integrated

Depending on the selected SIMOTION version, several versions are available for the SINAMICS Integrated. Please note that a separate SIMOTION D firmware is available for each version of the SINAMICS Integrated.

Configuring the PROFINET interface

After you have acknowledged the "Insert SIMOTION Device" dialog with "OK", the "Properties - Ethernet Interface" dialog box opens in the case of a D4x5-2 DP/PN.

If you are using the PROFINET interface, set the interface properties in the "Properties - Ethernet Interface" dialog box.

To this end, proceed as follows:

1. Click the "New" button.
   The "New Subnet Industrial Ethernet" dialog box opens. Rename the new subnet, or accept the default name by clicking "OK".
2. Select the new Ethernet subnet which is now displayed in the "Properties - Ethernet Interface" dialog box.
3. Enter the required addresses in the "IP address" and "Subnet mask" fields of the "Properties - Ethernet Interface" dialog box. Change to the "Network node" field and define whether you are going to use a router and, if yes, enter the router address. Confirm with "OK".

Result

If you have not yet configured a PG/PC in your project, you can select the interface for the PG/PC connection now.

Configuring the PROFIBUS PG/PC interface

Requirements

The following requirements must be satisfied in order to configure the PG/PC interface:

- You have completed the "Insert SIMOTION Device" dialog box with "OK".
- A PG/PC has not yet been configured in the project.

If these requirements have been satisfied, you can configure the interface for the PG/PC connection in the "Interface Selection - D4x5" dialog box.

Proceed as follows to configure the PROFIBUS DP interface:

Procedure

1. In the "Interface Selection - D4x5" dialog box, select the entry "PROFIBUS DP/MPI (X136)".

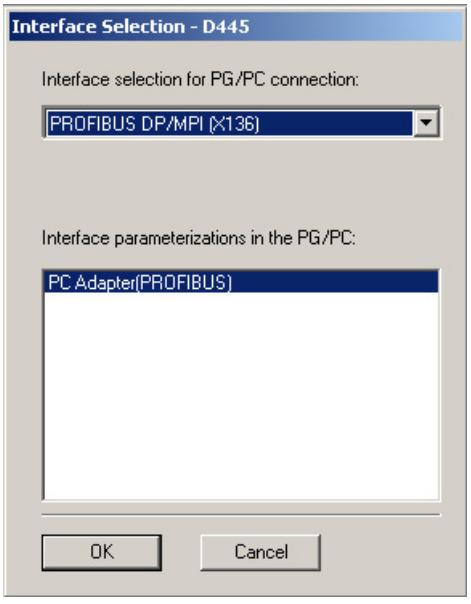

Figure 10-40 Selecting a PROFIBUS interface

2. Select the interface parameter assignment that you would like to use to go online, and confirm with "OK".

The dialog box is closed, the SIMOTION D4x5-2 is created in the project navigator and **HW Config** is started automatically (if parameterized).

A PROFIBUS subnet with factory settings (1.5 Mbit/s transmission rate) is created automatically. The PG/PC is now connected to the SIMOTION D4x5-2 via PROFIBUS. You can configure and parameterize your system.

Note

If you do not use the factory settings, you must configure the PROFIBUS interfaces in **HW Config**. Please make sure that the S7 online access has been activated (PG/PC connection must be yellow and bold in NetPro).

Inserting a further SIMOTION device

If you insert a further SIMOTION device using "Insert SIMOTION device", the PG/PC interface selection dialog box is not displayed. A further SIMOTION device is automatically connected to the PG/PC via PROFIBUS and a new unique IP address (address 4, 5, etc. until 125 is reached) is calculated.

Establishing a PG/PC assignment (Page 7022)

Configuring the Ethernet PG/PC interface

Requirement

The following requirements must be satisfied in order to configure the PG/PC interface:

- You have completed the "Insert SIMOTION Device" dialog box with "OK".
- A PG/PC has not yet been configured in the project.

If these requirements have been satisfied, you can configure the interface for the PG/PC connection in the "Interface Selection - D4x5" dialog box.

Proceed as follows to configure the Ethernet interface:

Procedure

1. In the "Interface Selection - D4x5" dialog box, select the entry "Ethernet PNxIE (X127)".

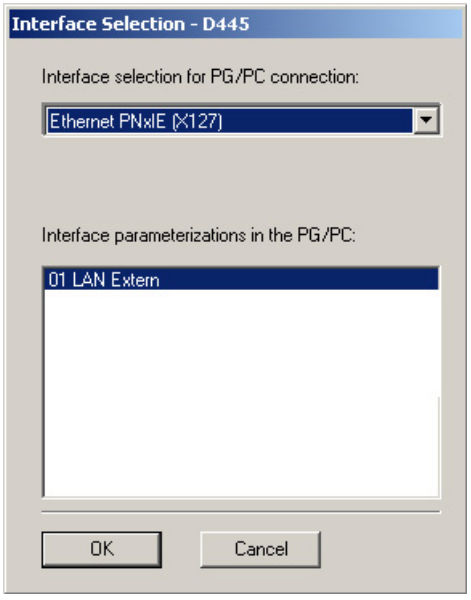

Figure 10-41 Configuring the Ethernet interface

2. Select the interface parameter assignment that you would like to use to go online, and confirm with "OK".

The dialog box is closed, the SIMOTION D4x5-2 is created in the project navigator and **HW Config** is started automatically (if parameterized).

An Ethernet subnet with factory settings is created automatically. (Factory settings, see Section Properties of the Ethernet interfaces (Page 7040).)

The PG/PC is now connected to the SIMOTION D4x5-2 via Ethernet. You can configure and parameterize your system.

Note

If you want to change the default settings for IP addresses and the transmission rate, you must configure the Ethernet interfaces in **HW Config** and **NetPro**. Please make sure that the S7 online access has been activated (PG/PC connection must be yellow and bold in NetPro).

Inserting a further SIMOTION device

If you insert a further SIMOTION device using "Insert SIMOTION device", the PG/PC interface selection dialog box is not displayed. The second SIMOTION device is automatically connected to the PG/PC via Ethernet and a new unique IP address (last digit + 1, up to 255) is calculated.

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Representation of SIMOTION D4x5-2 in HW Config

Once you have created a project and inserted a SIMOTION D4x5-2 as module, **HW Config** opens automatically (if parameterized).

In **HW Config** the SIMOTION D4x5-2 units are shown with the SINAMICS Integrated and the interfaces.

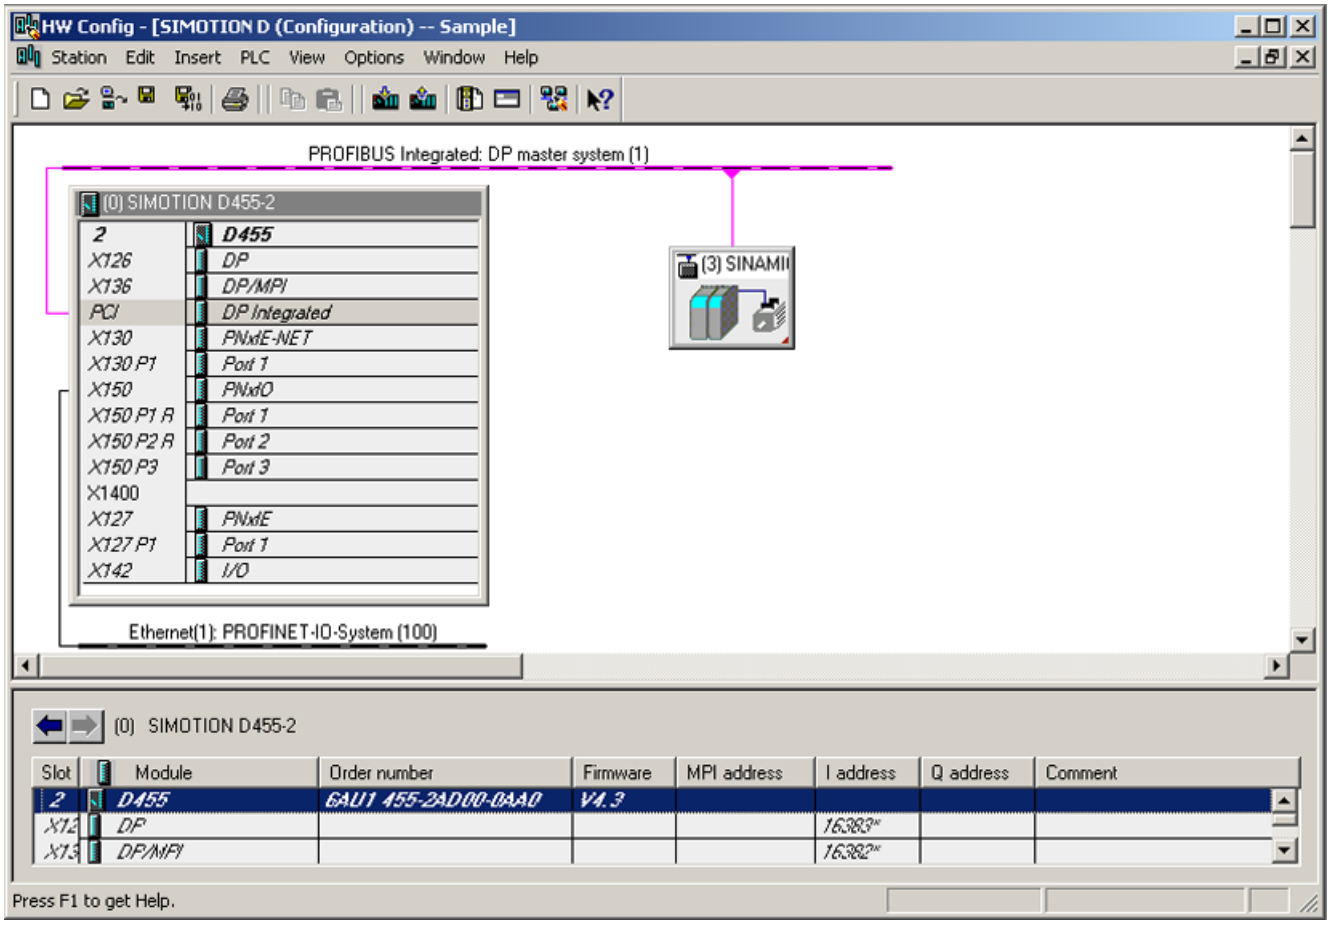

Figure 10-42 Representation of a D4x5-2 in HW Config

Note

According to the DNS conventions, "/" is a permissible character. For this reason, the Ethernet and PROFINET interfaces have a different name in the engineering software than on the module lettering ("/" is replaced by "x")

Example:
PN/IE (lettering on module) → PNxIE (as shown in SCOUT, HW Config, NetPro)

Configuring PROFIBUS DP

General information about communication via PROFIBUS DP

Definition of PROFIBUS DP

PROFIBUS DP is an international, open field bus standard specified in the European field bus Standard EN 50170 Part 2. PROFIBUS DP is optimized for high-speed, time-sensitive data transfer at field level.

Components communicating by means of PROFIBUS DP are classified as master or slave components.

- Master (active bus node):
  Components that represent a master on the bus define data transfer along the bus, and are therefore known as active bus nodes.
  Masters components are divided into two classes:
  - DP master class 1 (DPMC1):
    Central master devices are thus designated, which exchange information with the slaves in specified message cycles.
    Examples: SIMOTION D445-2 DP/PN, C240, P350, SIMATIC S7, etc.
  - DP master class 2 (DPMC2):
    These are devices for configuration, commissioning, and operator control and monitoring while the bus is in operation.
    Examples: Programming devices, operator control/monitoring devices
- Slaves (passive bus nodes):
  These devices may only receive, acknowledge and transfer messages to a master when so requested.
  Examples: SINAMICS drives, I/O modules

Functions on PROFIBUS DP

The functional scope can differ between DP masters and DP slaves. The functional scope is different for DP-V0, DP-V1 and DP-V2.

These functions on the PROFIBUS DP are characterized by:

- Configurable, equidistant, isochronous PROFIBUS DP cycle
- Synchronization of slaves by the master by means of a global control message frame in each cycle clock
- Independent maintenance of the isochronous cycle clock by the slaves in the event of a short-term communication failure.

Additional references

You will find additional information about PROFIBUS DP in the *SIMOTION Communication* System Manual.

Operating the SIMOTION D4x5-2 on PROFIBUS DP

PROFIBUS DP interface (X126, X136)

SIMOTION D4x5-2 has two interfaces for connection to the PROFIBUS DP. Transmission rates up to 12 Mbit/s are possible. Both interfaces can be operated isochronously.

The X136 interface can also be used as an MPI interface.

As supplied, both PROFIBUS DP interfaces are preset as a master with address 2 and a transmission rate of 1.5 Mbit/s. The PROFIBUS DP network is automatically created for this setting.

However, other settings can also be configured. This requires that you configure the network manually using **HW Config** and **NetPro**.

Note

Communication with the SINAMICS Integrated of a D4x5-2 or CX32-2 is always isochronous. Here, SIMOTION D4x5-2 is the master and the SINAMICS Integrated drives are slaves.

Master-slave configuration

The master/slave configuration can be used, for example, to establish hierarchical PROFIBUS networks that can be used to implement a modular machine concept.

Table 10-32 Master-slave configuration

X126 DP	X136 DP/MPI	Remark	Actions in the application
DP slave, isochronous	DP master, isochronous	Application synchronized to DP master (X136), application controls synchronization to DP slave (X126) Internal drive is synchronous with external cycle clock Cycle clock X136 = cycle clock DP Integrated	DP master / DP slave synchronization mechanisms
DP master, isochronous	DP slave, isochronous	Application synchronized to DP master (X126), application controls synchronization to DP slave (X136) Internal drive is synchronous with external cycle clock Cycle clock X126 = cycle clock DP Integrated	DP master / DP slave synchronization mechanisms
DP slave, isochronous	DP master, not isochronous	Application synchronized to DP slave (X126) (can be monitored by the application) Internal drive is synchronous with X126	DP slave synchronization mechanisms
DP master, not isochronous	DP slave, isochronous	Application synchronized to DP slave (X136) (can be monitored by the application) Internal drive is synchronous with X136	DP slave synchronization mechanisms
DP master, isochronous	DP master, isochronous	Application synchronized to DP master (X126, X136) Internal drive is synchronous with external cycle clock Cycle clock X126 = cycle clock X136 = cycle clock DP Integrated	None
DP master, isochronous	DP master, not isochronous	Application synchronized to DP master (X126) Internal drive is synchronous with X126 Cycle clock X126 = cycle clock DP Integrated	None
DP master, isochronous	DP slave, not isochronous	Application synchronized to DP master (X126) Internal drive is synchronous with X126 Cycle clock X126 = cycle clock DP Integrated	None
DP master, not isochronous	DP master, isochronous	Application synchronized to DP master (X136) Internal drive is synchronous with X136 Cycle clock X136 = cycle clock DP Integrated	None
DP slave, not isochronous	DP master, isochronous	Application synchronized to DP master (X136) Internal drive is synchronous with X136 Cycle clock X136 = cycle clock DP Integrated	None
DP master, not isochronous	DP master, not isochronous	Application synchronized to internal drive cycle clock	None
DP slave, not isochronous	DP master, not isochronous	Application synchronized to internal drive cycle clock	None
DP master, not isochronous	DP slave, not isochronous	Application synchronized to internal drive cycle clock	None
DP slave, not isochronous	DP slave, not isochronous	Application synchronized to internal drive cycle clock	None

X126 DP	X136 DP/MPI	Remark	Actions in the application
DP slave, isochronous	DP slave, not isochronous	Application synchronized to DP slave (X126) (can be monitored by the application) Internal drive is synchronous with X126	DP slave synchronization mechanisms
DP slave, not isochronous	DP slave, isochronous	Application synchronized to DP slave (X136) (can be monitored by the application) Internal drive is synchronous with X136	DP slave synchronization mechanisms

For detailed information about controlling synchronization across the application, see the *Basic Functions for Modular Machines* Description of Functions.

Alternatively, the X136 interface can be used as an MPI interface with a transmission rate of 19.2 kbit/s up to 12 Mbit/s.

Assignment of the PROFIBUS addresses in HW Config

Assigning PROFIBUS addresses

In order for all devices to communicate with each other, you must assign a PROFIBUS address to each device before connecting them:

Note

Before you assign any PROFIBUS addresses, please remember that all addresses must be unique on the PROFIBUS subnet.

You set these PROFIBUS addresses individually for each device with the PG/PC using **HW Config**. Some PROFIBUS DP slaves have a switch for this purpose.

Note

The PROFIBUS addresses set at the devices using these switches must correspond with the address settings in **HW Config**.

Recommendation for PROFIBUS addresses

Reserve PROFIBUS address "0" for a service programming device and "1" for a service HMI device, which will be connected to the subnet if required.

Recommendation for the PROFIBUS address of the SIMOTION D4x5-2 in case of replacement or service:

Reserve address "2" for a SIMOTION D4x5-2. This prevents duplicate addresses when installing a SIMOTION D4x5-2 with a default setting on the subnet (e.g. when a SIMOTION D4x5-2 is replaced). You should therefore assign addresses greater than "2" to additional units on the subnet.

Setting the DP cycle and system cycle clocks

All cycle clocks for the SIMOTION D4x5-2 are based on the DP cycle of SINAMICS Integrated, which must be set in **HW Config**.

To do so, click the SINAMICS block on the integrated PROFIBUS. The "DP Slave Properties" dialog box opens. You can adjust the DP cycle of the SINAMICS Integrated on the "Isochronous mode" tab.

Table 10-33 SIMOTION D4x5-2 value range

	D425-2 DP D425-2 DP/PN D435-2 DP	**D435-2 DP/PN D445-2 DP/PN D455-2 DP/PN**
DP cycle	≥ 0.5 ms (DP internal)≥ 1.0 ms (DP external)	≥ 0.25 ms (DP internal) ≥ 0.5 ms (DP internal, < V4.5) ≥ 1.0 ms (DP external)
Grid	0.125 ms	0.125 ms
Min. IPO cycle clock	≥ 0.5 ms	≥ 0.25 ms ≥ 0.5 ms (< V4.5)

External DP interfaces can only be operated with a DP cycle of ≥ 1 ms.

SINAMICS Integrated always runs in isochronous mode. The DP cycle setting of the SINAMICS Integrated is displayed as the "Bus data cycle" in the "System Cycle Clocks" dialog box. In SIMOTION SCOUT, select the SIMOTION D Control Unit and then select the "Set system cycle clocks" option in the "Target system" > "Expert" menu.

The table below shows the possible ratio settings for the SIMOTION D4x5-2 system cycle clocks based on the bus cycle clock.

Table 10-34 Ratios of system cycle clocks

Servo cycle clock: Bus cycle clock	**IPO cycle clock: Servo cycle clock**	**IPO2 cycle clock: IPO cycle clock**
As of V4.3: 1 ...4, 8 V4.2: 1	1 ... 6	2 ... 64

As of V4.3, a reduction ratio for the servo cycle clock to the DP cycle clock is possible. The reduction ratio is only permitted when PROFINET IO with IRT has not been configured.

If the DP interfaces (X126/X136) are configured as isochronous master interfaces, you must set both DP cycles equal to the bus cycle clock of the SINAMICS Integrated in **HW Config**.

If the DP interfaces (X126/X136) are operated as the master, the system cycle clocks are obtained from an internal cycle clock of the module. Of the two DP interfaces (X126/X136), no more than one can also be operated as an isochronous slave interface. In this case, the system cycle clocks are obtained from the cycle clock of the slave interface.

As a result, the task system of SIMOTION and SINAMICS Integrated runs synchronously to the slave cycle clock. This assumes that a slave cycle clock exists and synchronization with the slave cycle clock has been achieved. If this is not the case, the system cycle clocks are acquired from an internal replacement cycle clock.

When the project is downloaded, the cycle clock configuration is downloaded to the SIMOTION D4x5-2 and automatically set according to the specifications.

Note

The deployment of TM15 (SIMOTION) and TM17 (SIMOTION) is possible only with DP Integrated, PN and servo cycle clocks ≥ 0.5 ms. This applies to TM modules connected directly to D4x5-2 and indirectly via CX32-2/CU320-2.

Cycle clock scaling of external PROFIBUS interface to internal PROFIBUS interface

Definition

Cycle clock scaling means that an external PROFIBUS interface of the SIMOTION D4x5-2 (X126/X136) can be operated in an integer multiple of the internal PROFIBUS interface. This reduces the CPU load, thereby allowing you to operate more axes, for example. The settings of the scaled cycle clocks for the external DP interfaces are made in **HW Config**.

Supplementary conditions

The following supplementary conditions are applicable to cycle clock scaling:

- An external DP interface of the D4x5-2 is used as an isochronous slave interface. Only in this case can an **integer** cycle clock scaling of isochronous external DP slave interface to internal interface be specified. This is checked during compilation and an error message is output in the event of noncompliance. If the external DP interfaces are configured as equidistant interfaces but none are configured as slaves and cycle clock scaling is specified for these interfaces, an error is output during compilation.
- For SERVO, IPO, and IPO2, settings can also be made for all permissible cycle clocks. Master and slave axes can run in different IPO levels. Different cycle clocks and phase offsets are tolerated by the system.

  Note

  The IPO cycle clock of the IPO in which the synchronous operation technology object runs must be set equal to the cycle clock of the isochronous external DP slave interface.

- The second external DP interface can be operated as an isochronous master (while the other is an isochronous slave) in order to operate external drives, for example. In this case, the cycle clock must be the same as the cycle clock of the internal PROFIBUS DP. If this condition is not satisfied, an error message is output during compilation.
- One or both external DP interfaces can also be operated as non-isochronous, free-running interfaces. In this case, there is no effect on the cycle clock settings.

Application example

The system consists of a synchronous master (DP master) and at least one SIMOTION D4x5-2 synchronous slave (DP slave). The synchronous master contains the master axis; the synchronous slave contains the following axes:

- The axes in the SINAMICS Integrated of the D4x5-2 synchronous slave must exhibit high performance with a servo cycle clock of 1 ms and an internal DP cycle of 1 ms. This requires that the internal fast PROFIBUS DP be decoupled from the slower external PROFIBUS DP.
- The PROFIBUS DP has, for example, a cycle time of 4 ms due to the quantity framework on the bus; in all cases, its cycle time exceeds that of the cycle clock of the internal DP interface.
- The master values are transmitted via the DP bus. Further nodes can also be connected to the DP bus, e.g. DP drives, distributed I/Os, etc.

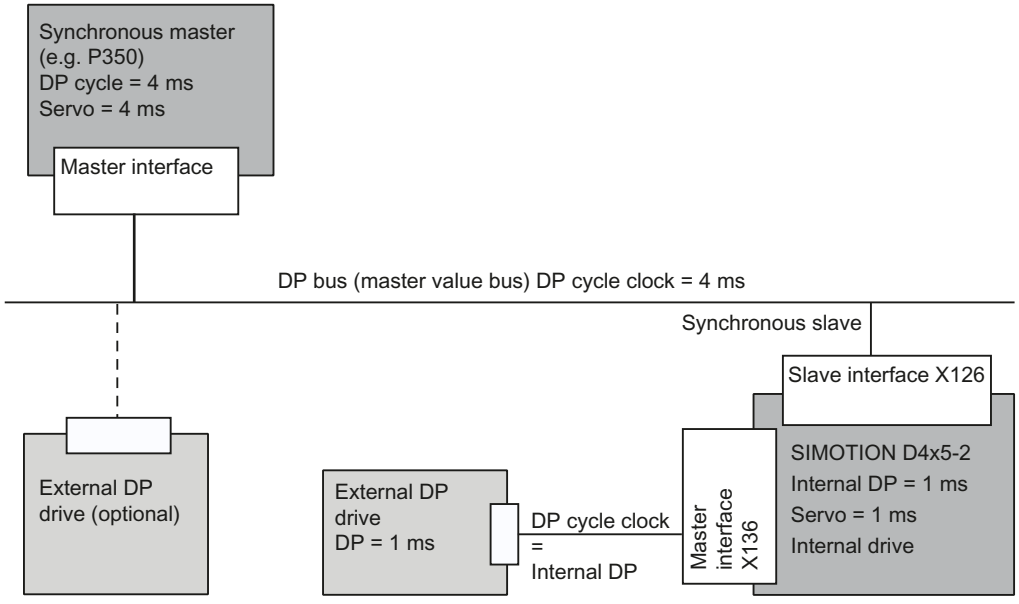

Figure 10-43 Example of a cycle clock scaling for PROFIBUS DP

Internal PROFIBUS interface with DP Integrated < 0.5 ms

Requirement

The minimum settable cycle clock for the internal PROFIBUS interface (DP Integrated) is 0.5 ms.

As of SIMOTION version V4.5, the following SIMOTION D Control Units can also be operated with a DP Integrated with 250 µs and 375 µs:

- SIMOTION D435-2 DP/PN
- SIMOTION D445-2 DP/PN
- SIMOTION D455-2 DP/PN

Configuration rules

The following configuration rules must be taken into account when using DP Integrated cycle clocks < 0.5 ms:

- Simultaneous use of Servo_fast and IPO_fast with DP Integrated cycle clocks < 0.5 ms is not possible because the resulting cycle clock ratios violate the rules for the use of Servo_fast and IPO_fast.
  See also Section Setting of the cycle clocks (two servos activated) (Page 7034)
- If the SINAMICS Integrated is operated with a DP Integrated cycle clock of 250 µs or 375 µs, this results in a higher utilization on the drive side in comparison to a cycle clock of ≥ 500 µs. Depending on the utilization situation (e.g. through ALM, CXs, TMs, etc.), this can result in a reduction in the number of axes (e.g. from six to five servo drives). It can also result in a reduction of the quantity structure for vector and V/f-controlled drives.
- CBE30 supports a minimum send cycle clock of 500 µs. The SINAMICS Integrated can therefore only be operated with 250 µs or 375 µs if isochronous communication has not been configured for the CBE30.

Creating a new PROFIBUS subnet

Introduction

SIMOTION SCOUT is used to network the SIMOTION D4x5-2. During the configuration process, the desired bus parameters can be set for the PROFIBUS DP interfaces.

Note

If a hardware configuration is loaded without a PROFIBUS network (X126 or X136) being configured on the CPU, a new PROFIBUS address that was previously set in HW Config or **NETPro** will **not** be accepted by the CPU.

Requirement

You have created a project and have inserted a SIMOTION D4x5-2.

Procedure

To create a new subnet, proceed as follows:

1. In the project navigator, double-click the SIMOTION D control unit to call **HW Config**.
2. In the SIMOTION D4x5-2 representation, double-click the interface for which you want to create a PROFIBUS subnet.
   The "DPx Properties" dialog box is opened.
3. Click "Properties" to show the "PROFIBUS Interface DPx" dialog box.
4. Click "New" to call the "Properties - New PROFIBUS Subnet" dialog.
5. Name the new subnet and enter the properties of the new subnet, such as transmission rate, on the "Network settings" tab.

6. If the PROFIBUS interface is to be operated isochronously, click "Options". Activate the "Activate isochronous bus cycle" option in the "Options" dialog box and set the DP cycle. Confirm with "OK" to exit the "Options" dialog box.
7. Confirm with "OK" again to exit the "Properties - New PROFIBUS Subnet" dialog box and accept the settings.

The new subnet is now displayed in the "Properties - PROFIBUS Interface DPx" dialog. You can now connect the new subnet to the corresponding PROFIBUS interface.

Follow the same steps to configure the second PROFIBUS interface.

A graphical representation of the PROFIBUS subnet you have created is shown in **HW Config**.

Note

PROFIBUS DP functionality is both equidistant and isochronous in nature. As such, it can guarantee that bus cycles will have exactly the same length and ensures deterministic behavior. Applications: Connecting drives or synchronized I/O devices.

Modifying the data transmission rate

Introduction

You can modify the transmission rate in a PROFIBUS subnet in **HW Config** according to your requirements.

Procedure

1. Open the project in SIMOTION SCOUT.
2. Double-click the device whose PROFIBUS subnet you want to configure.
   HW Config is displayed showing the settings for this device.
3. In **HW Config**, double-click in the graphical display on the PROFIBUS network whose transmission rate you want to configure.
   The "Properties - DP Master System" dialog is displayed.
4. Click on "Properties" to display the "PROFIBUS Properties" dialog.
5. Select the required transmission rate on the "Network settings" tab.
   If you wish to activate an isochronous bus cycle, the setting can be made under "Options."
6. Confirm with "OK".
7. Save and compile the new hardware configuration, and load it on the SIMOTION D.

Note

If you modify the transmission rate of the subnet over which you are operating the PG/PC, the PG/PC loses its active designation. You must then reconfigure it manually in **NetPro** or else you will no longer be able to go online by means of this PG/PC.

Note

PROFIBUS DP functionality is both equidistant and isochronous in nature. As such, it can guarantee that bus cycles will have exactly the same length and ensures deterministic behavior. Applications: Connecting drives or synchronized I/O devices.

See also

SIMOTION Runtime Basic Functions Function Manual, Chapter "Isochronous I/O processing on fieldbus systems."

Establishing a PG/PC assignment

Introduction

A PG/PC is required to create projects for a SIMOTION D4x5-2 and download them to the target device. The interface that can be connected via the PG/PC will be automatically queried during the communications configuring. If you change these settings, you must reestablish the active designation of the PG/PC in **NetPro** (the PG/PC connection must appear yellow and bold in **NetPro**).

Procedure

1. Open the project in SIMOTION SCOUT.
2. Click the "Open NetPro" button.
   NetPro is accessed, and the configured network is graphically displayed. The PG/PC connection to the configured network is shown in bold in a color other than yellow.
3. Double-click the PG/PC you would like to configure.
   The "Properties - PG/PC" dialog will be displayed with the "Assignment" tab in foreground.
4. Select the interface in the "Assigned" field and activate S7ONLINE access by clicking the appropriate checkbox.
5. Click "OK" to accept the settings.
   The PG/PC connection to the configured network is displayed again in bold and yellow.
6. Save and compile the changes and download them to the SIMOTION D4x5-2.

You can now go online via the PG/PC once again.

Alternatively, you can make the assignment in SIMOTION SCOUT by clicking the "Assign PG/PC" button. This calls the properties window for PG/PC assignment, where you can modify the assignment and "activate" it (S7ONLINE access).

Configuring the MPI bus

Operating the X136 interface as MPI

The X136 interface can also be used as an MPI interface, for example, to connect to an external PG/PC.

When the X136 interface is used as an MPI bus, additional activation of a drive on this interface is not possible.

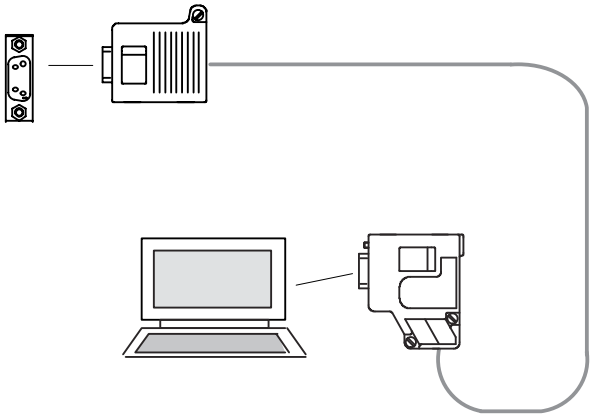

Figure 10-44 Connection of the D4x5-2 to MPI bus components

MPI parameters

MPI bus addresses and data transmission rate

Every node on the MPI bus must have a bus address in the range 0 to 31.

The data transmission rate on the MPI bus can be set to any value for the SIMOTION D4x5-2.

Communication attempt unsuccessful

If communication cannot be established at all, or if it cannot be established with individual nodes on the MPI bus, check the following:

- Is the transmission rate setting for the D4x5-2 used for all nodes?
- Are there any loose plug connections?
- Are all bus segments terminated properly?
  Bus segments that are not terminated properly will disrupt communication on the MPI bus.

Configuring PROFINET IO

General information about communication via PROFINET IO

Communication cycle

In PROFINET, the communication cycle is subdivided into different, time-specific intervals. The first interval is used for isochronous real-time communication (IRT), followed by real-time communication (RT) and standard TCP/IP communication. The bandwidth reservation for IRT ensures that RT communication and standard communication have no effect on the transmission of IRT telegrams, which are important for motion control applications.

The following figure shows how the PROFINET communication cycle is divided into isochronous real-time communication (IRT), real-time communication (RT), and standard TCP/IP communication.

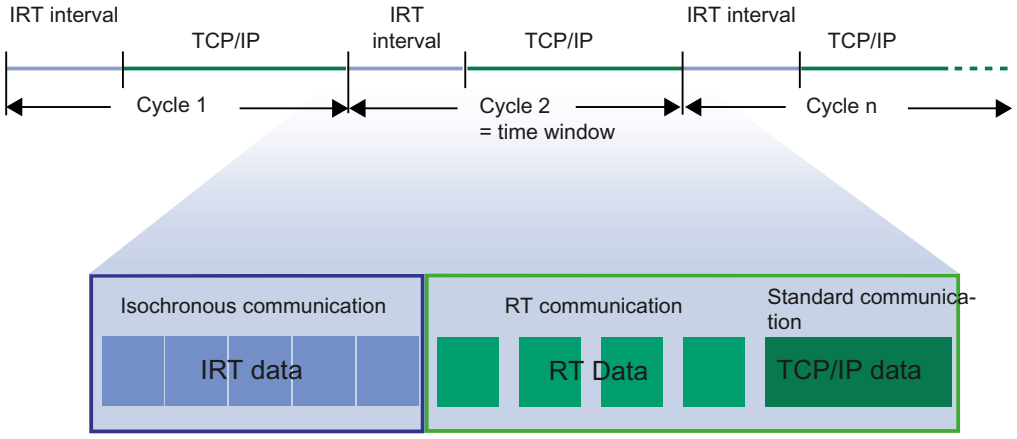

Figure 10-45 PROFINET communication cycle

Isochronous real-time Ethernet

STEP 7 can be used to configure PROFINET devices supporting data exchange via isochronous real-time Ethernet (IRT). IRT telegrams are transferred deterministically via planned communication paths in a defined sequence to achieve the best possible synchronism and performance.

IRT requires special network components supporting a planned data transfer.

Isochronous operation and mode

Equidistant mode and isochronous mode function similarly in PROFINET IO to the way they function in PROFIBUS DP.

For PROFIBUS DP, in isochronous operation all nodes are synchronized using a Global Control Signal created by the DP master.

In PROFINET IO with IRT, a sync master generates a signal to which sync slaves synchronize themselves. Sync master and sync slaves belong to a sync domain which is assigned a name via configuration. The role of the sync master can in principle be played by an I/O controller as well as an I/O device. A sync domain has exactly one sync master.

Context: Sync domain and I/O systems

An important fact is that sync domains do not need to be limited to one PROFINET IO system: The devices of several I/O systems can be synchronized by a single sync master, provided they are connected to the same Ethernet subnet.

The following applies the other way around: An I/O system must only belong to a single sync domain.

Signal propagation delays not negligible

For the extremely exact synchronization interval, line lengths, namely the associated delay times, must be taken into consideration. You can use a topology editor to enter the properties of the lines among the ports of the switches. STEP 7 uses this data and the other configuration data to calculate the optimized process of the IRT communication and the resulting updating time.

IRT runs in parallel to real-time and TCP/IP communication

Apart from IRT communication, for which a defined bandwidth is reserved within the update time, RT communication and TCP/IP communication are also permitted within the update time.

With RT communication (real-time communication), the cyclic data is transferred between I/O controller and I/O device, but without "best possible synchronism".

With non-synchronized I/O devices, data is exchanged automatically via RT communication.

Due to the fact that TCP/IP communication is also possible, other data, e.g. non-real-time data, configuration data or diagnostic data, can be transported.

PROFINET IO controller

Typically, the function of a PROFINET IO controller is taken on by controllers (e.g. SIMOTION C/P/D, SIMATIC S7 CPUs, ...).

The PROFINET IO controller takes on the master function for I/O data communication of the distributed field devices. The function is comparable to a PROFIBUS DP master class 1.

PROFINET IO device

Distributed field devices such as I/Os, drives (e.g. SINAMICS S120) or operator terminals are designated as I/O devices. The function is comparable to a PROFIBUS DP slave.

Addressing

In the delivery condition, the onboard PROFINET IO interface does not have an IP address or a subnet mask.

Note

The IP addresses 192.168.215.240 to 192.168.215.255 are reserved for internal communication in the SIMOTION D4x5-2 (subnet mask 255.255.255.240). When configuring the PROFINET interface (X150), make sure that the internal addresses are not located within the network of this interface. In IP, the network is defined as an AND link of IP address and subnet mask.

Media redundancy (MRP), as of V4.3

It is possible to establish redundant networks via the Media Redundancy Protocol (MRP). Redundant transmission links (ring topology) ensure that an alternative communication path is made available when a transmission link fails. The PROFINET devices that are part of this redundant network form an MRP domain.

MRP guarantees media redundancy in the event of a problem in the ring. The switchover of the ring is performed by the Redundancy Manager.

The switchover times depend on:

- The actual topology
- The devices used and
- The network load in the relevant network

The typical reconfiguration time of the communication paths for TCP/IP and RT frames in the event of a fault is < 200 ms.

In most systems, the switchover time of MRP is far above the PROFINET update time for cyclic data, so that a failure for cyclic data is detected. The PROFINET connection therefore fails and is reestablished after the switchover by the Redundancy Manager. In this way, an error can be corrected in the network, while the system continues to run **with bumps**.

Note

During the interruption of the ring, as well as when correcting the interruption (e.g. repair of the defective cable), there is a brief failure of the communication.

Ring ports

A SIMOTION/SINAMICS device may only be inserted in an MRP ring as a node with MRP-capable ports. For SIMOTION D, the first two ports of the PROFINET IO interfaces are designed as ring ports.

These two ports are marked with an "R" in the module rack in HW Config.

Note

Only devices with MRP-capable ports may be inserted in an MRP ring. If MRP-capable ports are not used, the reconfiguration times can be in the seconds range.

Bumpless media redundancy (MRPD)

Requirement for SIMOTION D4x5-2:

- SIMOTION SCOUT as of V4.3
- SIMOTION SCOUT TIA as of V4.5

MRPD is a procedure for bumpless media redundancy for PROFINET IO with IRT. MRPD also requires MRP.

The combination of MRP with MRPD provides bumpless PROFINET operation for short cycle times in the event of a fault in the ring. MRPD is based on IRT and ensures bumpless operation by the provider sending the cyclic data in both directions which the consumers then receive twice. If the ring is interrupted somewhere (e.g. through the failure of a ring node), receipt of the cyclic data via the fault-free side of the ring is still guaranteed.

Bumpless media redundancy MRPD always requires the activation of MRP in the individual rings.

A maximum of two Ethernet nodes may be between the sync master and the redundant sync master. If the redundant sync master is used together with MRPD, it is recommended that the redundant sync master be connected directly to the sync master and the two nodes located in a shared cabinet so that the cable connection between both nodes is protected.

If there is an interruption in the link between the sync master and the redundant sync master, the system continues to run without bumps, but after switching off and on again faults can occur.

Too high a network load or too-rapid coming and going of faults can also result in unfavorable cases in the failure of the PROFINET connection with activated MRPD because of delayed or incomplete switchover actions of MRP/MRPD.

For example, with two consecutive faults at different points in the ring, bumpless operation is only ensured when there is approx. three seconds between the two faults.

Additional information

You will find additional information about media redundancy in the *SIMOTION Communication* System Manual.

Setting a send cycle clock and system cycle clocks

Basic principles

Basic cycle clock

For the SIMOTION D4x5-2, the basic cycle clock depends on:

- Whether a second servo task has been activated for the runtime system.
- Whether a second PROFINET interface (=CBE30-2) is used for the SIMOTION D4x5-2 DP/PN.

By default, one servo task and two IPO tasks (IPO, IPO_2) are used. The IPO_2 cycle clock can be set as a multiple of the IPO cycle clock. In this way, the IPO_2 cycle clock can be used for lower priority technology objects (e.g. axes with less dynamic response).

Second servo task

A second servo task is only required for applications with special requirements, e.g.:

- For fast I/O processing via PROFINET IO (for particularly short sampling times and response times).
- If in addition to the electric axes (e.g. servo drives), hydraulic axes with particularly high-performance pressure/position control are implemented.
- If the electric axes have to be split into two performance classes on the servo level (fast servo - slow servo).

Note

If the axes have to be split into two performance classes, usually a split on the IPO level (IPO, IPO_2) is sufficient, a split on the servo level (Servo, Servo_fast) is only required in exceptional circumstances.

- The reference variable calculation / motion profile calculation of the axes is performed in the IPO level.

- The position control and monitoring of the axes is performed in the servo level.

Note that an additional Servo_fast/IPO_fast places an extra load on the SIMOTION runtime system.

In addition, with DSC (Dynamic Servo Control) for servo axes, the dynamically effective part of the position controller in the drive is performed in the frequency of the speed control loop (i.e. usually with 125 µs in the case of SINAMICS S120). If symbolic assignment with automatic telegram determination is used, DSC is activated automatically.

Table 10-35 Comparison of the task system with one or two servos

Characteristic	One servo (default)	Two servos	
Available servo tasks	- Servo	- Servo_fast - Servo	
Available IPO tasks	- IPO - IPO_2	- IPO_fast - IPO - IPO_2	
Basic cycle clock	• PROFINET cycle clock for servo, IPO, IPO_2, if PROFINET is isochronous • DP cycle of the SINAMICS Integrated for servo, IPO, IPO_2, if PROFINET is not isochronous	DP cycle of the SINAMICS Integrated for -Servo, - IPO, - IPO_2	PROFINET cycle clock (interface X150) for - Servo_fast - IPO_fast
Basic cycle clock when using a second PROFINET interface (= CBE30-2)	Both PROFINET interfaces use the same basic cycle clock	DP cycle of the SINAMICS Integrated = PROFINET cycle clock (X1400 interface, CBE30-2) for - Servo, - IPO, - IPO_2	PROFINET cycle clock (X150 interface) for - Servo_fast - IPO_fast
DP cycle	0.25/0.5 ... 0.8 ms (DP internal)[4] 1 ... 8 ms (DP external)	0.25/0.5 ... 8 ms (DP internal)[4] 1 ... 8 ms (DP external)	
PN cycle	0.25 ... 4 ms	0.25 ... 4 ms (D455-2 as of V4.5: Minimum 0.125 ms)[5]	
Grid [1]	125 µs	125 µs	
Servo cycle clock - D425-2 DP - D425-2 DP/PN - D435-2 DP - D435-2 DP/PN - D445-2 DP/PN - D455-2 DP/PN	Servo ≥ 0.5 ms ≥ 0.5 ms ≥ 0.5 ms ≥ 0.25 ms (≥ 0.5 ms for < V4.5) ≥ 0.25 ms (≥ 0.5 ms for < V4.5) ≥ 0.25 ms (≥ 0.5 ms for < V4.5)	Servo_fast/Servo[6] --- [2] --- [2] --- [2] ≥ 0.25 ms / ≥ 0.75 ms ≥ 0.25 ms / ≥ 0.75 ms ≥ 0.125 ms / ≥ 0.5 ms (< V4.5: ≥ 0.25 ms / ≥ 0.75 ms)	
IPO cycle clock - D425-2 DP - D425-2 DP/PN - D435-2 DP - D435-2 DP/PN - D445-2 DP/PN - D455-2 DP/PN	IPO ≥ 0.5 ms ≥ 0.5 ms ≥ 0.5 ms ≥ 0.25 ms (≥ 0.5 ms for < V4.5) ≥ 0.25 ms (≥ 0.5 ms for < V4.5) ≥ 0.25 ms (≥ 0.5 ms for < V4.5)	IPO_fast/IPO[6] --- [2] --- [2] --- [2] ≥ 0.25 ms / ≥ 0.75 ms ≥ 0.25 ms / ≥ 0.75 ms ≥ 0.125 ms / ≥ 0.5 ms (< V4.5: ≥ 0.25 ms / ≥ 0.75 ms)	
Notes regarding the drives		In Servo_fast/IPO_fast, only drives that are connected via PROFINET IO can be operated. [3]	

[1] The following applies for < V4.4: If there are IO devices with RT class "RT" in a sync domain, it is only possible to set the send cycle clocks 0.25 ms (for two servos), 0.5 ms, 1 ms, 2 ms and 4 ms.

[2] Servo_fast and IPO_fast are only provided on modules with PROFINET interface and as of performance class D435-2.

[3] CU310-2 PN/CU320-2 PN: Minimum PROFINET send cycle clock: 250 µs (as of SINAMICS version V4.5)

[4] 0.25 ms as of V4.5 for D435-2 DP/PN, D445-2 DP/PN and D455-2 DP/PN

[5] Only available for SIMOTION D455-2 DP/PN in the TIA Portal (SCOUT TIA as of V4.5) Additional cycle clock setting: 125 µs

[6] Note the rules for the cycle clock ratio "PROFIBUS bus cycle clock" to "PROFINET cycle clock" when using two servos.

See also SINAMICS manuals.

Note

The DCC tasks T1...T3 are always assigned to Servo, IPO, or IPO_2.

You can also display the basic cycle clock used in **HW Config**. You can also activate the Servo_fast/ IPO_fast there, when required.

Proceed as follows to do this:

1. Open **HW Config**. Double-click the D4x5-2 module to open the "Properties - D4x5-2" dialog box.
2. You can activate use of the Servo_fast/IPO_fast in the "Isochronous tasks" tab. The basic cycle clock for the Servo and (if parameterized) the basic cycle clock for the Servo_fast is displayed.

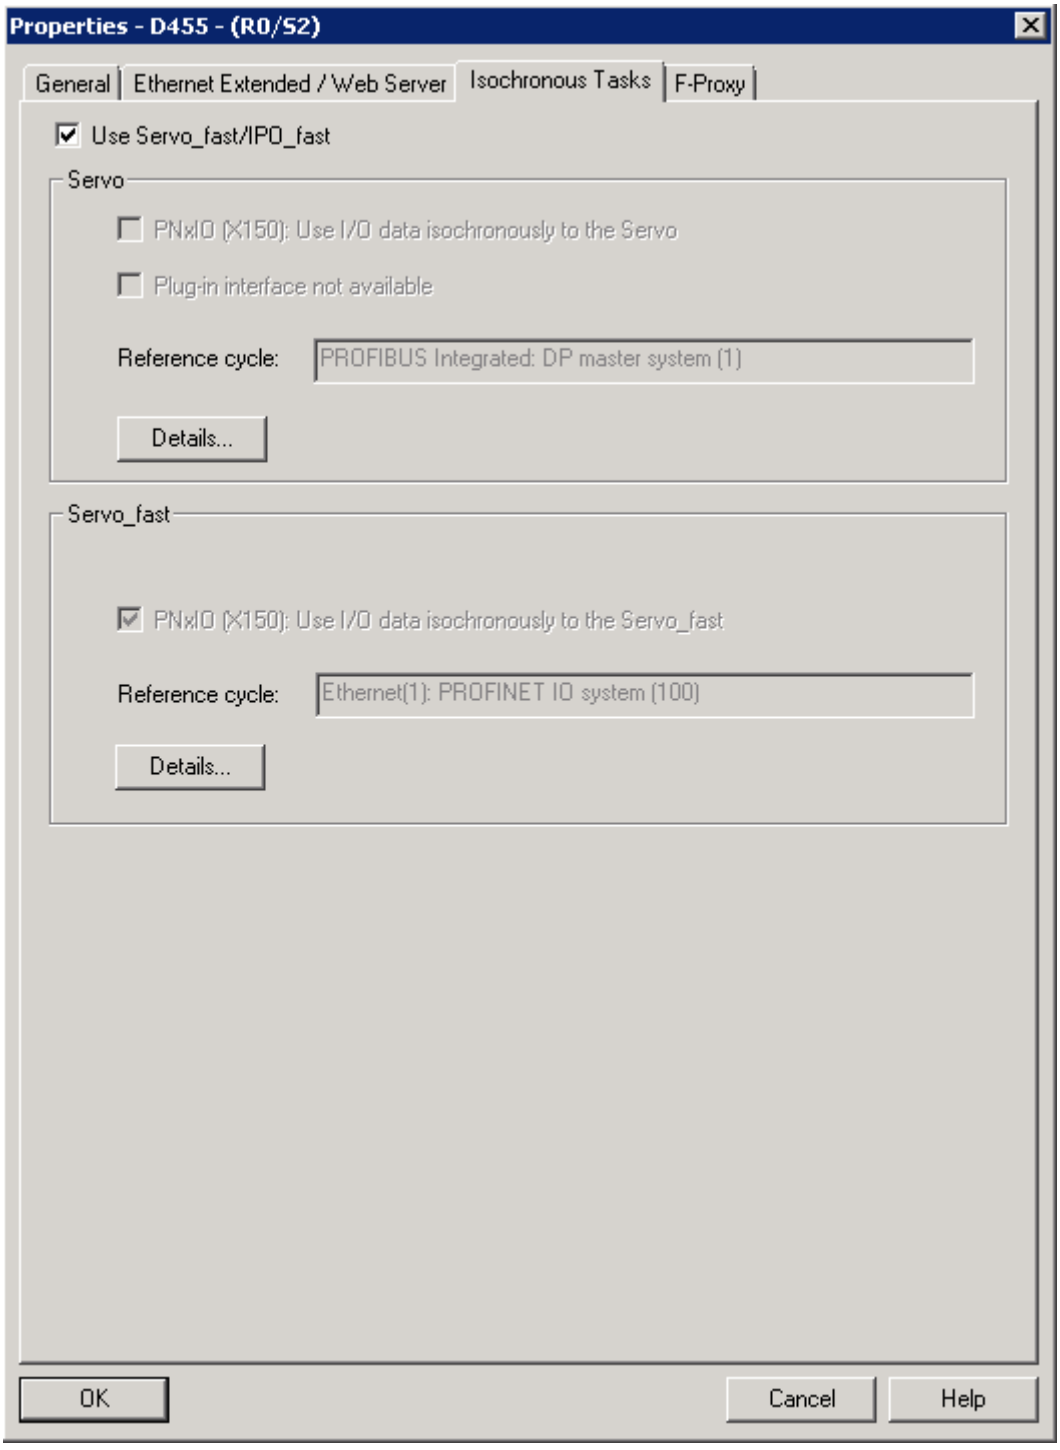

Figure 10-46 Properties D4x5-2 - Isochronous Tasks dialog box

3. Close the "Properties - D4x5-2" dialog box with "OK".
4. Save and compile the modified hardware configuration.
5. Load the new hardware configuration to the SIMOTION D4x5-2 via PROFIBUS DP / PROFINET IO / Ethernet.

The setting of the cycle clocks is described in the following.

Note

The deployment of TM15 (SIMOTION) and TM17 (SIMOTION) is possible only with DP Integrated, PN and servo cycle clocks ≥ 0.5 ms. This applies to TM modules connected directly to D4x5-2 and indirectly via CX32-2/CU320-2.

See also

You will find detailed information on the system cycle clocks in the *SIMOTION Runtime Basic Functions* Function Manual and in the *SIMOTION Communication* System Manual.

You will find detailed information on the configuration of axes in the *SIMOTION TO Axis, Electrical/Hydraulic, External Encoder* Function Manual.

Setting of the cycle clocks (one servo activated = default)

Setting the DP cycle in HW Config

To set the DP cycle of the SINAMICS Integrated, double-click the SINAMICS block on the integrated PROFIBUS in HW Config.

The "DP Slave Properties" dialog box opens. You can adjust the DP cycle of the SINAMICS Integrated on the "Isochronous mode" tab. See also Settings for DP slave properties (Page 7101).

Table 10-36 SIMOTION D4x5-2 value range

	D425-2 DP **D425-2 DP/PN** **D435-2 DP**	**D435-2 DP/PN** **D445-2 DP/PN** **D455-2 DP/PN**
DP cycle	≥ 0.5 ms (DP internal) ≥ 1.0 ms (DP external)	≥ 0.25 ms (DP internal) ≥ 0.5 ms (DP internal, < V4.5) ≥ 1.0 ms (DP external)
Grid	0.125 ms	0.125 ms

If, in addition to the drives on the SINAMICS Integrated / CX32-2, external drives are also to be connected via isochronous PROFIBUS, the DP cycle must be ≥ 1 ms.

Setting the send cycle clock in HW Config

The send cycle clock for PROFINET IO must be set in the "Domain Management" dialog in **HW Config**. To do this, select the "Edit" > "PROFINET IO" > "Domain management ..." menu command in **HW Config** and set the desired cycle clock.

The PROFINET interface can be operated with a send cycle clock in the range of 0.25 ms ≤ send cycle clock ≤ 4 ms when one servo is used. The smallest configurable time base is 0.125 ms.

Note

Information for version < V4.4

If there are IO devices with RT class "RT" in a sync domain, it is only possible to set the send cycle clocks 0.25 ms, 0.5 ms, 1 ms, 2 ms and 4 ms.

Cycle clock reduction ratio

As of V4.3, a reduction ratio for the PROFIBUS cycle clock to the Servo cycle clock is possible. The reduction ratio is only permitted when PROFINET IO with IRT has not been configured. A reduction ratio for the PROFINET send cycle clock to the PROFIBUS cycle clock is also possible.

Example:
PROFINET send cycle clock = 0.5 ms
PROFIBUS cycle clock = servo cycle clock = 1 ms

The PROFIBUS cycle clock can be operated relative to the PROFINET send cycle clock at a ratio of 1:1 to 16:1.

The table below shows the possible ratio settings for the SIMOTION D4x5-2 system cycle clocks based on the DP cycle of the SINAMICS Integrated or PROFINET send cycle clock.

Table 10-37 Ratios of the system cycle clock (when one servo is used)

Cycle clock name	Settable factors	Reference cycle clock
PROFIBUS DP bus cycle clock	1, 2, 3, 4, 6, 8, 10, 12, 14, 16	PROFINET IO send cycle clock
Servo	As of V4.3: 1, 2, 3, 4, 8[1)] V4.2: 1	PROFIBUS DP bus cycle clock
IPO	1, 2, 3, 4, 5, 6	Servo
IPO_2	2, 3, 4, 5, ..., 64	IPO

[1)] Always "1" if PROFINET with IRT has been configured

Setting the cycle clock ratios

The set bus cycle clock is displayed in SIMOTION SCOUT as the "Bus data cycle" in the "System Cycle Clocks - D4x5-2" dialog box. Select SIMOTION D4x5-2 and then select the "Set system cycle clocks" command from the "Target system" > "Expert" menu.

Set the required cycle clock ratios for the servo, IPO and IPO_2 in the "System Cycle Clocks - D4x5-2" dialog box.

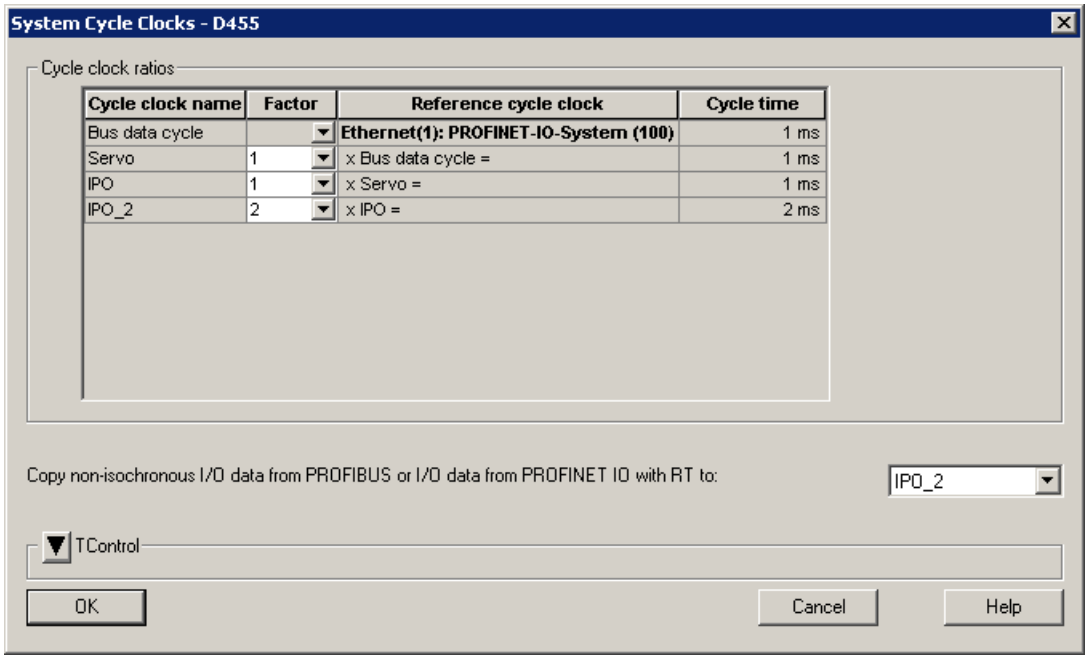

Figure 10-47 D4x5-2 system cycle clocks (one servo activated)

Setting of the cycle clocks (two servos activated)

Requirement

Supported control units: SIMOTION D435-2 DP/PN, D445-2 DP/PN and D455-2 DP/PN

If Servo_fast and IPO_fast are used, the PROFINET must be operated isochronously.

A reduction ratio for the PROFINET cycle clock to the Servo_fast-cycle and the PROFIBUS cycle clock to Servo cycle clock is not possible.

Cycle clock ratios and conditions

The table below shows the possible ratio settings for the SIMOTION D4x5-2 system cycle clocks based on the DP cycle of the SINAMICS Integrated or PROFINET send cycle clock.

Table 10-38 Ratios of system cycle clocks (two servos)

Cycle clock name	Settable factors	Reference cycle clock
Servo_fast	1	Send cycle clock of the onboard PROFINET IO interface (X150)
IPO_fast	1, 2, 4	Servo_fast
Servo	1	PROFIBUS DP bus cycle clock and send cycle clock of the optional second PROFINET IO interface (CBE30-2)
IPO	1, 2, 4	Servo
IPO_2	2, 3, 4, 5, ... 64	IPO

Note

- If illegal settings are made in the "D4x5-2 System Cycle Clocks" dialog box, an error is signaled during the consistency check.
- If the required isochronous buses have not be configured, "???" is displayed under cycle time in the "D4x5-2 System Cycle Clocks" dialog box.

The following conditions must also be met when using 2 servos:

- Bus cycle clock PROFIBUS DP = N x send cycle clock of the onboard PROFINET IO interface X150
  N = 2, 4, 8, 16, 32, 64 (N = 2 only for send cycle clock > 250 µs)
  (for < V4.4: N = 2, 4, 8, 16 for all send cycle clocks)
- Send cycle clock of an optional second PROFINET IO interface (CBE30-2) = PROFIBUS DP bus cycle clock
- IPO ≥ IPO_fast
- Servo_fast and IPO_fast are always assigned to the PROFINET interface
- The onboard PROFINET interface can only be operated as sync master (consequently with distributed synchronous operation via PROFINET, the D4x5-2 cannot participate as sync slave when Servo_fast/IPO_fast is used)
  If the PROFINET interface is configured as sync slave, the faulty configuration is indicated via a diagnostic buffer entry and the controller goes into starting inhibit.

Setting the bus cycle clocks

See Section Setting of the cycle clocks (one servo activated = default) (Page 7032). This procedure is described in:

- Setting the DP cycle in HW Config or
- Setting the send cycle clock in HW Config

Setting the cycle clock ratios

The set bus cycle clocks are displayed in SIMOTION SCOUT as the "Bus data cycle 1" and "Bus data cycle 2" in the "System Cycle Clocks - D4x5-2" dialog box. Select SIMOTION D4x5-2 and then select the "Set system cycle clocks" command from the "Target system" > "Expert" menu.

Set the required cycle clock ratios for the Servo_fast/IPO_fast as well as the Servo/IPO/IPO_2 in the "System Cycle Clocks - D4x5-2" dialog box.

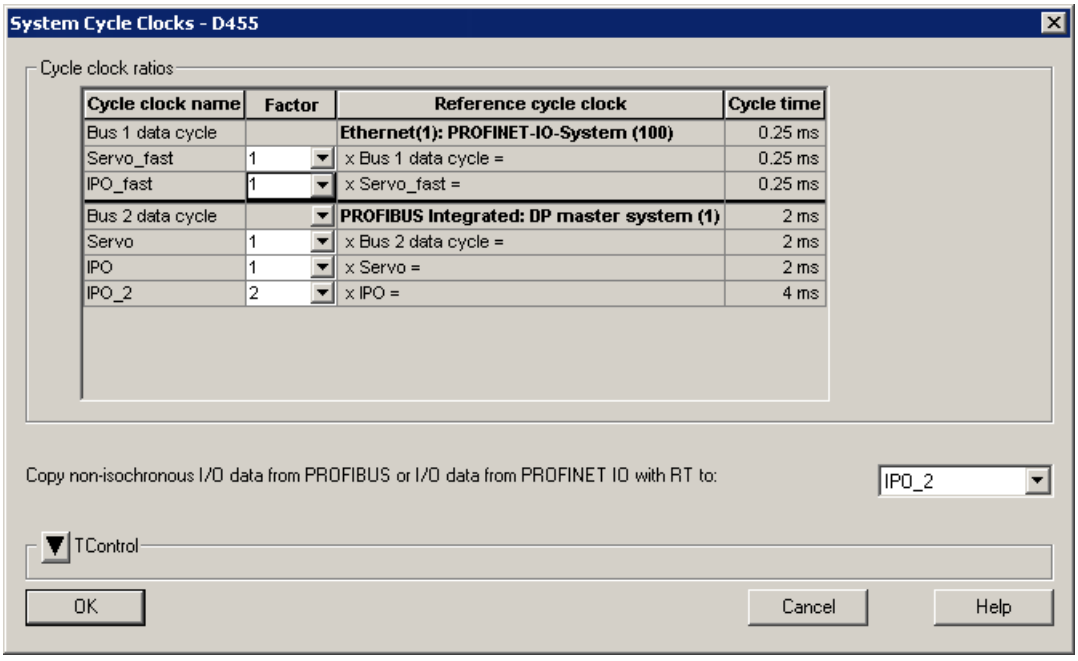

Figure 10-48 D4x5-2 system cycle clocks (two servos activated)

Using a second PROFINET interface

With the SIMOTION D4x5-2 DP/PN Control Units, optionally a second PROFINET interface is available as of V4.3 in addition to the onboard PROFINET interface (X150) with the Ethernet communication board (CBE30-2, X1400).

The CBE30-2 can only be operated in the D4x5-2 DP/PN Control Units, operation in the D4x5-2 DP Control Units is not possible.

Applications

A CBE30-2 can be used, for example, for the following applications:

- To use the second PROFINET interface.
  - To increase the maximum number of connectable devices.
  - To increase the available I/O address space.
- Devices are to be operated with different send cycle clocks and assigned different isochronous tasks (Servo and Servo_fast).
- Devices are to receive an independent IP address area or NameOfStation (e.g. higher-level network as plant network; local network for machine module; nodes in the "local network" can be addressed separately from the nodes in the "plant network").
- I-device and controller are to be operated isochronously at the same time.
  If one PROFINET interface is operated simultaneously as I-device and controller, either only the I-device or only the controller can be operated isochronously (i.e. with IRT). With two PROFINET interfaces, it is possible to operate a PROFINET IO controller and an I-device isochronously on a D4x5-2 DP/PN at the same time.

Rules for two PROFINET interfaces

The following rules must be taken into account when using two PROFINET interfaces, if both interfaces are to be operated isochronously (an isochronous device or an isochronous I-device or data exchange broadcast is configured at the interface):

- Both interfaces can be configured as a PROFINET IO I-device and/or as a controller.
- A higher-level controller must always be connected isochronously via the CBE30-2.
  This applies both for the controller-controller communication and for the I-device communication to a higher-level controller. Lower-level isochronous drives/I/O should be connected via the onboard PROFINET interface.
- The onboard PROFINET interface must be configured as sync master.
- The CBE30-2 can be configured as sync master or sync slave.
- An F-CPU can only be connected to one of the two PROFINET interfaces, because fail-safe I/O transfer areas can only be configured either on the I-device on the onboard PROFINET interface or on the CBE30-2.
  The PROFIsafe telegrams are routed to the following drives:
  - Drives on the SINAMICS Integrated and CX32-2
  - Drives on the onboard PROFINET interface (X150 interface)
  - Drives on the CBE30-2 (X1400 interface)

  The maximum quantity structure for PROFIsafe on PROFINET is therefore not increased by using a second PROFINET interface.
- If Servo_fast is not used, the servo isochronous devices can be assigned to both PROFINET interfaces.
- A redundant sync master is not permitted in the SYNC domain of the onboard PROFINET interface if both PROFINET interfaces are operated isochronously and the CBE30-2 is configured as a sync slave or IRT I-device.
- CBE30 supports a minimum send cycle clock of 500 µs. The SINAMICS Integrated can therefore only be operated with 250 µs or 375 µs if isochronous communication has not been configured for the CBE30.

Rules for Servo_fast

The following rules apply for the onboard PROFINET interface (X150) assigned to the Servo_fast:

- The interfaces are permanently assigned:
  - Servo/IPO/IPO_2 to the CBE30-2 (or DP and DP Integrated)
  - Servo_fast and IPO_fast to the onboard PROFINET interface
- If the Servo_fast is used, only one CACF (Controller Application Cycle Factor) = 1 is permitted for Servo and Servo_fast, i.e. it must be set:
  - Servo cycle clock = send cycle clock of the PROFINET interface X1400 (CBE30-2)
  - Servo_fast cycle clock = send cycle clock of the PROFINET interface X150 (onboard interface)
- The Servo_fast must have a reduction ratio to the Servo of 2, 4, 8, or 16.

Further information

For further information, see the *SIMOTION Communication* System Manual.

PROFINET V2.3: Optimized data transfer / 125 µs PROFINET send cycle clock

All SIMOTION D4x5-2 DP/PN Control Units support PROFINET according to the PI specification PN V2.3. For SIMOTION D455-2 DP/PN, the optional functionality **Performance Upgrade** is available, which provides the following functional scope:

- Reduction of the minimum PROFINET send cycle clock from 250 µs to 125 µs (isochronous)
- Optimization of data transfer (e.g. by Dynamic Frame Packing - DFP)
  By optimized data transfer
  - more devices can be operated with the same cycle time or
  - the cycle time can be reduced for the same number of devices

Requirements

The following configuration rules must be taken into account when using the 125 µs send cycle clocks:

- The 125 µs send cycle clock is only available for the SIMOTION D455-2 DP/PN
- Configuration only with SCOUT TIA as of V4.5 (SIMOTION in the TIA Portal)
- The 125 µs send cycle clock is only supported by the onboard PROFINET interface X150
- X150 can only be used as a PROFINET IO controller (not as an I-device)
- Only one port can be used on X150; the other two ports must therefore be deactivated in the interface properties of X150
  The following then applies:
  - The deactivated ports also cannot be used for TCP/IP and UDP communication
  - No MRP/MRPD media redundancy
  - Devices **that support a send cycle clock of 125 µs** must be connected via "one" active port of X150 (assign device to the controller and configure the Ethernet topology in the topology view)
- For isochronous mode, the clock synchronization must be activated on the controller (sync master) and on the device (sync slave) (RT class: IRT)
- The 125 µs send cycle clock is only supported in conjunction with Servo_fast/IPO_fast; activate the "Use Servo_fast" option at Isochronous mode in the CPU properties in the TIA Portal.
- In addition to the send cycle clock, the "Enable High Performance" option must be activated for the sync domain.

- Note the cycle clock dependencies for the DP Integrated and set a suitable cycle clock at PROFIBUS Integrated:
  - For a 125 µs PN send cycle clock: Only DP Integrated cycle clock 0.5 / 1 / 2 / 4 ms permitted
- For the ET 200SP, the Isochronous mode option must also be set for the I/O module in the device properties at Isochronous mode in the detail view; in addition, "Servo_fast" must be set as process image at I/O addresses in the properties of the I/O terminal.

Components that can be used

The 125 µs send cycle clock is only supported by selected PROFINET nodes (e.g. by the ET 200SP I/O system). No SCALANCE switches are currently available for a 125 µs send cycle clock.

For the PROFINET nodes that support a send cycle clock of 125 µs and the conditions that have to be met, see the relevant product documentation.

Further information

You will find further information on configuration in the *SIMOTION Communication* System Manual.

Properties of PROFINET

Properties

The onboard PROFINET IO interface supports the parallel operation of:

- IRT - isochronous real-time Ethernet
  - Operation of IRT I/O (e.g. ET 200SP)
  - Operation of a SINAMICS S120 as an IRT device
- RT - real-time Ethernet
  - Operation of RT I/O (e.g. ET 200SP, ET 200pro, etc.)
  - Operation of a SINAMICS S120 as an RT device
- TCP/IP, UDP, HTTP, ... standard Ethernet services

Note

For mixed operation of IRT and RT, make sure that the IRT-compatible devices form what is referred to as an IRT domain; i.e. there must not be any non-IRT devices on the data transmission link between the IRT devices.

Additional references

You will find an overview of the specific properties of PROFINET IO on SIMOTION D in the *SIMOTION Communication* System Manual.

Configuration tasks

Configuration of PROFINET involves the following steps:

1. Insert the SIMOTION D4x5-2.
2. Configure the onboard PROFINET IO interface in **HW Config**.
3. Create a topology: Here, you specify how the individual ports of the PROFINET IO devices are interconnected.
4. Configure the sync domain: Here, you specify which PROFINET nodes are sync masters (clock generators) and sync slaves.
5. Specify the send clock: Describes the time during which a PROFINET IO device exchanges user data with the PROFINET IO controller.
6. Configure the direct data exchange: The direct data exchange specifies which address areas are to be used for sending and receiving respectively.

Additional references

You will find a detailed description of each configuration step in Section "Configuring PROFINET IO with SIMOTION" of the *SIMOTION Communication* System Manual.

Configuring an Ethernet subnet

Properties of the Ethernet interfaces

Characteristics

SIMOTION D4x5-2 has several onboard Ethernet interfaces:

- X127 P1 PN/IE (on the front of the module)
- X120 P1 PN/IE-OP (under the front flap, only for D4x5-2 DP)
- X130 P1 PN/IE-NET (under the front flap)

You can connect an Industrial Ethernet with a transmission rate of 10/100/1000 Mbit/s to the 8-pin **X127 P1**, **X120 P1** and **X130 P1** RJ45 sockets.

As the X127 is easily accessible on the front of the module, this should preferably be used for the PG/PC connection.

Note

As of V4.3, the three Ethernet interfaces support the PROFINET basic services - they therefore have the designation PN/IE-NET, PN/IE-OP or PN/IE.

The interfaces do not have any HUB/switch functionality, i.e. telegrams are not forwarded from one interface to the other. As a rule, the interfaces belong to separate S7 subnets.
SIMOTION D4x5-2 does not have any IP router functionality; it does not forward the telegrams from one IP subnet to another.

The features of the Ethernet interfaces are as follows:

- TCP/IP timeout parameters can be set jointly for all Ethernet/PROFINET interfaces (HW Config: Double-click the D4x5 module, "Ethernet extended" tab).
- The transmission rate / duplex can be set separately for all interfaces
- The interfaces have autocrossing functionality.

Ethernet communication

SIMOTION D4x5-2 offers the following functions via Industrial Ethernet:

- Communication with STEP 7, SIMOTION SCOUT and SIMATIC NET OPC via a PG/PC
- Communication via UDP (user datagram protocol) with other components, e.g. other D4x5-2 devices
- Communication with other devices via TCP/IP
- Connection of SIMATIC HMI devices, such as MP27x, MP37x or PC-based HMIs
- IT communication (e.g. via SIMOTION IT OPC XML-DA)
- Communication based on OPC UA (Unified Architecture)
- PROFINET basic services (e.g. DCP, LLDP, SNMP)
  These PROFINET basic services provide uniform functions for the address assignment and diagnostics, but do not provide PROFINET IO communication for the connection of drives, I/O modules, etc.

Setting/reading the IP address

As of V4.4, new system functions (_setPnIpConfig/_getPnIpConfig) for setting/reading the IP address are available. The new system functions have a larger functional scope (e.g. temporary or permanent setting of the IP address) and support all Ethernet-based interfaces of a SIMOTION D4x5-2.

The previous system functions _setIpConfig/_getIpConfig only support the interfaces X127 PN/IE (EnumInterfaceID = IE_01(0)) and X130 PN/IE-NET (EnumInterfaceID = IE_02(1)). The interfaces X120 PN/IE-OP, X150 PN, and X1400 PN (CBE30-2) cannot be used. We recommend only using the new system functions in the future.

Routing

"Services via TCP" are supported for all Ethernet interfaces.
From the two Ethernet interfaces, S7 routing is possible to the

- PROFIBUS interfaces and
- PROFINET interfaces
- As well as between the Ethernet interfaces

IP routing from one Ethernet interface to another, as well as from the PROFINET interface to the Ethernet interface and vice versa, is not possible.

You can find the MAC addresses on the rating plate located on the front of the SIMOTION D4x5-2.

See also

Further information about routing and the differences between IP and S7 routing can be found in the *SIMOTION Communication* System Manual.

Default Ethernet addresses

The following addresses are assigned by default:

Table 10-39 IP address assignment for a SIMOTION D4x5-2

Interface	Use case	Default address	
X127 P1 PN/IE	Insert SIMOTION device or HW Config	IP address: Subnet mask: Router address: Automatic private IP address	169.254.11.22 255.255.0.0 0.0.0.0
	D4x5-2 as delivered	IP address: Subnet mask: Router address: Automatic private IP address	169.254.11.22 255.255.0.0 0.0.0.0
X120 P1 PN/IE-OP (only for D4x5-2 DP)	Insert SIMOTION device or HW Config	IP address: Subnet mask: Router address:	192.168.213.1 255.255.255.0 0.0.0.0
	D4x5-2 DP as delivered	IP address: Subnet mask: Router address: Automatic private IP address	0.0.0.0 0.0.0.0 0.0.0.0
X130 P1 PN/IE-NET	Insert SIMOTION device or HW Config	IP address: Subnet mask: Router address:	192.168.2.1 255.255.255.0 0.0.0.0
	D4x5-2 as delivered	IP address: Subnet mask: Router address:	0.0.0.0 0.0.0.0 0.0.0.0

Note

The IP addresses 192.168.215.240 to 192.168.215.255 are reserved for internal communication in the SIMOTION D4x5-2 (subnet mask 255.255.255.240). When configuring the external Ethernet interfaces (X127 P1, X120 P1 and X130 P1), make sure that the internal addresses are not inside their network. (In IP, the network is defined as an AND link of IP address and subnet mask.)

Note

If you want to go online via Ethernet, you have to make sure that the connection from PG/PC to SIMOTION D4x5-2 is active. You can check this in **NetPro**. A description of how to switch a connection to active again can be found in the Section Establishing the PG/PC assignment (Page 7022).

Automatic Private IP Addressing

The Ethernet interfaces support the automatic IP assignment according to the Automatic Private IP Addressing (APIPA) process.

Interface X127 P1 already has IP address 169.254.11.22 in the delivery condition. Further information on Automatic Private IP Addressing can be found on the Internet, e.g. in WIKIPEDIA with the keywords "APIPA" or "Zeroconf".

Separate Ethernet interfaces

The Ethernet interfaces are entirely separate and are generally connected to different networks.

The Ethernet interfaces support:

- S7 routing
- No IP routing

SIMOTION D4x5-2 can therefore be connected to the machine user's internal company network with one interface and the second interface can be used, for example, by the machine manufacturer for the purpose of remote maintenance.

The Ethernet connection of the D4x5-2 can be configured in HW Config. Proceed as follows to do this:

1. Open your project.
2. Open HW Config. Double-click the Ethernet port (e.g. X127 P1) to open the "Properties PNxIE ..." dialog box.
3. You can configure the Ethernet connection in the "Options" tab.
   Recommendation: Use the default setting "Automatic setting". With Automatic setting, the baud rate and duplex operating mode are automatically aligned with the connection partner. The autocrossing functionality is also available so that you can use crossed and uncrossed cables.
   If transmission is to be set manually, not only must the connection (e.g. 10 Mbit/s half duplex) be set manually but autonegotiation must also be deactivated.
4. Close the "Properties PNxIE ..." dialog box with "OK".
5. Save and compile the modified hardware configuration.
6. Load the new hardware configuration to the SIMOTION D4x5-2 via PROFIBUS DP / PROFINET IO / Ethernet.

Shielded twisted pair cables are used for the networking.

- 4- and 8-wire cables can be used for 10/100 Mbit/s
- 8-wire cables must be used for 1000 Mbit/s

Note

With SIMOTION < V4.3, the settings are made via HW Config by double-clicking the D4x5-2 module. The "Properties - D4x5 2" dialog box opens. You can configure the Ethernet connection in the "Extended Ethernet" tab.

For additional information, see the *SIMATIC NET, Industrial Twisted Pair, and Fiber Optic Networks* Manual.

For further information about the cabling spectrum for Ethernet, see the *Industrial Communication IK PI* Catalog.

Configuring Ethernet addresses in HW Config

Requirement

For configuration using Industrial Ethernet, SIMOTION D4x5-2 must be provided with an IP address, the subnet mask, and the router address.

Note

Only one router may be configured.

Procedure

To configure and transfer Ethernet addresses to the D4x5-2, proceed as follows:

1. Open your project.
2. Open **HW Config**. Double-click the interface to be configured (e.g. X127) to open the "Properties" dialog box.
3. On the "General" tab, click the "Properties" button of the Ethernet interface. The "Properties - Ethernet Interface" dialog is displayed.
4. Click the "New" button. The "New Industrial Ethernet" subnet dialog is displayed. In this dialog box, you can change the name of the new subnet or confirm the default setting with "OK".
5. The newly created Ethernet subnet is now displayed under "Subnet" in the "Properties - Ethernet Interface" dialog box and must be selected.
6. In this dialog box, enter the required addresses for "IP Address" and "Subnet". Under "Router", choose whether a router is to be used. If using a router, enter the router address.
7. Confirm this dialog box with "OK".
8. Close the "Properties" dialog by clicking "OK".
9. To configure another Ethernet interface, open the "Properties" dialog box of the other interface and repeat Steps 3 to 7.
10. Save and compile the modified hardware configuration.
11. Load the new hardware configuration to the SIMOTION D4x5-2.

Assigning the Ethernet address later

It is possible to assign the IP address later on (e.g. on modular machines). In this case, an IP address is not assigned in HW Config, but activated differently with the "Set IP address using different method" option. The address will then be assigned later on the machine, for example, by a the user program or by commissioning tools, such as PRONETA.

Further information on PRONETA can be found on the Internet:

- PRONETA: See Internet address (http://support.automation.siemens.com/WW/view/en/67460624)

Reading out IP and MAC address

Requirement

To read out the IP and MAC addresses, the following requirements must be met:

- SIMOTION D4x5-2 is wired.
- You have assigned the communication parameters.
- You are online.

Procedure

The IP addresses and MAC addresses of SIMOTION D4x5-2 can be displayed as follows via SIMOTION SCOUT.

1. Right-click the module.
2. Select "Target device" > "Device diagnostics" in the context menu.

The addresses are displayed as follows, e.g. for SIMOTION D4x5-2 DP/PN:

X127 P1 (PN/IE)

- Active MAC Address: 08-00-06-73-25-3E
- IP address: 169.254.11.22
- Subnet mask: 255.255.0.0
- Standard gateway: No router used

X130 P1 (PN/IE-NET)

- Active MAC address: 08-00-06-73-25-3F
- IP address: 192.168.2.1
- Subnet mask: 255.255.255.0
- Standard gateway: No router used

As an alternative, you can determine the IP address as follows:

- By selecting "Project" > "Accessible nodes" in SIMOTION SCOUT or
- By calling "Target system" > "Ethernet" > "Edit Ethernet node..." in HW Config and browsing to "Online accessible nodes"
- Using the system function _getIpConfig

Note

The MAC address is listed on the nameplate on the front of the module.

10.1.1.7 Commissioning (software)

Overview of commissioning

Requirements

The following requirements must be fulfilled in order to commission the SIMOTION D:

- The system has been connected and wired.
- The SIMOTION D has been switched on and powered up (STOP mode).
- SIMOTION SCOUT (with integrated STARTER) has been installed and powered up on the PG/PC.
- The communication and networks have been configured.
- You have created a project and inserted a SIMOTION D in the project.

Note

The article numbers of the SINAMICS S120 components must be available.

You need these order numbers when setting up a SIMOTION project to verify that the components selected from the hardware catalog in the **HW Config** application correspond to the ones used in the system.

Symbolic assignment / adaptation

Symbolic assignment

As of V4.2, SIMOTION supports the symbolic assignment on SINAMICS drive objects (DOs) during the configuration of technology objects (TO) and I/Os.

This simplifies the configuration of the technological relationships including the communication between controller and drive.

With the symbolic assignment:

- Only suitable assignment partners are offered in an assignment dialog box.
- Communication between axis and drive is set up automatically by the engineering system and the required PROFIdrive axis telegrams as well as the used addresses set up.
- Telegrams are extended and interconnections created automatically in the drive depending on the selected TO technology (e.g. SINAMICS Safety Integrated).
- Axis and drive configuration can initially be performed independently of one another.
- Communication connections are established automatically during the configuration of I/O variables on SINAMICS I/Os (telegrams are set up automatically, the I/Os interconnected to the telegram and the addresses set up).

Apart from the symbolic assignment, no further configuration is required for the communication. As addresses no longer have to be configured, the connection is retained even with address offsets.

Note

During the configuration of drive objects (DO drive, DO encoder, ...) as well as in the Telegram Configuration dialog box (see Section Telegram configuration (Page 7148)), you can deactivate the **automatic telegram configuration** and the **automatic telegram adaptation**.

As many of the previously described advantages are lost through a deactivation, we recommend that a deactivation only be performed in exceptional circumstances.

The symbolic assignment enables an independent configuration of the axes on the SIMOTION side and the drives on the SINAMICS side.

This enables, for example:

- The PLC and motion control functions to be completely configured by a programmer even without drive know-how using technology objects (e.g. TO axis) and loaded to the device.
- The drives to be separately configured and optimized by a drive expert.
- The technology objects to be symbolically assigned later to the drive objects via an interconnection dialog box.

Note

The previous methods of drive, axis and I/O configuration are still available.
Symbolic assignment must be deactivated for these methods.

For newly created projects, the symbolic assignment is used by default.

If projects < V4.2 are upgraded, the symbolic assignment is deactivated by default and must be activated when required.

Symbolic assignment can be activated/deactivated in SIMOTION SCOUT via the "Project" > "Use symbolic assignment" menu.

Activating symbolic assignment later

Symbolic assignment simplifies the configuration of the technological relationships including the communication between controller and drive significantly. The names of the symbolic assignments in plain text is also advantageous for project maintenance.
Symbolic assignment is therefore recommended for new projects as of V4.2 and is automatically active.

If symbolic assignment is used in a project, telegrams, interconnections and addresses are automatically created by the engineering system by default.

The engineering system sets the "optimal" PROFIdrive telegrams and telegram extensions for the system, makes the required BICO interconnections and determines the addresses.

It is also possible to change upgraded projects to symbolic assignment and must be decided individually, as follow-up work may be required.

Extensive follow-up work is usually required particularly for free telegram configurations (e.g. for TB30, TM15 DI/DO, TM31).

Note

If the symbolic assignment is activated later, previously existing telegram settings and BICO interconnections for all SINAMICS telegrams that are set to Standard/Automatic (Communication -> Telegram configuration) are replaced at the next compilation. This may change telegrams and BICO interconnections and delete telegram extensions previously set up manually.

For this reason, make a backup copy of your project before activating the symbolic assignment.

To retain the settings that have been made, after the selection of "Use symbolic assignment," the setting "User-defined" must be selected and the check box cleared for automatic telegram setting/address adaptation for the respective message before compilation.

For further details, see the *SIMOTION Runtime Basic Functions* Function Manual.

Assigning a drive later

You can create an axis in SIMOTION SCOUT and assign it later to a drive. You can thus load your user program to the controller and (with the exception of the non-existent drives) test it.

Compared to a procedure with temporarily created "virtual axes", "axes without assigned drive" have the advantage that the configuration data is completely available and do not require a "virtual axis -> real axis" reconfiguration.

Simulation of axes

The axis simulation can also be used to test the user program.

You can find a script for switching the axis simulation on and off in
SIMOTION Utilities & Applications, which is part of the scope of delivery of SIMOTION SCOUT.

For further details, see also *TO Axis Electrical/Hydraulic, External Encoder* Function Manual.

Adaptation

In addition to the symbolic assignment, the **automatic adaptation** facilitates the configuration of SINAMICS S110/S120 data as of SIMOTION V4.2. During power-up of the SIMOTION devices, reference variables as well as drive and encoder data of the SINAMICS S110/S120 are automatically taken over for the configuration data of the SIMOTION technology objects "TO axis" and "TO externalEncoder". This data no longer has to be entered in SIMOTION.

For additional information, see the following sources:

- *SIMOTION Runtime Basic Functions* Function Manual
- *TO Axis Electrical/Hydraulic, External Encoder* Function Manual

Requirement

Symbolic assignment is supported by the TO axis, TO externalEncoder and the TO outputCam, TO camTrack and TO measuringInput. The onboard I/Os of a SIMOTION D, of a SINAMICS S110/S120 control unit as well as from a TB30 and selected Terminal Modules can be interconnected symbolically.

Table 10-40 Control units that support a symbolic assignment

Module	Supports symbolic assignment
SIMOTION D410-2	As of SIMOTION V4.3
SIMOTION D410	As of SIMOTION V4.2
SIMOTION D4x5-2	As of SIMOTION V4.2
SIMOTION D4x5	As of SIMOTION V4.2
Controller extension • CX32-2 • CX32	As of SIMOTION V4.2
SINAMICS S110 CU305	As of SINAMICS V4.3
SINAMICS S120 • CU310-2 • CU310 • CU320-2 • CU320	 • As of SINAMICS V4.4 • As of SINAMICS V2.6.2 • As of SINAMICS V4.3 • As of SINAMICS V2.6.2

See also

Only the drive configuration by means of symbolic assignment is described in this documentation.

On the Internet, you can find documentation of older SIMOTION versions at: (https://support.industry.siemens.com/cs/ww/en/view/40211807)

For further information on the configuration of the TO axis and TO externalEncoder, see the *TO Axis Electrical/Hydraulic, External Encoder* Function Manual.

Procedure when commissioning

Commissioning steps

This section shows you how to configure a system and test the configured drives and axes. The commissioning steps are listed below. The sequence is only an example and can vary depending on the supplementary conditions.

1. Configure the SINAMICS Integrated:
   You can configure the integrated drives (SINAMICS Integrated) offline or online:
   - Offline configuration:
     Performing D4x5-2 offline configuration (Page 7052) and CX32-2 offline configuration (Page 7093)
     For offline configuration, all of the components and their article numbers must be known.
   - Online configuration:
     Performing D4x5-2 online configuration (Page 7080) and
     Performing CX32-2 online configuration (Page 7096)
     During online configuration, you can download all of the information from the connected DRIVE-CLiQ components to your user project.
     Note:
     The next two sections describe how a SIMOTION D4x5-2 including SINAMICS Integrated is configured. The described procedure also applies when CX32-2 controller extensions are used.
     The Section *Configuring a CX32-2* also describes the step-by-step commissioning with a CX32-2 controller extension. The advantage of a step-by-step configuration is that the location and cause of an error are easier to identify.
2. Test a drive with the drive control panel (Page 7132)
3. Create an axis with the axis wizard (Page 7135)
4. Test an axis with the axis control panel (Page 7142)
5. Activate the infeed (Line Module) (Page 7144)
6. Set up addresses and telegrams (Page 7147)
7. Link an additional encoder (optional) (Page 7152)
8. Configure drive-related I/Os (with symbolic assignment) (Page 7158)
9. Configure the technology (Page 7163)
10. Optimize the drive and controller (Page 7176)

This section also contains additional configuration information, e.g. for vector drives, Safety Integrated, etc.

Important functions for the project handling during commissioning

The following functions are very important for the project handling and commissioning:

Table 10-41 Buttons for operator control

Symbol	Function	Effect
	Save project and compile changes	Select Save project and compile changes to save the entire project and compile the project data (e.g. programs) in an executable code. Only the changes are compiled. Unchanged code is retained.
	Connect to selected target devices	The online connection is established to the selected target devices. Under "Target system" > "Select target devices", you can set which target devices are to go online.
	Download project to target system	Downloading programs to the SIMOTION device and performing configuration for the SINAMICS Integrated and any connected CX32-2 modules.
	Download CPU / drive unit to target device	The configuration is only loaded to the device selected in the project tree (which means that the function needs to be performed separately for each D4x5-2/CX32-2 and each SINAMICS Integrated).
	Load CPU / drive unit to PG	The unit's configuration is only loaded to the PG selected in the project tree (which means that the function needs to be performed separately for each D4x5-2/CX32-2 and each SINAMICS Integrated).
	Copy RAM to ROM	Copying from RAM to ROM is only performed for the device selected in the project tree (which means that the function needs to be performed separately for each D4x5-2/CX32-2 and each SINAMICS Integrated).

Note

Tips for going ONLINE:

In online operation, SCOUT attempts to conduct online operation with all hardware components contained in the project. This means that the time needed for going online increases.
We recommend that you make settings for SCOUT so that online operation is made only with those components currently needed. The setting can be found at "Target system > Select target devices..." in the menu. The selection and deselection of the devices in the online state can be made via the "Connect target device" context menu on the device.

This procedure is also advantageous when the configuration of the drive unit is completed. Without going completely offline, the connection can be simply deselected via the context menu on the drive unit.

Performing the configuration for the D4x5-2 offline

Overview

Introduction

In the case of offline configuration, the project is created while not all of the hardware components (in particular drives) are available. In this way, a SIMOTION project in the office environment can be created up to a point where a basic project specification including a program exists. You can then load the finished project to the SIMOTION D4x5-2 later and test it with the drives.

Requirements

- For offline configuration, all of the components and their article numbers must be known.
- You have created a project in SIMOTION SCOUT and inserted a SIMOTION D4x5-2 into the project in the hardware configuration.
- You have configured the communication between the SIMOTION D4x5-2 and the PG/PC. See Section Creating a project and configuring the communication (Page 7007).

Procedure

The offline configuration involves the following steps:

- Accessing the drive wizard (Page 7053)
- Configuring components (Page 7054)
- Downloading the project to the SIMOTION D4x5-2 by means of one of the following options:
  - Downloading to the target system (Page 7074)
  - Downloading to the CF card (Page 7077)
  - Downloading incl. sources and additional data (Page 7078)
  - Archiving on the CF card (zip file) (Page 7079)

Note

During offline configuration, you can also configure the option board (TB30) and Terminal Modules, e.g. TM41.

Accessing the drive wizard

Integrated drive

The SIMOTION D4x5-2 contains an integrated SINAMICS S120 drive unit, which is automatically inserted together with the SIMOTION D4x5-2 control unit in the project navigator. The integrated drive must be operated in equidistant, isochronous mode using PROFIdrive-compliant message frame types.

The drive wizard for the integrated STARTER is available in SIMOTION SCOUT for configuring the integrated drive and its associated modules (e.g. SINAMICS S120 active line modules and SINAMICS S120 motor modules).

Note

To configure the drive components of a CX32-2 controller extension, the same procedure should be used as for the integrated drive of the SIMOTION D4x5-2 control unit.

Note

Take note of all the necessary safety precautions and rules governing connections, which can be found in the latest SINAMICS S120 documentation on the SIMOTION SCOUT DVD.

Requirement

You have already created a project and have inserted a SIMOTION D4x5-2.

Procedure

To call the drive wizard for the configuration of your drive unit, double-click "Configure drive unit" below "D4x5-2" > "SINAMICS Integrated" in the project navigator.

You can configure the following components:

- Infeed (e.g. SINAMICS S120 active line module)
- Drive
- Power unit (e.g. SINAMICS S120 motor module)
- Motor
- Encoder
- Option module

Configuring components

Requirement

You have inserted a SIMOTION D4x5-2 into the project, configured the communication and called the drive wizard by double-clicking "Configure drive unit" in the project navigator.

Note

An overview of permissible configurations, quantity structures and DRIVE-CLiQ topologies can be found in the *SINAMICS S120* Commissioning Manual and in Section Quantity structures (Page 7199).

It should be noted, for example, that mixed operation of servo and vector **is not possible**, although mixed operation of servo and vector *V/f* **is possible**.

Failure to comply with the rules listed in this manual will result in errors that are not output until the download is performed, rather than at the configuration stage.

Procedure

While executing the wizard you will be prompted to perform, for example, the following configuration steps:

1. In the "Option Module" dialog box, select whether you want to use a TB30 as option module.

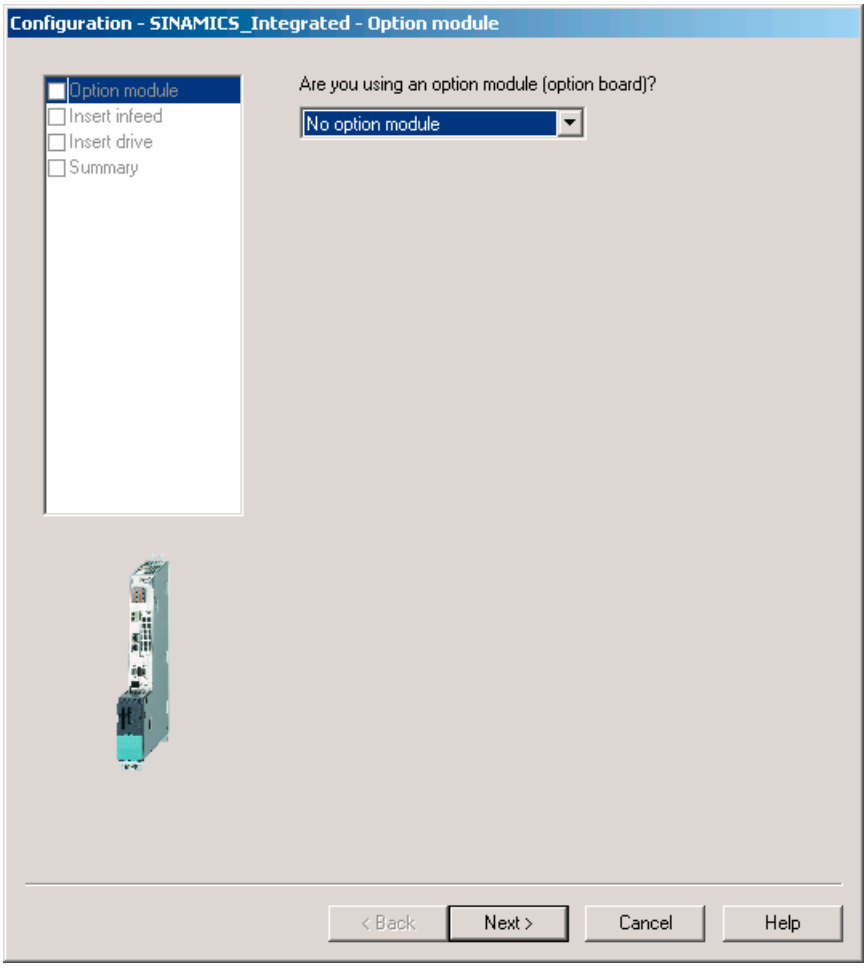

Figure 10-49 Selecting an option module

Note

The TB30 is displayed as drive object below the Control Unit in the project navigator and can be configured there.

2. In the "Insert Infeed" dialog box", select whether you want to use an infeed with or without a DRIVE-CLiQ connection. If the DC link has an external supply, select "No" (no DRIVE-CLiQ connection).

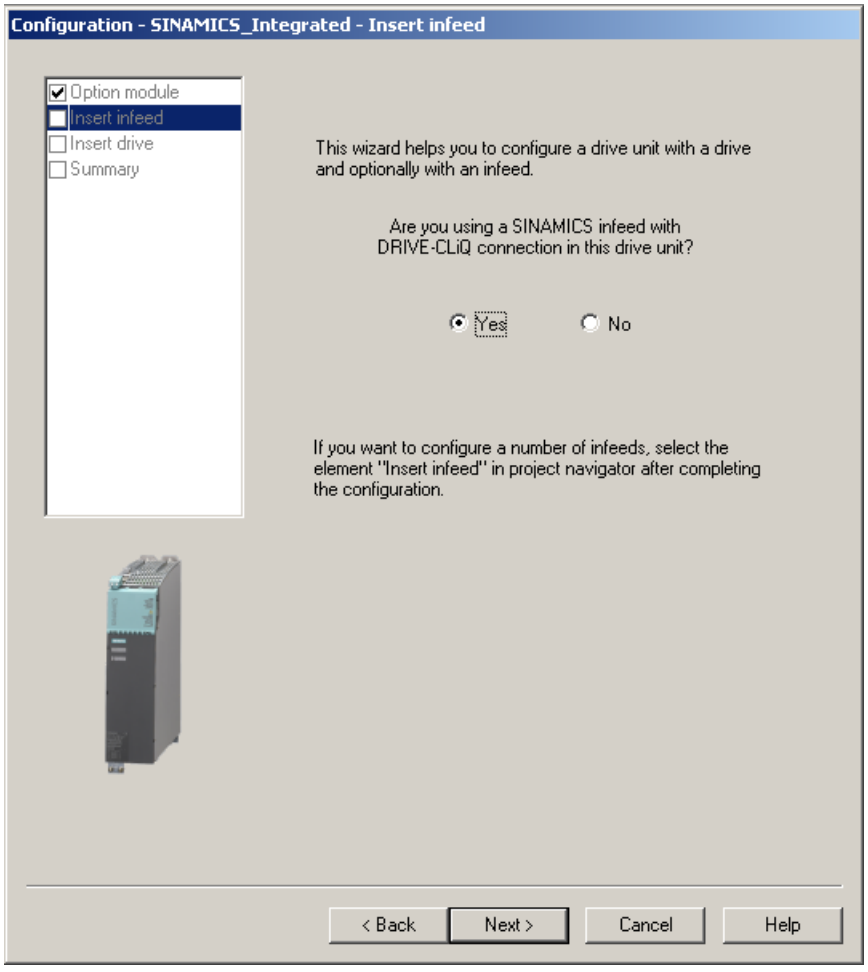

Figure 10-50 Selecting an infeed with DRIVE-CLiQ connection

Note

If you have selected an uncontrolled infeed without a DRIVE-CLiQ connection, omit steps 3 to 6 below.

3. In the "Infeed Configuration" dialog box, enter a name for the drive object and select a type for your infeed (e.g. Active Infeed).

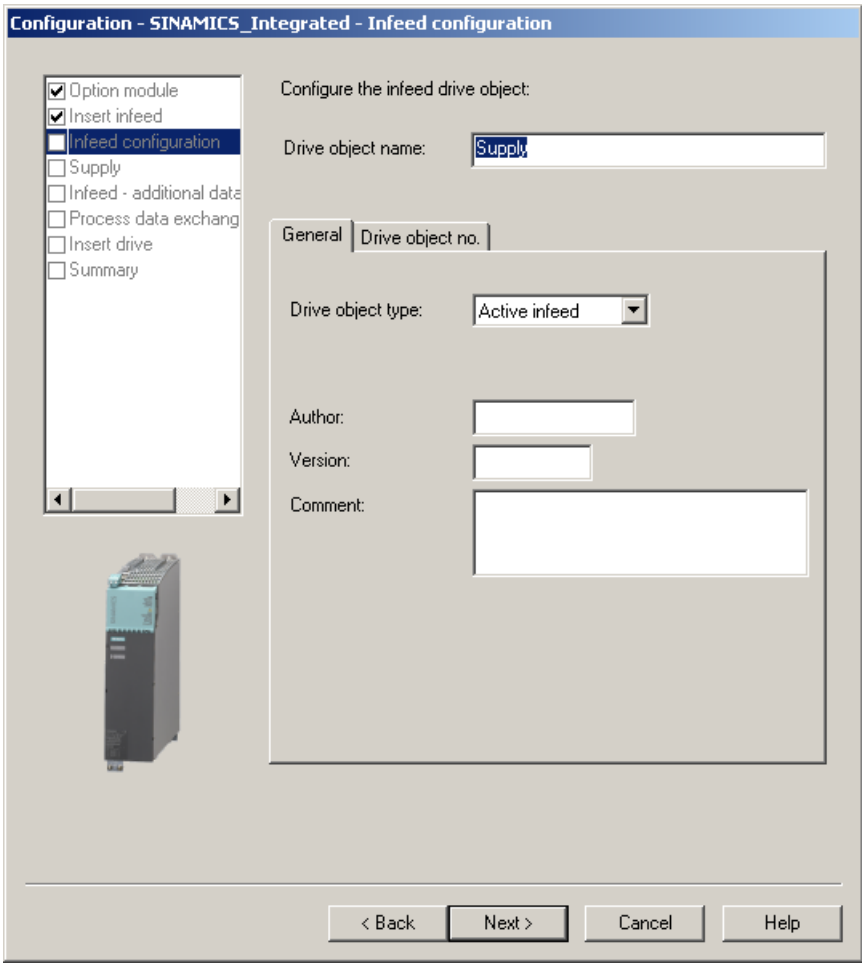

Figure 10-51 Selecting the infeed type

4. Using the article number, select an infeed from the list. You can filter the information to limit the number of infeeds displayed, for example, using "Type".

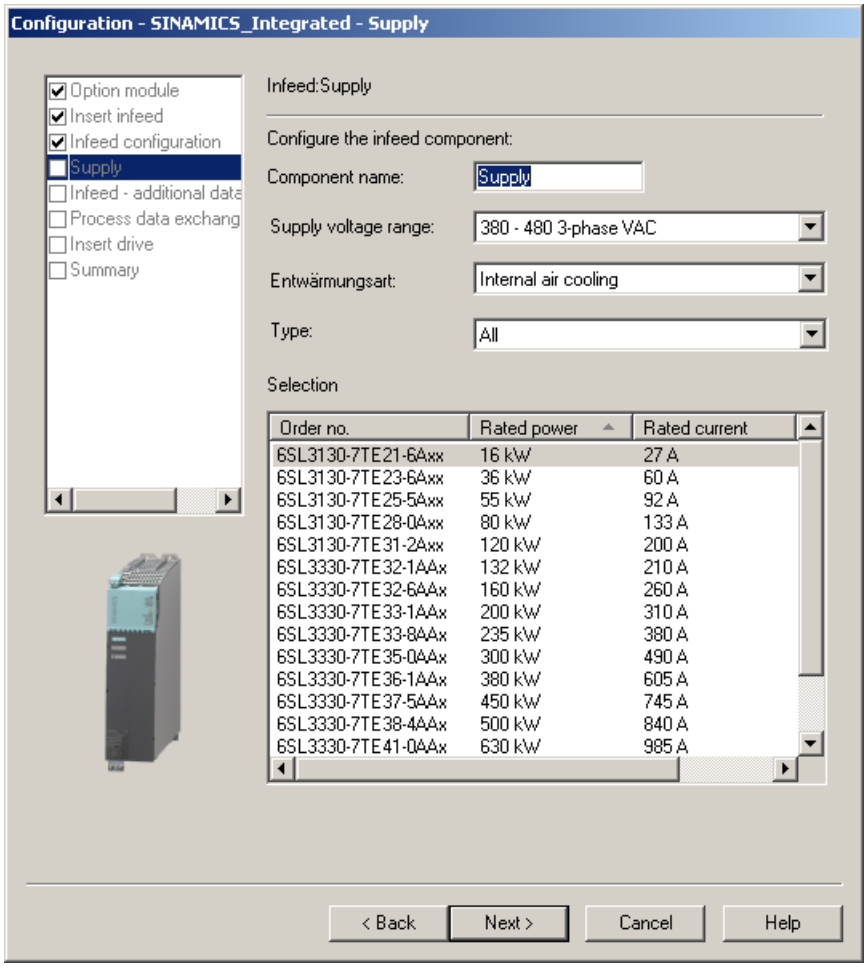

Figure 10-52 Selecting an infeed

5. You can make additional settings for the infeed in the "Infeed Drive Object - Additional Data" dialog box.

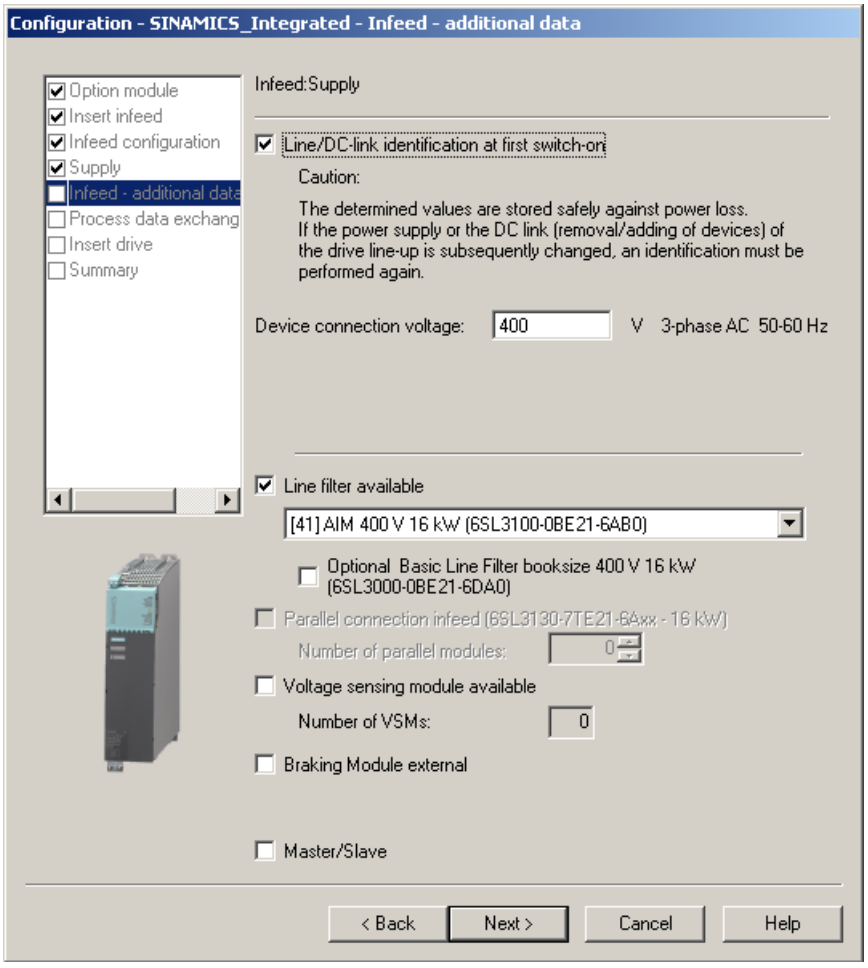

Figure 10-53 Making settings for the infeed

6. The communication for the control of the infeed is configured in the following dialog box. It is recommended that these settings be made automatically by the engineering system. You can also make the settings manually for the process data exchange by selecting "User-defined".

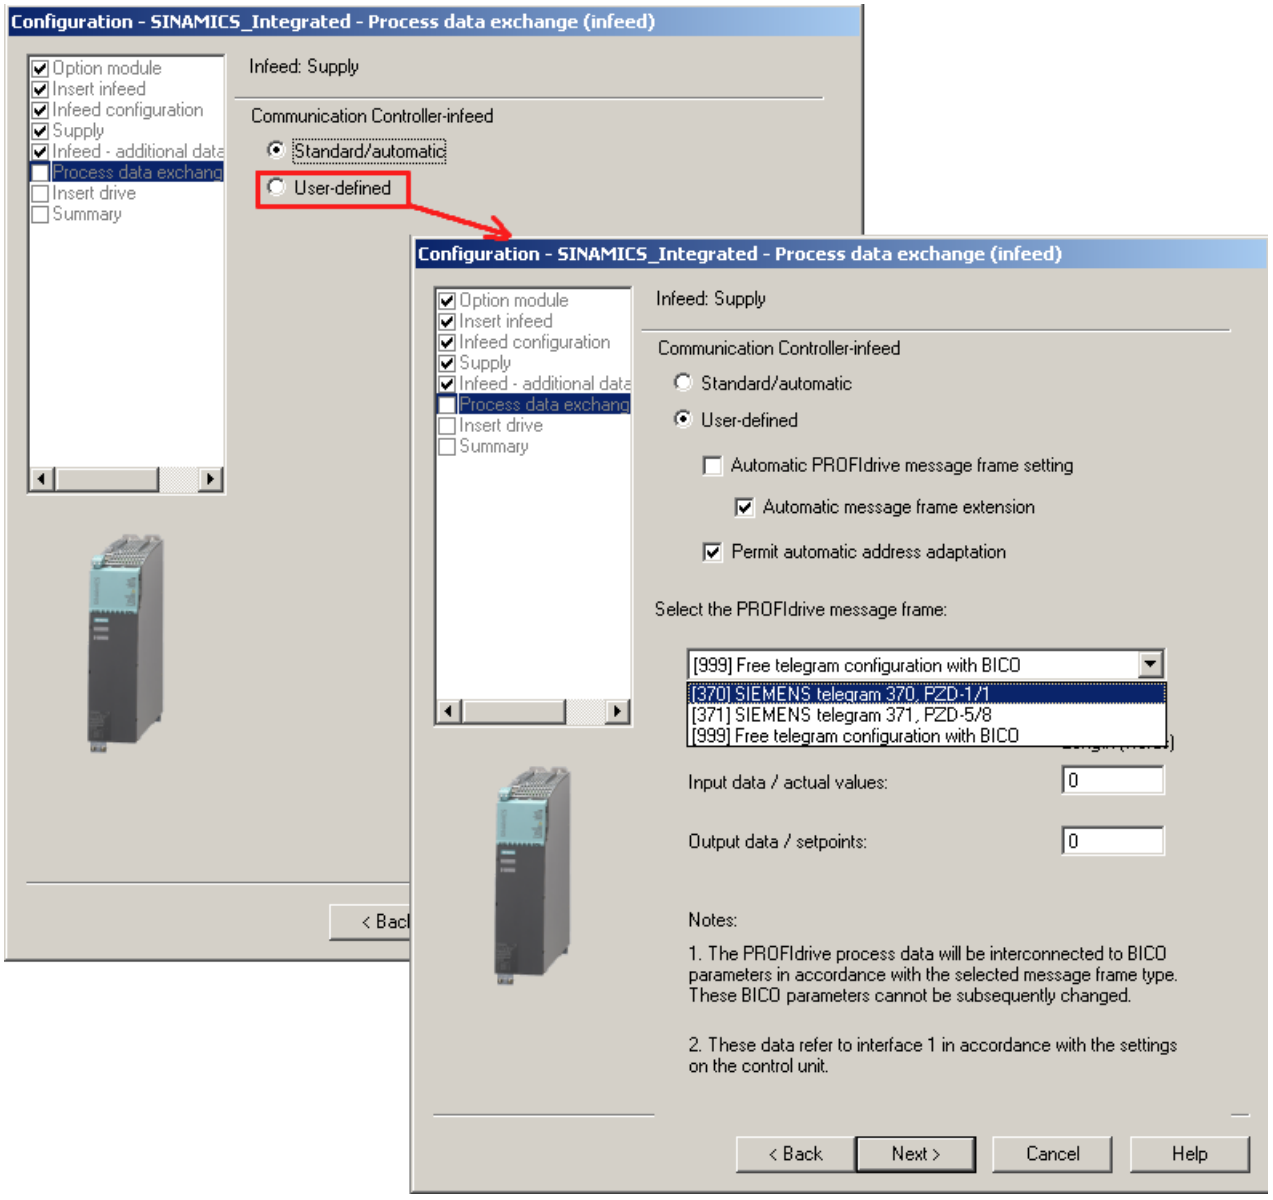

Figure 10-54 Configuring the process data exchange for the infeed

If the automatic communication setting has been selected, SIMOTION SCOUT uses PROFIdrive telegram 370 by default. This telegram is also used by the system function **_LineModule_control** to control the infeed.
You can find further information on control of the infeed in Section Activating the infeed (Line Module) (Page 7144).
If you are using a CX32-2 controller extension, also see the information in Section Interconnecting the infeed "Operation" signal on the CX32-2 (Page 7098).

7. Configure the drive.

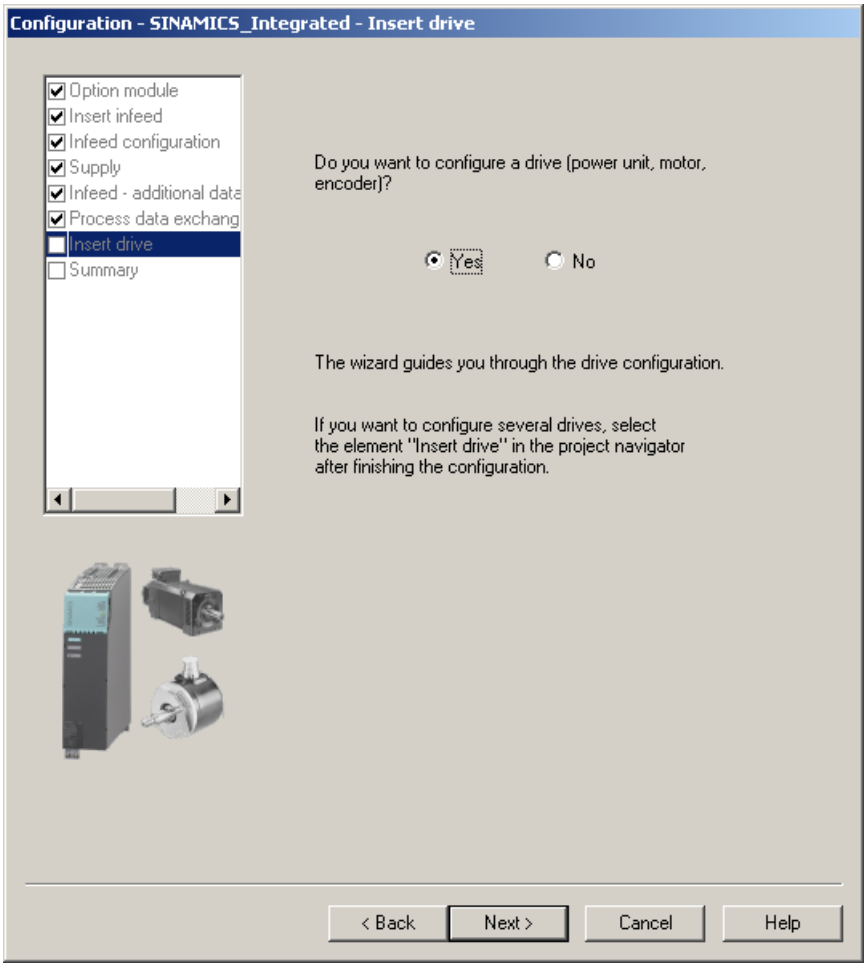

Figure 10-55 Configuring a drive

8. Enter a name for the drive and select the type of drive object (servo or vector).

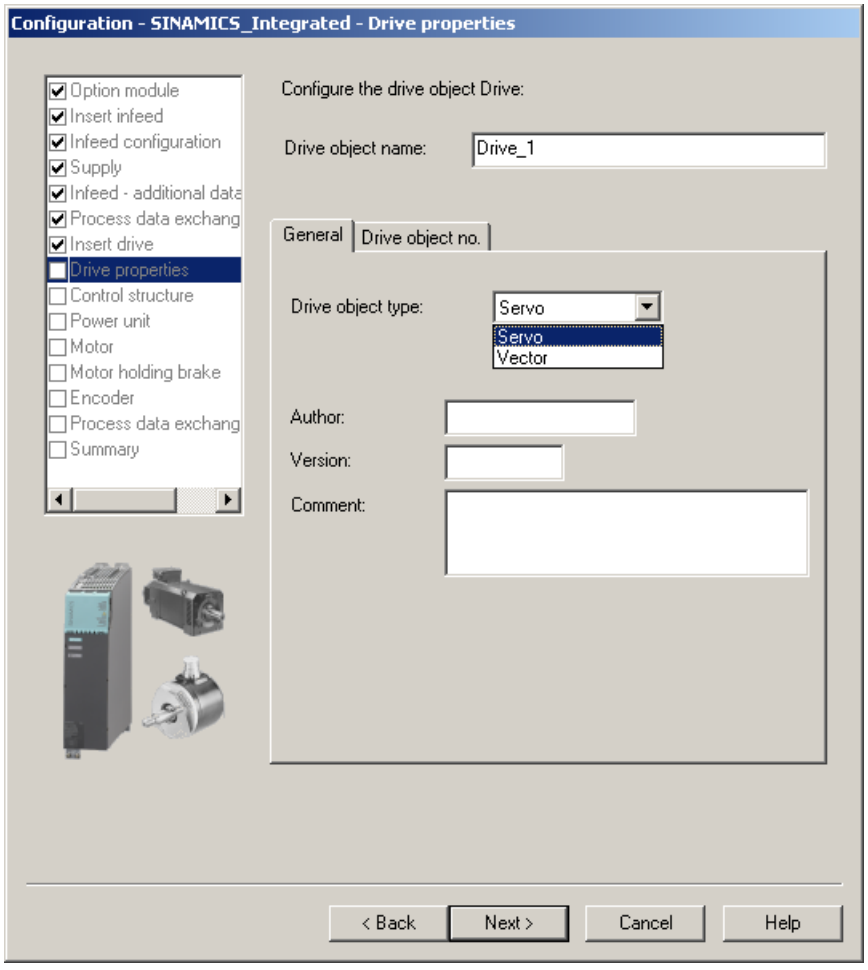

Figure 10-56 Drive properties

9. In the "Control Structure" dialog, you can select the function modules and the control type. Here, you can select the *VIf* control under drive objects type "vector".

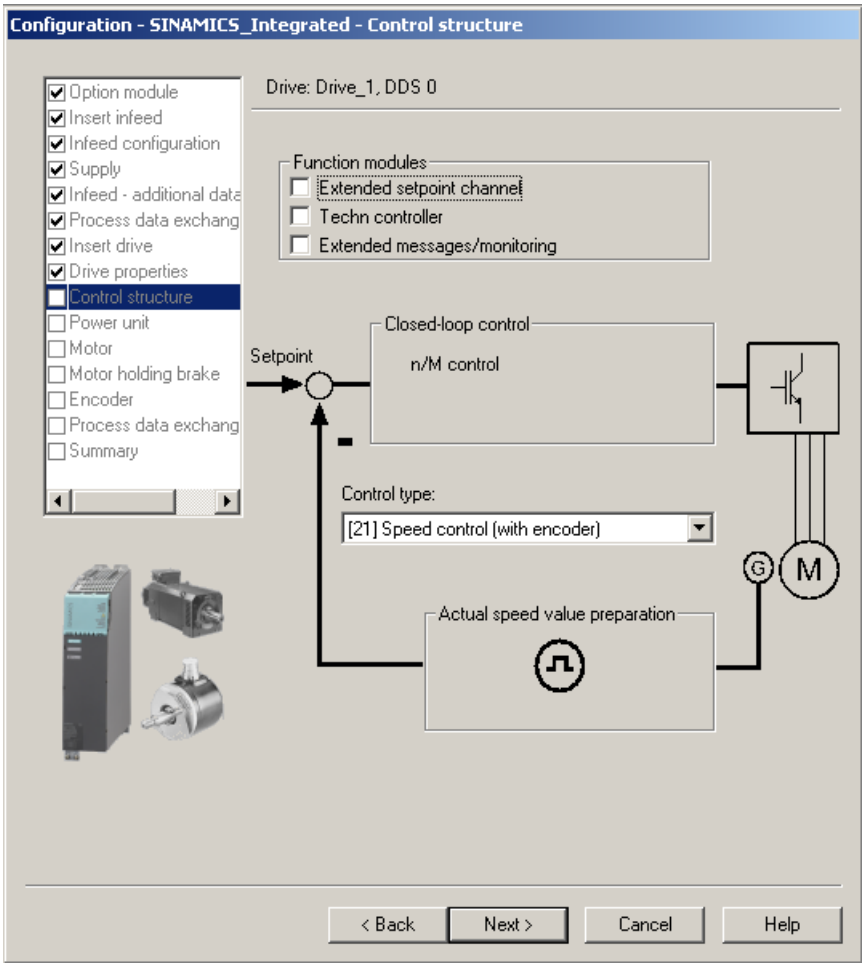

Figure 10-57 Control structure

10. In the "Power Unit" dialog box, use the article number to select your Motor Module from the list.

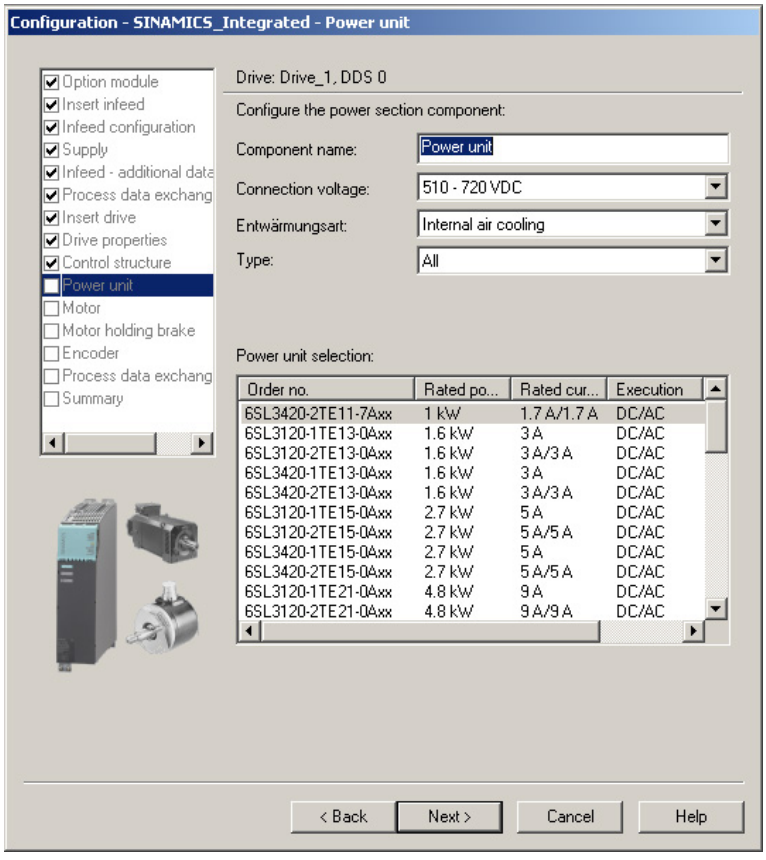

Figure 10-58 Selecting a power unit

11. If you have selected an infeed without a DRIVE-CLiQ connection in step 2, a message prompting you to wire the operation signal will appear. The next dialog box allows you to select the source of the infeed's operation signal.

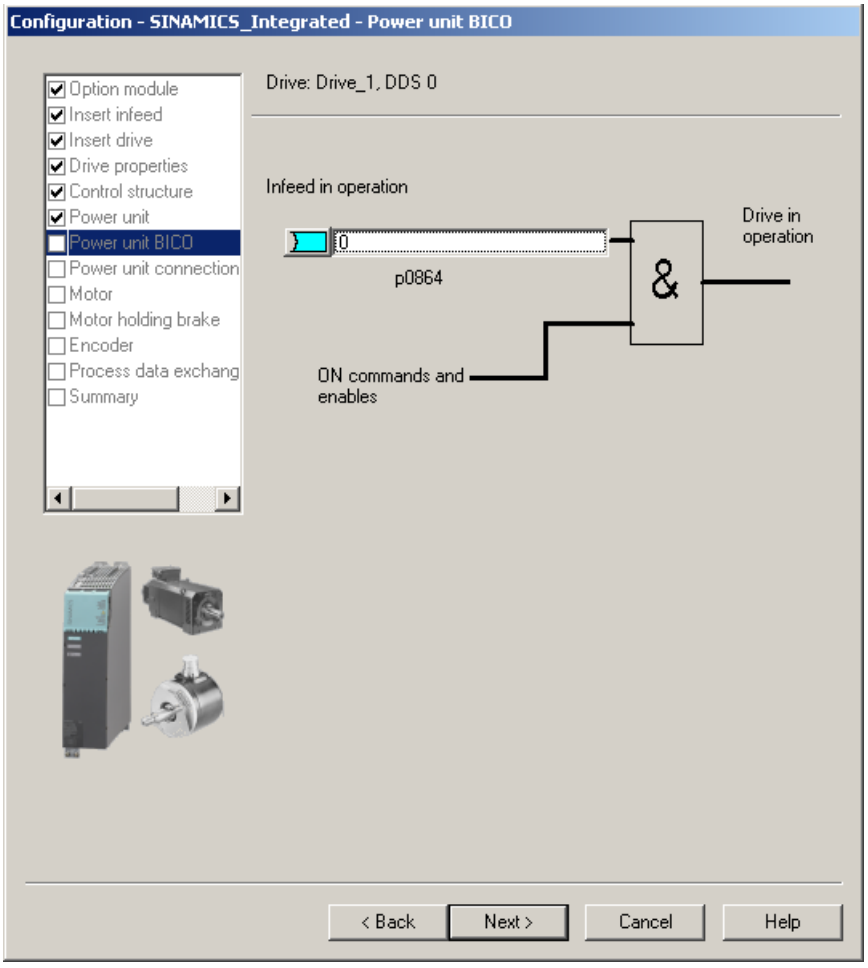

Figure 10-59 Selecting the infeed operation signal

12. In the case of Double Motor Modules, you need to specify the terminal to which the motor is connected.
    You specify the motor in the following dialog boxes:
    - Either by selecting a standard motor from the list
    - Or by entering the motor data

– Or by automatically identifying the motor (motor with DRIVE-CLiQ interface)

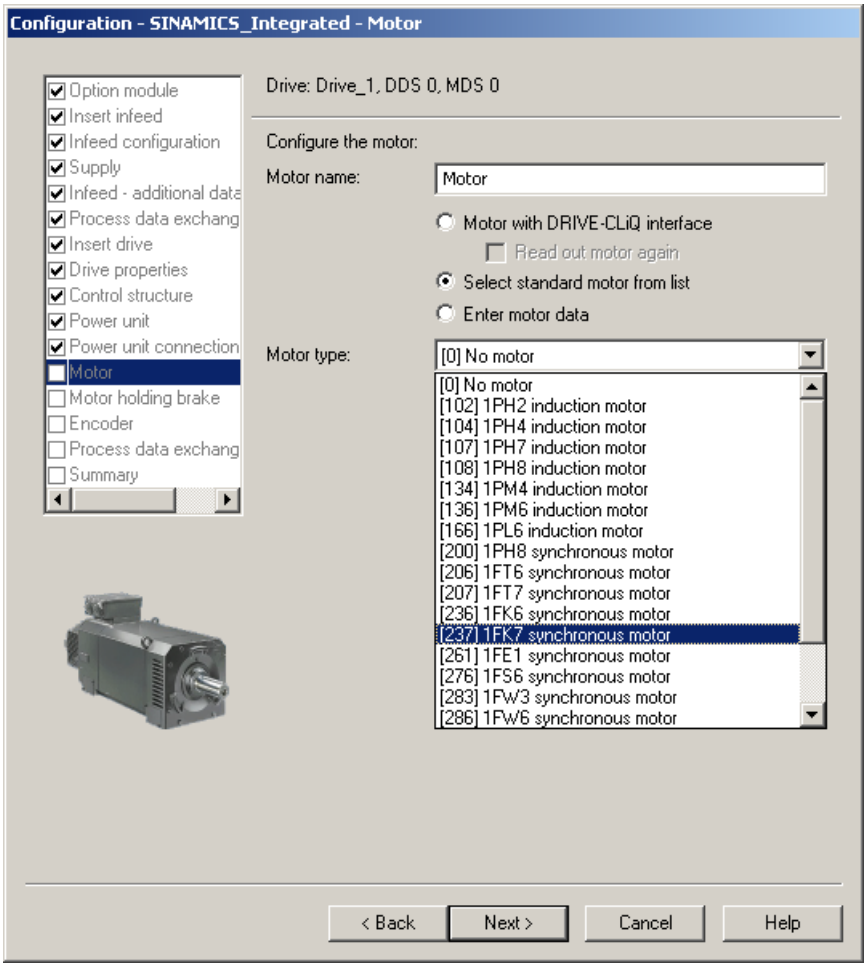

Figure 10-60 Selecting a motor (1)

Note

Motors with DRIVE-CLiQ interface have an integrated encoder evaluation that is connected to the Motor Module via a fully digital communication interface (DRIVE-CLiQ).

In this way, motor encoder and temperature signals as well as electronic rating plate data, such as unique article numbers, rated data (voltage, current, torque) can be transferred directly to the Control Unit.

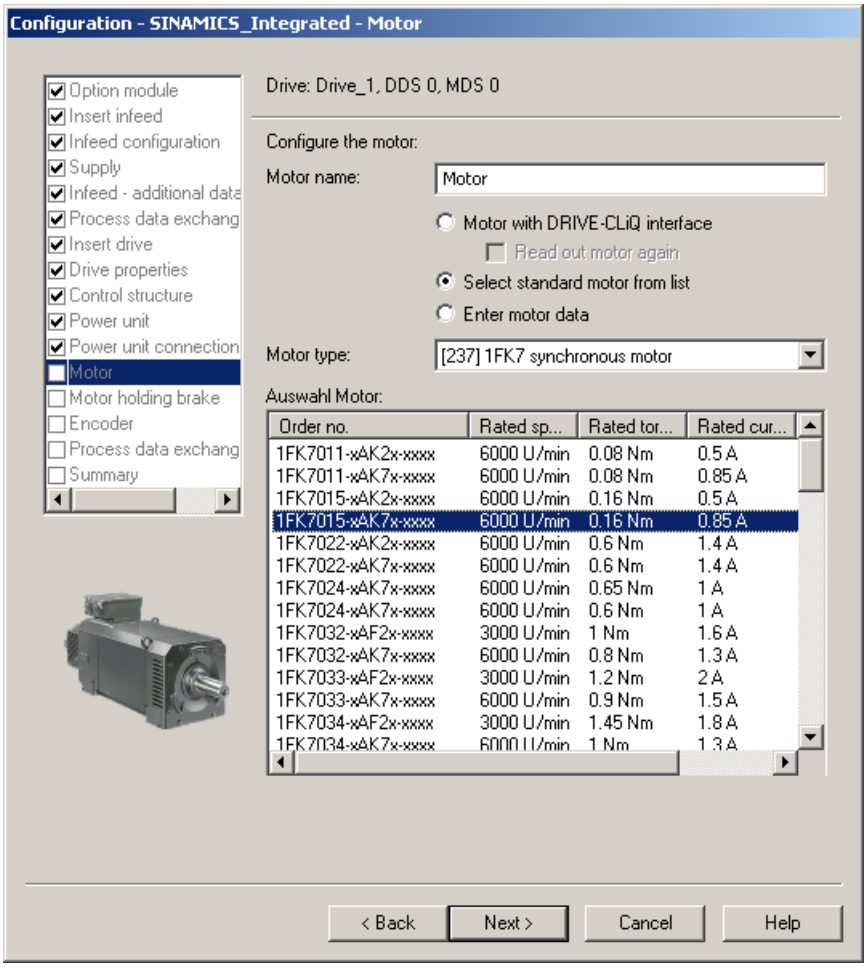

Figure 10-61 Selecting a motor (2)

13. Select a motor holding brake (if installed).

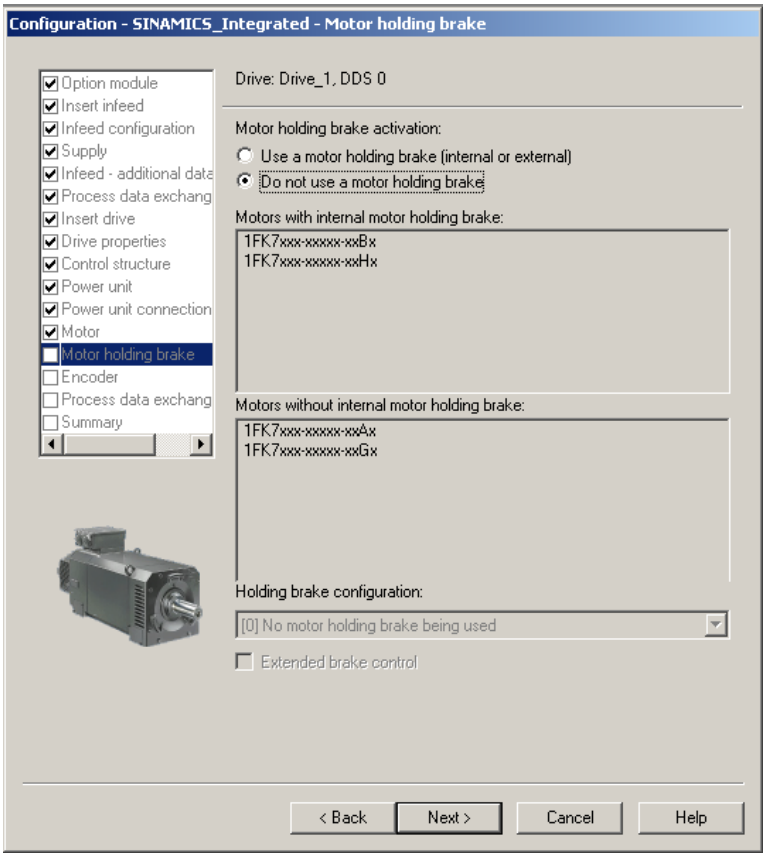

Figure 10-62 Motor holding brake

14. If you are using a motor that is not equipped with a DRIVE-CLiQ interface, select the encoder order number in the "Encoder Selection via Motor Order Number" dialog box.

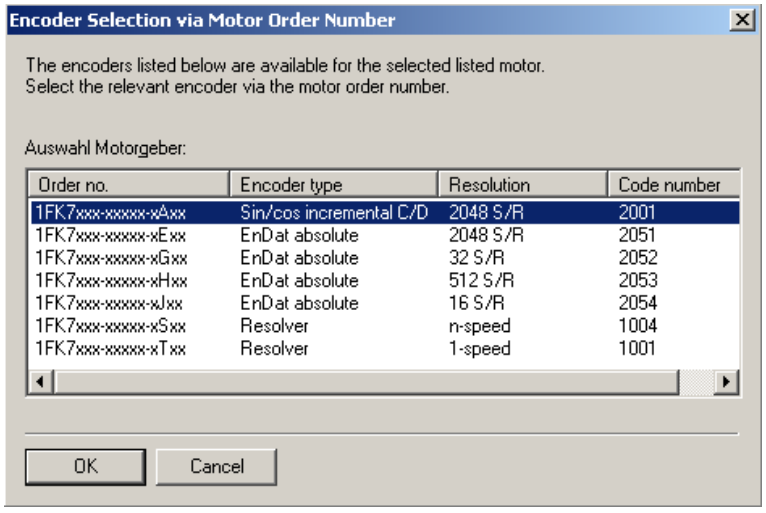

Figure 10-63 Selecting a motor encoder (1)

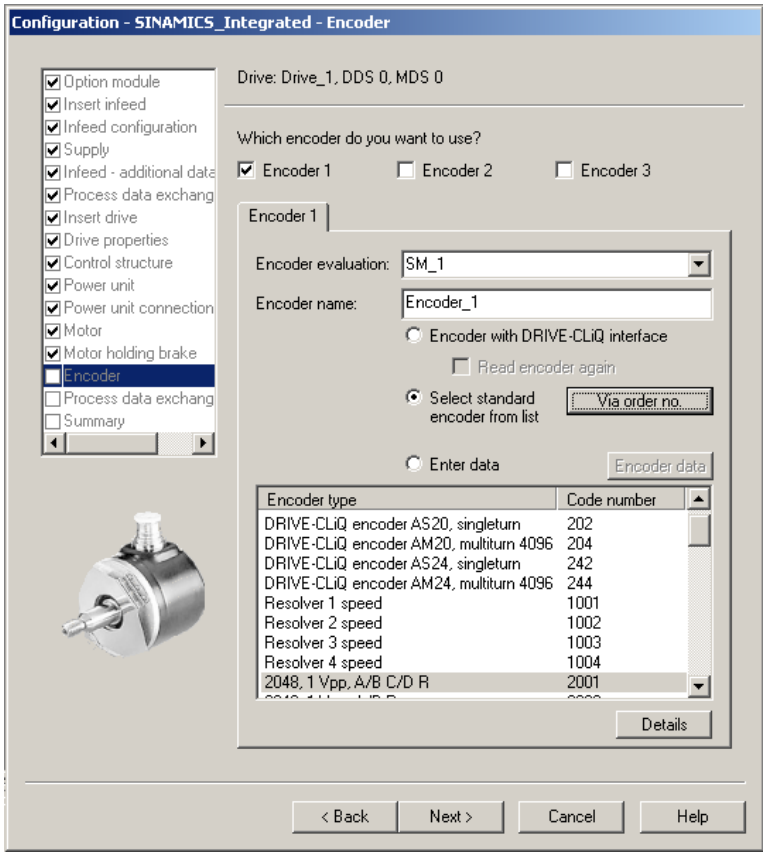

Figure 10-64 Selecting a motor encoder (2)

Note

If required, you can configure a second or third encoder in the "Encoder" dialog box. You can transfer a maximum of two encoder values to SIMOTION via the axis telegram.

In the case of motors with a DRIVE-CLiQ interface, the motor encoder is identified automatically. It is not necessary to enter encoder data in such cases (the dialog for selecting Encoder 1 is grayed out and, therefore, inactive).

15. The communication for the control of the SINAMICS drive is configured in the following dialog box.
It is recommended that these settings be made automatically by the engineering system.
You can also make the settings manually for the process data exchange by selecting "User-defined".
Information about the manual setting options can be found in the online help and in the manuals for the SINAMICS S120 drive system.

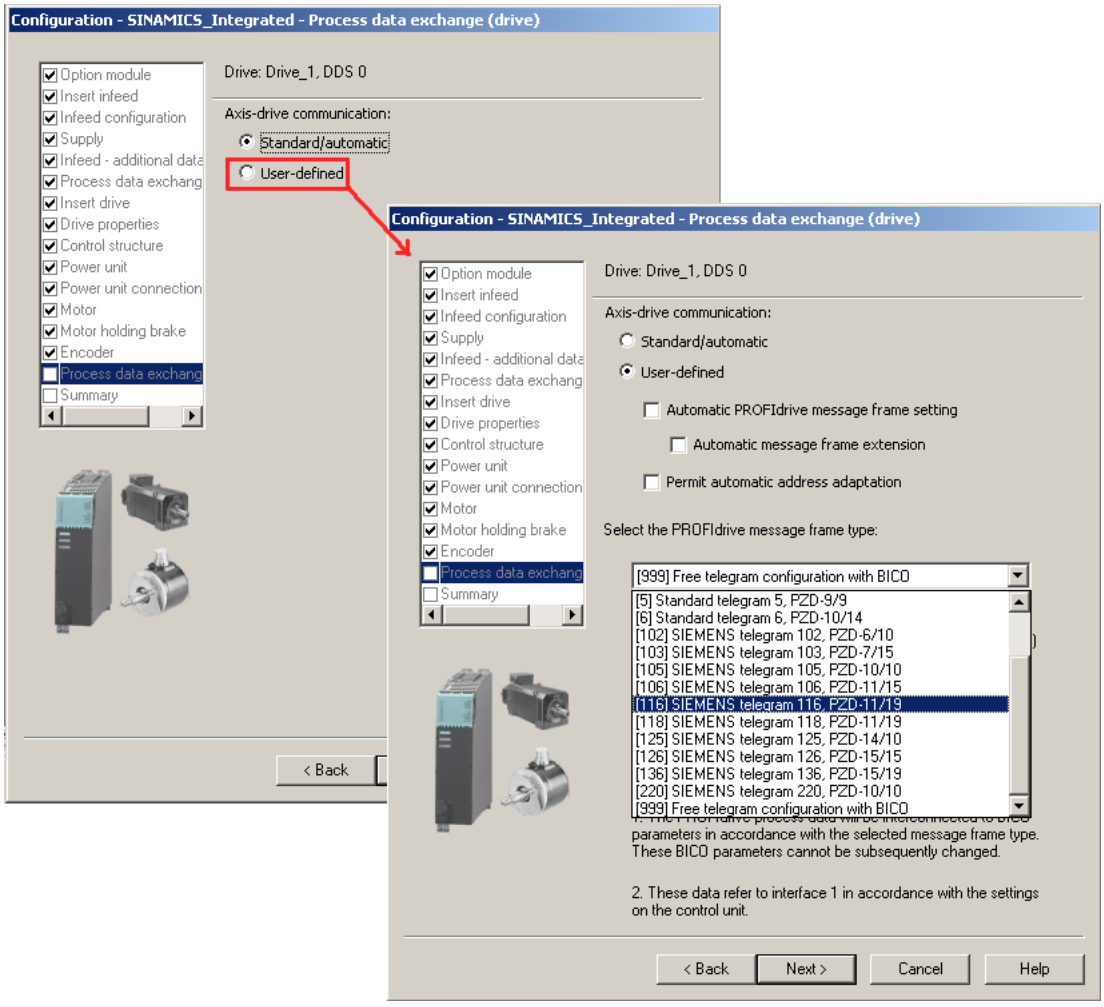

Figure 10-65 Configuring the process data exchange

After you have configured all of the settings in the drive wizard, the "Summary" dialog box displays a list of all settings. You can accept these settings with "Finish" or edit the configuration of individual components using the "Back" button.

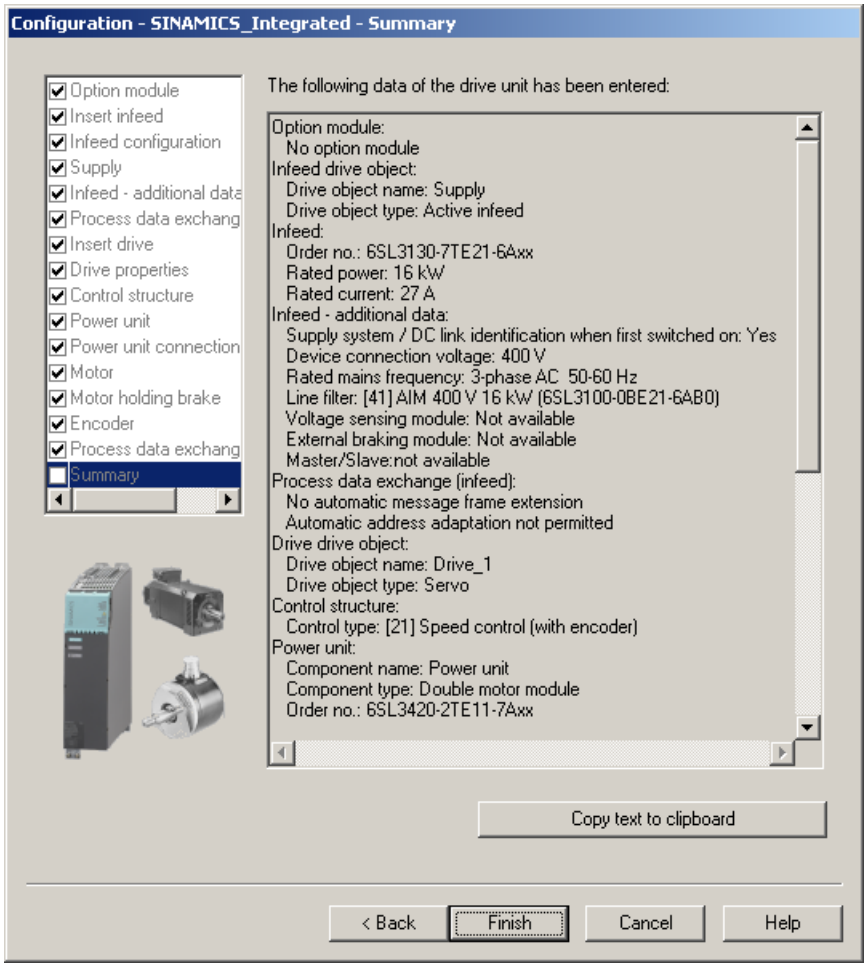

Figure 10-66 Finishing the drive

Result

The configured drive is displayed in the project navigator.

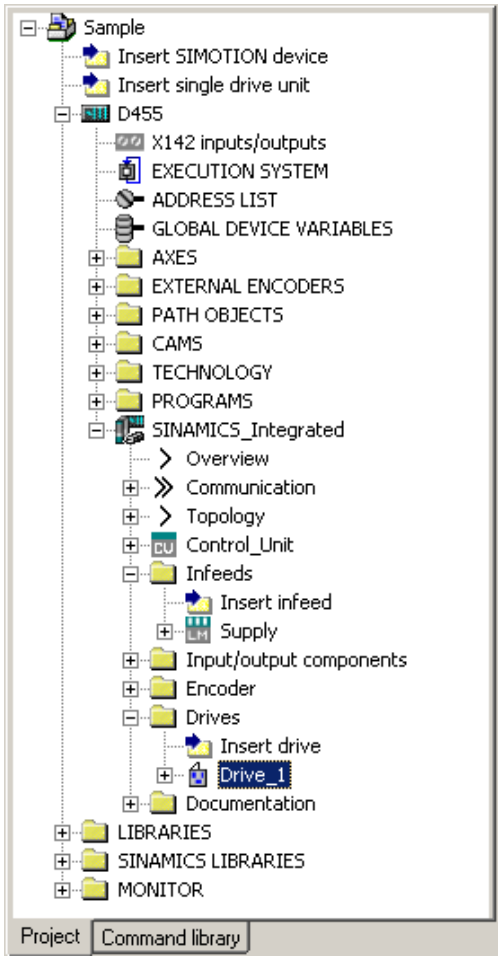

Figure 10-67 Representation in the project navigator

You will find an overview of the configured SINAMICS components under "SINAMICS_Integrated" > "Topology".

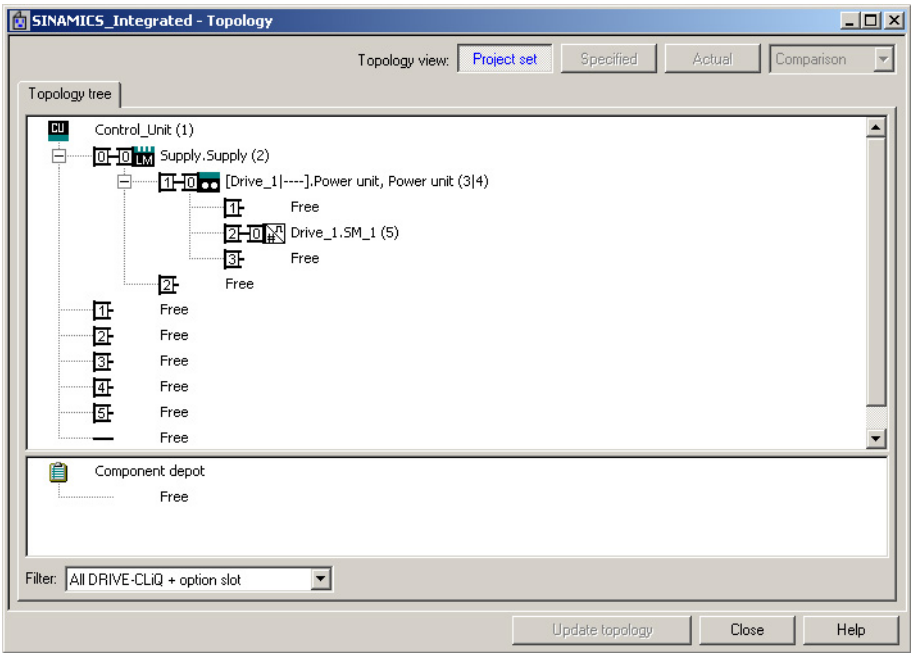

Figure 10-68 Displaying the topology

See also

If you configure the telegrams for the infeed and drive manually, you can find detailed information on the respective telegram types in the following:

- *Motion Control, TO Axis Electrical/Hydraulic*, *External Encoder* Function Manual
- *SINAMICS S120* Function Manual

Downloading a project into the target system

Requirement

You have configured the hardware. You now need to download the hardware configuration and the entire SIMOTION project to the target system.

If you have not yet configured your SIMOTION project (i.e. created ST programs, assigned execution levels, etc.), complete this step first.

Note

You can only perform a project download in the STOP operating mode and for all target devices with which you are ONLINE. You cannot download to drives that cannot be configured in SCOUT, e.g MASTERDRIVES. The project data is loaded to all the devices connected ONLINE and their subordinate drive units (provided these are selected in the Target Device Selection dialog box). This can only be done in the STOP operating mode.

Procedure

1. Save and compile the project.
2. Go online.

3. To load the project, perform "Download project to target system".
   The data must also be saved on the CompactFlash card to ensure that the project is retained in the event of a power failure. The following options are available:
   - Perform the "Copy RAM to ROM..." function manually on the D4x5-2 and all drives (SINAMICS Integrated, CX32-2, etc.).
   - In the "Download to Target System" dialog box, select the option "After loading, copy RAM to ROM". You can change the default setting for this dialog box in **"Options" > "Settings" > "Download"**.

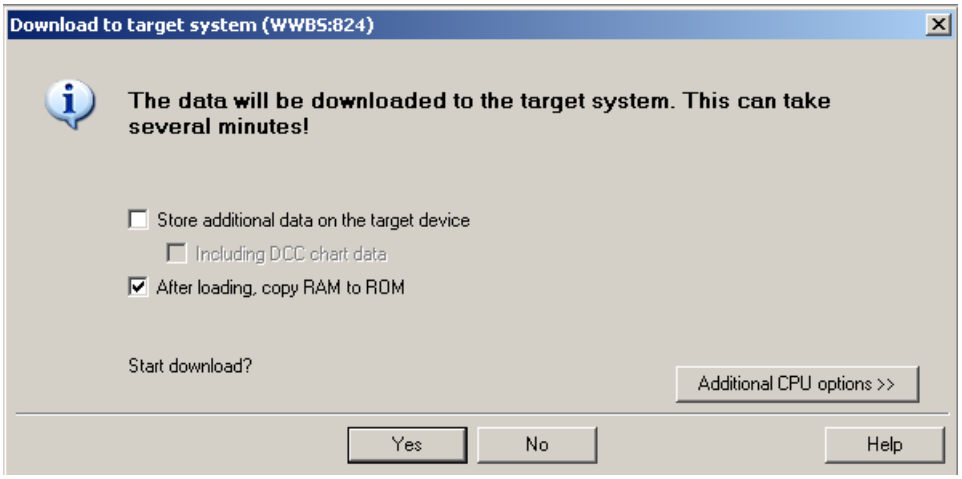

Figure 10-69 Download project to target system

The SIMOTION project is downloaded to the target system and the online connection to the drives established automatically.

Note

Online access to the drives is not possible if HW Config is not loaded at the time you initially connect to the target system.

Download HW Config first to enable online access to the drives. During the "Download to target system" process, SIMOTION SCOUT automatically attempts to establish an online connection to SINAMICS Integrated.

Note

If you have deselected the "Drives" option under "Tools" > "Settings" > "Download" in SIMOTION SCOUT, you must download the configuration separately to each drive (SINAMICS Integrated, CX32-2, etc.).

To do this, select the drive (e.g. SINAMICS Integrated) in the project navigator and perform "Download CPU / drive unit to target device".
For fast operation, we recommend that, in principle, the drives be deselected and a download only performed when required.

4. To save the parameter calculations of the drive in the project, perform "Target device" > "Load CPU / drive unit to PG" for each drive.

Downloading a project to the CompactFlash card

Requirement

Loading a project created offline to the CF card has the advantage of being faster than a download.

It should be noted, however, that the first system power-up will take longer, as the SINAMICS Integrated and CX32-2 controller extension will perform one-off parameter calculations. These are automatically backed up on the CF card.

Note

In order to save the project data via the PG/PC, you need a CF card adapter in which you can insert the CF card. The CF card must be displayed as a removable storage device with any drive letter in Windows Explorer.

If the CF card is not displayed, check the CF card adapter and contact the hotline if necessary.

Procedure

You can use a card adapter to write the entire project to the CF card, even in offline mode. In SIMOTION SCOUT, you can call the "Load to file system" function in the context menu of the SIMOTION device.

1. Save and compile the project.
2. Switch the SIMOTION D4x5-2 off.
3. Remove the CF card and insert it into a card adapter. The card adapter must be connected to a PG/PC.
4. In the SCOUT project, select the SIMOTION D4x5-2 device that you want to download to the CF card.
5. Click "Load to file system" in the context menu. A dialog box opens.
6. In the "Load to File System" dialog box, select the "Save normally" option and click the "Select target" button.
7. Select the target drive.
8. Confirm your entries with "OK". The data is written to the CF card.

Note

With "Load to file system", the project data of the controller (including SINAMICS Integrated / CX32-2) is written directly to the CF card. Separate execution of "Load to file system" for SINAMICS Integrated / CX32-2 is not possible.

9. Remove the CF card and insert it into the slot on the D4x5-2.
10. Switch the D4x5-2 on. The D4x5-2 powers up with the downloaded project.

Note

The components' firmware is upgraded or downgraded automatically based on the FW version on the CF card and the FW version on the SINAMICS components (DRIVE-CLiQ components, CBE30-2, TB30, Power Modules, etc.).

The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red/green:

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are displayed additionally via a yellow RDY LED on the SIMOTION D/CX32-2, indicating that components connected to SIMOTION D/CX32-2 are carrying out a firmware update or that all components have finished their firmware update.

Components that require a POWER ON after the firmware update will indicate this through a rapidly flashing RDY-LED. Go offline with SCOUT and switch the 24 V supply off/on (POWER ON) at the respective components for initialization.

CBE30-2 option board:

During the firmware update, the OPT LED of the SIMOTION D module and the SYNC LED of the CBE30-2 flash green.

Loading a project, including sources and additional data

Overview

It is possible to download additional data (e.g. sources) to the target device when saving a project to the CF card or downloading to the D4x5-2.

These data are required for:

- Online object comparison (e.g. additional properties)
- Various detailed comparisons (e.g. ST source file comparison)
- Synchronization with online objects

In order to be able to load a project's sources and additional data to the PG, this must be specified in the project under "Options" > "Settings" > "Download" > "Store additional data on the target device". Alternatively, this setting can also be made when the data is loaded to the target device/target system.

If the sources and additional data have been saved on the CF card, the option described in the sections that follow becomes available.

Project comparison

You intend to perform servicing work on a commissioned system and have placed a project on your PG/PC. This project is not consistent with the project on the D4x5-2 in the system. In order to analyze the differences, perform an object comparison via "Start object comparison".

You have the following options in terms of re-establishing consistency:

- In the object comparison, you can establish consistency for sources and technology objects on an object-granular basis.
- Consistency can be established for the entire Control Unit by loading from the CF card via "Target system" > "Load" > "Load CPU / drive unit to PG...."

Additional references

Detailed information on loading data to the target device can be found in the *SIMOTION Runtime Basic Functions* Function Manual.

Archiving a project to the CompactFlash card (zip file)

Procedure

In SIMOTION SCOUT, you can save the project as a zip file to the CF card.

Proceed as follows to archive the SIMOTION project on the CF card:

1. Open SIMOTION SCOUT and select the "Project" > "Archive" menu command.
2. In the "Archive" dialog box, select the SIMOTION project and save it to your drive (PG/PC).
3. Open the project.
4. Go online with the SIMOTION D4x5-2.
5. In the project navigator, select the SIMOTION D4x5-2 and select the "Target system" > "Load" > "Save archive project on card ..." menu command.
6. In the dialog that is displayed, select the project and click "Open".
   This saves the project to the CF card as Project.zip in the following directory: USER\SIMOTION \HMI\PRJLOG

Note

If you want to load the current project from the card, select the "Target system" > "Copy archived project from card to PG/PC ..." menu command.

Prerequisite is that you have backed up the project with "Save archive project on card..." each time a change was made.

Additional references

Detailed information on loading data to the target device can be found in the *SIMOTION Runtime Basic Functions* Function Manual.

Performing an online configuration for the D4x5-2

Overview

Introduction

You can configure the plant in online mode after having completed its wiring. You can load the data of SINAMICS components connected via DRIVE-CLiQ to your PG/PC using the "Automatic configuration" function. However, this is only possible for initial commissioning.

Note

Components without DRIVE-CLiQ connection must be edited in offline mode. You may need to edit DRIVE-CLiQ components which were detected in the course of automatic configuration (for example, adding encoder data if using SMC modules).

Requirements

- Your system has been mounted and wired
- You have created a project in SIMOTION SCOUT and inserted a SIMOTION D4x5-2 in the project
- You have configured the communication between the SIMOTION D4x5-2 and the PG/PC. See Section Creating a project and configuring the communication (Page 7007).

Procedure

The online configuration involves the following steps:

- Establish the online connection (Page 7080)
- Starting automatic configuration (Page 7081)
- Reconfiguring SINAMICS components (Page 7085)
- Downloading a project to the SIMOTION D4x5-2 (Page 7086)

Establish an online connection

Requirement

You have created a project.

Procedure

This section outlines the procedure for initial commissioning.

To perform an online configuration, you must establish an online connection to the SIMOTION D4x5-2. In this case, no connection can yet be established to the SINAMICS

Integrated. An appropriate message is output. Once the hardware configuration has been loaded to the target device, an online connection to the SINAMICS Integrated is established automatically. Proceed as follows:

1. Save and compile the project.
2. Establish an online connection.
3. Select the SIMOTION D4x5-2 device in the project navigator.
4. Use the "Download CPU / drive unit to target device" function to download the SIMOTION D4x5-2 to the target device. The connection to the SINAMICS Integrated is established automatically.

Result

You can now run **automatic configuration** on the SINAMICS Integrated.
See Section Starting the automatic configuration (Page 7081).

Additional references

Further information about establishing an online connection to the programming device/PC can be found in the following documentation:

- *SIMOTION SCOUT* Configuration Manual
- *SIMOTION SCOUT* Online Help
- SIMOTION Utilities & Applications FAQs
  SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.
- FAQOnline connection to SIMOTION (https://support.industry.siemens.com/cs/ww/en/view/22016709)

Starting automatic configuration

Requirements

You have activated the online connection with the SINAMICS Integrated.

Procedure

1. In the project navigator, open the "Automatic Configuration" dialog box by selecting "SINAMICS Integrated" > "Automatic configuration".

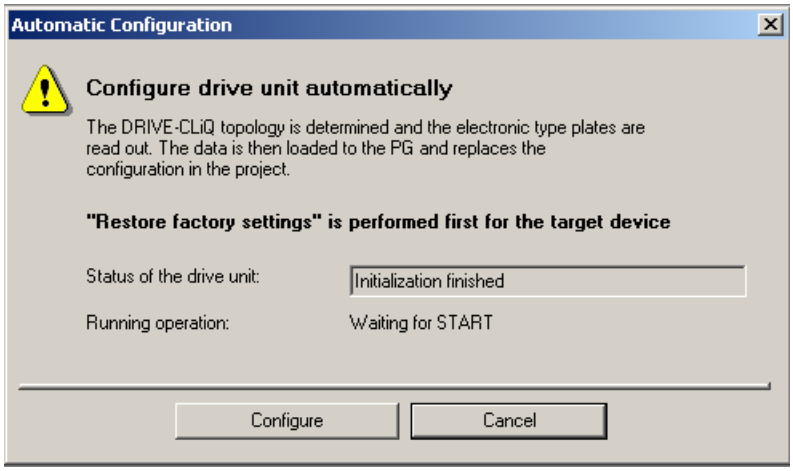

Figure 10-70 Starting automatic configuration

2. Click the "Configure" button.
3. If the drive unit is not in the "First commissioning" state, the factory settings are restored after acknowledging a prompt.
4. The drive object types can now be selected via a further dialog box.

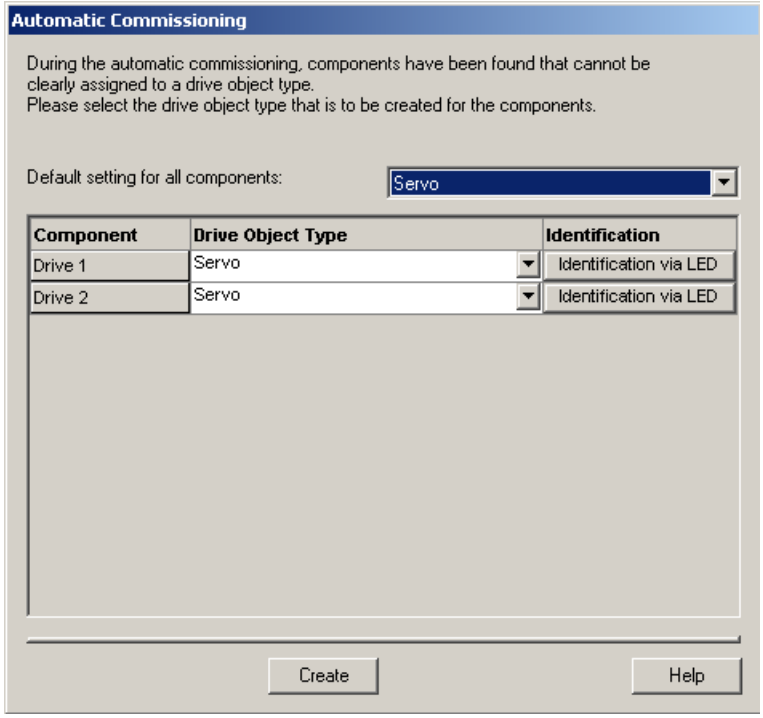

Figure 10-71 Selecting the drive object type

5. Select whether a servo- or vector-type drive object is to be used.

6. Click "Create" to start the automatic configuration. As soon as automatic commissioning has been run through, an upload operation (Load to PG) is performed automatically.

Note

The components' firmware is upgraded or downgraded automatically based on the firmware version on the CF card and the firmware version on the SINAMICS components (DRIVE-CLiQ components, TB30, CBE30-2, Power Modules, etc.).

The update procedure can take several minutes and is indicated in the "Automatic Configuration" dialog box by the following message:

State of the drive unit: Automatic FW update of DRIVE-CLiQ components

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are also displayed by the yellow RDY LED on the SIMOTION D/CX32-2 and indicate that a firmware update is being carried out on components connected to the SIMOTION D/CX32-2 or that all components have completed the firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

CBE30-2 option board:

During the firmware update, the OPT LED of the SIMOTION D module and the SYNC LED of the CBE30-2 flash green.

7. At the end of the automatic configuration, you are prompted whether you want to "Go OFFLINE" or "Stay ONLINE" with the drive unit.

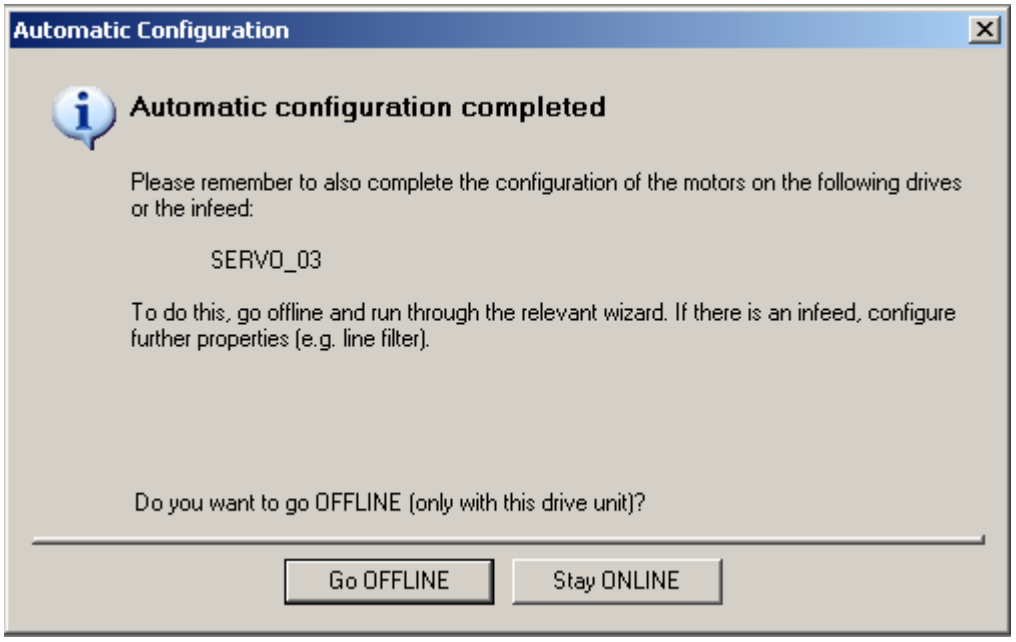

Figure 10-72 Automatic configuration completed

8. Execute the "Copy RAM to ROM ..." function on the D4x5-2 and on the SINAMICS Integrated. This saves the project on the CF card so that it does not need to be reloaded after switching off and on.

Result

The DRIVE-CLiQ components loaded to the user project by means of automatic configuration are displayed in the project navigator.

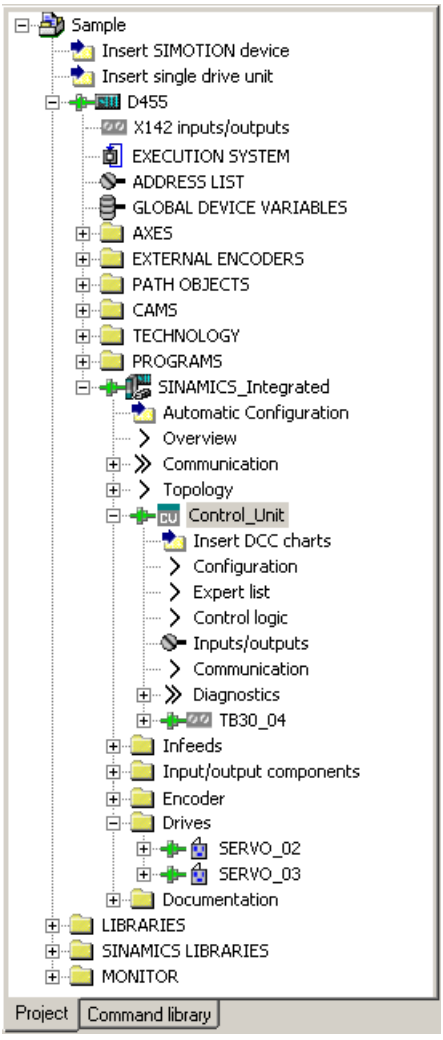

Figure 10-73 Project navigator with real configuration

You must then

- If required, reconfigure SINAMICS components (e.g. components without a DRIVE-CLiQ interface, such as an encoder connected via SMCxx).
- Assign the "TO axis" to "Drive"

Editing SINAMICS components

Requirement

- You have loaded all connected DRIVE-CLiQ components to your user project.
- You have shut down the connection to the target system (offline mode).

Procedure

You can now adapt your components to the application.

Run through the wizard for all the DRIVE-CLiQ components to be adapted and perform the required reconfigurations.

This procedure corresponds with the description in Performing the configuration for the D4x5-2 offline (Page 7052).

The amount of editing work involved depends on the components used. For example, in the case of a motor with a DRIVE-CLiQ interface, the motor and encoder type are identified automatically.

Downloading a project to the SIMOTION D4x5-2

After you have performed the reconfigurations, you must download the configuration to the SIMOTION D4x5-2 (incl. SINAMICS Integrated).

1. Save and compile the project.
2. Go online.

3. To load the project, perform "Download project to target system".
   The data must also be saved on the CompactFlash card to ensure that the project is retained in the event of a power failure. The following options are available:
   - Perform the "Copy RAM to ROM..." function manually on the D4x5-2 and all drives (SINAMICS Integrated, CX32-2, etc.).
   - In the "Download to Target System" dialog box, select the option "After loading, copy RAM to ROM". You can change the default setting for this dialog box in **"Options" > "Settings" > "Download"**.

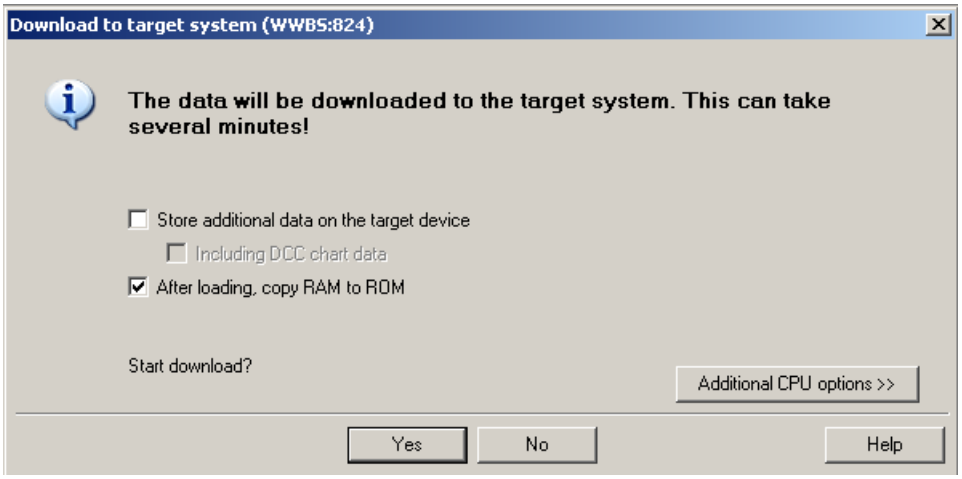

Figure 10-74 Download project to target system

The SIMOTION project is downloaded to the target system and the online connection to the drives established automatically.

Note

Online access to the drives is not possible if **HW Config** is not loaded at the time you initially connect to the target system.

Download the data to **HW Config** in order to enable online access to SINAMICS Integrated. During the "Download to target system" process, SIMOTION SCOUT automatically attempts to establish an online connection to SINAMICS Integrated.

Note

If you have deselected the "Drives" option under "Tools" > "Settings" > "Download" in SIMOTION SCOUT, you must download the configuration separately to each drive (SINAMICS Integrated, CX32-2, etc.).

To do this, select the drive (e.g. SINAMICS Integrated) in the project navigator and perform "Download CPU / drive unit to target device".
For fast operation, we recommend that, in principle, the drives be deselected and a download only performed when required.

4. To save the parameter calculations of the drive in the project, perform "Target device" > "Load CPU / drive unit to PG" for each drive.

The drive has been assigned parameters and commissioned. You can now test the drive via the drive control panel.

Configuring a CX32-2

Overview

The SIMOTION CX32-2 controller extension is a component in SINAMICS S120 booksize format and enables scaling of the drive-side computing performance of the SIMOTION D4x5-2 control units. Each CX32-2 can operate up to six additional servo, six vector or twelve *V/f* drives.

The CX32-2 controller extension offers the following advantages:

- With a width of only 25 mm, the CX32-2 is extremely compact.
- The CX32-2 is connected to the SIMOTION D4x5-2 via DRIVE-CLiQ, so that high-performance, isochronous closed-loop control of the drives is possible without the need for additional modules.
- The communication interfaces on the SIMOTION D4x5-2 remain available for other connections.
- The data for the CX32-2 is stored exclusively on the SIMOTION D4x5-2 CompactFlash card, which means that no action needs to be taken when the module is replaced.
- The "Control operation" signal from an infeed connected to the SIMOTION D4x5-2 is particularly easy to interconnect to the drives of a CX32-2.
- SIMOTION CX32-2 is automatically also upgraded when the SIMOTION D4x5-2 is upgraded

Basic principles of the CX32-2

Basic principles of the CX32-2

Each CX32-2 is entered as a separate DRIVE object in the project navigator on the level of SINAMICS Integrated. In principle, a CX32-2 can be configured the same way as SINAMICS Integrated.

Communication

With CX32-2 (as with the SINAMICS Integrated), communication takes place via the PROFIBUS Integrated, but is still routed by the SINAMICS Integrated to the relevant CX32-2 via DRIVE-CLiQ.

Communication with the CX32-2 runs in the same cycle (same DP cycle) as communication with the SINAMICS Integrated. Direct communication between two CX32-2 modules or the SINAMICS Integrated and CX32-2 is not possible. Exception: Interconnection of the "Operation" signal of the infeed for the CX32-2. For a description of how to interconnect to the "Operation" signal, refer to Section Interconnecting the infeed "Operation" signal on the CX32-2 (Page 7098).

Power-up

The CX32-2 does not require its own CompactFlash card. The firmware and the parameterization are stored centrally on the SIMOTION D CompactFlash card. After a firmware change, the CX32-2 firmware from the CompactFlash card is copied to the CX32-2 at the first power-up and saved there as non-volatile data.
For this reason, the first power-up with new firmware takes longer than subsequent power-ups.

Copying from RAM to ROM also takes longer, as the devices perform this function one after the other.

How to detect if a power-up has been completed is described in Section *CX32-2 configuration information* in CX32-2 power-up (Page 7097).

Online functions

Since the SINAMICS Integrated routes online functions to the CX32-2 via DRIVE-CLiQ, operational performance is reduced in the case of online functions (e.g. parameter changes or downloads) compared to a similar installation with CU320-2.

Commissioning requirements

To commission a SIMOTION D with CX32-2, all drive components which were configured offline must also be actually available and connected to the correct DRIVE-CLiQ port.

Only when there are no topology errors

- Will the download be successful (where a project created offline is loaded to the target system)
- Will the system startup be successful

To be able to go online on a CX32-2, at least the **HW Config** configuration must be loaded to the D4x5-2 and the CX32-2 connected "correctly" via the configured DRIVE-CLiQ ports on the D4x5-2.

Loading the SINAMICS Integrated

If the SINAMICS Integrated of a SIMOTION D is loaded, the connected CX32-2 controller extensions go offline as a result of reinitialization.

Preparing for configuration

Preparing for configuration

The following measures are required to enable online or offline configuration of a CX32-2.

1. Create a project and insert a SIMOTION D4x5-2 (in this example, D455-2).
2. In the project navigator, double-click the D4x5-2. The **HW Config** appears.
3. In the hardware catalog, open the "PROFIBUS DP" entry and select "SINAMICS".

4. Drag a CX32-2 to the PROFIBUS Integrated master system of the SIMOTION D module. The mouse pointer permits the CX32-2 to be inserted on the master system only. The "DP Slave Properties" screen form is displayed with the PROFIBUS address. The PROFIBUS address is assigned automatically. See the table below.
   Select the relevant DRIVE-CLiQ port by selecting the relevant PROFIBUS address (in this example, PROFIBUS address 15).

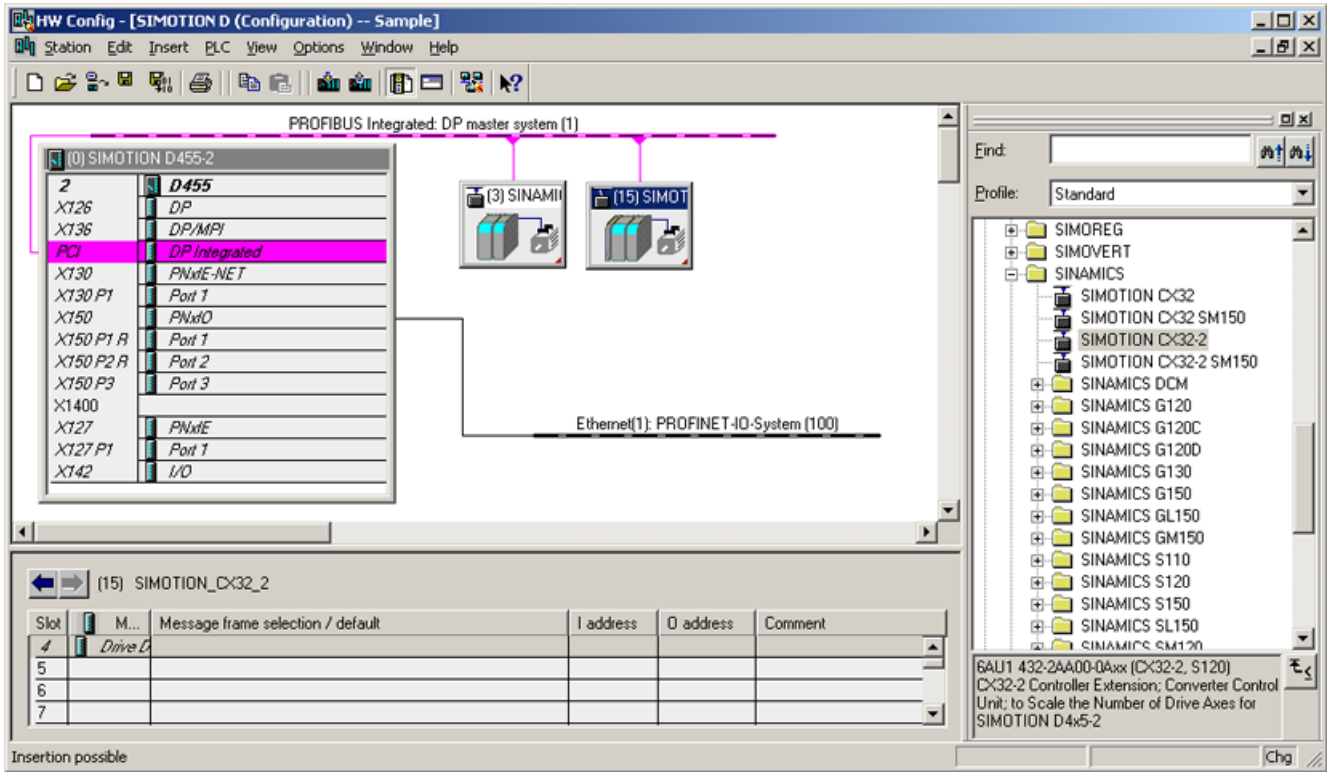

Figure 10-75 Inserting the CX32-2 in HW Config

5. Click "OK" to confirm your settings.
   The CX32-2 is displayed in the project navigator and can be configured there in the same way as a SINAMICS Integrated.
   In **HW Config**, the respective PROFIBUS address of the CX32-2 is displayed in parentheses in the module icon.

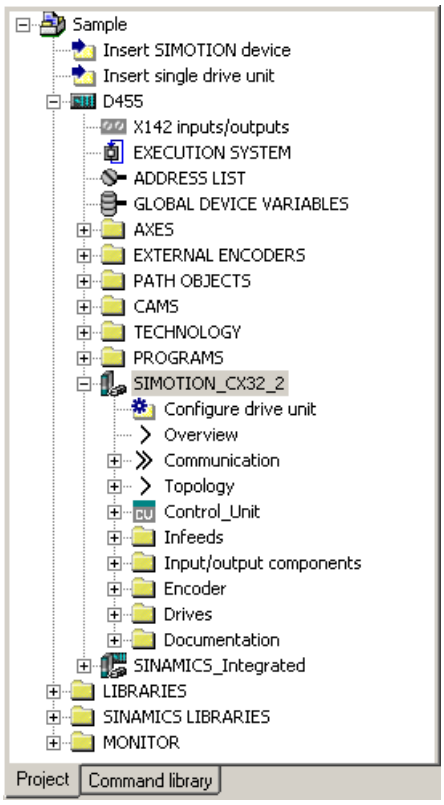

Figure 10-76 CX32-2 in the project navigator

6. Save the project.

7. A CX32-2 is configured in the same way as the SINAMICS Integrated on a SIMOTION D4x5-2.
   Using an offline configuration
   Where configuration is being performed offline, configure the drive components (infeed, motor modules, motor, encoder, terminal modules, etc.) by running through the drive wizards for the SINAMICS Integrated or CX32-2. After you have done this, carry out commissioning.
   Automatic commissioning
   During the automatic commissioning, the drive components that are physically connected to a SIMOTION D are determined. I.e. you only require a D4x5-2 project with the CX32-2 modules configured in **HW Config**.

Assigning DRIVE-CLiQ ports to PROFIBUS addresses

Table 10-42 CX32-2 PROFIBUS addresses (PROFIBUS Integrated)

DRIVE-CLiQ port	PROFIBUS address (PROFIBUS Integrated)
X105 (not for D425-2)	15
X104 (not for D425-2)	14
X103	13
X102	12
X101	11
X100	10

Displaying the topology

Topology of the SINAMICS Integrated

Because the CX32-2 is connected to the SINAMICS Integrated of a SIMOTION D4x5-2 via DRIVE-CLiQ, it is also displayed in the topology tree of the SINAMICS Integrated.

All inserted CX32-2s are displayed in the SINAMICS Integrated topology without their subtopology.

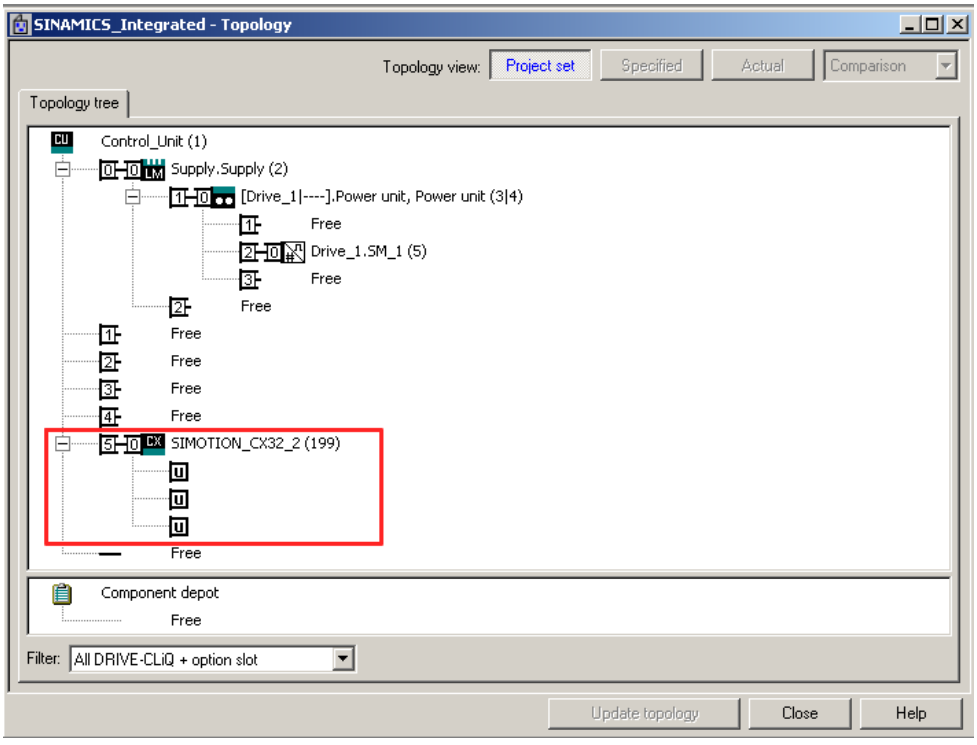

Figure 10-77 SINAMICS Integrated topology (example of D455-2 DP/PN)

CX32-2 topology

The CX32-2 topology displays the DRIVE-CLiQ port required for connection to the SINAMICS Integrated. The drive objects connected to the CX32-2 are also displayed.

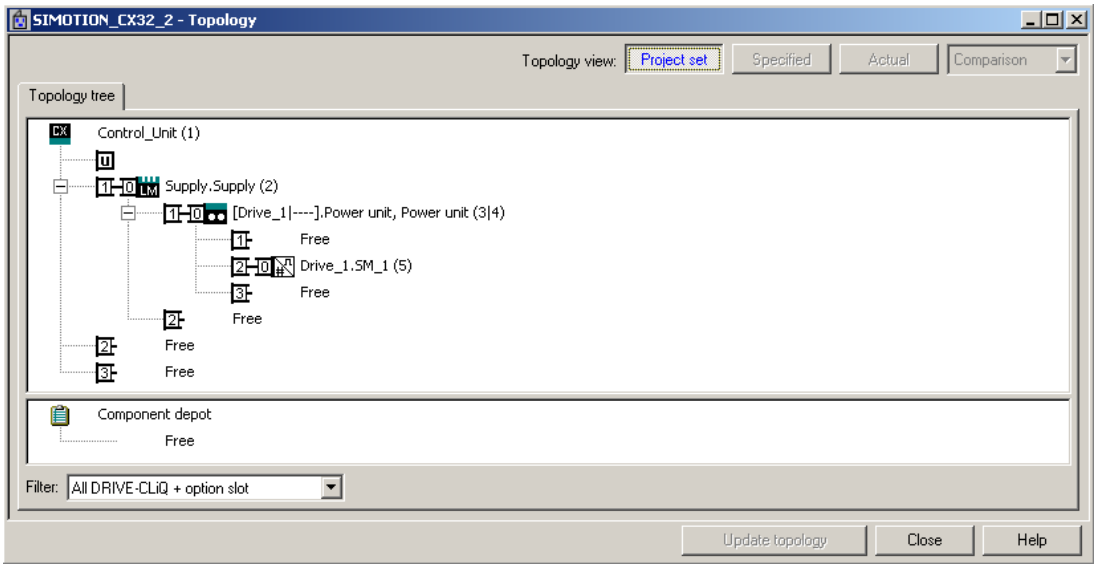

Figure 10-78 CX32-2 topology

Note

Topology errors can result in a download or system power-up not being possible.

CX32-2 offline configuration

Options

The following options are available for commissioning a project created offline:

- Loading a project created offline to the target system
- Loading a project created offline to the CompactFlash Card

Loading a project created offline to the target system

Requirement

- Your project, including all SINAMICS Integrated and CX32-2 drive components, must have been configured already (see Preparing for configuration (Page 7089)).
- The actual topology must correspond with the reference topology.

Note

A step-by-step commissioning with the CX32-2 controller extension is described below.

In a step-by-step procedure, first the D4x5-2, then the SINAMICS Integrated and finally each CX32-2 is commissioned. This step-by-step procedure is not mandatory, but has the advantage that the location and cause of an error are easier to identify.

Procedure

1. Deselect all target devices, with the exception of the SIMOTION D4x5-2, using the "Target system" > "Select target devices" menu command in SCOUT.
2. Go online with the D4x5-2 by clicking "Connect to selected target devices".
3. Select the D4x5-2 in the project tree. Load the configuration to the SIMOTION D4x5-2 with "Download CPU / drive unit to target device".
4. Copy the configuration from RAM to ROM with "Copy RAM to ROM".
5. Select "Connect target device" in the SINAMICS Integrated context menu. You will then be connected to the SINAMICS Integrated online.
6. Load the parameterization by selecting "Target device" > "Download" in the SINAMICS Integrated context menu.
7. Copy the parameterization from RAM to ROM with "Copy RAM to ROM".
8. Then select "Load CPU / drive unit to PG" to load the parameterization from the SINAMICS Integrated back to the programming device in order to back up the SINAMICS parameter calculations.

The SINAMICS Integrated is now ready for operation (RDY LED flashes green at 0.5 Hz). The CX32-2 can be accessed online, although it has not been configured yet (RDY LED flashes green at 0.5 Hz, DP LED is off).

1. Select "Connect online" in the CX32-2 context menu. You will then be connected to the CX32-2 online.
2. Load the parameterization to the CX32-2 and copy the parameterization from RAM to ROM.
3. Then load the parameterization from the CX32-2 back to the programming device in order to back up the SINAMICS parameter calculations.

4. Repeat steps 1 to 3 for each CX32-2.
5. Save the project.

Note

Topology errors can result in a download or system power-up not being possible.

Result

The CX32-2 is now also ready for operation (RDY LED is green, DP LED is green (in RUN mode) or flashes green at 0.5 Hz (in STOP mode)).

Loading a project created offline to the CF card

Loading a project created offline to the CF card has the advantage of being faster than a download.

It should be noted, however, that the first system power-up will take longer, as the SINAMICS Integrated and CX32-2 will perform one-off parameter calculations. These are automatically backed up on the CF card.

Requirement

- You will need a card reader for the SIMOTION D4x5-2 CF card.
- Your project, including all SINAMICS Integrated and CX32-2 drive components, must have been configured already (see Preparing for configuration (Page 7089)).
- The actual topology must correspond with the reference topology.

Procedure

1. Select "Load to file system" in the SIMOTION D4x5-2 context menu.
2. Select "Normal save" and click the "Select target" button. Select your card reader's drive and confirm with "OK".
3. If a project has already been saved to the CF card, the message "Memory card file already exists. Do you want overwrite this file?" appears. Confirm the message with "Yes".
4. Once the project has been subsequently transferred to the CF card, insert the card into the disconnected SIMOTION D4x5-2. Switch on the power supply of the D4x5-2 and the connected components.
5. After a successful power-up, the RDY LED of the D4x5-2 and the CX32-2 will be green, as will the DP LED of the CX32-2.

The components' firmware is automatically updated, depending on the FW version on the SINAMICS components and on the CF card. Note the information in Section Upgrading the D4x5-2/CX32-2 (Page 7100).

Note

Topology errors can result in a download or system power-up not being possible.

Performing an online configuration for the CX32-2

Requirement

You need a project which has already been created and which contains the SIMOTION D4x5-2 with SINAMICS Integrated, as well as the CX32-2 controller extension(s).

Additional drive components (Line Module, Motor Modules, Terminal Modules, etc.) are configured using "Automatic commissioning" and must not, therefore, be created offline.

Procedure

1. Deselect all target devices, with the exception of the SIMOTION D4x5-2, using the "Target system" > "Select target devices" menu command in SCOUT.
2. Go online with the D4x5-2 by clicking "Connect to selected target devices".
3. Select the D4x5-2 in the project tree. Load the configuration to the SIMOTION D4x5-2 with "Download CPU / drive unit to target device".
4. Copy the configuration from RAM to ROM with "Copy RAM to ROM".
5. Select "Connect target device" in the SINAMICS Integrated context menu. You will then be connected to the SINAMICS Integrated online.
6. Perform "Automatic Configuration" on the SINAMICS Integrated. This may take several minutes, depending on the number of components connected.
   The SINAMICS Integrated is now ready for operation (RDY LED flashes green at 0.5 Hz). The CX32-2 can be accessed online, although it has not been configured yet (RDY LED flashes green at 0.5 Hz, DP LED is off).
7. Select "Connect target device" in the CX32-2 context menu. You will then be connected to the CX32-2 online.
8. Perform the automatic configuration on the CX32-2. The CX32-2 is now also ready for operation (RDY LED is green, DP LED is green (in RUN state) or flashes green at 0.5 Hz (in STOP state)).
9. Repeat steps 7 to 8 for each CX32-2.
10. Copy the parameterization from RAM to ROM with "Copy RAM to ROM".
11. Save the project.

If you run the "automatic configuration" in Step 6 and 8, a check will be made to see if the firmware on the SINAMICS components differs from the firmware on the CF card. If it does, you

will be informed accordingly and the firmware on the SINAMICS components will be upgraded/downgraded automatically.

The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are also displayed by the yellow RDY LED on the SIMOTION D/CX32-2 and indicate that a firmware update is being carried out on components connected to the SIMOTION D/CX32-2 or that all components have completed the firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

Note

Topology errors can result in a download or system power-up not being possible.

CX32-2 configuration information

This section contains configuration tips relating to a number of features which are specific to operating the CX32-2 together with the D4x5-2.

CX32-2 power-up

Powerup times

The CX32-2 does not require its own CF card. The firmware and the parameterization are stored centrally on the SIMOTION D CF card. After a firmware change, the CX32-2 firmware from the CF card is copied to the CX32-2 at the first power-up and saved there as non-volatile data. For this reason, the first power-up with new firmware takes longer than subsequent power-ups.

Detecting when the CX32-2 powers up in the user program

The user must wait for the CX32-2 to power up before the drive objects can be accessed by the user program.

One way of checking is to query the status of system variables of the drives on the CX32-2.

- <axis name>.actormonitoring.cyclicinterface = ACTIVE AND
- <axis name>.sensordata[1].state = VALID

This procedure can also be used to establish when the SINAMICS Integrated drives power up.

Interconnecting the infeed "Operation" signal on the CX32-2

Requirement

- Drive line-up with SIMOTION D4x5-2 control unit and Line Module with DRIVE-CLiQ interface
- One or more CX32-2 controller extensions without a Line Module of their own (i.e. the Motor Modules of the D4x5-2 and the CX32-2 modules are supplied by the same DC link)

In this example, the Line Module must to be connected to the SIMOTION D4x5-2 (not to the CX32-2).
For all other cases, see Section Using one infeed for several CUs (Page 7146).

Procedure

When drives are created in Drive system 1, the signal "Closed-loop control operation" r0863.0 from the Line Module is automatically interconnected with the "Infeed operation" signal from the drives (Drive 1...n) via p0864.

There is an internal communication channel available for the CX32-2 controller extension (drive system 2), via which the following signals from the SIMOTION D4x5-2 control unit can be automatically interconnected to the CX32-2 controller extensions:

- "Closed-loop control operation" of the Line Module connected to the SIMOTION D4x5-2
- Status of the SIMOTION D4x5-2 onboard digital inputs (X122/X132, DI 0 ... 7 and DI/DO 8 ... 15)

These signals are available on the CX32-2 controller extension; since there is no need to perform any additional configuration steps, it is very easy to make additional interconnections with them within the CX32-2.

Interconnecting the infeed operation signal

The "Closed-loop control operation" signal of the Line Module connected to the SIMOTION D4x5-2 is available in parameter r8510.0 of the CX32-2. Using the expert list or the drive wizard, interconnect parameter p0864 (drives on CX32-2) to parameter r8510.0 of the CX32-2 controller extension.

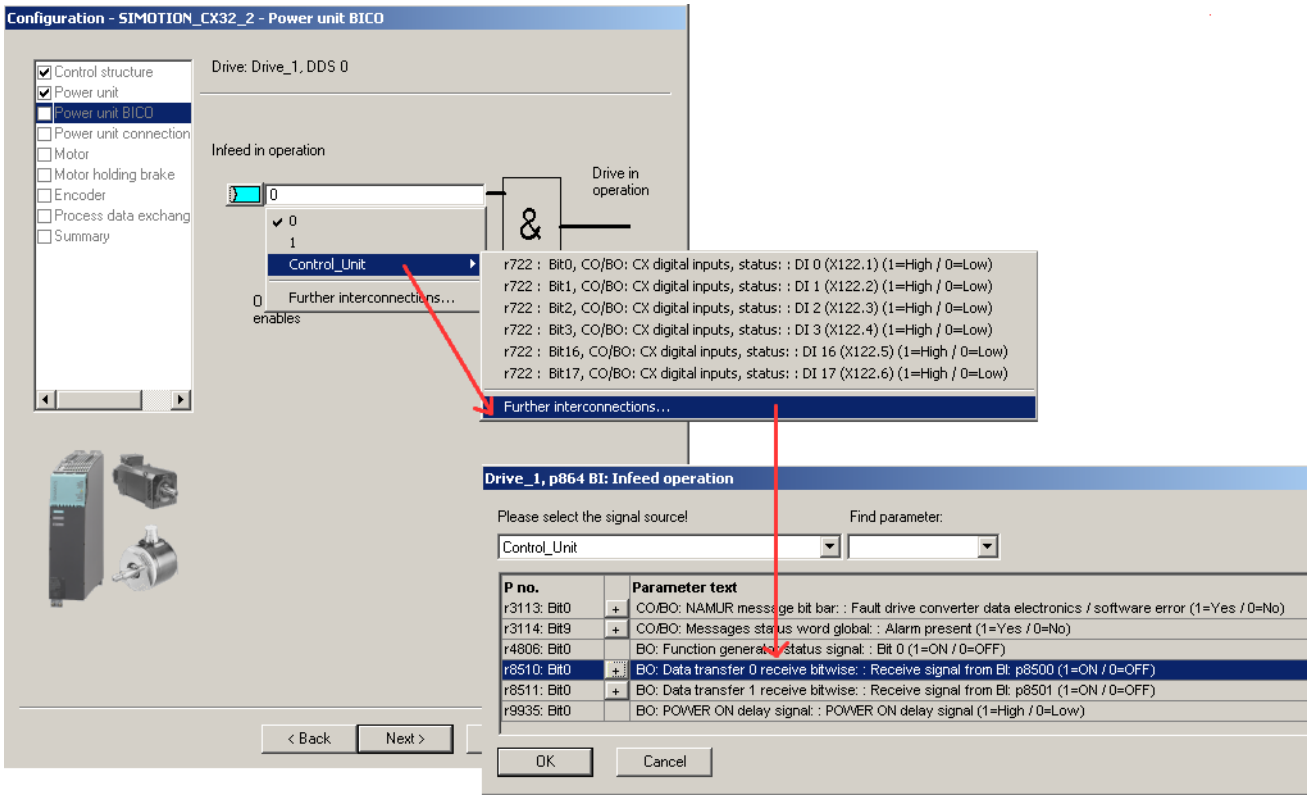

Figure 10-79 Interconnecting the infeed operation signal

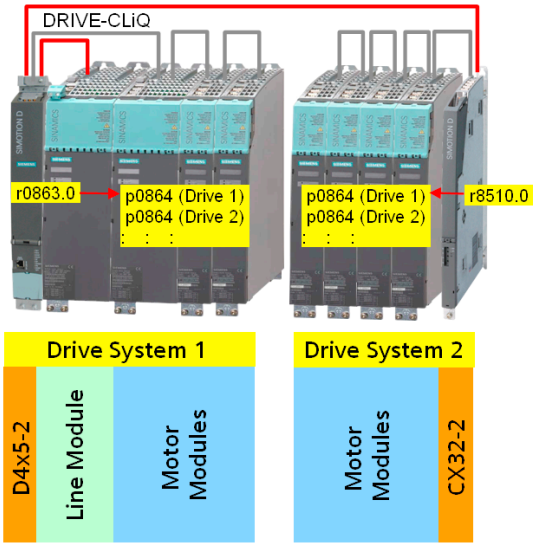

Figure 10-80 Operation signal interconnection (explanatory illustration)

Infeed to CX32-2 / CU320-2

If the infeed is connected to a CX32-2 / CU320-2 and the ready signal is to be connected to the SINAMICS Integrated, or another CX32-2 or CU320-2, proceed as described in Section Using one infeed for several CUs (Page 7146).

Terminal state of D4x5-2 onboard digital inputs

The terminal states of the SIMOTION D4x5-2 onboard digital inputs (X122/X132, DI 0 ... 7 and DI/DO 8 ... 15) are available in parameter r8511[0 ... 15] of the CX32-2. These can be interconnected further on the CX32-2.

Upgrading the CX32-2

CX32-2 modules are always operated with the same firmware version as the SINAMICS Integrated of a SIMOTION D.

This means no additional measures need to be taken for CX32-2 modules.

If the firmware version of the SIMOTION D is upgraded via HW Config, the SINAMICS Integrated and the connected CX32-2 controller extension are also automatically upgraded.

For instructions on upgrading a SIMOTION D, see also Section Adapting a project (Upgrading the project / Replacing the SIMOTION controller) (Page 7221).

FW update

The components' firmware is upgraded or downgraded automatically based on the firmware version on the CF card and the firmware version on the SINAMICS components (DRIVE-CLiQ components, CBE30-2, TB30, Power Modules, etc.).

The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are also displayed by the yellow RDY LED on the SIMOTION D/CX32-2 and indicate that a firmware update is in progress on components connected to the SIMOTION D/CX32-2 or that all components have completed the firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

See also

Also refer to the information in Section General information on SINAMICS firmware update (Page 7244).

Replacing the CX32-2

Replacing a module

When used as a spare part, a CX32-2 behaves like other DRIVE-CLiQ components.

A module replacement is detected automatically as of SINAMICS V4.5.
See Section

- Replacing modules in the spare part scenario (Page 6998)
- Backing up / restoring / deleting SINAMICS NVRAM data (Page 7110)

D435-2/D445-2/D455-2 ↔ D425-2 replacement

Drag-and-drop operations can be used to perform a D435-2/D445-2/D455-2 ↔ D425-2 module replacement in HW Config.

Please note that it will not be possible to replace a D435-2/D445-2/D455-2 with a D425-2 if a CX32-2 has been configured with the address 14 or 15. (A D425-2 does not have DRIVE-CLiQ ports X104/X105 and therefore does not have addresses 14 and 15.)

Additional information on configuring the SINAMICS Integrated

Settings for DP slave properties

Settings in HW Config

Depending on the cycle clock ratios (bus cycle clock, servo cycle clock) and the drives used, it may be necessary to change the properties of the DP slave (SINAMICS Integrated) on the PROFIBUS Integrated.

Open HW Config. Double-clicking the SINAMICS Integrated enables you to display and, if required, change the properties of the DP slave on the "Isochronous mode" tab. Example:

- Synchronizing a drive to the isochronous DP cycle
  SINAMICS Integrated and CX32-2 can only be operated isochronously. For this reason, this option cannot be deactivated.
- Changing the master application cycle (T_{MAPC})
  The master application cycle must always be the same as the servo cycle clock set (setting: "Shortcut menu of the D4x5-2" > "Set system cycle clocks" in the project tree). Provided that the DP cycle is not reduced to the servo cycle clock, the master application cycle will always be the same as the DP cycle.

Note

As of V4.3, a reduction ratio for the DP cycle to the Servo cycle clock is possible. The reduction ratio is only permitted when PROFINET IO with IRT has not been configured.

- Changing the DP cycle (T_{DP})
  Depending on the requirements in terms of the quantity structures and response times, the DP cycle may need to be changed (see also *SIMOTION Runtime Basic Functions* Function Manual).
  In addition, the minimum DP cycle for vector drives also depends on the speed controller cycle clock, which in turn depends on the drive quantity structure and the device type used. This means that, particularly in the case of vector drives, the DP cycle must be checked and changed if necessary (see Section Use of vector drives (Page 7104)).

  Note

  After T_{DP} has been changed on the PROFIBUS master, the drive system must be switched on (POWER ON).

- Changing the T_I and T_O times
  A change to T_I/T_O is required in the case of vector drives, for example, where the T_I/T_O time depends on the number of vector drives or, with chassis devices, on the device type used.

If you change the settings for the SINAMICS Integrated, you must also change the settings on the CX32-2 modules accordingly. This is easily done by using the Align button to transfer the settings for all the CX32-2 modules.

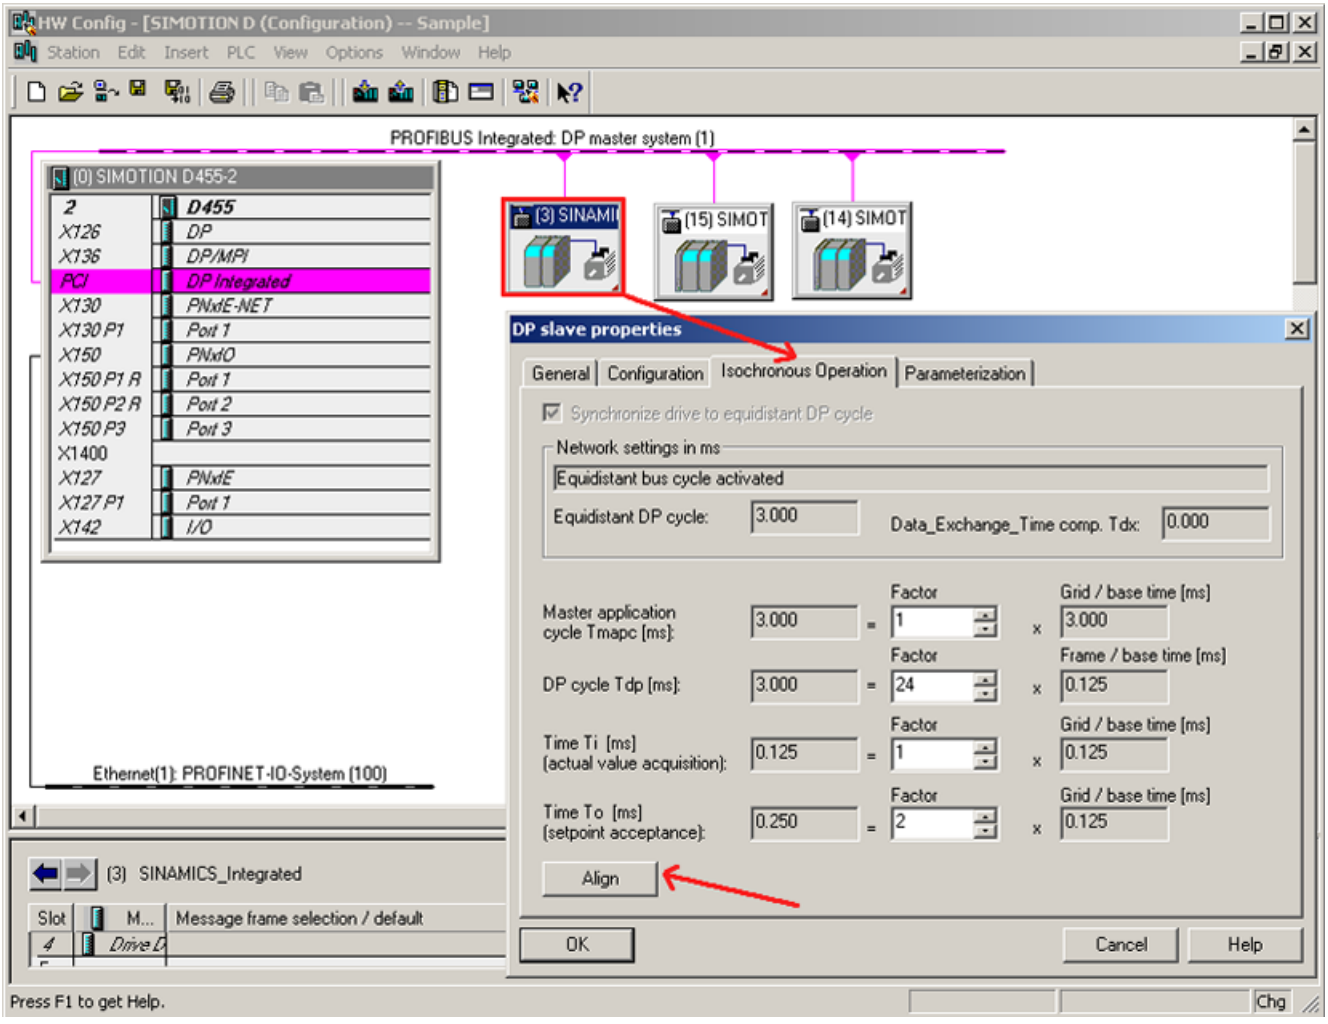

Figure 10-81 HW Config - settings

The times are modified by changing the value in the "Factor" field.

SCOUT TIA

In order to parameterize the isochronous cycle clock for the PROFIBUS Integrated in the TIA Portal, proceed as follows:

1. Select the PROFIBUS Integrated in the network view.
2. Select the "General" tab in the Inspector window and click "Equidistance" to display the parameters for the isochronous PROFIBUS. The "Activate isochronous bus cycle" setting is permanently selected and cannot be edited.

The other parameters are set to default settings and can be edited.

Additional references

Further information is available in the following references:

- *SINAMICS S120* Function Manual
- *SIMOTION Runtime Basic Functions* Function Manual
- *SIMOTION SCOUT TIA* Configuration Manual

Using vector drives

Changes need to be made in HW Config when using SINAMICS vector drives. This means, for example, that the T_I/T_O time and the minimum DP cycle depend on the number of vector drives or, with chassis drives, also on the device type used.

Therefore, we recommend adopting the following procedure when using vector drives with the SIMOTION D4x5-2.

Scenario 1: Current and speed controller cycle is known

As long as you know the current and speed controller cycle, you will be able to determine times T_{MAPC}, T_{DP}, T_I, and T_O. Where there are several drives with different cycle clocks, the largest cycle clock must be used for the current and speed controller cycle.

Procedure

1. Open HW Config. By "double clicking" the SINAMICS Integrated, you can change the properties of the DP slave in the "Isochronous operation" tab.
2. For $T_I = T_O =$, enter an integer multiple of the current controller cycle.
3. For T_{DP}, enter an integer multiple of the speed controller cycle. For drives on the SINAMICS Integrated, T_{DP} must always be $\geq T_O$.
4. Enter $T_{MAPC} = T_{DP}$ (exception: you are working with cycle clock scaling; i.e. position control cycle clock > DP cycle).
5. Use the "Download project to target system" menu command to load the configuration to the SIMOTION D4x5-2.
6. After the download has successfully completed, you should determine the current and speed controller cycles of the drives from the drives' expert lists, as the cycle clocks are set in the SINAMICS drive unit after a project has been downloaded.
   p0115[0] current controller cycle clock
   p0115[1] speed controller cycle clock
7. If the current and speed controller cycles from the expert lists are different to the cycle clocks used in steps 2 and 3, you will have to repeat the steps with the current values for the current and speed controller cycles.

Note

The described procedure is also required for an online configuration with an automatic configuration.

Table 10-43 Example for power units in booksize format (vector drives)

Example	Settings
1 to 3 vector drives Current controller cycle = 250 µs Speed controller cycle = 1 ms	$T_I = T_O$ = at least 250 µs T_{DP} = 1 ms (... or 2 ms, 3 ms, ...) $T_{MAPC} = T_{DP}$
4 to 6 vector drives Current controller cycle = 500 µs Speed controller cycle = 2 ms	$T_I = T_O$ = at least 500 µs T_{DP} = 2 ms (... or 4 ms, 8 ms, ...) $T_{MAPC} = T_{DP}$

Note

Vector drives in chassis format can also be operated with a current controller sampling time of 400 µs (amongst other settings).

In the SIMOTION context, the following should be considered:

- A current controller sampling time of 400 µs is only possible if control is via a SINAMICS S120 control unit, which is not operated isochronously via PROFIBUS/PROFINET on SIMOTION D.
- If the bus is operated isochronously, only cycle clocks with an integer multiple of 125 µs are possible (i.e. 375 µs or 500 µs instead of 400 µs, for example).
- The PROFIBUS Integrated of a D4x5-2/CX32-2 is always isochronous! This means that a current controller sampling time of 400 µs is not possible.
- With CU parameter p0092 = 1, the sampling times are pre-assigned so that isochronous operation with a controller is possible.

Scenario 2: Current and speed controller cycle is not known

This procedure is especially suitable for devices in chassis format, as the current and speed controller cycle also depends on the relevant device type.

1. To determine which cycle clocks are set in the SINAMICS drive unit after a project has been downloaded, first set reliable values for the cycle clocks in HW Config (see table "Recommended cycle clock settings in HW Config").
2. Use the "Download project to target system" menu command to download the parameterization.
3. After the download has successfully completed, you will be able to determine all the current and speed controller clock cycles of the drives from the drives' expert lists.
   p0115[0] current controller cycle clock
   p0115[1] speed controller cycle clock
4. If required, it is now possible to optimize the T_{MAPC}, T_{DP}, T_I, and T_O times in HW Config (see the procedure in Scenario 1).

Table 10-44 Recommended cycle clock settings in HW Config

Setting	Explanation
T_{DP} = 3.0 ms	T_{DP} = DP cycle time
$T_I = T_O$ = 1.5 ms	T_I = time of actual value acquisition T_O = time of setpoint transfer
T_{MAPC} = 3.0 ms	T_{MAPC} = master application cycle time

Setting the sampling times

Automatic setting

On SIMOTION D4x5-2, if p0112 = 3 (default) is set, the sampling times in the p0115 (current controller, speed controller, ...) are automatically set after a project download and may therefore differ from the offline values. The sample times depend, e.g. on the number of vector drives and the Power Module used (e.g. chassis). If the sampling times have been adapted by the system, p0112 = 0 (expert) is set automatically.

Manual setting

With p0112 = 1...5, the sampling times (current controller, speed controller, ...) can be selected.

If sampling times are required which cannot be set using p0112 > 0, then you can directly set the sampling times using p0115. To do so, p0112 must be set to "0" (Expert).

p0112 = 0 enables the individual sampling times to be adjusted in p0115. Moreover, with this setting, the system does not change the current controller sampling time automatically.

Output cams / measuring inputs with vector drives

With vector drives, the cycle clock ratios (current controller cycle clock, speed controller cycle clock, sampling time of the I/Os, etc.) depend on the number of vector drives, or with chassis units also on the device type used.

Note the information in Section Current controller cycle clocks <> 125 µs / use of output cams and measuring inputs (Page 7116).

Additional references

Additional information on quantity structures and cycle clock settings can be found in the *SINAMICS S120* Function Manual.

Setting the time of day

Time on SIMOTION (real-time clock)

SIMOTION D4x5-2 has an integrated real-time clock. All events on a module (alarms, messages, etc.) are "time-stamped" based on the time shown by this real-time clock.

Various options are available to set the clock of the SIMOTION D4x5-2:

- Setting the clock via the engineering system
  - SIMOTION SCOUT: Select the SIMOTION D4x5-2 in the project tree and then "Target system" > "Set time" in the menu.
  - SIMOTION SCOUT TIA: Call the "Set time" function at "Online & diagnostics" in the TIA Portal in the project tree.
- Setting the clock using the "rtc" system function block
- Synchronization of the local time with an NTP time server (as of V4.5)

The status of the NTP time synchronization can be determined with the **_getStateOfNTPClockSynchronisation** system function.

For further information on the NTP process, see the *SIMOTION Communication* System Manual and the *SIMOTION SCOUT TIA* Configuration Manual.

SINAMICS system runtime (operating hours counter)

Faults and alarms are "time-stamped" based on the system runtime on SINAMICS Integrated of a SIMOTION D, Controller Extensions and SINAMICS S120 Control Units. This means that events are recorded by default on the basis of operating hours rather than a particular time of day or date.

System runtime

The entire system runtime is displayed in CU parameter p2114.

- p2114[0] indicates the system runtime in milliseconds. After reaching 86,400,000 ms (24 hours), the value is reset.
- p2114[1] indicates the system runtime in days.

The counter value is saved when the power is switched off. After the drive unit has been switched on, the counter continues to run with the value stored when the power was last switched off.

As a result, the drive displays the system runtime from 00:00:00 on 01/01/1992 in both the alarm window in SIMOTION SCOUT and the diagnostic buffer for entries.

If faults and alarms need to be "time-stamped" based on a time of day, "Time stamp operating hours" needs to be changed to "Time stamp UTC format" as described below.

Requirements

A telegram 39x is required for the time synchronization. If the automatic PROFIdrive telegram setting is selected for the Control Unit, this telegram is used automatically (see Section Calling the drive wizard (Page 7053), Standard/Automatic setting).

If the telegrams are specified manually, telegram 39x must be set up (see Section Telegram configuration (Page 7148)).

So that drive units can be synchronized with the SIMOTION time, they must support telegram 39x and the UTC time format.

For precise time synchronization, the drive unit must also be operated via an isochronous bus on SIMOTION. The SINAMICS Integrated for SIMOTION D and the CX32/CX32-2 Controller Extension always have an isochronous connection.

The following Control Units support time synchronization:

- SINAMICS Integrated of the SIMOTION D
- CX32/CX32-2 Controller Extensions
- SINAMICS S120 CU310, CU310-2, CU320, CU320-2 Control Units connected via PROFIBUS or PROFINET
- SINAMICS S110 Control Units CU305, connected via PROFIBUS or PROFINET (precondition: as of SCOUT V4.4)

Synchronizing the SINAMICS clock

Proceed as follows to convert the SINAMICS clock to UTC format and to synchronize this with the SIMOTION clock:

1. Call the D4x5-2 context menu in the project navigator.
2. Select the "Properties..." entry in the context menu.
3. Select the "Perform time synchronization with SINAMICS drive units" option in the "Settings" tab of the "Properties - D4x5-2" dialog box.

Note

This setting is automatically activated for new projects as of V4.2 and applies for all drive units connected to the D4x5-2. The SINAMICS clock is automatically synchronized with the SIMOTION clock for all drive units with configured telegram 39x.

The first time synchronization is performed after the SIMOTION D Control Unit has reached the RUN operating state.

To compensate for deviations between the SIMOTION and SINAMICS clocks, the time of day is automatically resynchronized at regular intervals.

Via the system variable **_driveStates.allClocksSynchronized** on the D4x5-2 device, the user program can query whether the automatic time synchronization is activated (=YES) or deactivated (=NO).

Before the first synchronization, alarms and messages are stored with the time stamp valid in the SINAMICS at this time, all subsequent alarms and messages with the synchronized time.

The first time synchronization after switching on is entered with the status of the operating hours counter and the time (UTC time, synchronized with SIMOTION) in the diagnostic buffer of the drive (e.g. SINAMICS Integrated).

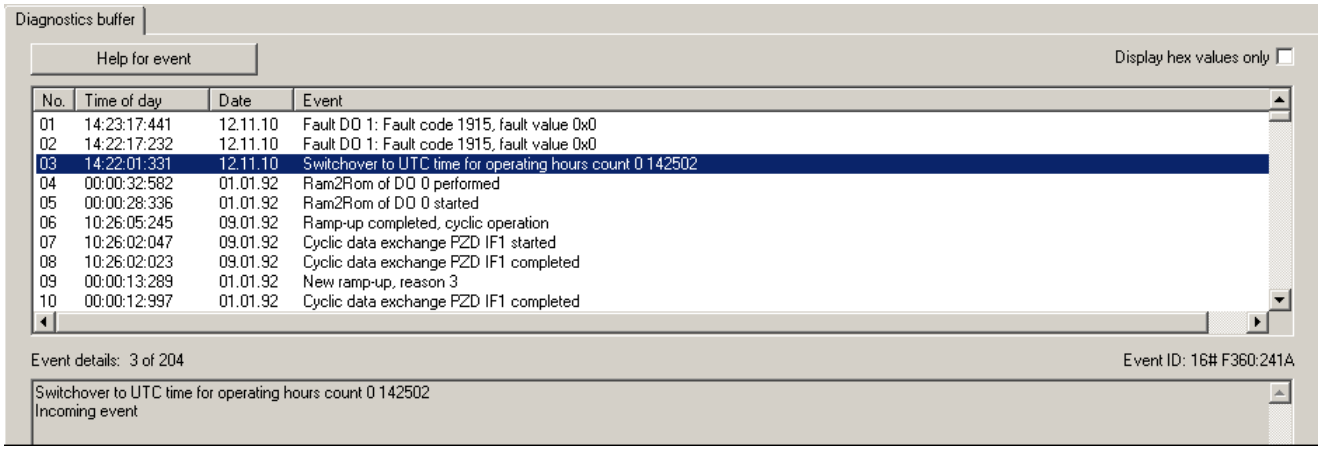

Figure 10-82 SINAMICS time synchronization diagnostic buffer entry

Error correction

If problems occur with time synchronization, this may be due to deactivated symbolic assignment to incorrect configuration information (Fast IO configuration).

For more information, see Section Message frame configuration (Page 7148).

Compensation of runtime deviations

To compensate for deviations between the SIMOTION and SINAMICS clocks, the time of day is automatically resynchronized at regular intervals.

The following behavior must be taken into consideration when setting the SIMOTION time:

- "Time/date to be set" is later than "Time/date on SINAMICS": Time and date are corrected on the SINAMICS.
- "Time/date to be set" is earlier than "Time/date on SINAMICS": The SINAMICS clock must be stopped until the SINAMICS "Time/date" has caught up with "Time/date to be set".

Adopting this procedure ensures that the sequence of SINAMICS diagnostic buffer entries remains the same, even when the runtime differences are aligned.

The SINAMICS clock operates with a resolution of 1 ms. A synchronization accuracy of 1 ms can be achieved for all bus cycle clocks that can be divided exactly by 1 ms (e.g. 1 ms, 2 ms, 3 ms, etc.).
Due to system considerations, a slightly lower synchronization accuracy is achieved for all bus cycle clocks that cannot be divided exactly by 1 ms (e.g. 1.25 ms).

If the drive unit does not have an isochronous connection on SIMOTION, this can result in runtime differences of milliseconds (depending on the set cycle clock ratios).

Resetting the time

Requirement:

- SIMOTION D4x5-2: As of SIMOTION V4.3
- SINAMICS S120: As of SINAMICS V4.5
- SINAMICS S110: Not available

A threshold value is defined via parameter cu.p3109 and is effective as follows:

- In the case of negative time jumps less than the threshold value (p3109), the time is halted (for details, see "Compensation of runtime deviations").
- In the case of negative time jumps greater than the threshold value (p3109), the time is reset.
  Default setting: cu.p3109 = 100 ms
  This means that in the case of negative time jumps greater than 100 ms, the time is reset. The default value is configured so that normal runtime deviations (drift of the quartzes) are below the threshold value.
  If the SIMOTION clock is reset by more than 100 ms, this is interpreted as a "specific reset of the time" and the time of the drives is also immediately reset.

If the real-time clock is reset by more than 60 seconds, a diagnostic buffer entry is also made in the drive:

Time correction (reset) by <correction value> seconds

After a resynchronization (negative time jump greater than the threshold value)

cu p3107[0..1] the UTC time after synchronization

cu p3107[2..3] the UTC time before synchronization

is displayed in the parameter, whereby [0] and [2] are milliseconds and [1] and [3] are days.

Note

The diagnostic buffer entries are not converted to the new time when the time is changed.

Backing up / restoring / deleting SINAMICS NVRAM data

Requirement

- SIMOTION D: SIMOTION D4xx-2/CX32-2 as of SIMOTION V4.3 / SINAMICS V4.5
- SINAMICS S120 CU310-2/CU320-2: SINAMICS V4.5
- Other supported SINAMICS CUs: See the SINAMICS manuals

Saving the NVRAM data

The backup of the SINAMICS NVRAM data is performed by setting parameter p7775 to 1.

The following applies:

- Parameter p7775 can also be set to 1 during pulse enable.
- A warm restart is not required.

Note

The consistent backup of the NVRAM data must be ensured by the application.

Make sure that there is no change of the NVRAM contents during the backup.

The greatest possible consistency is achieved when

- Backup is performed during pulse disable or
- The drives are run down to 0 Hz.

The data is stored on the CF card:

- "....\USER\SINAMICS\NVRAM" for S120 CUs and SINAMICS Integrated
- "....\USER\SINAMICS\\NVRAM\xx" for CX32-2 (xx corresponds to the DRIVE-CLiQ port)

The data itself is stored in the PMEMORY.ACX backup file.

For the S120 Control Units, the data is stored on the CF card of the S120 Control Unit.

Similar to the non-volatile SIMOTION data, an already existing PMEMORY.ACX file is first renamed as PMEMORY.BAK and then the PMEMORY.ACX file is generated when you save the SINAMICS data.

If an error occurs during backup, the BAK file can be used to restore the data.

Parameter p7775 is set to 0 at the end of the backup.

Restoring the NVRAM data

The SINAMICS NVRAM data can only be restored when none of the connected drives has a pulse enable.

When restoring, the PMEMORY.ACX file is accessed first. If this is available and is error-free, it is loaded. If no PMEMORY.ACX file is available or is corrupt, the PMEMORY.BAK file is loaded (if available and error-free).

Restoration of the NVRAM data can be performed manually and automatically:

Automatic restoration during module replacement

- SINAMICS detects whether the control unit has been replaced on the basis of the serial number.
- In this case, the NVRAM of the used control unit is deleted first after POWER ON.
  The following are not deleted:
  - CU operating hours counter
  - CU temperature and
  - Safety logbook
  - Crash diagnostic data

If there is an error-free PMEMORY.ACX or PMEMORY.BAK file on the CF card, the data is then loaded to the NVRAM.

If no error-free backup file is available, ramp-up is as for SINAMICS < V4.5. A fault is not issued and any existing "corrupt" backup files are not deleted.

Manual restoration

The manual restoration of the NVRAM data is performed by setting parameter p7775 to 2.

If the backup file (ACX or BAK) is error-free is, a warm restart is performed. The contents of the NVRAM are deleted first and then the data is loaded from the backup file to the NVRAM.

The following are not loaded:

- CU operating hours counter
- CU temperature and
- Safety logbook
- Crash diagnostic data

Parameter p7775 is set to 0 at the end of the restoration.

If the backup files are corrupt or no backup exists, the job is acknowledged with an error value in parameter p7775.

Deleting the NVRAM data

The SINAMICS NVRAM data can only be deleted when none of the connected drives has a pulse enable.

The deletion of the NVRAM data is performed by setting parameter p7775 to 3.

After setting p7775 to 3, a warm restart is performed automatically.

During the following ramp-up, first all NVRAM data is deleted on the control unit.

The following are not deleted:

- CU operating hours counter
- CU temperature and

- Safety logbook
- Crash diagnostic data

At the end of the deletion, the initialization data of the applications is in the NVRAM, similar to as after a device automatic commissioning (with the exception of the above-mentioned data).

Parameter p7775 is set to 0 at the end of the deletion.

Explanations for p7775

The following jobs can be issued via p7775:

1: Backup NVRAM data (on CF card)

2: Restore NVRAM data (from CF card)

3: Delete NVRAM data on CU

The acknowledgement of a job is delayed.

- If the job cannot be executed, it is acknowledged negatively.
- If the job can be executed, it is acknowledged with the value 255.

Acknowledgements of the parameter jobs

Table 10-45 Acknowledgements of the parameter jobs

Value	Cause
17	Job cannot be executed because of the operating state
20	Illegal value
107	Write access is not permitted (cause: At least one DO has a pulse enable). As the SINAMICS has to perform a warm restart when restoring and deleting the data, none of the connected drives must have a pulse enable
132	Parameter change blocked (see p0300, p0400, p0922, p7760, macro being executed)
204	Write access not permitted
255	"OK": Job being executed

If an error is detected during the execution of a parameter job, the error cause is signaled via the parameter itself (no message via the fault buffer).

Causes of errors for parameter jobs

Table 10-46 Causes of errors of the parameter jobs

Value	Cause
10	Error occurred while deleting
11	No backup possible: Memory card is not inserted
12	No backup possible: Memory card is full
13	Backup could not be completed (e.g. memory card removed during the backup)
14	Restoration not possible: Memory card is not inserted

Value	Cause
15	Restoration not possible: Checksum of the NVRAM data backup file is faulty
16	Restoration not possible: No backup available

Note

The memory card must be always remain inserted for SIMOTION D; please refer to the SINAMICS manuals for which SINAMICS Control Units allow the memory card to be removed.

Parameter p7775 is only reset automatically to 0 after the successful completion of a job.

Know-how and write protection

- Parameter p7775 is not part of the know-how protection.
  I.e. the parameter can be read and written irrespective of the know-how.
- Parameter p7775 is part of the write protection. This means the parameter can only be written by the controller that configured a PZD cyclic communication with the SINAMICS when write protection is activated (p7761 = 1).
  All other write jobs are acknowledged negatively, e.g.
  - SCOUT/STARTER
  - For SINAMICS CUs, BOP, IOP, AOP
  - Other masters that only communicate acyclically with the SINAMICS

SINAMICS diagnostic buffer

The diagnostic buffer of the SINAMICS Integrated, the CX32-2 and the SINAMICS S120 control unit can be displayed in SIMOTION SCOUT.

To do this, select the SINAMICS Integrated, the CX32-2 or the SINAMICS S120 control unit in the project tree. Then select "Target system" > "Device diagnostics" in the menu.

In addition, the SINAMICS diagnostic buffer entries are also displayed in the D4x5-2 device diagnostics. All D4x5-2 diagnostic buffer entries are displayed first, followed by those for the SINAMICS Integrated and the CX32-2. The start of the SINAMICS diagnostic buffer entries is identified by the following entry:

>>>>>> Start of SINAMICS Integrated diagnostic buffer, station address = x <<<<<<

You also have the option of viewing the SIMOTION D4x5-2 and SINAMICS Integrated diagnostic buffers via SIMOTION IT web server.

Acyclic communication with the drive

Overview

PROFIdrive drive units are supplied with control signals and setpoints by the controller and return status signals and actual values. These signals are normally transferred cyclically (i.e. continuously) between the controller and the drive.

For the SINAMICS S110/S120, configure the axis telegrams for data exchange (see Section Performing the configuration for the D4x5-2 offline (Page 7052)).

As well as offering cyclic data exchange, PROFIdrive drive units have an acyclic communication channel. In particular, this is used for reading and writing drive parameters (e.g. error codes, alarms, controller parameters, motor data, etc.).

As a result, data can be transferred on an "acyclic" as opposed to "cyclic" basis when required. Acyclic reading and writing of parameters for PROFIdrive drives is based on the DP V1 services "Read data set" and "Write data set".

The acyclic DP-V1 services are transferred in parallel to the cyclic communication via PROFIBUS or PROFINET. The PROFIdrive profile specifies precisely how these basic mechanisms are used for read/write access to parameters of a PROFIdrive-compliant drive.

The PROFIdrive standard states that "pipelining" of jobs on PROFIdrive drives is not supported. This means:

- Only one "Write/read data set" can be performed at any one time on a drive unit (e.g. SINAMICS S110/S120 control unit or the SINAMICS Integrated of a SIMOTION D).
- However, if several PROFIdrive drive units are connected to a controller, a job can be processed for each of these drive units at the same time. In this case, the maximum total number of jobs will depend on the controller (maximum of eight jobs simultaneously with SIMOTION).

For acyclic data exchange with SINAMICS drives, this means you will have to coordinate the write/read jobs with each other (buffer management). An interlock must be set to prevent the application or different parts of the application from sending overlapping jobs to the same PROFIdrive drive unit.

Additional references

Additional information on how to use DP V1 services can be found in the *SIMOTION Communication* System Manual.

SIMOTION Utilities & Applications also has a DP V1 library with functions that are capable of performing coordination tasks commonly associated with acyclic communication. The library not only coordinates access to the system functions (_readRecord/_writeRecord/ _readDriveParameter/_writeDriveParameter/, etc.), but also expands the range of functions for frequently required tasks, e.g. the reading of faults and alarms from the drive unit.

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

The following functions are available in the DP V1 library:

- Buffer management (coordination of a number of parallel DP V1 services)
- StartUp (function for coordinating the power-up of the SINAMICS drive with SIMOTION)
- TimeSync (applicative time synchronization: Transfer of SIMOTION time of day to the SINAMICS drives)
- SetActIn (activating/deactivating objects in SIMOTION and SINAMICS)
- RwnPar (reading and writing of drive parameters)
- GetFault (reading faults and alarms from the drive)

Control properties and performance features

With a few exceptions, the integrated drive control of SIMOTION D4x5-2 and CX32-2 has the same control properties and performance features as the SINAMICS S120 CU320 control unit.

However, the following points must be particularly observed:

- SINAMICS Integrated and CX32-2 have no basic positioner (EPOS). EPOS functionality is provided by SIMOTION technology functions.
- A BOP20 basic operator panel cannot be connected to the SIMOTION D4x5-2.
  The following alternative options are available:
  - Use of SIMATIC HMI devices (e.g. TP177B, configurable with WinCC flexible)
  - Use of the SIMOTION IT web server: You can use a Web browser to access the standard diagnostics pages of the SIMOTION D4x5-2 (diagnostics and alarm buffers, Watch table, read/write SIMOTION variables and drive parameters, access protection, trace function, etc.)
    You also have the option of creating your own Web pages, in order for example to visualize machine states and implement service functions. The SIMOTION D4x5-2 web pages can be accessed, for example, with a PC or PDA via Ethernet. Wireless access is also possible in conjunction with WLAN.
- Not all SINAMICS function modules are supported (e.g. the function modules free function blocks, spindle diagnostics, and CAN are not supported).
- The SINAMICS Integrated of the SIMOTION D4x5-2 does not support a reset via parameter p0972. A reset via p0972, is only supported by CX32-2 and SINAMICS Control Units. You can use this method, for example, in the context of the implementation of modular machine concepts to force a restart of the CX32-2 controller extension (only required for versions < V4.3). See also the *Motion Control basic functions for modular machines* Function Manual.

Current controller cycle clocks <> 125 µs / use of output cams and measuring inputs

If current controller cycle clocks <> 125 µs are used, the parameter calculations of the drive must be transferred to the PG when using cam outputs on the TM15 / TM17 High Feature or for global measuring inputs, and FastIO configuration generated again.

A change of the current controller cycle clock may have effects on the sampling times of the inputs/outputs on the drive side (e.g. TM15/TM17 High Feature, p4099 Sampling time of the inputs/outputs).

Sampling times <> 125 µs occur in the following cases:

- For servo drives with manual change of the current controller sampling time (drive parameters p0112 and p0115[0])
- For vector drives depending on the number of vector drives and with chassis units depending on the device type used
- If only an infeed and **no drives** are connected to the drive unit, then the sampling time is 250 µs

For the cam outputs and the measuring input inputs (only for global measuring inputs) to function correctly, the sampling times must be known to the engineering system.

Table 10-47 Influence of the current controller cycle clock on the dead time compensation

	Current controller cycle clock has no effect on the function	**Current controller cycle clock has an effect on the function**
Cam outputs	• SIMOTION D • ET 200MP TM timer DIDQ 16x24V • ET 200SP TM timer DIDQ 10x24V	TM15 / TM17 High Feature
Measuring input inputs (global measuring inputs)	• D4x5-2 (terminal X142) • ET 200MP TM timer DIDQ 16x24V • ET 200SP TM timer DIDQ 10x24V	• TM15 / TM17 High Feature • SIMOTION D (except D4x5-2, terminal X142) • Controller Extension (CX) • SINAMICS S110/S120 Control Units
Measuring input inputs (local measuring inputs)	---	---

In order that the changed cycle clock ratios are taken into account by the engineering system, proceed as follows:

1. Go online and perform a project download. The SINAMICS performs parameter calculations once.
2. Perform an upload to the PG ("Target system" > Load" > "Load CPU / drive unit to PG").
3. This transfers the parameter calculations of the drive to the PG. The cycle clock ratios are then known in the engineering system.
4. Go offline.
5. Generate the configuration information (Fast IO configuration) again. To do this, select the SIMOTION CPU in the project tree and right-click to open the context menu "Fast IO" > "Create new configuration".
6. Execute "Save project and recompile all".
7. Go online and download the project to the target system.
8. Save the data on the CF card.

SCOUT uses the described procedure to calculate internal system data that is required for outputting/detecting signals with a high level of position accuracy.

Note

If the cycle clock ratios are not set correctly, an appropriate message is output in the diagnostic buffer.

CU-Link (data transfer via DRIVE-CLiQ)

Terms

The following table provides an overview of the terms used in this section.

Table 10-48 Terms used

Designation	Explanation
CU-Link communication	Communication between Controller Extension CX32-2 and SINAMICS Integrated of a SIMOTION D4x5-2 based on DRIVE-CLiQ communication
CU_I (also DO1)	CU drive object of the SINAMICS Integrated
CU_CX32 (also DO1)	CU drive object of the Controller Extension CX32-2
CU_LINK	Each Controller Extension is represented on the SINAMICS Integrated of a D4x5-2 by a drive object CU_LINK
CU_NX_CX	CU drive object for CX/NX Term usually used in SINAMICS manuals for drive extensions for SIMOTION (CX32-2) and SINUMERIK (NX1x.3)
DO	Drive object (DO)

CU-Link

For communication between Controller Extension CX32-2 and Control Unit SIMOTION D4x5-2, not only PROFIBUS-Integrated but also a further fast communication channel is available for communication with the drives. This communication channel is named CU-Link and can only be used via BiCo interconnections.

Communication via the CU-Link is performed in the very fast DRIVE-CLiQ basic cycle clock 0 (r0110[0]) with 125 µs. The CU-Link is therefore especially suitable for transmission of the signal "Infeed ready" between the SINAMICS Integrated of the SIMOTION D4x5-2 and the connected Controller Extensions CX32-2. CU-Link cannot be used for communication with a CU320-2.

For every CX32-2 that is connected via the DRIVE-CLiQ Port X100 to X105 on a SIMOTION D4x5-2, a separate CU-Link communication channel exists.

The CU-Link communication channel consists of

- two data transfer channels for **bit-by-bit transmission and receipt** of information (p8500[0..7], p8501[0..21], and r8510.0-7, r8511.0-21)
- four data transfer channels for **word-by-word transmission and receipt** of information (p8502 to p8505, and r8512 to r8515). These data transfer channels also ahve a scaling factor that can be set in parameter p8520[0..3].
  Observe the notes below in this section under "Word-by-word data transfer via p850x/r851x (CU-Link)".

At the CX32-2 end, it is possible to access the CU-Link via the parameters on the DO CU_CX32. At the SINAMICS Integrated end, the parameters are accessed via the DO CU_LINK.

Note

There are only CU-Link communication channels between the SINAMICS Integrated and the CX32-2 Controller Extensions. Such a communication channel does not exist between the individual Controller Extensions CX32-2. If data are to be exchanged between Controller Extensions CX32-2, this is only indirectly possible via the SINAMICS Integrated.

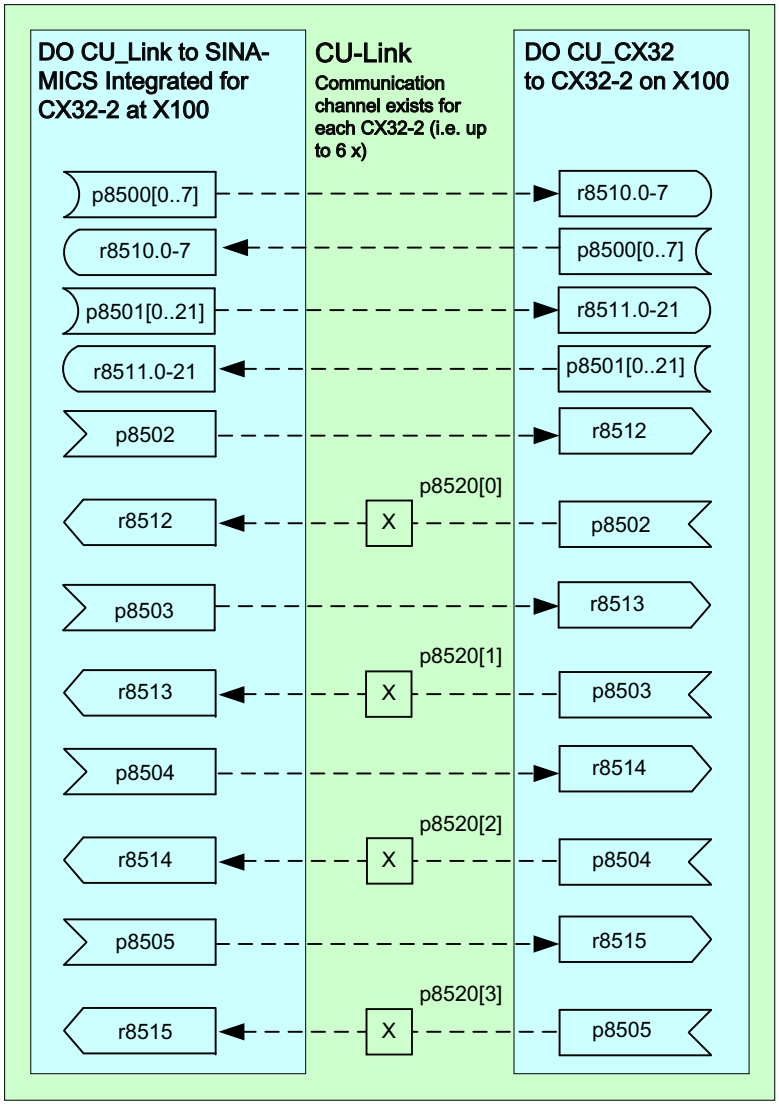

Figure 10-83 CU-Link communication channel

Interconnections on the CX32-2

At the CX32-2 end, the CU-Link communication channel can only be interconnected via the expert list of the CU.

The following interconnections are already set by default

- p8501[0..3] with cu.r0722.0-3 (status DI 0 to 3 on CX32-2)
- p8501[8..11] with cu.r0722.8-11 (status DI 8 to 11 on CX32-2)
- p8501[16..17] with cu.r0722.16-17 (status DI 16 to 17 on CX32-2)

The interconnections are visible via the expert list and also in the parameter screens for the CX32-2 Onboard I/Os (see the following figure).

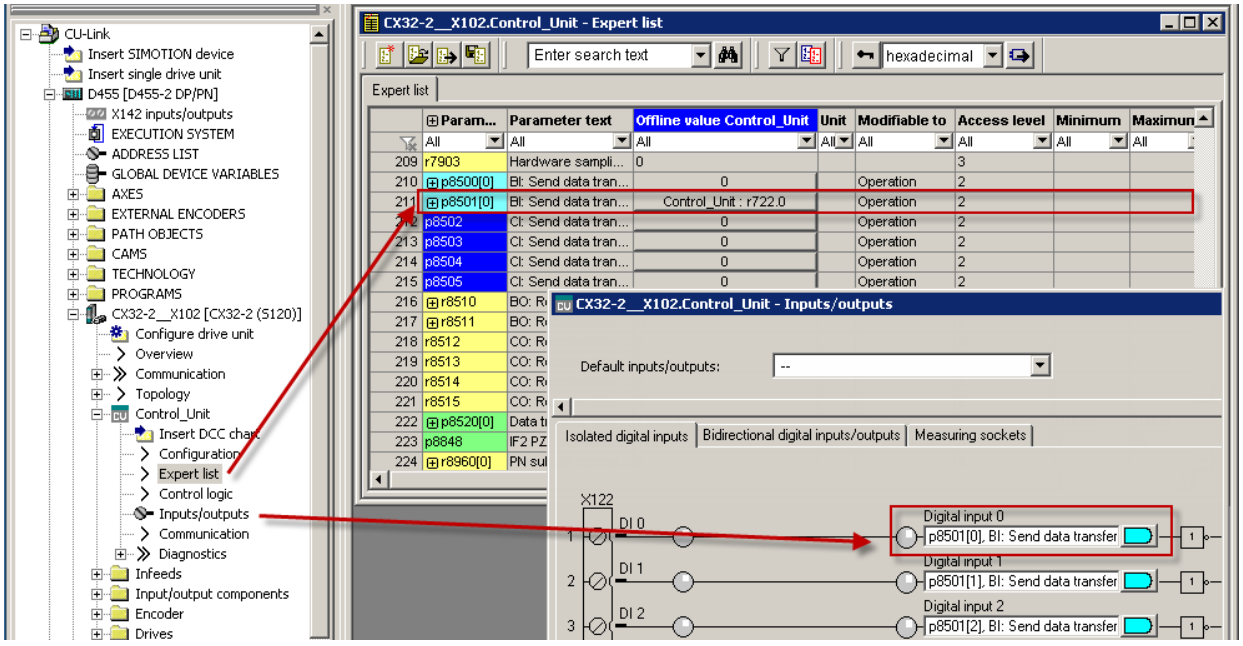

Figure 10-84 Interconnection of the DO CU_CX32 at the CX32-2 end

Interconnections on the SINAMICS Integrated

For each configured Controller Extension CX32-2, there is a separate CU-Link communication channel, including DO CU_LINK.

It must be considered that the CU_LINK DOs can **not directly** be configured, i.e. it is not possible to access the DO CU_LINK via an expert list to interconnect, for example, parameters.

Access to the DO CU_LINK is **only indirectly** possible via other DOs (e.g. via the drive DO or the DO or the infeed). Direct interconnection between two CU_Link DOs is therefore not possible (red arrow in the following figure).

To interconnect two CU_Link DOs, the CU drive object of the SINAMICS Integrated (DO CU_I) has parameters p8500-p8505 and r8510-r8515. These are visible in the expert list of the Control Unit of the SINAMICS Integrated and can be used for interconnection (blue arrow in the following figure).

Remember that the 6 CU_Link DOs have to share this one parameter set in the DO CU_I.

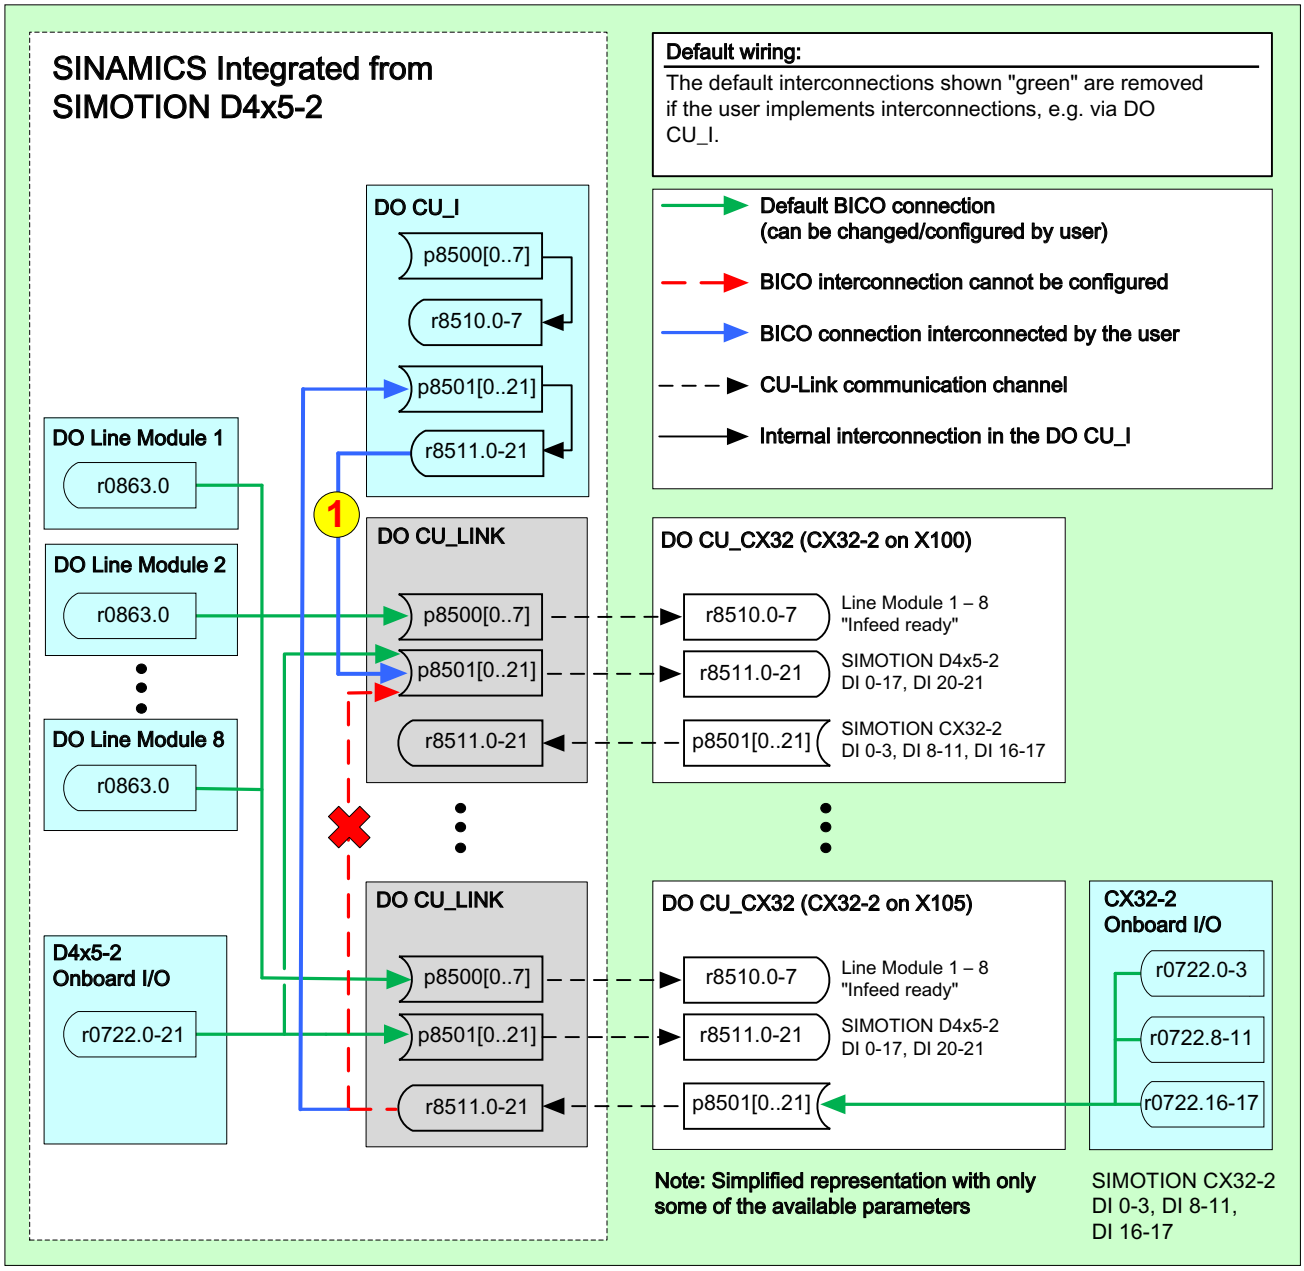

Figure 10-85 Interconnection on the SINAMICS Integrated

Transfer parameters p850x/r851x (DO CU_I)

Parameters p8500-p8505 and r8510-r8515 of the Control Unit (DO CU_I) are so-called transfer parameters. This means that a signal, for example, at the binector input p8500[0] is made available at the binector output p8510[0] and can be interconnected further from there.

With this property, the transfer parameters are ideal for the following applications:

- With the transfer parameters, CU_LINK DOs can be interconnected. This is only possible using transfer parameters because it is only possible to access a DO CU_LINK indirectly.
- With the transfer parameters, cross-DO interconnections can be created that are independent of the source DO. For example, if multiple signal sinks are interconnected to one signal source and the signal source is to be changed, it becomes necessary to change the interconnection of all signal sources. On the other hand, if the signal sources are interconnected to a transfer parameter, it is only necessary to change the signal sources entered in the signal sink of the transfer parameters.

Word-by-word data transfer via p850x/r851x (CU-Link)

The CU-Link data transfer channels for word-by-word transmission and receipt of information (p8502 to p8505 and r8512 to r8515) do not have normalization. Therefore they should only be used for the transmission of drive parameters that are normalized to SI units (V, A, m, s, etc.) or their derivatives (N, °C, Hz, W, V, etc.) or that are normalized to PERCENT. For information on normalization, see the Parameter List in the SINAMICS S120/S150 List Manual under "Normalization".

Example:
Voltage (V, normalized acc. to p2001); current (A, normalized acc. to p2002); torque (Nm, normalized acc. to p2003); temperature (°C, normalized acc. to p2006);
the speed (normalized acc. to p2000) is normalized to rpm and therefore not normalized to an SI unit. The same applies to power in kW.

For the data transfer via CU-Link, the data source and data sink should have the same normalization.

If this is not adhered to, the transferred values may be assigned a factor.

CU-Link data consistency

Data transfer via p8500[0..7] and p8502 to p8505 is consistently performed in the set DRIVE-CLiQ basic cycle clock 0 (r0110[0]) at 125 µs.

With p8501[0..21], on the other hand, transmission is performed bit-sequentially, that is, in each cycle, only one of the 22 bits is transmitted so that all data in parameter r8511 have only been updated after 2.75 ms (22 bits x 0.125 µs). The individual bits are then not consistent among themselves.

This behavior only applies to bidirectional data transfer via the CU-Link (DO CU_Link, DO CU_CX32). The transfer parameters p850x/r851x in the DO CU_I are always consistent.

Preset interconnections

Some interconnections are already preset in the system (green arrows in the figure above).

The following interconnections are available by default:

- On the SINAMICS Integrated, the "infeed ready" signal of all connected infeeds is provided on the CU-Link. This means the "infeed ready" signal is on all Controller Extensions CX32-2
  - can be picked off via r8510.0 for the first infeed
  - via r8510.1 for the second infeed etc.

  The default interconnections are only created if an infeed has be configured with a DRIVE-CLiQ connection (CX32-2 must **first** have been configured).
- The status of the onboard I/Os of the D4x5-2 is forwarded to all CX32-2, where it can be picked off via r8511.0-21.
- The status of the onboard I/Os of the CX32-2 is forwarded to the relevant DO CU_LINK.

Default interconnections can be deleted by appropriate user configurations (e.g. by configuration of the interconnection, see the previous item ①). If an existing interconnection is disconnected, an information dialog box will be displayed to indicate this.

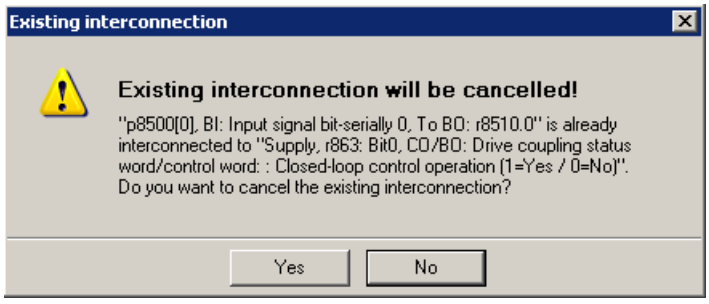

Figure 10-86 Information dialog box when an existing interconnection is disconnected

The interconnection options via CU-Link are explained below using an example.

Configuring example:

Task definition (example)

The ready signal of an infeed r0863.0 on CX32-2 (X102) is to be interconnected to three other CX32-2 Controller Extensions and to the drives of the SINAMICS Integrated via CU-Link. The items indicated the necessary interconnection measures, which are explained in detail below.

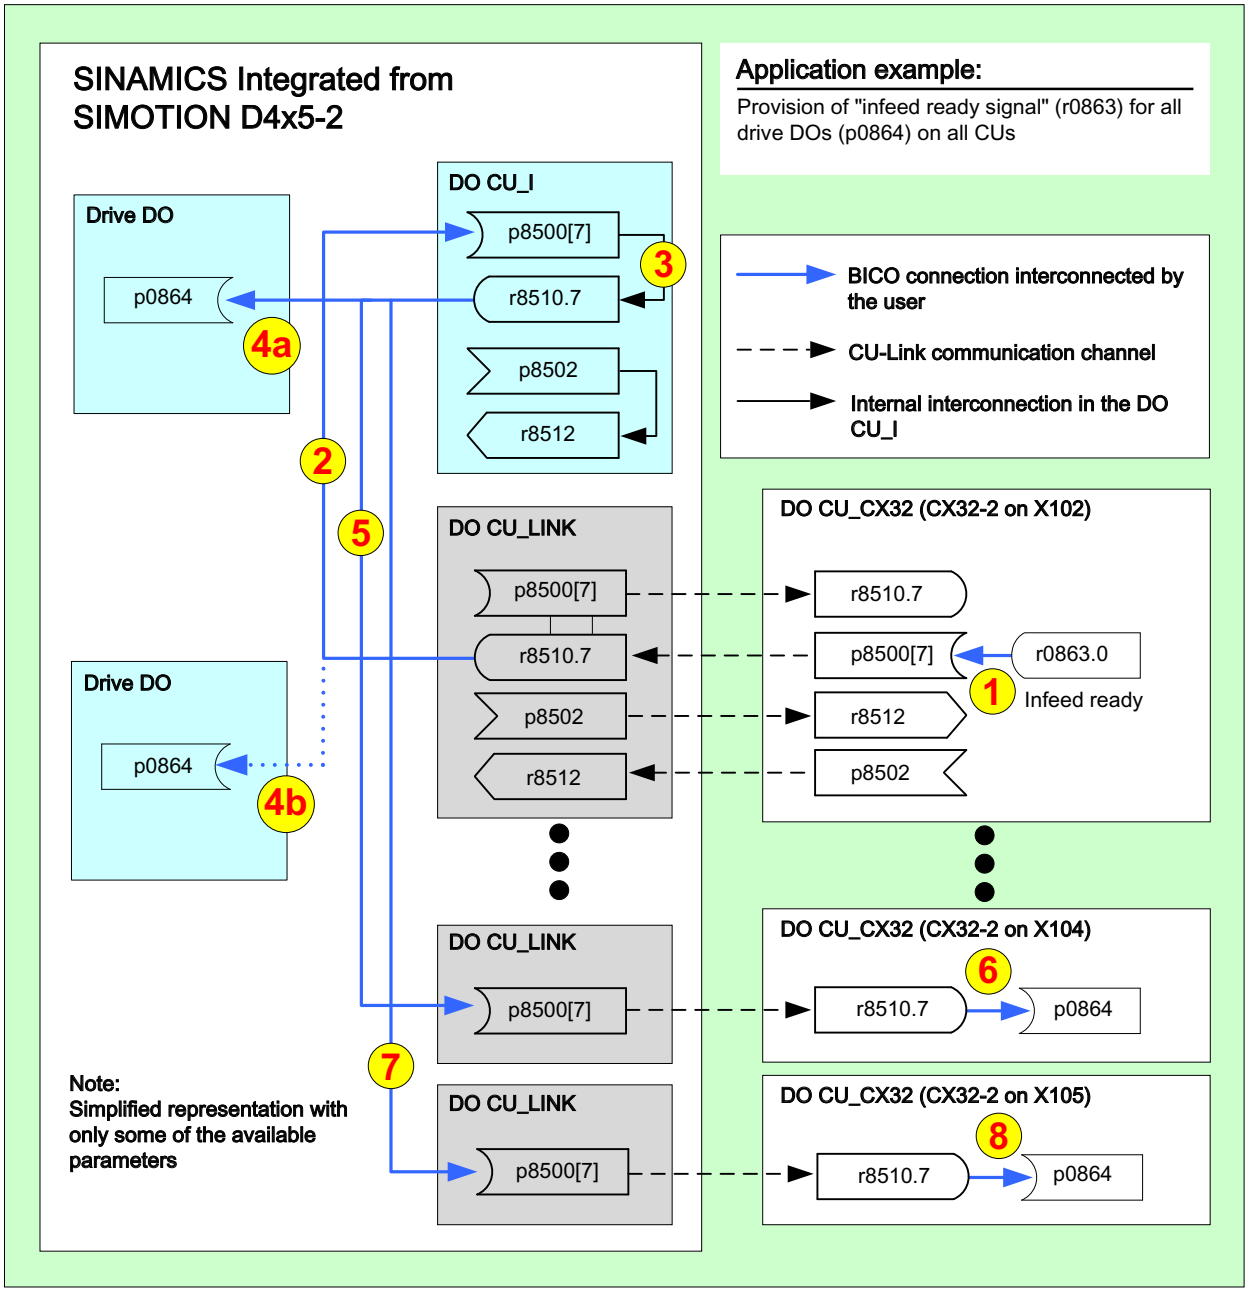

Figure 10-87 Configuration example

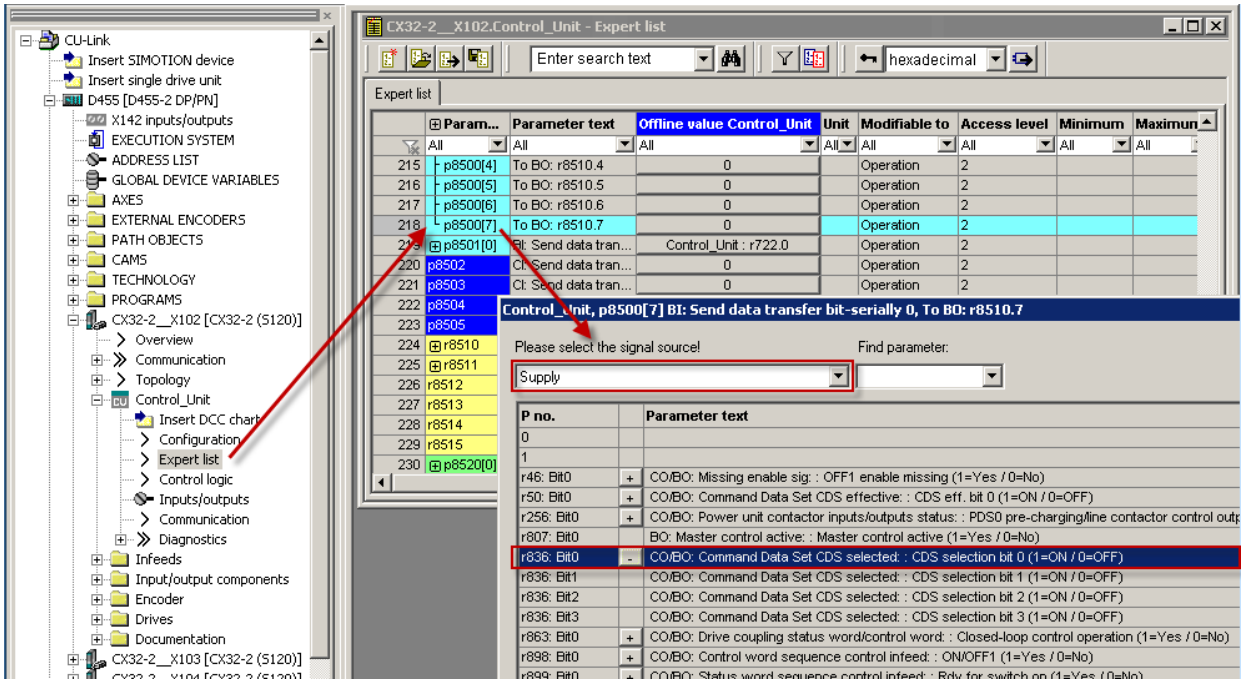
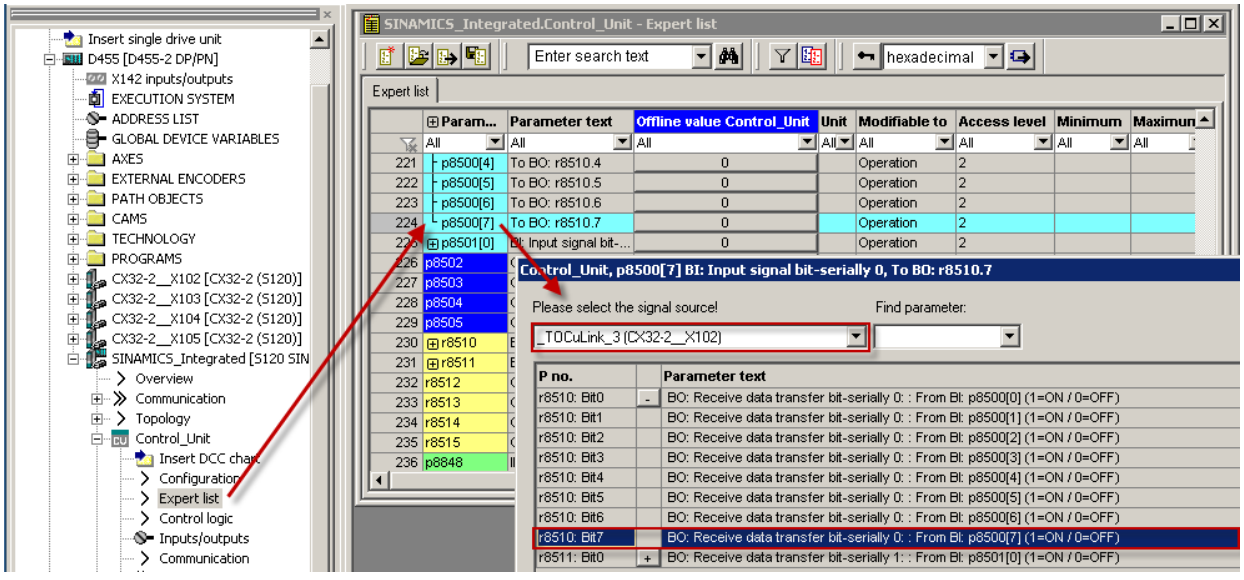
Step 1: In the expert list of the CX32-2 (X102), interconnect the "infeed ready" signal (r0863.0) of the infeed on the DO CU_CX32 (p8500[7]).

The status of the signal "infeed ready" is available on the CU-Link communication channel and can be further interconnected via the DO CU_LINK.



Step 2: In the expert list of the SINAMICS Integrated, interconnect the signal from the DO CU_LINK (r8510.7) of the CX32-2 (X102) to DO CU_I (cu.p8500[7]).



Step 3: In the DO CU_I of the SINAMICS Integrated, the parameter cu.p8500.7 "internal" is forwarded to the read parameter cu.r8510.7 (use of the transfer parameters).

Step 4: There are 2 ways of interconnecting the "infeed ready" drive signal (p0864) to drives of the SINAMICS Integrated:

- 4a: direct interconnection to the DO CU_LINK (preferred solution)
- 4b: Interconnection via the DO CU_I of the SINAMICS Integrated

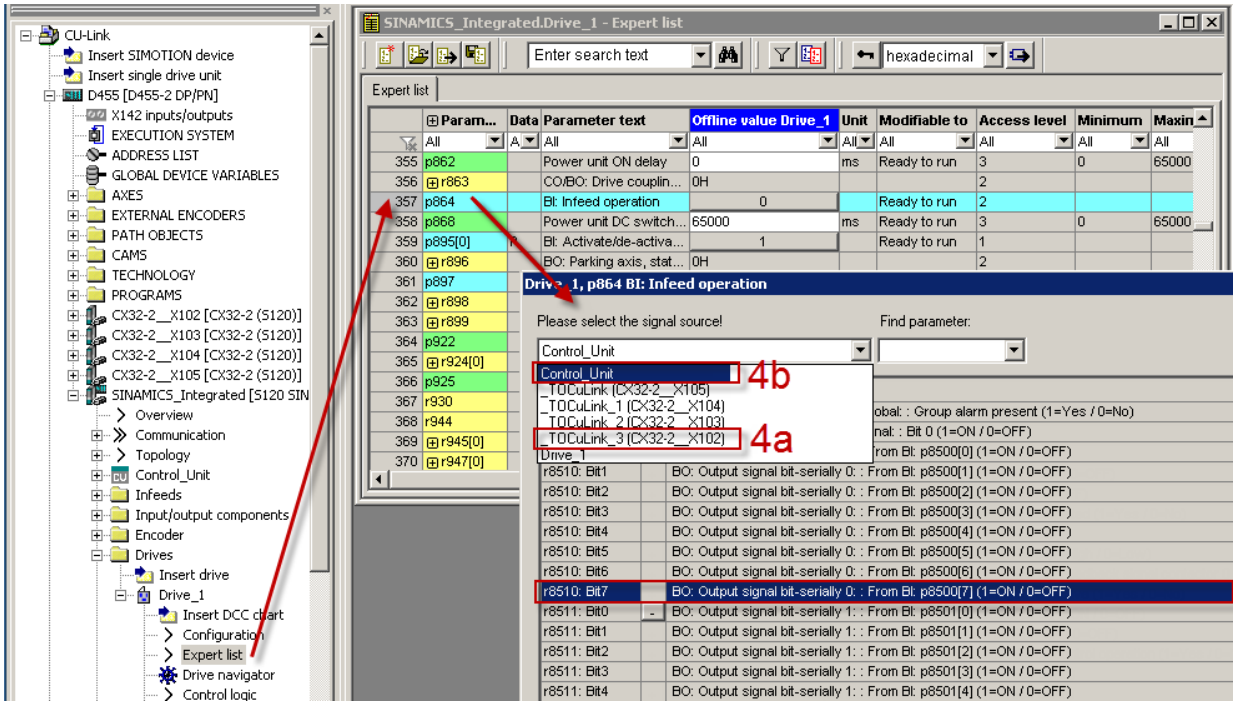


Figure 10-88 Step 4 - interconnect "infeed ready" drive signal (p0864)

Step 5: p8500[7] from the DO CU_LINK (X104) is interconnected with the parameter cu.r8510.7 of the DO CU_I of the SINAMICS Integrated.

This interconnection can only be made via "Diagnostics > Interconnections > Binector output (BO)" because there is no expert list for the CU_LINK DOs.

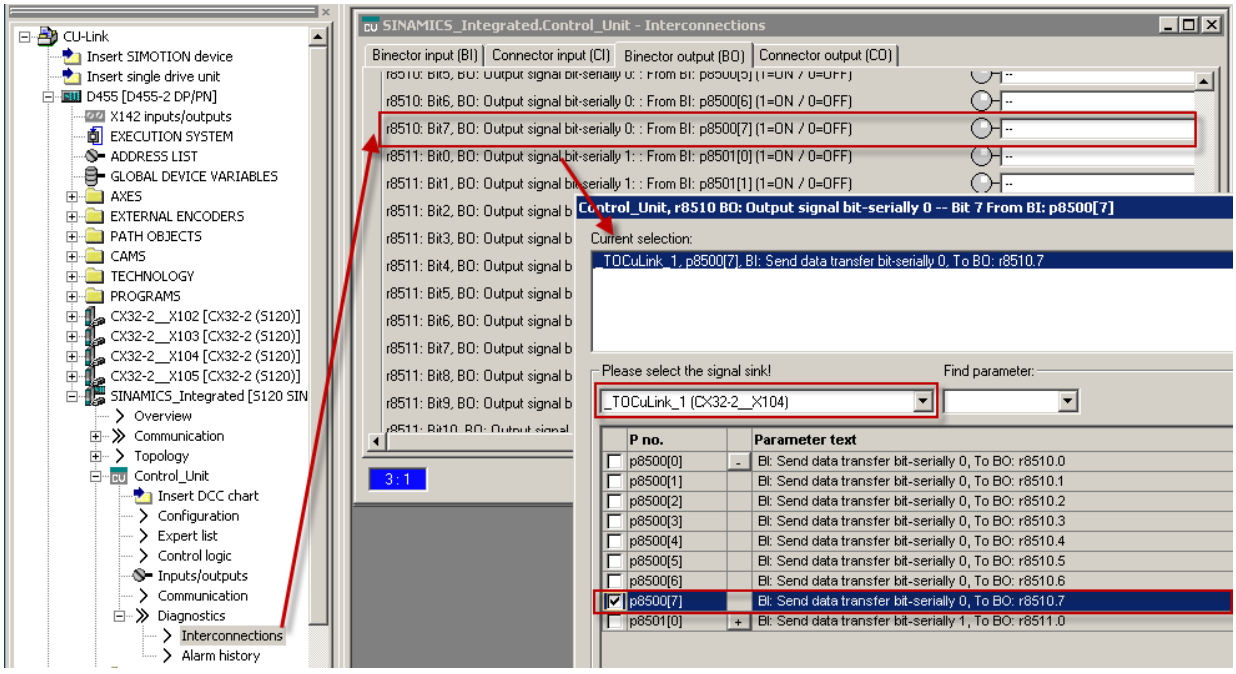

Figure 10-89 Step 5 - interconnect p8500[7] from the CU_LINK DO (X104) with parameter cu.r8510.7 of the DO CU_I

Step 6: On the drives of the CX32-2, the "infeed ready" drive signal (p0864) must be interconnected with the r8510.7 of the DO CU_CX32 of the CX32-2.

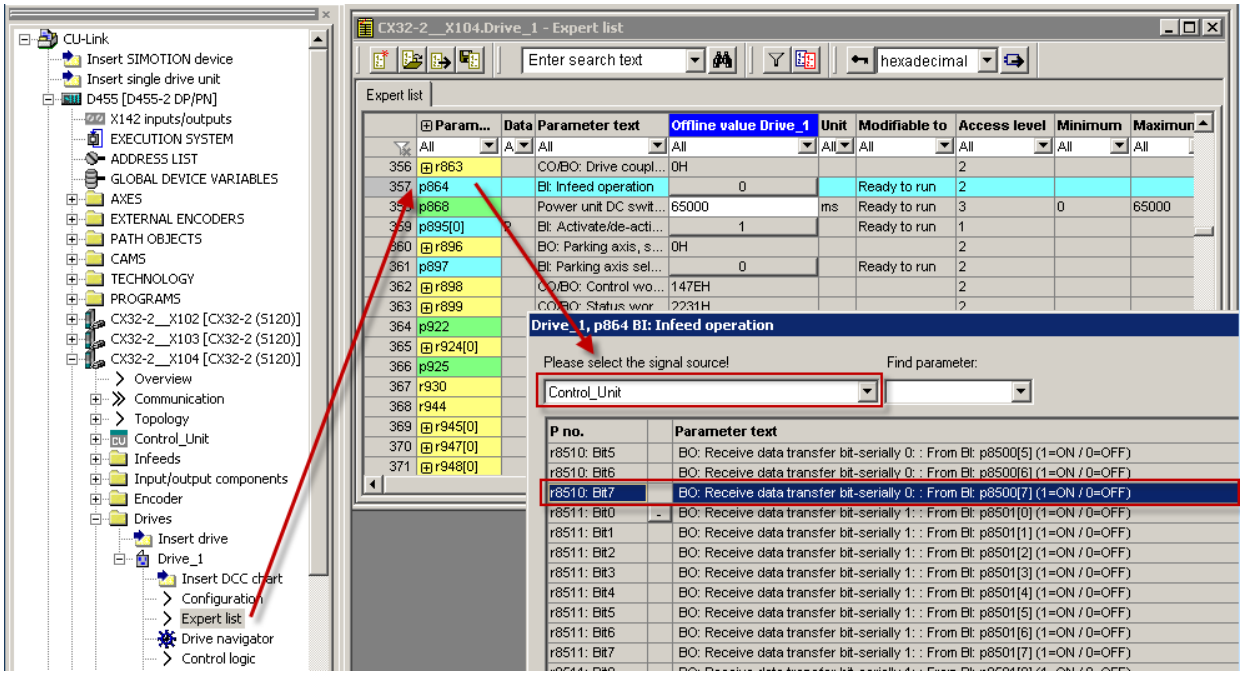

Figure 10-90 Step 6 - on CX32-2, interconnect the drive signal (p0864) with the r8510.7 of the DO CU_CX32 of the CX32-2

Step 7+8: To interconnect the "infeed ready" signal to further Controller Extensions CX32-2, repeat steps 5 and 6 for the CU-Link in question.

For more information, see the List Manual *SINAMICS S120/S150,* function block diagrams 2179 to 2195.

Licenses for the SINAMICS Integrated / CX32-2

The following SINAMICS functions are licensed via SIMOTION:
- SINAMICS Safety Integrated Extended Functions for SIMOTION D

SINAMICS Safety Integrated Advanced Functions for SIMOTION D (as of V5.2)

- SINAMICS high output frequency for SIMOTION D

SINAMICS Integrated / CX32-2

SINAMICS Safety Integrated Extended Functions for SIMOTION D

Highly effective protection of personnel and machinery can be implemented with SIMOTION D thanks to the integrated safety functions of SINAMICS S120. Whereas the Safety Integrated Basic Functions are license-free, the Safety Integrated Extended Functions and Advanced Functions require a license for each drive with safety functions.

- SINAMICS Safety Integrated Extended Functions for SIMOTION D or

- SINAMICS Safety Integrated Advanced Functions for SIMOTION D

With the licenses, the Safety Integrated Extended and Advanced Functions are licensed for drives on the SINAMICS Integrated of a SIMOTION D Control Unit as well as on the CX32-2 Controller Extensions.

Licensing method: License for each drive with Safety Integrated Extended Functions or Advanced Functions. The Safety Integrated Advanced Functions also include the Safety Integrated Extended Functions.

Note

Instead of for each drive, the licensing can be performed for all integrated SINAMICS drives and CX32-2 Controller Extensions with the **MultiAxes and Safety Extended Package** for SIMOTION D.

SINAMICS high output frequency for SIMOTION D

Because of legal specifications, the output frequency for converter systems is limited to 550 Hz per default.

- SINAMICS S120 Control Units as of firmware V4.7 HF7

- SIMOTION D Control Units as of firmware V4.4 HF6

The **SINAMICS high output frequency for SIMOTION D** license allows users to cancel the output frequency limit if, as a result of the application, output frequencies of more than 550 Hz

are required for drives. The license cancels the limitation **for all drives** that are connected to the SINAMICS Integrated of a SIMOTION D Control Unit as well as to the CX32-2 Controller Extensions.

Licensing method: License for each SIMOTION D Control Unit

Note

The display of the Runtime licenses in the SCOUT Licensing dialog is updated after the power-up of the SINAMICS Integrated and the CX32-2 Controller Extensions.

SINAMICS Control Units

SINAMICS Control Units connected via PROFINET or PROFIBUS (e.g. CU310-2, CU320-2) are licensed via the SINAMICS memory card. Licensing via SIMOTION is not possible.

Support of motors with PT1000 temperature sensor

Because of the discontinuation of the KTY84-130 temperature sensor, SIMOTICS motors will be equipped with PT1000 temperature sensor in the future.

- Motors with DRIVE-CLiQ interface remain compatible and can be operated on any SW version.
- Motors without DRIVE-CLiQ interface require SIMOTION SCOUT as of V4.5 for the configuration of the PT1000 temperature sensor.

Support of Motor Modules (C/D type)

The SINAMICS S120 booksize C/D type Motor Modules are a further development of the previous Motor Module and can be used compatibly with regard to the configuration.

The new Motor Modules partly extend the previous spectrum or the functionality. In this case, there are special conditions of use.

Table 10-49 Conditions of use for Motor Modules C/D type

Motor Module	Article number	Conditions of use
Single Motor Module 18 A C type	6SL3120-1TE21-8A C0	These Motor Modules extend the previous spectrum and can only be used with: • **SIMOTION SCOUT V4.5** – With SIMOTION Runtime/firmware: V4.4 as of HF11 (SINAMICS Integrated V4.7 as of HF17) or – With SIMOTION Runtime/firmware V4.5 (SINAMICS Integrated V4.8) and installed SSP SINAMICS V4.8 HF1 • **SIMOTION SCOUT TIA V4.5** – With SIMOTION Runtime/firmware: V4.4 as of HF11 (SINAMICS Integrated V4.7 as of HF17) – NOT with SIMOTION Runtime/firmware V4.5 (SINAMICS Integrated V4.8) -> SSPs cannot be installed in the TIA Portal and therefore cannot be used with SCOUT TIA) • **SIMOTION SCOUT / SCOUT TIA as of V5.1** – With SIMOTION Runtime/firmware: As of V4.4 HF11 (SINAMICS Integrated as of V4.7 HF17) **SCOUT V4.4 HFx** Does not contain an integrated STARTER V4.4 with Service Pack 1, which is required for the configuration of these three Motor Modules. For details, see also: Link (https://support.industry.siemens.com/cs/ww/en/view/109480497)
Double Motor Module 18 A D type	6SL3120-2TE21-8A D0	
Single Motor Module 30 A D type	6SL3120-1TE23-0A D0	
Single Motor Module 24 A C type	6SL3120-1TE22-4A C0	**Engineering: SCOUT / SCOUT TIA as of V5.1** and SIMOTION Runtime/firmware as of SIMOTION V4.5 (SINAMICS Integrated as of V4.8) The 24 A Motor Modules require a new firmware in each case. The 45 A and 60 A Motor Modules require a current firmware if the maximum current of 90 A or 120 A is to be utilized. For details, see also: Link (https://support.industry.siemens.com/cs/ww/en/view/109751266)
Single Motor Module 24 A D type	6SL3120-1TE22-4A D0	
Single Motor Module 45 A C type	6SL3120-1TE24-5A C0	
Single Motor Module 60 A C type	6SL3120-1TE26-0A C0	

The latest information on the SINAMICS components that can be used is available at:

FAQ (https://support.industry.siemens.com/cs/de/en/view/11886029)

Testing a drive with the drive control panel

Introduction

You can test a configured drive with the drive control panel, where you can specify a speed and adjust it with a scaling factor. The drive control panel should only be used for commissioning.

Requirements

- The project has been downloaded to the target system.
- SIMOTION SCOUT is in online mode.
- The drive is not being used by a current project in RUN mode.

⚠ WARNING
Danger to life from unexpected movement of driven machine parts
Make sure this presents no hazard to personnel or property.

Testing a drive with the drive control panel

1. Change to the configured drive in the Project Navigator and open the drive control panel by selecting "Commissioning" > "Control panel". The drive control panel opens in the detail view.

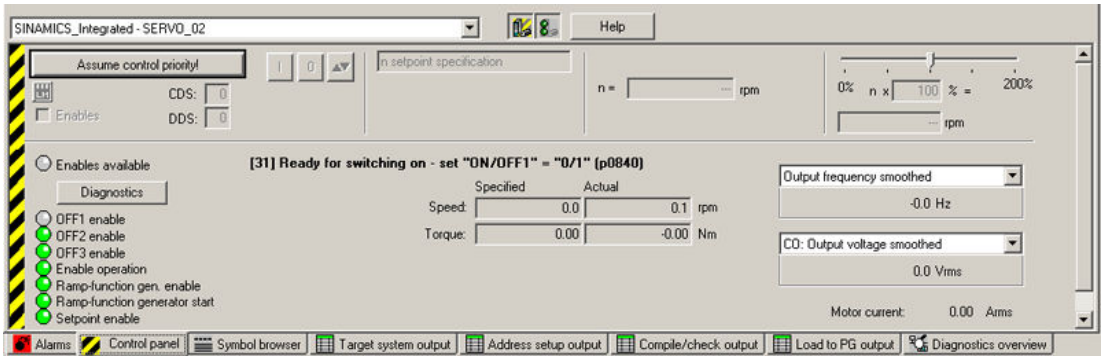

Figure 10-91 Drive control panel

2. To display the control area and axis diagnostics, click the "Show/hide control area" and "Show/hide diagnostics area" buttons.

3. Click "Assume control priority". The "Assume Control Priority" dialog box is opened.

Note

If you are using an infeed without a DRIVE-CLiQ interface, you will have to interconnect the "Infeed operation" signal (drive parameter p0864) yourself. If you are using an infeed with a DRIVE-CLiQ interface, select the infeed for which the control priority is to be assumed under "Infeed" in the "Assume Control Priority" dialog box.

If the infeed signal "Closed-loop control operation" already has a BICO interconnection to the drive, the infeed is permanently specified (infeed selection and checkbox are grayed out).

The infeed must be switched on before the drive can move ("LM" button, switch infeed on/off).

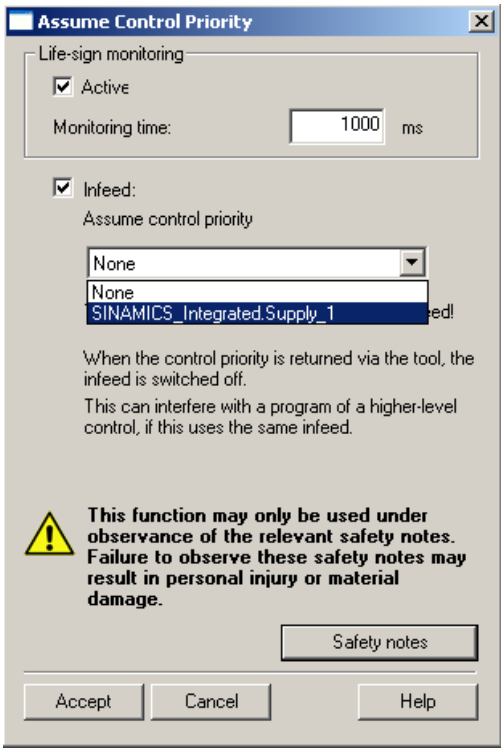

Figure 10-92 Assume_control_priority

4. Read the notes and confirm these with "Accept."
5. Activate the "Enables" checkbox to enable the drive.
   All enables are now set with the exception of ON/OFF1.

6. Enter the desired setpoint in the entry field, and, as a safety setting, slide the scaling to 0%.

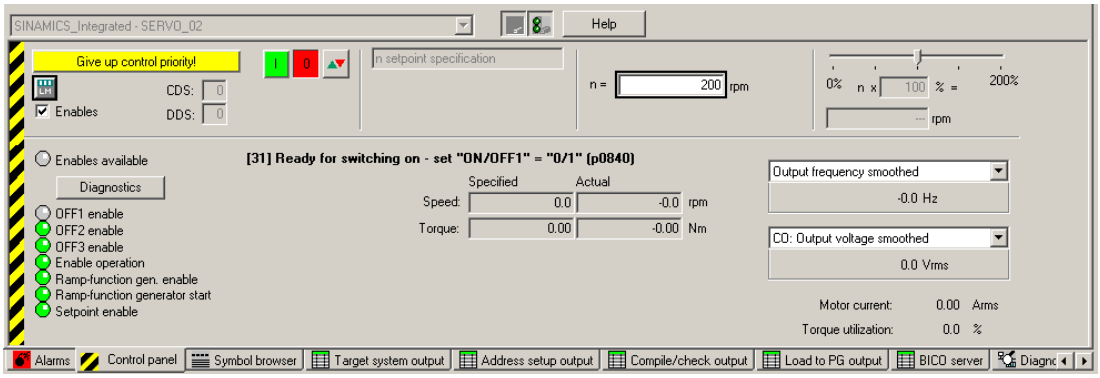

Figure 10-93 Entering a setpoint

7. Click the "Drive On" button. The "Enable is set" LED lights up in green color. If you move the slider to the right, the drive rotates. The current motor speed is displayed in "Actual."
8. Click "Drive Off" to stop the drive after you completed the test.
9. Deactivate the enable and click the "Give up control priority" button to deactivate control from the PG/PC. In this state, you can no longer make the drive rotate.

Creating and testing axes

Overview of SIMOTION engineering

Performing engineering with SIMOTION SCOUT

You use the engineering software to configure the individual axes and define the project sequence by means of programs.

1. First, run through the axis wizard to configure the axes and interconnect to the real drive (e.g. SINAMICS Integrated).
2. Provided you have completed the configuration at the drive end, we strongly recommend for faster working that the SINAMICS Integrated is deactivated via "Target system" ⇒ "Select target device".
3. Complete your SIMOTION application, for example, by creating axis functions and SIMOTION execution programs.
4. Compile the project and download it to the SIMOTION D4x5-2.

Creating an axis with the axis wizard

Overview

The TO axis provides the user with the technological functionality and the interface to the drive/actuator. The TO axis processes the motion control commands from the user program (e.g. MCC) and coordinates the interface to the drives. It executes control and motion commands and indicates statuses and actual values. The TO axis communicates with an actuator (drive or hydraulic valve) via a fieldbus system (PROFIBUS or PROFINET via PROFIdrive protocol) or via a direct setpoint interface (analog ±10 V or pulse/direction).

When running through the axis wizard, the basic settings are made for the axis and the TO axis interconnected to a drive (e.g. SINAMICS Integrated). Further options are available when "Use symbolic assignment" has been activated:

- A real axis is interconnected to an already configured drive
- A real axis including drive is created via the axis wizard and the drive interconnected to the axis
- A real axis is created without assigning this to a drive (assignment is made later)

Inserting an axis

1. In the Project Navigator, double-click the entry "Axis" > "Insert Axis."
   This will access the axis wizard. Set the required technology and then click "OK."

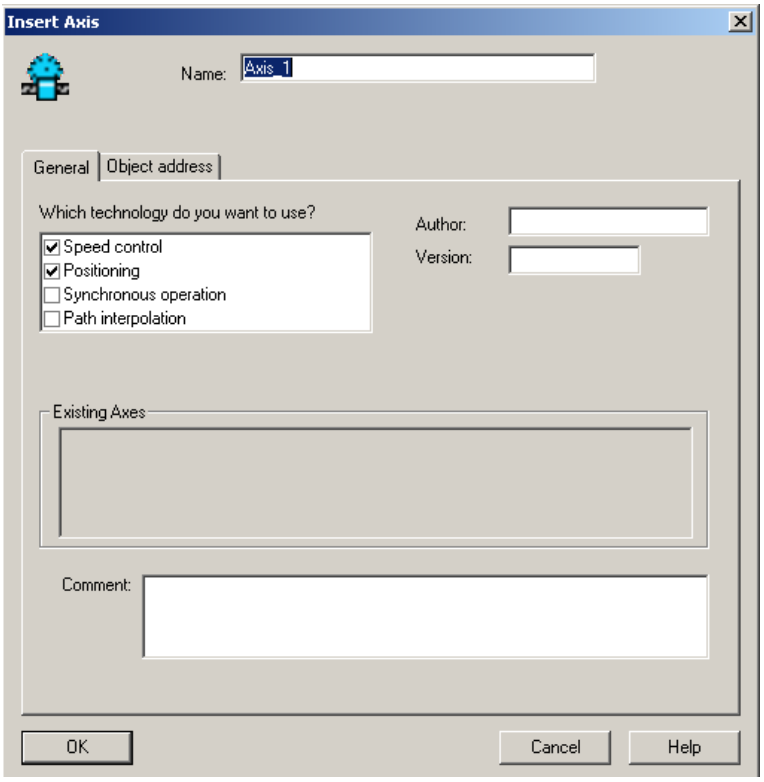

Figure 10-94 Inserting an axis

2. Set an axis type and, if required, configure the units.

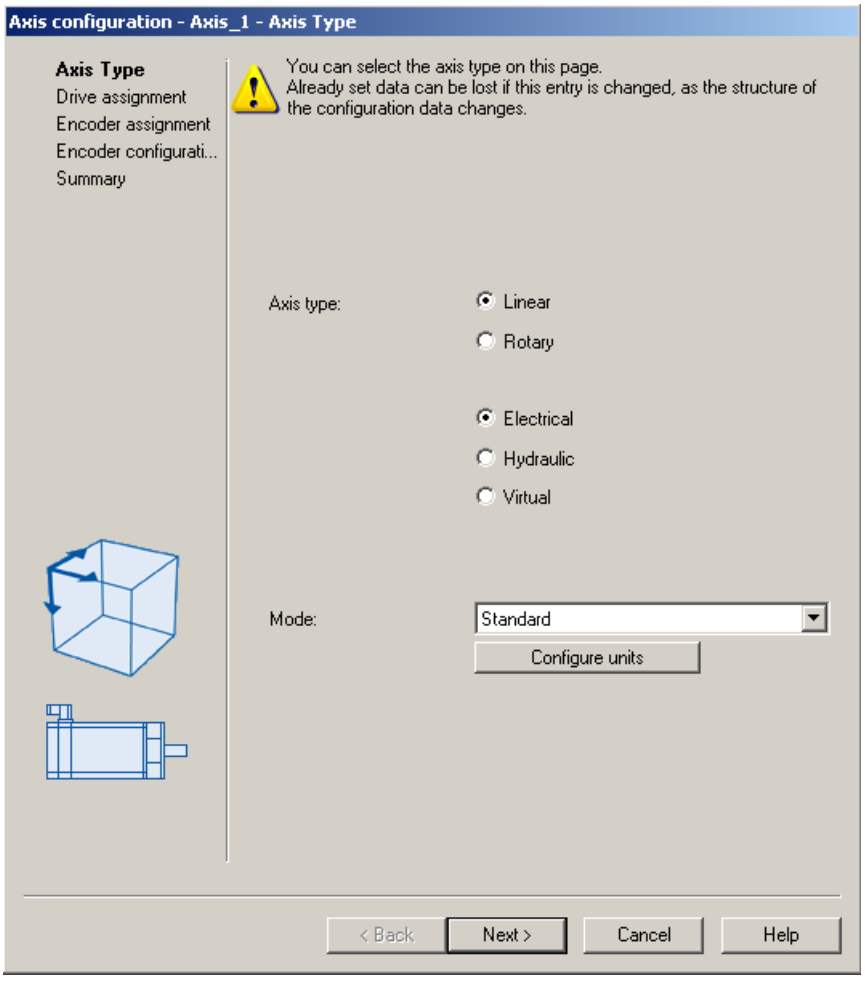

Figure 10-95 Defining the axis type

3. Create a new drive or make the assignment to an existing drive.

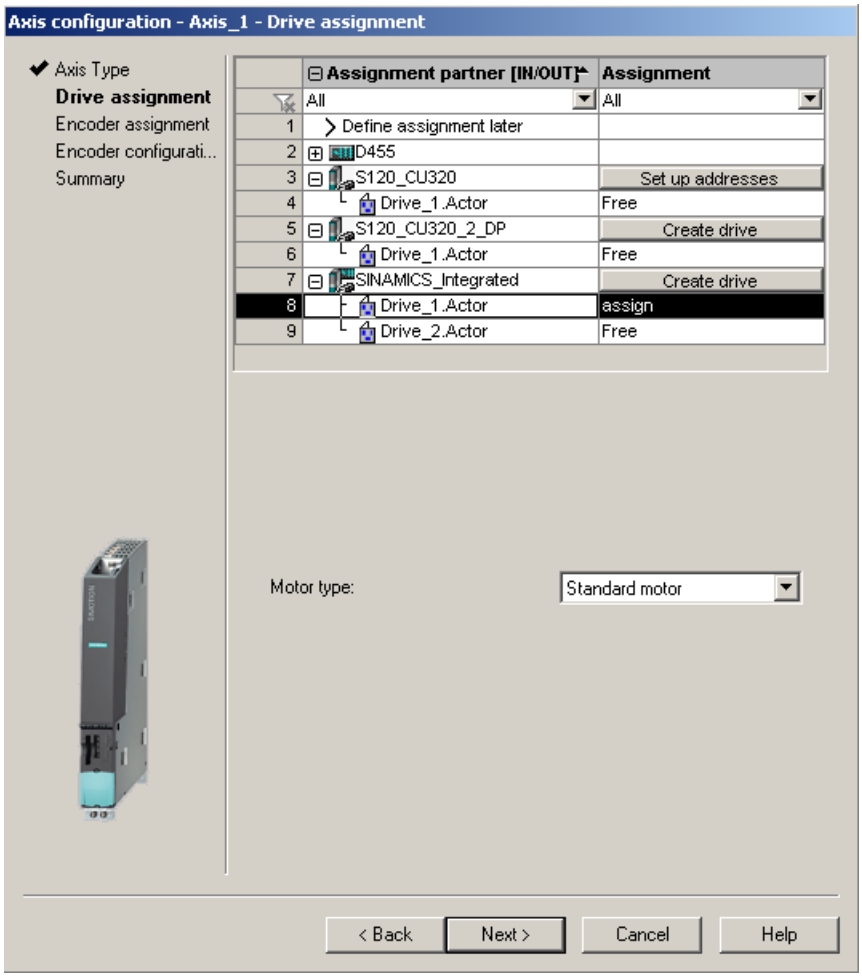

Figure 10-96 Assigning a drive

The following setting options are available for the drive assignment:

– Assign drive
  Assigning a previously configured drive

– Define a subsequent assignment
  The axis should not be assigned to a drive until a later point in time.
  In this way, the PLC and motion control functions can be completely configured by a programmer even without drive know-how using technology objects (e.g. TO axis) and loaded to the device, the drives can be configured and optimized separately by a drive expert, and the technology objects can be assigned symbolically later to the drive objects via an interconnection dialog box.

– Create drive
  From the assignment dialog box, a new drive can be created on an existing drive unit (e.g. S120 CU320-2 or SINAMICS Integrated) and assigned to the axis. This allows the axis, including the drive, to be created in one operation. It is not necessary to configure a drive before creating an axis.

– Set up addresses
  The addresses must be set up manually if "Use symbolic assignment" has been deactivated. This corresponds to the previous methods of the drive and axis configuration, available in SCOUT versions < V4.2. This is required, for example, for drive units that do not support symbolic assignment (e.g. SINAMICS S120 with FW version < 2.6.2, MASTERDRIVES, SIMODRIVE, etc.).

The address list in the "All Addresses" view provides an overview of the assignments to all interfaces of the TO axis. From this view, the assignments can also be changed via the Interconnection dialog box (... button).

Note

The methods of the drive and axis configuration, previously available in SCOUT versions < V4.2, are still available. Symbolic assignment must be deactivated for these methods.

4. Run through the wizard and enter the settings of your system. The required axis telegrams as well as the addresses used are automatically specified by the engineering system. Telegrams are also extended and interconnections created automatically in the drive depending on the selected TO technology (e.g. SINAMICS Safety Integrated).
5. Click **Finish** to confirm the "Summary" window.
   The configured real axis is displayed in the project navigator.

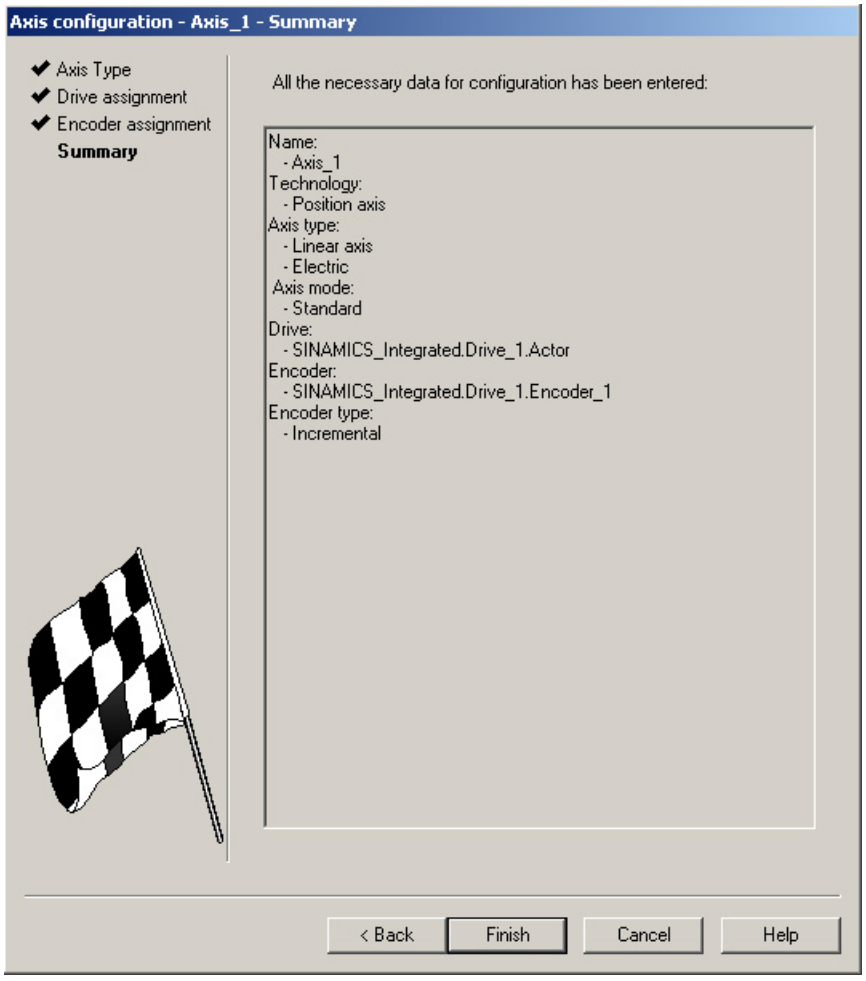

Figure 10-97 Axis wizard summary

Note

During system power-up, reference variables as well as drive and encoder data of the SINAMICS are automatically taken over for the SIMOTION configuration data of the SIMOTION technology objects "TO axis" and "TO externalEncoder".

Encoder assignment

With a position axis, encoder 1 is also created on the TO axis (motor encoder) and automatically assigned to the first encoder on the drive.

If encoder 2 (direct encoder) is created at the TO axis, it is assigned to the second encoder of the drive control.

Result

The configured axis will appear in the project navigator.

Save and compile the project and download it to the target system.

On completion of the axis wizard, the symbolic drive assignment is visible:

- Via the "configuration" of the axis
- Via the address list (view all addresses)

The Assignment dialog box can be called again from these dialog boxes using the ... button.

Instead of calling the Assignment dialog box, it is also possible to edit the input field SINAMICS_Integrated.SERVO_02.Actor ... containing the symbolic name directly.

TBD, DSDB, and SIDB

In the "Configuration" dialog box of the TO axis, you can activate the following functions from "Functions" > "Change":

- Technology data block (TDB): for the cyclic exchange of technology data, e.g. actual torque value
- Drive Safety data block (DSDB), V4.4 and higher: to support the SINAMICS Safety Integrated Functions by means of the TO
- Safety Info Data Block (SIDB): Predecessor of the DSDB (for compatibility only)

The assignment is always made to the drive DO of the actuator of the axis. The system automatically generates a telegram extension and the BICO interconnection of the relevant SINAMICS parameters.

Note

The safety data blocks (DSDB or SIDB) are automatically configured by the engineering system and interconnected in the drive.

The PROFIsafe telegram must be configured by the user.

If the activation of the safety functions is to be made using PROFIsafe, configure the PROFIsafe communication to the higher-level SIMATIC F-CPU (see *SINAMICS S120 Safety Integrated* Function Manual).

I/O signals at the TO axis

For the assignment of I/O signals on the TO axis (e.g. the inputs for the homing output cam or hardware limit switches), call the assignment dialog box from the parameterization dialog boxes of the TOs created or from the address list (view of all addresses) by clicking the ... button.

See also

Downloading a project into the target system (Page 7074).

For more information on symbolic assignment, see the *SIMOTION Runtime Basic Functions* Function Manual.

Testing the axis with the axis control panel

Axis control panel

The axis control panel is used exclusively for testing axes. You can use the axis control panel for the following tasks, for example:

- To test each part of the system individually before program-driven axis motions are initiated.
- In the event of an error, to test whether the individual axes and drives can be traversed from the axis control panel
- To traverse the axes for optimization purposes (controller optimization)
- To perform active homing
- To set and remove the axis enable
- To test an axis that has been created

Requirement

The following requirements must be fulfilled for testing:

- The project has been downloaded to the target system.
- SIMOTION SCOUT is in online mode.

Axis test

1. Open the AXES folder in the project navigator and click the "Control Panel" entry below the axis (for example, Axis_1).
   The axis control panel is displayed.

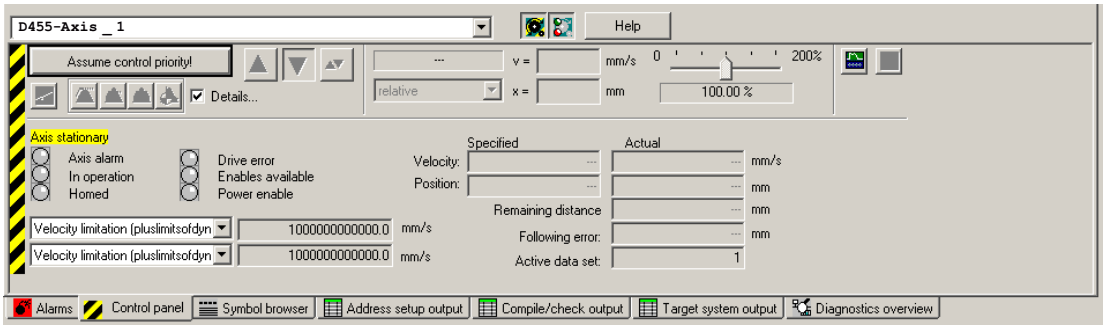

Figure 10-98 Axis control panel

2. To display the control range and axis diagnostics, click the "Show/hide control range" and "Show/hide diagnostics area" buttons.
3. Click "Assume control priority".

   Note

   In order to move the axis from the PG/PC, you must assume control priority. However, by pressing the SPACER bar, you can stop the axis at any time.

4. The further procedure depends on the CPU status:

   – Case 1: CPU in the STOP/STOPU state
   If the CPU is in the STOP state, a message will appear, indicating that the CPU has been put in the STOPU state.
   A safety message appears in a further dialog box and must be accepted.
   The activated Service function is then displayed via the LEDs (RUN flashes green at 2 Hz and SU/PF flashes yellow at 2 Hz).

   – Case 2: CPU in the RUN state (as of SCOUT/Kernel V4.4)
   Control priority can only be assumed if the axis is not in motion.
   After accepting the safety message, a message is shown on the control panel that the CPU is in the RUN state, that the user program is running, and further axes may be moving (LED display: RUN).
   If the control priority for a TO is active, commands for the TO from the user program are rejected with an error code. Alarm 30009: reason 0x04 is output.

5. To enable the axis, click the "Set/remove enable" button. Confirm the "Switch Axis Enable" dialog box with "OK".

   Note

   If the control panel is operated in the RUN state, switching the power supply on/off and setting/canceling the axis enable can alternatively be controlled via the user program.

   Note

   If you are using **an infeed without a DRIVE-CLiQ interface**, you will have to interconnect the "Infeed operation" signal (drive parameter p0864) yourself.

   If you are using **an infeed with a DRIVE-CLiQ interface**, select the infeed for which the control priority is to be assumed under "Infeed" in the "Switch Axis Enable" dialog box. Select this checkbox when the control priority is to be fetched and activated. If the infeed signal "Closed-loop control operation" already has a BICO interconnection to the drive, the infeed is permanently specified (infeed selection and checkbox are grayed out).

6. To traverse the axis, click the "Position-controlled traversing of the axis" button.
7. Enter a velocity and close the dialog box by clicking "OK".
8. Click the "Start motion" button to traverse the axis. You can monitor the traversing motion under velocity and position. Use "Stop motion" to stop axis movement again.
9. To cancel the enable and switch off the infeed, click the "Set/remove enable" button. Confirm the "Remove Axis Enable" dialog box with "OK".
10. Click the "Give up control priority" button to deactivate axis control from the PG/PC. In this operating state, the axes can no longer be controlled from the PG/PC.

    Note

    For commissioning kinematics transformations, a path control panel is available as of SIMOTION V4.4.

See also

Please refer to the additional information in the SCOUT Online Help (Axis control panel index).

Activating the infeed (line module)

Requirement

Before a drive can be traversed, the infeed (line module) must be switched on and the "Closed-loop control operation" signal of the infeed must be present at the drives.

If this is not taken into account, this can result in a fault state, and in the worst case, damage to the infeed.

How the infeed is controlled and how the drives receive the Ready signal depends on the type of infeed used.

A distinction is made between:

- Infeeds without DRIVE-CLiQ connection
- Infeeds with DRIVE-CLiQ connection

Infeed without DRIVE-CLiQ connection

The infeed is controlled via terminals on the line module, e.g. DO Ready (DC link is precharged and ´pulse enable is set).

These terminals must be connected to the SIMOTION D4x5-2 (e.g. wire "DO Ready of the infeed" to "X122, DI 0 of the D4x5-2").

The enable signal is queried when the drive is configured and must be interconnected accordingly.

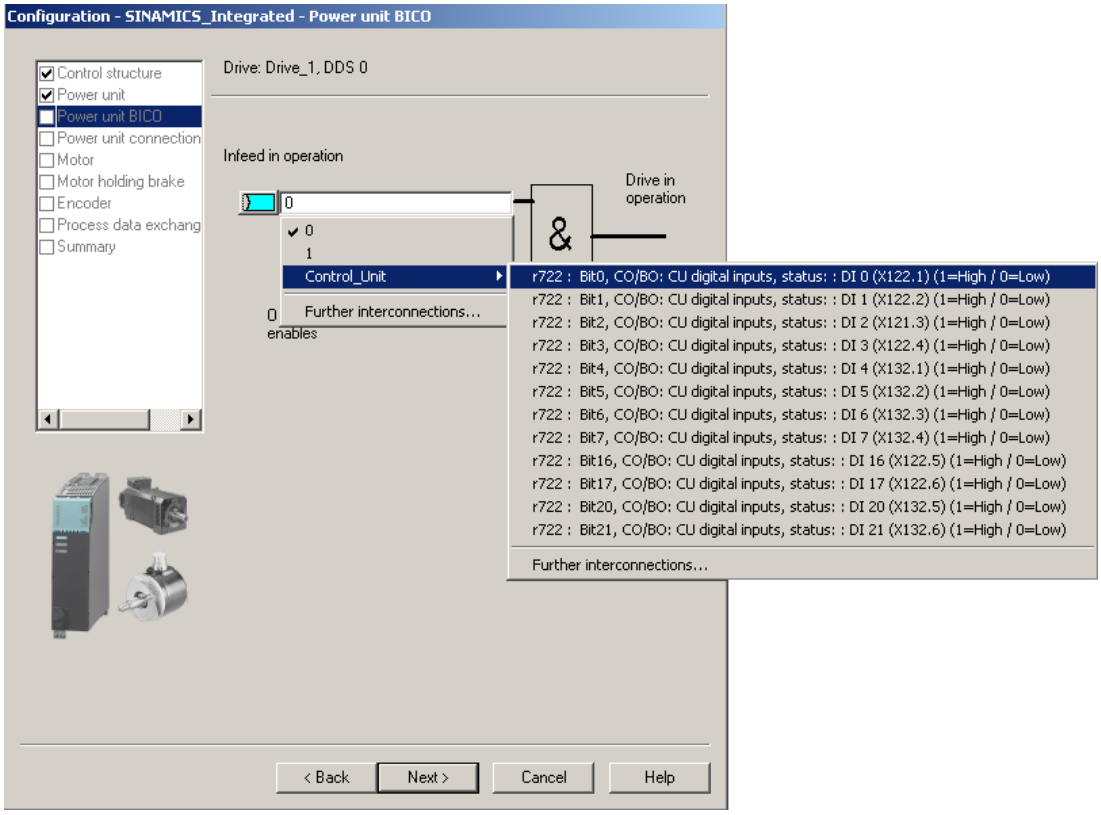

Figure 10-99 Interconnection of the "Infeed in operation" signal

Infeeds with DRIVE-CLiQ connection

The infeed is controlled via DRIVE-CLiQ. The infeed is switched on or off by the SIMOTION D4x5-2 via PROFIdrive message frame 370.

If "Use symbolic assignment" has been activated, message frame 370 is set automatically when setting standard/automatic (see Section Calling the drive wizard (Page 7053)).

With message frame 370, the required BICO interconnections to the message frame are created automatically on the drive unit.

If an infeed with DRIVE-CLiQ connection has already been created, the infeed signal "Closed-loop control operation, r863.0" is automatically interconnected to "Infeed operation, p0864" of the drive when drives are inserted (only applies to drives that are attached to the same drive unit as the infeed).

The **FB _LineModule_control** function block is available on the controller for control and diagnostics of the infeed.

Note

Always create the infeed first so that the infeed "Closed-loop control operation" signal is automatically interconnected to a drive when this is inserted.
Recommendation: If the drive unit has not been configured, use "Configure drive unit" in the project navigator. "Configure drive unit" has the advantage that all basic settings for the drive unit are queried via one wizard.

FB _LineModule_control

The **_LineModule_control** function block (FB) can be used to switch the infeed on and off and also perform simple diagnostics.

The following infeeds are supported by the **_LineModule_control** function block:

- Basic Line Modules (BLM)
- Smart Line Modules (SLM)
- Active Line Modules (ALM)

The **_LineModule_control** FB is part of the command library of the "SIMOTION SCOUT" engineering system. You can find the FB at "Drives" > "SINAMICS".

For detailed information on the **_LineModule_control** FB, refer to the SIMOTION SCOUT online help or the *Standard Function for SINAMICS S120 Line Modules* Function Manual.

CX32-2

Further information on how to use line modules with the CX32-2 can be found in Section Interconnecting the infeed "Operation" signal on the CX32-2 (Page 7098).

Additional references

For a detailed description of the control words and status words of the PROFIdrive message frames for SINAMICS S120 drives, see the *SINAMICS S120 Commissioning Manual*.

Using one infeed for several CUs

If the infeed is controlled from another control unit, then the Ready for operation signal of the infeed (parameter r0863.0) must be connected to parameter p0864 "Infeed operation" of the drive via a digital input/output. If this is not taken into account, the infeed may be damaged.

The following table shows which interconnection options are available, depending on the topology.

Table 10-50 Interconnection options for the ready signal of an infeed

Infeed is controlled by ...	Ready signal of the infeed to be interconnected to ...	Recommended interconnection option for the ready signal of the infeed
SINAMICS Integrated of D4x5-2	CX32-2	① Default CU-Link interconnection
	CU320-2	③ Wiring via terminals

	CX32-2	
	CU320-2	③ Wiring via terminals
CU320-2	SINAMICS Integrated of D4x5-2	③ Wiring via terminals
	CX32-2	
	CU320-2	

① Use of the CU-Link (DRIVE-CLiQ data transfer channel); by factory setting, the ready signal of an infeed on the SINAMICS Integrated is automatically communicated to the connected Controller Extensions and only has to be interconnecgted to the drives there.
For details, see Section Interconnecting the infeed "Operation" signal on the CX32-2 (Page 7098).

② For the interconnection, the CU-Link (DRIVE-CLiQ data transfer channel) can be used. For this purpose, it is necessary to configure the CU-Link according to the requirements.
For details, see Section CU-Link (data transfer via DRIVE-CLiQ) (Page 7118).

③ Wiring via terminals is recommended.
An interconnection of the Ready for operation signal via PROFIBUS/PROFINET is not recommended because of the delay times (communication, evaluation in controller, etc.) or a possible CPU stop (no execution of the user program).

Setting up addresses and message frames

Overview

After all SINAMICS components have been configured, addresses must be determined for the process data exchange between the drive and the controller.

This procedure depends on whether **symbolic assignments** are used:

- With **symbolic assignment**, the addresses are determined automatically by the engineering system, see Section Setting up communication for symbolic assignment (Page 7147).
- Without symbolic assignment, the determination of the addresses must be started manually, see Section Telegram configuration (Page 7148).

Setting up communication for symbolic assignment

The communication for symbolic assignment is set up with the following actions:

- In the SCOUT menu (call "Project" > "Set up communication for symbolic assignment")
- At "Download project to target system"
- At "Save project and compile changes"

When setting up the communication, the message frames, BICO interconnections and addresses are set up for the entire project.

See also

Message frame configuration (Page 7148)

Message frame configuration

Requirement

You have configured the drive unit.

On the basis of this configuration, one or more of the following actions should be performed:

- The automatic PROFIdrive telegram setting for a drive object should be activated/deactivated
- The automatic telegram extension for a drive object should be activated/deactivated
- The automatic address adaptation for a drive object should be activated/deactivated
- PROFIdrive telegrams should be configured for drive objects
- The addresses should be set up
- Telegrams should be extended manually

Procedure

Proceed as follows:

In the project navigator, open the "Communication" > "Telegram configuration" entry under "SINAMICS_Integrated."
The "SINAMICS Integrated - telegram Configuration" dialog box is displayed with the PROFIdrive PZD telegrams tab.

The dialog box lists all the available drive objects. The possible setting options are described in the following.

When using the symbolic assignment, the default setting does not have to be changed and no configuration performed.

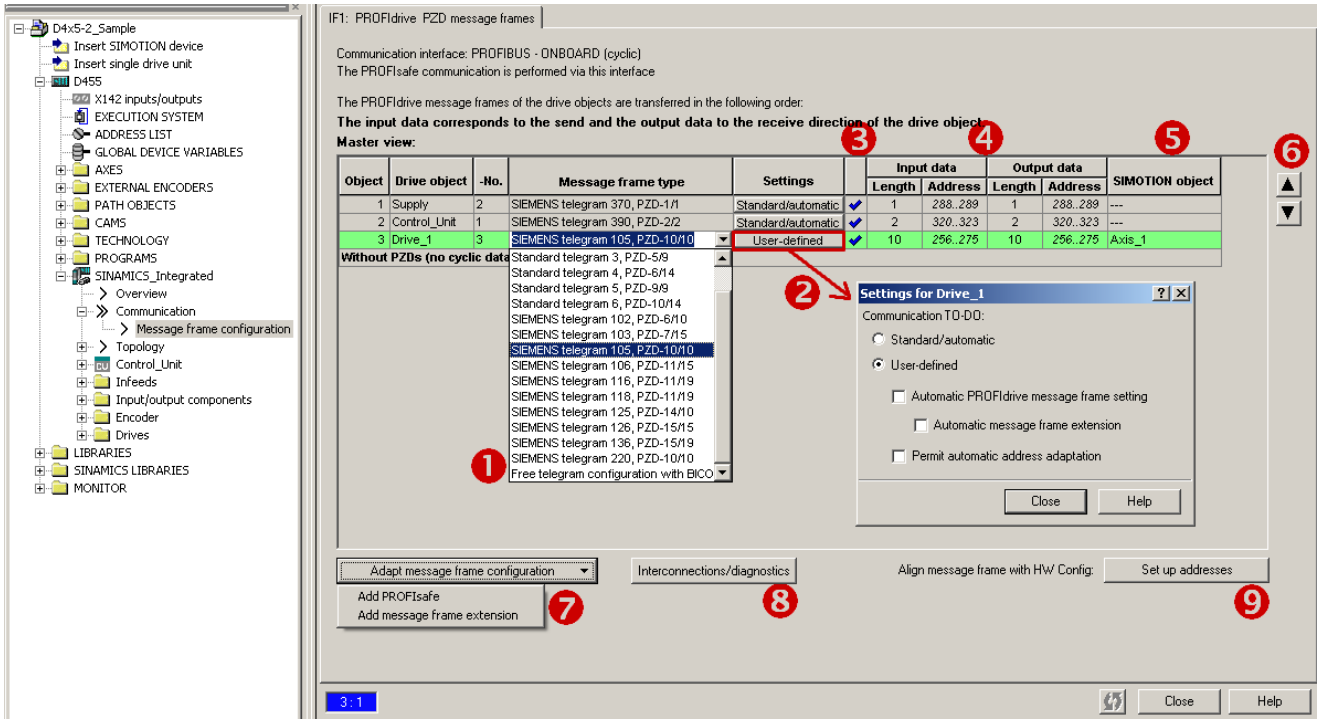

Figure 10-100 Telegram configuration

Table 10-51 Explanation of the figure

Number	Meaning
1	Selection of a telegram • The drive telegrams (telegrams 1 ... 6 and telegram 1xx) are defined in accordance with the PROFIdrive specification and can be selected based on the required functional scope. • You can transfer the signals of the I/Os or the global measuring inputs, for example, via the telegrams 39x. Telegram 39x is also required for the time synchronization between SIMOTION and SINAMICS. • Free telegram configuration with BICO allows you to define your own telegram. • Free telegram configuration with p0915/p0916 (for TM15/17). • Telegrams 37x for control of the infeed.
2	The "Standard/automatic" and "User-defined" settings are only visible if "Use symbolic assignment" is activated. Using the setting "Standard/automatic" is generally recommended. The "User-defined" setting allows the automatic telegram setting, telegram extension, and address adaptation to be deactivated or activated. • "Automatic PROFIdrive telegram setting" allows the telegram to be set by the system depending on the configured technology (telegram selection, e.g. for infeed, drive, and control unit incl. onboard I/O). • "Automatic telegram extension" allows the telegram to be extended by the system depending on the configured technology (e.g. if the technology data block is activated in the axis configuration). • "Permit automatic address adaptation" allows addresses to be adapted by the system in the case of address offsets, for example. Address offsets can occur, for example, if a telegram is extended and the adjacent addresses are already occupied by other telegrams. With TM15/TM17 High Feature, "Automatic PROFIdrive telegram setting", "Automatic telegram extension", and "Automatic address adaptation" cannot be deactivated by design, since for these drive objects the telegram is always set up in accordance with the parameterized terminal functionality (DI, DO, output cam, measuring input) and cannot be extended. "Automatic PROFIdrive telegram setting" and "Automatic telegram extension" must be deactivated if the telegrams are to be configured manually for TM15 DI/DO, TM31, and TB30 and interconnected with BICO. See Section Setting up communication for symbolic assignment (Page 7147).
3	Telegram status The icons in the status column show the following information: The message frame is configured differently in HW Config. You must align it with HW Config. You are using a predefined standard message frame or free BICO interconnection. You are using a modified standard message frame, which you have extended to include additional data. You are using a message frame for which one of the two message frame lengths is too long. The drive object cannot process this entry.
4	Length: Displays the size of the telegram component. Address: Address area in HW Config. The addresses will be displayed only after they have been set up.
5	Displays the SIMOTION object that is interconnected to the SINAMICS object (e.g. axis or encoder).
6	Changing the telegram order **Note**: Before the alignment, all drive objects without I/O addresses ("---..---") must be moved behind the objects with valid I/O addresses or those still to be aligned ("???..???").

Number	Meaning
7	"Manual" adaptation of the telegram configuration (e.g. when additional data, such as a motor temperature, is to be transferred via the telegram).
8	Display of the individual control and status words of the associated telegram.
9	Setting up the addresses (alignment of the addresses with HW Config) Only the addresses for the respective drive unit are determined (no automatic determination of telegrams / BICO interconnections).

Note

If symbolic assignment is deactivated, the following applies:

If the telegrams for drive objects (drives, Terminal Modules, etc.) change, you must set up the addresses again. The addresses are not updated automatically.

Error correction (symbolic assignment deactivated)

Based on the 39x telegram, SIMOTION generates further configuration information (FastIO configuration) for the following functions:

- Time-of-day synchronization SIMOTION ⇔ SINAMICS
- Use of onboard I/Os of SIMOTION D, CU, or CX
- Use of cams and global measuring inputs
- System function _setDriveObjectSTW

If the telegrams are defined manually (symbolic assignment is deactivated), a telegram 39x must be set up in the telegram configuration. The telegram then has to be aligned with HW Config via "Set up addresses."

If use of the functions stated above is not possible, generate the FastIO configuration anew. For this purpose select in the project tree the affected SIMOTION D Control Unit, the SINAMICS CU or Controller Extension CX and open the "FastIO" > "Create new configuration" shortcut menu with the right mouse button. Then compile the project and load it into the CPU. Perform a restart.

The FastIO configuration is also used for the telegram of the Terminal Modules TM15 and TM17 High Feature. Proceed in the same way if problems occur.

Linking an additional encoder (optional)

Basic principles

Using encoders

In addition to a motor encoder, additional encoders can be linked and configured:

- Additional encoders on the drive
  - Encoders with DRIVE-CLiQ interface
  - Encoders connected to a CU310/CU310-2 or CUA32 via the onboard encoder interface
  - Encoders connected to SIMOTION D via an SMx module
- Additional encoders on SIMOTION D
  - Encoders connected via PROFIBUS
  - Encoders connected via PROFINET

Configuring additional encoders

The additional encoder can be used in SIMOTION, for example, as:

- Machine encoder (second encoder = direct measuring system)
  A direct measuring system measures the technological parameter directly, i.e. without the interference of influences such as torsion, backlash, slip, etc. This can facilitate improved smoothing of mechanical influences by means of the closed-loop control. If you use a second encoder as a machine encoder, you can work with the encoder changeover function.
- External encoder
  You can use the external encoder to record an external master value, for example.
- Encoder for hydraulic axes
- Encoders for the implementation of cam controllers

Additional encoders on the drive

The following options are available for configuring additional encoders on the drive:

- Configuration of a second encoder on the drive
- Configuration of an encoder as drive object (as of SINAMICS firmware V4.3)

The following options are available for configuring additional encoders on the drive.

Second encoder on the drive

The configuration of a second encoder on the drive is useful when the second encoder value is also to be used for this drive (e.g. motor or machine encoder). Note that only a maximum of two encoder values can be transferred via PROFIdrive message frames.

In principle, the second encoder value can be freely used (e.g. for acquisition of an external master value), however the use of an encoder as a separate drive object (drive object DO encoder) is preferable because of the clear functional separation.

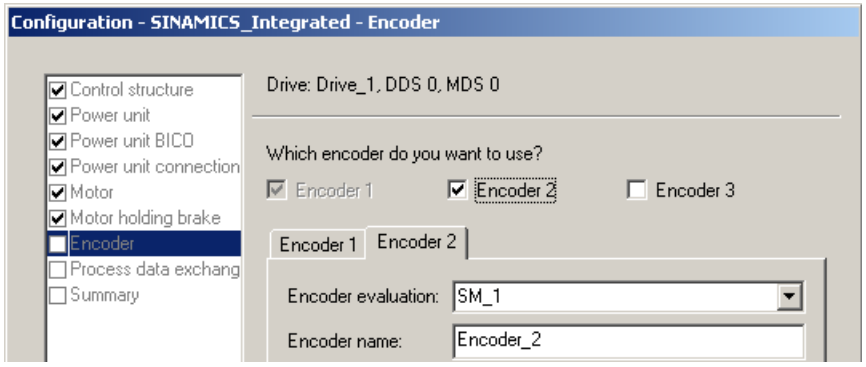

Figure 10-101 Configuration of a second encoder on the drive

Encoder as drive object

The configuration of an encoder as drive object (drive object DO encoder) has the advantage that this encoder can be used independently of a configured drive (e.g. for acquisition of a master value).

The configuration is performed by inserting an encoder via the project navigator.

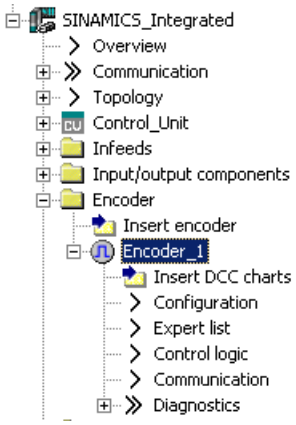

Figure 10-102 Configuration of an encoder as drive object

Note

In the same way as for axes, a "DO encoder" can also be symbolically interconnected to a "TO externalEncoder".

Additional encoders via PROFIBUS/PROFINET

Additional encoders can be connected via PROFIBUS or PROFINET. The following options are available for the encoder integration.

- Encoder interconnection using a PROFIdrive message frame (encoder with message frame type 81 and 83)
- Encoder interface as a direct value in the I/O area.

Additional references

Detailed information is contained in the
SIMOTION TO Axis, Electric/Hydraulic, External Encoder Function Manual

Symbolic assignment of I/O variables (PROFIdrive message frame / drive parameters)

Symbolic assignment of I/O variables to the PROFIdrive message frame of the TO axis

You can assign I/O variables from the address list which you require for display and diagnostic purposes, for example, to individual components (status word, for example) of the PROFIdrive message frame using the assignment dialog. Only components suitable for the data type of the I/O variable are displayed. If no data type is specified at the I/O variable, this is determined via the assignment partner after the selection.

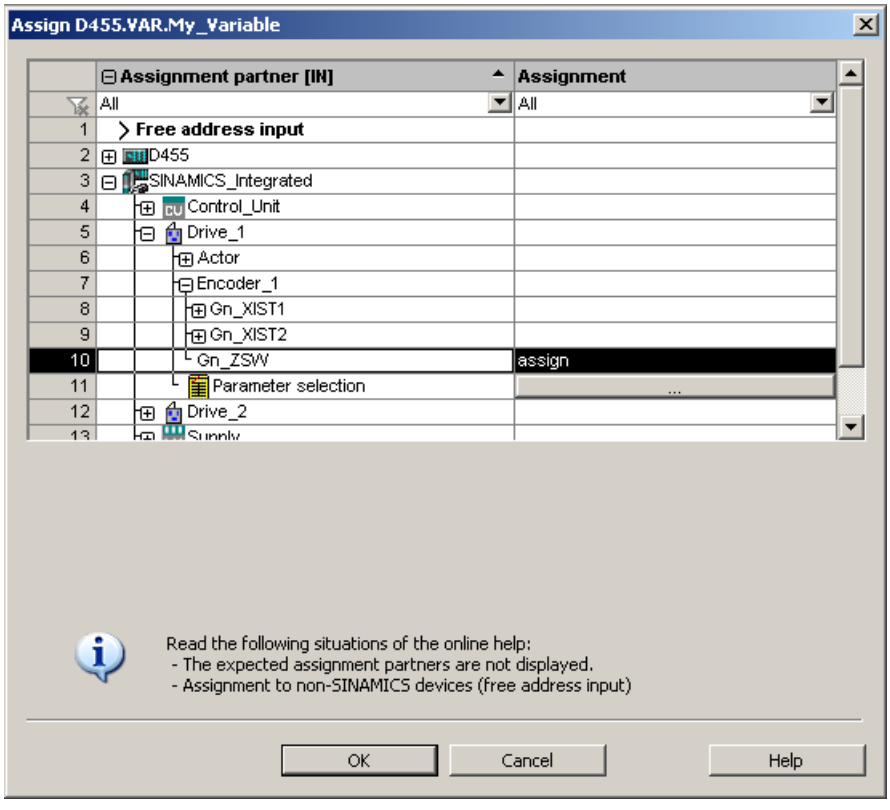

Figure 10-103 Assignment of I/O variables to the PROFIdrive message frame

Symbolic assignment of I/O variables to drive parameters

I/O variables from the address list can be assigned to drive parameters using the assignment dialog. Only parameters suitable for the data type of the I/O variable are displayed. If no data type is specified at the I/O variable, this is determined by the parameter selection.

An extension of the standard message frame is created automatically for the transfer of the parameters to/from the drive.

Procedure

1. Open the assignment dialog box from the address list (view of all addresses). The assignment dialog opens with the corresponding assignment partners.
2. Click the ... button in the parameter selection line to open the parameter list.

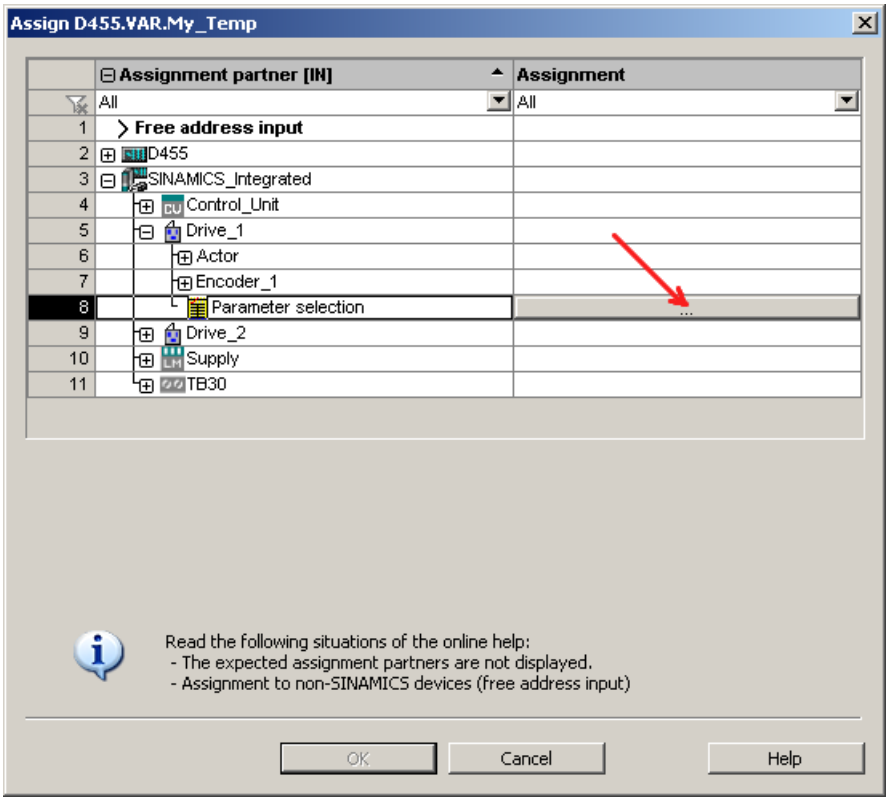

Figure 10-104 Assignment dialog for drive parameters

3. Select the desired signal source (e.g. DO drive). Then select the required parameter.

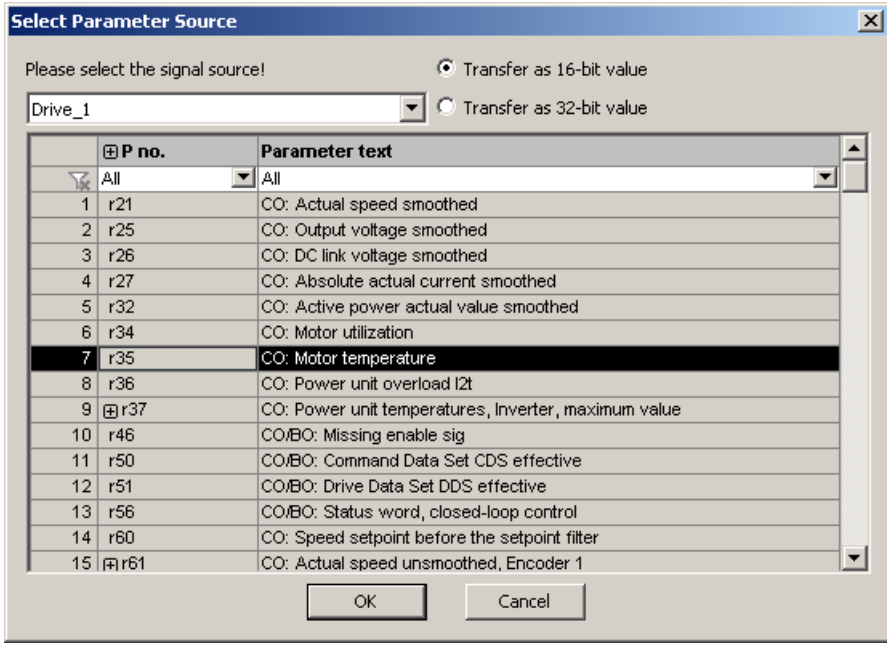

Figure 10-105 Dialog box for the DO and parameter selection

4. Click "OK" to accept the selection.

5. The desired SINAMICS parameter is assigned to the I/O variable in the interconnection dialog box.

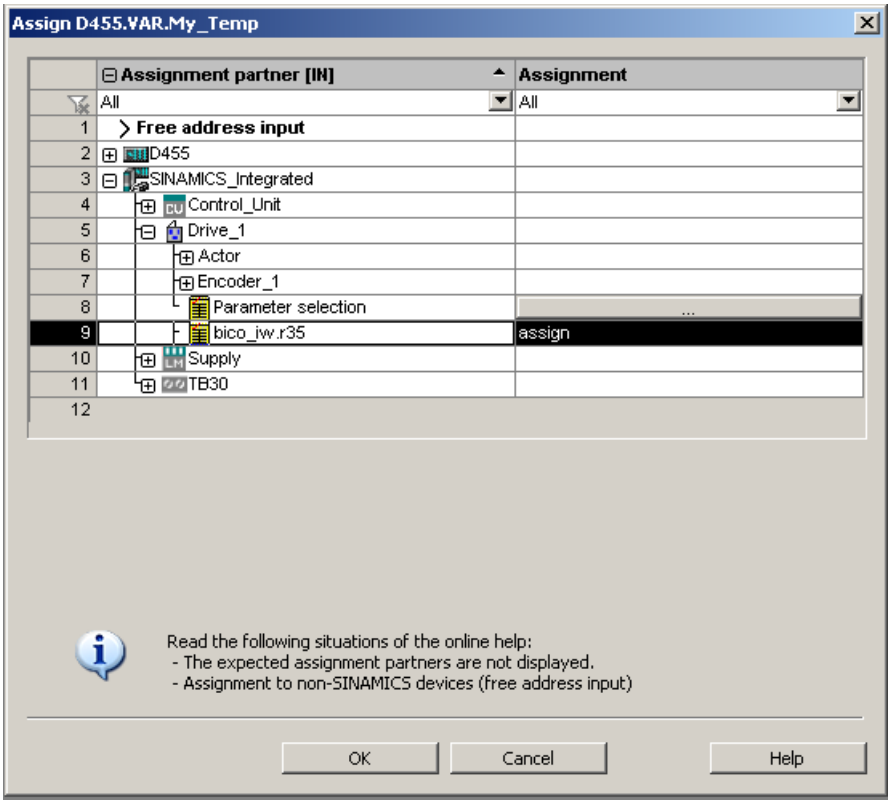

Figure 10-106 Assigned drive parameters

6. Click "OK" to accept the assignment.

The following table shows the possible types of assignment:

Name of the assignment	Data type	Direction	Transferrable BICO parameters
BICO_IW.<parameter number>	WORD	Input	All CO parameters (BICO source)
BICO_QW.<parameter number>	WORD	Output	All CI parameters (BICO sink)
BICO_ID.<parameter number>	DWORD	Input	All CO parameters (BICO source)
BICO_QD.<parameter number>	DWORD	Output	All CI parameters (BICO sink)

Syntax of the assignment names

- A number of parameters (separated by periods) are specified for outputs (SINAMICS side = received data) which can be interconnected with a number of BICO sinks.
- If the transferred parameter is on another drive object (DO), the DO name precedes the parameter. "#" is used as a separator between the DO name and the parameter.
- Individually transferred bits of a parameter appear in brackets [x].

Configuring drive-related I/Os (with symbolic assignment)

Overview

SIMOTION D4x5-2, the CX32-2 controller extension as well as the SINAMICS S110/S120 control units and additional components (TB30, TMs) have I/Os that can be used by the drive unit and SIMOTION.

So that I/Os, which were originally assigned to SINAMICS, can be used by SIMOTION, they must be interconnected to a message frame.

Symbolic assignment

As of version V4.2, SIMOTION SCOUT supports the symbolic configuration of I/Os. "Use symbolic assignment" must be activated for this purpose (see also Section Symbolic assignment / adaptation (Page 7046)).

The symbolic assignment simplifies the configuration significantly:

Table 10-52 Comparison of configuration with/without symbolic assignment

	With symbolic assignment	**Without symbolic assignment**
Configuring message frames	So that SIMOTION can use SINAMICS I/Os, the required message frames are created automatically	Message frames must be set manually (either predefined message frame (e.g. 39x) or free message frame configuration)
BICO interconnections	The required BICO interconnections are made automatically (I/Os are interconnected to message frame)	With predefined message frames (e.g. 39x), the BICO interconnections are made automatically With free message frame configuration with BICO, the interconnection must be made by the user
Parameterization of the I/O functionality (e.g. measuring input)	Parameterization via screen forms	Parameterization via screen forms and partly via parameters in the expert list
Handling of I/O addresses	Handling of addresses is not required because of symbolic assignment	I/O addresses must be determined
Setting up addresses	Addresses are set up automatically, see also Section Setting up addresses (Page 7147)	Addresses must be set up manually, see also Section Message frame configuration (Page 7148)

Only the configuration with symbolic assignment is described in the following. For further information on the configuration of drive-related I/Os without symbolic assignment, see Configuration of drive-related I/Os (without symbolic assignment) (Page 7280).

Procedure

The configuration of the I/Os is divided into two basic steps:

1. Configuration of the I/O terminals (Page 7159). The functionality of an I/O channel is configured (e.g. configuration of a DI/DO as digital output).
2. Configuration of the technology objects and I/O variables. (Page 7163)
   The access of technology objects and I/O variables to I/Os is configured.
   The configuration is performed symbolically, whereby only "function-compatible" I/O channels are offered for selection.
   Example:
   For the TO measuringInput, only symbolic assignments of the type MI (measuring input) are offered for selection.

The required message frames and the interconnection are then set automatically by the engineering system.

Configuration of the I/O terminals

The following table provides an overview of the configuration options for the I/O terminals of various modules.

Table 10-53 Overview of the configuration of I/O terminals

Module	Use of the I/Os by		Configuration of the I/O terminals	Supports symbolic assignment
	SIMOTION	SINAMICS		
SIMOTION D4x5-2 • Terminal X122/X132 • Terminal X142	 X [1] X	 X -	 On the drive unit (CU) On the D4x5-2 (HW Config)	As of SIMOTION V4.2
SIMOTION D4x5	X [1]	X	On the drive unit (CU)	As of SIMOTION V4.2
CX32-2, CX32	X [1]	X	On the drive unit (CU)	As of SIMOTION V4.2
SINAMICS S110 CU305	X [1]	X	On the drive unit (CU)	As of SINAMICS V4.3
SINAMICS S120 • CU310 • CU310-2 • CU320 • CU320-2	X [1]	X	On the drive unit (CU)	 • As of SINAMICS V2.6.2 • As of SINAMICS V4.4 • As of SINAMICS V2.6.2 • As of SINAMICS V4.3
TB30, TM15 DI/DO, TM31	X [1]	X	On the drive unit (TB30 or TM)	Yes
TM41	X [1]	X	On the drive unit (TM41)	Yes [2]
TM15, TM17 High Feature	X	-	On the drive unit (TM15 or TM17)	Yes
Time-based I/O • ET 200MP TM timer DIDQ 16x24V • ET 200SP TM timer DIDQ 10x24V	X	-	On the ET 200 I/O system	Yes, as of SIMOTION V4.4 HF6

[1] I/Os are originally assigned to a SINAMICS drive unit and can be assigned to SIMOTION via configuration

[2] TM41 supports symbolic assignment only for encoder interfaces (not symbolic assignment for DI, DO and AI)

Note

The module hardware for TM15 and TM15 DI/DO is identical. A distinction is only made by the addition of the component in the SIMOTION SCOUT project navigator using "Insert input/output component".

I/Os that are originally assigned to the SINAMICS drive unit can also be used by SIMOTION via configuration:

- An output is always only exclusively available for the SINAMICS drive unit or SIMOTION.
- An input used by SIMOTION can also be interconnected on the drive side.

The configuration of the I/O terminals is described in detail in the following:

- Configuration of the D4x5-2 I/Os (terminal X122/X132) (Page 7160)
- Configuration of the D4x5-2 I/Os (terminal X142) (Page 7161)
- Configuration of the CX32-2/CU3xx/TB30/TMxx I/O terminals (Page 7162)

Configuration of the D4x5-2 I/Os (terminal X122/X132)

Procedure

The I/Os of terminals X122 and X132 are originally assigned to the drive unit. The configuration is therefore performed via the drive unit ("SINAMICS_Integrated" > "Control_Unit" > "Inputs/outputs).

Using the default settings as basis for further parameterizations, you can assign SIMOTION to all I/Os or SINAMICS to all I/Os.

The properties of the I/O channel can be configured in the parameterization dialog box. With the bidirectional digital I/Os, for example, an I/O channel can be:

- Parameterized as input or output.
- Inverted.
- BICO-interconnected (use as drive I/O).
- Used as digital input for SIMOTION with "DI (SIMOTION)".

- Used as digital output for SIMOTION with "DO (SIMOTION)".
- Used as a global measuring input input for SIMOTION with "Measuring input (SIMOTION)".

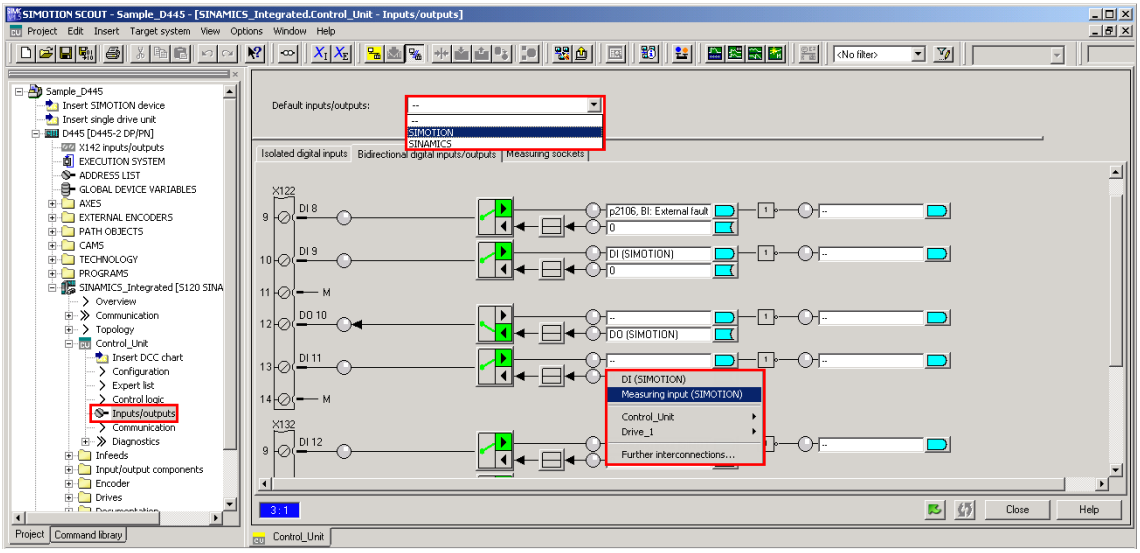

Figure 10-107 Configuration of the D4x5-2 I/Os (terminal X122/X132)

Note

The properties of the I/O channel must be configured offline

Online changes only take effect after a restart (power off/on), provided that the setting has been previously saved with "Copy RAM to ROM" power off.

Data transfer

If the X122 and X132 I/Os are interconnected using symbols (or if telegram 39x is used for the X122/X132 I/Os), the status information of the DI and DO will be transmitted to cu.p2048 at the PROFIdrive PZD sampling rate. Sampling of the inputs and outputs is also performed in the sampling time parameterized according to cu.p0799.

The same applies if the I/Os are manually interconnected to a drive telegram via a BICO converter.

Transfer of the output values and feedback of the input values is therefore subject to dead times and jitter.

For time-critical applications, use of measuring probes or cams is recommended. Alternately, the isosynchronous X142 onboard I/Os, I/Os of TM15, TM17, or isosynchronous ET 200 I/Os can be used.

Configuration of the D4x5-2 I/Os (terminal X142)

Procedure

The I/Os of terminal X142 are permanently assigned to the SIMOTION D4x5-2. The configuration is therefore performed via the D4x5-2 ("D4x5-2" > "X142 inputs/outputs).

Alternatively, the dialog box can also be called in HW Config by double-clicking the X142 interface.

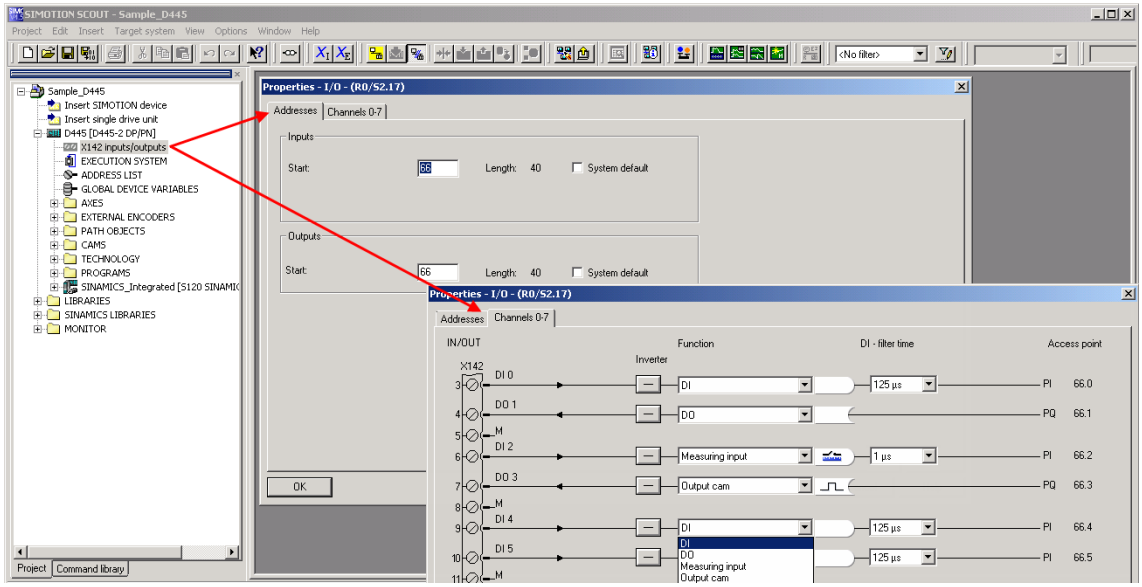

Figure 10-108 Configuration of the D4x5-2 I/Os (terminal X142)

Addresses tab

The start address for the X142 I/Os can be set in the "Addresses" tab. The address can be specified or automatically assigned by the system.

Channel tab

The function of each individual I/O channel is set in the "Channel 0-7" tab. Possible functions:

- DI
- DO
- Output cam
- Measuring input

All I/O channels can be inverted. A filter time of 1 µs or 125 µs can also be set for digital inputs and measuring inputs.

The displayed logical address of a channel is only required when symbolic assignments are not used.

Configuration of the CX32-2/CU3xx/TB30/TMxx I/O terminals

The configuration is performed in a similar way as for the onboard I/Os X122/X132 for the SIMOTION D4x5-2, i.e. the I/Os can be

- BICO-interconnected (use as drive I/O)
- Used by SIMOTION

See also Section Configuration of the D4x5-2 I/Os (terminal X122/X132) (Page 7160)

Note

If symbolic assignment is activated retrospectively for a project in which message frames have already been configured and interconnected, these can be changed together with the BICO interconnections.

For this reason, make a backup copy of your project before activating the symbolic assignment.

TB30, TM15 DI/DO and TM31 are especially affected.

See also Section Symbolic assignment / adaptation (Page 7046)

Configuration of the ET 200SP/MP timer DIDQ

The I/O terminals of the ET 200SP and ET 200MP timer DIDQ can be used as drive-related I/Os for measuring input and output cam applications.

The DI/DQ timers are configured via the hardware configuration of STEP 7 or TIA Portal. The properties of the I/O channel can be configured in the parameterization dialog box, for example

- Timer DI for use of the I/O as measuring input input or
- Timer DQ for use of the I/O as cam output

Note

For the technological use of the timer DIDQ, you must operate the I/O station isochronously on PROFINET:

- ET 200SP timer DIDQ: With SCOUT or SCOUT TIA, IM 155-6 PN HF required
- ET 200MP timer DIDQ: Only with SCOUT TIA, IM 155-5 PN ST or HF required

Operation via PROFIBUS is not possible.

For detailed information on the configuration, see *Technology Modules TM Timer DIDQ for SIMOTION SCOUT* and *SIMOTION SCOUT TIA* Commissioning Manual

Configuration of the technology objects and I/O variables

Configuration of global measuring inputs

Overview

The type of measuring input must be selected during the configuration of the TO measuringInput.

The following measuring input types are available:

Table 10-54 Measuring input types

Measuring input types	Explanation
Standard (global measuring input)	Compared with the drive-related local measuring inputs, global measuring inputs have extended functionality and also support a symbolic configuration. They are therefore set as standard.
Drive-related (local measuring input)	The drive-related local measuring inputs are configured via drive parameters, see Section Configuration of drive-related I/Os (without symbolic assignment) (Page 7280) (in the appendix).
Listening measuring input	Through the configuration of a listening measuring input, measuring can be performed simultaneously on several axes or external encoders with one measuring input. Detailed information can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs* Function Manual.

A detailed comparison of "local" and "global" measuring inputs as well as an overview of which modules support local or global measuring inputs can be found in the appendix in Section Configuration of drive-related I/Os (without symbolic assignment) (Page 7280).

Procedure

If a global measuring input is selected, it must be assigned a hardware input.

To do this, open the assignment dialog box via ... and select a free (i.e. not yet used) I/O.

Note

Only those I/Os are displayed that have the appropriate measuring input functionality (MI_xx [channel name, terminal number]). If no suitable I/Os are displayed, you must first configure the I/Os (I/O must be configured as "measuring input")

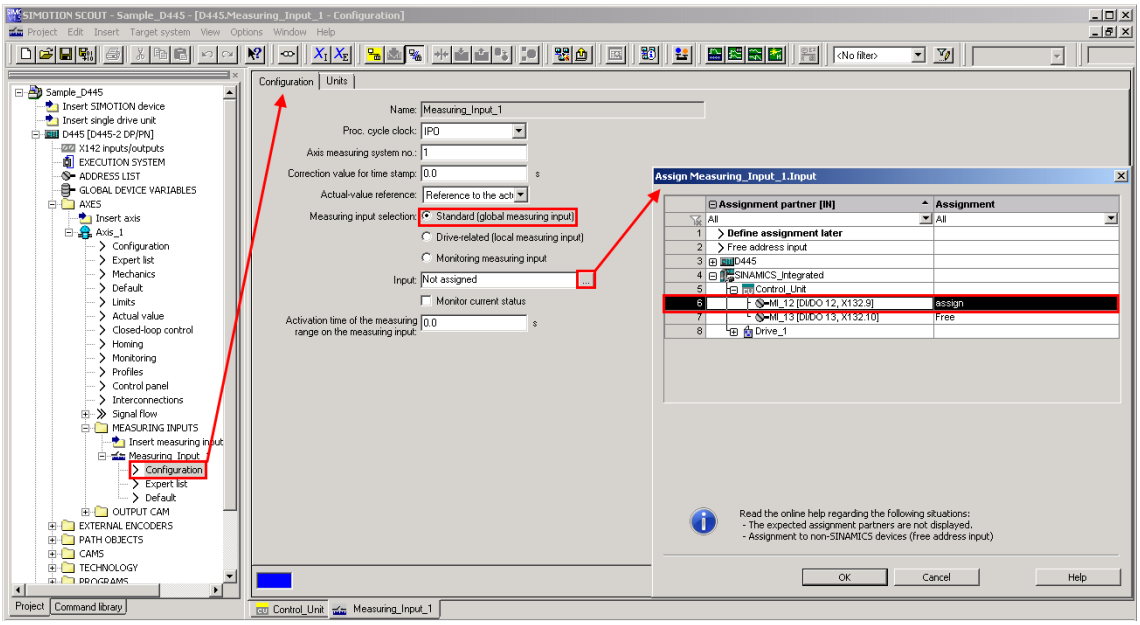

Figure 10-109 Configuration of a global measuring input for the D4x5-2

Detailed information on the configuration of the TO measuringInput can be found in the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Configuration of local measuring inputs

Local measuring inputs are drive-related measuring inputs. The configuration is performed via drive parameters.

For further details, see:

- Section Configuration of drive-related I/Os (without symbolic assignment) (Page 7280) in the appendix
- *SIMOTION Output Cams and Measuring Inputs* Function Manual

Configuration of output cams / cam tracks

Overview

The type of cam output must be selected during the configuration of the TO outputCam and TO camTrack.

The following output types are available:

Table 10-55 TO outputCam / TO camTrack output types

Cam output on ...	Explanation
Output cam output (CAM)	The cam output is performed on the basis of an internal time stamp. The temporal resolution of the cam output depends on the hardware used. Supported hardware: • SIMOTION D4x5-2 (terminal X142): Resolution 1 µs • TM17 High Feature: Resolution 1 µs • TM15: Typical resolution 125 µs (DRIVE-CLiQ cycle clock) • D410-2 (DI/DO 8 to 15): Typical resolution 125 µs • ET 200MP TM timer DIDQ 16x24V: Resolution 1 µs • ET 200SP TM timer DIDQ 10x24V: Resolution 1 µs
High-speed digital output (DO)	The cam output is performed via onboard outputs of the SIMOTION CPU. The output is via a hardware timer and the cam output is achieved with a resolution with respect to time < servo cycle. Supported hardware: • SIMOTION D4x5 (terminal X122, X132) • SIMOTION D410 (terminal X121) • SIMOTION C240, C240 PN (terminal X1)
Standard digital output (DO)	The output cam calculations are performed in the processing cycle clock (IPO or IPO2 cycle clock or in the servo cycle clock). Actual cam output is performed in the servo cycle clock. The resolution with respect to time of the cam output is generally reduced by the output cycle of the I/O used. The resolution is therefore dependent as follows: • For the standard I/O (e.g. ET 200), on the cycle time of the bus system (PROFIBUS DP / PROFINET I/O) • For the TM15 / TM17, on the cycle time of the bus system (PROFIBUS Integrated / PROFIBUS DP / PROFINET IO) • For the TM15 DI/DO, TM31, TM41, TB30, on the configured sampling time: – cu.p0799 (CU inputs/outputs sampling time) for the onboard outputs – p4099 (TMxx inputs/outputs sampling time) for TB30, TM15 DI/DO, TM31, and TM41 Supported hardware: • Onboard outputs (SIMOTION D, Controller Extension CX, SINAMICS Control Unit CU3xx) • Centralized I/O (SIMOTION C) • Distributed I/O via PROFIBUS DP/PROFINET I/O (e.g. ET 200, ...) • Drive-related I/O (TM15, TM15 DI/DO, TM17 High Feature, TM31, TM41, TB30)

Note

The deployment of TM15 (SIMOTION) and TM17 (SIMOTION) is possible only with DP Integrated, PN and servo cycle clocks ≥ 0.5 ms. This applies to TM modules connected directly to D4x5-2 and indirectly via CX32-2/CU320-2.

Procedure

To achieve the best possible output cam resolution on the onboard I/Os of a SIMOTION D4x5-2, activate the output and select "Cam output on output cam output (CAM)."

Then assign a hardware output. To do this, open the Assignment dialog box via ... and select a free (i.e. not yet used) I/O.

Note

Only those I/Os are displayed that have the appropriate output cam functionality (CAM_xx [channel name, terminal number]). If no suitable I/Os are displayed, you must first configure the I/Os (I/O must be configured as "output cam (CAM)")

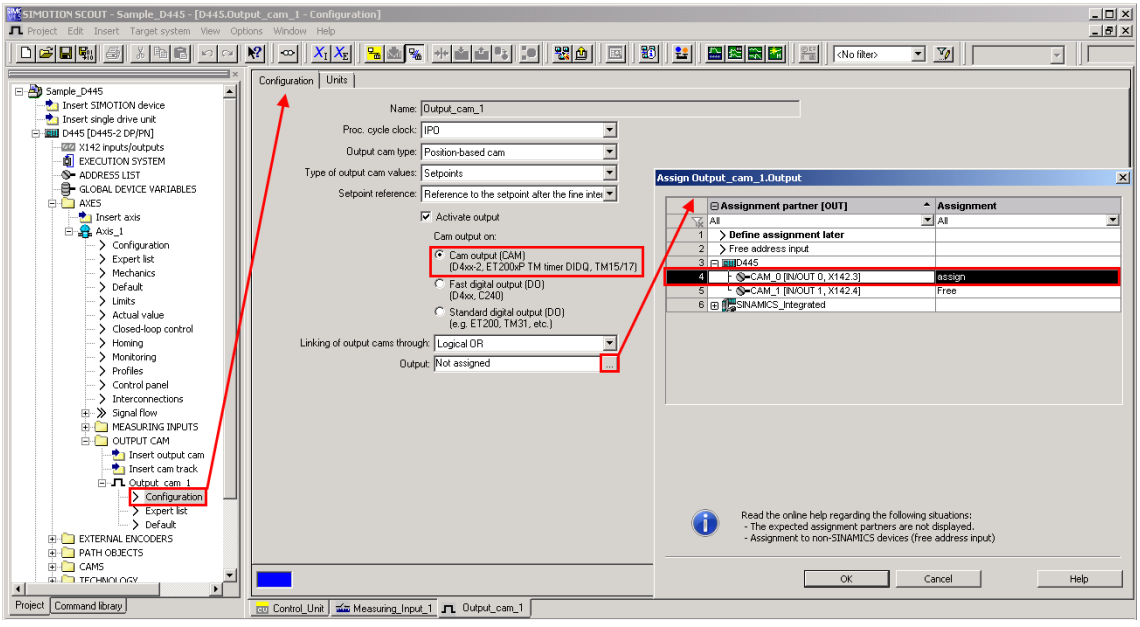

Figure 10-110 Configuration of an output cam for the D4x5-2

A maximum of 2 edges can be output per processing cycle clock of TO outputCam or TO camTrack.

Detailed information on configuring the output cam and cam track technology objects can be found in the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Supplementary interconnection options for X142 I/Os

Supplementary interconnection options for X142 I/Os

If the X142 I/Os are symbolically interconnected, further interconnection options are offered for selection under DI, DO, MI, and CAM, depending on the chosen data type.

With the exception of ACTVAL and LEC, these interconnection options are only intended for diagnostics by the Siemens Hotline.

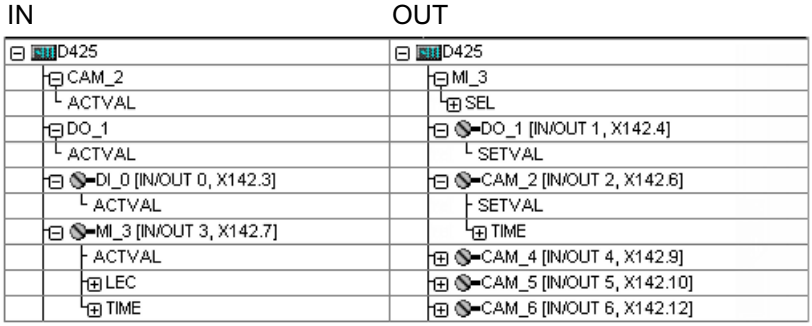

Figure 10-111 Supplementary interconnection options for X142 I/Os

ACTVAL, terminal status

ACTVAL represents the logical channel status, considering an configured inversion.

- in the case of a DI, ACTVAL corresponds to the logic state of the DI
- in the case of an MI, ACTVAL corresponds to the logic state of the measuring input
- in the case of a DO / CAM, ACTVAL corresponds to the actual terminal status of the digital output or output cam output. If the terminal status differs from the controlled status, there may be a short-circuit or fault of the output driver.

LEC, lost edge counter

The LEC (Lost Edge Counter) counts the lost edges at a measuring input input. Lost edges are edges that must be measured according to the measurement job, i.e.

- the measurement job is active and
- the edge corresponds to the edge selection

For example, if only rising edges are to be acquired according to the measurement job, only lost "rising" edges will be acquired.

Note

The precondition for the use of the LEC is that "servo" is set as the processing cycle clock for the measuring input TO.

If the capacity of the measuring input input (2 edges per servo cycle or per measurement job) is exceeded, the edges will be lost.

Up to 7 lost edges

- can be acquired per servo cycle (cyclic measurement) or
- per measurement job (single measurement)

.

If more than 7 edges are lost, the counter will stop at the value 7.

Therefore: if the value is 7, 7 or more edges have been lost.

Lost edges can indciate that measurement is faulty (contact bounce, disturbances, etc.).

Example 1:

- Measuring input input is only to measure positive edges.
- 6 negative and 5 positive edges occur in cycle n.
- 2 positive edges are measured

Result: The number of lost positive edges is 3.

Example 2:

- Measuring input input is to measure any edges.
- 11 edges occur in cycle n.
- 2 edges are measured

Result: 7 lost edges are signaled; 2 further edges cannot be recorded due to the limitation of the counter to 7 in the module.

Evaluation in the user program

In eveluation of the LEC, ensure that the edge counter only fills 3 bits of the LEC byte in each case. The non-relevant bits have to be masked in this way.

Lost edge counter	**Relevant bits in the LEC byte**							
	7	6	5	4	3	2	1	0
for I/O channel 1 / 3 / 5 / 7		x	x	x				
for I/O channel 0 / 2 / 4 / 6						x	x	x

Program example

```
// lec_1 : IO variable in the SCOUT,  symbolically interconnected
with LEC measuring input 1 (type byte)
// lec_2 : IO variable in the SCOUT, symbolically interconnected with
LEC measuring input 2 (type byte)

VAR
   LecMeasuringInput1 : BYTE;
   LecMeasuringInput2 : BYTE;
END_VAR

LecMeasuringInput1:= (lec_1 AND 16#07);           //  even channel
LecMeasuringInput2:= SHR((lec_2 AND 16#70),4);    //  odd channel
```

Configuration of the I/Os (variables / TO axis)

You have two ways to assign an I/O variable to I/O terminals:

- Assignment via preferred interconnection (e.g. DI_0 [DI 0, X122.1])
  To do this, you must use the SIMOTION preferred interconnection for the corresponding input/outputs of the SINAMICS DOs. The BICO interconnection is performed automatically.
- Assignment via PZD (e.g. via DI_0_15 or DO_0_15).
  Note that for these signals a message frame of the appropriate length is generated, but the BICO interconnection is not performed.

Interconnection via preferred interconnection

The I/O variables are configured via the address list. Components that support a symbolic assignment can be configured without I/O addresses.

Preferred interconnections are displayed as assignment targets in the Assignment dialog box (e.g. DI_0 [DI 0, X122.1]). The assignment is made by direct selection of the corresponding terminal signal.

Components that do not support symbolic assignment (e.g. standard PROFIBUS I/O) are configured via I/O addresses.

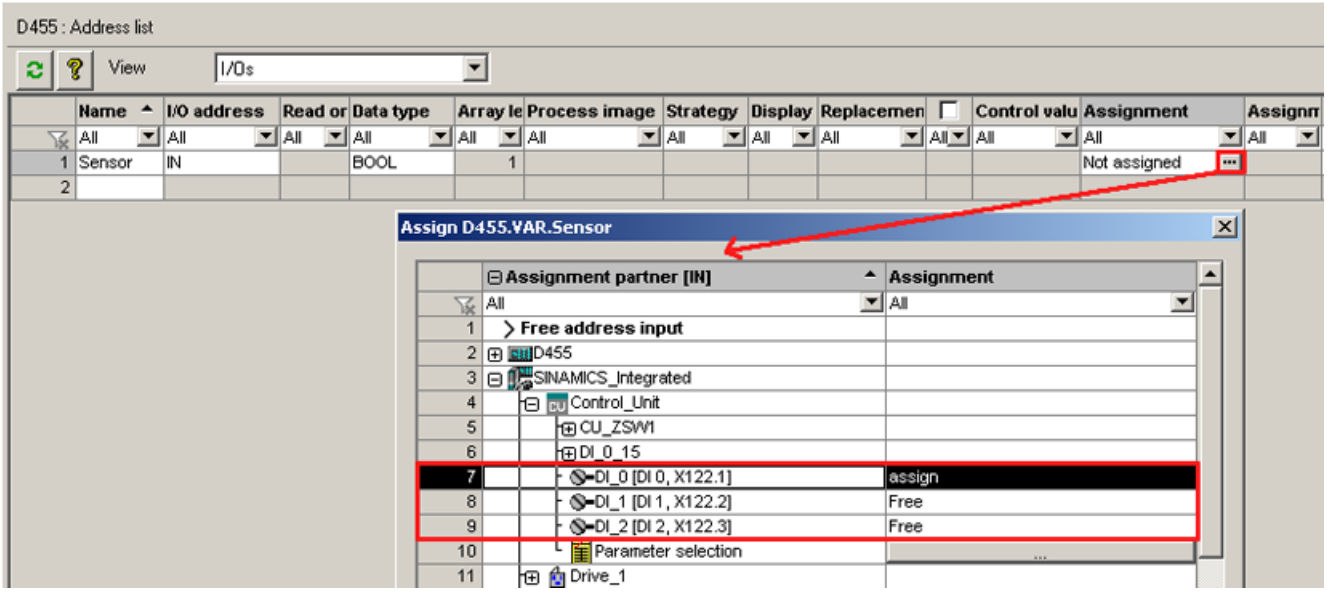

Figure 10-112 Address list

Interconnection via PZD

In principle, an assignment via the PZD is also possible (e.g. via DI_0_15 or DO_0_15). Note that for these signals a message frame of the appropriate length is generated, but the BICO interconnection is not performed.

For this purpose, switch to the "Communication" dialog box of the corresponding SINAMICS DO. You can now see the individual bits of the PZD (e.g. I_Digital or O_Digital) listed there. Interconnect the appropriate bit of the PZD with a signal.

Alternatively, you can assign SIMOTION to an I/O channel during the terminal configuration (e.g. by selecting "DI (SIMOTION)", see Section Configuration of the D4x5-2 I/Os (terminal X122/ X132) (Page 7160)).

TO axis

The symbolic assignment of I/Os is also supported by the TO axis (e.g. for a HW limit switch).

Substitute values for I/O variables

Substitute values cannot be specified for input variables of the BOOL data type. If you do require substitute values however, proceed as follows:

1. Assign a digital input (e.g. SINAMICS_Integrated.Control_Unit.DI_0 [DI 0, X122.1]) to an input variable of the BOOL type (e.g. sensor).
2. Create a global variable (e.g. all_inputs) (at least data type WORD, e.g. SINAMICS_Integrated.Control_Unit.DI_0_15).
3. Configure the substitute value.
   The appropriate bit of the substitute value must then contain the substitute value for the BOOL variable.
   In the same way, you can assign a substitute value to a BICO parameter.

For various SINAMICS drive objects, higher-level types are available for the assignment of substitute values.

D455 : Address list

View: I/Os

	Name	I/O address	Read only	Data type	Array leng	Process image	Strategy	Display	Substitute v		Control valu	Assignment	Assignment
	All	All	All	All	All	All	All	All	All	All	All	All	All
1	all_inputs	IN		WORD	1		Substitute value	HEX	16#00_00			SINAMICS_Integrated.Control_Unit.DI_0_15	4: Set up
2	sensor	IN		BOOL	1							SINAMICS_Integrated.Control_Unit.DI_0 [DI 0, X122.1]	4: Set up
3													

Figure 10-113 Configuration of substitute values

DMC20/DME20 DRIVE-CLiQ hub

Hub properties

DRIVE-CLiQ hub characteristics

The DMC20 and DME20 DRIVE-CLiQ hub modules are used to implement point-to-point distribution of a DRIVE-CLiQ line. With the DMC20/DME20, an axis grouping can be expanded with 4 DRIVE-CLiQ sockets for additional subgroups.

- DMC20 is the hub for the control cabinet configuration
- DME20 is the hub for use without a control cabinet (IP67 degree of protection).

The modules are especially suitable for applications which require DRIVE-CLiQ nodes to be removed in groups, without interrupting the DRIVE-CLiQ line and therefore the data exchange.

Application examples

Typical applications of DRIVE-CLiQ hubs are encoder expansion and hot plugging.

- In an encoder expansion, direct measuring systems are connected. For example, these are attached directly to the machine in the control cabinet. Several encoders can be connected to one hub in the cabinet.
- Hot plugging is the option for changing Motor Modules while in operation. To do so, the Motor Modules are connected via a DRIVE-CLiQ hub in the form of a point-to-point topology. This means they can be deactivated without impairing downstream components (via cascading).

Note

Cascading is permitted one time only (from hub to hub).

Connection conditions for ENCODER drive objects

- All encoders that can be assigned to a drive can be used.
- ENCODER drive objects may be connected to all DRIVE-CLiQ ports.
- Up to 4 DRIVE-CLiQ HUBs (DMC20 or DME20) can be used to establish a star-shaped wiring of the ENCODER drive objects. This means that a maximum of 19 possible ENCODER drive objects can be connected to one Control Unit. This means that the number of possible ENCODER drive objects is restricted so that a total maximum of 24 drive objects can be connected to one Control Unit.
- The DRIVE-CLiQ HUBs must be directly connected to the Control Unit.

Additional references

Additional information on the DMC20/DME20 DRIVE-CLiQ is contained in the

- *SIMOTION D4x5-2* Manual
- *SINAMICS S120 Control Units and Additional System Components* Manual

Creating a DMC20/DME20 DRIVE-CLiQ hub

Introduction

A DMC20/DME20 can be inserted directly in the project navigator. The hub is not wired when you insert the DMC20/DME20 and is displayed in the topology tree in the component storage. The hub has to be wired manually.

Procedure

1. Right-click "Topology" in the project navigator.
2. Select the "Insert new object" > "DRIVE-CLiQ hub" command from the context menu and confirm with "OK".

3. Double-click "Topology" to display the topology tree.
   In the topology tree, the hub is stored in the component archive.
4. Drag-and-drop the hub to the required DRIVE-CLiQ interface.
   The components connected to the hub are displayed in the topology tree.

Result

The added hub is displayed for the "Topology" entry in the project navigator. All components connected to a hub are also displayed during an automatic configuration.

TM41 terminal module

Overview

The TM41 terminal module can be used to expand the number of digital I/O and of analog inputs within a drive system. TM41 also returns TTL signals which emulate an incremental encoder, for example, for a master control system.

The emulated encoder signal has the signal characteristic of an incremental TTL encoder (A track, B track, R track). The resolution of the encoder signal can be specified in the configuration.

Note

The digital inputs/outputs and the analog input can be interconnected via BICO configuration.

The TM41 encoder interface (incremental encoder representation) can

- Be interconnected with an encoder signal of the control unit by means of parameterization, e.g. sin/cos incremental encoders. For detailed information, see the SINAMICS manuals.
- From the SIMOTION viewpoint, be accessed as axis. This allows you to return the axis position (a master value) as an encoder signal to a second controller, for example. The configuration can be performed symbolically and is described in the following.

  Note

  TM41 only supports the symbolic assignment for the encoder interface (no symbolic assignment for the DI, DO and AI).

Configuring the TM41 involves the following steps:

- Configuring the TM41 at SINAMICS Integrated
- Configuring the TM41 using the axis wizard

Configuring TM41 at SINAMICS Integrated

The TM41 can be configured after you completed configuration of the SINAMICS Integrated. Proceed as follows:

1. Double-click "Insert input/output component" at "Input/output component" in the project navigator.
2. Select TM41 from the "Drive object type" field of the "Insert Input/Output Component" dialog box and assign a unique name to the module.
3. Confirm your entry with "OK".
   The TM41 is inserted in the project navigator by the name you entered.
4. Double-click "Inputs/outputs". The "Inputs/Outputs" property dialog box of TM41 opens.
5. Set "SIMOTION" as the operating mode on the "Pulse encoder emulation" tab, and make the settings for the emulated sensor signal.
6. Double-click "Configuration" under "SINAMICS_Integrated" in the project navigator and select the "PROFIdrive telegram" tab.
7. Click "Close" to exit the dialog box.

You have now programmed the TM41 and aligned it with HW Config.

Configuring the TM41 using the axis wizard

After configuring the TM41 for a SINAMICS Integrated device in the project navigator, you can interconnect it with an axis using the Axis Wizard. The wizard implements the TM41 as a drive device.

1. Open the Axis Wizard and create a position or following axis (electrical).
2. Step the Axis Wizard forward until the "Drive Assignment" dialog box opens.

3. Select "SINAMICS_Integrated" as the drive device and "TM41" as the drive. TM41 operates as setpoint sink of the axis with this setup.

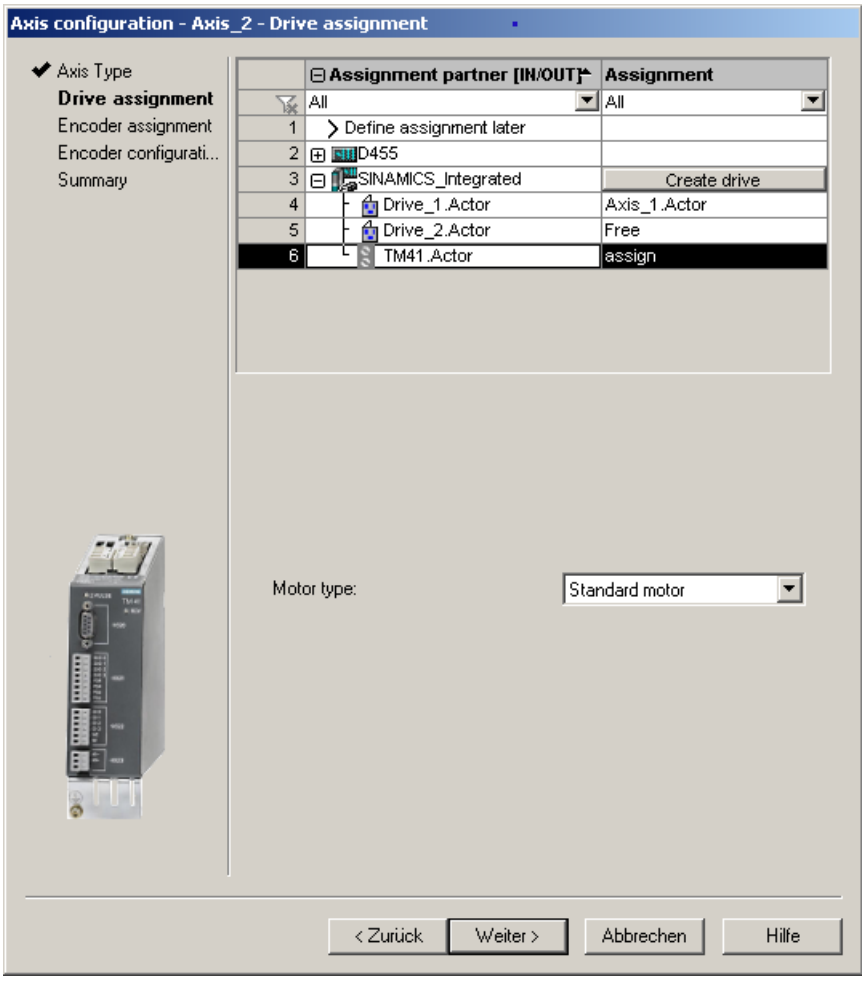

Figure 10-114 Drive assignment

4. Run through the wizard to the end.

Detailed information on configuring incremental encoder emulation with the TM41 can be found in:

- FAQs at: (https://support.industry.siemens.com/cs/ww/en/view/27554028)
- *SIMOTION Utilities & Applications*
  SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Optimizing the drive and controller

Overview of automatic controller setting

Overview

For the controller optimization of the drive, SIMOTION SCOUT offers a wizard for the automatic controller setting.

In the "Automatic Controller Setting" screen form, you can configure an automatic setting for the speed controller and the DSC (dynamic servo control) position controller for SINAMICS drive units. The necessary steps for this calculation can be controlled from this screen form. The parameter values calculated for the speed controller or position controller are displayed; these can then be transferred online to the drive or axis on the controller.
You can set the controller automatically using the menu command "Target system" > "Automatic controller setting".

For a detailed description of the parameters that can be defined, to the *SIMOTION SCOUT* Online Help.

Requirements

- You have configured a SINAMICS drive.
- The configured drive is operated in the "Servo" drive object type.
- Closed-loop control takes place with the motor encoder.
- There is an online connection to the relevant drive unit.

Procedure

Automatic controller setting involves the following steps:

1. Setting the speed controller
2. Setting the position controller

Note

You can cancel the automatic controller setting by pressing the SPACEBAR.

- The step currently being executed is aborted.
- The drive enable is canceled.

Additional references

Information on the controller structure can be found in the *SIMOTION TO Axis, Electric/ Hydraulic, External Encoder* Function Manual.

In addition to automatic controller setting, SIMOTION SCOUT also offers the option of optimizing the drive and controller manually by means of measuring functions, trace and function generator (see Sections Measuring functions, trace, and function generator (Page 7179) and Manual speed controller optimization (Page 7180)).

Automatic speed controller setting

Characteristics

The automatic speed controller setting has the following features:

- Attenuation of resonances in the speed-controlled system
- Automatic setting of the Kp gain factor and the Tn reset time of the speed controller
- The speed setpoint filter and the reference model are not changed.

Procedure

To perform an automatic setting of the speed controller, proceed as follows:

1. Select the "Target system" > "Automatic controller setting" menu command.
2. Select the drive unit and the drive.
3. Select the "Speed controller" from the "Controller Selection".
4. Click "Assume control priority" to assume control priority.
5. Click the "Drive on" button to enable the drive.
   Perform these steps (1 to 4) in automatic mode or as individual steps.
6. Click "Transfer" to transfer the calculated parameter values for the speed controller to the drive.
7. Disable the drive by clicking the "Drive Off" button.
8. Click "Give up control priority" to give up control priority of the PG/PC.
9. Save the online parameters.

You can now transfer the automatically set parameters to the project.

Backing up parameters

Proceed as follows to back up the parameters:

1. In the project navigator, select the SINAMICS unit with the drive for which you want to perform the automatic setting.
2. Select "Target device" > "Copy RAM to ROM" in the context menu.
3. Select "Target device" > "Load CPU / drive unit to PG" in the context menu.

If required, the automatic controller settings can be checked using the measuring functions.

Automatic position controller setting

Introduction

In the "Automatic Controller Setting" screen form, you can select the SINAMICS drive unit and the drive for which you want to carry out an automatic DSC position controller setting. The necessary steps for this calculation can be performed from this screen form. The calculated Kv value is displayed and can then be accepted online in the configuration data of the axis that is assigned to the drive.

Requirements

In addition to the General requirements for the automatic controller setting, the following boundary conditions apply for setting the position controller:

- DSC is required for the position controller setting.
  Tip:
  Activate the project setting "Use symbolic assignment" and select the Standard/Automatic option for the axis-drive communication when configuring the drives. You automatically use DSC for the servo drives with these settings.
- The speed controller has already been configured (e.g. with the automatic speed controller setting).
- At least one axis is connected to the SINAMICS drive (servo).
- An online connection to the SIMOTION device must be established to transfer the results of the automatic position controller setting.
- The balancing filter is not changed.
- For operation without precontrol, the equivalent time constant of the position controller must be adjusted manually by the user (PositionTimeConstant = 1/Kv).
- Vibration on the load side is not taken into account for the position controller setting.

Procedure

To perform an automatic setting of the position controller, proceed as follows:

1. Select the "Target system" > "Automatic controller setting" menu command.
2. Select the drive unit and the drive (axis).
3. Select the "Position controller (DSC)" from "Controller selection".
4. Click "Assume control priority" to assume control priority.
5. Click the "Drive on" button to enable the drive.
   Perform the steps either in automatic mode or as individual steps.
6. Select the axis data sets to which the Kv factor is to be transferred.
7. Click "Accept values" to transfer the calculated Kv factor to the axis data sets.
8. Disable the drive by clicking the "Drive off" button.

9. Give up the control priority of the PG/PC.
10. Save the online parameters.

You can now transfer the automatically set parameters to the project.

Backing up parameters

Proceed as follows to back up the parameters:

1. In the project navigator, select the SIMOTION unit with the axis for which you want to perform the automatic setting.
2. Select "Target device" > "Copy current data to RAM" in the context menu.
3. Select "Target device" > "Copy RAM to ROM" in the context menu.
4. Select "Target device" > "Load CPU / drive unit to PG" in the context menu.

If required, the automatic controller settings can be checked using the measuring functions.

Measuring functions, trace, and function generator

Drive optimization

Drive optimization is part of commissioning and can be performed with SIMOTION SCOUT.

Note

Controller optimization may only be performed by skilled personnel with control engineering knowledge.

Controller optimization

Various measuring functions are available for controller optimization of the drive. These measuring functions enable the control of the higher-level control loop to be selectively switched off and the dynamic response of individual drives to be analyzed through simple parameter assignment. The function generator and the trace recorder are used.

The control loop is supplied with the ramp-function generator signal at a specific point (e.g. speed setpoint), and the signal from the trace recorder is recorded at another point (e.g. speed actual value).

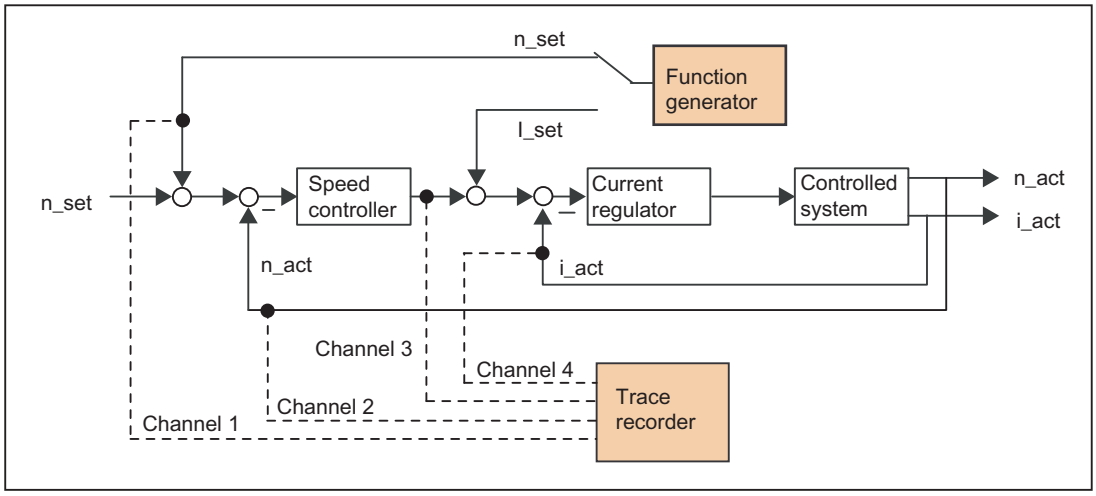

Figure 10-115 Optimizing a controller

Depending on the form of controller optimization to be performed, it is possible to define the quality (e.g. signal form, amplitude, transient recovery time) of the disabled signal, the measuring duration for step functions in the time range, or the bandwidth and number of averaging operations in the frequency range for the trace. The analytical and graphical evaluation can then be performed accordingly (FFT diagram, Bode diagram).

The following measuring functions are available:

- Setpoint jump at current controller
- Reference frequency response at current controller
- Setpoint jump at speed controller
- Disturbance variable jump at speed controller
- Reference frequency response at speed controller
- Disturbance frequency response at speed controller
- Speed-controlled system (input at current setpoint filter)

Additional references

For additional information about drive optimization, consult the *SINAMICS S120* Commissioning Manual.

Additional information on trace and measuring functions, as well as on the function generator, can be found in the *SIMOTION SCOUT Online Help*.

Manual speed controller optimization

Requirement

You have already created a project and configured an axis and a drive. You can now optimize the speed controller.

Procedure

1. Open the project and go to online mode.
2. Click  to call the "Measuring Functions" dialog box.
3. Select the drive unit and the drive.
4. Select "Speed controller setpoint jump".
   You can change the values in the following fields: "Settling time", "Amplitude", "Offset", "Ramp-up time" and "Measuring time".

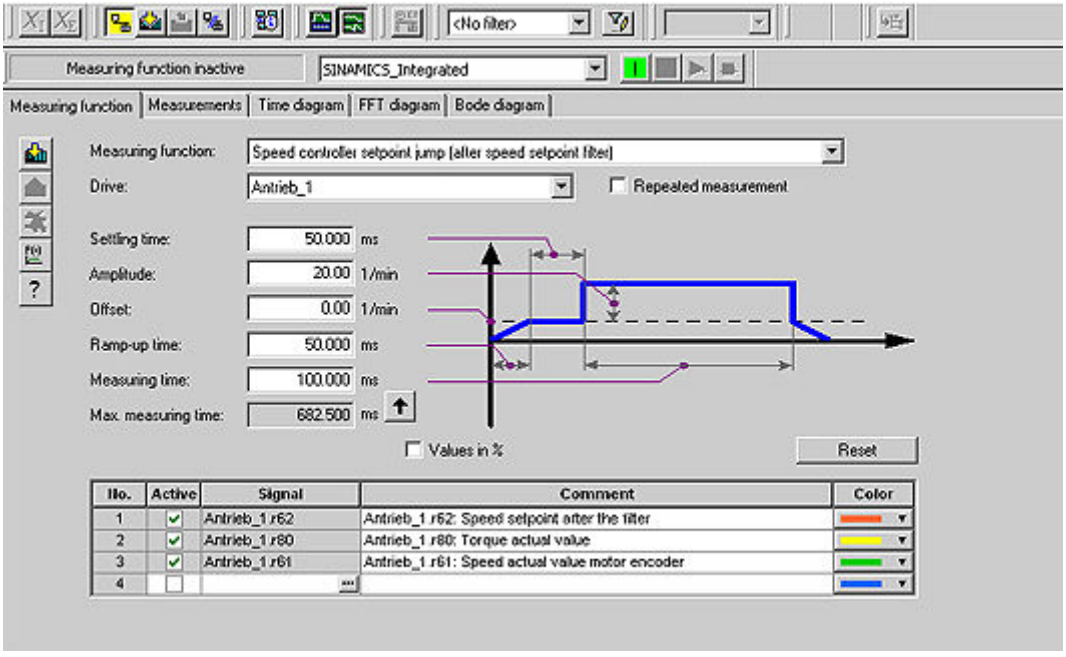

Figure 10-116 Speed controller measuring function

   Four channels can be traced. Certain channels are preassigned, depending on the measuring function.
5. Download the changes to the drive by clicking  (Download parameter assignment).

Starting the measuring function

1. Click "Assume control priority" to assume control priority.
   Read the notice that appears and click "Accept" to confirm. The activated Service function is displayed via the LEDs (RUN flashes green at 2 Hz and SU/PF flashes yellow at 2 Hz).
2. Click the "Drive on" button to enable the drive.

3. Click (Start measuring function) to start the measuring functions.
   The axis is moved during the measurement. For this reason, a safety message that allows the process to be aborted is displayed.
4. The traced signals are represented on the "Time diagram" tab.

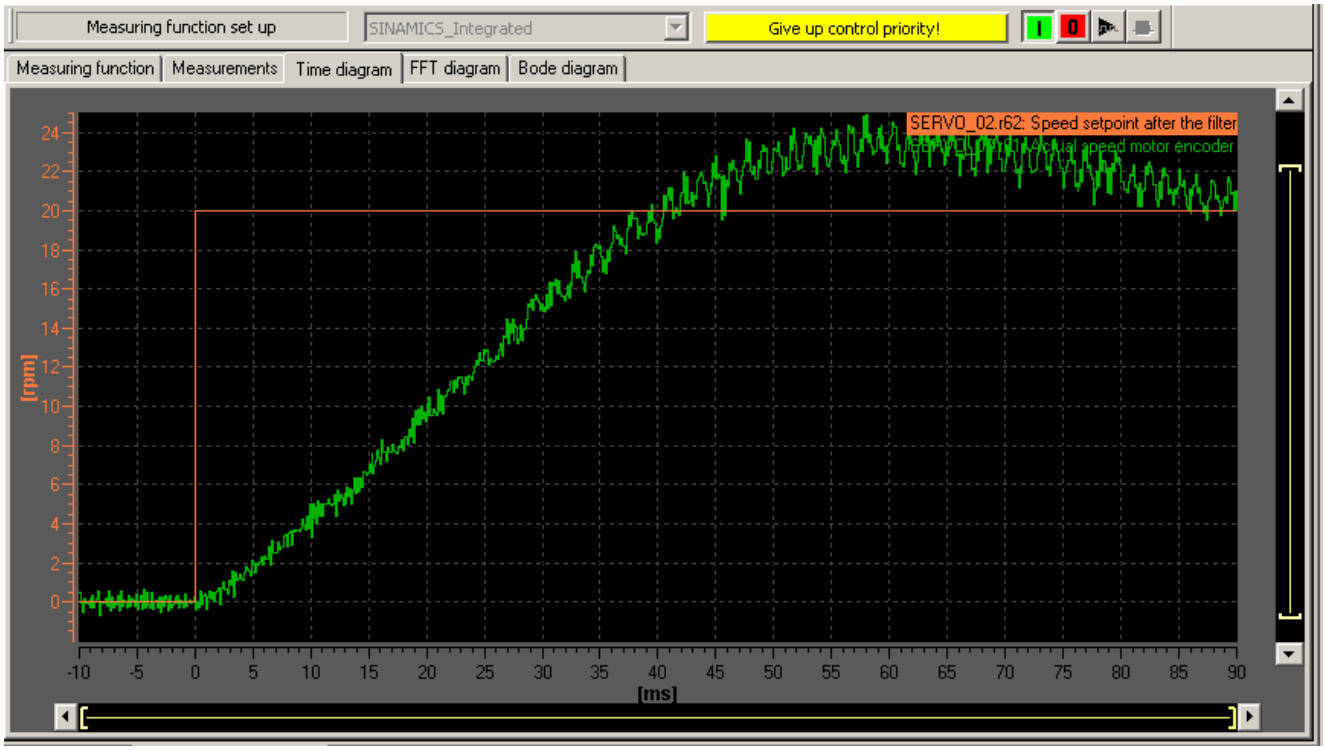

Figure 10-117 Time diagram before parameter change

Adjusting the P-gain

You can adjust the P-gain of the controller to optimize the transient response.

1. In the project navigator under the corresponding drive, for example, Servo_1, use the menu command "Open-loop/closed-loop control" > "Speed controller" to display the "Speed Controller with Encoder" dialog box.
2. Enter an appropriate value in the "P-gain" field and the "Integral time" field.

Note

The values entered take immediate effect.

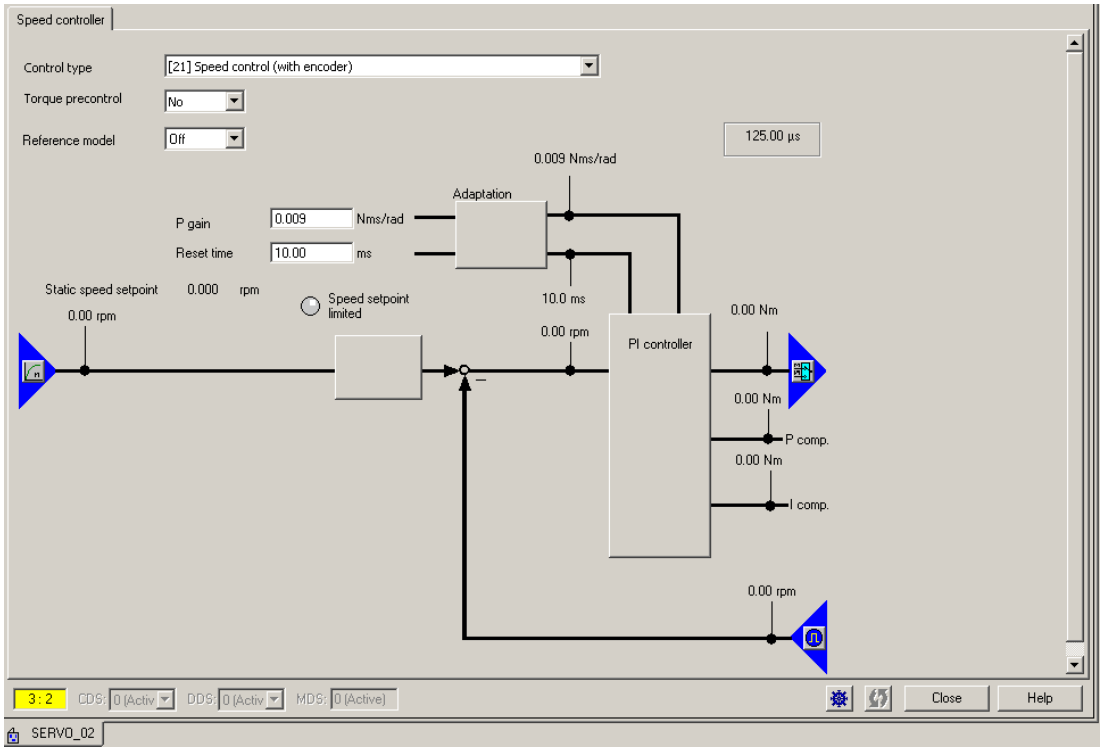

Figure 10-118 Entering P-gain

3. For verification purposes, perform the measurement again.
4. With the modified parameters, the controller displays a much better transient response. If necessary, you can continue changing the value until the transient response is optimal.

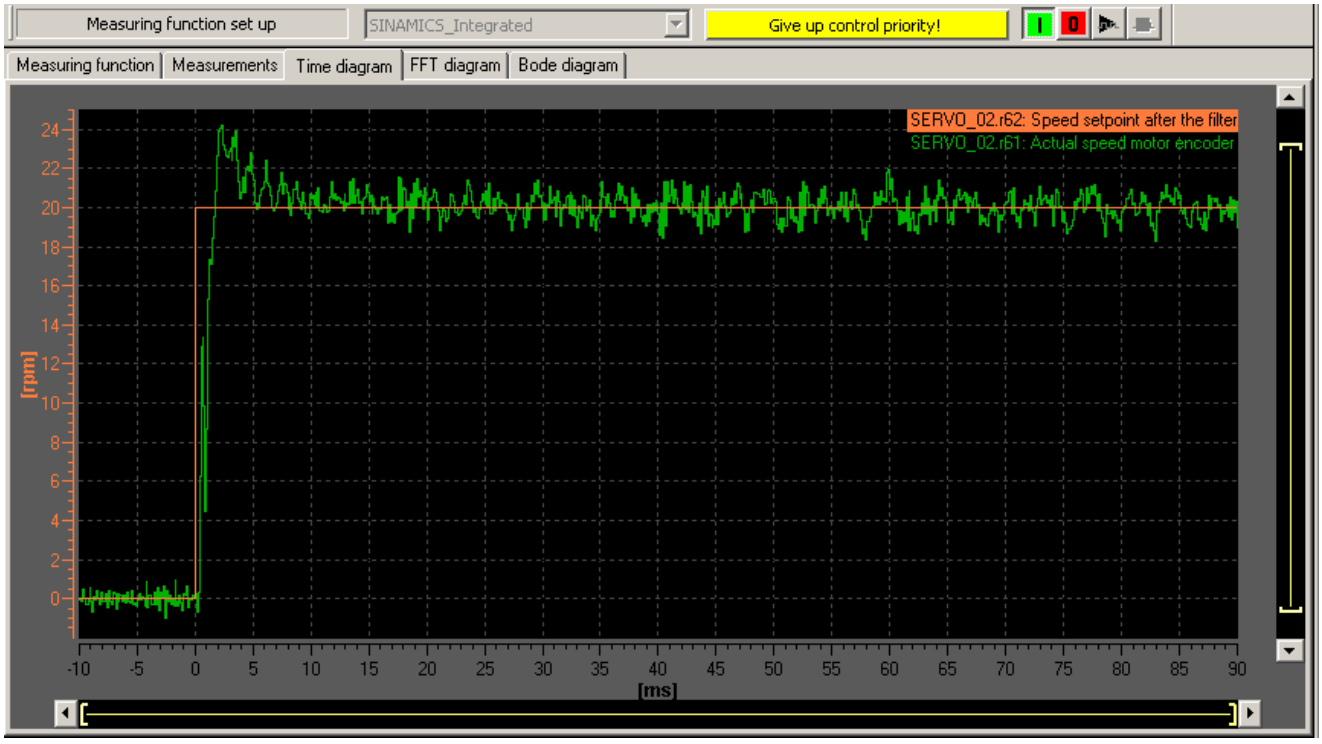

Figure 10-119 Measurement with modified P-gain

Loading and saving SIMOTION user data

Overview

After commissioning the SIMOTION D4x5-2, we recommend that you back up the user data (programs, configuration data and parameter assignments) on the CF card.

Loading user data

The menu command "Target system" > "Load" > "Download project to target system" is used to transfer the following data from the SIMOTION SCOUT engineering system to the "non-volatile SIMOTION data" area of the SIMOTION D4x5-2:

- Configuration data
- Programs
- Parameterization
- Technology packages

The hardware configuration of the SIMOTION D4x5-2 and the retain variables are also stored in the "non-volatile SIMOTION data" area.

Note

Using the menu:

- "Target system" > "Load" > "Load project to target system" downloads all of the project data to the target system.
- "Target system" > "Load" > "Load CPU / drive unit to target device" only loads the data of the selected device / drive element to the target device.

After the SIMOTION D4x5-2 is switched off, the contents of the "volatile SIMOTION data" area are lost.

Additional information on the SIMOTION SCOUT Engineering System can be found in the *SIMOTION SCOUT* Configuration Manual.

Saving user data

The "Copy RAM to ROM" function is used in SIMOTION SCOUT to save the following data from RAM to the CF card:

- Technology packages and user data (units, configuration data, parameter assignments, task configuration) from the "volatile SIMOTION data" area
- Current data values are copied to the "volatile SIMOTION data" area, depending on the settings in SIMOTION SCOUT.

  Note

  The "Copy RAM to ROM" command **cannot** be used to save the current values of retain variables to the CF card.

You have the following options for backing up the current values of retain variables to the CF card:

- User program
  Use the **_savePersistentMemoryData** system function in the user program.
- Back up with the service selector switch or DIAG button on the SIMOTION D4x5-2 or via SIMOTION IT web server: See Section Back up diagnostic data and non-volatile SIMOTION data via the web server (Page 7276)

With the SCOUT functions "Save variables" and "Restore variables," you also have the option of backing up to your PC and restoring data that were changed during operation and only stored in the runtime system.

Execute the "Copy RAM to ROM" function separately for the SINAMICS Integrated. This requires that the drive element has been selected in the Project Navigator.

See also

Properties of the user memory (Page 6987)

Deleting data

Overview of data deletion

The SIMOTION D4x5-2 memory described in the "user memory concept" can be deleted in various graduations. This enables you to determine whether data in your system should be deleted completely or partially.

You have the following options for deleting SIMOTION D4x5-2 data:

- Memory reset of SIMOTION D4x5-2 (Page 7186)
- Deleting user data on CompactFlash card (Page 7189)
- Setting SINAMICS Integrated to the factory settings (Page 7189)
- Setting SIMOTION D4x5-2 to the factory settings (Page 7190)
- Deleting/restoring non-volatile SIMOTION data (Page 7274)
- Backing up / restoring / deleting SINAMICS NVRAM data (Page 7110)

Memory reset of SIMOTION D4x5-2

Introduction

During the memory reset, the memory of the SIMOTION D4x5-2 and the non-volatile SIMOTION data in the NVRAM with the exception of the communication configuration (baud rates, network addresses, etc.), are deleted. The data on the CF card is retained during the memory reset.

You must perform a memory reset of SIMOTION SIMOTION D4x5-2:

- If you want to undo changes made to user data (programs, configuration data, parameter assignments) which you have not backed up by means of the "Copy RAM to ROM" command.
- If the STOP LED is flashing (slow flashing, yellow) to indicate that the SIMOTION D4x5-2 is requesting a memory reset.
- If the non-volatile SIMOTION data and the project on the CF card do not match and an error occurs (diagnostic buffer entry).

You can perform the memory reset online via SIMOTION SCOUT or offline via the mode selector on the SIMOTION D4x5-2.

Data deleted on memory reset

The following data are deleted during a memory reset:

- User data (units, configuration data, parameter settings, task configuration)
- Technology packages

- Retain TO (absolute encoder adjustment)
- Retain variables
  Retain variables are variables in the interface or implementation section of a UNIT that are declared with VAR_GLOBAL RETAIN or global device variables with the RETAIN attribute.

Note

Absolute encoder data are deleted during a memory reset and must therefore be readjusted after the memory reset.

Data retained during memory reset

The following data are retained during a memory reset:

- TCP/IP parameters and DP parameters
- Diagnostic buffer
- Data saved with the **_savePersistentMemoryData**, **_saveUnitDataSet** or **_exportUnitDataSet** system functions and the "Copy RAM to ROM" function
  If backup files (PMEMORY.XML/PMEMORY.BAK) backed up with **_savePersistentMemoryData** exist, the data in these files is restored to the non-volatile SIMOTION data after the memory reset. The user can therefore perform a memory reset to force the backed up non-volatile SIMOTION data to be restored. This also includes the absolute encoder position.
- Licenses
- SINAMICS NVRAM data

The technology packages and user data (configuration data, programs, parameter assignments) that were previously backed up on the CF card using the "Copy RAM to ROM" menu command will be transferred to the "non-volatile SIMOTION data" area of the SIMOTION D4x5-2 during the next power-up. Thus, an existing configuration on the CF card is loaded to the SIMOTION device following the memory reset.

Memory reset via SIMOTION SCOUT

The SIMOTION device for which overall reset is to be performed must be online.

1. Open the "Control Operating State" dialog box in SIMOTION SCOUT. Select the "Target system" > "Control operating state" menu command. Or click on "Control Operating State" on the toolbar.
2. Switch the SIMOTION device for which memory reset is to be performed to STOP in the "Control Operating State" dialog box.
3. Select the SIMOTION device under "Memory reset (MRES)." Click the "Run" button. Confirm the command by clicking "Yes."
   The memory reset will now be performed.

Memory reset with the mode switch

You can perform a memory reset with the mode switch when you are offline with the SIMOTION D4x5-2.

NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Comply with the ESD rules.

Proceed as follows to reset the memory:

1. Place the mode switch in the STOP position (switch setting 2, see figure below).

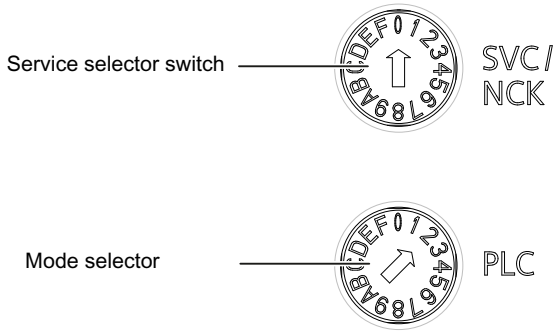

Figure 10-120 Memory reset with the mode switch (position 2 = STOP)

2. When the STOP LED is steadily yellow, turn the switch to the MRES position (switch position 3). The STOP LED starts to flash slowly (slow yellow flashing).
   Wait until the STOP LED stops flashing.
3. Turn the selector back to the STOP setting.
4. You must turn the selector back to the MRES position again within 3 seconds. The memory reset will now be performed.
   The SIMOTION D4x5-2 has completed the memory reset when the STOP LED is steadily yellow.

   Note

   If you do not return the mode switch to the MRES position (switch position 3) within 3 seconds, but take longer, then the memory reset may not be performed. You must then repeat the procedure.

5. Now move the mode switch back to the required operating mode.

NOTICE
Unintentional restoration of the default settings instead of memory reset
Note that the MRES position (switch position 3) during power-up causes the default settings to be restored. See Section Setting SIMOTION D4x5-2 to the default settings (Page 7190).
Make sure you do not accidentally switch the power supply OFF/ON in the MRES selector setting, as this restores the default settings instead of performing the desired memory reset.

Deleting user data on CompactFlash card

Overview

Deletion of the user data from the CompactFlash card is necessary, for instance, if you wish to load another (new) project to the CompactFlash card and therefore find it necessary to delete the existing user data for an old project (e.g. unit data sets) from the CompactFlash card.

You can delete the user data with SIMOTION SCOUT. This requires you to go online on the SIMOTION D4x5-2. The following data is deleted:

- User data from the "volatile data" area
- Non-volatile data, with the exception of IP and DP parameters
- User data on the CompactFlash card (user directories), including the SINAMICS configuration

You can thus continue to go online to the SIMOTION D4x5-2 with your PG/PC. The licenses on the CompactFlash card are retained.

Deleting user data

1. Open the project you want to edit in SIMOTION SCOUT.
2. Go online with the SIMOTION D4x5-2.
3. Select the SIMOTION D4x5-2 in the project navigator and select the "Delete user data on card" option in the "Target system" menu.
4. Confirm the "Delete user data on card" prompt with "OK".
   The user data is deleted and the SINAMICS Integrated goes offline.

Restoring the default settings of SINAMICS Integrated

Requirement

You must be online to SINAMICS Integrated in order to restore its factory settings.

Restoring the factory settings

1. Right-click "SINAMICS_Integrated" in the project navigator.
2. Select the "Target device > Restore factory settings" command from the context menu.

This restores the delivery state of SINAMICS Integrated.

Note

Use the same procedure for the CX32-2 controller extension and the SINAMIC S120 drive units.

Note

Note if a CX32-2 is configured

If the factory settings are restored on a SINAMICS Integrated with an already configured CX32-2, and the SINAMICS Integrated is subsequently uploaded, the CU-Link is deleted and thus also the entry of the CX32-2 in the topology. The project can then no longer be corrected by the user.

Setting SIMOTION D4x5-2 to the factory settings

Overview

SIMOTION D4x5-2 is supplied with preset parameters, such as the transmission rate or PROFIBUS addresses. You can restore the default settings with the mode selector. This will delete the following data:

- Non-volatile SIMOTION data in the SIMOTION device
- The backup copy of non-volatile SIMOTION data on the CF card (PMEMORY.XML/ PMEMORY.BAK)
- User data in the "volatile SIMOTION data" area and on the CF card
- The communication configuration (IP and DP parameters) on the CF card is set to the factory settings.

The licenses on the CF card are retained.

Restoring default settings with the mode selector

1. The power supply is switched off.
2. Set the mode selector on the SIMOTION D4x5-2 to MRES (switch position 3).

3. Switch on the power supply.
   The NVRAM and the SIMOTION user data are deleted. The default settings are loaded. SIMOTION D4x5-2 remains in STOP mode.
4. Now use the mode selector to change to the desired operating state.

Note

The communication parameters are now reset to the default settings (PROFIBUS address 2, baud rate of 1.5 Mbit/s). The communication configuration for SIMOTION D4x5-2 must be performed again. The existing IP settings for the CBE30-2 are restored to the default settings.

Powering down the system

If you wish to shut the system down, you must ensure that all axes and system parts are set to a safe state. You can set this up by providing a separate motion task, for example.

Once the system is at a standstill, you can switch off the power supply.

Note

You must observe the safety notes for SINAMICS components, which you will find in the corresponding SINAMICS manuals.

Configuring Safety Integrated functions

Overview

Integrated safety functions

When used in conjunction with SIMOTION D, the integrated safety functions of SINAMICS S120 provide highly effective practical protection for personnel and machinery.

- Safety Integrated Basic Functions
- Safety Integrated Extended Functions
- Safety Integrated Advanced Functions

Note

As of SIMOTION V5.2 / SINAMICS Integrated V5.1, a distinction is made between Safety Integrated Extended and Advanced Functions. The Safety Integrated Advanced Functions also include the Safety Integrated Extended Functions.

The safety functions listed here conform to:

- Safety Integrity Level (SIL) 2 according to IEC 61508
- Category 3 according to DIN EN ISO 13849-1
- Performance Level (PL) d according to DIN EN ISO 13849-1

The safety functions correspond to the functions according to DIN EN 61800-5-2 (if they are defined there).

Safety Integrated Functions overview

If motors without a (safety-capable) encoder are being used, not all Safety Integrated Functions can be used.

Note

Definition: "Without encoder"

When "without encoder" is used in this manual, then this always means that either no encoder or no safety-capable encoder is being used.

In operation without encoder, the actual velocity values are calculated from the measured electrical actual values. Therefore, velocity monitoring is also possible during operation without encoder.

Table 10-56 Overview of the Safety Integrated Functions

	Functions	Abbreviation	With encoder	Without encoder	Brief description
Basic Functions	Safe Torque Off	STO	Yes	Yes	Safe torque off
	Safe Stop 1	SS1 [1)]	Yes	Yes	Safe stop according to stop category 1
	Safe Brake Control	SBC [2)]	Yes	Yes	Safe brake control

	Functions	Abbreviation	With encoder	Without encoder	Brief description
Extended Functions	Safe Torque Off	STO	Yes	Yes[4]	Safe torque off
	Safe Stop 1	SS1[1]	Yes	Yes[4]	Safe stop according to stop category 1
	Safe Brake Control	SBC	Yes	Yes[4]	Safe brake control
	Safe Operating Stop	SOS	Yes	No	Safe monitoring of the standstill position
	Safe Stop 2	SS2	Yes	No	Safe stop according to stop category 2
	Safely-Limited Speed	SLS	Yes	Yes[5][6]	Safe monitoring of the maximum velocity
	Safe Speed Monitor	SSM	Yes	Yes[5][4]	Safe monitoring of the minimum velocity
	Safe Direction	SDI	Yes	Yes[5][4]	Safe monitoring of the direction of motion
	Sicheres Referenzieren	SR	Yes	No	Safe homing
	Safe Acceleration Monitor	SAM	Yes	Yes[4]	Safe monitoring of the drive acceleration
	Safe Brake Ramp	SBR	Yes	Yes[4]	Safe braking ramp
	Safe gear change	–	Yes	No	–
	Safely-Limited Acceleration	SLA[3]	Yes	No	Safely-limited acceleration
	Safe Brake Test	SBT	Yes[5]	No	Safe test of the required holding torque of a brake
Advanced Functions	Safely-Limited Position	SLP	Yes[5]	No	Safely-limited position
	Transfer of safe position values	SP	Yes[5]	Yes[4]	Transfer of safe position values
	Transfer of Safe Cam position values	SCA[3]	Yes	No	Safe cams

1) Incl. SS1E (SS1 with external brake). In this variant of SS1, SIMOTION is responsible for the stop response.

2) For SBC you require a Safe Brake Relay in addition to Power Modules in blocksize format connected via CUA31/32. A Safe Brake Adapter is required for Power Modules in chassis format.

3) As of SIMOTION V5.2 / SINAMICS Integrated V5.1

4) The use of this safety function without encoder is permitted only for induction motors or synchronous motors of the SIMOTICS A-1FU (previously: SIEMOSYN).

5) As of SIMOTION V4.4 / SINAMICS Integrated V4.7. (SBT: As of V4.4 HF4)

Note

Details on the Safety Integrated functions, such as information on the configuration of safety functions as well as operating conditions for the encoderless operation can be found in the *SINAMICS S120 Safety Integrated* Function Manual.

Notes

Parameterize the desired Safety Integrated functions and the monitoring with or without encoder and activate them in the safety screen forms of the SIMOTION SCOUT engineering system.

If motors are used without an encoder or with an encoder that is not suitable for Safety Integrated Extended Functions, not all Safety Integrated functions can be used (see previous table, column "without encoder").

The safe speed monitoring without encoder also functions at standstill as long as the drive is switched on.

PROFIsafe telegrams

SIMOTION D4x5-2 supports PROFIsafe telegrams 30, 31, 901, 902 and 903. (902 as of SIMOTION V4.4; only in conjunction with the TIA Portal; 903 as of SIMOTION V5.1 for Safe Cam, SCA).

With telegrams 901, 902 and 903, it is possible to apply a factor to the SLS limit value 1 parameterized in the drive, allowing the SLS monitoring limit to be changed during operation. Moreover, in telegrams 901 and 902, the safe position actual values communicated in the SINAMICS S120 are transferred via PROFIsafe to the F-CPU (function SP). With telegram 903, the state of up to 30 cams can be transferred.

Note

The "Transfer safe position values via PROFIsafe" function is supported as of SIMOTION V4.4.

Activate Safety Integrated functions

Control

The Safety Integrated functions are completely integrated into the drive system. They can be activated as follows:

- Safety Integrated Basic Functions are activated via terminals on the device or via a PROFIsafe telegram by means of PROFIBUS or PROFINET.
- Safety Integrated Extended/Advanced Functions are activated via the TM54F Terminal Module or via a PROFIsafe telegram by means of PROFIBUS or PROFINET.
- The Safety Integrated Basic Functions via terminals and the Safety Integrated Extended/ Advanced Functions (via TM54F or PROFIsafe) can be used simultaneously.
- As of SIMOTION V4.5, the Safety Integrated Basic Functions STO, SS1 and SBC can also be controlled license-free via the TM54F. (Requirement: STARTER V4.4 SP1; STARTER V4.4 SP1 is not part of SCOUT V4.4 - the functionality is therefore only available as of SCOUT V4.5)
- The SLS and SDI functions can also be activated permanently via parameter assignment.
- The SLA Extended Function can only be activated via PROFIsafe.

The output signals of the SCA Advanced Function can only be output via PROFIsafe.

Note

PROFIsafe or TM54F

Using a Control Unit, control is possible either via PROFIsafe or TM54F. Mixed operation is not permitted.

The Safety Integrated functions are implemented electronically and therefore offer short response times in comparison to solutions with externally implemented monitoring functions.

Note

Although SIMOTION does not contain any safety-related functionality, it provides support for SINAMICS drives that can perform safety-related functions.

The purpose of this SIMOTION support, depending on the activated the safety-related monitoring functions, is to prevent fault reactions at the drive end by ensuring that the drive does not exit the monitored operating state.

Further information on support of the SINAMICS Safety Integrated functions on the TO axis can be found in the *TO Axis Electric/Hydraulic, External Encoder* Function Manual.

Required hardware

When safety functions are controlled via the TM54F or via PROFIBUS/PROFINET with PROFIsafe, at the very least the following hardware versions must be used:

Table 10-57 Required hardware versions

Module	Article number	Required product version
SIMOTION D425-2 DP	6AU1425-2AA00-0AA0	E
SIMOTION D425-2 DP/PN	6AU1425-2AD00-0AA0	E
SIMOTION D435-2 DP	6AU1435-2AA00-0AA0	E
SIMOTION D435-2 DP/PN	6AU1435-2AD00-0AA0	E
SIMOTION D445-2 DP/PN	6AU1445-2AD00-0AA0	C
	6AU1445-2AD00-0AA1	C
SIMOTION D455-2 DP/PN	6AU1455-2AD00-0AA0	C
SIMOTION CX32-2	6AU1432-2AA00-0AA0	B
CBE30-2	6FC5312-0FA00-2AA0	A

The hardware requirements of the drive components can be found in the *SINAMICS S120 Safety Integrated* Function Manual.

Quantity structures

The maximum number of servo drives with Safety Integrated functions for each Control Unit is:

Table 10-58 SIMOTION D4x5-2 quantity structures

Maximum number of drives when safety function is activated (servo / vector / V/f) [3]	**SIMOTION D4x5-2** [5]	**CX32-2**	**CU320-2**
• Via CU/EP terminals (STO, SBC, SS1 only)	6 / 6 / 12	6 / 6 / 12	6 / 6 / 12
• Motion monitoring without selection	6 / 6 / 12 [4]	6 / 6 / 12 [4]	6 / 6 / 12 [4]
• Via TM54F terminals	6 / 6 / 6	6 / 6 / 6	6 / 6 / 6
• Via PROFIBUS with PROFIsafe [1]	6 / 6 / 11	6 / 6 / 11	6 / 6 / 11
• Via PROFINET with PROFIsafe [2] (D4x5-2 DP/PN only)	6 / 6 / 11	6 / 6 / 11	6 / 6 / 11

1) PROFIBUS with PROFIsafe:
If SIMOTION D is operated as an intelligent DP slave on an F-CPU, a maximum of 32 safety slots can be configured for each intelligent DP slave in **HW Config**. If the Safety Integrated functions are controlled via PROFIBUS with PROFIsafe, one slot in the input area and one slot in the output area are used for each safety axis. This results in a maximum of 16 drives with the Safety Integrated function for each PROFIBUS interface (intelligent DP slave) of the D4x5-2. If with SIMOTION D both PROFIBUS interfaces are operated as an intelligent DP slave on a F-CPU, the quantity structure increases to 2 x 16 drives (sum of the drives on the SINAMICS Integrated, CX32-2 and SINAMICS Control Units). In this case however, no PROFIBUS master interface is available for the connection of I/Os, for example.

2) PROFINET with PROFIsafe:
The maximum permissible quantity structure for the D4x5-2 is max. 128 drives depending on the Control Unit (< V4.2 SP1 HF1: 42 drives; V4.2 SP1 HF1 to V4.4: 64 drives) with Safety Integrated function (sum of drives on SINAMICS Integrated, CX32-2 and SINAMICS Control Units).

3) Data for V/f refers to versions as of SIMOTION V4.3 / SINAMICS V4.5

4) All axes V/f control, 500 µs, Safety Integrated with encoder

5) Also with CX32-2 connected to D4x5-2

The maximum drive quantity structure depends on other factors. For example with T_i= 125 µs, maximum of four Motor Modules may be operated with Safety Integrated Extended/Advanced Functions on a DRIVE-CLiQ line. Additional drive components (e.g. Line Modules, Terminal Modules, encoders, etc.) can also reduce the maximum drive quantity structure.

Recommendation:
With the SIZER configuration tool, you can easily configure the SINAMICS S110/120 drive family including SIMOTION.

For further information see

- *SINAMICS S120* Function Manual (FH1), Section *Rules for wiring with DRIVE-CLiQ*
- *SINAMICS S120 Safety Integrated* Function Manual

Use of two PROFINET interfaces

An F-CPU can only be connected to one of the two PROFINET interfaces, because fail-safe I/O transfer areas can only be configured either on the I-device on the onboard PROFINET interface or on the CBE30-2.

The PROFIsafe telegrams are routed to the following drives:

- Drives on the SINAMICS Integrated and CX32-2
- Drives on the onboard PROFINET interface (X150 interface)
- Drives on the CBE30-2 (X1400 interface)

The maximum quantity structure for PROFIsafe on PROFINET is therefore not increased by using a second PROFINET interface.

Safety Integrated functions with TM54F

Safety Integrated functions are activated via fail-safe digital inputs on the TM54F. This means that every drive control (SINAMICS Integrated of SIMOTION D4x5-2, CX32-2, CU320-2, etc.) requires its own TM54F (assuming appropriate safety functions are to be used on the respective Control Unit). Only one TM54F can be connected for each SIMOTION D4x5-2, CX32-2 or SINAMICS S120 Control Unit.

Safety Integrated functions with PROFIsafe (PROFINET example)

Safety Integrated functions are activated via "PROFIsafe on PROFINET" safe communication. Control (F logic) is via a SIMATIC F-CPU which is connected to PROFIsafe via PROFINET, e.g. a SIMATIC S7-1500 F-CPU.

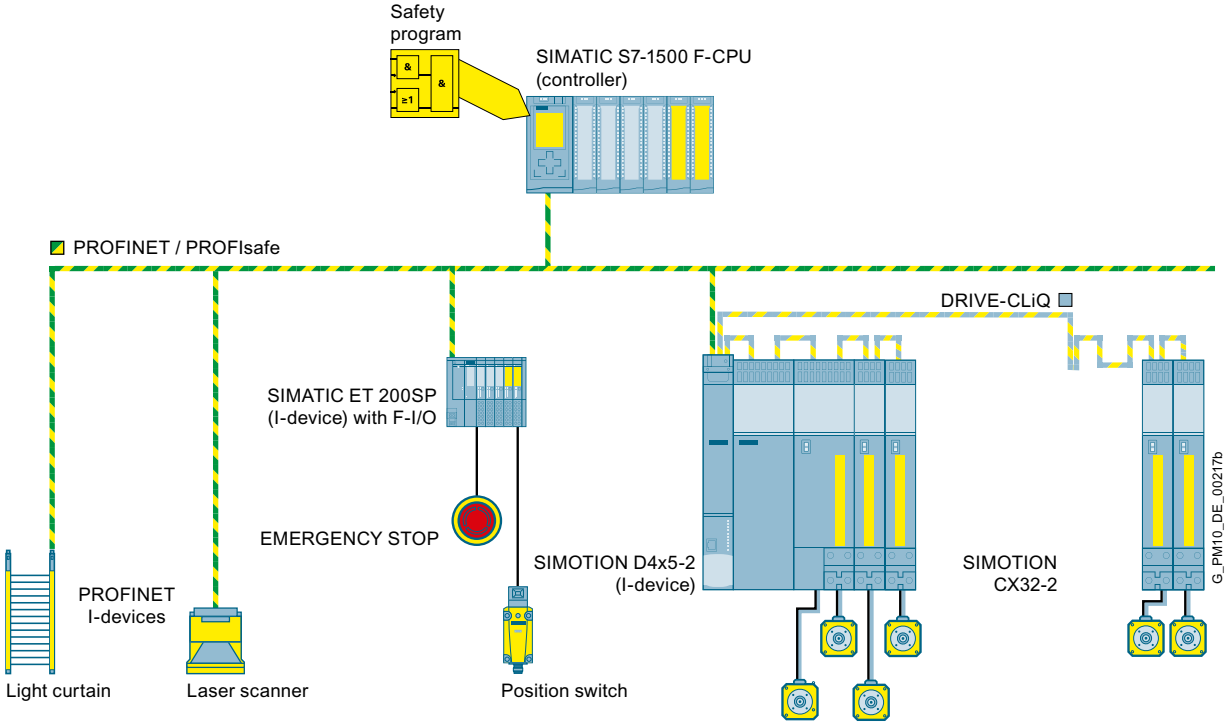

Figure 10-121 SIMOTION D, control of F functions via PROFINET with PROFIsafe

You will find an example function in Internet (https://support.industry.siemens.com/cs/ww/en/view/36489289).

Topologies (F proxy)

The F proxy functionality enables transparent routing of safety telegrams from the SIMOTION I-device (or slave) to the SIMOTION controller (or master).

The topologies that may be used with the SIMOTION D4x5-2 and CX32-2 are listed below. In each case, the description specifies whether the control of Safety Integrated functions is routed through to the drives.

- SIMATIC F-CPU (master), connected via PROFIBUS with PROFIsafe to SIMOTION D4x5-2 (I-slave)
  Note: PROFIBUS not possible configuration via SCOUT TIA
  - Routing to SINAMICS Integrated drives of the D4x5-2 and the CX32-2.
  - Routing to the drives of a SINAMICS S110/S120 CU connected to the D4x5-2.
    The CU is connected as a slave via PROFIBUS to the DP master interface of the D4x5-2.
    Routing to a CU connected via PROFINET is not possible.
- SIMATIC F-CPU (controller), connected via PROFINET with PROFIsafe to SIMOTION D4x5-2 (I-device)
  - Routing to SINAMICS Integrated drives of the D4x5-2 and the CX32-2.
  - Routing to the drives of a SINAMICS S110/S120 CU connected to the D4x5-2.
    The CU is connected as device via PROFINET to the PROFINET interface of the D4x5-2 (=controller) or the CU is connected as a slave via PROFIBUS to the DP master interface of the D4x5-2.
- The SIMOTION D4x5-2 is the PROFIBUS master for a direct fail-safe slave-to-slave communication, e.g. between a SIMATIC F-CPU (e.g. ET 200S F-CPU) and a SINAMICS S110/S120 CU.
  Direct fail-safe slave-to-slave communication with telegram 901: As of V4.3 SP1 HF9
  Not for SCOUT TIA (SIMOTION in the TIA Portal)
  See also application example in Internet (https://support.industry.siemens.com/cs/ww/en/view/38701812).

Note

Control for the Safety Integrated functions cannot be routed to the SINAMICS Integrated of the D4x5-2 or a CX32-2 in this constellation.

Topologies (Shared Device)

With the Shared Device functionality, you can configure access to an IO device with several IO controllers using PROFINET. This enables channels/modules to be flexibly assigned to different IO controllers. This option is available for inputs and outputs. You can use this mechanism to access the fail-safe data of a drive configured below a SIMOTION CPU via the F-CPU (e.g. access of an S7-1500 F-CPU to a SINAMICS S120 CU320-2 which is subordinate to a SIMOTION D4x5-2).

Requirement:

SIMOTION SCOUT (not possible with SCOUT TIA)

Note

When configuring PROFIsafe, it is recommended that you use the I-device F proxy functionality instead of the Shared Device.

Additional references

Additional information on configuring Safety Integrated functions can be found in the

- *SINAMICS S120 Safety Integrated* Function Manual
- *TO Axis Electrical/Hydraulic, External Encoder* Function Manual
- *SIMOTION Communication* System Manual
- Internet at the following address (https://www.automation.siemens.com/safety)

Quantity structures

With SIMOTION D, the SIMOTION PLC and motion control functionalities as well as the SINAMICS S 120 drive software run on a shared control hardware. The IEC 61131-3-compliant PLC integrated in SIMOTION D means that the system is not just capable of controlling sequences of motions, but the entire machine as well.

- The **scaling of the PLC and motion control functionality** is performed via Control Units of various performance classes for SIMOTION D
  - SIMOTION D410-2 is predestined for single-axis solutions and small multi-axis solutions with typically 2-3 axes (max. 8 axes)
  - SIMOTION D425-2 (BASIC performance) for up to 16 axes
  - SIMOTION D435-2 (STANDARD performance) for up to 32 axes
  - SIMOTION D445-2 (HIGH performance) for up to 64 axes
  - SIMOTION D455-2 DP/PN (ULTRA-HIGH performance) for up to 128 axes or applications with very short control cycle clocks

The possible axis quantity structures depend on the required servo and interpolator cycle clocks and apply for electric, hydraulic and virtual axes.

- The **scaling of the drive computing performance** is performed via SINAMICS drive controls for the SIMOTION D4x5-2. With the SIMOTION D4x5-2, the drive control of a CU320-2 is already integrated (SINAMICS Integrated). It can be extended as follows:
  - SINAMICS S110/S120 Control Units can be connected via PROFIBUS or PROFINET
  - The CX32-2 Controller Extension can be connected via DRIVE-CLiQ

SIZER

With the SIZER configuration tool, you can easily configure the SINAMICS S120 drive family including SIMOTION. It provides you with support for selecting and dimensioning the components required for a Motion Control task.

- Dimensioning of the PLC and motion control functionality --> selection of the SIMOTION D Control Unit
- Dimensioning of the drive computing performance and the required drive components.

Depending on your performance requirements, SIZER determines the possible number of axes and the resulting utilization on the SIMOTION and SINAMICS side.

Drive quantity structure

The following table can be used for a rough estimation of the maximum possible quantity structures on the drive side.

Depending on the functionality used, more or less performance resources are used on the drive control.

The performance points specified in the table can be used for a rough estimation. Maximum 15.5 performance points are available for each drive control (SINAMICS Integrated, CX32-2, CU320-2).

As well as the maximum number of available performance points, the maximum quantity structure of a functionality must also be taken into account (e.g. max. 6 servo drives with 125 µs current controller cycle clock).

Note

The following method just serves as a rough estimation of the possible quantity structures. It is not a substitute for dimensioning with the SIZER configuration tool.

Higher utilization can result through the use of SINAMICS function modules (e.g. extended messages / monitoring functions) or with a DP Integrated cycle clock < 0.5 ms.

Table 10-59 Estimation of the possible quantity structure

Information on dimensioning					**Your dimensioning (example)**	
Functionality	Characteristic [2]	max. number	Performance points		Quantity	SUM of the performance points
Line Module [5]	ALM/SLM with DRIVE-CLiQ	1	1.3		1	1.3
	BLM	1	0.4			
Servo[1]	125 µs	6	2	For each drive	6	12
	250 µs	6	1.2	For each drive		
2nd encoder	Not relevant	6	2 encoder/ drive	0.1		
DO encoder	1 ms	19	0.4	For each DO		

Information on dimensioning					Your dimensioning (example)	
Vector [1]	250 µs	3	4	For each drive		
	500 µs	6	2	For each drive		
V/f	500 µs	12	1	For each drive		
Safety Extended/ Advanced Function	12 ms	Depending on the drive	0.25	For each drive	6	1.5
TB30	Not relevant	1	0.1			
TM15 DI/DO	250 µs 1 ms 4 ms	8 [3]	0.5 0.2 0.1	For each TM		
TM31	250 µs 1 ms 4 ms	8 [3]	0.5 0.25 0.2	For each TM		
TM41 (SIMOTION operating mode)	125 µs / 2 ms [4] 125 µs / 4 ms [4] 250 µs / 4 ms [4]	8 [3]	1 1 0.5	For each TM		
TM54F	---	1 [3]	0.5	For each TM		
TM15/TM17	Not relevant	8 [3]	1	For each TM		
CX32-2	Not relevant	6	0.3	For each CX32-2		
CBE20 (for CU320-2)	Not relevant	1	0.5			
DCC SINAMICS	2 ms	75 DCC	2			
		50 DCC	1.5			
			SUM (max. 15.5)			14.8

[1] No mixed servo-vector operation possible

[2] Used time slice (for drives: Speed controller cycle clock)

[3] Absolute maximum: 16 Terminal Modules; these quantities can only be achieved with considerable restrictions (e.g. not with TM15/TM17).

[4] Sampling time for encoder emulation / sampling time for digital and analog I/Os

[5] Max. one Line Module, SLM without DRIVE-CLiQ (5 kW and 10 kW) not relevant

The required performance resources depend on further factors. The influence of the functions listed below can be neglected for an estimation using performance points:

- Use of DSC (linear)
- Connection of blocksize Power Modules via CUA31/32 ⇒ counts as booksize Motor Modules.

During the drive configuration, note that each CX32-2 on the SINAMICS Integrated generates an additional load. The transfer of a CX32-2/CU320-2 configuration on the SINAMICS Integrated is

therefore only possible with a connected CX32-2 when the CX32-2/CU320-2 were not fully utilized.

Note

Note also the topology rules of the SINAMICS S120, see *SINAMICS S120* Function Manual, Section *Rules for wiring with DRIVE-CLiQ*.

Mixed operation

Note the following when mixing control types on a drive control:

- A mixture of servo-controlled and vector-controlled drives is not possible
- A mixture of servo-controlled and V/f-controlled drives is possible
- A mixture of vector-controlled and V/f-controlled drives is possible

With regard to the drive quantity structure, the maximum number of servo or vector drives may not be exceeded by drives with V/f control in mixed operation, whereby two drives with V/f control (500 µs) count as one servo or vector drive.

In mixed operation of vector control and V/f control, the following axis constellations and current controller sampling times are not possible:

- 1 axis (vector control, 250 µs) and 8 axes (V/f control, 500 µs)
- 2 axes (vector control, 250 µs) and 4 axes (V/f control, 500 µs)

Migration of SIMOTION D4x5 to SIMOTION D4x5-2

Changeover from SIMOTION D4x5 to SIMOTION D4x5-2

A SIMOTION D4x5-2/CX32-2 not only has a different structure, but also a different functionality to a SIMOTION D4x5/CX32.

This has effects that must be taken into account during a changeover.

Change from D4x5 to D4x5-2 (upgrade)

The change from D4x5 to D4x5-2 is performed via a module replacement in **HW Config**. That means the change is similar to that of a D425 to D435.

The module replacement is started by dragging the new module to the frame of the module rack with the existing module in **HW Config**, see Section Device replacement in HW Config (Page 7228).

The module replacement is performed automatically. During this operation, the technology packages and the device versions are updated.

Existing configurations of the D4x5 are mostly taken over by the D4x5-2 during the module replacement.

Information on when project adaptations are required or not required when changing from a D4x5 to a D4x5-2 can be found in the following sections (see Table *Transfer of existing projects from D4x5 to D4x5-2*).

For further information on measures generally required for project adaptations, see Section Service and maintenance (Page 7209).

Change from D4x5-2 to D4x5 (downgrade)

As a SINAMICS drive cannot be downgraded, a module replacement of a SIMOTION D4x5-2 (SINAMICS Integrated firmware V4.x/V5.x) with a SIMOTION D4x5 (SINAMICS Integrated firmware V2.x) is not possible.

However, project data can be transferred by means of an XML export/import.

Transfer of existing projects

Existing configurations of the D4x5 are mostly taken over by the D4x5-2 during the module replacement.

The following table provides information on where project adaptations are required or not required:

Table 10-60 Transfer of existing projects from D4x5 to D4x5-2

Keyword	Explanation
PROFINET interface	D4x5 with CBE30 (4 ports) is mapped on D4x5-2 DP/PN onboard PROFINET interface (3 ports): • Only the wiring of ports 1 to 3 are taken over • Components on port 4 have to be reconnected • Communication relations, I/O data, synchronous operation connections, data exchange broadcast data, module addresses and diagnostics addresses are retained • Any existing PG/PC assignment is taken over Mapping of D4x5 on D4x5-2: X1400 (P1, P2, P3, not P4) → X150 (P1, P2, P3)
PROFIBUS interfaces	The configurations on the PROFIBUS interfaces including any existing PG/PC assignment are retained. Mapping of D4x5 on D4x5-2: X126 DP1 → X126 DP X136 DP2/MPI → X136 DP/MPI
Reduction ratio of PROFIBUS cycle clock to servo cycle clock	As of SIMOTION V4.3, the SIMOTION D4x5-2 supports a reduction ratio of PROFIBUS cycle clock to servo cycle clock. The following applies for V4.2: **PROFIBUS cycle clock: servo cycle clock = 1 : 1** If SIMOTION D4x5 projects have been transferred in which a reduction ratio factor was set, • a SIMOTION version ≥ V4.3 must be used, or • the cycle clock setting must be adapted for V4.2 projects

Keyword	Explanation
Ethernet interfaces	The configurations on the Ethernet interfaces including any existing PG/PC assignment are retained. **Mapping of D4x5 on D4x5-2:** X120 IE1/OP → X127 P1 PN/IE (interface on the front of the module) X130 IE2/NET → X130 P1 PN/IE-NET (interface under the front flap) The X120 P1 PN/IE-OP interface is only available on the D4x5-2 DP. Mapping is never performed on this interface. The following figure provides an overview of the default addresses as well as the behavior when upgrading a D4x5 to D4x5-2 (assumption: The default addresses have been used for the D4x5).  With SIMOTION D4x5, the Ethernet interfaces of the D4x5 have default addresses in the delivery condition. These addresses are also offered as default addresses in the configuration of SIMOTION SCOUT. With SIMOTION D4x5-2, only interface X127 P1 has a default address in the delivery condition. Interface X127 P1 is preferable for the PG/PC connection because it is easier to access. The default address is an Automatic Private IP Address (APIPA, Automatic Private IP Addressing). In this way, a PG/PC can automatically configure the network interface. Interfaces X120 P1 and X130 P1 do not have an address in the delivery condition. When configuring the interfaces, the addresses shown in the figure are offered as default addresses.
Telegram configurations	Telegram configurations on the PROFIBUS and PROFINET interfaces are retained. The same applies for the addresses of the slots/subslots.
SINAMICS Integrated / Controller Extension	The SINAMICS Integrated and Controller Extension are changed to the new type and its corresponding version. The drive configuration and the assignments of the DRIVE-CLiQ interfaces are retained.

Keyword	Explanation
Configuration of the onboard I/Os	The configuration of the onboard I/Os is retained. Functionality, quantity structure and terminal designations of the onboard I/Os for the D4x5-2/CX32-2 differ from the previous modules because of innovations. Example: • D4x5-2 has additional technology I/Os on terminal block X142 (e.g. for high-precision cam outputs); a cam output on X122/X132 is no longer supported • Terminal blocks X122/X132 have additional digital inputs and therefore the pin assignments on the terminal block have been moved.
CF card / firmware	SIMOTION D4x5 and D4x5-2 have different CompactFlash cards and different card mappers (firmware). 1 GB CF cards of the D4x5 can also be used for the D4x5-2 when a new boot loader is loaded. For details, see Section Boot loader on the CompactFlash card (Page 7247).
Mixture of Control Units of different generations	The firmware version of a Controller Extension (CX) is always identical to the SINAMICS Integrated. Therefore • The CX32 can only be operated on the D4x5 • The CX32-2 can only be operated on the D4x5-2 These dependencies do not apply for SINAMICS S120 Control Units. A CU320 can therefore be operated on a D4x5-2.
Connectable drive components	As for the CU320-2, some older drive components are also no longer supported by the D4x5-2/CX32-2. For details, see Section Permissible combinations (Page 7206)
User program	In principle, a D4x5 user program can run on a D4x5-2, however, adaptations may be required because of innovations in the hardware. Examples: • The non-volatile data is backed up permanently and maintenance-free for the D4x5-2 (backed-up SRAM for D4x5); a buffer failure signaled via **persistentDataPowerMonitoring.powerFailure = "YES"** therefore only applies to the real-time clock, not for the non-volatile data. • The runtime behavior of the D4x5-2 modules changes because of the increase in performance. As long as the user program does not contain any "runtime-dependent code", adaptations should not be necessary. • The D4x5-2 has a double fan module. The user program must be adapted in order to profit from the advantages of a double fan compared with a single fan (identification of required maintenance). See Section Overview of the fan/battery module states (Page 7002). • The user program will have to be modified with respect to detection of the maintenance case for D425-2/D435-2 if D425/D435 was used without a fan/battery module. See Section Overview of states, fan/battery module (Page 7002). • The **batterynecessary** and **fannecessary** system variables have different states depending on the device. See – Section Operations and their effect on the user memory (Page 6990) and – Section Cooling the SIMOTION D4x5-2 (Page 7001) • As of SIMOTION V4.3, the following additional functions are available for the D4x5-2: – System variables **rtcFailure** and **retainDataFailure** – Backup of the non-volatile SINAMICS data (NVRAM data) via CU parameter p7775 – Automatic detection of a module replacement on the basis of the serial number of the Control Unit

Keyword	Explanation
Hardware	The following changes have been made because of the hardware innovations: • CF card under a cover (previously open access) • Additional and slightly differently arranged operator control and display elements • Modified connectors (larger cable cross-section, screw connection on the 24 V terminal block, etc.) • D445-2 DP/PN and D455-2 DP/PN have a heat sink so that the spacers (with the exception of external heat dissipation) cannot be disassembled as for the D445-1. See also Section Mounting a SIMOTION D4x5-2 (Page 6923). • A double fan/battery module is always required for D4x5-2 Control Units. See Section Cooling the SIMOTION D4x5-2 (Page 7001). • Controller Extensions (CX) for D4x5 can only be used for the D435 and D445/D445-1; with the D4x5-2, all Control Units support the use of CX32-2 Controller Extensions.
Installation options	For the SIMOTION D4x5 Control Units, it was possible to mount the Control Unit directly on the Line Module via lateral mounting elements. This mounting option is no longer offered for D4x5-2 Control Units because of their higher weight. This mounting option is now only available for the CX32-2 Controller Extension and the CU320-2 Control Unit.

Permissible combinations

DRIVE-CLiQ components

Some "older" DRIVE-CLiQ components can no longer be used with the SIMOTION D4x5-2/ CX32-2.

Table 10-61 DRIVE-CLiQ components that cannot be used with the D4x5-2/CX32-2

DRIVE-CLiQ components	Notes	Ending of the Article No.
Single Motor Modules (SMM) Double Motor Modules (DMM)	6SL31* (all Motor Modules Booksize Compact 6SL34* can be used)	< 3
Line Modules (ALM/SLM)	6SL313* The following can generally be used: • All BLM (6SL313*) • SLM (6SL313*) 5 and 10 kW	< 3
Chassis power units (Line Modules, Motor Modules, Power Modules)		< 3
SMC30 Sensor Module Cabinet		< 2
TM31/TM41 Terminal Modules		< 1
SME20/25 Sensor Modules External		< 3
CUA31 Control Unit Adapter		< 1
Power Modules (chassis)		< 3

A detailed, regularly updated list of the DRIVE-CLiQ components approved for use with SIMOTION, as well as notes on their use, can be found on the Internet at (https://support.industry.siemens.com/cs/ww/en/view/11886029).

If incorrect components are used, a topology error is signaled
F01360 Topology: Actual topology not permitted.

CX32-2

The tables below provide an overview of the possible combinations:

Table 10-62 Controller extension combinations

Controller extension	Article number	Use in D4x5	Use in D4x5-2
CX32	6SL3040-0NA00-0AA0	Possible	Not possible
CX32-2	6AU1432-2AA00-0AA0	Not possible	Possible

Only approved combinations can be configured. If physically an incorrect controller extension is used, a topology error is signaled.
F01360 Topology: Actual topology not permitted

CBE30-2

The tables below provide an overview of the possible combinations:

Table 10-63 Communication Board Ethernet combinations

Communication Board Ethernet	Article number	Use in D4x5	Use in D4x5-2
CBE30	6FC5312-0FA00-0AA0	Possible	Not possible
CBE30-2	6FC5312-0FA00-2AA0	Not possible	• D4x5-2 DP/PN: As of V4.3 • D4x5-2 DP: Not possible

Only approved combinations can be configured. If physically an incorrect Communication Board Ethernet is used, the CBE cannot be fully inserted into the option slot.

CF card

A CF card with D4x5 firmware / drive software cannot run on a D4x5-2. The same applies for the reverse situation.

In case of an error, the 6 LED displays (RUN to DP/MPI) flash yellow at 2 Hz.

Licenses

Licenses purchased for SIMOTION D can be used for both the D4x5 and D4x5-2.
Previously used platform-specific "MultiAxes Package for D445/D445-1" licenses can also be used for the D445-2 DP/PN and D455-2 DP/PN.

A new license has not been introduced for the D455-2 DP/PN performance class.

Migration of SIMOTION D445-2 (-0AA0) to D445-2 (-0AA1)

SIMOTION D445-2 (article number 6AU1445-2AD00-0AA1) is the successor type of SIMOTION D445-2 (article number 6AU1445-2AD00-0AA0). Availability: from approx. mid/end 2020.

Compatibility

SIMOTION D445-2 (-0AA1) is compatible with SIMOTION D445-2 (-0AA0). (Compatibility regarding installation, electrical connections, project and engineering).

Configuration with older software versions

SIMOTION D445-2 (6AU1445-2AD00-0AA1) is available as of SCOUT/SCOUT TIA Version V5.4.x in the module catalog.

For SCOUT/SCOUT TIA versions (≤ V5.3 SP1), the new article number (6AU1445-2AD00-0AA1) is not yet included in the module catalog. SIMOTION D445-2 (6AU1445-2AD00-0AA1) can be configured due to the compatibility with the article number (6AU1445-2AD00-0AA0).

Spare part scenario

For a spare part scenario, you can swap the CF card from the predecessor (-0AA0) to the successor (-0AA1). The SCOUT/SCOUT TIA project does not have to be changed when exchanging SIMOTION D445-2 (-0AA0) for SIMOTION D445-2 (-0AA1). You also do not need to upgrade the SCOUT/SCOUT TIA project to the successor type (-0AA1).

Note

Depending on the application, SIMOTION D445-2 (-0AA1) provides higher performance than SIMOTION D445-2 (-0AA0). A configured CF card can be operated with SIMOTION D445-2 (-0AA0) and D445-2 (-0AA1) under the following conditions:

- When changing from SIMOTION D445-2 (-0AA0) to SIMOTION D445-2 (-0AA1), the application is able to cope with the increased PLC and motion control performance; i.e. the application is programmed in such a way that shorter running times do not result in a deviating/incorrect program sequence.
- When changing from SIMOTION D445-2 (-0AA1) to SIMOTION D445-2 (-0AA0), the lower PLC and Motion Control performance is sufficient for the application. If this is not the case, adjustments need to be made (e.g. in the cycle clock settings).

It is recommended to ensure there is no effect on the application before changing the module.

10.1.1.8 Service and maintenance

Overview

Introduction

It is possible to distinguish between the following scenarios when replacing and updating components:

- Replacing modules (spare part scenario)
  - Parts replacement for SIMOTION D4x5-2 (Page 7213)
  - Removal and replacement of the SIMOTION D4x5-2 (Page 7214)
  - Replacing DRIVE-CLiQ components (Page 7215)
  - For information on replacing SIMOTION D4x5-2 fans, see Chapter "Replacing the battery in the fan/battery module" in the *SIMOTION D4x5-2* Manual
  - Replacing the CompactFlash card (Page 7217)
- Adapting a project (new device type / new device version)
  The project needs to be adapted if you want to change the type (e.g. D445 ⇒ D445-2 DP/PN) or the version of the SIMOTION device in your existing project.
  - Creating backup copies (project/CF) (Page 7222)
  - Backing up user data (Save variables) (Page 7222)
  - Upgrading a user project to the new SCOUT version (Page 7224)
  - Platform replacement via XML export/import (Page 7225)
  - Preparing the device replacement (Page 7226)
  - Device replacement in HW Config (Page 7228)
  - Upgrading technology packages (Page 7228)
  - Upgrading the device version of SINAMICS S120 control units (Page 7231)
  - Upgrading a library (Page 7232)
  - Save project, compile and check consistency (Page 7233)
- Performing a firmware and project update
  - Upgrading the boot loader on the CF card (Page 7233)
  - Update - preparatory measures (Page 7234)
  - Update via SIMOTION IT web server (Page 7235)
  - Upgrade via device update tool (upgrading SIMOTION devices) (Page 7235)

– Update via CF card
  Backup of the CF card data (Page 7239)
  Firmware update via CF card (Page 7240)
  Upgrading SINAMICS (Page 7241)
  Download project to target system (Page 7243)
  General information on SINAMICS firmware update (Page 7244)

Note

Upgrading using the device update tool offers a number of advantages (keeping retain data, option of downgrading, no license key handling, etc.). We would therefore recommend using this method for firmware and project updates.

Please also observe the information on handling the CompactFlash Card.

- Changing the CompactFlash card (Page 7245)
- Writing to a CompactFlash card (Page 7246)
- Formatting the CompactFlash card (Page 7246)
- Boot loader on the CompactFlash card (Page 7247)
- Recommended method of handling CF cards (Page 7248)
- Card reader for CF cards (Page 7249)

Note

This document uses the following terms:

- Upgrade: Denotes upgrading to a higher version of a component/software
- Downgrade: Denotes reverting to a previous version of a component/software
- Update: In general terms, denotes the act of bringing a component/software up to date (or, more specifically, an upgrade or downgrade)

Overview

The exact procedure when replacing or updating components depends on various factors.

When you update a project, how you proceed will depend on the which parts are affected by the version change.

- Change of the SIMOTION main version
- Change of the SIMOTION service pack or hotfix version
- Change of the PROFINET version
- Change of the SINAMICS version
  (There are SIMOTION versions that contain several SINAMICS versions for a device.)

If another SIMOTION controller is to be used, then the procedure depends on whether a device or a platform replacement is required.

Examples of upgrade scenarios are listed in the following overview table. They are shown in the columns. The lines list the principle measures that have to be performed. Whether the measure

has to be performed in a specific case, must be decided project-specifically.
Grayed-out cells mean that a measure is not required.

Note

If the version is changed and the SIMOTION controller replaced at the same time, then all measures apply; the measures must be performed in the TOP-DOWN sequence according to the table.

Action/Measure	Upgrade project				Replacement of SIMOTION controller		Activity relates to
	Main version	Service pack or hotfix version	PROFINET version	SINAMICS version	Device replacement via HW Config	Platform replacement via XML export/import	
Customize project							
Examples	V4.1 ⇨ V4.2	V4.1 SP2 ⇨ V4.1 SP4	PN2.1 ⇨ PN2.2	V2.5 ⇨ V2.6.2	D445-2 ⇨ D455-2 D4x5 ⇨ D4x5-2 D410-2 DP ⇨ D410-2 DP/PN	C240 ⇨ D445-2 D410-2 ⇨ D445-2 D445 ⇨ D445 (S120) (SM150)	Project/SIMOTION SCOUT
Create backup copy (project/CF)							
Back up user data (back up variables)	Only if required				Only if required	Only if required	
Upgrade user project to new SCOUT version							
Platform replacement via XML export/import	During platform replacement, the target version is specified (= version of the device that is the recipient of the import)						
Prepare device replacement							
Device replacement in HW Config							
Upgrade technology packages (TP)	[4]	[4]			[4]		
Upgrade device version of SINAMICS S120 CUs [3]				For external CUs, only if necessary			
Upgrade library	Libraries are version-dependent				Libraries may be device-dependent	Libraries may be device-dependent	
Save/compile project; check consistency							
Perform a firmware and/or project update							
Upgrade the boot loader on the CompactFlash card	Check whether new version requires a new boot loader [2]				Check whether the new [2] device requires a new boot loader		Memory card/Target hardware
Update - preparatory measures							
Upgrade via IT DIAG	Selection of one of the 3 update methods				Only possible if the CF card contains valid firmware		
Update via device update tool							
Update via CompactFlash Card							
Backup of the CompactFlash card data							
Firmware update using a CompactFlash card							
Upgrade SINAMICS [5]							
Download the project to the target system [1]							

Not relevant Relevant

1) Alternative: Load the project to the CF card using a card reader

2) See SW compatibility list (https://support.industry.siemens.com/cs/ww/en/view/18857317)

3) The versions of SINAMICS Integrated and Controller Extensions are upgraded automatically in the HW Config during device replacement

4) The technology packages are updated automatically. The user can directly specify a TP

5) SINAMICS components are upgraded/downgraded to the component version of the CF card. Ensure that LED codes are observed. After the upgrade it is necessary to switch the device off and on.

Figure 10-122 Overview of upgrade options

Replacing modules (spare part scenario)

Parts replacement for SIMOTION D4x5-2

Kernel/firmware ≥ V4.3

As of SIMOTION V4.3, a module replacement is detected by the controller on the basis of the serial number. This automatically deletes the non-volatile data and transfers the data backed up on the CF card to the controller. See Section Replacing modules in the spare part scenario (Page 6998).

Kernel/firmware V4.2

If a used D4x5-2 is used for the module replacement, we recommend that the non-volatile SIMOTION data be deleted on the used D4x5-2.

Two options are available for this.

Table 10-64 Options for deleting non-volatile SIMOTION data

Option	Reference to description	Notes
Module memory reset	Memory reset of SIMOTION D4x5-2 (Page 7186)	Controller via mode selector (position "3" MRES). Is available on all SIMOTION platforms.
Deleting and restoring non-volatile SIMOTION data	Overview (Page 7274)	Controller via Service switch (position "1"). Is only available on SIMOTION D.

NOTICE
Unintentional restoration of the default settings instead of memory reset
With a Power OFF/ON, "Restore default settings" is performed instead of "Memory reset" in switch position "3" (MRES) of the mode switch.
To avoid and unintentional/accidental deletion of the project data on the CF card, we recommend that the non-volatile SIMOTION data be deleted using the service selector switch. Restore default settings deletes all the project data on the CF card!

Operations and their effect on the user memory (Page 6990)

Removal and replacement of the SIMOTION D4x5-2

Removing the Control Unit

NOTICE
Damage to property can occur Installing or removing SIMOTION D410 with power connected can result in undefined states in your system. Damage to property can occur in your automation solution as a result. For this reason, only ever install or remove SIMOTION D410 with the power source disconnected. When configuring a system therefore always comply with the relevant standards and safety regulations, which are mandatory in any case.

Proceed as follows to remove the SIMOTION D4x5-2:

1. Switch off the power supply.
2. Remove the front cover and remove the CompactFlash card from the plug-in slot.
3. Disconnect the terminal block for the power supply.
4. Disconnect the DRIVE-CLiQ connectors to the SINAMICS S120 modules, the connectors of the PROFIBUS DP interfaces (X126 and X136), the Ethernet connectors to the X127, X120 and X130 interfaces (X120 only for D4x5-2 DP) and, if necessary, the connectors on the PROFINET X150 interface (X150 only for D4x5-2 DP/PN).
5. Remove the connectors to the digital inputs/outputs at interfaces X122, X132 and X142.
6. Disconnect any option module which may be inserted (CBE30-2, TB30).
7. Remove the mounting screws of the control unit.

Installing a new module

Proceed as follows to install a new SIMOTION D4x5-2:

1. Remove the front cover from the new Control Unit.
2. Mount the new Control Unit.
3. Reconnect all connectors that were removed previously.
4. Connect the terminal block for the power supply.
5. Reattach the designated shielding for all cables.
6. Reinsert the original CompactFlash card into the plug-in slot.
7. Reattach the front cover and close it.
8. Switch on the power supply. The Control Unit is immediately ready to operate.

SIMOTION D4x5-2 module replacement without PG/PC

To enable a module replacement without a PG/PC, you must back up the current non-volatile SIMOTION and SINAMICS data on the CF card during operation.

NOTICE
Loss of data due to failure to make backup copies
Non-backed-up non-volatile SIMOTION data can be lost on hardware replacement (module defect), for example, if the current value of the retain variables have not been backed up and replaced by their initial values again.
Back up the non-volatile SIMOTION data on the CF card.

NOTICE
Repeat referencing necessary after absolute encoder overflow
If an absolute encoder overflow occurs after **_savePersistentMemoryData**, the actual position value is no longer correct after the non-volatile SIMOTION data are restored.
In this case, homing (absolute encoder adjustment) must be repeated.

Operations and their effect on the user memory (Page 6990)

Replacing modules in the spare part scenario (Page 6998)

Replacing DRIVE-CLiQ components

Module replacement

DRIVE-CLiQ components not only support replacement in the switched-off state of the machine/system (Power Off), but also a replacement during operation. For this, the component to be replaced must be at the end of the DRIVE-CLiQ line.

Requirement

- The affected components are located at the end of the line.
- If an infeed is affected, the power units supplied by it do not function.

Procedure for "Removing a component"

1. Deactivate the affected component or the drive object.
2. Remove the DRIVE-CLiQ connector.
3. Remove the supply voltage of the component and uninstall the component.

Procedure for "Installing a component"

1. Install the component and reconnect the supply voltage.
2. Reconnect the DRIVE-CLiQ cable at the same location (port). The cable must have the same length as the old one.
3. Activate the affected component or drive object.

Parameters for topology comparator and component replacement

In the expert list, you can use CU parameter p9906 to specify how the electronic rating plates are compared for all the components of a Control Unit. The type of comparison can be changed subsequently for each individual component by using p9907/p9908 or right-clicking in the topology. All data on the electronic rating plate is compared by default.

- If p9909 = 1, the serial number and the hardware version of the new replaced component will be transferred automatically from the actual topology to the target topology and then saved to non-volatile memory.
- When p9909 = 0, serial numbers and hardware versions are not automatically transferred.

The setting p9901 = 1 enables the **spare parts / components replacement without tool support** to be carried out. The new serial number of the spare part is automatically transferred from the actual topology to the target topology and saved in non-volatile memory. Prerequisite is that the replaced components are of the same type and have the same article number, e.g. "6SL3055-0AA00-5BA2". The last or last two digits of the article number (depending on the component type) are not checked, as the HW version, for example, is coded in these. This mechanism is also applied when several components are replaced.

Modified wiring following module replacement

In the default setting for the topology comparator, modified wiring configurations of DRIVE-CLiQ components (e.g. cross-exchange) cannot be accepted for safety reasons and a fault is generated.

If a cross-exchange of components is required (i.e. existing components are replaced with other existing components, and no spare parts are used), e.g. for troubleshooting purposes, the topology comparator must be reduced via parameter p9906, or preferably via p9907/p9908; alternatively, by right-clicking in the topology.

Note

In this case, incorrect insertion of components is no longer monitored.

Automatic upgrading/downgrading (firmware update)

When starting up, the system automatically upgrades or downgrades DRIVE-CLiQ components to the version of the component firmware on the CF card. Components that cannot be downgraded to the component firmware version on the CF card (e.g. old firmware on the CF card and new components to which the old firmware cannot be loaded) retain their firmware version. The resulting firmware version combinations are always functional.

Note

During an automatic firmware update, please read the messages and alarms in the SIMOTION SCOUT detail window.

Note

The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are displayed additionally via a yellow RDY LED on the SIMOTION D/CX32-2, indicating that components connected to SIMOTION D/CX32-2 are carrying out a firmware update or that all components have finished their firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

The upgrade/downgrade function can be deactivated using the p7826 CU parameter in the expert list.

The component version can be obtained from the CONTENT.TXT file in the main directory of the CF card.

Additional references

You can find further information on this topic:

- In the *SINAMICS S120* Commissioning Manual
- In the *SINAMICS S120* Function Manual

Replacing the CompactFlash Card

If spare parts are being used, you must contact the Technical Support Center to convert the license key of the defective CompactFlash card to the new CompactFlash card. Proceed as described in the following sections to write your project to the new CompactFlash card:

- Changing the CompactFlash card (Page 7245)
- Writing to a CompactFlash card (Page 7246)

Detailed information about licensing can be found:

- In the *SIMOTION SCOUT* Configuration Manual
- As well as in the FAQ (https://support.industry.siemens.com/cs/ww/en/view/73501913)

Replacing the fan/battery module

Overview

The procedure for replacing the double-fan/battery module is described below.

Procedure

Proceed as follows to replace the double-fan/battery module:

1. Press the latch. This detaches the module from its front latching device.

Figure 10-123 Unlatching the fan/battery housing

2. Tilt the double-fan/battery module forwards at an angle and pull out the plastic lug from the Control Unit cutout.
3. Now take the double-fan/battery module and hold at an angle to the front with the open side facing up (battery visible).
4. Push the plastic lug into the cutout on the lower side of the Control Unit.
5. Tilt the double-fan/battery module up until the front latch snaps into place.
   The electrical connection between the double-fan/battery module and the Control Unit is made automatically.

Note

The fan/battery module should preferably be replaced in the POWER OFF state.

Replacement during POWER ON

The fan/battery module should preferably be replaced in the POWER OFF state. In principle, replacement during POWER ON is possible, but the following aspects must be taken into consideration:

- If the fan/battery module is disconnected and heat dissipation is required because of the temperature conditions, a fan fault is signaled (fan fault is signaled via system variable, PeripheralFaultTask and diagnostic buffer entry; if no PeripheralFaultTask is configured, the Control Unit switches to the STOP state)
- For every SIMOTION D4x5-2 with a fan fault, the Control Unit switches to RESET after approximately 1 minute to protect itself
- During the replacement, the missing fan and battery is signaled via the fanbattery.fanexisting and fanbattery.batteryexisting system variables

NOTICE
Unintentional failure of the machine/system Only replace the fan/battery module when the CPU is in the STOP state so that there is no risk of an unintentional failure of the machine/system.

The causes of an unintentional failure can be, for example:

- No PeripheralFaultTask has been configured; if no PeripheralFaultTask is configured, the Control Unit switches to the STOP state when a fan fault occurs
- A delayed replacement can result in a RESET state
- Cables may be unintentionally disconnected during the replacement

Fan service life

Fans are parts subject to wear. The fans are monitored in the SIMOTION D4x5-2. A failure is signaled in the diagnostic buffer and can be evaluated by the user program (e.g. via the PeripheralFaultTask).

Contamination is the main cause of fan failure. A visual inspection should be made as a first criterion for replacement. If the fan is highly contaminated, it must be replaced.

If no contamination is present, we recommend that the service period is used as criterion. Because the service life of the fans depends greatly on the operating conditions (temperature, humidity, number of operating hours per day, contamination caused by dust, etc.), no fixed limits for all applications are can be specified. In the field, under average industrial conditions, a replacement interval of 5 to 7 years has proven itself.

We recommend that the maintenance intervals are adapted for the specific application based on empirical values.

Replace battery in the fan/battery module

Overview

The procedure for replacing the double-fan/battery module's battery is described below.

Procedure

Proceed as follows to replace the battery:

1. To disassemble the double-fan/battery module, proceed as described in section Replacing fan/battery module (Page 7218).
2. Remove the battery using a screwdriver (at the side) and disconnect the battery from the module by unplugging the connector.
3. Connect the cable connector of the new battery to the mating connector in the fan/battery module and push the battery in.

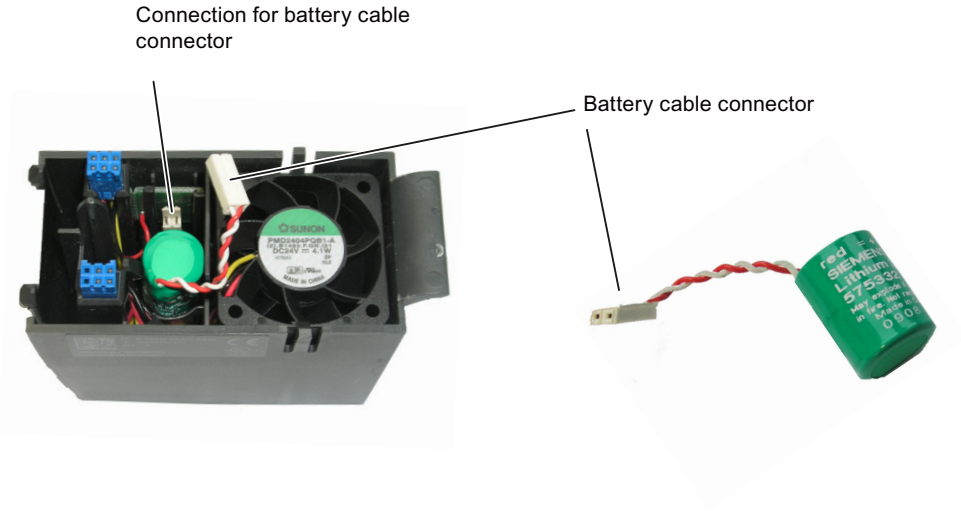

Figure 10-124 Battery replacement

4. To reassemble the double-fan/battery module, proceed as described in section Replacing fan/battery module (Page 7218).

Note

The fan/battery module should preferably be replaced in the POWER OFF state.

The battery should be replaced at least once every 3 years, at the latest when the prewarning level is reached (see SIMOTION D4x5-2 Commissioning and Hardware Installation Manual).

Later replacement of the battery can result in a backup failure of the RTC (real-time clock) and therefore loss of the date and time!

Rules for handling backup batteries

⚠ WARNING

Risk of ignition, explosion, and combustion

Incorrect handling of backup batteries can result in a risk of ignition, explosion, and combustion.

The regulations of DIN EN 60086-4, in particular regarding avoidance of mechanical or electrical tampering of any kind, must be complied with.

- Do not recharge
- Do not throw into a fire
- Do not solder on the body of the cell
- Do not open
- Only replace with identical types
- Only obtain replacements through Siemens (see *SIMOTION D4x5-2 Equipment Manual, section: Available spare parts and accessories*)

For information on transport and storage of backup batteries, see section Transport and storage conditions (see *SIMOTION D4x5-2 Equipment Manual, section: Transport and storage conditions*).

Notes on disposal

Dispose of used batteries in the specially provided collection points on site. This will ensure that the batteries are recycled in the correct manner or treated as special waste.

Adapting a project (Upgrading the project / Replacing the SIMOTION controller)

Overview

The project needs to be adapted if you want to replace the type (e.g. D445-2 DP/PN ⇒ D455-2 DP/PN) or version of the SIMOTION device in your existing project.

Procedure

The exact procedure for project adaptations depends on the scope of the target hardware and version changes.

An overview of the different applications can be found in Figure 10-122 Overview of upgrade options (Page 7212).

See also

Overview (Page 7209)

Creating backup copies (project/CF)

Requirement

Before adapting the project, it is essential that you create the following backup copies:

- A backup copy of the project and
- A backup copy of the contents of the CF card, see Backup of the CompactFlash card data (Page 7239)

Backing up user data (backup variables)

Overview

With the SCOUT functions "Save variables" and "Restore variables", you have the option of backing up and restoring data that were changed during operation and only stored in the runtime system. This is necessary if a SIMOTION platform is changed or a version upgraded, for example.

The "Save variables" function creates XML files which are stored in a folder of your choice.

The following types of data can be backed up:

- Retentive global device variables and unit variables, as well as TO retain data (as of V4.1), located in the SRAM or NVRAM depending on the controller
- Data saved with **_saveUnitDataSet** or **_exportUnitDataSet** and located on the CF card.

Note

When performing an upgrade with a firmware version that is ≥ V4.1, this function is only required for backing up and restoring unit data sets that have been created using **_saveUnitDataSet**.

Retain and unit data (saved with **_exportUnitDataSet**) remain valid even after a version upgrade.

SIMOTION retain data can also be easily backed up to a memory card without the use of SIMOTION SCOUT. For this purpose, use:

- The **_savePersistentMemoryData** function or
- The service selector switch or DIAG button on the SIMOTION D4x5-2 or SIMOTION IT web server
  See also Section Backing up diagnostic data and non-volatile SIMOTION data (Page 7266).

Procedure

The backup of the user data must be performed **before** the upgrade of the SCOUT project. This is possible for a version upgrade with the "old" SCOUT version or the "new" SCOUT version.

The following is a description of the procedure with a "new" SCOUT.

1. Open the project.
   When you open the project, a window appears with a message that the project you are opening was created with a different SCOUT version, as well as a query asking whether you want to perform an upgrade.

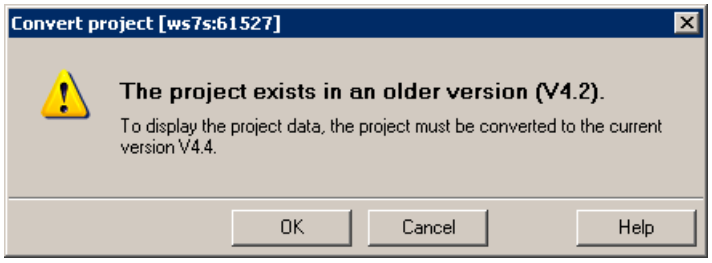

Figure 10-125 "Convert project" message

2. Confirm the prompt with "OK". The project will be converted to the current version.
3. A dialog then appears with a prompt asking whether the project should be opened write-protected.

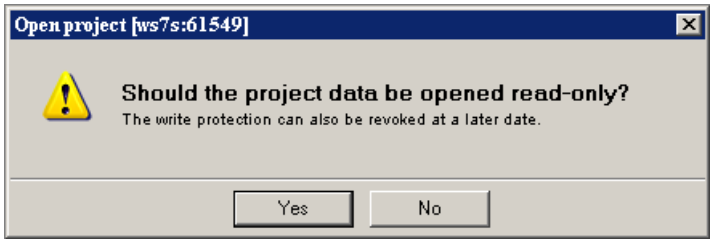

Figure 10-126 Prompt for write-protected opening

4. Confirm this prompt with "Yes" (open write-protected).
5. Set the SIMOTION D4x5-2 to the STOP operating state.
6. Set the SIMOTION D4x5-2 to online mode and perform the SCOUT **Save variables** function. The retain variables (interface and implementation) and the user files (with _saveUnitDataSet or _exportUnitDataSet) are saved to the PG/PC.
7. Then close the project.

Note

An online connection is possible only when the PG/PC is configured for the controller.

Update the PG/PC assignment using .

Online connection is now possible.

Additional references

For further information, see the *SIMOTION SCOUT* Configuration Manual.

Upgrading a user project to the new SCOUT version

Requirement

It is essential that a backup copy be made of the original project before the upgrade, because the data storage of the project is also upgraded during the upgrade. This ensures that you can always return to the original project if the upgrade fails (power interruptions, unexpected faults, incorrect operation, etc.).

Procedure

1. When opening the project a window appears with a message that the project to be opened was created with another SCOUT version, as well as a prompt as to whether the upgrade should be performed.
   Confirm the prompt with "OK".

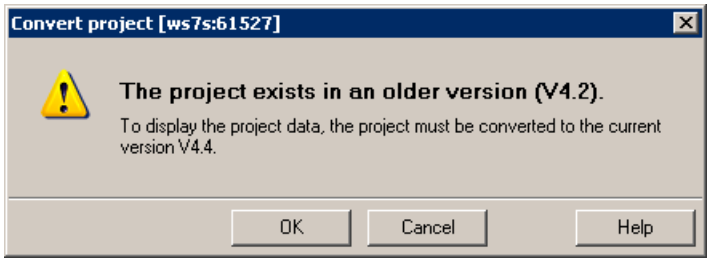

Figure 10-127 Prompt as to whether the project should be upgraded

2. After the conversion another prompt appears as to whether the project should be opened write-protected. Confirm this prompt with "No" for a version upgrade (do not open write-protected).

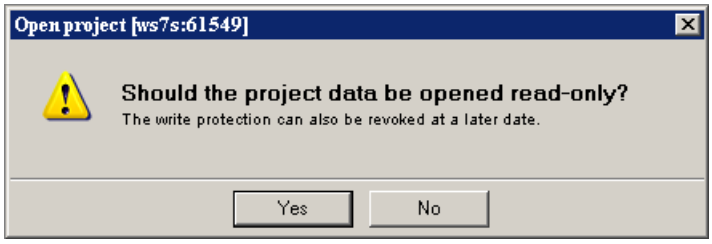

Figure 10-128 Prompt as to whether the project should be opened as write-protected

Note

A project that was last edited with a higher SCOUT version cannot be opened by a SCOUT with a lower version. However, the project with the more current SCOUT version can first be converted to the required software version (command: "Project" > "Old project format" > "Save in old project format"). The project can then be opened with the lower SCOUT version.

Platform replacement via XML export/import

Overview

A platform replacement is always required when an existing project is to be used for another SIMOTION platform. The platform replacement is always performed via an XML export/import.

The following devices can be interchanged via a platform replacement:

- Replacement between SIMOTION C, P, and D (e.g. C240 → D445-2 DP/PN)
- Replacement between D410 and D4x5/D4x5-2 (e.g. D410-2 → D445-2 DP/PN)
- Replacement between SIMOTION D (SINAMICS S120 Integrated) → SIMOTION D (SINAMICS SM150 Integrated)

Platform replacement during project downgrades:

It is not possible to downgrade to a lower SINAMICS version. However, it is possible to transfer project data by means of an XML export/import.

Preparations

Before the platform replacement can be performed, preliminary work may be necessary in the existing project.

If a D4x5-2 is to be imported into a D410-2, then only the permitted quantity structure of the D410-2 may be configured in the D4x5-2. This applies for all components, e.g. not only an infeed, but also the permissible power units.

A D4x5-2 with CU adapter and blocksize Power Module can be imported into a D410-2 when the CU adapter is connected to port 0. Otherwise, the topology will be destroyed.

Generally, the success of an import always also depends on the specific configurations of the drive units, and whether the configuration is possible for the device to which the import is to be performed. Also note any error messages that may occur.

Procedure

Proceed as follows:

1. In the project navigator of SIMOTION SCOUT, right-click the SIMOTION controller that is to be replaced.
   Select "Expert" > "Save project and export object" in the context menu.
   "Save project and export object" exports selected data of the selected object in XML format. This data export can then be reimported into other projects. The entire project is not exported, only the data of the selected object (e.g. only the D4x5-2 or only the SINAMICS Integrated).
2. Specify the desired path and start the XML export.
3. When the export has been performed error-free, delete the device from the project and confirm the prompt.
4. Insert the desired platform as new device in the project navigator of SIMOTION SCOUT. With the selection of the device, you also define the SIMOTION version, and with a SIMOTION D, also the SINAMICS version.

5. Import the data of the original platform into the new device. To do this, right-click the new device and select "Expert" > "Import object" in the context menu.
6. Select the location where the XML export data is to be stored and start the import. Confirm the prompt to continue with the import.

Confirm the message with regard to the import of a "non-compatible type" with "OK".

Preparing the device replacement

Overview

The device replacement process differs from the platform replacement process in that it is really easy to accept project data during device replacement.
The device replacement is performed via **HW Config**, whereas an **XML export/import** is required for a platform replacement.

A device replacement is only possible within SIMOTION D.

The following devices can be interchanged:

- Replacement between different performance classes (e.g. D445-2 DP/PN ⇔ D455-2 DP/PN)
- Replacement between generations (D4x5 ⇒ D4x5-2)
- Replacement between variants (D425-2 DP ⇔ D425-2 DP/PN)
- Replacement between SIMOTION, SINAMICS and/or PROFINET version (e.g. D425 V4.1 - PN V2.1 SINAMICS S120 V2.5 ⇒ D425 V4.2 - PN V2.2 SINAMICS S120 V2.6.2).

One SIMOTION D can only be replaced with another SIMOTION D if the SINAMICS version involved is the same or higher. It is not possible to downgrade to a lower SINAMICS version.

Preparation

Before the device replacement can be performed, it is recommended that preliminary work be performed in the existing project. The existing project must be adapted so that it can be mapped to the new device during the device replacement.

Examples:

1. Number of DRIVE-CLiQ interfaces
   If the replacement is to a device with fewer DRIVE-CLiQ interfaces, then the ports that are no longer available must be rewired before the device replacement (double-click "Topology" in the project navigator). Components on DRIVE-CLiQ ports that are no longer available are moved to the component archive during the device replacement.
   Example:
   Replacement of D445-2 DP/PN (six DRIVE-CLiQ ports) with D425-2 DP/PN (four DRIVE-CLiQ ports)
   → ports X104 and X105 are no longer available.
2. Number of CX32-2s
   If the replacement is with a D4x5-2 that only supports a small number of CX32-2 modules, then a device replacement in **HW Config** is not possible.
   In this case, the CX32-2 must be replaced by a SINAMICS S120 CU320-2.
3. PROFINET interface
   If a D4x5 with CBE30 is replaced by a D4x5-2 DP/PN with onboard PROFINET interface, then the number of PROFINET ports is reduced from four to three.
   Components on port 4 have to be rewired

TIP for synchronous grouping

If you use device-dependent ST libraries, then the upgrade can be accelerated through the following procedure:

1. Upgrade the device version for all devices that participate in the synchronous grouping in the ST libraries
   (example: Change D445 V4.1 to D445-2 V4.2).
   See also Section Upgrading a library (Page 7232).
2. Save the project and close it in SIMOTION SCOUT.
3. Perform the module replacement for all devices of the synchronous grouping in **HW Config** for this project and then save.
4. Open the project in SIMOTION SCOUT.
   The entire synchronous grouping is now completely upgraded.

Device replacement in HW Config

Procedure

1. Double-click the SIMOTION device to be replaced in the project navigator in SIMOTION SCOUT. **HW Config** opens.
2. Open the "SIMOTION Drive-based" folder in the hardware catalog.

   Note

   SIMOTION D is modeled as a compact device in **HW Config**. When modules are being replaced, this means the new module must be moved to the header of the module rack shown and **not to slot 2**. Please make sure that you do not delete the D4x5-2 rack!

   When you move the new module to the rack header using drag-and-drop, the old module will be replaced. Alternatively, you can:

   - Select the rack header and double-click the new module in the module catalog to replace the previous module, or:
   - Right-click the rack header and select "Replace Object"

3. Move the new module to the top field of the module rack using drag-and-drop.
4. Confirm the dialog box that appears with "Yes" if you want to replace the SIMOTION device. The module is replaced.
5. Accept the changes made to the hardware configuration with "Station" > "Save and compile".
6. Close **HW Config**.

   Note

   During the module replacement, the following actions are performed automatically by the engineering system (if required):

   - Update of the technology packages (TPs)
   - Automatic upgrade of the SINAMICS Integrated
   - Automatic upgrade of all connected CX32-2

   The updated data is transferred to the project and the entire project saved.

If the module hardware changes (e.g. a D445-2 DP/PN is replaced with a D455-2 DP/PN), proceed as described in Section Removal and replacement of the SIMOTION D4x5-2 (Page 7214).

Upgrading technology packages

Overview

The SIMOTION technology packages (e.g. TP CAM, TP PATH, DCBlib) are available in various versions.

You can only use the functions of the technology objects selected if the technology objects are available in the target system. You can select the technology packages and their version for each SIMOTION device. Each version of SIMOTION SCOUT has a kernel (FW version) for the SIMOTION CPU and an appropriate technology package.

TPs during upgrades

Device replacement (in **HW Config**), platform replacement (XML export/import), or even upgrades may cause versions of SIMOTION technology packages (TPs), which are assigned to individual technology objects (TOs), to change.

- The TP version may change when the main version is changed.
  The TP version depends on the relevant main version in all cases; it may, however, remain unchanged through a number of main versions.
- If service packs and hotfixes are installed, there may even be a selection of TP product versions available for the same TP version.

During device replacement (in HW Config) the TP version is automatically updated. If the TP version is changed and more than one version of the new TP version is available, the latest version is automatically installed. If another product version is preferred, this must be set manually (e.g. selection of V4.1.5.3).

With a platform replacement (XML export/import), the required technology package along with the TP version and, if necessary, the product version have to be selected manually after the import.

When a SIMOTION CPU is inserted, the TP CAM (latest TP version and product version) is preset per default.

Special displays in the "Product version" field:

- "Select" means that no TP product version has been selected; this state occurs when older projects, in which the selection of a specific product version was not supported, are upgraded. If the project is loaded to the CPU without making a selection, the latest available technology package is loaded automatically.
- "---" means that no version can be determined (e.g. for the TP DCBlib or for older CPU versions < V4.1). If no version can be determined, you must select "---".

Selecting the TP product version

The desired technology package is selected with fine granularity in SIMOTION SCOUT at "Target device" > "Select technology packages ...".

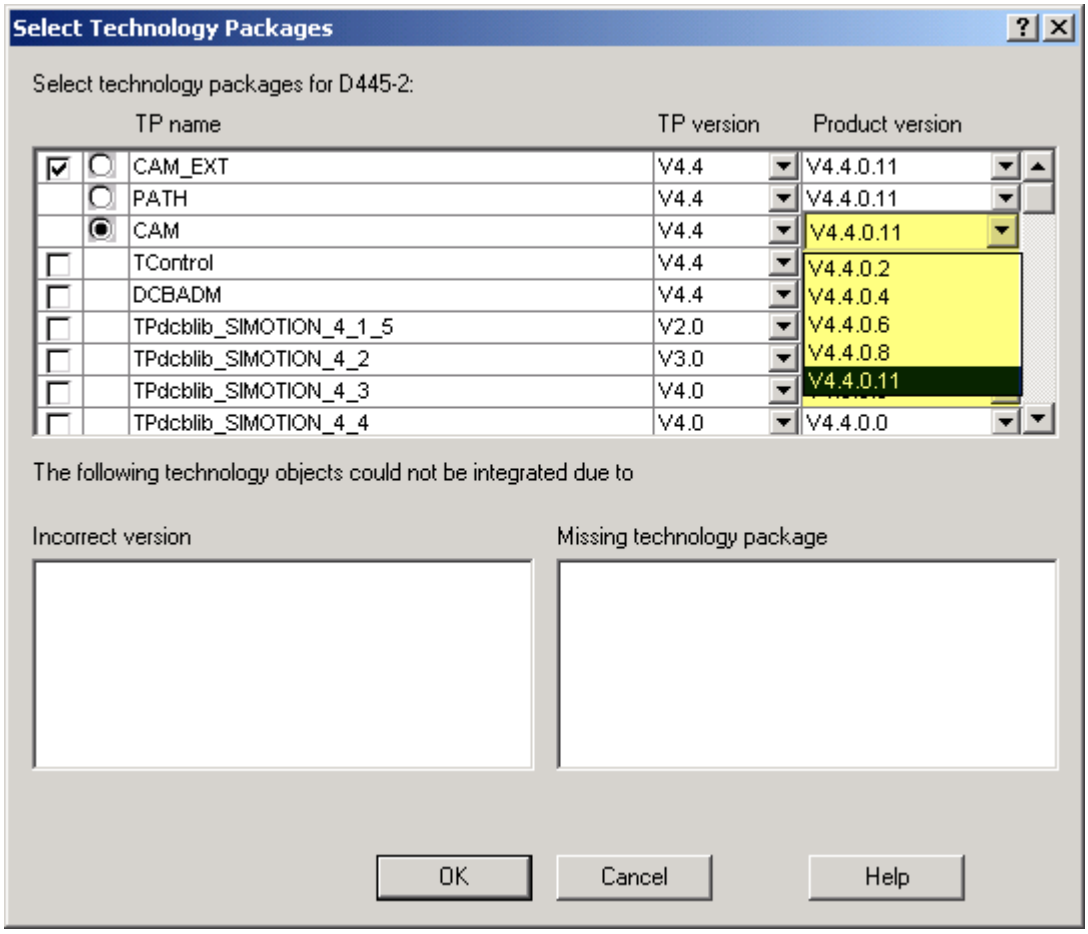

Figure 10-129 Selecting technology packages (example: D445-2)

Note

Device diagnostics can provide information on which technology package product version has been loaded to a CPU.

Loading technology packages to the target device

Technology packages are only loaded to the target device if no technology package has been loaded so far or if "Load to file system" is executed.

If a technology package version changes, the technology package must be explicitly reloaded to the target device. To do this, proceed as follows:

1. Select "Download project to target system" in SIMOTION SCOUT.
2. Select the "Replace product versions of the technology packages" option at "Additional CPU options" and confirm with OK.

For further information, please refer to the online help for SIMOTION SCOUT.

Upgrading the device version of SINAMICS S120 control units

Overview

You can upgrade the device versions of SINAMICS S120 control units that are connected to the SIMOTION D via PROFIBUS or PROFINET in the SIMOTION SCOUT. The SINAMICS version can only ever be upgraded in a project; it cannot be downgraded.

Note

During the device replacement in **HW Config**, the SINAMICS version

- Of the SINAMICS Integrated of the SIMOTION D4x5-2 as well as
- The connected CX32-2 controller extensions

are also upgraded automatically.

A CX32-2 always has the same SINAMICS version as the SINAMICS Integrated. During the module replacement in **HW Config**, the SIMOTION **and the SINAMICS version** is always defined with the selection of a D4x5-2 module.

If a SINAMICS S120 control unit is connected via PROFIBUS or PROFINET, the SINAMICS version can be selected independently of the SINAMICS Integrated version.

Procedure

To upgrade a SINAMICS drive unit:

1. Right-click the relevant device, e.g. the SINAMICS S120 CU320-2 DP.
2. Select "Target device" > "Upgrade device version/characteristic" in the context menu.
   The "Upgrade Device Version/Characteristic" dialog box is displayed. It lists all available firmware versions.

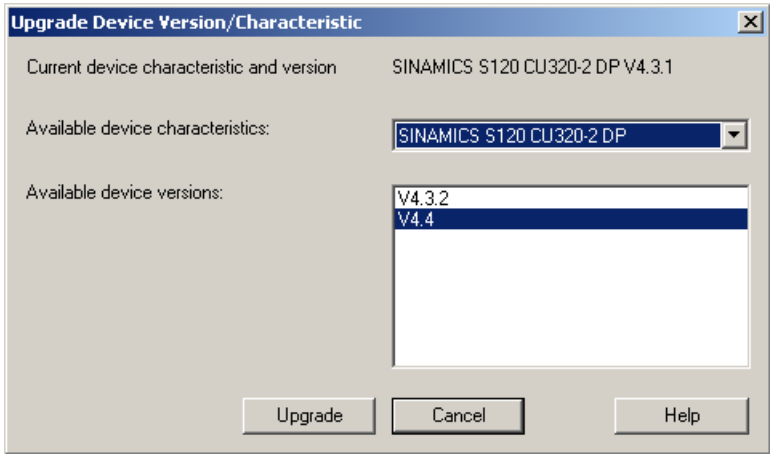

Figure 10-130 Upgrading the device version

3. Select the desired device version/characteristic and click "Upgrade".
   This upgrades the SINAMICS S120 control unit.

Upgrading a library

Depending on the configured properties of the libraries used in the project (device-dependent or device-independent), an upgrade of the libraries may be required if the SIMOTION device or the device version changes.

1. Open the LIBRARIES directory in the project navigator.
2. Select a library, right-click to open the context menu, and select "Properties...."
3. Select the "Technology packages" tab in the "Properties" window.
4. Select the SIMOTION device and the technology packages for which the library is to be valid.
5. Close the dialog box with "OK".

Note

Please also observe the information on device-dependencies in the SIMOTION SCOUT online help.

Save project, compile and check consistency

Procedure

1. Execute "Save and recompile all" ("Project" > "Save and recompile all" menu).
2. Then perform a consistency check ("Project" > "Check consistency" menu).
3. If error messages occur, correct these and repeat the operation.

Note

Note the difference between

- "Save and recompile all" and
- "Save and compile changes"

Save and recompile all

All sources of the entire project are recompiled with this command.

The command is suitable if you are quite sure that all the old data from older SCOUT versions should be removed and replaced with new compilation results.

Use this command if you specifically want to convert a project from an earlier SCOUT version to a newer version. In this way, you take over all error corrections and optimizations.

Save and compile changes

On this command, the whole project is searched for changes. Therefore only the changes are compiled. Use this command for day-to-day operations within a SCOUT version.

Performing a firmware and project update

Upgrading the boot loader on the CompactFlash card

The boot loader may have to be upgraded in the following cases:

- Upgrade of the SIMOTION D
- If a D4x5 CF card is to be used for a D4x5-2 (or vice versa).
- Error corrections and optimizations

Generally, we recommend that the latest boot loader available for the associated CF card be used.

Detailed information on the compatibility relationships for the CF card, boot loader version, SIMOTION D hardware and SIMOTION firmware version can be found in the software compatibility list. This list can be found on the Internet at (https://support.industry.siemens.com/cs/ww/en/view/18857317).

See also

Bootloader on the CompactFlash card (Page 7247)

Update - preparatory measures

Upgrading the SIMOTION D

The actions described in this section also apply to downgrading to an older version.

Various options are available for performing a firmware and/or project update on the SIMOTION D.

- Update via SIMOTION IT web server (Page 7235)
- Upgrade via device update tool (upgrading SIMOTION devices) (Page 7235)
- Update via CF card (Page 7239)

Note

Upgrading using the device update tool offers a number of advantages (keeping retain data, option of downgrading, no license key handling, etc.).

We therefore recommend using this method for firmware and/or project updates.

Requirement (firmware update)

The current firmware for SIMOTION D can be found at Internet address (https://support.industry.siemens.com/cs/ww/en/view/31045047).

Upgrading the SIMOTION D automatically upgrades the firmware of all connected SINAMICS DRIVE-CLiQ components.

Note

Observe the information in the the Read Me files and the upgrade instructions included in the scope of delivery of new SIMOTION versions.

Use only CF cards that have been released for SIMOTION D and have an appropriate and correct boot loader version.

The compatibility relationships can be found at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317).

NOTICE
The upgrade operation deletes all project data and parameters from the CF card! Back up the data before starting an upgrade.

Requirement (project update)

You have upgraded your project and, if necessary, adapted the device type and device version, see section Adapting a project (Upgrading the project / Replacing the SIMOTION controller) (Page 7221).

Update via SIMOTION IT web server

The SIMOTION D features an integrated web server.

In addition to customized web pages and comprehensive device/diagnostic information, SIMOTION IT web server also allows you to update the firmware and project using a standard PC with a web browser.

As of firmware version V4.2, it is no longer necessary to purchase licenses for the web server (IT DIAG license) and for SIMOTION IT OPC XML-DA.

You will find detailed information in the
SIMOTION IT Diagnostics and Configuration Diagnostics Manual.

Upgrade via device update tool (upgrading SIMOTION devices) (Page 7235)

Upgrade via device update tool (upgrading SIMOTION devices)

Overview

SIMOTION D Control Units and projects can be upgraded using previously created upgrade data.

Performing an upgrade using upgrade data has the following advantages:

- User-friendly creation of upgrade data via SIMOTION SCOUT with the aid of a wizard (at the machine manufacturer's site)
- SIMOTION devices can be upgraded by the machine operator without the SIMOTION SCOUT Engineering System.
- The machine manufacturer can conveniently send upgrade data via e-mail or post to the machine operator
- There is no need to use license keys, as licenses are retained
- Retain data and unit data is retained when upgrades are performed, even across versions
- An upgrade which has been imported can be discarded again, and the previous configuration restored
- You can upgrade either a single SIMOTION device or multiple devices from one or more SIMOTION projects.
- It is possible to upgrade parts of a configuration only (e.g. Technology Packages only, firmware only, project only, etc.).

Handling

Upgrade data is created by the application engineer at the machine manufacturer's premises using SIMOTION SCOUT. The upgrade data can then be handled flexibly depending on both the SIMOTION device in question (SIMOTION C, D, or P) and the customer requirements:

- Creating upgrade data and then copying it to a storage or upgrade medium:
  - CF card
  - USB stick or
  - Upgrade file for the SIMOTION IT web server
- Alternatively, the upgrade data can be created and stored in an archive on the PC, with a view to importing it to an upgrade medium suitable for SIMOTION devices at a later time.
- The process of importing the data to an upgrade medium can be performed at the machine manufacturer's premises; alternatively, if the upgrade archive has been transferred to the machine operator, the service engineer can do this on site.
- The service engineer imports the upgrade data on an operator-guided basis (without any involvement by the application engineer) to the SIMOTION device(s), and upgrades the SIMOTION devices in the process (SIMOTION SCOUT is not required on-site).

The following describes how to upgrade a SIMOTION D with a USB stick. This assumes you have a USB stick containing the appropriate upgrade data.

Requirement

You have a USB stick containing the upgrade data.

Note

When upgrading using a USB stick, the points listed below must be observed. The version information refers to the firmware version on the CF card (that is, the original version from which upgrading is to take place).

- Version V4.2: Upgrading via a USB stick is not supported.
- Version < V4.3 SP1 HF12: The USB stick may only be inserted when the Control Unit is switched off.
- Version ≥ V4.3 SP1 HF12: The USB stick can be inserted when the Control Unit is switched on or off.

Procedure

When using a USB stick to perform an upgrade, proceed as follows:

1. Check the position of the service selector switch (upper rotary switch SVC/NCK). The switch must be in the "0" position.
2. Insert the USB stick in one of the two USB interfaces of the activated D4x5-2 (only one USB stick may be inserted).
3. Switch the device OFF/ON or reset it using the RESET button.

4. SIMOTION D4x5-2 will now begin copying the data from the USB stick to the CF card. Copying begins with some LED state changes until finally a yellow/green flashing RDY LED is displayed (0.5 Hz). In the end phase of the upgrade, the RDY LED has longer steady green or yellow phases (< 10 s).
   Once copying is complete, the RDY LED will change to:
   - "Steady green" if the procedure has been completed successfully (the copying procedure has been completed successfully when the RDY LED is constantly green > 10 s).
   - "Steady red" if copying was not successful.

Meaning of the 7-segment display	
0	No memory card available.
1	Internal error
2	Internal error
3	No or incomplete update data available on the USB memory stick.
4	No update data can be copied because there is no project available in the SIMOTION device, but update data for several SIMOTION devices is available on the USB memory stick. Because of the missing project on the SIMOTION device, assignment to the data on the USB memory stick is not possible.
5	The update data cannot be copied, for example, because there is not sufficient memory space.
6	Internal error
7	Unknown update data available on the USB memory stick.

5. Switch the D4x5-2 off and remove the USB stick.
6. Switch the D4x5-2 on again. The D4x5-2 now begins with the actual upgrade. The SF LED flashes green (0.5 Hz) during the upgrade. The procedure can take several minutes.
7. Observe the green flashing of the SF LED.
   - As soon as the update procedure has been completed successfully, the SF LED is extinguished. An automatic power-up with the updated configuration is then performed (SF/BF LED display then depends on the respective operating state of the device).
   - If the upgrade was not successful, the SF LED flickers red.

If the upgrade was not successful "from the point of view of the application" (for example, the machine is not behaving as desired), it can be undone as follows:

1. Switch the D4x5-2 off.
2. Turn the upper rotary switch (SVC/NCK) to position "B".
3. Switch the D4x5-2 on again.
   The flickering green SF LED indicates that restoration is requested.
4. Set the service selector switch back to position "0."
   The system restores the data saved during the upgrade. The data from the upgrade will be deleted.

The restoration is indicated by a green flashing SF LED (0.5 Hz) and can take several minutes.

After successful restoration, the module starts up automatically. (SF LED display then depends on the respective operating state of the device.)

If the restoration procedure was not successful, the SF LED flickers red.

Note

For SIMOTION < V4.4, restoration will start when the module is switched on (step 3). For this, the service selection switch must be rotated to position "0" immediately when the flashing code is displayed (SF LED flashes green with 0.5 Hz).
If the service selector switch is not reset or not reset in good time to "0," this results in fault state "Service selector switch is still set to restore" (SF LED flickers red).
In this case, switch the D4x5-2 off, reset the service selector switch and switch the D4x5-2 on again. If the restoration was otherwise successful, the D4x5-2 boots up with the restored configuration.

Note

In the case of a CPU update via USB stick the SIMOTION D4x5-2 is booted from the USB stick. A bootable USB stick must therefore be used. Due to the rapid developments within the market for USB sticks, it is not possible to recommend any specific devices. SIMATIC USB sticks are an exception. Information on this is available on the Internet (https://support.industry.siemens.com/cs/ww/en/view/32580863).

Note

If the firmware for SIMOTION D is being upgraded or downgraded, the component firmware will also be upgraded or downgraded automatically depending on the firmware version on the CF card and the firmware version on the SINAMICS components (DRIVE-CLiQ components, CBE30-2, TB30, Power Modules, etc.).

The upgrade can take several minutes and is indicated by LED displays.

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- Firmware update running: RDY LED flashes slowly (0.5 Hz)
- Firmware update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are also displayed by the yellow RDY LED on the SIMOTION D/CX32-2 and indicate that a firmware update is in progress on components connected to the SIMOTION D/CX32-2 or that all components have completed the firmware update.

Components that require a POWER ON after the firmware update will indicate this through a rapidly flashing RDY-LED. Go offline with SCOUT and switch the 24 V supply off/on (POWER ON) at the respective components for initialization.

CBE30-2 option board:

During the firmware update, the OPT LED of the SIMOTION D module and the SYNC LED of the CBE30-2 flash green.

Additional references

You will find detailed information on "upgrading devices" in the *Upgrading SIMOTION Devices* Operating Instructions.

Upgrading the boot loader on the CompactFlash card (Page 7233)

Backup of diagnostic data and non-volatile SIMOTION data (Page 7266)

Update via CompactFlash card

Backup of the CompactFlash card data

Backing up licenses, retain data, and user data

Prior to upgrading/downgrading, as a precaution we recommend backing up the entire contents of the CF card to the PG/PC using the card adapter and Windows Explorer.

How you should proceed when backing up and subsequently restoring data on the CF card depends on whether licenses and/or other retain data and user data that will be required again in the future are located on the CF card.

Case 1: The CF card contains no licenses and no retain data or user data that will be required in the future

You do not need to take any steps in this case. Delete the contents of the CF card and install the firmware as described.

Case 2: The CF card contains licenses (e.g. axis licenses)

Before loading the new firmware, back up the "KEYS" directory to your PC. This can then be copied back to the CF card once you have installed the new firmware.

Note

The license key is stored in the "KEYS" directory on the CF card. When the SIMOTION device starts up for the first time, the license key is saved in the boot sector of the CF card.

A license key saved in the boot sector cannot be deleted by means of a user operation; nor can it be deleted by formatting the CF card or rewriting the boot loader.

If the Keys.txt file is no longer present on the CF card (because the "KEYS" directory has been deleted, for example), it will be written again from the boot sector to the "KEYS" directory while the SIMOTION device is starting up. The license key can be changed at any time (by relicensing, for example). When the device is next started up, the license key will be saved in the boot sector again.

In the event of the loss of a license key, a copy can be obtained via the Web License Manager at the following Internet address (http://www.siemens.com/automation/license). You will need the hardware serial number printed on the CF card. In the Web License Manager, you have the option of displaying the associated license key.

Case 3: The CF card contains retain data / user data that is still required in the future

If you are using your application to back up data to the CF card, you must back this up before upgrading the new firmware.

Example:

- Backup of the retain data
  - user\simotion\pmemory.xml
    For non-volatile SIMOTION data backed up with **_savePersistentMemoryData**
  - user\sinamics\nvram\pmemory.acx or \nvram\xx\pmemory.acx
    For non-volatile SINAMICS data (Integrated or CX32-2) backed up with p7775
- Backing up SIMOTION IT user files, settings (e.g. trace.xml), task trace data, log files, and Java files (classes, archives, user file system, etc.), stored in the following directories:
  - user\simotion\hmicfg
  - user\simotion\hmi
- Backing up configuration data for modular machines in conjunction with the **_activateConfiguration** system function, stored in the following directory:
  - install\simotion
- Backing up unit data (data saved on the CF card using **_saveUnitDataSet/ _exportUnitDataSet**), stored in the following directory:
  - user\simotion\user dir\<unitname>

Note

When a version is changed, you must use the "Save variables" function to back up data saved using **_saveUnitDataSet** or **_exportUnitDataSet** in a way that is not dependent on the version. You then have the option of restoring them using "Restore variables."

When performing an upgrade with a firmware version that is ≥ V4.1, these two functions are only required for backing up and restoring unit data sets that have been created using **_saveUnitDataSet**.

Retain and unit data (saved with **_exportUnitDataSet**) remain valid even after a version upgrade.

Firmware update via CompactFlash card

Procedure

Proceed as follows to perform the upgrade:

1. Switch off the power supply to the D4x5-2.
2. Remove the CompactFlash card from the SIMOTION D4x5-2 and insert it into the CompactFlash card adapter on your PC.
3. Open Windows Explorer. The CompactFlash card must be visible as a removable data carrier in the Windows Explorer under an arbitrary drive letter.

4. If necessary, back up the licenses, retain data, and user data on the CompactFlash card to your PC (see Section Backup of the CompactFlash card data (Page 7239)).
5. Delete all the data from the CompactFlash card.
6. Unzip the firmware file to the CompactFlash card using a ZIP file utility such as WinZip. Always maintain the file structure when setting up the unpacking tool.
7. Copy the data saved in step 4 back to the appropriate folder structure on the CompactFlash card.
8. Remove the CompactFlash card from the CompactFlash card adapter on your PG/PC.
9. Insert the CompactFlash card into the D4x5-2.
10. Switch on the power supply for the D4x5-2. The new firmware is loaded from the CompactFlash card to the SIMOTION D4x5-2.

Upgrading SINAMICS

Depending on the settings, the SINAMICS components are also automatically upgraded to the component version of the CF card with a firmware update of the SIMOTION D.

In order for a FW update to be performed for all components, the components must be correctly connected in accordance with the configured topology.

The component version can be obtained from the CONTENT.TXT file in the main directory of the CF card.

Upgrading the firmware of SINAMICS components automatically

When starting up, the system automatically upgrades or downgrades all DRIVE-CLiQ components to the version of the component firmware on the CF card. Components that cannot be downgraded to the component firmware version on the CF card (e.g. old firmware on the CF card and new components to which the old firmware cannot be loaded) retain their firmware version. The resulting firmware version combinations are always functional.

Note

The components' firmware is upgraded or downgraded automatically based on the FW version on the CF card and the FW version on the SINAMICS components (DRIVE-CLiQ components, CBE30-2, TB30, Power Modules, etc.).

The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

A firmware update on DRIVE-CLiQ components is indicated by the RDY LED flashing red and green:

- Firmware update running: RDY LED flashes slowly (0.5 Hz)
- Firmware update complete: RDY LED flashes quickly (2 Hz), POWER ON required

These flashing patterns are also displayed by the yellow RDY LED on the SIMOTION D/CX32-2 and indicate that a firmware update is being carried out on components connected to the SIMOTION D/CX32-2 or that all components have completed the firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

CBE30-2 option board:

During the firmware update, the OPT LED of the SIMOTION D module and the SYNC LED of the CBE30-2 flash green.

Updating the firmware of the SINAMICS components

The SINAMICS components' firmware is updated automatically, depending on the setting of parameter p7826.

- p7826 = 0: Upgrade/downgrade deactivated
- p7826 = 1: Upgrade and downgrade (factory setting)
- p7826 = 2: Upgrade only

Note

The automatic firmware update via p7826 = 1 (upgrade and downgrade) must not be deactivated when using Safety Integrated.

If you are updating the firmware manually, proceed as follows:

1. Select the SINAMICS component in the Project Navigator, e.g. SINAMICS Integrated.
2. Double-click "Overview" in the Project Navigator.
   The "SINAMICS_Integrated - Overview" dialog box opens with a list of available drive objects.

3. Click "Version overview" to open the list of connected SINAMICS components.
4. Go online and select the devices whose firmware you wish to update.
   The list displays the current firmware version of the devices.
5. Click "Firmware update" to download the new firmware to the devices. To do so, you must select all components whose firmware is to be updated.
6. When the firmware update is complete, switch the 24 V power supply off and back on again. The device is now ready for operation.

Note

The SINAMICS components must be configured for a firmware update to take place. The firmware cannot be updated if the components have not been configured.

You can also update the firmware using the expert list. See the *SINAMICS S120* Commissioning Manual for a description of how to do this.

Download project to target system

Once all the changes required for upgrading your project have been made, you must download the project to the SIMOTION D4x5-2.

Requirement

The firmware required is located on the CompactFlash card; for information, refer to the section titled Firmware update via CompactFlash card (Page 7240).

You have recompiled the project and checked it for consistency. See Section Save project, compile and check consistency (Page 7233).

Procedure

1. Save the project.
2. Click "Connect to selected target systems" to establish a connection to the target system.
3. Execute "Download project to target system" and then "Copy RAM to ROM" to download the upgraded project to the CompactFlash card as well.
4. Because of the automatic follow-up configuration in the SINAMICS Integrated drive, you must now execute "Load CPU / drive unit to PG".
5. Save the project.

Note

When upgrading SINAMICS drive units (e.g. SINAMICS Integrated) only the p parameters (setting parameters) are loaded into the upgraded project. The r parameters (monitoring parameters) are not loaded. The r parameters in the drive unit are derived or calculated from an automatic subsequent parameterization and must therefore be uploaded to the project. To do this, execute "Load CPU/drive unit to PG". If the upload is not performed, this can lead to inconsistencies in the drive parameterization dialog boxes.

General information on SINAMICS firmware update

Requirements for firmware update

For a firmware update of the SINAMICS Integrated incl. connected CX32-2, it is enough to plug a CF card with new drive firmware into SIMOTION D4x5-2.

To ensure that a firmware update of all connected SINAMICS components is performed (Line and Motor Modules, TM, SMC, ...), the CF card must additionally contain a project, incl. configured drive component, and the drive components must be topologically correctly connected.

Impermissible operating actions during firmware update

The following actions must be avoided while a firmware update is in progress because they could cause the firmware update to be interrupted:

- Disconnection of the DRIVE-CLiQ cable to the CX32-2
- Connection of an CX32-2 to DRIVE-CLiQ
- POWER ON on D4x5-2 or CX32-2 Controller Extensions
- Operation of the RESET button on D4x5-2 or CX32-2 Controller Extensions
- Memory reset with the hardware mode switch
- Updates via the SIMOTION IT web server
- CPU download and memory reset via HW Config

If a firmware update is interrupted, it may be necessary switch the power off and then on the power again, and repeat the firmware update.

The following operating actions are not possible during a firmware update:

- Going online to the SINAMICS
- Delete user data on card
- Project download
- Download CPU / drive unit to target device
- Memory reset via software mode switch
- Restoring the default settings
- Automatic drive configuration

If an attempt is made to go online with SIMOTION SCOUT to the SINAMICS Integrated/CX32-2 during the update, the connection attempt with be abandoned after > 1 minute, depending on the constellation.

Note

With a CF card adapter, in addition to new firmware, "Load to file system" can be used to store a project with configured drive components on the CF card.

If the CF card is plugged into the D4x5-2 Control Unit and the latter is switched on, the firmware of all connected components is updated immediately. Depending on the quantities involved (number of CX32-2, Line and Motor Modules, TM, SMC, ...), the update can take several minutes (RDY-LED flashes slowly).

Online connection to the SINAMICS Integrated/CX32-2 is not possible during this time.

Components requiring POWER OFF-ON following a firmware update signal this by means of the fast flashing RDY LED. Switch the 24 V supply to the relevant components off and on again to initialize.

SIMOTION CompactFlash card

Changing the CompactFlash card

Requirement

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D4x5-2 device before inserting or removing the CompactFlash card. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Comply with the ESD rules.

Procedure

To change the CF card, proceed as follows:

1. Switch off the power supply.
2. Remove the CF card from the plug-in slot of the Control Unit.
3. Gently insert the new CF card into the empty plug-in slot until it clicks into place. The direction of insertion of the CF card is indicated by an arrow located on both the plug-in slot and the CF card.
   When properly installed, the card does not extend beyond the housing of the SIMOTION D4x5-2.
4. Switch the power supply on again.

Writing to the the CompactFlash card

Overview

You can write to the CF card by:

- Writing to the CF card inserted into a SIMOTION D
  This function requires the connection to be established between the PG/PC and the module.
- Writing to the CF card without a SIMOTION D module
  For this function, you need a CF card adapter.

Note

The CF card always comes formatted. It contains the SIMOTION Kernel (SIMOTION D firmware).

To ensure that the CF card functions properly, the card must not be repartitioned.

Writing to the CF card inserted into a SIMOTION D

The CF card can be used to store technology packages and user data (programs, configuration data and parameter assignments) from the "volatile data" area on the CF card. Proceed as follows:

1. Establish the connection between the SIMOTION D and the PG/PC.
2. In SIMOTION SCOUT, the CF card is written to by means of the "Copy RAM to ROM" menu command.

Writing to the CF card without a SIMOTION D module

With a suitable memory card adapter, you can write to the CF card directly via a PG/PC. Writing to the CF card using the PG/PC is required, for example, when you want to upgrade the SIMOTION firmware.

Note

Files that have been written to the CF card with "Copy RAM to ROM" in SIMOTION SCOUT must not be modified or deleted with Windows. This can corrupt the project.

Formatting the CompactFlash card

You can format a faulty CF card, for example.

Before formatting the CF card, please observe the notes in Section Backup of the CompactFlash card data (Page 7239).

The procedure for formatting the CF card is as follows:

1. Insert the CF card into a CF card adapter connected to your PG/PC.
2. Format the CF card in Windows (FAT, FAT16 or FAT32 file system).
3. If the boot sector of the CF card is also defective, you will have to rewrite the boot loader.

Note

The CF card may not formatted with NTFS.

The following formats are permitted:

- For D410-2/D4x5-2: FAT, FAT16 and FAT32
- For D410/D4x5: FAT and FAT16

Because of the improved memory utilization on the CF card, FAT32 formatting is preferable for the D410-2 and D4x5-2. As of Kernel/firmware V4.3, D410-2 and D4x5-2 CF cards supplied as standard with FAT32 formatting.

FAT32 requires at least the boot loader version V3.02.

Bootloader on the CompactFlash card

Writing a boot loader

A boot loader may need to be written in the following situations:

- When a new boot loader is required for the SIMOTION D firmware version used
- When a new boot loader is required for the SIMOTION D hardware version used
- The boot loader is defective.
- A D410-2 CF card is to be used for SIMOTION D4x5-2.

The boot loader version can be read out using the SIMOTION SCOUT device diagnostics. If this is not possible, the boot loader version may be incorrect.
Possible error profile: All 10 LEDs light up yellow.

In this case, replace the boot loader version with the current version.

Use the "Options > Write boot sector..." function to write the boot loader version in the SIMOTION SCOUT to the CF card.

Note

You require PG/PC administrator rights to write to the boot sector. If you do not have administrator rights on your PG/PC, an administrator can enter an administrator login for you to use this function at "Options" > "Settings" > "Rights."

Detailed information on the compatibility relationships for the CF card, boot loader version, SIMOTION D hardware and SIMOTION firmware version can be found in the software compatibility list.

This list can be found on the Internet at (https://support.industry.siemens.com/cs/ww/en/view/18857317).

Note

Note that the CF cards for SIMOTION D410-2 and D4xx have a different boot loader!

Recommended method of handling CompactFlash cards

Handling CF cards correctly

Please note the following when handling the CF card:

- The CF card may only be inserted or removed when the system is de-energized.

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D4x5-2 device before inserting or removing the CompactFlash card. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Comply with the ESD rules.

- CF cards are not designed to be rewritten as many times as the user wishes.
  With this in mind, you should avoid writing user data from the application to the CF card cyclically. Depending on the system, a write operation from the application may trigger one or more write operations on the CF card.
  Therefore, we recommend you adopt a conservative approach in terms of the number of writing processes. In other words, do not perform more than 100,000 write access instances from the user program over the estimated service life of the application.
- Never switch off the SIMOTION D Control Unit during write accesses to the CF card. If the SIMOTION D Control Unit is switched off during write accesses, this can result in destruction of the data and, in the worst case, to damage to the file system (FAT Table = directory) on the CF card.
  If the FAT table is destroyed, the CF card will have to be reformatted and the firmware/user data reloaded. During this process the licenses remain on the CF card.
  The FAT table can be destroyed if updating the FAT table is interrupted by switching off the SIMOTION D Control Unit. The FAT table is updated, for example, by functions such as **_exportUnitDataSet**, copy RAM to ROM, or save SINAMICS NVRAM data via p7775.
  The FAT table can also be destroyed if you pull a CF card out of a CF card adapter while Windows is accessing the CF card.
- The following functions do not update the FAT table:
  - **_saveUnitDataSet** (writing the data to an existing file)
  - **savePersistentMemoryData** (as of V4.4: writing the data to an existing file)

  Once the backup files have been created with **_saveUnitDataSet** / **savePersistentMemoryData**, this also results in updating the FAT table.

Card reader for CF cards

Because of the quickly changing market and the large differences in the quality of card readers, no specific recommendation can be made.

If problems occur identifying the CF card, this may be due to an incorrect power up of the card reader.

License key on the CF card

Depending on the type and number of runtime functions used in the project, licenses must be purchased as part of the licensing procedure for SIMOTION.

For further information on the licensing of runtime functions, see (https://support.industry.siemens.com/cs/en/en/view/42014324)

The licenses required for SIMOTION D are assigned to an individual license key for the CF card (license key cannot be transferred to another CF card).

The license key must be stored in the \KEYS\SIMOTION directory in the keys.txt file on the CF card.

Backup in the boot sector

The license key is stored in the "KEYS" directory on the CF card. When the SIMOTION D Control Unit is ramped up for the first time, the license key is backed up in the boot sector of the CF card.

A license key saved in the boot sector cannot be deleted by means of a user operation; nor can it be deleted by formatting the CF card or rewriting the boot loader.

If the keys.txt file is no longer present on the CF card (e.g. because the "KEYS" directory has been deleted), it will be written again from the boot sector to the "KEYS" directory while the SIMOTION D Control Unit is ramping up. The license key can be changed at any time (e.g. through relicensing). At the next power-up, the license key is backed up in the boot sector again.

Loss of the license key

In the event of the loss of a license key, a copy can be obtained via the Web License Manager at the following Internet address (http://www.siemens.com/automation/license). You require the hardware serial number printed on the CF card to do this. You can display the associated license key in the Web License Manager. The license file (Keys.txt) is also offered as download.

Notes for Keys.txt

- If a firmware card image is unpacked on the CF card, a KEYS directory is not available per default.
- If the CF card ramps-up **without a KEYS directory** in a controller, an empty file structure (\KEYS\SIMOTION) is created.
- The keys.txt must be stored in this directory (\KEYS\SIMOTION\keys.txt).
- If the directory contains a keys.txt with an invalid license key, this is deleted from the keys.txt when the controller ramps up, i.e. the keys.txt file exists, but is empty.
- If the directory contains a keys.txt with a valid license key, this is also stored in the boot sector of the CF card as backup when the controller ramps up.

- The keys.txt can be written online via SCOUT, with a CF card reader, or via a set up remote access (FTP).
- When licensing via the Web License Manager, you receive a keys.txt that you must store on the CF card under \KEYS\SIMOTION
- It is also possible to create this text file yourself (without formatting) with a text editor (e.g. Notepad). In this case, make sure that only the license key and a line break (CR/LF) is contained in the file.
- If the SF LED flashes slowly in red (0.5 Hz) after the control has ramped up, then either the keys.txt file is faulty (error in the license key, formatting or file/directory name) or the licensing is not adequate for the used objects that require a license.

10.1.1.9 Diagnostics

Diagnostics via LED displays

Arrangement of LED displays

The front side of the SIMOTION D4x5-2 has 10 LED displays arranged vertically in a row. There is also a 7-segment display below the blanking cover.

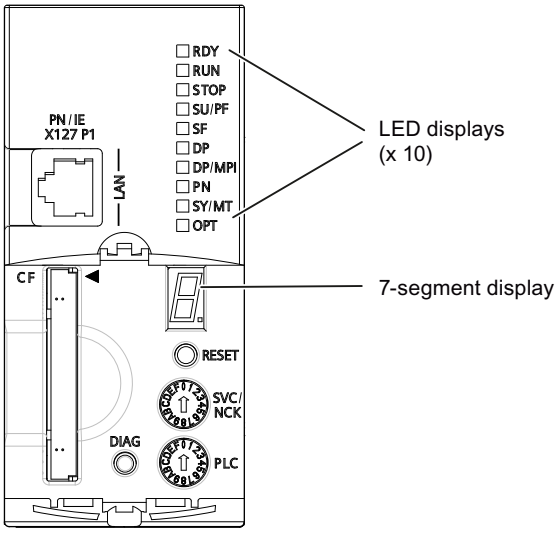

Figure 10-131 7-segment and LED displays on the D4x5-2

LED status key

The LED displays indicate the different operating modes and any errors occurring on the SIMOTION D4x5-2. They do so by illuminating, flashing, or flickering in different colors.

The following tables provide an overview of all occurring LED display combinations.

Symbols in the tables for states of the LEDs:

- 1 = LED an
- 0 = LED off
- 0.5/1 = flashing LED (0.5 Hz)
- 2/1 = flashing LED (2 Hz)
- Λ = flickering LED
- X = LED state any

SIMOTION D4x5-2 and SINAMICS Integrated displays

LED displays

Every LED can illuminate in yellow, red, or green. In the following table, the color of the LED is indicated along with the illumination state.

Table 10-65 LED displays

Meaning	LED display									
	RDY	RUN	STOP	SU/PF	SF	DP	DP/MPI	PN	SY/MT	OPT
Power-up	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)
Power-up of the D4x5-2 without CF card or with CF card without valid operating system (possibly incorrect / missing defective boot loader).	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)
Power-up stopped, reason e.g.: • incorrect firmware (e.g. D4x5) • CBE30-2 plugged into D4x5-2 DP	x	2/1 (yellow)	2/1 (yellow)	2/1 (yellow)	2/1 (yellow)	2/1 (yellow)	2/1 (yellow)	x	x	x
CF card has begun to boot, however, an error has occurred (faulty firmware).	0.5/1 (red)	0	0	0	0	0	0	0	0	0

PROFINET IO interface for D4x5-2 DP/PN (onboard interface, X150)										
Onboard PROFINET interface is operating without error; the data exchange to all configured IO devices is running.	x	x	x	x	x	x	x	0	x	x
Bus error	x	x	x	x	x	x	x	1 (red)	x	x
Failure of a connected IO device	x	x	x	x	x	x	x	2/1 (red)	x	x
The PROFINET interface has not yet synchronized with the send cycle clock of PROFINET IO with IRT, or PROFINET IO with IRT has not been configured	x	x	x	x	x	x	x	x	0	x
The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT	x	x	x	x	x	x	x	x	1 (green)	x
The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT (SINAMICS Integrated and ext. DP interfaces have not synchronized yet)	x	x	x	x	x	x	x	x	2/1 (green)	x
PROFINET IO interface (CBE30-2, X1400)										
No CBE30-2 inserted	x	x	x	x	x	x	x	x	x	0
CBE30-2 runs error-free	x	x	x	x	x	x	x	x	x	1 (green)

Meaning	LED display									
	RDY	RUN	STOP	SU/PF	SF	DP	DP/MPI	PN	SY/MT	OPT
Bus error (CBE30-2): • Failure of a connected IO device • At least one of the assigned IO devices cannot be addressed • Incorrect or no configuration	x	x	x	x	x	x	x	x	x	2/1 (red)
Firmware download running	x	x	x	x	x	x	x	x	x	2/1 (green)
Firmware download faulty	x	x	x	x	x	x	x	x	x	0.5/1 (red)

1) The LED state appears only very briefly due to the speed at which the "general reset" is completed. The module then powers up (the STOP LED flashes yellow at 2 Hz).

2) Copying is completed when the SF LED is steady green for at least 10 s.

3) Both options depend on the LED state when activated via p0124[0] = 1.

4) The upgrade or downgrade is complete when the SF LED goes out. The device then powers up automatically in the upgraded or downgraded configuration (SF LED display then depends on the operating state of the device).

5) In the case of SINAMICS licenses (e.g. SINAMICS DCB Extension), underlicensing of SINAMICS Integrated/CX32-2 via the flashing SF-LED is indicated on the SIMOTION D Control Unit. An entry is also made in the diagnostic buffer and the underlicensing is displayed in the license dialog box of SIMOTION SCOUT. The licensing is effected (like for SIMOTION licenses) via SIMOTION SCOUT or via the SIMOTION license key on the CF card.

For detailed information on the LED states, see Section LED displays of the PROFINET interface (Page 7260).

Additional references

Further references can be found in the *Upgrading SIMOTION Devices* Operating Instructions.

7-segment display

The 7-segment display provides further status information in addition to the LED displays.

State (code)	Meaning
5	**CBE30-2 is plugged into wrong Control Unit.** (CBE30-2 is only supported by SIMOTION D4x5-2 DP/PN, not by SIMOTION D4x5-2 DP) In addition: • All LEDs light up yellow (RUN, STOP, SU/PF, SF, DP, DP/MPI flashing at 2 Hz) • CBE30-2: SYNC lights up green; FAULT flashes red at 0.5 Hz.
6	**SIMOTION D has ramped up**
8	**Module in RESET state** (RESET button pressed; overtemperature; faulty/ disconnected fan/battery module) Fan faults are detected by • A cyclic fan test • Or when the fan is switched on a malfunction is detected (fan does not turn or fan turns at too low a speed). State 8 is also displayed when a fan module is not connected at switch on. For further information, see "Special operating states".
8 Middle segment of the "8" flickers	**Power-up of the SIMOTION D4x5-2 has failed** Possible cause: Incorrect boot loader on the CF card Update this with SIMOTION SCOUT (see *SIMOTION D4x5-2 Commissioning and Hardware Installation Manual* Update boot loader of the CF card (Page 7247)).
A or E	**Software system error** Backup the diagnostics data for further diagnostics (see *SIMOTION D4x5-2 Commissioning and Hardware Installation Manual* Backup of diagnostic data and non-volatile SIMOTION data (Page 7266)). If you cannot determine the cause with the diagnostics data, contact the Hotline and provide this code and the diagnostics data.
F	**F state (FAULT)** In the F state, the CPU of the D4x5-2 is in HOLD state, i.e. no software is running (D4x5-2 operating system is stopped) For further information, see "Special operating states".

State (code)	Meaning
6.. Flashing dot	**Servo running** (flashing frequency depends on the servo cycle clock)
1.2.3.4. 4-digit code (followed by a dot)	**BIOS error** Possible cause: Module defect Contact the Hotline and provide the code.
F.2 2-digit code (starting with "F")	**Boot loader error** F2: Sector "0" cannot be read F3: File system cannot be initialized F5: Bin file too large for the internal buffer Try a different CF card with F2/F3. If it functions correctly, the CF card is defective. The cause for F5 can be an older boot loader; update this with SIMOTION SCOUT (see *SIMOTION D4x5-2 Commissioning and Hardware Installation Manual* Update boot loader of the CF card (Page 7247)). For code F1, F4 and F6-F9, contact the Hotline and provide the code.
Further states for a firmware and project update	See Section Update via device update tool (Page 7235)

Special operating states

The following "special operating states" are displayed via the status LEDs and the 7-segment display.

F state (FAULT)

In the F state, the CPU of the D4x5-2 is in HOLD state, i.e. no software is running (D4x5-2 operating system is stopped)

The state occurs with faults to which the D4x5-2 operating system cannot respond.

The state is displayed as follows:

- All LEDs flicker red and
- The 7-segment display shows "F"

Possible measures:

- Check the CF card.
- Perform a commissioning again.
- Replace the D4x5-2.
- Back up the diagnostics data for further diagnostics (see Section Backup of diagnostic data and non-volatile SIMOTION data (Page 7266)).

The state can only be exited by switching the D4x5-2 off and on.

If you cannot determine the cause, contact the Hotline and provide this code and the diagnostics data.

RESET state (permanent RESET)

In the RESET state, the CPU of the D4x5-2 is in a permanent RESET, i.e.

- No software is running (D4x5-2 operating system is stopped) and
- The hardware is in a state that produces less power loss

This state occurs, for example, if the max. module temperature has been greatly exceeded.

The state is displayed as follows:

- The RDY LED flashes red/yellow at 2 Hz
- The 7-segment display shows "8"

Possible measures:

- Correct any overtemperature.
- Ensure that the 24 V supply is stable without any power dips.
- Insert the fan/battery module.

The state can only be exited by switching the D4x5-2 off and on.

LED displays of the PROFINET interface

Position of the onboard PN interface (X150)

The following figure contains information on the PROFINET interface of the SIMOTION D4x5-2 DP/PN Control Unit. Position of the interface, labeling of the ports and the associated displays are described.

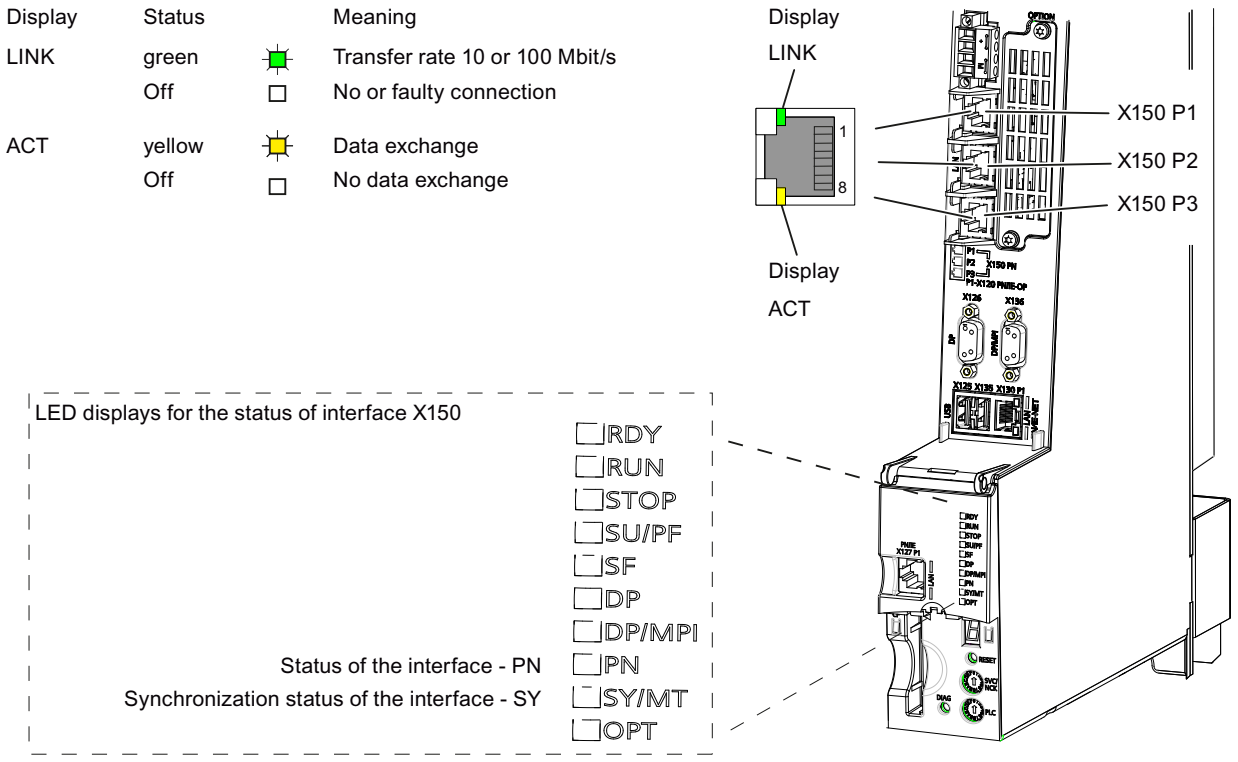

Figure 10-132 Position of the PROFINET interface X150

Note

The 3rd port of the PROFINET IO interface X150 P3 is also designated as X120 PN/IE OP. This designation is not relevant for SIMOTION D.

Position of the PN interface of the CBE30-2 (X1400)

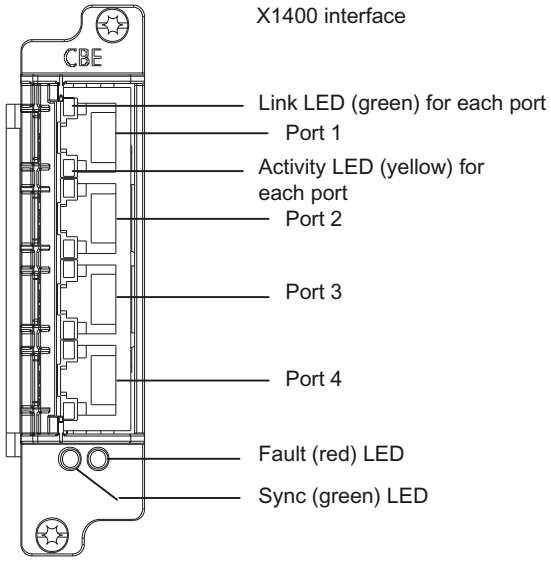

Figure 10-133 CBE30-2 front view

LED displays for PROFINET

Table 10-66 Meaning of the LED displays for the D4x5-2 DP/PN and CBE30-2

Name	Color	State	Meaning
LINK	Green	On	A different device is connected to port x and a physical connection exists.
ACT	Yellow	Flashing	Data is being received or sent at port x.

Name	Color	State	Meaning
D4x5-2: PN CBE30-2: FAULT	red	Off	as an IO controller: • PROFINET interface is operating without error; the data exchange to all configured IO devices is running as an I-Device: • PROFINET interface is running without error, there is at least one communication link with the I-Device
		On	PROFINET interface bus fault • No physical connection to a subnet/switch • Incorrect transmission rate • Full duplex transmission is not activated • More than one IP address/NameOfStation in the network
		Flashing (2 Hz)	as an IO controller: • Failure of a connected IO device • At least one of the assigned IO devices cannot be addressed. • Incorrect or no configuration as an I-device: The LED flashes until at least one controller has correctly established communication with this I-Device. Possible causes: • Incorrect IP address • Incorrect configuration / parameterization • IO controller not connected / switched off, although an Ethernet connection has been established. • IN Shared I-Device operation: all configures IO controllers are not connected/switched off, but the Ethernet connection is up (link established to the neighboring device) • Incorrect or missing device name. • The response monitoring interval has elapsed • The CPU is an I-Device and communication with the higher-level controller fails
		flashing (0.5 Hz)	CBE30-2 power-up stopped, possible reason: CBE30-2 is plugged into wrong Control Unit. (CBE30-2 is only supported by SIMOTION D4x5-2 DP/PN, not by SIMOTION D4x5-2 DP)

Name	Color	State	Meaning
D4x5-2: SY/MT [1] CBE30-2: SYNC [1]	Green	Off	The PROFINET interface has not synchronized yet to the send cycle clock of PROFINET IO with IRT, or PROFINET IO with IRT has not been configured (e.g. only PROFINET IO with RT or TCP/IP communication). If IRT data has been configured for SIMOTION, the PROFINET interface generates a local substitute cycle clock as long as there is no synchronization to the send cycle clock of PROFINET IO with IRT: SIMOTION task system has synchronized to the local substitute cycle clock of the PROFINET interface. SINAMICS Integrated and external isochronous DP interfaces are synchronized to the local substitute cycle clock of the PROFINET interface.
		On	The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT. If isochronous IRT data has been configured for SIMOTION, then the following applies: The task system of SIMOTION has synchronized to the send cycle clock of PROFINET IO with IRT. SINAMICS Integrated and external isochronous DP interfaces are synchronized to the send cycle clock of PROFINET IO with IRT. If no isochronous IRT data has been configured for SIMOTION, this state indicates that only the PROFINET interface is synchronized to the send cycle clock of PROFINET IO with IRT. The PROFINET interface is then used to forward the IRT data.
		Flashing (2 Hz)	The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT If IRT data has been configured for SIMOTION, then the following applies: The task system of SIMOTION has synchronized to the send cycle clock of PROFINET IO with IRT. SINAMICS Integrated and external isochronous DP interfaces are not yet synchronized to the send cycle clock of PROFINET IO with IRT.

[1] If no IRT has been configured, then generally no synchronization will be made to the send cycle clock. LED is off.

Note

LED displays of the PROFINET interface for D4x5-2 DP

Up to and including firmware V4.4, the PN and SY/MT LEDs light up yellow in normal operation.

As of firmware V4.5, the LEDs are off.

Note

If the I-Device is deactivated via the system function _deactivateDpSlave, the PN or FAULT LED will respond as if the I-Device had not been configured.

The PN/FAULT LED is lighted if an IO controller is configured and no IP address exists.

If no IO controller is configured, the LED will not light up.

LED displays of the Ethernet interface

The Ethernet ports are equipped with LEDs to display Link and Activity.

Table 10-67 State of the Link and Activity LEDs

LED	State	Meaning
LINK (upper LED)	OFF	No or faulty connection
	Lights up green	Transfer rate 10 or 100 Mbit/s: A different device is connected to port x and a physical connection exists
	Lights up yellow	Transfer rate 1,000 Mbit/s: A different device is connected to port x and a physical connection exists
ACT (lower LED)	OFF	No data exchange
	Flickers yellow	Data exchange: Data is being received or sent at port x

LED displays of the CX32-2 controller extension

The different states that occur during power-up are indicated by the LEDs on the CX32-2 controller extension.

- The duration of the individual states varies.
- If an error occurs, the power-up is terminated and the cause is indicated accordingly via the LEDs.
- At the end of an error-free power-up, all LEDs are switched off briefly.
- After power-up, the LEDs are controlled via the loaded software.

Table 10-68 Load software

LED		State	Comment
RDY	DP		
Yellow	Yellow	Reset	Hardware reset All other LEDs light up yellow
Red	Red	BIOS loaded	-
Red 2 Hz	Red	BIOS error	Error occurred while loading the BIOS
Red 2 Hz	Red 2 Hz	File error	• D4x5-2 CompactFlash card not available or faulty • Software on D4x5-2 CompactFlash card not available or faulty
Red	Yellow (flashing)	FW loading	RDY LED lights up red, DP LED flashes yellow without fixed frequency
Red	Off	FW loaded	-
Off	Red	FW checked (no CRC error)	-
Red 0.5 Hz	Red 0.5 Hz	FW checked (CRC error)	CRC invalid

Table 10-69 Firmware

LED		State	Comment
RDY	DP		
Yellow	Not relevant	Initializing	–
Alternating		Running	See the table below

Table 10-70 CX32-2 – Description of the LEDs after ramp-up

LED	Color	State	Description, cause	Remedy
RDY (READY)	-	Off	Electronic power supply is missing or outside the permissible tolerance range.	Check power supply
	Green	Continuous light	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.	–
		Flashing 0.5 Hz	Commissioning/reset	–
		Flashing 2 Hz	Writing to the memory card	–
	Red	Flashing 2 Hz	General errors	Check parameterization/ configuration data
	Red/ green	Flashing 0.5 Hz	CX32-2 is ready for operation. However, software licenses are missing.	Obtain licenses
	Yellow	Flashing 0.5 Hz	Firmware update of the connected DRIVE-CLiQ components running	–
		Flashing 2 Hz	DRIVE-CLiQ component firmware update complete. Wait for POWER ON for the components in question.	Perform POWER ON for the respective component
	Green/ yellow or red/ yellow	Flashing 2 Hz	Component detection via LED is activated (p0124[0]). **Note**: Both options depend on the LED state when component detection is activated via p0124[0] = 1.	–

LED	Color	State	Description, cause	Remedy
DP (PROFIdrive cyclic operation)	–	Off	Cyclic communication has not (yet) taken place. **Note:** The PROFIdrive is ready to communicate when the CX32-2 is ready for operation (see RDY LED).	–
	Green	Continuous light	Cyclic communication is taking place.	–
		Flashing 0.5 Hz	Full cyclic communication has not yet taken place. Possible causes: • D4x5-2 does not transfer any setpoints. • During isochronous operation, no global control (GC) or a faulty global control (GC) is transferred by the controller.	–
	Red	Flashing 0.5 Hz	D4x5-2 sends faulty parameterization/configuration.	Adapt configuration between D4x5-2 and CX32-2
		Flashing 2 Hz	Cyclic bus communication has been interrupted or could not be established.	Correct fault
RDY and DP	Red	Flashing 2 Hz	Bus error - communication has been interrupted.	Correct fault

Diagnostic data and non-volatile SIMOTION data

Overview

With simple operation actions (e.g. by setting the switch position) and without the need for the SCOUT engineering system, you can:

- Back up diagnostic data, including non-volatile SIMOTION data (retain data) to the CompactFlash card; for information, see Section Backing up diagnostics data and non-volatile SIMOTION data (Page 7266).
- Back up HTML pages (including the most up-to-date content) to the CompactFlash card for diagnostic purposes; for information, see Section Diagnostics via HTML pages (Page 7273).
- Restore backed-up non-volatile SIMOTION data (retain data); for information, see Section Deleting/restoring non-volatile SIMOTION data (Page 7274).

Backup of diagnostic data and non-volatile SIMOTION data

Diagnostic data

Following a fault on a SIMOTION device, diagnostic data (e.g. diagnostic buffer content, up-to-date content of HTML pages, etc.) can provide important information on the cause of the fault. For this purpose, data can be backed up to the CF card via a "simple operator action" (e.g. via service selector switch or DIAG button on the D4x5-2).

You then have the following options for the diagnostic data:

- Fetching them from the CF card using a card reader
- You can load it with the SIMOTION IT web server or by FTP

You can also use them for diagnostic purposes or provide Technical Support with them for evaluation purposes.

Various options are available to you for backing up diagnostic data:

- Backing up during operation (in STOP/STOPU/RUN mode); see Section Procedure for backing up during operation (Page 7267)
  - Using the SIMOTION IT web server;
    The web server also offers the option of fetching diagnostic data online.
  - Via the DIAG button
  - Via the service selector switch
- Backing up while the module is starting up; for details, see Section Procedure for backing up during startup (Page 7269)
  - Via the DIAG button
  - Via the service selector switch
  - Control of the diagnostic data creation using an INI file stored on the CF card

Non-volatile SIMOTION data (retain data)

In addition to the diagnostic data, non-volatile SIMOTION data (retain data) is also saved on the CompactFlash card. You can use these in situations where the non-volatile SIMOTION data has not been saved on the CompactFlash card using the **_savePersistentMemoryData** system function, and you wish to restore the non-volatile SIMOTION data after a CPU has been replaced.

Note

While the non-volatile SIMOTION data is stored as a "PMEMORY.XML" backup file in the "...USER\SIMOTION" directory using the **_savePersistentMemoryData** system function, backing up diagnostic data and non-volatile SIMOTION data stores the data in the "...\USER\SIMOTION\HMI\SYSLOG\DIAG directory.

Procedure for backing up during operation

Procedure

The advantage of backing up diagnostic data and non-volatile SIMOTION data during operation is that enhanced diagnostic information via HTML pages and TO alarm information is available.

Data are backed up:

- With the SIMOTION IT web server by selecting "Diagnostics > Diagnostics Files"; see Section "Backing up diagnostic data and non-volatile SIMOTION data using the web server.
- Via the DIAG button (see the description below).
- Via the service selector switch (see the description below).

Note

In addition to the service selector switch, SIMOTION D4x5-2 modules also have a DIAG button.

If the diagnostic data are to be backed up "during operation", simply press the DIAG button. The DIAG button is therefore preferable to switch position "D" of the service selector switch.

DIAG button (preferred solution)

To back up diagnostic data and non-volatile SIMOTION data via the DIAG button, proceed as follows:

1. Press the DIAG button.
   The diagnostic data and non-volatile SIMOTION data can be created in STOP, STOPU and RUN states.
2. The diagnostic data and non-volatile SIMOTION data are backed up to the CF card.
   Backup is displayed via the status LEDs as in the table below:
3. Once the backup is complete, switch the D4x5-2 off.
4. Remove the CF card.

Table 10-71 LED displays during backup

Status	LED displays on the D4x5-2
Backup in progress	STOP LED and SU/PF LED flicker yellow
Backup complete	RUN LED flickers green

Service selector switch (alternative)

To back up diagnostic data and non-volatile SIMOTION data using a service selector switch, proceed as follows:

1. Set the service selector switch to "Diagnostics" (position "D").
   The positions of the mode selector are not relevant (i.e. the set operating mode remains unchanged).
   The diagnostic data and non-volatile SIMOTION data can be created in STOP, STOPU, and RUN states.

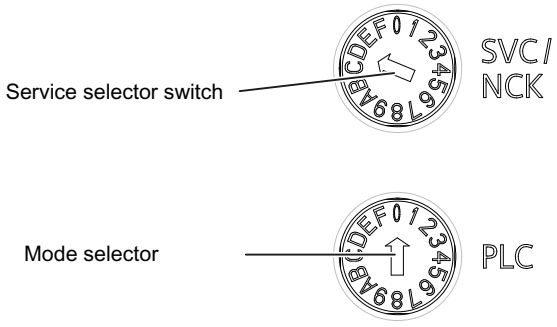

Figure 10-134 Service selector switch and mode selector

2. The diagnostic data and non-volatile SIMOTION data are backed up to the CF card. Backup is displayed via the status LEDs as in the table below.
3. Once the backup is complete, switch the D4x5-2 off.
4. Remove the CF card and reset the service selector switch to its original setting.

Table 10-72 LED displays during backup

Status	LED displays on the D4x5-2
Backup in progress	STOP LED and SU/PF LED flicker yellow
Backup complete	RUN LED flickers green

Procedure for backing up during startup

Procedure

Backing up diagnostic data and non-volatile SIMOTION data "during power-up" provides you with diagnostic information **without HTML pages / TO alarm information**.

Backing up during startup is particularly advisable for SIMOTION devices that cannot run or have crashed.

Diagnostic data and non-volatile SIMOTION data are backed up

- Via the service selector switch
- Via the DIAG button or
- Using an INI file saved on the CF card.

The procedure for each is described below.

Note

In addition to the service selector switch, SIMOTION D4x5-2 modules also have a DIAG button.

As an alternative to setting the service selector switch to the "D" position, you have the option of backing up diagnostic data and non-volatile SIMOTION data by pressing the DIAG button. When backing up data during power-up, the DIAG button must be held down until the backup is completed. As this can take 20-30 seconds, switch position "D" is preferable here.

Service selector switch (preferred solution)

Data are backed up using a service selector switch as follows:

1. Set the service selector switch to "Diagnostics" (position D).
   The positions of the mode switch are not relevant (i.e. the set operating mode remains unchanged).

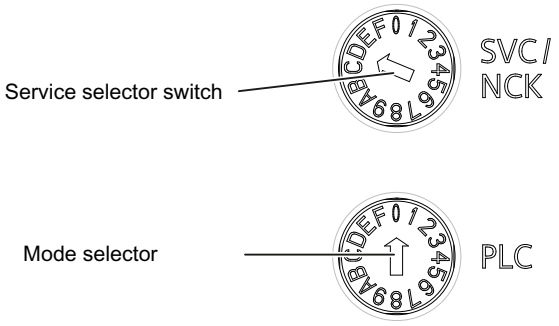

Figure 10-135 Service selector switch and mode switch, Service switch in position "D"

2. Switch the D4x5-2 off and back on again.
3. Wait for the device to start up.
   The diagnostic data and non-volatile SIMOTION data are backed up to the CF card during power-up, provided that this is still possible and is not prevented by HW defects, for example.
4. Once the backup is complete, switch the D4x5-2 off.
5. Remove the CF card and reset the service selector switch to its original setting.

Table 10-73 LED displays during backup

Status	LED displays on the D4x5-2
Backup in progress	STOP LED and SU/PF LED flicker yellow
Backup complete	RUN LED flickers green

DIAG button (alternative)

To back up data via the DIAG button, proceed as follows:

1. Switch the D4x5-2 off.
2. Press the DIAG button and hold it down. Switch the D4x5-2 on.
3. Wait for the device to ramp up.
   The diagnostic data and non-volatile SIMOTION data are backed up to the CF card during power-up, provided that this is still possible and is not prevented by hardware defects, for example.
4. Once the backup is complete, you can release the button and switch off the D4x5-2.
5. Remove the CF card.

Table 10-74 LED displays during backup

Status	LED displays on the D4x5-2
Backup in progress	STOP LED and SU/PF LED flicker yellow
Backup complete	RUN LED flickers green

INI file in the main directory of the CF card

1. Use a text editor (such as Notepad) to create a file called *simotion.ini*
2. Add the following text: **DIAG_FILES=1**
   You must use a text editor and may not use any formatting in the text.
3. Copy the simotion.ini file to the main directory of the CF card.
4. Insert the CF card into the module, which is switched off.
5. Switch the D4x5-2 on and allow the SIMOTION device to power up.
   The diagnostic data and the non-volatile SIMOTION data will be backed up to the data carrier during power-up, provided that this is still possible and is not prevented by HW defects, for example.
6. Once the backup is complete, switch off the SIMOTION device.
7. Remove the CF card.

Note

To suppress startup in diagnostics mode again, you must delete the *simotion.ini* file from the CF card.

Table 10-75 LED displays during backup

Status	LED displays on the D4x5-2
Backup in progress	STOP LED and SU/PF LED flicker yellow
Backup complete	RUN LED flickers green

Storing data

Storing diagnostic data and non-volatile SIMOTION data

You can find diagnostic data and non-volatile SIMOTION data on the CF card in the \USER \SIMOTION\HMI\SYSLOG\DIAG directory.

Copy these data and transfer them to Technical Support when requested to do so. A standard card reader can be used to transfer the diagnostic data from the CF card via standard SIMOTION IT web server pages or via FTP.

The following data are stored:

Table 10-76 Diagnostic data on the CF card

File	Application
DIAGBUF.TXT	Diagnostic buffer in a simple text format: Numerical values; no specific plain text. A text editor is used for evaluation purposes.
PMEMORY.XML	Non-volatile data (retain data) You can restore the backed up non-volatile SIMOTION data "via an operator action" after a CPU has been replaced. (See Section Overview (Page 7274).)
TOALARMS.TXT	Text file containing the pending TO alarms. Only TO IDs, alarm numbers, and associated HEX values. Note: The TO alarms are only created if diagnostic data have been created during operation (STOP / STOPU / RUN).
HTML page	If the diagnostic data are backed up, the URLs are requested from the text file (DIAGURLS.TXT) and stored as HTML pages together with their contents. (See Section Diagnostics via websites (Page 7273).) Note: The HTML pages are only stored if diagnostic data are created during operation (STOP/STOPU/RUN).
Other files	All other files stored in the directory are only of relevance to Technical Support.

Note

Use HTML pages if you wish to back up diagnostic data in plain-text format. HTML pages enable user-friendly diagnostics. In addition to the standard SIMOTION IT web server pages, you have the option of creating your own HTML pages (e.g. for the axis status or for machine diagnostics). Customized diagnostics pages are particularly suitable for application problems, as you can define the contents yourself.

Diagnostics via websites

In the "DIAGURLS.TXT" text file found in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory, you can specify HTML files whose current content is to be stored on the CF card when diagnostic data is created during operation (e.g. "devinfo.mwsl" must be entered for the "devinfo.mwsl" website).

Since the pages in question are stored together with their most up-to-date contents, this enables the latest status information regarding the SIMOTION device, as well as the machine/system, from the point at which diagnostic data was created (e.g. when the service selector switch was activated) to be archived.

In addition to the standard SIMOTION IT web server pages, it is possible to store customized pages. Information on creating pages of this type can be found in, for example, an FAQ of the Utilities & Applications.

A tutorial on the creation of user-defined websites is also contained on the Utilities & Applications-DVD.

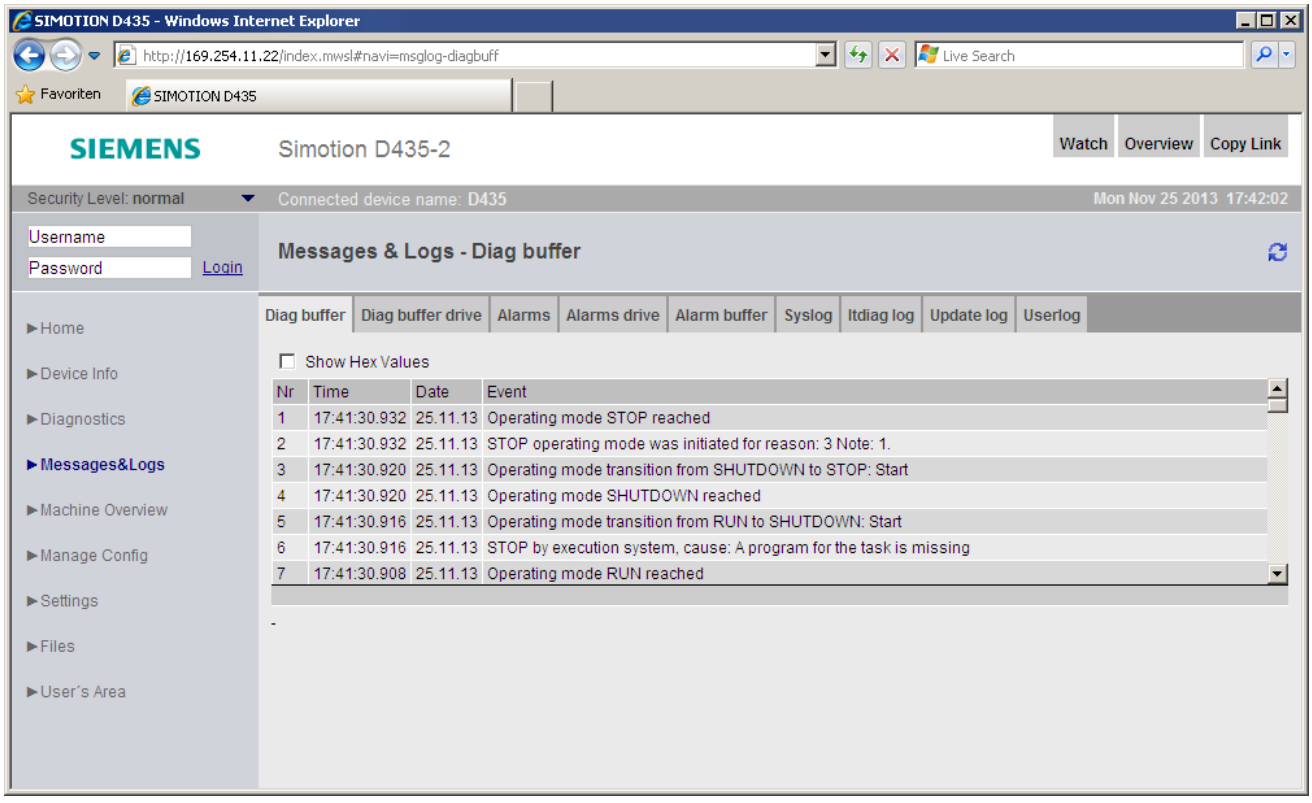

Figure 10-136 Diagnostic buffer with generated diagnostic data

The following points must be noted for the DIAGURLS.TXT file:

- A DIAGURLS.TXT file containing the standard websites is automatically created if you have not stored your own DIAGURLS.TXT file.
- Standard websites are entered "without" specifying a path (e.g. "devinfo.mwsl" for the standard website "devinfo.mwsl").
- User websites (such as "user.mwsl") in the \USER\SIMOTION\HMI\FILES directory on the CF card must contain the FILES/ path specification.

- If you have created subfolders (e.g. "myfolder" in the FILES directory), these must also appear in the path.
- Only one file name may be used per line.
- Empty lines are not permitted (an empty line will be interpreted as the end of the list).
- No distinction is made between upper-case and lower-case letters.
- It does not matter whether you use "\" or "/" in the path name.

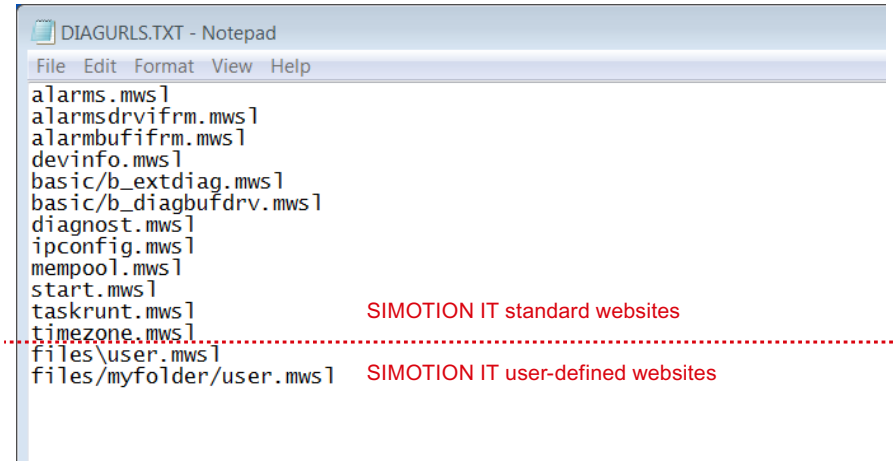

Figure 10-137 Depiction of DIAGURLS.TXT editor

Additional references

You will find detailed information on device and diagnostic information of the SIMOTION IT web server in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

Delete/restore non-volatile SIMOTION data

Overview

Requirement

The non-volatile SIMOTION data have been backed up on the CF card by one of the following methods:

- by system function (_savePersistentMemoryData), see also Section Operations and their effect on the user memory (Page 6990).
- manually by service selector switch / web server / DIAG button, see Section Backup of diagnostic data and non-volatile SIMOTION data (Page 7266).

Procedure

The non-volatile SIMOTION data are restored automatically during a module replacement, see Section Replacing modules in the spare part scenario (Page 6998). The non-volatile data can also be restored manually (by manual operation).

The CF card may contain backups of non-volatile SIMOTION data in various storage locations:

- data backed up with the system function _savePersistentMemoryData
  Storage location on CF card:
  - /USER/SIMOTION/PMEMORY.XML
  - /USER/SIMOTION/PMEMORY.BAK (backup file)
- manually by service selector switch / web server / DIAG button, backed-up data
  Storage location on CF card:
  - /USER/SIMOTION/HMI/SYSLOG/DIAG/PMEMORY.XML

On manual restoration, the position of the service selector switch defines which of these data will be preferably restored.

During restoration, the non-volatile SIMOTION data are first deleted and then the non-volatile SIMOTION data are restored via the PMEMORY backup file.

If restoration is not possible (e.g. file does not exist or corrupt), the next file in the priority list is accessed.

Table 10-77 Restoration of the non-volatile SIMOTION data

Position of the service selector switch	Use case	Priority sequence for use of the data backups
1	The data backed up with the system function _savePersistentMemoryData are preferably restored	1. /USER/SIMOTION/PMEMORY.XML 2. /USER/SIMOTION/PMEMORY.BAK 3. /USER/SIMOTION/HMI/SYSLOG/DIAG/PMEMORY.XML
A (as of V4.4)	The data backed up by service selector switch position "D" / web server / DIAG pushbutton are preferably restored	1. /USER/SIMOTION/HMI/SYSLOG/DIAG/PMEMORY.XML 2. /USER/SIMOTION/PMEMORY.XML 3. /USER/SIMOTION/PMEMORY.BAK

For how to proceed, see Section Restoring data with switch position "1" or "A" (Page 7276).

Note

Firmware / kernel < V4.4

Because switch position "A" is only supported as of V4.4, for < V4.4, restoration must be performed with switch position "1." To force restoration of the data backed up by service selector switch position "D" / web server / DIAG button, it may be necessary to delete existing files PMEMORY.XML and PMEMORY.BAK in the directory /USER/SIMOTION/ on the CF card.

Restoring data with switch position "1" or "A"

Procedure

To restore the non-volatile SIMOTION data, proceed as follows:

Step	Switch position "1"	Switch position "A" (as of V4.4)
1.	Insert the CF card into the new SIMOTION D4x5-2. The SIMOTION D4x5-2 must be switched off!	
2.	Set the service selector switch to "**1**." The position of the mode switch is not relevant, i.e. the set operating mode remains unchanged.  Service selector switch (position 1)	Set the service selector switch to "**A**." The position of the mode switch is not relevant, i.e. the set operating mode remains unchanged.  Service selector switch (position A)
3.	Switch the SIMOTION D4x5-2 on.	Switch the SIMOTION D4x5-2 on. The flickering green SF LED indicates that restoration is requested via position "A."
4.	Restoration is started automatically.	Turn the service selector switch to "1" to start restoration.
5.	Once restoration has been completed, the module will start up automatically.	
6.	Switch the module off and turn the service selector switch back to "0."	
7.	Switch the SIMOTION D4x5-2 on again.	

Back up diagnostic data and non-volatile SIMOTION data via the web server

SIMOTION devices provide a web server with already prepared standard web pages. These pages can be displayed via Ethernet using a commercially available browser. Additionally, you have the option of creating your own HTML pages and incorporating service and diagnostic information.

Diagnostic data and non-volatile SIMOTION data can be backed up via the web server. The home page of the web server is opened by entering the IP address of the SIMOTION device in the address line of the browser; e.g. http://169.254.11.22

This opens the home page of the web server. To back up diagnostic data and non-volatile SIMOTION data, call the "Diagnostic files" page from the "Diagnostics" menu.

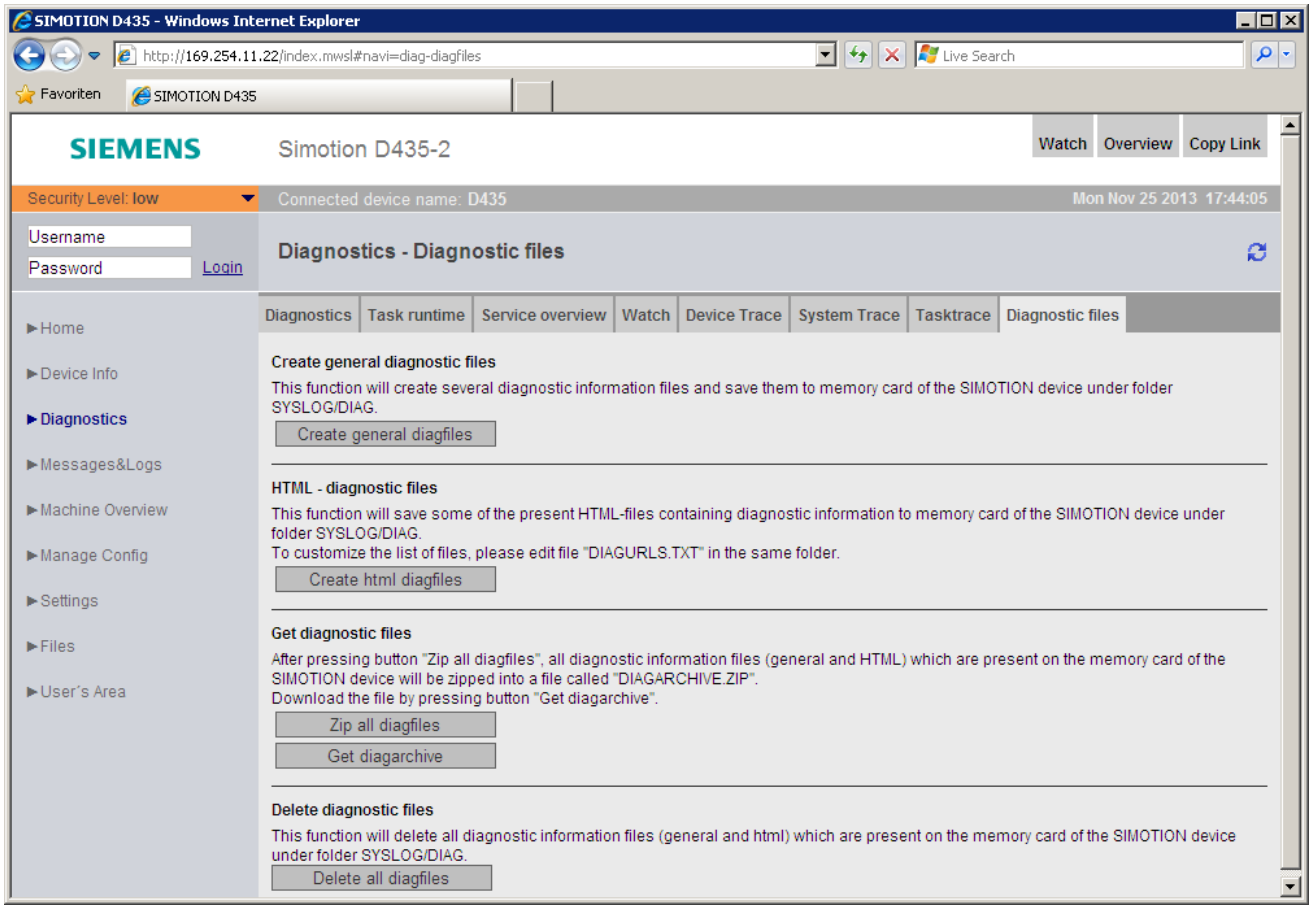

Figure 10-138 SIMOTION IT web server

Table 10-78 Functions on the "Diagnostic files" HTML page

Button	Function
Create general diagfiles	This button saves the diagnostic data and non-volatile SIMOTION data to the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory. HTML files used for diagnostics purposes are not saved.
Create html diagfiles	This button is used to save diagnostics HTML pages on the data carrier. It should be noted that only those pages that are listed in the DIAGURLS.TXT file in directory ...\USER\SIMOTION\HMI\SYSLOG\DIAG are backed up, see Section Diagnostics via HTML pages (Page 7273).
Zip all diagfiles	The "zip all Diagfiles" button enables you to compress diagnostics files. This stores all files and folders in a ZIP file in directory ...\USER\SIMOTION\HMI\SYSLOG\DIAG, while retaining the folder structure.
Get diagarchive	This button is used to save the ZIP archive to connected programming devices/PCs.
Delete all diagfiles	This button is used to delete all data stored in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory; the directory itself is not removed, however.

You can find diagnostic data and non-volatile SIMOTION data on the CF card in the following directory:
\USER\SIMOTION\HMI\SYSLOG\DIAG

Additional references

You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

Storing diagnostics data and trace on the CF card

As of V4.5, the following data can be saved to the CF card with the **_saveTraceAndDiagnosticFiles** system function:

- Diagnostics data (same data as when the DIAG button is actuated)
- TO trace
- Device trace

The function can be used, for example, to collect diagnostic information (e.g. in the event of a fault) locally on the machine and without backing up SCOUT. The function saves the available data in a ZIP file, whereby the file name and the archive directory can be specified.

The packed data can be accessed, for example, via the web server.

Additional service and diagnostics options

SIMOTION Task Profiler application

The SIMOTION Task Profiler is a dedicated application installed parallel to SIMOTION SCOUT during SIMOTION SCOUT setup. The Task Profiler can be called in online mode using device diagnostics in SIMOTION SCOUT or the Windows application. In the event of a malfunction or error, the Task Trace data can be written to a directory or the CF card. They can then be processed using the Task Trace Viewer.

Additional references

For detailed information, see the *SIMOTION Task Trace* Function Manual.

Diagnostics via the SIMOTION IT web server

The SIMOTION D features an integrated web server.

In addition to customized websites and the option of performing firmware and project updates, SIMOTION IT web server provides comprehensive device and diagnostic information that can be called using a standard PC with a web browser.

Security concept of HTTP/S, FTP, and Telnet access on the web server

As of version V4.4, access to the SIMOTION IT web server is protected by a multi-level security concept.

The security state of the web server is indicated by the security level on the website. This security level can have three different stages: Low, normal, high.

Security Level Low

The device is supplied with an empty user database. No projects exist yet. The security level is low to allow configuration of the device.

- In this state, access to the web server as an anonymous user is possible to enable use of functions such as the project and firmware update or OPC XML.
- Access to the FTP and Telnet is also possible.
- New users can be entered in the empty user database.

In this state, series commissioning is possible via the web server.

NOTICE
Protecting the device Security level low should only be used for commissioning and service as otherwise the device is not adequately access protected.

Security Level Normal

The controller has a user database. There is a project on the controller; HTTP, HTTPS, FTP, and Telnet have been activated in the HW Config.

User password authentication is mandatory for access to websites with sensitive content (e.g. firmware update watch table, ...), FTP, and Telnet.

Security Level High

High security with maximum access protection:

HTTP, HTTPS, FTP, and Telnet have been deactivated via HW Config. Access to the Ethernet via the various ports of the services is then no longer possible.

State transition from security level low to normal

After taking delivery of the device, the user creates a project and loads it onto the device. This can be done by using the download functions of the SCOUT, by loading it directly onto the memory card (e.g. also via FTP), or via the Manage Config website, Device update tab.

Whichever method is used, the act of loading a project onto the device corresponds to a transition from security level low to security level normal from the point of view of the web server.

Resetting the security level from normal to low

If the user forgets to edit the UserDataBase.xml during initial commissioning, it will no longer be possible to access FTP, web services, or access-protected pages during use.

If there is no mechanical access to the memory card or the device, this can be achieved with the SCOUT function "Delete user data on card". After setting up the user administration, the project must be downloaded again.

Alternatives without SCOUT:

Setting the service selector switch to position "8" restores security level low (SIMOTION IT service mode). Using this method, the device can always be reset to security level low by hardware means. The following behavior must be taken into account:

- The "Service mode" is activated by turning the SVC switch to position "8".
- If the switch is already set to "8" at ramp-up, it is ignored (protection against forgetfulness).
- The service mode stops immediately when position "8" is exited.
- The service mode stops automatically after 120 minutes.
- It is possible to retrigger 120 minute timeout at any time by turning the switch briefly from "8" to "7" and back, for example.
- The service mode is indicated (as for underlicensing) through slow red flashing of the SF LED.

Note

As an alternative to switch position "8," security level low can also be activated via a simotion.ini file in the main directory of the CF card.

To achieve this, use a text editor (such as Notepad) to create a file called simotion.ini Add the following text: SERVICE_SELECTOR_MODE=8

You must use a text editor and may not use any formatting in the text.

To exit security level low again, undo the changes you have made.

Additional references

You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

10.1.1.10 Configuration of drive-related I/Os (without symbolic assignment)

Overview

The configuration of **local measuring inputs** is fundamentally different to the configuration of **global measuring inputs**.
The assignment of the local measuring inputs is permanently related to the hardware of the control unit and is performed

- On the drive side via the drive expert list and
- During the configuration of the TO measuringInput via the measuring input number.

Local and global measuring inputs have different properties. Detailed information on the differences can be found in the appendix,
- in Section Local and global measuring inputs (Page 7281).

Information about the configuration can be found

- For global measuring inputs (with symbolic assignment) in Section Configuration of global measuring inputs (Page 7163).
- For local measuring inputs in the appendix, in Section Configuration of local measuring inputs (Page 7283)

Additional references

Further information and programming examples for configuring drive-related I/Os without symbolic assignment can be found

- At the following Internet address (https://support.industry.siemens.com/cs/ww/en/view/29063656)
- In SIMOTION Utilities & Applications
  SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Local and global measuring inputs

Local and global measuring inputs

Depending on the used hardware platform, the following local and global measuring inputs are available for the measuring tasks:

- **Local measuring inputs** are axis-related and implemented in the SINAMICS drive. The actual position value is measured.
- **Global measuring inputs** can be freely assigned to the axes and add an internal time stamp to the measurement result for more precise determination of the axis positions.
  The term "central measuring input" is also used within the context of drives.

Table 10-79 Comparison of local and global measuring inputs

	Local measuring input	Global measuring input
Hardware supported	D410, D410-2, D4x5, D4x5-2 (terminal X122/X132), CX32, CX32-2, CU310, CU310-2, CU320, CU320-2	TM15, TM17 High Feature, D410, D410-2, D4x5, D4x5-2 (terminal X122, X132, X142), CX32, CX32-2, CU310, CU310-2,CU320, CU320-2, ET 200SP/MP timer DIDQ
Measurement procedure	With a signal edge at the relevant input, the current actual values of an encoder connected to a Control Unit are measured with positioning accuracy to determine lengths and distances.	With a signal edge at the relevant input, the current actual values of one or more encoders are measured using time stamp functionality with positioning accuracy in order to provide information for determining lengths and distances (possible with any encoders included in the project).
Configuration of the measuring input TO in SIMOTION SCOUT	The assignment of inputs is always permanent depending on the hardware of the Control Unit and is performed during the configuration of the TO measuringInput using the measuring input number.	The assignment of inputs is not fixed depending on the hardware and is performed during the configuration of the TO measuringInput by means of symbolic assignment or the hardware address.

	Local measuring input	Global measuring input
TO measuringInput setting: Single measurement (Measurement jobs must be issued individually for each measurement. Several interpolation cycle clocks lie between two measurements.)	Yes	Yes
TO measuringInput setting: Cyclical measurement (The measurement is activated just once and runs cyclically until deactivated.)	No	Yes **D410, D410-2, D4x5, D4x5-2 (terminal X122, X132), CX32, CX32-2, CU310, CU310-2, CU320, CU320-2:** The minimum interval between two measurements is three servo cycle clocks (max. two edges per measurement). **D4x5-2 (terminalX142), TM17 High Feature, ET 200SP/MP timer DIDQ:** The minimum interval between two measurements is one servo cycle clock (max. two edges per measurement). **TM15:** No cyclic measurement available
Use of multiple TO measuringInputs on one axis/encoder. They can be active concurrently	No	Yes
Listening TO measuringInput	No	Yes
Measuring on virtual axes	No	Yes
Measuring on axes attached to a different drive unit	No	Yes

SIMOTION Utilities & Applications includes, for example, a tool to estimate:

- The time between a measurement job being initiated and it being effective in the drive.
- The minimum time between two measurement jobs.

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

	Max. number of measuring input inputs	As local measuring input configurable	As global measuring input configurable
D410-2, CU310-2	8	x	x
D4x5-2 • X122/X132 • X142	 • 8 • 8	 • 8 • 0	 • 8 • 8
CX32-2	4	x	x
D410, CU310, CX32	3	x	x
D4x5, CU320	6	x	x
ET 200MP TM timer DIDQ 16x24V	8	-	x
TM15	24	-	x
TM17 High Feature	16	-	x

Configuring local measuring inputs

Properties

Local measuring inputs are always permanently assigned to an axis (drive). They are configured separately for each drive. The drive and the measuring input input must always be located on the same control unit. The measurement results are transferred using the axis message frame in accordance with the PROFIdrive profile. Message frame 39x does not need to be configured for local measuring inputs.

The settings for the use of the local measuring inputs must be made in the expert list.

Procedure

In order to use an I/O terminal on a D4x5-2, CX32-2 or SINAMICS control unit as measuring input input, proceed as follows:

1. Double-click the "Inputs/outputs" entry below the control unit in the project navigator.
2. Click the "Bidirectional digital I/Os" tab.
3. In this tab, configure the required I/O terminal as input. The configuration can also be set channel-granular on the p0728 parameter using the expert list of the control unit.

Specification of the measuring input input terminal must be made in the expert list of the respective drive for local measuring inputs.

Table 10-80 Local measuring inputs, required settings in the expert list (2)

	Parameters in the expert list of the drive	**Parameterization as**	
		D4x5-2, CU320-2	**CX32-2**
Specification of the input terminal of the measuring input in the expert list of the drive	p0488[0] (measuring input 1 input terminal, encoder 1)	DI/DO 8 or DI/DO 9 or DI/DO 10 or DI/DO 11 or DI/DO 12 or DI/DO 13 or DI/DO 14 or DI/DO 15	DI/DO 8 DI/DO 9 or DI/DO 10 or DI/DO 11
	p0488[1] (measuring input 1 input terminal, encoder 2)		
	p0488[2] (measuring input 1 input terminal, encoder 3)		
	p0489[0] (measuring input 2 input terminal, encoder 1)		
	p0489[1] (measuring input 2 input terminal, encoder 2)		
	p0489[2] (measuring input 2 input terminal, encoder 3)		

As a maximum of three encoders can be assigned to a drive, the index [0..2] specifies whether the measurement applies to encoder 1, 2, or 3.

The following must be taken into account:

- Only two TO measuringInputs can be configured per TO axis or TO externalEncoder
- Only one TO measuringInput can be active on a TO axis or TO externalEncoder.

Table 10-81 Local measuring inputs, configuration of the TO measuringInput

Axis measuring system no.	Under axis measuring system number, enter the number of the used encoder system (namely, encoder 1, 2 or 3). Encoder system 1 is the default setting.
Drive-related (local measuring input)	Activate the checkbox when a local measuring input is used.
Measuring input number	Enter here which measuring input is used (namely, 1 or 2). Input 1 is the default setting.

Detailed information can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs* Function Manual.

10.1.1.11 Standards and approvals

General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

EMC limits in South Korea

	KC registration number: KCC-REM-S49-SIMOTION For sellers or other users, please keep in mind that this device in an A-grade electromagnetic wave device. This device is intended to be used in areas other than home. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

The EMC limits to be observed for Korea correspond to the limits of the EMC product standard for variable-speed electric drives EN 61800-3 of category C2 or the limit class A, Group 1 according to EN 55011. By implementing appropriate additional measures, the limit values according to category C2 or limit value class A, Group 1, are observed. Additional measures, such as the use of an additional RFI suppression filter (EMC filter), may be necessary.

The measures for EMC-compliant design of the system are described in detail in this manual respectively in the Installation Guideline EMC.

Note that the final statement on compliance with the standard is provided by the respective label attached to the individual unit.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (https://support.industry.siemens.com/cs/ww/en/ps/14506/cert).

Marking for Australia and New Zealand

	SIMOTION D4x5-2 incl. CX32-2 and CBE30-2 satisfy the requirement of the standard AS/NZS CISPR 16.
or	
	Marking with RCM (Regulatory Compliance Mark) or C-Tick with older components.

Marking for the Eurasian customs union

	EAC (Eurasian Conformity) Customs union of Russia, Belarus and Kazakhstan Declaration of conformity in accordance with the technical regulations of the customs union (TR CU).

Standards that are not relevant

	China Compulsory Certification SIMOTON D does not belong to the validity area of the China Compulsory Certification (CCC).

China RoHS

SIMOTION D complies with the China RoHS directive. You can find more information on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109738656).

SIMOTION D4x5-2 device-specific notes

Note regarding SIMOTION D

Note

The product standard EN 61800-3 describes the EMC requirements placed on "Variable-speed drive systems". As such, it defines different limits depending on the location of the drive system.

SINAMICS S120 power units are designed for use in the second environment. The term second environment refers to all locations outside residential areas. These are basically industrial areas which are supplied from the medium-voltage line supply via their own transformers.

The same installation instructions apply for the SIMOTION D4x5-2/CX32-2 Control Units as for the SINAMICS S120 CU320-2 Control Units with regard to EMC.

It is essential to follow the installation instructions in the SINAMICS S120 Manuals in order to ensure compliance with emitted interference and immunity values.

For further information on this topic also refer to the *SIMOTION PM 21* Catalog as well as the SINAMICS Function Manuals.

10.1.1.12 ESD guidelines

ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

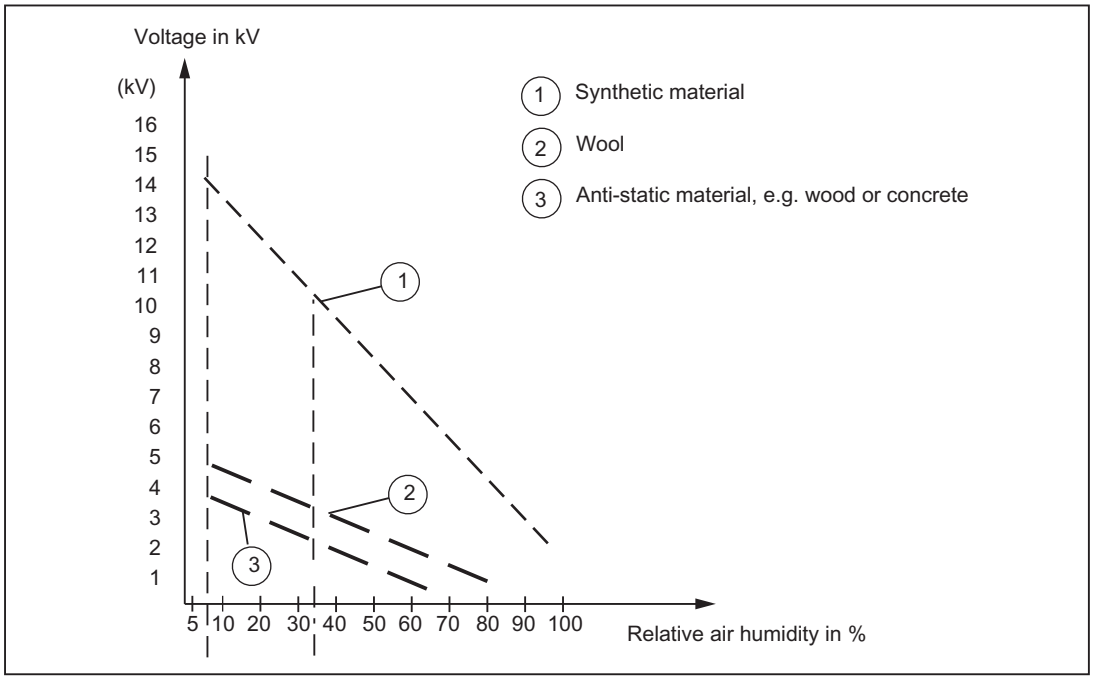

Figure 10-139 Electrostatic voltage that can accumulate on operating personnel

Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

10.1.2 SIMOTION D410-2

Preface

Contents of the Commissioning and Hardware Installation Manual

This document is part of the **SIMOTION D** documentation package.

Scope

The SIMOTION D410-2 Commissioning and Hardware Installation Manual describes the commissioning and installation of the SIMOTION D410-2 DP and SIMOTION D410-2 DP/PN control units. A separate *SIMOTION D410* Commissioning Manual is available for the SIMOTION D410 DP and SIMOTION D410 PN Control Units.

The software configuration is described in this manual based on SIMOTION SCOUT and SIMATIC STEP 7 Version V5.x.
Information of configuration of the SIMOTION D Control Units in the Engineering Framework Totally Integrated Automation Portal (SCOUT in the TIA Portal), you will find in the configuration manual *SIMOTION SCOUT TIA*. The TIA Portal requires at least SIMOTION SCOUT V4.4 and SIMOTION D4xx-2 Control Units as of firmware V4.3.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Sections in this manual

The following is a description of the purpose and use of this Commissioning and Hardware Installation Manual:

- Description
  This section describes the SIMOTION system and its integration into the information landscape.
- Installing
  This section provides information on the the various installation options for the device.
- Connecting
  This section provides information about connecting and cabling the various devices, and about the communication interfaces.
- Commissioning (hardware)
  This section describes how to start up the device and what you must take into account.
- Parameter assignment / addressing
  This section describes how to integrate the SIMOTION D410-2 cm a project and how to configure the interfaces.
- Commissioning (software)
  This section describes how to configure a system and how to test the configured drives and axes.
- Service and maintenance
  This section describes how to replace a module, how to run updates, and how to modify settings.
- Diagnostics
  This section provides information on the service and diagnostics options, as well as LED states.
- Appendices with factual information for reference (for example, Standards and Approvals, ESD guidelines, etc.)
- Index for locating information.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References

- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Disposal and recycling

SIMOTION D410-2 is an environmentally friendly product! It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Identification of plastic materials in accordance with ISO 11469.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The disposal of the products described in this manual should be performed in compliance with the valid national regulations.

The products can be largely recycled owing to their low pollutant content. For environmentally friendly recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner

Further information / FAQs

You can find further information on this manual at the following FAQ:

https://support.industry.siemens.com/cs/ww/de/view/27585482

The following information sources are also available:

- SIMOTION Utilities & Applications: SIMOTION Utilities & Applications will be included in the SIMOTION SCOUT scope of delivery and, along with FAQs, also contain free utilities (e.g. calculation tools, optimization tools, etc.) as well as application examples (ready-to-apply solutions such as winders, cross cutters or handling)
- The latest SIMOTION FAQs at https://support.industry.siemens.com/cs/ww/de/ps/14505/faq
- SIMOTION SCOUT online help
- For additional documentation, see the *Overview of SIMOTION documentation* (separate document).

Open source software

Third-party software - License conditions and copyright notes

Copyright notes for the third-party software contained in this product, in particular the open source software, as well as the applicable license conditions, can be found in the READ_OSS.ZIP file on the SIMOTION D CF card or in the corresponding firmware files.

Special note for resellers

The notes and the license conditions contained in the READ_OSS.ZIP file must be passed on to the purchaser in order to avoid the reseller and purchaser from violating the license conditions.

Source code availability

Some license terms of third-party software components used in this product may require us to provide you with the source code and other information for those components. You can find this information directly on or with the product (e.g. on mass storage devices, DVD). If this is not possible for technical reasons, Siemens will be happy to send you this OSS source code in exchange for reimbursement of the processing costs. Please contact the address provided at the end of this section.

10.1.2.1 Safety instructions

Fundamental safety instructions

General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following six steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Electric shock if there is no ground connection

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply

When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage

Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Spread of fire from built-in devices

In the event of fire outbreak, the enclosures of built-in devices cannot prevent the escape of fire and smoke. This can result in serious personal injury or property damage.

- Install built-in units in a suitable metal cabinet in such a way that personnel are protected against fire and smoke, or take other appropriate measures to protect personnel.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Unexpected movement of machines caused by radio devices or mobile phones

The use of radio devices or mobile telephones in the immediate vicinity of the components can result in equipment malfunction. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- If you come closer than around 2 m to such components, switch off any radios or mobile phones.
- Use the "SIEMENS Industry Online Support app" only on equipment that has already been switched off.

⚠ WARNING

Fire due to inadequate ventilation clearances

Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position

The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

⚠ WARNING

Unrecognized dangers due to missing or illegible warning labels

Dangers might not be recognized if warning labels are missing or illegible. Unrecognized dangers may cause accidents resulting in serious injury or death.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, where necessary in the national language.
- Replace illegible warning labels.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions

Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for Safety Integrated functions

If you want to use Safety Integrated functions, you must observe the safety notices in the Safety Integrated manuals.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Specific safety information for SIMOTION D410-2

Observe the following safety information when working with SIMOTION D410-2 and its components!

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Only safety extra low voltage in accordance with EN/IEC 609501 may be connected at all connectors and terminals.

⚠ WARNING

Danger to life from unexpected movement of machines on automatic restart

An automatic restart can be programmed for SIMOTION controllers. When the power returns, the axes start automatically.

Make sure this presents no hazard to personnel or property.

NOTICE

Damage to the CompactFlash card from electrical fields or electrostatic discharge

The CompactFlash card is an ESD-sensitive component.

De-energize the SIMOTION D410-2 device before inserting or removing the CompactFlash card. The SIMOTION D410-2 is in a de-energized state when all the LEDs are OFF.

Comply with the ESD rules.

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of systems / devices. Make sure the ventilation clearances of 50 mm are provided above and below the components. The ventilation openings may not be covered by connecting cables.

10.1.2.2 Description

System overview

SIMOTION D

SIMOTION D is a drive-based version of SIMOTION based on the SINAMICS S120 drive family.

With SIMOTION D, the SIMOTION PLC and motion control functionalities as well as the SINAMICS S120 drive software run on shared control hardware.

SIMOTION D is available in two versions:

- SIMOTION D410-2 is a compact Control Unit predestined for single-axis applications.
- SIMOTION D4x5-2 is a Control Unit for multi-axis applications in the SINAMICS S120 booksize format.
  The following performance variants of the SIMOTION D4x5-2 Control Units are offered:

Control Unit	Performance variant	Range of applications
SIMOTION D425-2	BASIC performance	For up to 16 axes
SIMOTION D435-2	STANDARD performance	For up to 32 axes
SIMOTION D445-2	HIGH performance	For up to 64 axes
SIMOTION D455-2	ULTRA-HIGH performance	For up to 128 axes or applications with very short control cycles

Note

The SIMOTION D410-2 is described in this manual.

Separate manuals are available for the SIMOTION D4x5-2 and the SIMOTION D4x5 and SIMOTION D410 predecessor modules.

SIMOTION D is an integral part of the Totally Integrated Automation (TIA) concept. TIA is characterized by integrated data management, configuration, and communication for all

products and systems. Thus, an extensive toolbox of automation modules is also available for the SIMOTION D410-2.

Note

In order to cover all variants of SIMOTION D in blocksize format, the product will be referred to as "D410-2". Specific product designations will be used for information that applies only to one product version, e.g. D410-2 DP/PN.

SIMOTION D410-2

Figure 10-140 SIMOTION D410-2 DP (pictured on left), SIMOTION D410-2 DP/PN (pictured on right)

SIMOTION D410-2 is a compact Control Unit for single-axis applications.

The Control Unit is snapped directly on to the SINAMICS Power Module in blocksize format and has an integrated drive control for either one servo, one vector or one V/f axis.

SIMOTION D410-2 can be extended with additional SINAMICS S110/S120 control units (e.g. CU310-2) and so can also be used for smaller multi-axis applications (e.g. with 2 - 3 axes).

Example of a single-axis application

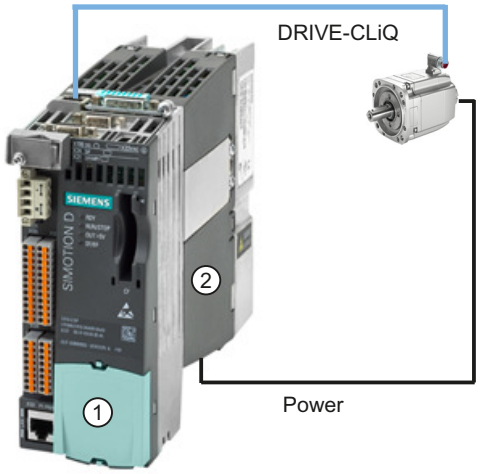

Figure 10-141 Application example with one axis

The example shows a single-axis application, consisting of a SIMOTION D410-2 (Control Unit) ① that is snapped directly on to the SINAMICS Power Module in blocksize format ②. The motors are supplied with power via the Power Module. The encoder is connected by means of DRIVE-CLiQ.

Example of a multi-axis application

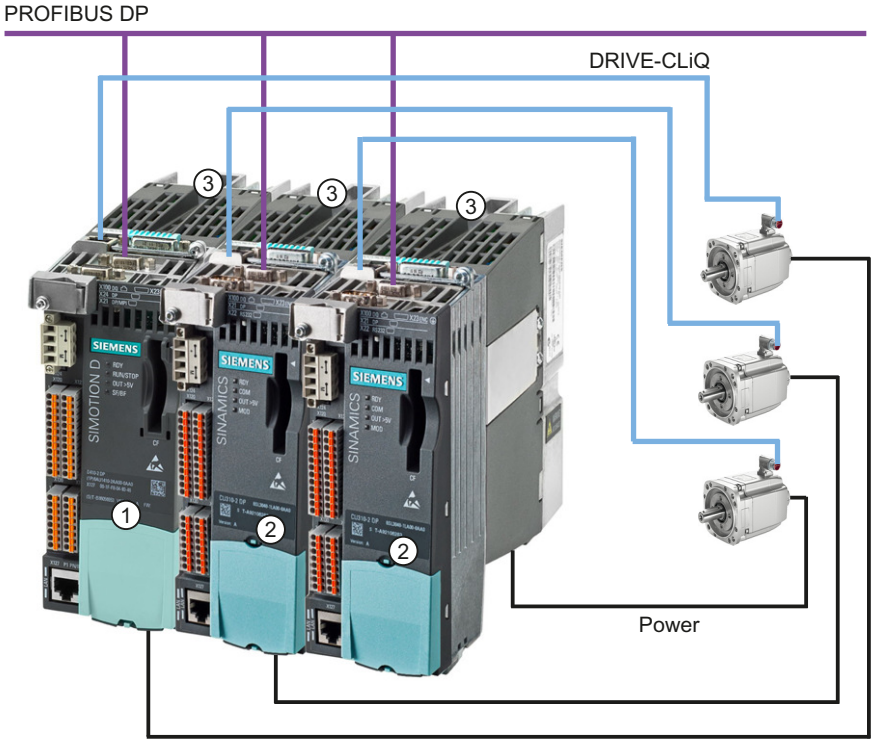

Figure 10-142 Application example with 3 axes

The example shows an application with 3 axes, consisting of:

- One SIMOTION D410-2 DP (Control Unit) ①, snapped on to the Power Module in blocksize format ③
  The SIMOTION D410-2 DP is snapped directly on to the SINAMICS Power Module. The motors are supplied with power via the Power Module. The encoder is connected by means of DRIVE-CLiQ.
- Two SINAMICS S120 CU310-2 DP ②, snapped onto a Power Module in blocksize format ③
  The Control Units are connected to the SIMOTION D410-2 DP via PROFIBUS DP. The two SINAMICS S120 CU310-2 DP are snapped directly on to the SINAMICS Power Module. The motors are supplied with power via the Power Modules. The encoders are connected by means of DRIVE-CLiQ.

Note

Path interpolation is supported as of V4.4.

Application

Combining a Power Module with SIMOTION D410-2 forms a compact single drive for machine and plant engineering.

Applications include:

- Machine concepts with central drive (e.g. presses, printing and packaging machines, etc.)
- Modular machine concepts where the machine modules were broken down into single axes
- Single drives with high accuracy, stability and concentricity requirements (compared with standard drives) in machine and industrial plant engineering
- Single drives for transport tasks (conveying, raising, lowering)
- Single drives with integrated PLC functionality and expanded motion control functionality such as output cams or cams
- Drives without power recovery (wire drawing, extruding)
- Drive connections with high availability requirements (incoming supply failure may not cause all axes to fail)
- Small multi-axis groupings (typically 2 to 3 axes) based on SINAMICS S110/120 blocksize.

Hardware components

As central hardware the SIMOTION D410-2 Control Unit is made up of the SIMOTION runtime system and the SINAMICS drive control.

A range of additional SINAMICS S120 components, such as SMx encoder systems or Terminal Modules can be connected via DRIVE-CLiQ.

With a few exceptions (e.g. no BOP20 Basic Operator Panel, etc.), the drive control integrated in SIMOTION D410-2 has the same control properties and performance features as the SINAMICS S120 CU310-2 Control Unit.

Extension of the drive computing performance

To fully utilize the motion control performance of a SIMOTION D410-2 when required, the drive-side computing performance can be extended by connecting additional SINAMICS S/G Control Units (e.g. CU305, CU310-2, CU320-2, CU250S-2, etc.) via PROFIBUS or PROFINET to the SIMOTION D410-2.

Software components

The basic functionality of SIMOTION D is supplied on a CompactFlash card containing the following:

- The SIMOTION runtime system with the following functions:
  - Freely programmable runtime system (IEC 61131)
  - Various runtime levels (tasks)
  - PLC and arithmetic functionality
  - Motion control functions
  - Communication functions
- The SINAMICS S120 drive control with the following functions:
  - Closed-loop current and torque control
  - Closed-loop speed control

System components

Overview

SIMOTION D410-2 communicates with the components of the automation landscape via the following interfaces:

- PROFIBUS DP (D410-2 DP and D410-2 DP/PN)
- PROFINET IO (D410-2 DP/PN only)
- Ethernet
- DRIVE-CLiQ (DRIVE Component Link with IQ)
- Power Module interface (PM-IF)

SIMOTION D features a SINAMICS Integrated drive element. Communication with the SINAMICS Integrated is via PROFIBUS mechanisms (DP Integrated), via PROFIdrive telegrams.

Shorter cycle times and greater numbers of addresses for each node are achieved with the "DP Integrated" compared to the "external PROFIBUS DP."

The most important components of the system and their functions are shown below.

Table 10-82 System components

Component	Function
SIMOTION D410-2	... is the central motion control module. The module contains the programmable SIMOTION runtime of SIMOTION D410-2 and the SINAMICS S120 drive runtime software. You can use the integrated high-speed I/Os (onboard I/Os) as: • User-addressable process I/Os • Homing inputs • Fail-safe digital inputs • Fail-safe digital output • Inputs for measuring inputs • Outputs for fast output cams • Analog input The measuring sockets can output any analog signals. The DRIVE-CLiQ interface permits a fast connection to the SINAMICS drive components.
System software	The basic functionality of SIMOTION D410-2 is supplied separately on a CompactFlash Card containing the following: • SIMOTION runtime (kernel) • Drive software of SINAMICS S120 The CompactFlash card is not included in the scope of delivery.
Power supply (PS)	... provides the electronic power supply for SIMOTION D410-2 (e.g. SITOP power supply).

PROFIBUS DP

SIMOTION D410-2 can communicate with the following components via the PROFIBUS DP interface.

Table 10-83 Components on PROFIBUS DP

Component	Function
Programming device (PG/PC)	... configures, assigns parameters, programs, and tests using the SIMOTION SCOUT Engineering System (ES).
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of the SIMOTION D410-2.
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.

Component	Function
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200S	Finely scalable I/O system for cabinet installation and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/IP67 degree of protection for machine-related applications with no cabinet; with features such as more compact designs, integrated PROFIsafe safety technology, PROFINET connection, and live module replacement.
SIMATIC ET 200eco	I/O system with IP65/IP67 degree of protection for machine-related applications with no cabinet, with a flexible and fast connection system in ECOFAST or M12.
Other PROFIBUS I/O	
Gateways	• DP/AS-Interface Link 20E and DP/AS-Interface Link Advanced for the PROFIBUS DP gateway to AS-Interface • DP/DP coupler for connecting two PROFIBUS DP networks
Drive interfaces	• ADI4 (Analog Drive Interface for 4 axes) for the connection of drives with analog ±10 V setpoint interface or for external encoders • IM 174 (Interface Module for 4 axes) for the connection of drives with analog ±10 V setpoint interface, external encoders or the connection of stepper drives with pulse/direction interface
Drive units with PROFIBUS DP interface (e.g. CU310-2 DP)	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors. Can also be operated as an isochronous slave on the PROFIBUS DP.
Teleservice adapter	Remote diagnostics

PROFINET IO

The SIMOTION D410-2 DP/PN can communicate with the following components via the onboard PROFINET IO interface.

Table 10-84 Components on the PROFINET IO

Component	Function
Programming device (PG/PC)	... configures, assigns parameters, programs, and tests using the SIMOTION SCOUT Engineering System (ES).
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit.
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Master computer	... communicates with other devices via UDP, TCP/IP.
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data. With the time-based I/O, signals can be recorded or output to the precise µs.

Component	Function
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety. With the time-based I/O, signals can be recorded or output to the precise µs.
SIMATIC ET 200S	Finely scalable I/O system for cabinet configuration and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related applications with no cabinet; with features such as compact designs, integrated PROFIsafe safety technology, PROFINET IO connection and live module replacement.
SIMATIC ET 200eco PN	Compact block I/O with IP65/66/67 degree of protection for cabinet-free usage in machines with M12 connection method. Very rugged and resistant encapsulated metal enclosure.
Other PROFINET IO I/O devices	
Drive units with PROFINET IO interface	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors.
Gateways	• IE/AS-Interface link PN IO for the PROFINET IO gateway to AS-Interface • PN/PN coupler for connecting two PROFINET IO networks

Ethernet

The Control Unit can communicate with the following components via the Ethernet interfaces or be embedded in an automation environment:

Table 10-85 Components on the Ethernet

Component	Function
Programming device (PG/PC)	... configures, assigns parameters, programs, and tests using the SIMOTION SCOUT Engineering System (ES).
Master computer	... communicates with other devices via UDP, TCP/IP.
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of the SIMOTION D410-2.

DRIVE-CLiQ

SIMOTION D410-2 can communicate via the DRIVE-CLiQ interface with the following components:

Table 10-86 Components on DRIVE-CLiQ

Component	Function
SINAMICS S120 AC DRIVE drive units (with CUA31/CUA32)	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors. The Power Module is connected via CUA31/CUA32. No more than one Power Module can be connected. The chassis Power Module is connected via DRIVE-CLiQ. **Note**: Components in booksize format are not supported!
TM15, TM17 High Feature Terminal Modules	The Terminal Modules TM15 and TM17 High Feature are used to implement measuring inputs inputs and output cam outputs. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times.
TM31 Terminal Module	... enables terminal expansion via DRIVE-CLiQ (additional analog and digital I/Os).
TM41 Terminal Module	... enables terminal expansion (analog and digital I/Os) and encoder simulation via DRIVE-CLiQ. The TM41 can be connected to a real axis.
TM54F Terminal Module	... enables terminal expansion (fail-safe digital inputs/outputs) for controlling the safe motion monitoring functions of the integrated drive. A TM54F is not usually necessary because the SIMOTION D410-2 has 3 F-DI and 1 F-DO.
TM120 Terminal Module	Four temperature sensors (KTY84-130 or PTC) can be evaluated via the TM120 Terminal Module. The temperature sensor inputs are safely electrically separated from the evaluation electronics in the TM120 Temperature Module and are suitable for evaluating the temperature of special motors, e.g. 1FN linear motors and 1FW6 built-in torque motors.
TM150 Terminal Module	The TM150 Terminal Module can be used to evaluate temperature sensors (KTY, PT100, PT1000, PTC, and bimetal normally closed contact). This means, for example, that other temperatures from the process can be measured in addition to the motor temperature. Temperature sensors can be evaluated using a 2, 3 or 4-wire system. Twelve temperature sensors can be evaluated with 2-wire evaluation and six temperature sensors with 3 and 4-wire evaluation.
SMx Sensor Modules	... enable acquisition of encoder data from connected motors via DRIVE-CLiQ.
Motors with DRIVE-CLiQ interface	... allow simplified commissioning and diagnostics, as the motor and encoder type are identified automatically.
DMC20/DME20 DRIVE-CLiQ hub	... enables the number of DRIVE-CLiQ interfaces to be increased and the creation of a point-to-point topology.

Note

Please note that SIMOTION D410-2 components in booksize format (Controller Extension, Motor Modules, Line Modules, etc.) are not supported.

SIMOTION D410-2 can only be used with the following Power Modules:

- PM340
- PM240-2 as of SIMOTION V4.4/SINAMICS V4.7

Other Power Modules are not supported by SINAMICS G120 (e.g. PM230).

Note

You will find detailed information on components in the SINAMICS S110/S120 family of products in the SINAMICS S110/S120 manuals.

It is possible that older DRIVE-CLiQ components can no longer be used with SIMOTION D410-2. You will find detailed information on this in the SIMOTION D410-2 Commissioning and Hardware Installation Manual in Section "Migration of SIMOTION D410 to SIMOTION D410-2" under "Permissible combinations".

See also

Permissible combinations (Page 7511)

I/O integration

Note

Note that not all modules in the ET 200 I/O family are approved for SIMOTION. Moreover, system-related functional differences can come into play when these I/Os or I/O systems are used on SIMOTION vs. on SIMATIC. For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

A detailed, regularly updated list of the I/O modules approved for use with SIMOTION, as well as notes on their use, can be found at Internet address (https://support.industry.siemens.com/cs/ww/en/view/11886029)

In addition to the I/O modules enabled for SIMOTION, in principle all certified standard PROFIBUS slaves (DP-V0/DP-V1/DP-V2) and PROFINET IO devices with RT and IRT real-time classes may be connected to SIMOTION D410-2. These modules are integrated using the GSD file (PROFIBUS) or GSDML file (PROFINET) provided by the relevant device manufacturer.

Note

Please note that in isolated cases, additional boundary conditions must be fulfilled in order to integrate a module into SIMOTION. Thus, a few modules require "driver blocks" , e.g. in the form of function blocks, that permit (or simplify) integration.

For modules enabled for SIMOTION (e.g. SIMATIC S7-300 module FM 350-1, etc.), these driver blocks are part of the SIMOTION SCOUT engineering system command library.

Commissioning software

Requirement

To create and edit projects on your PG/PC, you need the SIMOTION SCOUT commissioning and configuration tool.

For information on how to install SIMOTION SCOUT, see the *SIMOTION SCOUT* Configuration Manual.

Note

SIMOTION SCOUT contains the functionality of STARTER and SIMATIC S7-Technology.

Simultaneous operation of SIMOTION SCOUT, STARTER and SIMATIC S7-Technology as a single installation on one PG/PC is **not** possible.

Integrated STARTER

You can insert a standalone drive (e.g. SINAMICS S120) with the "Insert single drive unit" element in the project navigator. It is commissioned using wizards in the working area of the workbench that contains the STARTER functionality.

SINAMICS Support Package (SSP)

The following SSPs are relevant for SIMOTION SCOUT:

- SSP "SINAMICS" for single drive units (e.g. CU3xx)
- "SIMOTION SINAMICS Integrated" SSP for the SINAMICS drive integrated into SIMOTION D410-2.

You will find detailed information on the SSPs in the readme files and in the software compatibility list at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317).

Upgrading SIMOTION D410-2 projects and hardware

Projects that you have created for one SIMOTION D410-2 firmware version can also be converted for other firmware versions. See, for example, Section Service and maintenance (Page 7515).

SIMOTION IT web server

The SIMOTION D410-2 features an integrated web server.

The web server supports the display of diagnostics and system data in standard Internet browsers, even in the absence of an engineering system, and the carrying out of project/firmware updates.

Additional references

You will find detailed information on working with projects in the *SIMOTION SCOUT* Configuration Manual.

You will find detailed information on SIMOTION IT web server in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

10.1.2.3 Installing

General requirements

Mounting options

SIMOTION D410-2 comes in two designs:

- Mounting on the Power Module in blocksize format (mounted use).
- Mounting on a mounting plate (detached use).

Open components

SIMOTION D410-2 is an open device! This means, you can only install the modules in housings, cabinets or electrical equipment rooms. These may only be accessible via key or tool. Housings, cabinets, or electrical equipment rooms may only be accessed by trained or authorized personnel. An external fire protection casing is required.

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

Note

The components must be protected against conductive contamination, e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12.

If conductive contamination can be excluded at the installation site, a lower degree of cabinet protection may be permitted.

Mounting the SIMOTION D410-2 on the power module

Overview

A SIMOTION D410-2 can be snapped directly on to a SINAMICS S120 Power Module in blocksize format via the PM-IF interface. Power Modules PM340 and PM240-2 (PM240-2 as of SIMOTION V4.4/SINAMICS V4.7) can be used. Operation with SINAMICS G120 PM2x0 Power Modules or booksize Motor Modules is not possible.

Note

You can connect a Power Module in blocksize format to the DRIVE-CLiQ interface of SIMOTION D410-2 using the CUA31/CUA32 adapter module. Power modules in chassis format AC/AC are connected to SIMOTION D410-2 via the DRIVE-CLiQ interface of the Power Module.

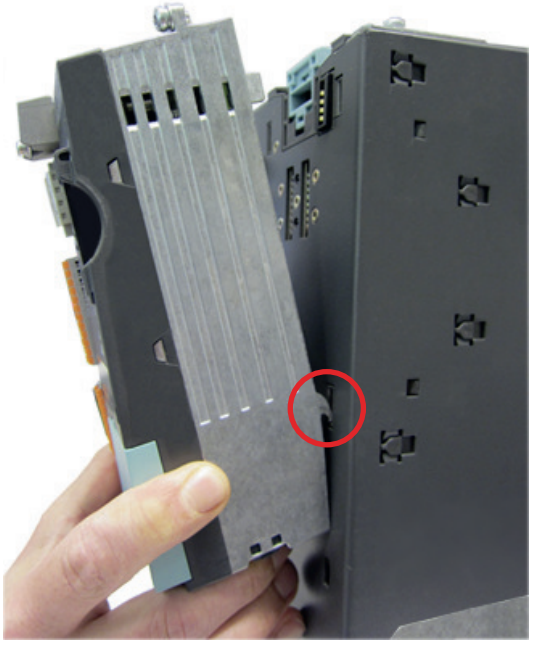
Requirement

As soon as the Power Module is properly installed, you can mount the SIMOTION D410-2 on the Power Module.

Note

Note the information in the *SINAMICS S120 AC Drive*Manual when commissioning the Power Module.

Mounting on the Power Module



Snapping the SIMOTION D410-2 on to the Power Module (example PM340)

PM340 Power Module with SIMOTION D410-2 (example PM340)

Disassembling the SIMOTION D410-2

To remove the SIMOTION D410-2 from the Power Module, the blue release, as shown in the figure, must be pressed down and SIMOTION D410-2 tilted forward.

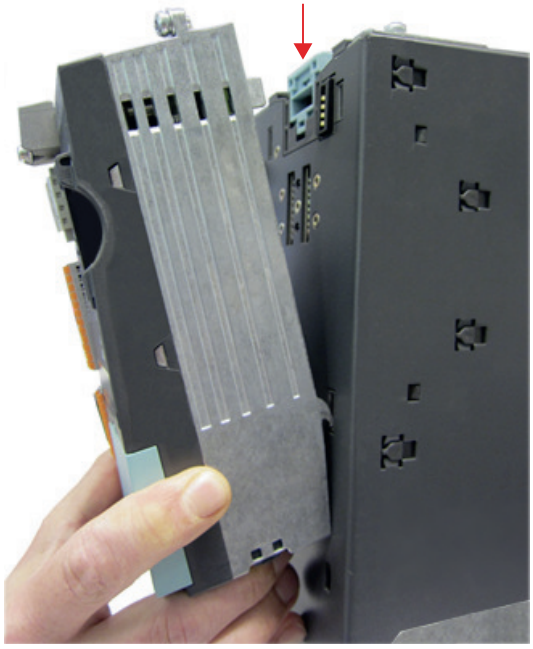


Figure 10-143 Removing the SIMOTION D410-2 from the Power Module

Mounting the SIMOTION D410-2 on the mounting plate

Overview

Using a mounting plate, SIMOTION D410-2 can be operated separately, which means it is not mounted directly on the Power Module.

Application examples:

- Offset installation using CUA31/CUA32 Control Unit Adapter (e.g. for reducing the mounting depth or in order to use additional interfaces on the CUA).
  The SIMOTION D410-2 is snapped on to the mounting plate and connected to the Power Module in blocksize format via DRIVE-CLiQ using CUA31/CUA32. No more than one Control Unit Adapter can be connected to the SIMOTION D410-2.
- Using SIMOTION D410-2 without a Power Module.
  A SIMOTION D410-2 mounted on the mounting plate is operated without the Power Module (e.g. for hydraulic applications).

Requirements

You must order the mounting plate for the SIMOTION D410-2 separately. For the article number, see Section "Spare parts and accessories" in the *SIMOTION D410-2* Manual.

Mounting on mounting plate

1. The mounting plate is attached to the control cabinet.
2. The SIMOTION D410-2 is snapped on to the mounting plate.

Figure 10-144 Mounting the SIMOTION D410-2 on the mounting plate

Note

When operating away from the Power Module, generally the power supply must be realized via the power supply connection (X124).

It is also not possible to use the Safety Integrated Extended and Advanced Functions via the onboard terminals (F-DI, F-DO) in distributed operation.

Observe the information on control cabinet installation in the *SINAMICS S120 AC Drive* Manual.

Mounting the SIMOTION D410-2 in the power module chassis

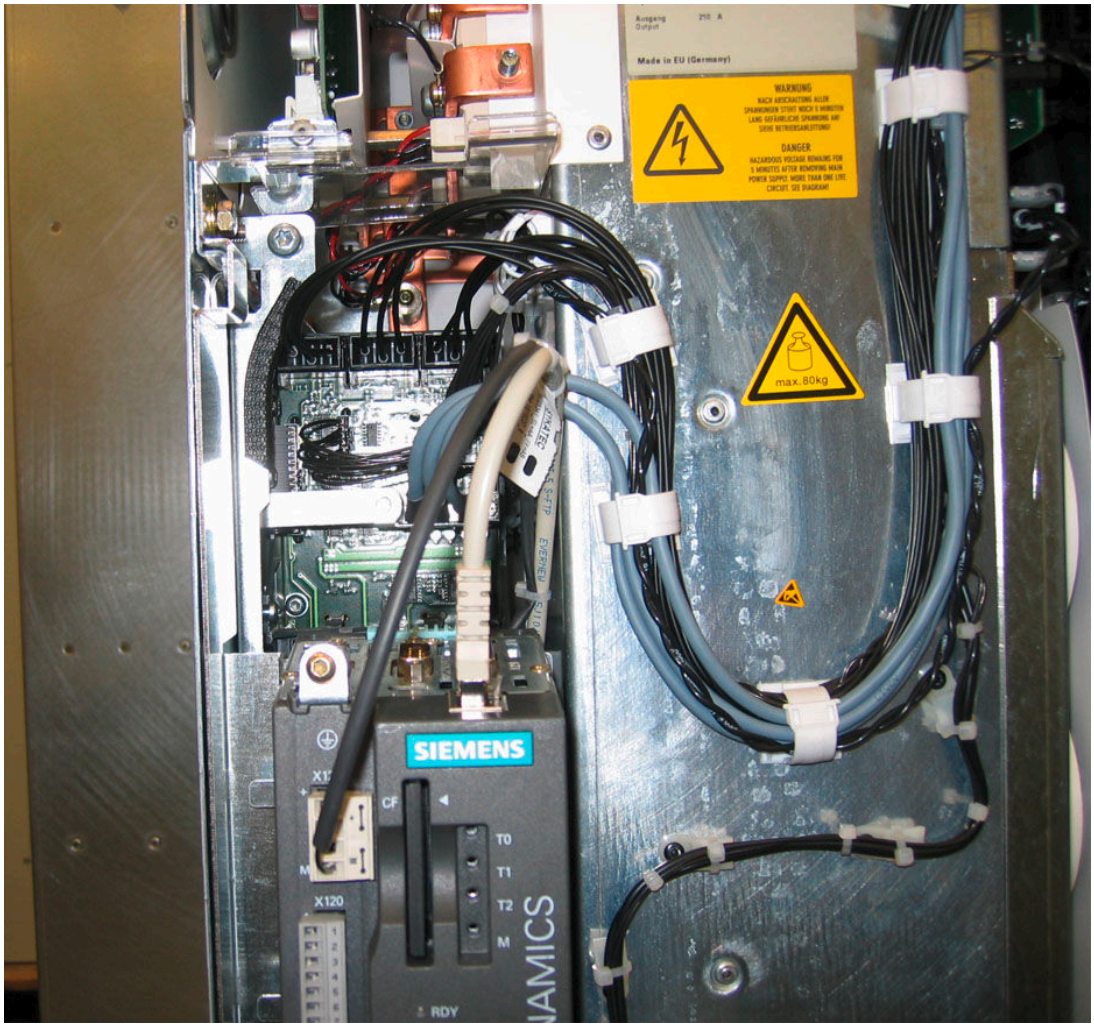

Figure 10-145 Mounting the CU310, for example, in the power module chassis, FX frame size

The DRIVE-CLiQ cable and the cable for the 24 V supply must be correctly routed so that the front flap can close.

Note

For the power module, a connecting cable is also supplied for the power supply of the SIMOTION D410-2. This cable must be connected to the SIMOTION D410-2.

10.1.2.4 Connecting

General Overview

Overview

The SIMOTION D410-2 has a number of interfaces that can be used for connecting the power supply and for communication with the other components of the system.

- The different SINAMICS components are interconnected via DRIVE-CLiQ.
- Actuators and sensors can be connected to the inputs/outputs.
- The SIMOTION D410-2 can be connected to PROFIBUS DP, MPI, Ethernet, and PROFINET (D410-2 DP/PN only) for communication purposes.

Arrangement of the interfaces on the device

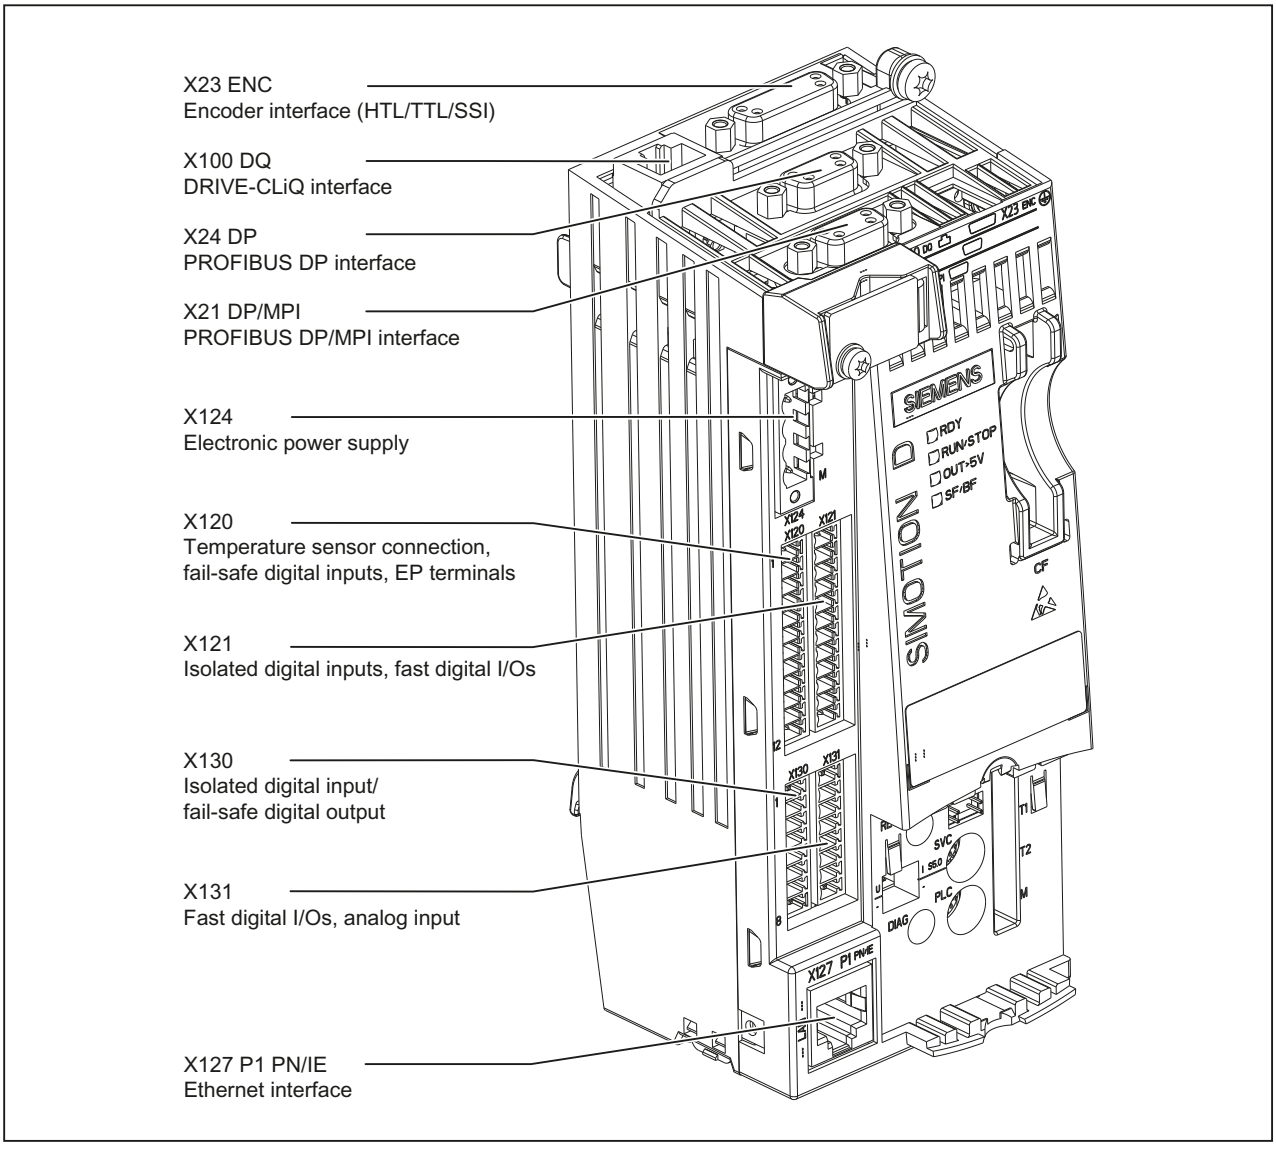

Figure 10-146 SIMOTION D410-2 DP, arrangement of the interfaces on the device

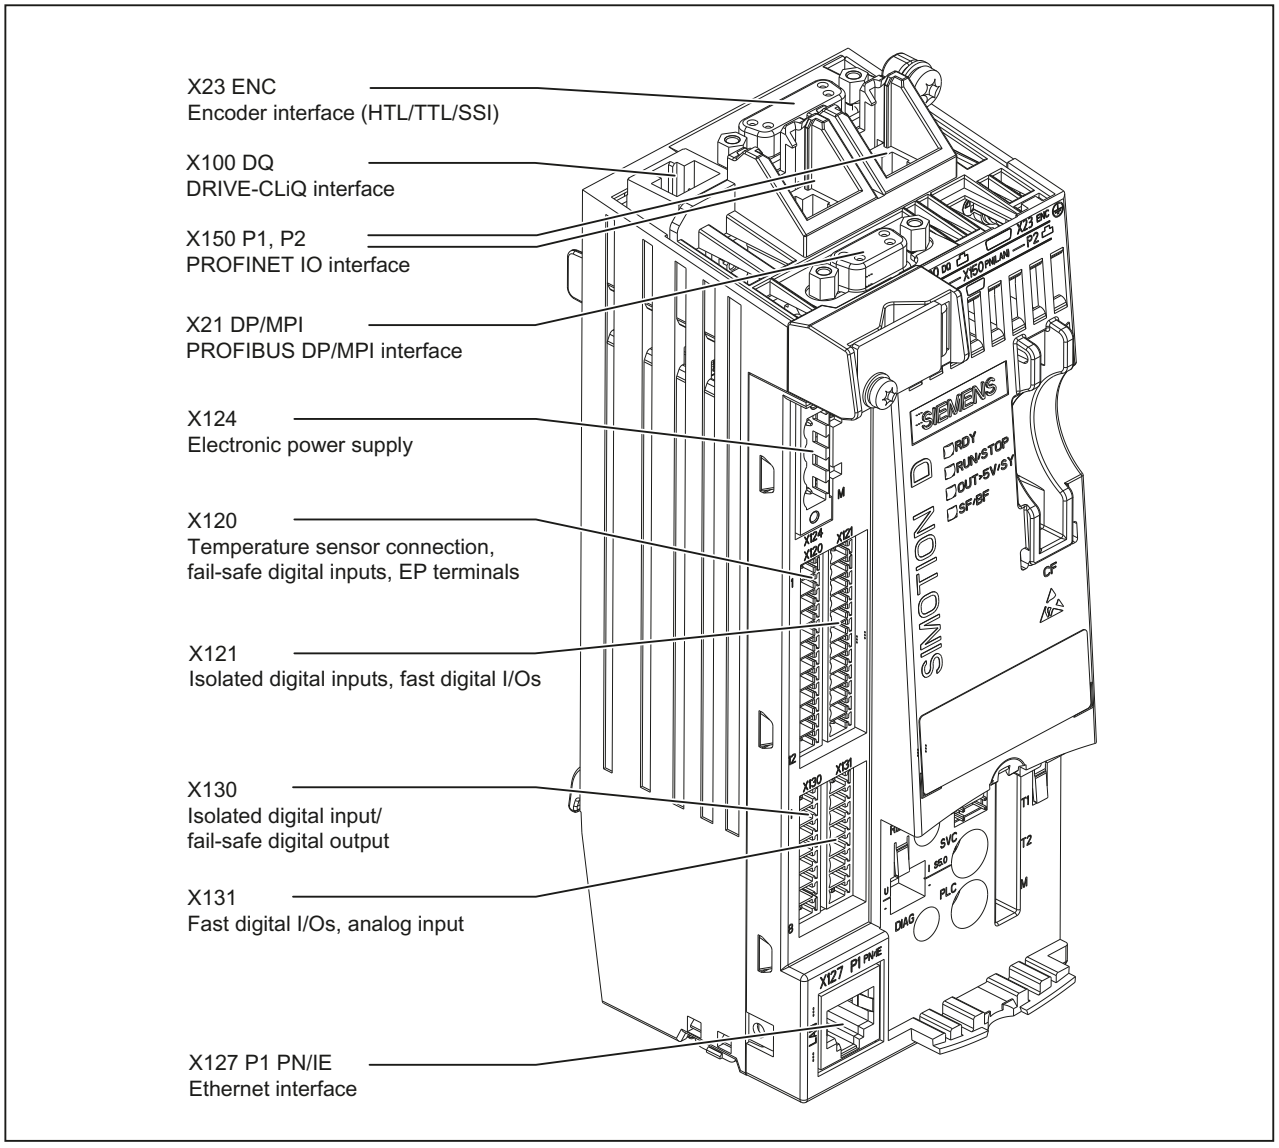

Figure 10-147 SIMOTION D410-2 DP/PN, arrangement of the interfaces on the device

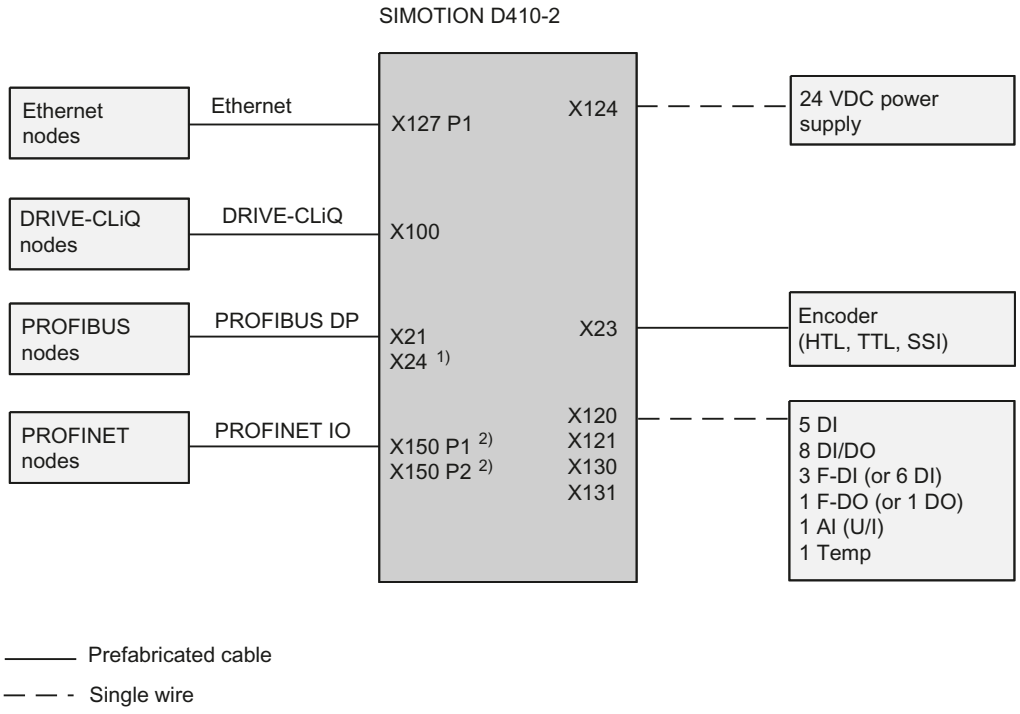
Overview of connections

The following overview shows examples of the various interfaces and their connection possibilities.



1) X24 only with SIMOTION D410-2 DP
2) X150 P1, P2 only with SIMOTION D410-2 DP/PN

Figure 10-148 SIMOTION D410-2 connection possibilities

General rules for operating the SIMOTION D410-2

When integrating the SIMOTION D410-2 into a system, you must observe the following general rules.

System startup after certain events

Observe the following rules when starting up a system following certain events:

- During startup after a voltage dip or power failure, no dangerous operating states may result. If necessary, force an EMERGENCY STOP.
- At startup, after unlocking the EMERGENCY STOP apparatus, there must not be an uncontrolled or undefined startup.

Supply voltage

Observe the following rules for the supply voltage:

- For stationary installations or systems that do not have all-pole line disconnect switches, the building installation must include a line side switch or a fuse.
- For load power supplies and power supply modules, the rated voltage range set must correspond to the local line voltage.
- For all electrical circuits, the fluctuation/deviation of the line voltage from the rated value must be within the permitted tolerance (refer to the technical data of the used components)

24 V DC supply voltage

Observe the following rules for the 24 V supply:

- Provide lightning protection (e.g. lightning protection devices):
  - External lightning protection is required for buildings.
  - Internal lightning protection must be provided for 24 V DC supply cables and signal cables.
- Ensure safe (electrical) isolation of the extra-low voltage for the 24 V supply.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Implement the 24 V DC supply with protective separation as protective extra-low voltage.

Disconnection of 24 V plug-in connections during operation

Observe the following safety notice when using SIMOTION D410-2:

⚠ WARNING

Personal injury and damage to property can occur

Personal injury and property damage can occur if 24 V plug-in connections are disconnected during operation. Disconnection of 24 V plug-in connections is only permitted when the power is off.

Protection against external electrical interference

Observe the following rules for protection against electric effects or faults:

- For all plants or systems, in which SIMOTION is installed, the plant or system must be connected to a protective conductor for the discharge of electromagnetic interference.
- The wiring arrangement and installation must comply with EMC regulations for the supply, signal and bus cables.
- A cable or wire break cannot lead to undefined states in the plant or system for signal or bus cables.

Rules for current consumption and power loss in an installation

The power loss of all components used in a cabinet must not exceed the maximum amount that can be dissipated from the cabinet.

Note

When designing the control cabinet, ensure that the temperature inside the cabinet does not exceed the permitted ambient temperature for the components even at high external temperatures.

Additional references

The same installation instructions apply for the SIMOTION D410-2 control unit as for the SINAMICS S120 CU310-2 control unit with regard to EMC.

Refer to *SINAMICS S120 for AC Drives* Manual.

Electromagnetic compatibility

General

Electromagnetic compatibility (EMC) means that the devices function satisfactorily, without interfering with other devices and without being disrupted by other devices. The EMC requirements for variable-speed drive systems (PDS, Power Drive System) are described in the product standard IEC/EN 61800-3.
A variable-speed drive system consists of the Control Unit and Power Module as well as the relevant electric motors and encoders, including connecting cables. The driven machine is not part of the drive system.

Note

PDS as component of machines or systems

For the integration of PDS into machines or systems, additional measures may be required so that the product standards of these machines or systems are complied with. The machine or system builder is responsible for taking these measures.

Environments and categories

The EMC environments and categories are defined in the EMC Product Standard EN 61800-3, as follows:

Environments

IEC/EN 61800-3 differentiates between the first and second environments - and defines different requirements for these environments.

First environment

Residential buildings or locations at which the drive system is directly connected to a public low-voltage line supply without intermediate transformer.

Second environment

All locations outside residential areas. These are basically industrial areas which are supplied from the medium-voltage line supply via their own transformers.

Categories

IEC/EN 61800-3 differentiates between four drive system categories:

Category C1

Drive systems for rated voltages < 1000 V for unrestricted use in the first environment.

Category C2

Stationary drive systems for rated voltages < 1000 V for operation in the second environment. The drive system must be installed by appropriately qualified and trained personnel. Additional measures are required for operation in the first environment.

Category C3

Drive systems for rated voltages < 1000 V, only for operation in the second environment.

Category C4

Drive systems for IT line supplies for operation in complex systems in the second environment. An EMC plan must be drawn up.

SIMOTION

SIMOTION D is designed for industrial use in accordance with Category C2.

Interference immunity

SIMOTION D and SINAMICS S120 are suitable for operation in the second environment. With regard to interference immunity, SIMOTION D and SINAMICS S120 can be used in the first and second environments.

Emitted interference

With regard to interference emission, to comply with the limit values in accordance with IEC/EN 61800-3 second environment, Category C2; in particular for the drive system, certain measures must be observed (EMC-conform installation by appropriately qualified and trained personnel, possibly required radio interference suppression filters, etc.) Observe the information on electromagnetic compatibility (EMC).

EMC notes

Note

Further information can be found in chapter "Control cabinet installation and EMC" in the SINAMICS S120 AC-Drive Equipment Manual.

Note

Requirements for implementing EMC are listed in EN 61000-6-2, EN 61000-6-4, EN 61800-3, EN 60204-1 and in the "EMC Installation Guidelines" Configuration Manual. (https://support.industry.siemens.com/cs/ww/de/view/60612658)

Note

Conformance with the EMC Directive of the EC is ensured by following the measures described in the "EMC Installation Guideline" Configuration Manual.

Protective conductor connection and potential equalization

Requirement

You have mounted the Control Unit in the control cabinet.

The SIMOTION D410-2 control unit has a protective conductor connection (M4 screw, Torx T20). This connection is also for the connection of an equipotential bonding conductor.

Note

Requirements for functional safety for machines and systems; reliability and EMC are only guaranteed with original SIEMENS cables.

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

Protective conductor connection

SIMOTION D and the SINAMICS S120 drive system are designed for use in cabinets with a protective conductor connection.

All system components and machine parts must be incorporated in the protection concept.

The drive line-up must be arranged on a common bright mounting plate ① in order to comply with the EMC limit values. The connection ② establishes a low-impedance connection to the mounting plate.

The mounting plate must be connected to the protective conductor connection of the control cabinet. For this purpose, a connection ③ must be established to the protective conductor bar ④. The protective conductor bar ④ must be connected to the protective conductor ⑤.

The protective connection (PE connection) that is used for the motors ⑥ must be established through the motor cable.

For EMC reasons, the motor cable shield must be laid flat at both the Motor Module (MM) / Power Module (PM) and motor.

A protective connection ⑧ must also be established for components that are **not** connected with low impedance (e.g. control cabinet door via hinges ⑦).

Example: Booksize axis grouping comprising Control Unit (CU), Line Module (LM), and Motor Modules (MM) as well as drive in blocksize format comprising a Power Module (PM) with snapped on Control Unit (CU)

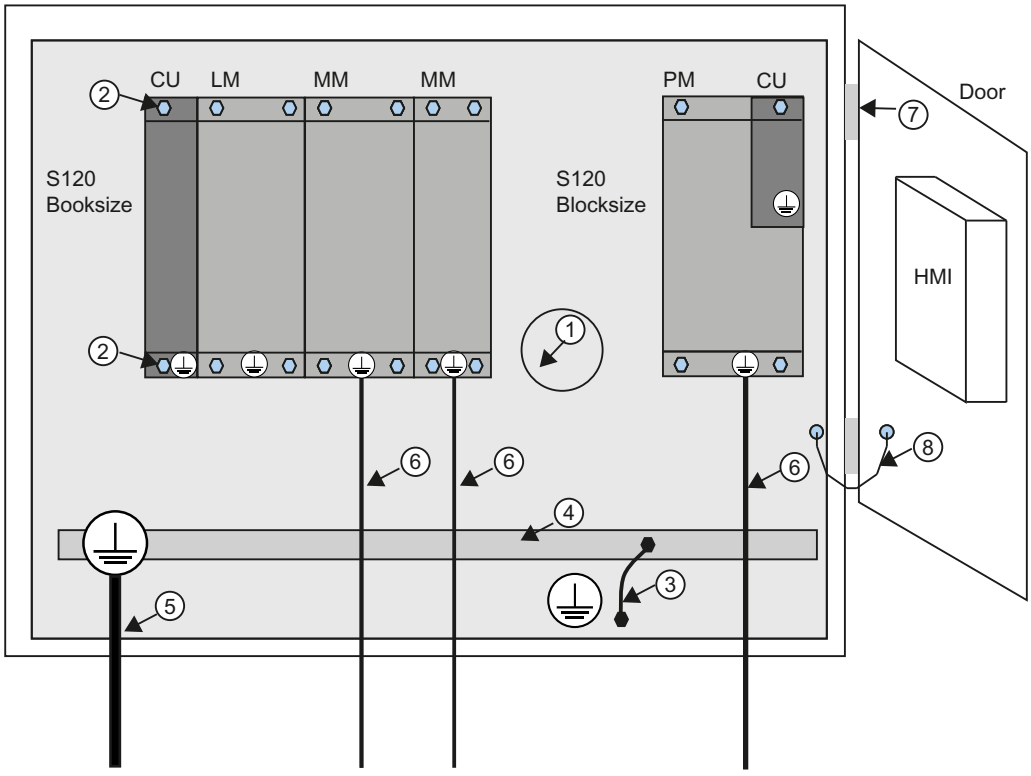


Figure 10-149 Protective conductor connection, cabinet with mounting plate / equipotential bonding surface

The protective conductor connections must be dimensioned as follows:

Table 10-87 Conductor cross-section for copper protective connections

Line supply cable in mm²	Copper protective connections in mm²
Up to 16 mm²	The same as the line supply cable
From 16 mm² to 35 mm²	16 mm²
From 35 mm²	0.5 x line supply cable

For materials other than copper, the cross-section should be increased so that as a minimum, the same conductivity is attained.

Equipotential bonding

A mounting plate serves simultaneously as an equipotential bonding surface. This means that no additional equipotential bonding is required within the drive line-up. If a common bright mounting plate is not available, then equally good equipotential bonding ⑨ must be established using cable cross-sections as listed in the table above or, as a minimum, with the same conductivity.

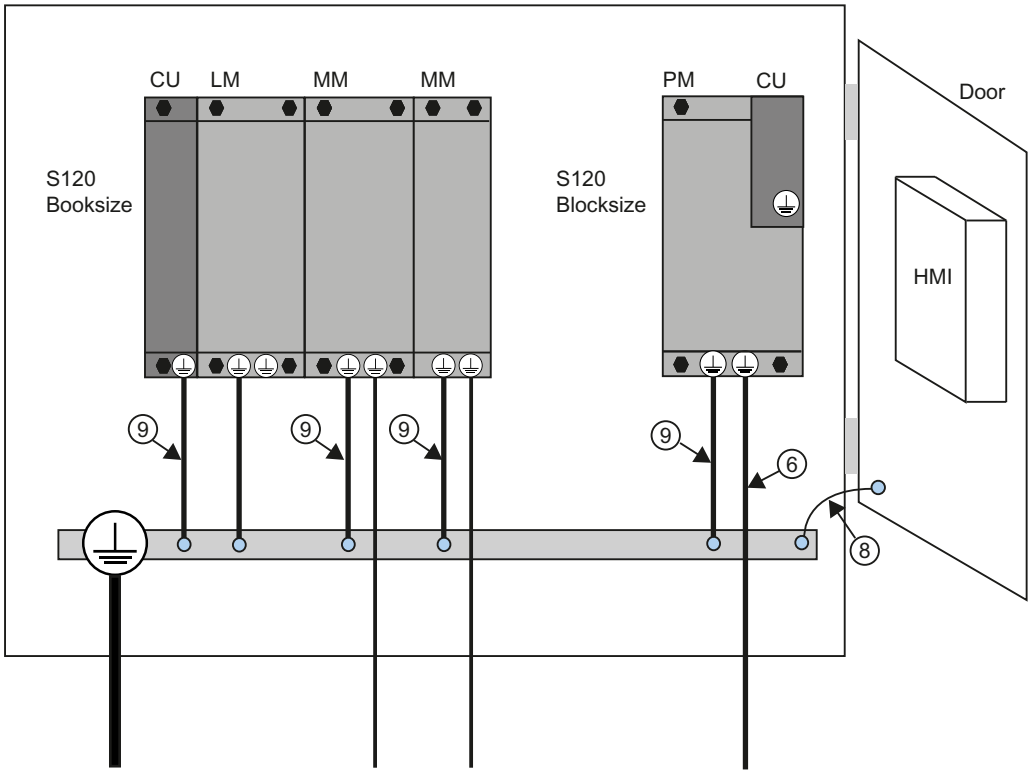

Figure 10-150 Protective conductor connection, cabinet without equipotential bonding surface

Note

Ground potential and housing (PE) for the SIMOTION D410-2 are connected internally with low impedance.

Communication links

Within the same control cabinet, no equipotential bonding conductor is required for fieldbus components if they installed as described above.

You have to ensure equipotential bonding for communication connections between remote components in a system (e.g. devices in different control cabinets) as well as between buildings or building sections.

If, for example, data cables (PROFIBUS, PROFINET, Ethernet or DRIVE-CLiQ) are routed through several control cabinets, equipotential bonding must be established with an equipotential bonding conductor. Install the equipotential bonding conductor together with the data cable.

The following minimum cross-sections are required according to IEC 60364-5-54:

- For copper, at least 6 mm^2
- For aluminum, at least 16 mm^2
- For steel, at least 50 mm^2

NOTICE
Fault of the data link or device defect with missing equipotential bonding
Considerable leakage currents can flow via the data cable if equipotential bonding is not provided. Disturbance of the data link or device faults may result.
Install an equipotential bonding conductor together with the data cable.

Due to the maximum length of 100 m for PROFIBUS copper cable at 12 Mbit/s or for PROFINET copper cable and due to the electrical isolation, EMC protection and equipotential bonding aspects, it is recommended that fiber-optic cables be used for connections between buildings.

Additional information

Further information on the protective connection and equipotential bonding can be found in the following references:

- SINAMICS drive system: See the SINAMICS manuals
- PROFIBUS and PROFINET: See the following Internet address (http://www.profibus.com) (at Downloads)

Connecting the power supply

Safety rules

Because of the wide range of possible applications, only the basic rules for electrical installation are described in this section. At a minimum, you must comply with these basic rules to ensure problem-free operation.

Rules for safe operation

In order to ensure safe operation of your equipment, implement the following measures and adapt them to suit your particular conditions:

- An EMERGENCY-OFF concept based on applicable technical specifications (e.g. European Standards EN 60204, EN 418 and associated standards).
- Additional measures to limit the travel of axes (e.g. hardware limit switch).
- Equipment and measures to protect motors and power electronics according to the SINAMICS Installation Guidelines.

In order to identify hazards, we also recommend that a risk analysis be conducted on the entire system in accordance with the basic safety requirements set out in Appendix 1 of the EU machinery directive.

Additional references

- Guidelines on Handling Electrostatic Sensitive Devices (ESD), see Appendix ESD guidelines (Page 7576) in this manual.
- For installing a system with SIMATIC ET 200 I/O (e.g. ET 200SP, ET 200 MP, etc.), see the manuals for the relevant ET 200 I/O systems.
- For further information on EMC, we recommend the *EMC Installation Guidelines* / *Basic System Requirements* Configuration Manual
  Download: https://support.industry.siemens.com/cs/ww/en/view/60612658

Standards and regulations

You must comply with the applicable VDE guidelines when wiring the SIMOTION D410-2, in particular VDE 0100 and VDE 0113 for disconnecting devices, short-circuit and overload protection.

Wiring the power supply

If no digital outputs are used or if the SIMOTION D410-2 is being operated on a mounting plate, the SIMOTION D410-2 can be supplied by the Power Module via the PM-IF interface.

If digital outputs are used, a 24 V load power supply must be connected to the X124 screw-type terminal block.

Note

If a digital output is parameterized and the 24 V load power supply is not connected (or the level is too low), alarm A03506 is issued on the SINAMICS side (can also be parameterized as a fault).

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Implement the 24 V DC supply with protective separation as protective extra-low voltage.

Wiring the screw-type terminal block

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

Use flexible cables with a cross-section of at least 1 mm^2 when you wire the power supply.

Wire-end sleeves are required if you wire several cables per connection.

1. Strip the cable ends.
2. Put on the wire-end sleeve if applicable.
3. Plug the cable end (with wire-end sleeve) into the screw-type terminal connection.
4. Tighten the mounting screw.
5. Plug the screw-type terminal with cables into the X124 connection.
6. Tighten the screw-type terminal block with a flat-bladed screwdriver.

Note

The 24 V DC cable must be approved for temperatures of up to 75 °C.

The maximum permissible cable length is 10 m.

Reverse polarity protection

The LED "RDY" lights up green when the power supply is connected correctly and switched on.

Note

The control does not run if the polarity is reversed. However, integrated reverse polarity protection protects the electronics from damage.

Fuse

If the control is defective, an internal fuse protects the electronics from consequential damage (e.g. fire). In this case, the module must be replaced.

Connecting DRIVE-CLiQ components

Overview

DRIVE-CLiQ connects the components in the SINAMICS S120 drive family as well as SIMOTION D410-2. DRIVE-CLiQ is a communications system, which enables SIMOTION D410-2 to automatically detect connected components. DRIVE-CLiQ provides a wiring tree, the topology of which can be visualized in SIMOTION SCOUT.

Information on the components that can be connected to DRIVE-CLiQ can be found in Section"DRIVE-CLiQ interface" of the *SIMOTION D410-2* Manual.

Rules for wiring DRIVE-CLiQ

The following rules must be followed for wiring DRIVE-CLiQ:

- Ring wiring is not permitted.
- Components must not be double-wired.

You will find detailed information about DRIVE-CLiQ wiring in the *SINAMICS S120 Control Units and Additional System Components* Manual.

Procedure

Connect the SIMOTION D410-2 X100 socket to the corresponding sockets on the drive components using the DRIVE-CLiQ signal cable (motor with DRIVE-CLiQ interface, TM and SMx modules).

Note

Please note that SIMOTION D410-2 components in booksize format (controller extension, motor modules, line modules, etc.) are not supported.

Connecting I/Os

Connecting cables

For the input/output wiring (X120, X121, X130, X131), use rigid or flexible cables with a conductor cross-section as stated in the manual.

See *SIMOTION D410-2* Manual, Section "Digital inputs/outputs / temperature sensor / analog input."

Note

To achieve optimum interference immunity, shielded cables must be used for connecting analog signals, measuring inputs or external zero marks.

Tools required

Screwdriver 0.4 x 2.0 mm

Wiring inputs/outputs

1. Strip 10 mm off the cable ends and press on a ferrule if required.
2. Wire:
   - The digital inputs for connection of sensors.
   - The digital outputs for the connection of actuators.
   - The analog input
3. Insert the cable into the corresponding spring-loaded terminals of the interfaces. Pressure can be applied to the spring with the tool to facilitate insertion.

Switching the analog input

For the use of the analog input (X131 connector) as analog voltage or current input, DIP switch S5.0 must be switched accordingly:

Table 10-88 S5.0 switch positions

Position	Function
U (left)	The analog input is used as voltage input.
I (right)	The analog input is used as current input.

Additional references

The connection examples for the wiring of the inputs/outputs can be found in the *SIMOTION D410-2* Manual, Section "Digital inputs/outputs / temperature sensor / analog input".

Creating a shield connection

Using shielded cables

The following options are available for the shield connection when using shielded cables:

- A shield connection using a shielding bus supplied separately
- Shield connection via the M3 screw-on shield connecting element on the housing of the SIMOTION D410-2

Using a shielding bus

If a shielding bus is used, proceed as follows:

1. Attach the cable shield to a grounded shielding bus after the cable entry point in the cabinet. Strip the insulation off the cable first.
2. Continue routing the shielded cable as far as the module, but do not make a connection to the shield there.

Using a shield connection on the SIMOTION D410-2

1. Unscrew the holding clamp of the M3 shield connection (Torx screwdriver T10) at the top of the SIMOTION D410-2 until there is a space below the clamp.
2. Insert the cable. The cable shield must first be exposed.
3. Tighten the fixing bracket so that the cable shield and cable are pressed against the shield connection through the holding clamp (tightening torque 0.8 Nm or 7.1 lbf in).

The following figure shows how to connect the cable shield.

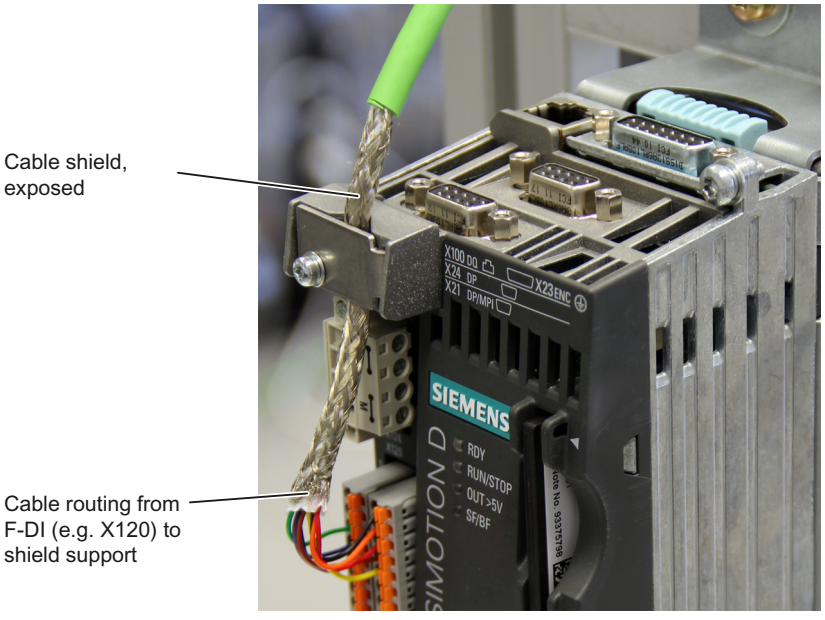

Figure 10-151 Shield connection using the SIMOTION D410-2 DP as an example

Connecting PROFIBUS/MPI

PROFIBUS connection components

Connection components

Individual nodes are connected by means of bus connectors and PROFIBUS cable. Remember to provide a bus connector with a programming port at the ends of the subnet. This will give you the option of expanding the subnet if required (for example, for a PG or SIMATIC HMI device).

Use RS 485 repeaters for the connection between segments and to extend the cable.

Segments

A segment is a bus cable between two terminating resistors. A segment can contain up to 32 nodes. In addition, a segment is limited by the permissible cable length, which varies according to the transmission rate.

Terminating resistor

A cable must be terminated with its own surge impedance to prevent line disturbances caused by reflections. Activate the terminating resistor at the first and last node of a subnet or segment.

Make sure that the nodes to which the terminating resistor is connected are always supplied with voltage during power-up and operation.

PROFIBUS cables and connectors

Properties of PROFIBUS cables

The PROFIBUS cable is a two-core, twisted and shielded cable with defined properties:

Table 10-89 Properties of PROFIBUS cables

Characteristics	Values
Characteristic impedance	Approximately 135 to 160 Ω (f = 3 to 20 MHz)
Loop resistance	≤ 115 Ω/km
Effective capacitance	30 nF/km
Damping	0.9 dB/100 m (f = 200 kHz)
Permissible conductor cross-section	0.3 mm^2 to 0.5 mm^2
Permissible cable diameter	8 mm + 0.5 mm

Connector features

The bus connector is used to connect the PROFIBUS cable to the PROFIBUS DP interfaces. thus establishing a connection to additional nodes.

Table 10-90 SIMOTION D410-2 PROFIBUS interfaces

	D410-2 DP	D410-2 DP/PN
PROFIBUS DP/MPI interface	X21	X21
PROFIBUS DP interface	X24	–

You will find an overview of the bus connectors available for order in the *SIMOTION D410-2* Manual, Section "Spare parts and accessories".

Length of PROFIBUS cables

Cable lengths and baud rate

The baud rate determines the cable length of a subnet segment.

Table 10-91 Permitted cable length of a subnet segment for specific baud rates

Baud rate	Max. cable length of a segment (in m)
19.6 to 187.5 kbit/s	1000 [1)]
500 kbit/s	400
1.5 Mbit/s	200
3 to 12 Mbit/s	100

[1)] With isolated interface

Longer cable lengths

If you must implement longer cable lengths than permitted in one segment, you must use RS 485 repeaters. The maximum possible cable lengths between two RS 485 repeaters correspond to the cable length of a segment. You can connect up to nine RS 485 repeaters in series.

Note that an RS 485 repeater must be counted as a subnet node when determining the total number of nodes to be connected, even if it does not have its own PROFIBUS address.

Rules for the laying of PROFIBUS cables

Laying of bus cable

During laying of the PROFIBUS cable, you must:

- Not twist the cable
- Not stretch the cable
- Not squeeze the cable

Supplementary conditions

In addition, when laying a bus cable for indoor use, you must take into account the following supplementary conditions (dA = external cable diameter):

Table 10-92 Supplementary conditions for the laying of PROFIBUS cables

Characteristics	Supplementary conditions
Bending radius for a single bend	80 mm (10xdA)
Bending radius for multiple bends	160 mm (20xdA)
Permissible temperature range for cable routing	-5° C to +50° C
Temperature range for storage and stationary operation	-30° C to +65° C

Additional references

Length codes for prefabricated cables can be found in:

- *SIMOTION PM 21, SIMOTION Motion Control* Catalog
- *IK PI Industrial Communication* Catalog

Connecting PROFIBUS DP (interface X21 and X24)

PROFIBUS cables are connected to the corresponding interface via a bus connector.

Table 10-93 SIMOTION D410-2 PROFIBUS interfaces

	D410-2 DP	D410-2 DP/PN
PROFIBUS DP/MPI interface	X21	X21
PROFIBUS DP interface	X24	–

Connecting the bus connector

Proceed as follows to connect the bus connector:

1. Plug the bus connector into the corresponding interface of the control unit.
2. Screw the bus connector into place.
   If the control unit is located at the start or end of a segment, you must switch on the terminating resistor ("ON" switch setting).

Figure 10-152 Terminating resistor "switched on" or "switched off"

Note

Make sure that the nodes at which the terminating resistor is located are always supplied with voltage during startup and operation.

Removing the bus connector

You can remove the bus connector with a looped-through bus cable from the PROFIBUS DP interface at any time without interrupting data traffic on the bus.

NOTICE
Data communication disturbed because bus terminator missing
A bus segment must be terminated at both ends with a terminating resistor. This is not the case if the last bus connector node is de-energized, for example. Because the bus connector takes its voltage from the station, this terminating resistor is ineffective.
Make sure that the stations at which the terminating resistor is connected are always energized.

Connection rules in the PROFIBUS subnet

Introduction

There are a number of rules for configuring and installing cables for PROFIBUS networks to ensure seamless communication over PROFIBUS. These rules apply to both configuring and cabling as well as address assignment for the different network nodes.

Connection rules

- **Before** you interconnect individual nodes in a subnet, you must assign a unique PROFIBUS address to each node.
- Narrow down the number of nodes by limiting the PROFIBUS addresses to the highest address in the network.
  Tip: Mark the address on the housing of all nodes in a subnet. Then you can always see which address is assigned to which node in your system.
- Connect all nodes in a subnet "in series". No spur lines may be routed to the PROFIBUS DP. In addition, integrate the PGs and SIMATIC HMI devices for commissioning or servicing in the subnet in series.
- If you operate more than 32 nodes on a subnet, you must use RS 485 repeaters to connect the bus segments. More detailed information can be found in the description of the RS 485 repeater, see the *S7-300 Automation Systems, Module Data* Manual.
  In a PROFIBUS subnet, all segments combined must have at least one DP master and one DP slave.
- Use RS 485 repeaters to connect ungrounded bus segments and grounded bus segments.
- The maximum number of nodes per bus segment decreases with each RS 485 repeater. This means that when a bus segment contains an RS 485 repeater, the bus segment can contain no more than 31 additional nodes. However, the number of RS 485 repeaters does not affect the maximum number of nodes on the bus.
- Up to 10 segments can be connected in a row (max. 9 repeaters).
- **At least** one terminator must be supplied with **5 V**.
  To accomplish this, the PROFIBUS DP connector with an activated terminating resistor must be connected to a device that is switched on.
- Before inserting a new node on the subnet, you must switch off its supply voltage.
  The station must be inserted **first** and then switched on.
  When a station is disconnected, the connection must **first** be deactivated and then the connector withdrawn.
- The bus line of a segment must be terminated at **both ends**. This is achieved by switching on the terminating resistor in the PROFIBUS DP connector at the first and last node and switching off the other terminating resistors.

Example

This illustration below shows an example configuration of a subnet with SIMOTION D410-2 DP.

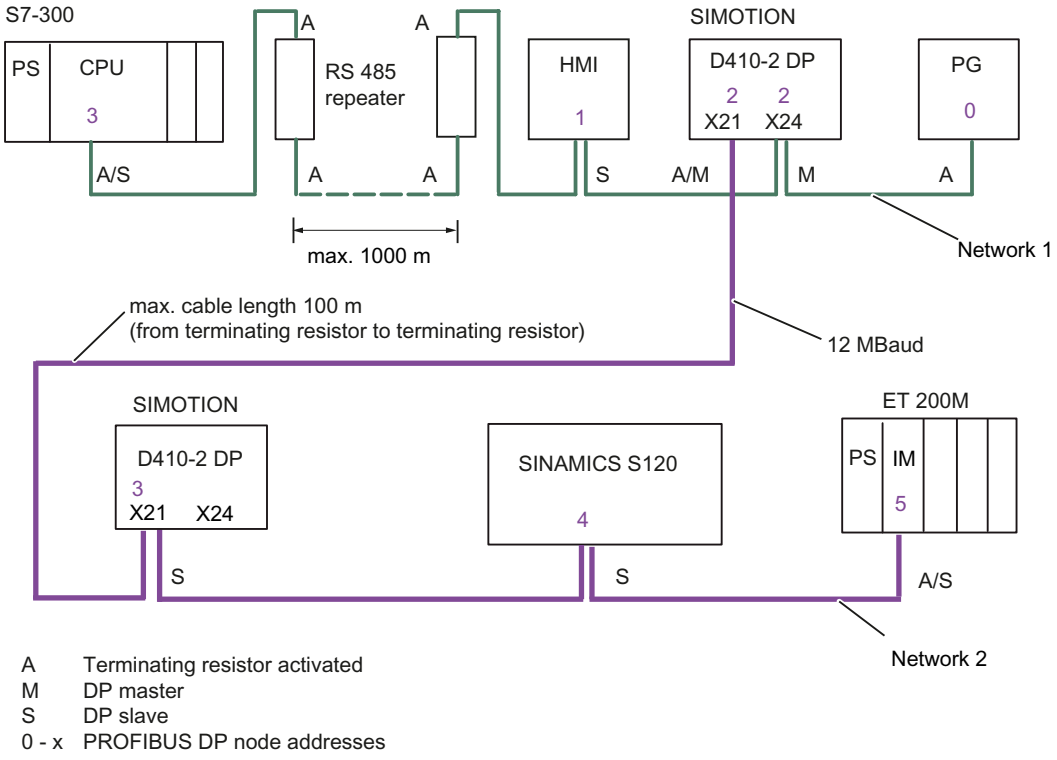

Figure 10-153 Networking example of SIMOTION D410-2 DP

Operating interface X21 as an MPI

Applications

The X21 interface can also be operated as an MPI interface instead of a PROFIBUS DP interface. The typical (default) baud rate is 187.5 Kbaud. A baud rate of up to 12 MBaud can be set for communication with other CPUs. It should be noted, however, that a rate of 12 MBaud is not supported by all CPUs (e.g. smaller SIMATIC S7 CPUs).

The following list provides examples of when using MPI (multi-point interface) may prove effective:

- If a PC/PG is being used with an MPI interface
- If an OP/TP only has an MPI interface
  (newer devices have PROFIBUS or PROFINET interfaces)
- If SIMOTION and SIMATIC CPUs are coupled via XSEND/XRECEIVE

When communicating with XSEND/XRECEIVE, there is no need to configure the connection in **NetPro**. XSEND/XRECEIVE can be used via PROFIBUS or MPI.

- Via PROFIBUS: For communication between SIMOTION devices
- Via MPI: For communication between SIMOTION and SIMATIC S7 devices
  The SIMOTION interface must be connected to the MPI interface of the SIMATIC S7 devices. Connection via PROFIBUS is not possible.
  The baud rate of the SIMATIC S7 device must be set at the SIMOTION interface (see documentation for the relevant SIMATIC S7 devices).

Operate MPI like PROFIBUS

The information on wiring the connector (terminating resistors) and the rules for routing of cables for PROFIBUS apply to this interface as well. When carrying out this procedure, consult the relevant references.

Connector features

The bus connector is used to connect the MPI bus cable to the MPI interface (X21). This enables you to establish connections to additional nodes (e.g. PG or SIMATIC S7-CPU).

You will find an overview of the bus connectors available for order in the *SIMOTION D410-2* Manual, Chapter "Spare parts and accessories".

MPI bus cable

The PROFIBUS cable specifications apply here as well;

Please note the relevant information on setting up an MPI network.

Setting up an MPI network

Keep in mind the following basic rules when setting up an MPI network:

- When using interface X21 as an MPI interface, it is not possible to arrange additional control for a drive in isochronous mode or to connect distributed I/Os to this interface.
- An MPI bus line must be terminated at both ends. This is achieved by activating the terminating resistor in the MPI connector in the first and last station and deactivating the other terminating resistors.
- At least one terminator must be supplied with 5 V.
  This means that an MPI connector with an activated terminating resistor must be connected to a device that is switched on.
- Spur lines (cables leading from the bus segment to the station) should be as short as possible, that is, < 5 m in length. Unused spur lines should be removed wherever possible.

- Every MPI station must be connected to the bus first and then activated.
  To disconnect the station, it must first be deactivated. Then, the station can be removed from the bus.
- Maximum cable lengths:
  - 200 m per bus segment
  - 2,000 m total length with RS 485 repeaters

Note

You can also use intelligent DP slave functionality for PROFIBUS communication between CPUs.

Connecting PROFINET IO components (D410-2 DP/PN only)

Wiring PROFINET

Procedure

As standard, a SIMOTION D410-2 DP/PN has a PROFINET IO interface with two ports.

Suitable PROFINET cables and connectors must be used for the PROFINET connection. The autocrossing functionality of the PROFINET interface means crossed as well as uncrossed cables can be used.

Mixed operation of IRT and RT

For mixed operation of IRT and RT, note that the IRT-capable devices must form a so-called IRT domain, i.e. there must not be any non-IRT devices on the data transmission link between the IRT devices.

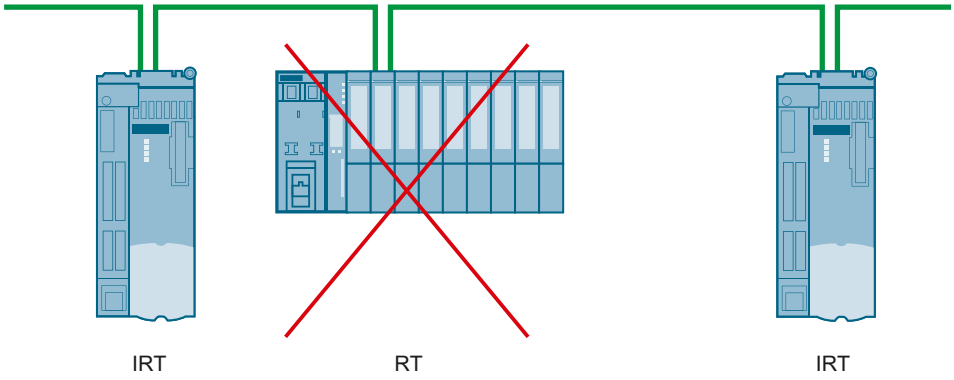

Figure 10-154 Mixed operation of IRT and RT

PROFINET cables and connectors

Cable and connector types

Note

For connecting PROFINET IO to D410-2, a connector with a 180° cable outlet is recommended (IE FC RJ45 plug 180).

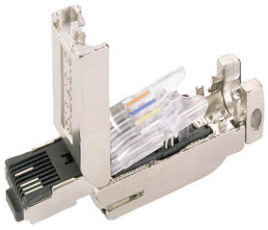

Figure 10-155 RJ45 PN connector with a 180° cable outlet

For further information about the cables, connectors, and stripping tool, see

- Section "Spare parts and accessories" in the SIMOTION D410-2 Manual
- *IK PI, Industrial Communication* Catalog

Connecting Ethernet

Wiring Ethernet

An Industrial Ethernet can be connected to the 8-pin RJ45 socket X127 P1.

The interface supports a transmission rate of 10/100 Mbit/s. Suitable Ethernet cables and connectors must be used for the Ethernet connection.

A shielded twisted pair cable is used for the networking.

Note

The Ethernet interface supports PROFINET basic services and therefore has the designation PN/IE. These PROFINET basic services (e.g. DCP, LLDP, SNMP) provide uniform functions for the address assignment and diagnostics, but do not provide PROFINET IO communication for the connection of drives, I/O modules, etc.

Recommended connecting cables

The following cables are available:

- SIMATIC NET, Industrial Ethernet TP XP CORD RJ45/RJ45
  - TP cable prefabricated with 2xRJ45 connectors
  - Crossed send and receive cable
  - Article number: 6XV1870-3R□□□ (□□□ - length code)
- SIMATIC NET, Industrial Ethernet TP CORD RJ45/RJ45
  - TP cable prefabricated with 2xRJ45 connectors
  - Uncrossed send and receive cable
  - Article No.: 6XV1870-3Q□□□ (□□□ - length code)

The autocrossing functionality of the Ethernet interface means crossed as well as uncrossed cables can be used.

Autocrossing

Per default, the Ethernet interface is set to "Automatic setting" in **HW Config**, so that autocrossing is available. The settings can be found in the port properties (X127 P1) in the module rack of **HW Config**.

Autocrossing is deactivated with "Manual setting". As the Ethernet interface of the D410-2 is wired as Ethernet terminal, in this case you must use crossed cables for the networking with a PG/PC or another D410-2.

If the communication peer has autocrossing (e.g. PC, switch or hub), crossed and uncrossed cables can be used.

Additional references

For further information about the cables and connectors, see the *Industrial Communication IK PI* Catalog.

Routing

Routing describes the cross-network transfer of information from Network x to Network y.

Routing on SIMOTION D

Routing between the different interfaces

SIMOTION D410-2 supports S7 routing between the following interfaces:

- Between Ethernet interface X127 and PROFIBUS interfaces X21 and X24 (X24 only available on D410-2 DP)
- Between Ethernet interface X127 and PROFINET interface X150 (only available on D410-2 DP/PN)
- Between PROFINET interface X150 and PROFIBUS interface X21 (only available on D410-2 DP/PN)

Each combination of Ethernet interface X127 and PROFINET interface X150 represents a separate IP subnet.

All ports of the X150 PROFINET interface belong to the same IP subnet.

IP routing from IP subnet to IP subnet is not supported. You can use an external IP router for this.

Below is a list of the options available for connecting a PG/PC or HMI device to a SIMOTION D using S7 routing.

Engineering System/HMI on PROFIBUS (example: D410-2 DP)

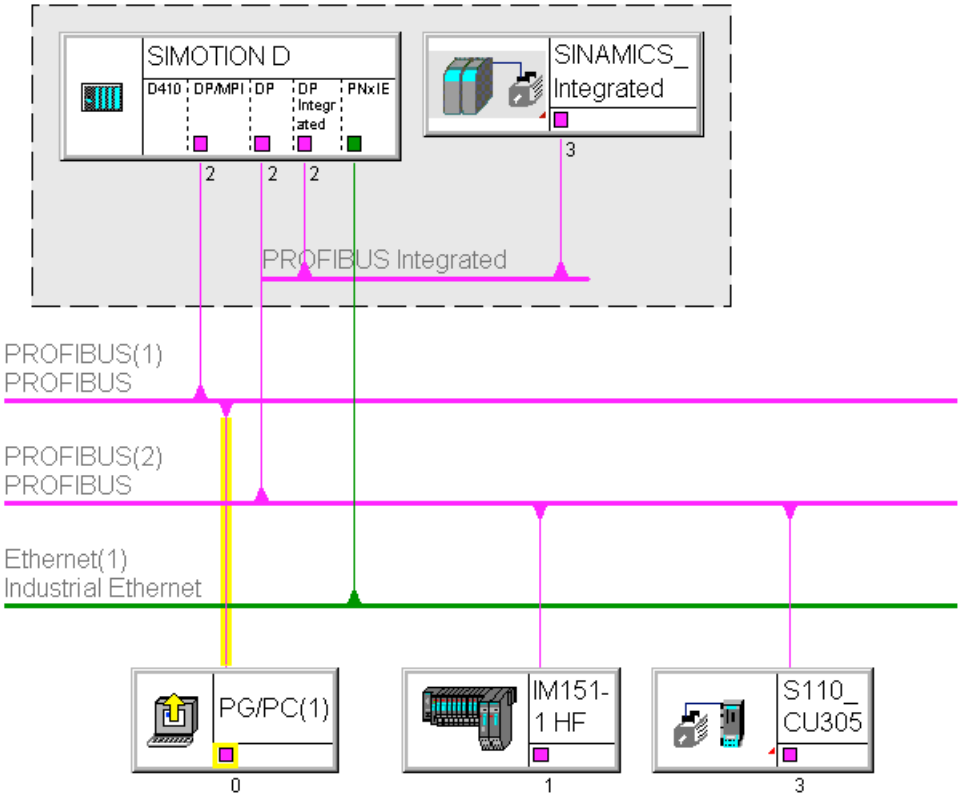

Figure 10-156 Example of PG/PC to PROFIBUS interface (X21)

- S7 routing to the other (master) PROFIBUS interfaces (only if configured)
- S7 routing to the PROFIBUS Integrated
- S7 routing to the Ethernet interface (X127 P1)

Engineering System/HMI on PROFINET (example: D410-2 DP/PN)

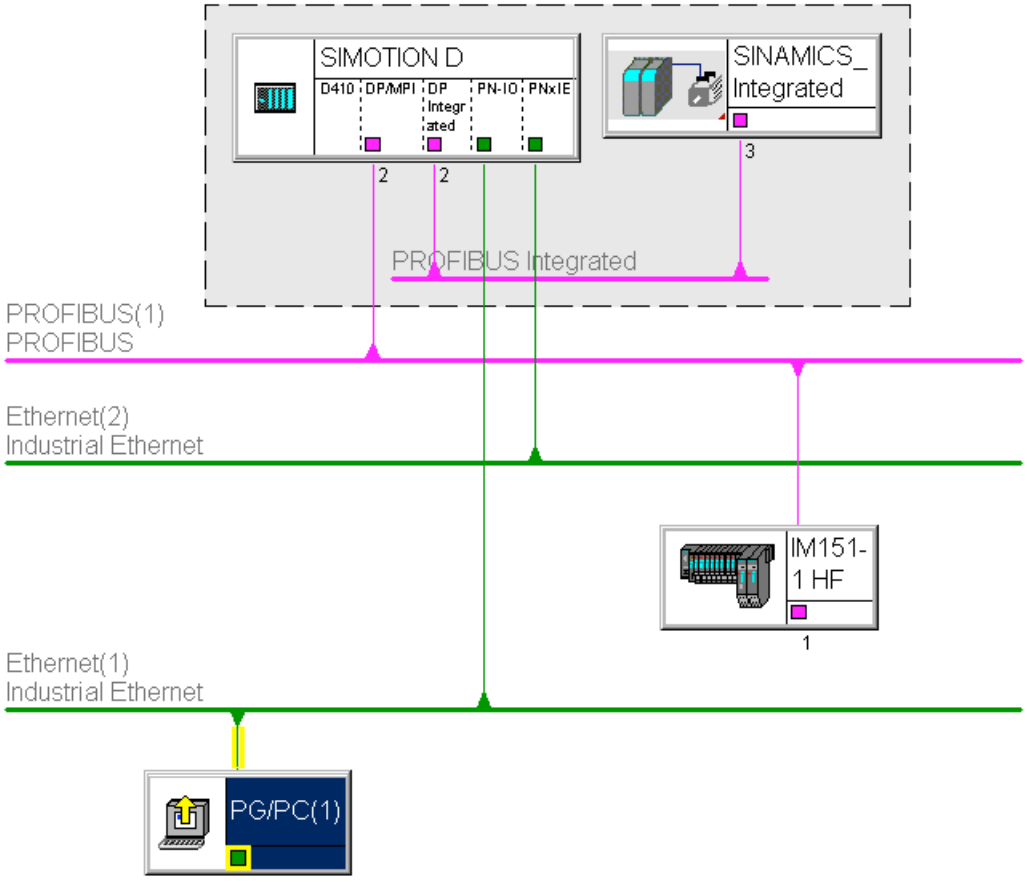

Figure 10-157 Example of PG/PC to PROFINET interface (PNxIO, X150)

- S7 routing to the (master) PROFIBUS interface (only if configured)
- S7 routing to the PROFIBUS Integrated
- S7 routing to Ethernet interface PN/IE (X127 P1)
- Access to the components on the same subnet via the switch functionality of the PROFINET IO interface

Engineering System/HMI on Ethernet (example: D410-2 DP)

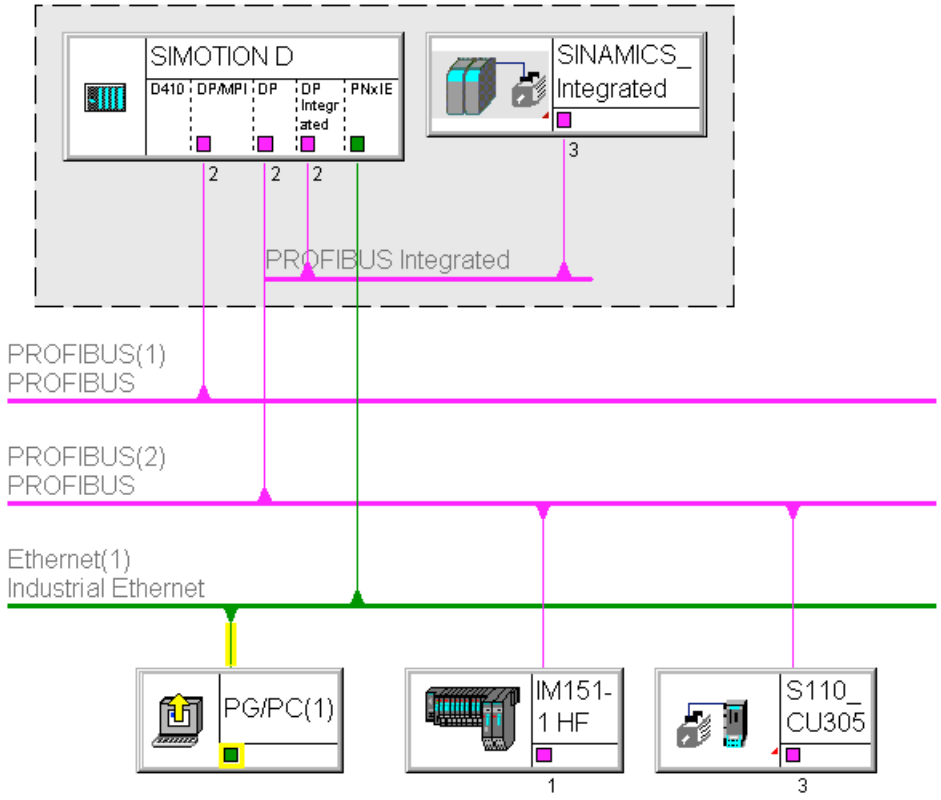

Figure 10-158 Example of PG/PC to Ethernet interface (X127 P1)

- S7 routing to the other (master) PROFIBUS interfaces (only if configured)
- S7 routing to the PROFIBUS Integrated

Routing on SIMOTION D (SINAMICS integrated)

S7 routing to the internal PROFIBUS on SINAMICS Integrated

All SIMOTION D have an integrated SINAMICS drive control. In order to be able to access drive parameters, the message frames must be routed from the external SIMOTION D interfaces to the internal PROFIBUS DP. S7 routing can be used to access the integrated PROFIBUS. Here, the internal PROFIBUS DP forms a separate subnet. This must be especially taken into account for the communication to several routing nodes.

Additional references

Further information about routing and the differences between IP and S7 routing can be found in the *SIMOTION Communication* System Manual.

Connecting an external encoder

Connecting the connecting cable

Use only shielded cables to connect an external encoder to the encoder interface (X23). The shielding must be connected with the metallic or metallized connector housing.

We recommend that bipolar encoders are used. When using unipolar encoders, the unused negative track signals can either be connected or connected to ground. This results in different switching thresholds.
See *SIMOTION D410-2* Manual, Section "Encoder interface (HTL/TTL/SSI)".

The pre-assembled connecting cables offer optimal noise immunity as well as sufficiently measured cross-sections for the supply voltage of the external encoder.

The connecting cables are available in various lengths, see *NC 60* Catalog.

Procedure for connecting encoders

To connect an external encoder (HTL, TTL or SSI encoder), proceed as follows:

1. Connect the connecting cable to the encoder.
2. Plug the D-Sub connector (15-pin) to the socket X23.
3. Lock the connector using the finger screws.

NOTICE
Destruction of the encoder electronics Operation of a 5 V encoder on the 24 V encoder supply may result in the destruction of its electronic components! Make sure that you can operate the connected encoder on a 24 V power supply (e.g. HTL encoder). This setting can be set in the expert list of the drive in parameter p0400 and in the following parameters.

10.1.2.5 Commissioning (hardware)

Overview

Requirements

The following requirements must be satisfied for the first commissioning of the SIMOTION D410-2:

- Your system with SIMOTION D410-2 has been installed and wired.
- Your PG/PC is connected to the SIMOTION D410-2 via the PROFIBUS DP, Ethernet, or PROFINET (D410-2 DP/PN only) interface.

Commissioning steps

Commissioning the hardware involves the following steps:

1. Inserting the CompactFlash card (Page 7347)
2. Checking the system (Page 7348)
3. Switching on the power supply (Page 7349).

Additional references

For information on installing/mounting and commissioning the SINAMICS S120 components, refer to the *SINAMICS S120* Commissioning Manual.

Inserting the CompactFlash card

Characteristics of the CF card

The CF card is mandatory for operation of the SIMOTION D410-2. The SIMOTION Kernel (SIMOTION D firmware) and the software used to control the drives (SINAMICS firmware) are on the CF card.

To load the SIMOTION Kernel, the CF card must be inserted when the SIMOTION D410-2 is powered up.

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge The CompactFlash card is an ESD-sensitive component. De-energize the SIMOTION D410-2 device before inserting or removing the CompactFlash card. The SIMOTION D410-2 is in a de-energized state when all the LEDs are OFF. Comply with the ESD rules.

Note

The ramp-up time of the SIMOTION D410-2 as well as the time behavior during CF card accesses depends on the type of memory card used. Take this into account in your application, as different memory card types are used for availability reasons.

Procedure

To insert the CF card, perform the following steps:

1. The direction of insertion of the CF card is indicated by an arrow located on both the plug-in slot and the CF card. Align the CF card with the arrows.
2. Gently insert the CF card into the empty plug-in slot of the SIMOTION D410-2 until it clicks into place.
   If correctly inserted, the CF card is flush with the housing.

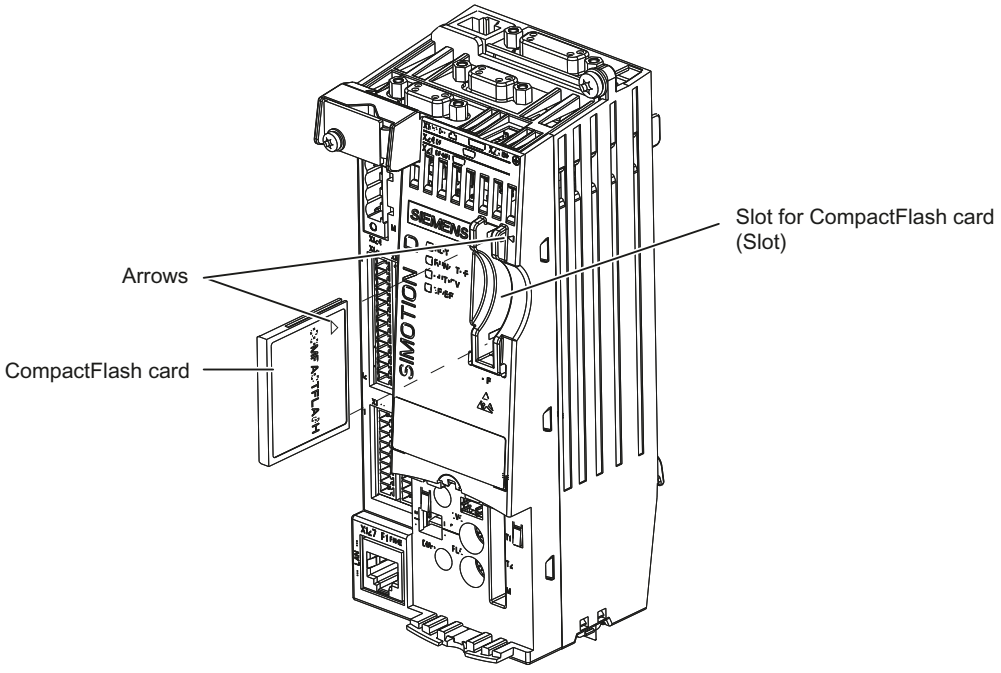

Figure 10-159 Inserting the CF card

Checking the system

Procedure

Check the final installed and wired system one more time before it is switched on, Observe the safety-relevant items of the following checklist.

Checklist	✓
Have you observed all ESD measures when handling the components?	
Have all screws been tightened to their specified torque?	
Have all connectors been properly inserted and locked/screwed?	
Are all components grounded and have all shields been attached?	
Have you taken the load capacity of the central power supply into consideration?	

Switching on the power supply

Switching on the external power supply

Power is supplied to the SIMOTION D410-2 via an external power supply unit, e.g. via a SITOP power supply. In exceptional cases, the SIMOTION D410-2 can also be supplied via the Power Module in blocksize format, see Section "Power supply" in the SIMOTION D410-2 Manual.

Switch on this power supply.

NOTICE
SIMOTION D410-2 shuts down if the power supply is interrupted It is essential to ensure that the external 24 VDC power supply to the SIMOTION D410-2 is not interrupted for longer than 3 ms. After a longer interruption, the SIMOTION D410-2 shuts down and can only be restarted with OFF/ON. You will find further information in Section Properties of the user memory (Page 7352).

Power-up of Control Unit

Once the power supply has been switched on, the SIMOTION D410-2 begins to power up:

1. At the start of the power-up, all LEDs are briefly illuminated in yellow for a short LED test. The LEDs on the SIMOTION D410-2 enable you to track the progress of the power-up. Any errors are displayed.
2. Startup of the SIMOTION Kernel.

3. All DRIVE-CLiQ connections (with SINAMICS Power Module, for example) are identified automatically.

   Note

   As long as the RDY LED continues to flicker, power-up is not complete and it is not possible to go online.

   During commissioning the firmware of the components is upgraded or downgraded automatically based on the FW version on the CF card and the FW version on the SINAMICS components (DRIVE-CLiQ components, Power Modules, etc.).

   The update can take several minutes and its progress is tracked by corresponding messages appearing in the alarm window of SIMOTION SCOUT.

   SIMOTION D410-2 / DRIVE-CLiQ components:

   A FW update on the SIMOTION D410-2 is indicated by yellow flashing and for DRIVE-CLiQ components by red-green flashing of the RDY LED:

   - FW update running: RDY LED flashes slowly (0.5 Hz)
   - FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

   Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

4. The first time it is switched on, the SIMOTION D410-2 goes into STOP state following power-up.

Following power-up, the SIMOTION D410-2 is in a state in which it can be configured.

Fan

SIMOTION D410-2 has an integrated fan. This fan is always required for operation.

Fan faults as well as overtemperature of the module are signaled by a system variable, PeripheralFaultTask and a diagnostic buffer entry .

Performing a reset

The RESET button is located behind the blanking cover on the SIMOTION D410-2.

The entire system is reset when the RESET button is pressed and a new power-up of the system forced. This operation is comparable with a "Power on Reset" but does not require the disconnection of the 24 V power supply.

User memory concept

SIMOTION D410-2 memory model

The following figure provides an overview of the memory model of SIMOTION D410-2.

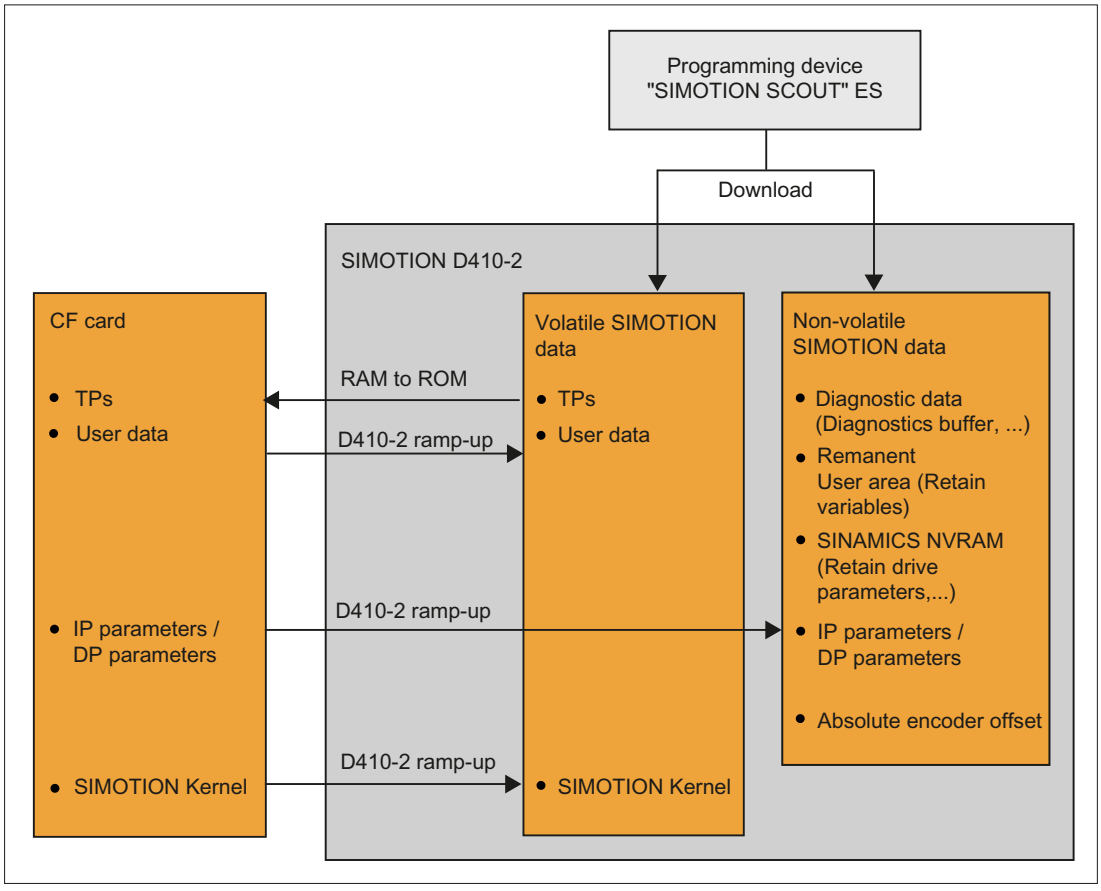

Figure 10-160 SIMOTION D410-2 memory model

The SIMOTION Kernel (SIMOTION D firmware, including SINAMICS Integrated Firmware) contains the functions required for virtually all applications, and essentially acts as a PLC with the command set in accordance with IEC 61131-3 as well as system functions for controlling various components, such as inputs and outputs.

The SIMOTION Kernel can be expanded by loading technology packages (TPs), e.g. for motion control or temperature controllers.

In the following sections, you will find information about the user memories and the steps involved in certain operations.

Properties of the user memory

Non-volatile data

Non-volatile data makes it possible to retain relevant data for the user and the system even when the SIMOTION D410-2 has been switched off. Information about the area which can be used for non-volatile data is available in the *SIMOTION D410-2* Manual, section "Technical Data".

A SIMOTION device has the following non-volatile data:

Table 10-97 Non-volatile data contents

Non-volatile data	Content
Kernel data	• Last operating state • IP parameters (IP address, subnet mask, router address) • DP parameters (PROFIBUS DP address, baud rate) • Diagnostic data (diagnostics buffer,...)
Retain variables	• Variables in the interface or implementation section of a unit declared with VAR_GLOBAL RETAIN • Global device variables with the "RETAIN" attribute
Retain TO	Absolute encoder offset
DCC blocks	SAV blocks and user-defined blocks with retain behavior ("SAV = SAVE", blocks for the non-volatile data backup).
NVRAM (SINAMICS)	For the SINAMICS Integrated and for the SINAMICS S120 CU310-2/CU320-2, data protected against loss at power failure is called NVRAM data or non-volatile data.

Note

DCC SIMOTION blocks with retain behavior act like retain variables in terms of copying RAM to ROM, resetting memory, downloading, backing up non-volatile SIMOTION data (_savePersistentMemoryData) and backing up data.

With DCC SINAMICS blocks, data buffering is only via NVRAM. SINAMICS data is not saved with _savePersistentMemoryData. The non-volatile SINAMICS data (NVRAM data) is backed up by setting the CU parameter p7775 to 1.

For further information on DCC, see the *DCC Programming* Programming Manual.

The non-volatile data of the SIMOTION D410-2 has the following properties:

Table 10-98 Non-volatile data and real-time clock properties

Properties	Non-volatile data	Real-time clock (RTC)
Location	Non-volatile data is located in the NVRAM of the SIMOTION D410-2.	The real-time clock is backed up maintenance-free via a SuperCap.
Back-up battery	No	No
Backup time	There is no maximum backup time	At least 5 days

If the buffer time is exceeded on the real-time clock, the time is reset.

CF card

With the _savePersistentMemoryData system function, the user program can back up the contents of the non-volatile SIMOTION data to the CF card. This ensures that the retain variables and the absolute encoder position are backed up in the event that a spare part is used.

For the SINAMICS Integrated and SINAMICS S120 CU310-2/CU320-2, the non-volatile SINAMICS data (NVRAM data) is backed up by setting the CU parameter p7775 to 1.

Note

IP and DP parameters in the non-volatile data

If the CF card contains a configuration, the IP and DP parameters are loaded from the CF card during ramp-up and used by the SIMOTION device. The SIMOTION D410-2 uses the addresses defined in these parameters to go online. During ramp-up, the IP and DP parameters on the CF card are also written to the non-volatile data. If the SIMOTION device is then powered up with a CF card with no configuration, the IP and DP parameters are retained in the non-volatile data and are used by the device. Thus, the SIMOTION device can continue to go online if a configuration was loaded with SIMOTION SCOUT at least once or if the SIMOTION device is powered up with a CF card containing a configuration.

The CF card contains the following data:

- SIMOTION Kernel (SIMOTION D firmware)
- Technology packages (TP)
- User data (units, configuration data, parameter settings, task configuration)
- IP parameters (IP address, subnet mask, router address)
- DP parameters (PROFIBUS DP address, baud rate)

It may also contain:

- User data saved with _savePersistentMemoryData and _export/_saveUnitDataSet
- Non-volatile SINAMICS data (NVRAM data) of the SINAMICS Integrated backed up with CU parameter p7775 = 1
- Data from SIMOTION IT
- Archived SCOUT project

Volatile SIMOTION data (RAM / current data RAM)

The volatile SIMOTION data is defined by the following properties:

- The volatile SIMOTION data is located in the RAM memory of the SIMOTION device.
- The download data of SIMOTION SCOUT is written to this memory.

- This data is lost when the SIMOTION D410-2 is switched off.
- The "volatile SIMOTION data" area contains the following data:
  - SIMOTION Kernel (D410-2 firmware)
  - Technology packages (TP)
  - User data (programs, configuration data, parameter settings)

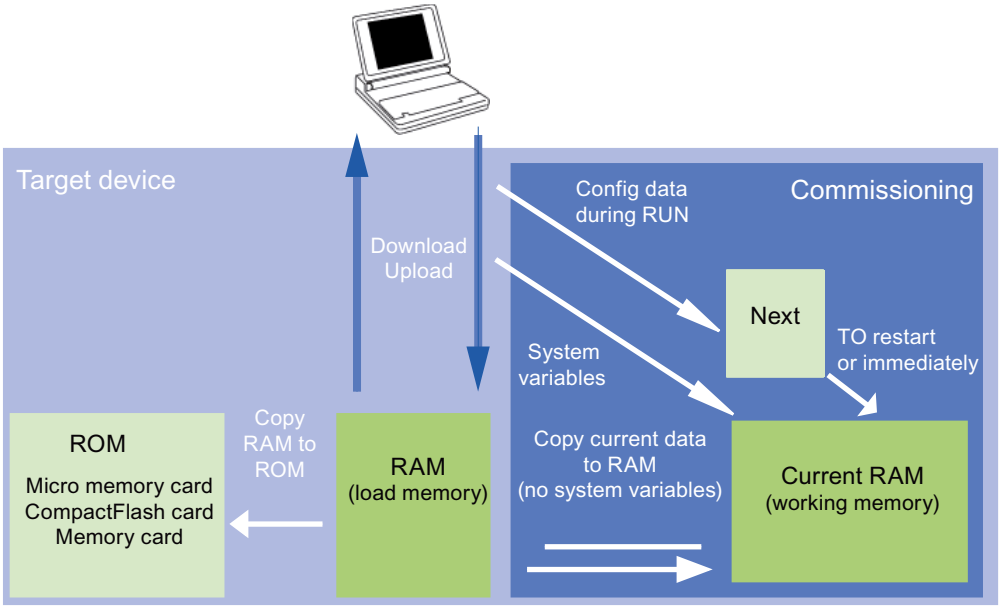

Figure 10-161 Configuration data and system variables in the volatile memory (memory concept, principle)

You can find additional information about memory management in SIMOTION in the *SIMOTION Runtime Basic Functions* Function Manual.

Operations and their effect on the user memory

The operator actions and their effects on the user memory are described below. These operator actions are marked with arrows in the following displays:

- Figure 10-160 SIMOTION D410-2 memory model (Page 7351)
- Figure 10-161 Configuration data and system variables in the volatile memory (memory concept, principle) (Page 7354)

SIMOTION SCOUT download

The following data is transferred with "Load project to target system" or "Load CPU / drive unit to target device" from the engineering system to the "volatile SIMOTION data" area:

- User data (units, configuration data, parameter settings, task configuration)
- Technology packages (TPs)

In addition, the IP and DP parameters are saved to the "non-volatile SIMOTION data" area. The retain variables are set to their initial values, but this depends on the settings in SIMOTION SCOUT. If the SIMOTION D410-2 is switched off following the download, the volatile SIMOTION data is lost.

Copy RAM to ROM

The Copy RAM to ROM menu command saves the following data via the engineering system to the CF card:

- Technology packages and user data (units, configuration data, parameter assignments, task configuration) from the "volatile SIMOTION data" area.
- Current values are copied to the "volatile SIMOTION data" area, depending on the settings in SIMOTION SCOUT.

Note

The "Copy RAM to ROM" menu command does not save the current values of the retain variables to the CF card. Use the system function "_savePersistentMemoryData" for this.

Note

The "Copy RAM to ROM" function is also available for drive units and saves the volatile SINAMICS data to the non-volatile memory (CF card).

Current RAM

If you change the system variable values, these take immediate effect in the current RAM. New configuration data values are initially stored in the Next memory. Configuration data that take immediate effect are automatically transferred to the current RAM. Configuration data that will only become active following a RESTART on the technology object (set the restartactivation system variable to the ACTIVATE_RESTART value) is not written to the current RAM until after the RESTART.

To save the configuration data changed online to the offline project, you must first transfer the content of the current data RAM to the RAM using the menu command "Target system" > "Copy current data to RAM".

Once you have done this, the configuration in SCOUT will no longer be consistent with the configuration in the target device, as a consistency check is performed on the RAM data. Read the data from the RAM using the menu command "Target system" > "Load" > "Load CPU / drive unit to PG" (for the configuration data only) to re-establish a consistent system state.

Use the "Target system" > "Copy RAM to ROM" menu command to save the configuration to the non-volatile memory on the CF card.

Note

The "Copy current data to RAM" command does not transfer the values of the system variables to the RAM memory. This means that "Save to memory card (Copy RAM to ROM)" or "Save in the engineering project (Load CPU / drive unit to PG)" is not possible.

In order to ensure that system variable values can also be saved to the engineering project and memory card, the system variable values must be changed OFFLINE and then downloaded to the target device and saved.

SIMOTION D410-2 power-up

During power-up of the SIMOTION D410-2, the SIMOTION Kernel is loaded from the CF card to the "volatile SIMOTION data" area.

When the SIMOTION D410-2 is switched off, the contents of the "volatile SIMOTION data" area are lost. When the unit is powered up again, the following data is loaded from the CF card:

- Technology packages and user data to the "volatile SIMOTION data" area.
- IP and DP parameters to the "non-volatile SIMOTION data" area.

Backing up non-volatile SIMOTION data

You have the following options for backing up non-volatile SIMOTION data on the CF card:

- In the user program:
  With the "_savePersistentMemoryData" system function, the user program can back up the non-volatile SIMOTION data content to the CF card. This ensures that the retain variables and the absolute encoder position are backed up in the event that a spare part is used. The contents are saved to the "PMEMORY.XML" backup file in the "USER\SIMOTION" directory.
- Via switch/button (service selector switch or DIAG button of the SIMOTION D410-2) or SIMOTION IT web server. See Section Diagnostic data and non-volatile SIMOTION data (Page 7557). The contents are saved to the "PMEMORY.XML" backup file in the "USER \SIMOTION\HMI\SYSLOG\DIAG" directory.

On the system side, this system function ensures that a consistent overall image of the non-volatile SIMOTION data is always available the next time the unit is switched on, even if there is a power failure during backup. An already existing backup file is renamed to "PMEMORY.BAK" before a new backup file is generated. If the save operation to the new backup file fails (e.g.

because the capacity of the CF card is insufficient), this backup copy of the backup file is used the next time an attempt is made to restore the non-volatile SIMOTION data content.

NOTICE
Loss of data due to failure to make backup copies Non-backed-up non-volatile SIMOTION data can be lost on hardware replacement (module defect), for example, if the current value of the retain variables have not been backed up and replaced by their initial values again. Back up the non-volatile SIMOTION data on the CF card.

NOTICE
Repeat referencing necessary after absolute encoder overflow If an absolute encoder overflow occurs after **_savePersistentMemoryData**, the actual position value is no longer correct after the non-volatile SIMOTION data is restored. In this case, homing (absolute encoder adjustment) must be repeated.

With the SCOUT functions "Save variables" and "Restore variables," you also have the option of backing up to your PC and restoring data that was changed during operation and only stored in the runtime system.

Reloading non-volatile SIMOTION data

SIMOTION data backed up on the CF card with **_savePersistentMemoryData** is reloaded in the following scenarios:

1. After a module replacement, see Section Replacing modules in the spare part scenario (Page 7361)
2. After a memory reset, see Section SIMOTION D410-2 memory reset (Page 7493)
3. Via switch position, see Section Delete/restore non-volatile SIMOTION data (Page 7564)

Reloading non-volatile SINAMICS data

For the SINAMICS Integrated and SINAMICS S120 CU310-2/CU320-2, as of SINAMICS FW version V4.5, the non-volatile SINAMICS data (NVRAM data) is backed up by setting the CU parameter p7775 to 1.

Restoring

- Is performed automatically in the event of a module replacement
  A module replacement is detected on the basis of the serial number.
- Can be performed manually
  Restoring can be initiated manually by setting the CU parameter p7775 to 2.

For further information, see Section Backing up / restoring / deleting SINAMICS NVRAM data (Page 7437).

Power failure

If a power failure occurs, the real-time clock is buffered by means of an internal SuperCap.

The non-volatile data is backed up on the D410-2 permanently and maintenance-free in an NVRAM. In this way, the Control Unit is immediately ready for operation without data loss after a power failure.

Power-up and non-volatile SIMOTION data

The table below lists the cases that can arise during power-up in conjunction with the non-volatile data and explains how they are handled.

Table 10-99 Power-up scenarios for non-volatile SIMOTION data

Case	Initial condition	Result
1	The non-volatile SIMOTION data is valid.	SIMOTION D410-2 powers up with the non-volatile SIMOTION data, i.e. with the PROFIBUS address in the non-volatile data.
2	The non-volatile SIMOTION data is invalid and there is no backup file (PMEMORY.XML) and no backup copy of the backup file (PMEMORY.BAK).	SIMOTION D410-2 copies the default settings to the non-volatile SIMOTION data and powers up with this data. In this case, for example, the default PROFIBUS address is used.
3	The non-volatile SIMOTION data is invalid and backup file (PMEMORY.XML) exists and is valid.	SIMOTION D410-2 copies the backup file contents to the non-volatile SIMOTION data and powers up with this data.
4	The non-volatile SIMOTION data is invalid, the backup file is invalid and there is no backup copy of the backup file (PMEMORY.BAK).	SIMOTION D410-2 copies the default settings to the non-volatile SIMOTION data and powers up with this data, in which case, for example, the default PROFIBUS address is used.
5	The non-volatile SIMOTION data is invalid; a backup file exists, but it is invalid; a backup copy of the backup file exists and is valid.	SIMOTION D410-2 copies the backup file contents to the non-volatile SIMOTION data and powers up with this data.

Non-volatile SIMOTION data diagnostics

The user can determine the state of the non-volatile SIMOTION data using the diagnostic buffer, system variables, and PeripheralFaultTask.

Evaluating via the diagnostic buffer

When they are issued, the following messages are entered once in the diagnostic buffer:

Table 10-100 Messages of the diagnostic buffer

Entry	Meaning	Remedy
Non-volatile data loaded from a file (Persistent Data File Loading done)	Non-volatile SIMOTION data has been successfully restored from the backup file on the CF card.	-
Non-volatile data loaded from the backup file (Persistent Data Backup File Loading done)	Non-volatile SIMOTION data has been successfully restored from the backup copy of the backup file on the CF card.	-
Error while loading non-volatile data from a file (Persistent Data File Loading Failure)	Backup file or backup copy could not be loaded. Possible causes: • Backup file or backup copy not available • Invalid data in backup file	Use the "_savePersistentMemoryData" system function to generate a valid backup file.
Module replacement detected - NVRAM has been initialized	A module replacement was detected on the basis of the serial number. The non-volatile SIMOTION data on the controller is deleted and the data from the CF card transferred to the controller.	
Module replacement not detected - NVRAM has not been initialized	An error has occurred. The non-volatile SIMOTION data on the controller has not been deleted.	Possible causes: • Incorrect controller type • File system of the CF card defective

Refer to the *SIMOTION SCOUT* Configuration Manual for how to read out the contents of the diagnostic buffer.

Evaluating via system variables

The system variables in the **device.persistentDataPowerMonitoring** structure indicate the state of the non-volatile SIMOTION data.

Table 10-101 State of the non-volatile SIMOTION data

System variable	Designation	State	Updating
rtcFailure	Indicates that the clock contents (RTC) are invalid (clock must be set again)	NO (91) YES (173)	The status is updated once during power-up; the status must be reset to "NO" via the application; the status is retained even after power off/on.
retainDataFailure	Indicates a checksum error of the non-volatile SIMOTION data; can be an indication of defective hardware	NO (91) YES (173)	The status is updated once during power-up; the status must be reset to "NO" via the application; the status is retained even after power off/on.
persistentDataState	Reading the persistent data	See the table below	The status is updated during power-up.

A data loss of the real-time clock is signaled via the system variable **device.persistentDataPowerMonitoring.rtcFailure = YES**.

The system variable **device.persistentDataPowerMonitoring.persistentDataState** shows the state of the non-volatile SIMOTION data after power-up.

Table 10-102 State of the non-volatile SIMOTION data after power-up (persistentDataState system variable)

State	Meaning
FROM_RAM (1)	Non-volatile SIMOTION data in the SIMOTION device is used
FROM_FILE (2)	Non-volatile SIMOTION data is restored from the backup file
FROM_BACKUP (3)	Non-volatile SIMOTION data is restored from the backup copy of the backup file
INVALID (4)	Data in the non-volatile SIMOTION data and in the backup file / backup copy of backup file is invalid or non-existent/deleted. The SIMOTION device has copied the default settings to the non-volatile SIMOTION data and used this data to power up.

Requirement/availability of the battery

System variables can be used to evaluate:

- Whether a battery is required for the operation of the device (or not)
- Whether a battery is available (or not)

SIMOTION D410-2 has no battery.

Table 10-103 System variable batterynecessary/batteryexisting

System variable on the device	States	Description
fanbattery of data type StructDeviceFanBattery (the system variables are of the data type EnumFanBattery)		
.batterynecessary	MANDATORY	Battery is required for the backup of the non-volatile data and the real-time clock (RTC) of the device. **.batteryexisting** can be used to query whether a battery is installed.
	OPTIONAL	The non-volatile data and the real-time clock (RTC) are backed up via SuperCap. A battery can be used as an option to extend the backup time. **.batteryexisting** can be used to query whether a battery is installed. **Example: D4x5**
	OPTIONAL_RTC [1)]	A battery is not required for backing up the non-volatile data. Only the real-time clock (RTC) is backed up via SuperCap. A battery can be used as an option to extend the backup time of the real-time clock. **.batteryexisting** can be used to query whether a battery is installed. **Example: D4x5-2**
	NOT_MANDATORY [1)]	A battery is not required for backing up the non-volatile data. The real-time clock (RTC) is backed up via SuperCap. **Example: D410-2**

System variable on the device	States	Description
.batteryexisting	EXISTING	EXISTING is only displayed when **.batterynecessary** is set to: • MANDATORY or • OPTIONAL or • OPTIONAL_RTC and a battery is installed.
	NOT_EXISTING	Battery is not available. **State is statically set for D410-2.**

[1] If the SuperCap is discharged, the contents of the real-time clock (RTC) are lost.

Replacing modules in the spare part scenario

SIMOTION module replacement

During a module replacement, a CF card that contains the non-volatile SIMOTION data backed-up with _savePersistentMemoryData, is inserted in a new device of the same type.

A module replacement is detected by the SIMOTION D410-2 on the basis of the serial number. The data backed up on the CF card with _savePersistentMemoryData are then automatically transferred to the new device.

Note

As an additional option, you can back up the non-volatile data by switching the service selector switch, with the DIAG button, or via SIMOTION IT web server. For details, see Section Diagnostic data and non-volatile SIMOTION data (Page 7557).

Initial power-up with the CF card

This requires a CF card on which no device serial number is stored.

If the SIMOTION D410-2 powers up successfully with a new CF card, the serial number of the device is stored on the CF card. In this case, a module replacement cannot be detected.

Note

The serial number stored on the CF card remains unaffected by the following actions:

- Copy RAM to ROM
- Project download
- Writing the CF card via the SCOUT function "Load to file system"
- FW/project update via device update tool

If the CF card contents are copied to another CF card, the serial number is also copied. A serial number stored on the CF card can only by removed by deleting the CF card contents.

SIMOTION D410-2 power-up with the CF card (no module replacement)

Prerequisite is that the same CF card and the same device are used.

If the SIMOTION device powers up successfully, the serial number stored on the CF card is compared with the serial number of the device.

If the serial numbers are identical, there has been no module replacement.

The device powers up. In the non-volatile data present in the device is valid, this will be used (for details, see Table 10-99 Power-up scenarios for non-volatile SIMOTION data (Page 7358)).

SIMOTION D410-2 power-up with the CF card (module replacement)

Prerequisite is that the same CF card and a different device (e.g. replacement because of a defect) are used.

If the device powers up successfully, the serial number stored on the CF card is compared with the serial number of the device.

If the serial numbers are not identical, there has been a module replacement.

This means:

- The serial number of the new module is stored on the CF card.
- The non-volatile SIMOTION data are deleted in the device.
- A diagnostic buffer entry is issued which signals that a module has been replaced.
- The non-volatile SIMOTION data stored on the CF card is transferred to the device (for details, see Table 10-99 Power-up scenarios for non-volatile SIMOTION data (Page 7358)).

NOTICE
Irrevocable data deletion due to incorrect CF card with stored device serial number A module replacement is detected only on the basis of the changed serial number. Inserting the wrong CF card with saved device serial number has the following consequences: • The non-volatile data on the device is permanently deleted. • The IP/DP address set in the device is deleted. You can no longer go online via the IP/DP address set originally. Make sure that the correct CF card is inserted into the SIMOTION D410-2.

Error scenarios

In the event of an error, a diagnostic buffer entry signals that it was not possible to determine whether a module has been replaced. This may have the following reasons:

- The serial number of the device cannot be determined.
- The serial number saved on the CF card cannot be determined (e.g. due to a corrupt file system).
- The controller has not powered up.
- The new serial number could not be transferred to the CF card (e.g. due to a corrupt file system).

Restart after reloading

The system variable **device.startupData.operationMode** is used to define whether the SIMOTION D410-2 Control Unit goes into the RUN state or the last operating state after a power-on/restart.

Possible values of **device.startupData.operationMode**:

- LAST_OPERATION_MODE [0] (default setting)
  The module remains in the STOP operating state after reloading the non-volatile SIMOTION data and must be switched manually to the RUN state with SCOUT, the web server, or the mode switch .
- RUN [1]
  The module goes automatically into the RUN state after reloading.

SINAMICS module replacement

A module replacement is detected as of SINAMICS V4.5.

For the SINAMICS Integrated and SINAMICS S120 CU310-2/CU320-2, a module replacement is also identified via the serial number.

Non-volatile SINAMICS data (NVRAM data) backed up previously via the CU parameter p7775 = 1 on the CF card, is then automatically transferred to the Control Unit.

Fan

Cooling the SIMOTION D410-2

Overview

A fan is always required for operation of the SIMOTION D410-2. This is included in the scope of delivery of the D410-2 control unit. The fan operates temperature-controlled and is switched on depending on the air intake temperature and the CPU load.

Fan faults

Fan faults are indicated as follows:

- Entry in diagnostic buffer
- Indicated via system variable
- Calling the PeripheralFaultTask

If a fan fault occurs or the fan is unplugged, the module continues to run. The controller goes into FAULT state when overtemperature occurs (temperature threshold 2 exceeded), whereby all LEDs flicker red. The state can only exited through power off/on

For further information on the evaluation of fan faults, see Section Overview of fan states (Page 7364).

Overview of fan states

Evaluation of fan faults

SIMOTION D410-2 has a single fan.

Fan faults are detected through a cyclic fan test or when a malfunction is determined when the fan is activated (fan does not rotate or fan rotates at too low a speed).

Fan faults are signaled by the following diagnostic buffer entry:
Fan on the module is defective.

The states that can occur during operation are described in the following.

Table 10-104 Overview of fan states

State	PeripheralFaultTask	System variable [1]
		_cpuDataRW.fanWarning
The fan fails in the STOP operating state, then RUN	PeripheralFaultTask: Is not called	=YES
The fan fails in the RUN operating state	PeripheralFaultTask: TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205) TSI#details = 16#00000080	=YES

[1] The "YES" value must be reset to "NO" by the application.

Requirement for/presence of a fan

System variables can be used to evaluate:

- Whether a fan is required for the operation of the device (or not)
- Whether a fan is installed (or not)

Table 10-105 System variable fannecessary/fanexisting

System variable on the device	States	Description
fanbattery of data type StructDeviceFanBattery (the system variables are of the data type EnumFanBattery)		
.fannecessary [1]	MANDATORY	Fan is required for operation of the device. **.fanexisting** can be used to query whether a fan is installed. **Examples: D410-2, D445-2, D455-2**
	OPTIONAL	Fan can be used optionally. **.fanexisting** can be used to query whether a fan is installed. **Examples: D425, D435**
	NOT_MANDATORY	Fan is not required for operation of the device.

System variable on the device	States	Description
.fanexisting [1)]	SINGLE	A single fan is installed **Examples: D410-2**
	REDUNDANT	Double fan is installed. **Examples: D445-2, D455-2**
	NOT_EXISTING	No fan is installed. **Example: D425 and D435 without optional fan**.

1) Value is statically set to MANDATORY/SINGLE in the SIMOTION D410-2.

SIMOTION D410-2 only detects an unplugged fan indirectly.
The system variable fanexisting has statically the state SINGLE for the SIMOTION D410-2 . If the module temperature increases to impermissible values due to a fan having been unplugged, the module signals overtemperature.

The fan speed is available in system variable **_cpuData.fanRpm** as of V4.4.

Additional references

You will find detailed information on setting up Taskstartinfo (#TSI) in the *SIMOTION Runtime Basic Functions* Function Manual.

Response to overtemperature

Operation at overtemperature reduces the module service life and can result in damage to the module.

Causes

Cause of problems in the heat dissipation of the module can be, for example:

- Violation of the maximum permissible air intake temperature
- Free convection is not ensured (clearances are not maintained, pollution, convection is prevented by cables)
- Impermissible mounting position of the module

Temperature thresholds

The internal module temperature is monitored via two module-specific temperature thresholds:

- Overtemperature is signaled when the first (lower) temperature threshold is exceeded.
- When the temperature falls below the first temperature threshold again (minus a hysteresis of approx. 5° C), "Normal temperature" is signaled.
- When the second (higher) temperature threshold is exceeded, the module goes into the FAULT state to protect itself.

The internal module temperature is available in system variable **_cpuData.moduletemperature** as of V4.4.

Response to overtemperature

Table 10-106 Response of the temperature monitoring

Temperature...	Response
... exceeds the 1st temperature threshold (overtemperature)	Call of the PeripheralFaultTask: • TSI#InterruptI = _SC_PC_INTERNAL_FAILURE (= 205) • TSI#details = 16#00000002 Diagnostic buffer entry: "Temperature exceeded in the housing"
... falls below the 1st temperature threshold minus a hysteresis of approx. 5° C	Call of the PeripheralFaultTask: • TSI#InterruptId = _SC_PC_INTERNAL_FAILURE (= 205) • TSI#details = 16#00000004 Diagnostic buffer entry: "Temperature in the housing has returned to normal"
... exceeds the 2nd temperature threshold	Module goes into the FAULT state to protect itself (all LEDs flicker red) Diagnostic buffer entry: "Temperature in the housing too high, self-protection function of the module activated"

Behavior of SINAMICS Integrated

If the internal temperature of the SIMOTION D410-2 exceeds the permissible limit value, the following warning message is displayed:

A1009: CU warning: Control unit overtemperature

The warning message will be cleared as soon as the fault is rectified and the temperature falls below the maximum permissible limit.

The behavior for overtemperatures in the power unit as well as possible STOP responses for the SIMOTION D410-2 corresponds to the behavior for a SINAMICS S120 CU310-2.

10.1.2.6 Parameter assignment / addressing

Software requirements

Engineering

The following requirements must be satisfied for the commissioning of the SIMOTION D410-2 Control Units:

- SIMOTION D410-2 DP: at least SCOUT V4.3 SP1 HF1 and firmware V4.3 SP1 HF2
- SIMOTION D410-2 DP/PN: at least SCOUT V4.3 SP1 HF3 and firmware V4.3 SP1 HF3

Please note the information on the latest SIMOTION SCOUT DVD.

For information on how to install SIMOTION SCOUT on your PG/PC, see the *SIMOTION SCOUT* Configuration Manual.

Note

The software configuration is described in this manual based on SIMOTION SCOUT and SIMATIC STEP 7 Version V5.x.

Information of configuration of the SIMOTION D Control Units in the Engineering Framework Totally Integrated Automation Portal (SCOUT in the TIA Portal), you will find in the configuration manual *SIMOTION SCOUT TIA*.

The TIA Portal requires at least SIMOTION SCOUT V4.4 and SIMOTION D4xx-2 Control Units as of firmware V4.3.

Creating a project and configuring the communication

Creating a SIMOTION project and inserting a SIMOTION D410-2

Procedure

Proceed as follows to create a new project in SIMOTION SCOUT and insert a SIMOTION D410-2:

1. Select the Project > New... menu command.
2. Enter a name for your project in the "New Project" dialog box and confirm your entry with "OK".
   A new folder with the name of the project will be created in the project navigator.

3. In the project navigator, double-click "Insert SIMOTION device". The "Insert SIMOTION Device" dialog box is opened:

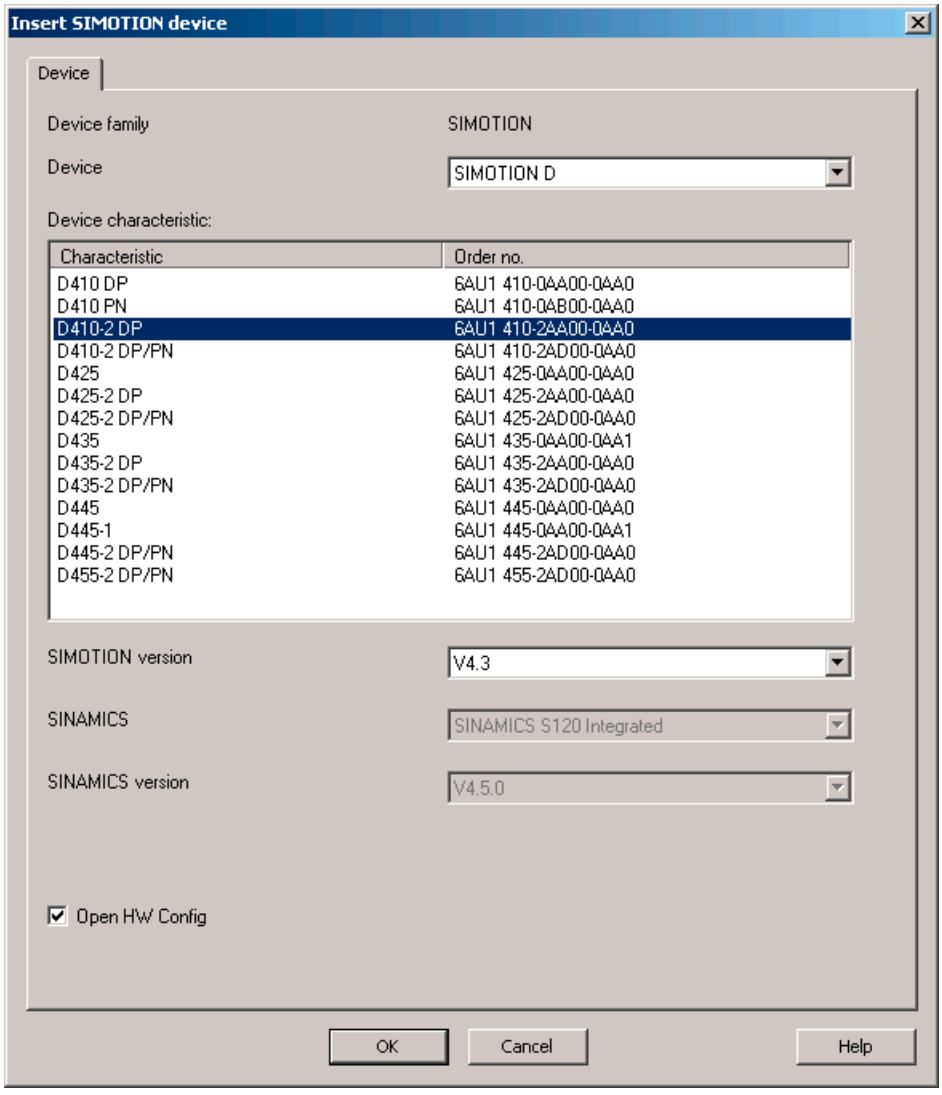

Figure 10-162 Inserting a SIMOTION device

4. In the "Insert SIMOTION Device" dialog box, select the device, its version and the SIMOTION version.
5. If required, make further settings:
   - SINAMICS: For SIMOTION D410-2 always set "SINAMICS S120 Integrated".
   - SINAMICS version: Select the SINAMICS Integrated version if several drive versions are available for a SIMOTION version.
6. The "Open HW Config" option allows you to select whether **HW Config** is opened in the next step (e.g. to configure the bus interfaces).
7. Confirm the "Insert SIMOTION Device" dialog with "OK".

SINAMICS Integrated type

For SIMOTION D410-2, the type is always SINAMICS S120 Integrated.

Version of the SINAMICS Integrated

Depending on the selected SIMOTION version, several versions are available for the SINAMICS Integrated. Please note that separate SIMOTION D firmware is available for each version of the SINAMICS Integrated.

Configuring the PROFINET interface

After you have acknowledged the "Insert SIMOTION Device" dialog with "OK", the "Properties - Ethernet Interface" dialog box opens in the case of a D410-2 DP/PN.

If you are using the PROFINET interface, set the interface properties in the "Properties - Ethernet Interface" dialog box.

To this end, proceed as follows:

1. Click the "New" button.
   The "New Subnet Industrial Ethernet" dialog box opens. Rename the new subnet, or accept the default name by clicking "OK".
2. Select the new Ethernet subnet, which is now displayed in the "Properties - Ethernet Interface" dialog box.
3. Enter the required addresses in the "IP address" and "Subnet mask" fields of the "Properties - Ethernet Interface" dialog box. Under "Gateway", define whether you are going to use a router and, if yes, enter the router address. Confirm with "OK".

Result

If you have not yet configured a PG/PC in your project, you can select the interface for the PG/PC connection now.

Configuring the PROFIBUS PG/PC interface

Requirements

The following requirements must be satisfied in order to configure the PG/PC interface:

- You have completed the "Insert SIMOTION Device" dialog box with "OK"
- A PG/PC has not yet been configured in the project.

If these requirements have been satisfied, you can configure the interface for the PG/PC connection in the "Interface Selection - D410" dialog box.

Procedure

Proceed as follows to configure the PROFIBUS DP interface:

1. In the "Interface Selection - D410" dialog box, select the entry "PROFIBUS DP/MPI (X21)" (in the case of the D410-2 DP, the following alternative is also available: PROFIBUS DP (X24)).

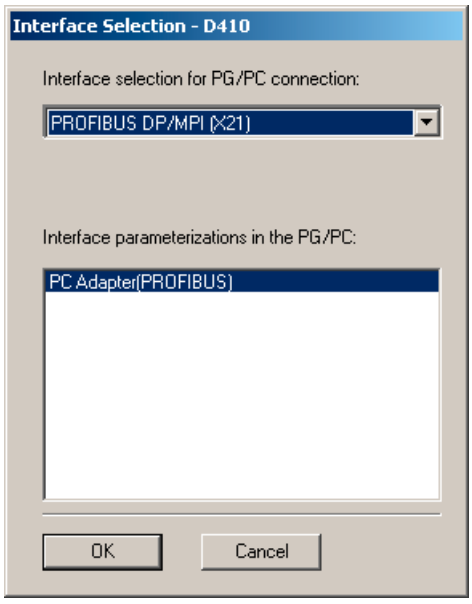

Figure 10-163 Selecting a PROFIBUS interface

2. Select the interface parameter assignment that you would like to use to go online, and confirm with "OK".

The dialog box is closed, the SIMOTION D410-2 is created in the project navigator and **HW Config** is started automatically (if parameterized).

A PROFIBUS subnet with factory settings (1.5 Mbit/s transmission rate) is created automatically.

Result

The PG/PC is now connected to the SIMOTION D410-2 via PROFIBUS. You can configure and parameterize your system.

Note

If you do not use the factory settings, you must configure the PROFIBUS interfaces in **HW Config**.

Please make sure that the S7 online access has been **activated** (PG/PC connection must be yellow and bold in **NetPro**).

Inserting a further SIMOTION device

If you insert a further SIMOTION device using "Insert SIMOTION device", the PG/PC interface selection dialog box is not displayed. Any further SIMOTION device is automatically connected to the PG/PC via PROFIBUS and a new unique DP address (address 4, 5 ... up to 125) is calculated.

Additional references

Further information on the topic of "Going online" can be found

- In the online help via the "Contents" tab at
  - "Diagnostics" > "Overview of service and diagnostics options" > "Part III" > "Go online"
  - "Insert device and connect to target system" > "Go online/offline"
- On the Internet at Internet address (https://support.industry.siemens.com/cs/ww/en/view/22016709)

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Configuring the Ethernet PG/PC interface

Requirements

The following requirements must be satisfied in order to configure the PG/PC interface:

- You have completed the "Insert SIMOTION Device" dialog box with "OK".
- A PG/PC has not yet been configured in the project.

If these prerequisites have been satisfied, you can configure the interface for the PG/PC connection in the "Interface selection - D410" dialog box.

Proceed as follows to configure the Ethernet interface:

Procedure

1. In the "Interface Selection - D410" dialog box, select the entry "Ethernet PNxIE (X127)".

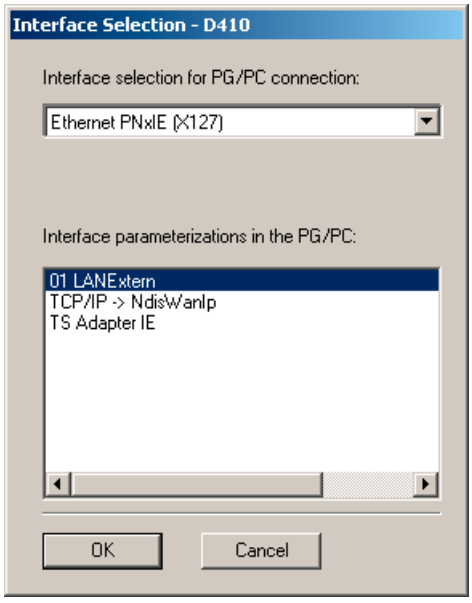

Figure 10-164 Selecting the Ethernet interface

2. Select the interface parameter assignment that you would like to use to go online, and confirm with "OK".

The dialog box is closed, the SIMOTION D410-2 is created in the project navigator and **HW Config** is started automatically (if parameterized).

An Ethernet subnet with factory settings is created automatically. For factory settings, see Section General information about communication via Ethernet (Page 7396).

Result

The PG/PC is now connected to the SIMOTION D410-2 via Ethernet.

You can configure and parameterize your system.

Note

If you want to change the default settings for IP addresses and the transmission rate, you must configure the Ethernet interfaces in **HW Config** and **NetPro**.

Make sure that the PG/PC and SIMOTION D410-2 are located in the same subnet and that S7Online access has been **activated** (the PG/PC connection must appear yellow and bold in **NetPro**).

Inserting a further SIMOTION device

If you insert a further SIMOTION device using "Insert SIMOTION device", the PG/PC interface selection dialog box is not displayed. The second SIMOTION device is automatically connected to the PG/PC via Ethernet and a new unique IP address (last digit + 1 up to 255) is calculated.

Additional references

Further information on the topic of "Going online" can be found

- In the online help via the "Contents" tab at
  - "Diagnostics" > "Overview of service and diagnostics options" > "Part III" > "Go online"
  - "Insert device and connect to target system" > "Go online/offline"
- On the Internet at Internet address (https://support.industry.siemens.com/cs/ww/en/view/22016709)
- In SIMOTION Utilities & Applications, FAQ "Online connections to SIMOTION devices".

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Display of the SIMOTION D410-2 in HW Config

Once you have created a project and inserted a SIMOTION D410-2 as module, **HW Config** opens automatically (if parameterized).

In **HW Config**, the SIMOTION D410-2 is displayed with the SINAMICS Integrated and the interfaces.

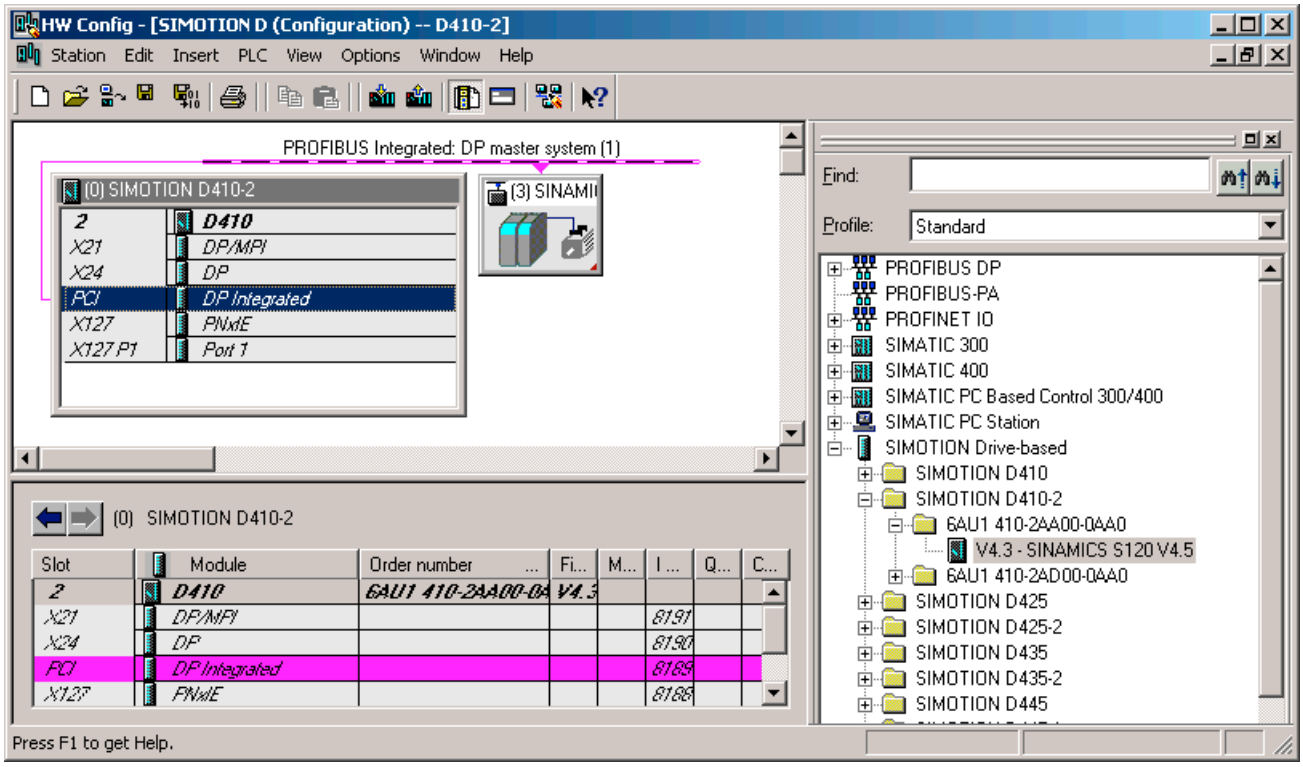

Figure 10-165 Display of a SIMOTION D410-2 in HW Config

Note

According to the DNS conventions, "/" is a permissible character. For this reason, the Ethernet and PROFINET interfaces have a different name in the engineering software than on the module lettering ("/" is replaced by "x").

Example: PN/IE (lettering on module) → PNxIE (as shown in SCOUT, HW Config, NetPro)

Configuring PROFIBUS DP

General information about PROFIBUS DP communication

Definition of PROFIBUS DP

PROFIBUS DP is an international, open field bus standard specified in the European field bus Standard EN 50170 Part 2. PROFIBUS DP is optimized for high-speed, time-sensitive data transfer at field level.

Components communicating on PROFIBUS DP are classified as master and slave components.

- Master (active bus device)
  Components that represent a master on the bus define data transfer along the bus, and are therefore known as active bus nodes.
  Masters components are divided into two classes:
  - DP master class 1 (DPMC1):
    Central master devices are thus designated, which exchange information with the slaves in specified message cycles.
    Examples: SIMOTION D410-2 DP, C240, P350, SIMATIC S7, etc.
  - DP master class 2 (DPMC2):
    These are devices for configuration, commissioning, and operator control and monitoring while the bus is in operation.
    Examples: Programming devices, operator control/monitoring devices
- Slaves (passive bus nodes):
  These devices may only receive, acknowledge and transfer messages to a master when so requested.
  Examples: SINAMICS drives, I/O modules

Functions on PROFIBUS DP

The functional scope can differ between DP masters and DP slaves. The functional scope is different for DP-V0, DP-V1 and DP-V2.

These functions on the PROFIBUS DP are characterized by:

- Configurable, equidistant, isochronous PROFIBUS DP cycle
- Synchronization of slaves by the master by means of a global control message frame in each cycle clock
- Independent maintenance of the isochronous cycle clock by the slaves in the event of a short-term communication failure.

Additional references

You will find additional information about PROFIBUS DP in the *SIMOTION Communication* System Manual.

Operating SIMOTION D410-2 on PROFIBUS DP

PROFIBUS DP interfaces (X21, X24)

For connection to PROFIBUS DP, the SIMOTION D410-2 DP has two interfaces (X21 and X24) and the SIMOTION D410-2 DP/PN has one interface (X21).

Table 10-107 SIMOTION D410-2 PROFIBUS interfaces

	D410-2 DP	**D410-2 DP/PN**
PROFIBUS DP/MPI interface	X21	X21
PROFIBUS DP interface	X24	–

Transmission rates up to 12 Mbits/s are possible. Interfaces X21 and X24 can both be operated isochronously.

Alternatively, the X21 interface can be used as an MPI interface with a transmission rate of 19.2 kbit/s up to 12 Mbit/s, see Section Configuring the MPI bus (Page 7385).

In the delivery condition, PROFIBUS DP interfaces X21 and X24 are both preset as a master with address 2 and a transmission rate of 1.5 Mbit/s. The PROFIBUS DP network is automatically detected and generated for this setting.

However, other settings can also be configured. This requires that you configure the network manually using **HW Config** and **NetPro**.

Note

Communication with the SINAMICS Integrated of a SIMOTION D410-2 is always equidistant. Here, the SIMOTION D410-2 is the master and the SINAMICS Integrated drive is the slave.

SIMOTION D410-2 DP master-slave configuration

Master-slave configurations can be used, for example, to establish hierarchical PROFIBUS networks that can be used to implement a modular machine concept.

Table 10-108 SIMOTION D410-2 DP master-slave configuration

X21 DP/MPI	X24 DP	Remark	Actions in the application
DP master, isochronous	DP slave, isochronous	Application synchronized to DP master (X21), application controls synchronization to DP slave (X24) Internal drive is synchronous with external cycle clock Cycle clock X21 = cycle clock DP Integrated	DP master / DP slave synchronization mechanisms
DP slave, isochronous	DP master, isochronous	Application synchronized to DP master (X24), application controls synchronization to DP slave (X21) Internal drive is synchronous with external cycle clock Cycle clock X24 = cycle clock DP Integrated	DP master / DP slave synchronization mechanisms

For detailed information about controlling synchronization across the application, see the *Basic Functions for Modular Machines* Description of Functions.

Assigning PROFIBUS addresses in HW Config

Assigning PROFIBUS addresses

Assign a PROFIBUS address to all devices **before** you start networking these in order to enable intercommunication.

Note

Before you assign any PROFIBUS addresses, please remember that all addresses must be unique on the PROFIBUS subnet.

Define the PROFIBUS address separately for each device with the PG/PC in **HW Config**. Certain PROFIBUS DP slaves are equipped with an address switch.

Note

The PROFIBUS addresses set at the devices using these switches must correspond with the address settings in **HW Config**.

Recommendation for PROFIBUS addresses

Reserve PROFIBUS address "0" for a service PG and "1" for a service HMI device which are connected to the subnet as required.

Recommended PROFIBUS address setting for SIMOTION D410-2 in case of replacement or service:

Reserve address "2" for a SIMOTION D410-2. This prevents duplicate addresses when installing a SIMOTION D410-2 with a default setting on the subnet (e.g. when a SIMOTION D410-2 is replaced). Assign addresses higher than "2" to any additional devices on the subnet.

Setting the DP cycle and system cycle clocks

Adapting the DP cycle of SINAMICS Integrated

SINAMICS Integrated serves as the basis for all cycle clocks of a SIMOTION D410-2 under the following circumstances:

- SIMOTION D410-2 DP: Always
- SIMOTION D410-2 DP/PN: Only if no synchronized data exchange takes place via the PROFINET interface (see also Section Setting a send cycle clock and system cycle clocks (Page 7391)).

To set the DP cycle of the SINAMICS Integrated, double-click the SINAMICS drive on the integrated PROFIBUS. The "DP Slave Properties" dialog box opens. You can synchronize the DP cycle of SINAMICS Integrated in the "Isochronous mode" tab.

Table 10-109 SIMOTION D410-2 value range

DP cycle	≥ 0.5 ms (DP internal)≥ 1 ms (DP external)
Grid	0.125 ms (the use of a clock grid ≥ 0.250 ms is recommended)

External DP interfaces can only be operated with a DP cycle of ≥ 1 ms.

SINAMICS Integrated always runs in isochronous mode. The cyclic tasks of SIMOTION are therefore always in synchronism with SINAMICS Integrated.

The set DP cycle of SINAMICS Integrated is displayed as "Bus data cycle" in the "System Cycle Clocks - D410" dialog box in SIMOTION SCOUT. Select the SIMOTION D410-2 in the project tree, and then select the "Set system cycle clocks" option in the "Target system" > "Expert" menu.

The table below shows the ratios you can set for the system cycle clocks of SIMOTION D410-2 based on the bus cycle clock.

Table 10-110 Ratios of system cycle clocks

Servo cycle clock[1] : Bus cycle clock	**IPO cycle clock: Servo cycle clock**	**IPO2 cycle clock: IPO cycle clock**
1 ... 4, 8	1 ... 6	2 ... 64

[1] When using the TO axis and the integrated drive control, the minimum servo cycle clock is 1 ms.

Note

The following statements relate to a SIMOTION D410-2 DP with 2 DP interfaces (X21/X24). The statements are equally applicable to a SIMOTION D410-2 DP/PN with only one DP interface (X21).

In addition, if the DP interfaces (X21/X24) are configured as equidistant master interfaces, you must set both DP cycles equal to the bus cycle clock of the SINAMICS Integrated in **HW Config**.

If the DP interfaces (X21/X24) are operated as the master, the system cycle clocks are obtained from an internal cycle clock of the module.

Of the two DP interfaces (X21/X24), no more than one can also be operated as an isochronous slave interface. In this case, the system cycle clocks are obtained from the cycle clock of the slave interface. As a result, the task system of SIMOTION and SINAMICS Integrated runs synchronously to the slave cycle clock. This assumes that a slave cycle clock exists and synchronization with the slave cycle clock has been achieved. If this is not the case, the system cycle clocks are acquired from an internal replacement cycle clock.

When the project is downloaded, the cycle clock configuration is downloaded to the SIMOTION D410-2 and automatically set according to the specifications.

Also observe the cycle clock setting rules in Section Rules for cycle clock settings with SIMOTION D410-2 DP (Page 7379).

Rules for cycle clock settings with SIMOTION D410-2 DP

The rules for making SIMOTION D410-2 DP cycle clock settings are described below.

For SIMOTION D410-2 DP/PN, see Section Rules for cycle clock settings with SIMOTION D410-2 DP/PN (Page 7394).

Rules for adjusting system cycle clocks in the case of SIMOTION D410-2 DP

You must conform to the following rules when setting the DP cycle and SINAMICS Integrated cycle clocks:

1. The DP cycle must be an integer multiple of the current controller cycle.
2. The master application cycle (T_{mapc}), which corresponds to the servo cycle, must be an integer multiple of the speed controller cycle. The smallest-possible T_{mapc} thus results from the smallest common multiple of the DP cycle and the speed controller cycle.
   If the master application cycle = 1, it follows that the DP cycle is also an integer multiple of the speed controller cycle.
3. The DP cycle must be an integer multiple of the basic cycles r0110[x] (DRIVE-CLiQ basic sampling rates).
   You can determine parameter r0110[x] using the expert list in SIMOTION SCOUT (select the "Control_Unit" from "SINAMICS_Integrated" in the project navigator, and then open the "Expert list" by selecting the "Expert" command from the shortcut menu).

Note

An overview of errors reported by the SINAMICS Integrated is provided in the *SINAMICS S* List Manual.

Dependencies of SINAMICS cycle clocks

The general rule for SIMOTION D410-2 DP is that the DP cycle serves as the basic cycle clock for the task system. All SIMOTION clock cycles (servo, IPO, IPO_2, etc.) longer than this basic cycle clock must be an integer multiple of the basic cycle clock.

This rule also applies to SINAMICS Integrated cycle clocks, if one of the successive cycle clocks is longer than the basic cycle clock:

- Speed controller p0115[1] (drive)
- Flow controller p0115[2] (drive)
- Setpoint channel p0115[3] (drive)
- Position controller p0115[4] (drive)
- Positioning p0115[5] (drive)
- Technology controller p0115[6] (drive)
- Onboard I/O p0799[0...2] (Control Unit)
- Terminal module I/O p4099

The corresponding cycle must be an integer multiple of the basic clock (DP cycle).

If any change to the DP cycle violates this rule you must also change the SINAMICS cycle clocks. In order to change the cycles in the Expert list of **SIMOTION SCOUT**, select the "Control_Unit" or the "Drive" from "SINAMICS_Integrated" in the Project Navigator, and then open the "Expert List" by selecting the "Expert" command from the shortcut menu.

If p0115 sampling times are required which cannot be set using p0112 > 1, then you can directly set the sampling times using p0115. This requires that p0112 must be set to "0" (expert).
If p0115 is changed online, the values of the higher indices are adapted automatically.

Note

At the SINAMICS end, there are further rules for setting the sampling times. You will find these described in the *SINAMICS S120* Function Manual, Section Rules for setting the sampling time.

Example

A default value of 4 ms is set for the SINAMICS Integrated setpoint channel p0115[3]. If the DP cycle is to be set to 3 ms, the fact that an integer multiple value is required means that you will need to set 3 ms or 6 ms (for example) for the setpoint channel.

Incorrect cycle clock setting

If the SINAMICS cycle clocks are not set correctly, this can be seen by the following messages:

- A01223 CU: Sampling time inconsistent and/or
- A01902 PB/PN isochronous operation parameterization impermissible and/or
- F01043 severe error downloading project
- F01951 CU SYNC: Synchronization application cycle clock missing

In this case, check the cycle clock settings on all drive objects signaling this error. For F01951, check the DP cycle. In this case, use a DP cycle that is a multiple of 0.25 ms or 0.5 ms.

Note

An overview of errors reported by the SINAMICS Integrated is provided in the *SINAMICS S* List Manual.

Current controller cycle clock

With the SIMOTION D410-2, the following current controller cycle clocks p0115[0] can be configured for the SINAMICS Integrated:

- for servo: 125 µs (default) or 250 µs
- For vector and vector V/f:
  - For blocksize Power Modules: 250 µs or 500 µs (default)
  - For chassis Power Modules: 375 µs.

Using vector drives (Page 7431)

Cycle clock scaling of external PROFIBUS interface to internal PROFIBUS interface

Definition

Cycle clock scaling means that an external PROFIBUS interface of the SIMOTION D410-2 DP (X21/X24) or SIMOTION D410-2 DP/PN (X21) can be operated in an integer multiple of the internal PROFIBUS interface. This reduces the CPU load, thereby allowing you to operate more axes, for example. The settings of the scaled cycle clocks for the external DP interfaces are made in **HW Config**.

Supplementary conditions

The following supplementary conditions are applicable to cycle clock scaling:

- An external DP interface of the D410-2 is used as an isochronous slave interface. Only in this case can an **integer** cycle clock scaling of isochronous external DP slave interface to internal interface be specified. This is checked during compilation and an error message is output in the event of noncompliance. If the external DP interfaces are configured as equidistant interfaces but none are configured as slaves and cycle clock scaling is specified for these interfaces, an error is output during compilation.
- For SERVO, IPO, and IPO2, settings can also be made for all permissible cycle clocks. Master and slave axes can run in different IPO levels. Different cycle clocks and phase offsets are tolerated by the system.

  Note

  The IPO cycle clock of the IPO in which the synchronous operation technology object runs must be set equal to the cycle clock of the isochronous external DP slave interface.

- The second external DP interface of a SIMOTION D410-2 DP can be operated as an isochronous master (while the other is an isochronous slave) in order to operate external drives, for example. In this case, the cycle clock must be the same as the cycle clock of the internal PROFIBUS DP. If this condition is not satisfied, an error message is output during compilation.
- One or both external DP interfaces can also be operated as non-isochronous, free-running interfaces. In this case, there is no effect on the cycle clock settings.

Application example

The system consists of a synchronous master (DP master) and at least one SIMOTION D410-2 DP synchronous slave (DP slave). The synchronous master contains the master axis; the synchronous slave contains the following axes:

- The axes in the SINAMICS Integrated of the D410-2 DP synchronous slave must exhibit high performance with a servo cycle clock of 1.5 ms and an internal DP cycle of 1.5 ms. This requires that the internal fast PROFIBUS DP be decoupled from the slower external PROFIBUS DP.
- The PROFIBUS DP has, for example, a cycle time of 6 ms due to the quantity framework on the bus; in all cases, its cycle time exceeds that of the cycle clock of the internal DP interface.
- The master values are transmitted via the DP bus. Further nodes can also be connected to the DP bus, e.g. DP drives, distributed I/O, etc.

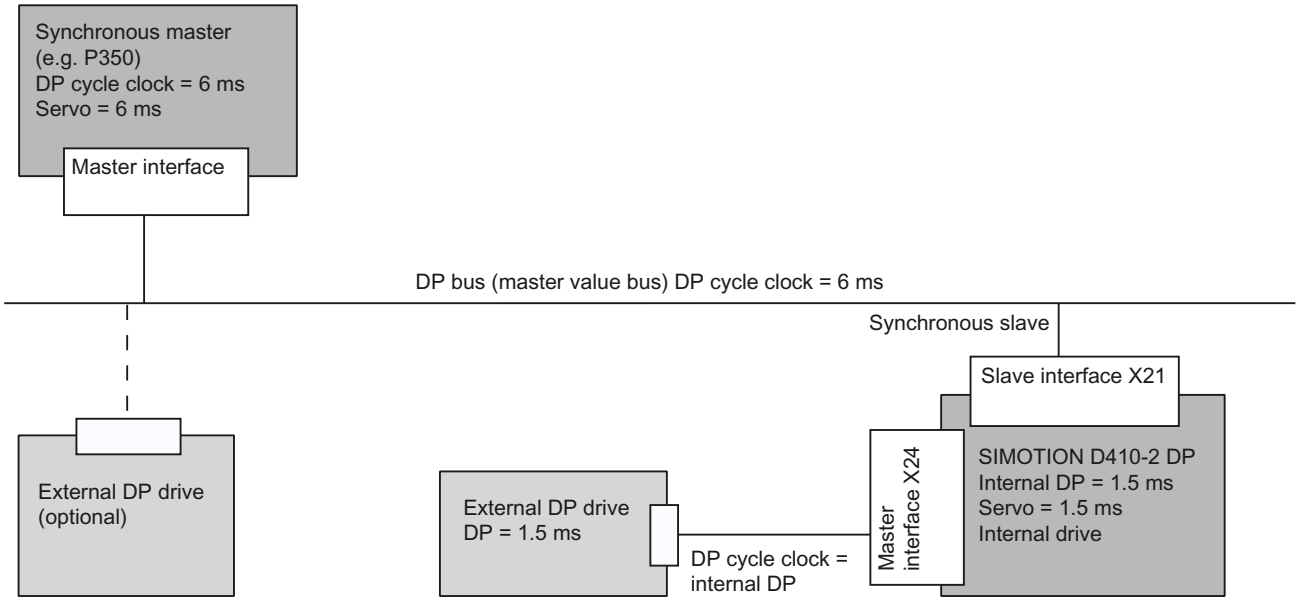

Figure 10-166 Example of a cycle clock scaling for PROFIBUS DP

Creating a new PROFIBUS DP subnet

SIMOTION SCOUT is used to network the SIMOTION D410-2. Set up your user-specific bus parameters for the PROFIBUS DP interfaces when you configure the network.

Note

If a hardware configuration is loaded without a PROFIBUS network being configured on the CPU, a new PROFIBUS address that was previously set in **HW Config** or **NetPro** will not be accepted by the CPU.

Requirement

You have created a project and have inserted a SIMOTION D410-2.

Note

The actions outlined below only need to be taken if you have not selected an interface when integrating the SIMOTION D410-2 into the project (see Section Creating a project and configuring the communication (Page 7367)).

Next the connection to the PG/PC must be established via **NetPro**, refer to:

- Section Configuring the PROFIBUS PG/PC interface (Page 7369)
- Section Configuring the Ethernet PG/PC interface (Page 7371).

Procedure

To create a new PROFIBUS subnet, proceed as follows:

1. Double-click the "D410-2" entry in the project navigator in order to open **HW Config**.
2. In the SIMOTION D410-2 representation, double-click the DP interface for which you want to create a PROFIBUS subnet.
   The "Properties - DP/MPI" dialog box opens.
3. Click "Properties" in the "General" tab to open the "PROFIBUS Interface DP/MPI" dialog box.
4. Click "New" to open the "Properties - New PROFIBUS Subnet" dialog box.
5. Name the new subnet and enter the properties of the new subnet, e.g. transmission rate, on the "Network settings" tab.
6. If the PROFIBUS interface is to be operated isochronously, click "Options". Activate the "Activate isochronous bus cycle" option in the opened dialog box and set the DP cycle. Confirm the settings with "OK" to exit the "Options" dialog box.
7. Accept the settings in the "Properties - New PROFIBUS Subnet" dialog box with "OK".
   The new subnet is now displayed in the "Properties - PROFIBUS Interface DP/MPI" dialog box.
   You can now connect the new subnet to the corresponding PROFIBUS interface.
   Follow the same steps to configure the second PROFIBUS interface for a SIMOTION D410-2 DP.
8. Save and compile the changes.

The PROFIBUS subnet you created is displayed as a graphic object in **HW Config**.

Note

PROFIBUS DP functionality is both equidistant and isochronous in nature. As such, it can guarantee that bus cycles will have exactly the same length and ensures deterministic behavior.

Applications: Connecting drives or synchronized I/O devices.

Additional references

For further information, see the *SIMOTION Runtime Basic Functions* Function Manual, Section "Isochronous I/O processing on fieldbus systems".

Establishing a PG/PC assignment

Introduction

A PG/PC is required to create projects for a SIMOTION D410-2 and download them to the target device. The interface via which the PG/PC can be connected is polled during the automatic communication configuration. If you change these settings, you must reestablish the active designation of the PG/PC in **NetPro** (the PG/PC connection must appear yellow and bold in **NetPro**).

Procedure

1. Open the project in SIMOTION SCOUT.
2. Click the "Open NetPro" button.
   NetPro is accessed, and the configured network is graphically displayed. The PG/PC connection to the configured network is shown in bold in a color other than yellow.
3. Double-click the PG/PC you would like to configure.
   The "Properties - PG/PC" dialog will be displayed with the "Assignment" tab in foreground.
4. Select the interface in the "Assigned" field and activate S7ONLINE access by clicking the appropriate checkbox.
5. Click "OK" to accept the settings.
   The PG/PC connection to the configured network is displayed again in bold and yellow.
6. Save and compile the changes and download them to the SIMOTION D410-2.

Now you can go online again via the PG/PC.

Alternatively, you can make the assignment in SIMOTION SCOUT by clicking the "Assign PG/PC" button. This calls the properties window for PG/PC assignment, where you can modify the assignment and "activate" it (S7ONLINE access).

Configuring the MPI bus

Operating interface X21 as an MPI

The X21 interface can also be operated as an MPI interface.

The typical (default) baud rate is 187.5 Kbaud. A baud rate of up to 12 MBaud can be set for communication with other CPUs. It should be noted, however, that a rate of 12 MBaud is not supported by all CPUs (e.g. smaller SIMATIC S7 CPUs).

The following list provides examples of when using MPI (Multi Point Interface) may prove effective:

- If a PC/PG is being used with an MPI interface
- If an OP/TP only has an MPI interface (newer devices have PROFIBUS or PROFINET interfaces)
- If SIMOTION and SIMATIC CPUs are coupled via XSEND/XRECEIVE

Note

When the X21 interface is used as an MPI bus, additional activation of a drive on this interface is not possible.

Additional references

For general information on MPI, see the *SIMOTION Communication* System Manual.

MPI parameters

MPI bus addresses and data transmission rate

Every node on the MPI bus must have a bus address in the range 0 to 31.

The data transmission rate on the MPI bus can be set to any value for the SIMOTION D410-2.

Communication attempt unsuccessful

If communication cannot be established at all, or if it cannot be established with individual nodes on the MPI bus, check the following:

- Is the transmission rate setting for the SIMOTION D410-2 used for all nodes?
- Are there any loose plug connections?
- Are all bus segments terminated properly?
  Bus segments that are not terminated properly will disrupt communication on the MPI bus.

Configuring PROFINET IO

General information about communication via PROFINET IO

Communication cycle

In PROFINET, the communication cycle is subdivided into different, time-specific intervals. The first interval is used for isochronous real-time communication (IRT), followed by real-time communication (RT) and standard TCP/IP communication. The bandwidth reservation for IRT ensures that RT communication and standard communication have no effect on the transmission of IRT telegrams, which are important for motion control applications.

The following figure shows how the PROFINET communication cycle is divided into isochronous real-time communication (IRT), real-time communication (RT), and standard TCP/IP communication.

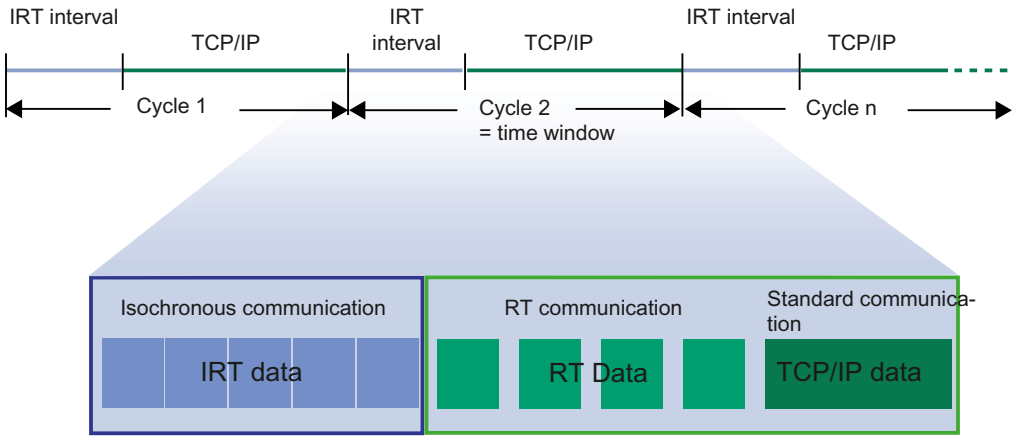

Figure 10-167 PROFINET communication cycle

Isochronous real-time Ethernet

STEP 7 can be used to configure PROFINET devices supporting data exchange via isochronous real-time Ethernet (IRT). IRT telegrams are transferred deterministically via planned communication paths in a defined sequence to achieve the best possible synchronism and performance.

IRT requires special network components supporting a planned data transfer.

Isochronous operation and mode

Equidistant mode and isochronous mode function similarly in PROFINET IO to the way they function in PROFIBUS DP.

For PROFIBUS DP, in isochronous operation all nodes are synchronized using a Global Control Signal created by the DP master.

In PROFINET IO with IRT, a sync master generates a signal to which sync slaves synchronize themselves. Sync master and sync slaves belong to a sync domain which is assigned a name via configuration. The role of the sync master can in principle be played by an I/O controller as well as an I/O device. A sync domain has exactly one sync master.

Context: Sync domain and I/O systems

An important fact is that sync domains do not need to be limited to one PROFINET IO system: The devices of several I/O systems can be synchronized by a single sync master, provided they are connected to the same Ethernet subnet.

The following applies the other way around: An I/O system must only belong to a single sync domain.

Signal propagation delays not negligible

For the extremely exact synchronization interval, line lengths, namely the associated delay times, must be taken into consideration. You can use a topology editor to enter the properties of the lines among the ports of the switches. STEP 7 uses this data and the other configuration data to calculate the optimized process of the IRT communication and the resulting updating time.

IRT runs in parallel to real-time and TCP/IP communication

Apart from IRT communication, for which a defined bandwidth is reserved within the update time, RT communication and TCP/IP communication are also permitted within the update time.

With RT communication (real-time communication), the cyclic data is transferred between I/O controller and I/O device, but without "best possible synchronism".

With non-synchronized I/O devices, data is exchanged automatically via RT communication.

Due to the fact that TCP/IP communication is also possible, other data, e.g. non-real-time data, configuration data or diagnostic data, can be transported.

PROFINET IO controller

Typically, the function of a PROFINET IO controller is taken on by controllers (e.g. SIMOTION C/P/D, SIMATIC S7 CPUs, ...).

The PROFINET IO controller takes on the master function for I/O data communication of the distributed field devices. The function is comparable to a PROFIBUS DP master class 1.

PROFINET IO device

Distributed field devices such as I/Os, drives (e.g. SINAMICS S120) or operator terminals are designated as IO devices. The function is comparable to a PROFIBUS DP slave.

Addressing

In the delivery condition, the onboard PROFINET IO interface does not have an IP address or a subnet mask.

Note

The IP addresses 192.168.215.240 to 192.168.215.255 are reserved for internal communication in the SIMOTION D410-2 (subnet mask 255.255.255.240). When configuring the PROFINET interface (X150), make sure that the internal addresses are not located within the network of this interface. In IP, the network is defined as an AND link of IP address and subnet mask.

Media redundancy (MRP)

Requirement: SIMOTION V4.4.

It is possible to establish redundant networks via the Media Redundancy Protocol (MRP). Redundant transmission links (ring topology) ensure that an alternative communication path is made available when a transmission link fails. The PROFINET devices that are part of this redundant network form an MRP domain.

MRP guarantees media redundancy in the event of a problem in the ring. The switchover of the ring is performed by the Redundancy Manager.

The switchover times depend on:

- The actual topology
- The devices used and
- The network load in the relevant network

The typical reconfiguration time of the communication paths for TCP/IP and RT frames in the event of a fault is < 200 ms.

In most systems, the switchover time of MRP is far above the PROFINET update time for cyclic data, so that a failure for cyclic data is detected. The PROFINET connection therefore fails and is reestablished after the switchover by the Redundancy Manager. In this way, an error can be corrected in the network, while the system continues to run **with bumps**.

Note

During the interruption of the ring, as well as when correcting the interruption (e.g. repair of the defective cable), there is a brief failure of the communication.

Ring ports

A SIMOTION/SINAMICS device may only be inserted in an MRP ring as a node with MRP-capable ports. For SIMOTION D, the first two ports of the PROFINET IO interfaces are designed as ring ports.

These two ports are marked with an "R" in the module rack in HW Config.

Note

Only devices with MRP-capable ports may be inserted in an MRP ring. If MRP-capable ports are not used, the reconfiguration times can be in the seconds range.

Bumpless media redundancy (MRPD)

Requirement for SIMOTION D410-2:

- SIMOTION SCOUT as of V4.4
- SIMOTION SCOUT TIA as of V4.5

MRPD is a procedure for bumpless media redundancy for PROFINET IO with IRT. MRPD also requires MRP.

The combination of MRP with MRPD provides bumpless PROFINET operation for short cycle times in the event of a fault in the ring. MRPD is based on IRT and ensures bumpless operation by the provider sending the cyclic data in both directions which the consumers then receive twice. If

the ring is interrupted at one position (e.g. through the failure of a ring node), receipt of the cyclic data via the problem-free side of the ring is still guaranteed.

Bumpless media redundancy MRPD always requires the activation of MRP in the individual rings.

A maximum of two Ethernet nodes may be between the sync master and the redundant sync master. If the redundant sync master is used together with MRPD, it is recommended that the redundant sync master be connected directly to the sync master and the two nodes located in a shared cabinet so that the cable connection between both nodes is protected.

If there is an interruption in the link between the sync master and the redundant sync master, the system continues to run without bumps, but after switching off and on again faults can occur.

Too high a network load or too-rapid coming and going of faults can also result in unfavorable cases in the failure of the PROFINET connection with activated MRPD because of delayed or incomplete switchover actions of MRP/MRPD.

For example, with two consecutive faults at different points in the ring, bumpless operation is only ensured when there is approx. three seconds between the two faults.

Additional information

You will find additional information about media redundancy in the *SIMOTION Communication* System Manual.

Setting a send cycle clock and system cycle clocks

Requirement

The SIMOTION system cycle clocks (servo/IPO/IPO_2) are based on the SINAMICS Integrated DP cycle or the PROFINET send cycle clock, depending on the PROFINET real-time class and the type of data transfer. The cycle clock source can be generated "internally" by the SIMOTION D410-2; otherwise, it is obtained "externally" from the clock signals received at the PROFINET interface.

Table 10-111 Basis for the SIMOTION system cycle clocks/cycle clock source

Real-time class in which the PROFINET interface is operated	Data transfer	Basis for the SIMOTION system cycle clocks		Cycle clock source
		DP cycle (Integrated)	PROFINET send cycle clock [1]	
RT communication		X		Internal
IRT communication	The D410-2 DP/PN is the SYNC master in the I/O system; synchronized data traffic takes place [2]		X	Internal
	The D410-2 DP/PN is the SYNC slave in the I/O system; synchronized data traffic takes place [2]		X	External Internal (as substitute value)
	No synchronized data traffic [2]	X		Internal

[1] If the PROFINET send cycle clock forms the basis for the SIMOTION system cycle clocks, the DP cycle (SINAMICS Integrated and external PROFIBUS interface) and the servo cycle clock must be the same.

[2] Synchronized data traffic, e.g. by means of:
- controller-controller slave-to-slave communication
- IO device in its own IO system

Setting the DP cycle in HW Config

To set the DP cycle of the SINAMICS Integrated, double-click the SINAMICS block on the integrated PROFIBUS in HW Config.

The "DP Slave Properties" dialog box opens. You can adjust the DP cycle of the SINAMICS Integrated on the "Isochronous mode" tab. See also Setting DP Slave properties (Page 7429).

Table 10-112 SIMOTION D410-2 DP/PN value range

	D410-2 DP/PN
DP cycle	≥ 0.5 ms (DP internal) ≥ 1.0 ms (DP external)
Grid	0.125 ms (the use of a clock grid ≥ 0.250 ms is recommended)

If, in addition to the drive on the SINAMICS Integrated, external drives are also to be connected via isochronous PROFIBUS, the DP cycle must be ≥ 1 ms.

Setting the send cycle clock in HW Config

The send cycle clock for PROFINET IO must be set in the "Domain Management" dialog in **HW Config**. To do this, select the "Edit" > "PROFINET IO" > "Domain management ..." menu command in **HW Config** and set the desired cycle clock.

The PROFINET interface can be operated with a send cycle clock in the range of: 0.25 ms ≤ send cycle clock ≤ 4 ms. The smallest configurable time base is 0.125 ms.

Note

Information for version < V4.4

If there are IO devices with RT class "RT" in a sync domain, it is only possible to set the send cycle clocks 0.5 ms, 1 ms, 2 ms, and 4 ms.

Cycle clock scaling

The PROFIBUS cycle clock can be scaled down in relation to the servo cycle clock. The reduction ratio is only permitted when PROFINET IO with IRT has not been configured. A reduction ratio for the PROFINET send cycle clock to the PROFIBUS cycle clock is also possible.

Example:
PROFINET send cycle clock = 0.5 ms
PROFIBUS cycle clock = servo cycle clock = 1 ms

The PROFIBUS cycle clock can be operated relative to the PROFINET send cycle clock at a ratio of 1:1 to 16:1.

The table below shows which ratios you can set for the system cycle clocks of the SIMOTION D410-2 DP/PN based on the DP cycle of SINAMICS Integrated or on the PROFINET send cycle clock.

Table 10-113 Ratios of system cycle clocks

Cycle clock name	Settable factors	Reference cycle clock
PROFIBUS DP bus cycle clock	1, 2, 3, 4, 6, 8, 10, 12, 14, 16	PROFINET IO send cycle clock
Servo[1)]	1, 2, 3, 4, 8[2)]	PROFIBUS DP bus cycle clock
IPO	1, 2, 3, 4, 5, 6	Servo
IPO_2	2, 3, 4, 5, ..., 64	IPO

1) When using the TO axis and the integrated drive control, the minimum servo cycle clock is 1 ms.

2) Always "1", if PROFINET with IRT is configured.

Setting the cycle clock ratios

The set bus cycle clock is displayed in SIMOTION SCOUT as the "Bus data cycle" in the "System Cycle Clocks - D410" dialog box. Select the SIMOTION D410-2 and then select the "Set system cycle clocks" option in the "Target system" > "Expert" menu.

Set the required cycle clock ratios for the servo, IPO, and IPO_2 in the "System Cycle Clocks - D410" dialog box.

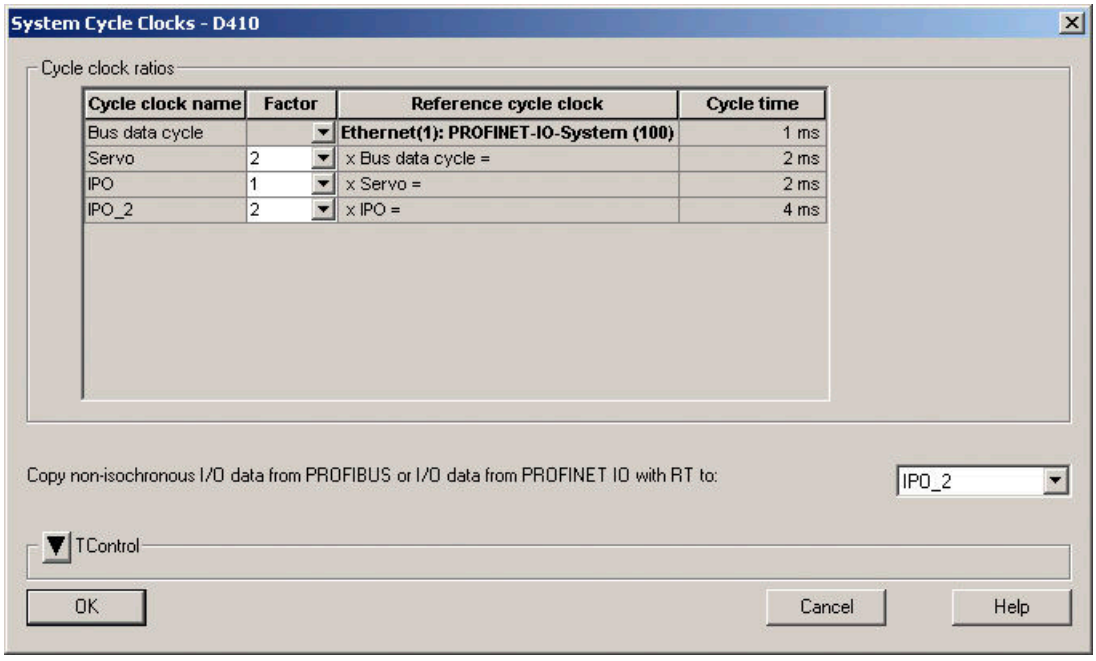

Figure 10-168 System cycle clocks

Additional information

For further information, see the *SIMOTION Communication* System Manual.

Properties of PROFINET

Properties

The onboard PROFINET IO interface supports the parallel operation of:

- IRT - isochronous real-time Ethernet
  - Operation of IRT I/O (e.g. ET 200SP)
  - Operation of a SINAMICS S120 as an IRT device
- RT - real-time Ethernet
  - Operation of RT I/O (e.g. ET 200SP, ET 200pro, etc.)
  - Operation of a SINAMICS S120 as an RT device
- TCP/IP, UDP, HTTP, ... standard Ethernet services

Note

For mixed operation of IRT and RT, make sure that the IRT-compatible devices form what is referred to as an IRT domain; i.e. there must not be any non-IRT devices on the data transmission link between the IRT devices.

Additional references

You will find an overview of the specific properties of PROFINET IO on SIMOTION D in the *SIMOTION Communication* System Manual.

Configuration tasks

Configuration of PROFINET involves the following steps:

1. Insert the SIMOTION D410-2 DP/PN.
2. Configure the onboard PROFINET IO interface in **HW Config**.
3. Create a topology: Here, you specify how the individual ports of the PROFINET IO devices are interconnected.
4. Configure the sync domain: Here, you specify which PROFINET nodes are sync masters (clock generators) and sync slaves.
5. Specify the send clock: Describes the time during which a PROFINET IO device exchanges user data with the PROFINET IO controller.
6. Configure the direct data exchange: The direct data exchange specifies which address areas are to be used for sending and receiving respectively.

Additional references

You will find a detailed description of each configuration step in Section "Configuring PROFINET IO with SIMOTION" of the *SIMOTION Communication* System Manual.

Rules for cycle clock settings with SIMOTION D410-2 DP/PN

The rules for making SIMOTION D410-2 DP/PN cycle clock settings are described below.

For SIMOTION D410-2 DP, see Section Rules for cycle clock settings with SIMOTION D410-2 DP (Page 7379).

Rules for using the PROFINET send cycle

If the PROFINET send cycle clock is the basis for the cycle clocks, ensure that the DP cycle and the servo cycle clock are the same. This applies to PROFIBUS interface X21 and the PROFIBUS of the SINAMICS Integrated.

The basis for the system clocks is generated internally if the PROFINET interface is not operated with RT class IRT or if IRT is set and no data is being transferred. This also applies if the PROFINET interface is operated as synchronization master with RT class IRT and data is being transferred. The SIMOTION device does not have to synchronize itself with an external cycle.

The basis for system clocks is derived from the clock signals received at the PROFINET interface if this interface is operated as synchronization slave with RT class IRT. The SIMOTION device does not have to synchronize itself with this external clock.

A substitute clock of a duration equivalent to the configured clock is generated internally if the PROFINET interface has not received a clock signal.

The clock settings are included in the project download to the SIMOTION device and are adjusted according to specification.

Dependencies of SINAMICS cycle clocks

The rule for SIMOTION D410-2 DP/PN in the case of synchronized data traffic is that the send cycle clock serves as the basic cycle clock for the task system. All SIMOTION clock cycles (servo, IPO, IPO_2, etc.) longer than this basic cycle clock must be an integer multiple of the basic cycle clock.

This rule also applies to SINAMICS cycles, if one of the successive cycles is longer than the basic clock:

- Speed controller p0115[1] (drive)
- Flow controller p0115[2] (drive)
- Setpoint channel p0115[3] (drive)
- Position controller p0115[4] (drive)
- Positioning p0115[5] (drive)
- Technology controller p0115[6] (drive)
- Onboard I/O p0799[0...2] (Control Unit)
- Terminal module I/O p4099

The corresponding cycle must be an integer multiple of the basic clock.

If any change to the send cycle violates this rule you must also change the SINAMICS cycles. In order to change the cycles in the Expert list of **SIMOTION SCOUT**, select the "Control_Unit" or the "Drive" from "SINAMICS_Integrated" in the Project Navigator, and then open the "Expert List" by selecting the "Expert" command from the shortcut menu.

If p0115 sampling times are required which cannot be set using p0112 > 1, then you can directly set the sampling times using p0115. This requires that p0112 must be set to "0" (expert).
If p0115 is changed online, the values of the higher indices are adapted automatically.

Note

At the SINAMICS end, there are further rules for setting the sampling times. You will find these described in the *SINAMICS S120* Function Manual, Section Rules for setting the sampling time.

Example

A default value of 4 ms is set for the SINAMICS setpoint channel p0115[3]. If the send cycle is to be set to 3 ms, the fact that an integer multiple value is required means that you will need to set 3 ms or 6 ms (for example) for the setpoint channel.

Incorrect cycle clock setting

If the SINAMICS cycle clocks are not set correctly, this can be seen by the following messages:

- A01223 CU: Sampling time inconsistent and/or
- A01902 PB/PN isochronous operation parameterization impermissible and/or
- F01043 severe error downloading project
- F01951 CU SYNC: Synchronization application cycle clock missing

In this case, check the cycle clock settings on all drive objects signaling this error. For F01951, check the DP Integrated cycle. In this case, use a DP Integrated cycle that is a multiple of 0.25 ms or 0.5 ms.

Note

An overview of errors reported by the SINAMICS Integrated is provided in the *SINAMICS S* List Manual.

Current controller cycle clock

With the SIMOTION D410-2, the following current controller cycle clocks p115[0] can be configured for the SINAMICS Integrated:

- for servo: 125 µs (default) or 250 µs
- For vector and vector V/f:
  - For blocksize Power Modules: 250 µs or 500 µs (default)
  - For blocksize Power Modules: 375 µs.

Using vector drives (Page 7431)

Configuring an Ethernet subnet

General information about communication via Ethernet

Properties of Ethernet

SIMOTION D410-2 has an onboard Ethernet interface X127 P1 PN/IE.

You can connect an Industrial Ethernet with a transmission rate of 10/100 Mbit/s to the 8-pin RJ45 socket **X127 P1**.

Note

The Ethernet interface supports PROFINET basic services. It therefore has the designation PN/IE.

The Ethernet interface has autocrossing functionality.

Ethernet communication

SIMOTION D410-2 offers the following functions via Industrial Ethernet:

- Communication with STEP 7, SIMOTION SCOUT and SIMATIC NET OPC via a PG/PC
- Communication via UDP (user datagram protocol) with other components, e.g. other D410-2 devices
- Communication with other devices via TCP/IP
- Connection of SIMATIC HMI devices or PC-based HMIs
- IT communication (e.g. via SIMOTION IT OPC XML-DA)
- Communication based on OPC UA (Unified Architecture)
- PROFINET basic services (e.g. DCP, LLDP, SNMP).
  These PROFINET basic services provide uniform functions for the address assignment and diagnostics, but do not provide PROFINET IO communication for the connection of drives or I/O modules, for example.

Routing

S7 routing is possible from the Ethernet interface to the PROFIBUS interfaces and the PROFIBUS Integrated.

You can find the MAC address on the rating plate located on the front of the SIMOTION D410-2.

For further information on routing, see the *SIMOTION Communication* System Manual.

Default Ethernet addresses

The following IP addresses are assigned by default for the Ethernet interface:

Table 10-114 IP address assignment for SIMOTION D410-2

Interface	Use case	Default address	
X127 P1 PN/IE	Insert SIMOTION device or HW Config	IP address: Subnet mask: Router address: Automatic private IP address	169.254.11.22 255.255.0.0 0.0.0.0
	SIMOTION D410-2 in the delivery condition	IP address: Subnet mask: Router address: Automatic private IP address	169.254.11.22 255.255.0.0 0.0.0.0

Note

The IP addresses 192.168.215.240 to 192.168.215.255 are reserved for internal communication in the SIMOTION D410-2 (subnet mask 255.255.255.240). When configuring the external Ethernet interface (X127 P1), make sure that the internal addresses are not inside their network. In IP, the network is defined as an AND link of IP address and subnet mask.

Note

If you want to go online via Ethernet, you have to make sure that the connection from PG/PC to SIMOTION D410-2 is active. You can check this in **NetPro**. You will find a description of how to reactivate the connection in Section Establishing a PG/PC assignment (Page 7384).

Automatic Private IP Addressing

The Ethernet interface supports the automatic IP assignment according to the Automatic Private IP Addressing (APIPA) process.

Interface X127 P1 already has IP address 169.254.11.22 in the delivery condition. Further information on Automatic Private IP Addressing can be found on the Internet, e.g. in WIKIPEDIA with the keywords *APIPA* or *Zeroconf*.

Configuring the Ethernet connection in HW Config

The Ethernet connection of the SIMOTION D410-2 can be configured in **HW Config**.

Procedure

1. Open your project.
2. Open **HW Config**. Double-click the Ethernet port (X127 P1) to open the "Properties - PNxIE" dialog box.
3. You can configure the Ethernet connection in the "Options" tab.
   Recommendation: Use the default setting "Automatic setting". With Automatic setting, the baud rate and duplex operating mode are automatically aligned with the connection partner. The autocrossing functionality is also available so that you can use crossed and uncrossed cables.
   If transmission is to be set manually, not only must the connection (e.g. 10 Mbit/s half duplex) be set manually but autonegotiation must also be deactivated.
4. Close the "Properties - PNxIE" dialog box with "OK".
5. Save and compile the modified hardware configuration.
6. Load the new hardware configuration to the SIMOTION D410-2 via PROFIBUS DP/Ethernet/ PROFINET IO.

Shielded twisted pair cables are used for the networking. 4- and 8-wire cables can be used for 10/100 Mbit/s.

Note

The TCP/IP timeout parameters are configured in **HW Config** by double-clicking the D410 module in the "Ethernet extended" tab.

Additional references

For additional information, see the *SIMATIC NET, Industrial Twisted Pair, and Fiber Optic Networks* Manual.

For further information about the cabling spectrum for Ethernet, see the *Industrial Communication IK PI* Catalog.

Configuring Ethernet addresses in HW Config

Requirement

For configuration using Industrial Ethernet, SIMOTION D410-2 must be provided with an IP address, the subnet mask and the router address.

Note

Only one router may be configured.

Procedure

To configure and transfer Ethernet addresses to the D410-2, proceed as follows:

1. Open your project.
2. Open **HW Config**. Double-click the interface to be configured (X127) to open the "Properties" dialog box.
3. On the "General" tab, click the "Properties" button of the Ethernet interface. The "Properties - Ethernet Interface" dialog is displayed.
4. Click the "New" button. The "New Industrial Ethernet" subnet dialog is displayed. In this dialog box, you can change the name of the new subnet or confirm the default setting with "OK".
5. The newly created Ethernet subnet is now displayed under "Subnet" in the "Properties - Ethernet Interface" dialog box and must be selected.
6. In this dialog box, enter the required addresses for "IP Address" and "Subnet". Under "Router", choose whether a router is to be used. If using a router, enter the router address.
7. Confirm this dialog box with "OK".
8. Close the "Properties" dialog by clicking "OK".

9. Save and compile the modified hardware configuration.
10. Load the new hardware configuration to the SIMOTION D410-2.

Assigning the Ethernet address later

It is possible to assign the IP address later on (e.g. on modular machines). In this case, an IP address is not assigned in HW Config, but activated differently with the "Set IP address using different method" option. The address will then be assigned later on the machine, for example, by a the user program or by commissioning tools, such as PRONETA.

Further information on PRONETA can be found on the Internet:

- PRONETA: See Internet address (https://support.industry.siemens.com/cs/ww/en/view/67460624)

Reading out IP and MAC address

Requirement

To read out the IP and MAC addresses, the following requirements must be met:

- SIMOTION D410-2 is wired.
- You have assigned the communication parameters.
- You are online.

Procedure

The IP address and MAC address of SIMOTION D410-2 can be displayed as follows via SIMOTION SCOUT.

1. Right-click the module.
2. Select "Target device" > "Device diagnostics" in the context menu.

Example

The addresses are displayed as follows for SIMOTION D410-2:

X127 (IE)

- Active MAC Address: 08-00-06-73-25-3E
- IP address: 169.254.11.22
- Subnet mask: 255.255.0.0
- Standard gateway: 0.0.0.0.

As an alternative, you can determine the IP address as follows:

- By selecting "Project" > "Accessible nodes" in SIMOTION SCOUT
- By calling "Target system" > "Ethernet" > "Edit Ethernet node..." in HW Config and browsing to "Online accessible nodes"
- Using the system function _getIpConfig

Note

The MAC address is listed on the nameplate on the front of the module.

10.1.2.7 Commissioning (software)

Overview of commissioning

Requirements for commissioning

The requirements for commissioning the SIMOTION D410-2 are as follows:

- The system has been connected and wired.
- The SIMOTION D410-2 is switched on and powered up (STOP operating state).
- SIMOTION SCOUT (with integrated STARTER) has been installed and started on the PG/PC.
- Communication between the SIMOTION D410-2 and the PG/PC is configured.
- You have created a project and installed a SIMOTION D410-2 in the project.

Symbolic assignment / adaptation

Symbolic assignment

SIMOTION supports the symbolic assignment on SINAMICS drive objects (DOs) during the configuration of technology objects (TOs) and I/Os.

This simplifies the configuration of the technological relationships including the communication between controller and drive.

With the symbolic assignment:

- Only suitable assignment partners are offered in an assignment dialog box.
- Communication between axis and drive is set up automatically by the engineering system and the required PROFIdrive axis telegrams as well as the used addresses set up.
- Telegrams are extended and interconnections created automatically in the drive depending on the selected TO technology (e.g. SINAMICS Safety Integrated).

- Axis and drive configuration are first performed independently.
- Communication connections are established automatically during the configuration of I/O variables on SINAMICS I/Os (telegrams are set up automatically, the I/Os interconnected to the telegram and the addresses set up).

Apart from the symbolic assignment, no further configuration is required for the communication. As addresses no longer have to be configured, the connection is retained even with address offsets.

Note

During the configuration of drive objects (DO drive, DO encoder, ...) as well as in the Telegram Configuration dialog box (see Section Telegram configuration (Page 7458)), you can deactivate the **automatic telegram configuration** and the **automatic telegram adaptation**.

A deactivation should only be performed in justified exceptional cases because many of the above mentioned benefits are lost.

The symbolic assignment enables an independent configuration of the axes on the SIMOTION side and the drives on the SINAMICS side. This allows the following:

- The PLC and motion control functions can be completely configured by a programmer even without drive know-how using technology objects (e.g. TO axis) and loaded to the device.
- The drives can be separately configured and optimized by a drive expert.
- The technology objects can be symbolically assigned later to the drive objects via an interconnection dialog box.

Note

The previous methods of drive, axis and I/O configuration are still available. Symbolic assignment must be deactivated for these methods.

For newly created projects, the symbolic assignment is used by default.

If projects < V4.2 are upgraded, the symbolic assignment is deactivated by default and must be activated when required.

Symbolic assignment can be activated or deactivated in SIMOTION SCOUT via the menu "Project" > "Use symbolic assignment."

Activating symbolic assignment later

Symbolic assignment is recommended and is automatically activated.

Conversion from upgraded projects to symbolic assignment is possible, but this requires post-editing of the project, especially for free telegram configurations (e.g. for TM15 DI/DO, TM31).

Note

If the symbolic assignment is activated later, previously existing telegram settings and BICO interconnections for all SINAMICS telegrams that are set to Standard/Automatic (Communication -> Telegram configuration) are replaced at the next compilation. This may change telegrams and BICO interconnections and delete telegram extensions previously set up manually.

For this reason, make a backup copy of your project before activating the symbolic assignment.

To retain the settings that have been made, after the selection of "Use symbolic assignment," the setting "User-defined" must be selected and the check box cleared for automatic telegram setting/address adaptation for the respective message before compilation.

For further details, see the *SIMOTION Runtime Basic Functions* Function Manual.

Assigning a drive later

You can create an axis in SIMOTION SCOUT and assign it to a drive later. You can thus load your user program to the controller and (with the exception of the non-existent drives) test it.

Compared to a procedure with temporarily created "virtual axes", "axes without assigned drive" have the advantage that the configuration data is completely available and do not require a "virtual axis -> real axis" reconfiguration.

Simulation of axes

You can also use the axis simulation to test the user program. You can find a script for switching the axis simulation on and off in SIMOTION Utilities & Applications, which is part of the scope of delivery of SIMOTION SCOUT.

Further details can be found in the *TO Axis Electrical/Hydraulic, External Encoder* Function Manual.

Adaptation

In addition to the symbolic assignment, the **automatic adaptation** also facilitates the configuration of SINAMICS S120 data. When SIMOTION devices ramp up, reference variables, along with drive and encoder data for SINAMICS S120, are transferred automatically for the configuration data of the SIMOTION technology objects "Axis" and "External Encoder". This data no longer has to be entered in SIMOTION.

For additional information, see the following sources:

- *SIMOTION Runtime Basic Functions* Function Manual
- *TO Axis Electrical/Hydraulic, External Encoder* Function Manual

Requirement

Symbolic assignment is supported by the TO axis, TO externalEncoder and the TO outputCam, TO camTrack and TO measuringInput. The onboard I/Os of a SIMOTION D, of a SINAMICS S110/S120 Control Unit, and selected Terminal Modules can be interconnected symbolically.

Module	Supports symbolic assignment
SIMOTION D	
• SIMOTION D410-2	• As of SIMOTION V4.3
• SIMOTION D410	• As of SIMOTION V4.2
• SIMOTION D4x5-2	• As of SIMOTION V4.2
• SIMOTION D4x5	• As of SIMOTION V4.2
Controller extension • CX32-2 • CX32	As of SIMOTION V4.2
SINAMICS S110 CU305	As of SINAMICS V4.3
SINAMICS S120	
• CU310-2	• As of SINAMICS V4.4
• CU310	• As of SINAMICS V2.6.2
• CU320-2	• As of SINAMICS V4.3
• CU320	• As of SINAMICS V2.6.2

See also

Only the drive configuration by means of symbolic assignment is described in this documentation.

You will find the documentation of older SIMOTION versions on the Internet at the following address (https://support.industry.siemens.com/cs/ww/en/view/40211807).

For further information on the configuration of the TO axis and TO externalEncoder, see the *TO Axis Electrical/Hydraulic, External Encoder* Function Manual.

Procedure when commissioning

Commissioning steps

This section shows you how to configure a system and test the configured drives and axes. The steps in commissioning are listed below in the order as recommended:

1. Configuring SINAMICS Integrated
   The integrated drive SINAMICS Integrated can be configured in offline or online mode:
   - Performing an offline configuration (Page 7406)
     For offline configuration, all of the components and their article numbers must be known.
   - Performing an online configuration (Page 7423)
     During online configuration, you can load all of the information from the connected DRIVE-CLiQ components to your user project.
2. Test the configured drive using the drive control panel (Page 7446)
3. Create an axis with the axis wizard (Page 7448)
4. Test a configured axis with the axis control panel (Page 7456)
5. Set up addresses and telegrams (Page 7458)
6. Link an additional encoder (optional) (Page 7461)
7. Configure drive-related I/Os (with symbolic assignment) (Page 7469)
8. Configure technology objects and I/O variables (Page 7474)
9. Optimize the drive and controller (Page 7483)

When carrying out this procedure, consult the relevant references.

This section also contains additional configuration information, e.g. for vector drives, Safety Integrated, etc.

Important functions for the project handling and for the commissioning

Below you will find an overview of the most important functions for project handling and for commissioning with the associated icons.

Save project and compile changes

The entire project is saved and the project data (e.g. programs) compiled into an executable code.

Connect to selected target devices

The online connection is established to the selected target devices. Under "Target system" > "Select target devices", you can set which target devices are to go online.

Download project to target system

The programs are loaded to the SIMOTION device as well as the configuration for the SINAMICS Integrated.

Download CPU / drive unit to target device

The configuration is only loaded to the device selected in the project tree which means that the function needs to be performed separately for each D410-2 and SINAMICS Integrated.

Load CPU / drive unit to PG

The unit's configuration is only loaded to the PG selected in the project tree which means that the function needs to be performed separately for each D410-2 and SINAMICS Integrated.

Copy RAM to ROM

Copying from RAM to ROM is only performed for the device selected in the project tree which means that the function needs to be performed separately for each D410-2 and SINAMICS Integrated.

Note

Tips for going online:

In online operation, SIMOTION SCOUT attempts to conduct online operation with all hardware components contained in the project. This means that the time needed for going online increases.

We recommend that you make settings for SIMOTION SCOUT so that online operation is made only with those components currently needed. The setting can be found at "Target system" > "Select target devices ..." in the menu. The selection and deselection of the devices in the online state can be made via the "Connect target device" context menu on the device.

This procedure is also advantageous when the configuration of the drive unit is completed. Without going completely offline, the connection can be simply deselected via the context menu on the drive unit.

Performing an offline configuration

Overview

Introduction

In the case of offline configuration, the project is created while not all of the hardware components (in particular drives) are available. In this way, a SIMOTION project in the office environment can be created up to a point where a basic project specification including a program exists. At a later time, the finished project can be loaded to the SIMOTION D410-2 and tested together with the drive.

Requirements

- For offline configuration, all of the components and their article numbers must be known.
- You have created a project in SIMOTION SCOUT and inserted a SIMOTION D410-2 in the project.
- You have configured the communication between the SIMOTION D410-2 and the PG/PC, see Section Creating a project and configuring the communication (Page 7367).

Procedure

The offline configuration involves the following steps:

- Accessing the drive wizard (Page 7407)
- Configuring components (Page 7408)
- Downloading the project to SIMOTION D410-2, by means of the following options:
  - Downloading to the target system (Page 7419)
  - Downloading to the CF card (Page 7420)
  - Downloading incl. sources and additional data (Page 7421)
  - Archiving to the CF card (Page 7422)

Note

During offline configuration, you can configure Terminal Modules such as the TM15, for example.

Accessing the drive wizard

Integrated drive

SIMOTION D410-2 features an integrated SINAMICS S120 drive (control unit) which is automatically included when you insert the SIMOTION D410-2 in the project navigator. The integrated drive must be operated in isochronous mode using PROFIdrive-compliant telegram types.

The drive wizard for the integrated STARTER in SIMOTION SCOUT is available for the purpose of configuring the integrated drive and its associated modules (SINAMICS S120 Power Module, for example).

Note

Take note of all the necessary safety instructions and rules governing connections, which can be found in the latest SINAMICS S120 documentation on the SIMOTION SCOUT DVD.

Procedure

Select the "SINAMICS_Integrated" > "Configure drive unit" drive element in the project navigator to open the drive wizard.

You can configure the following components:

- Power unit (e.g. SINAMICS S120 Power Module)
- Motor
- Encoder

Configuring components

Procedure

Note

An overview of permissible configurations, quantity structures and DRIVE-CLiQ topologies can be found in Section Quantity structures (Page 7507) and in the *SINAMICS S120* Commissioning Manual.

Failure to comply with the rules listed in this manual will result in errors that are not output until the download is performed, rather than at the configuration stage.

1. Enter a drive name in the "Drive Properties" dialog box and select the drive type (servo or vector).

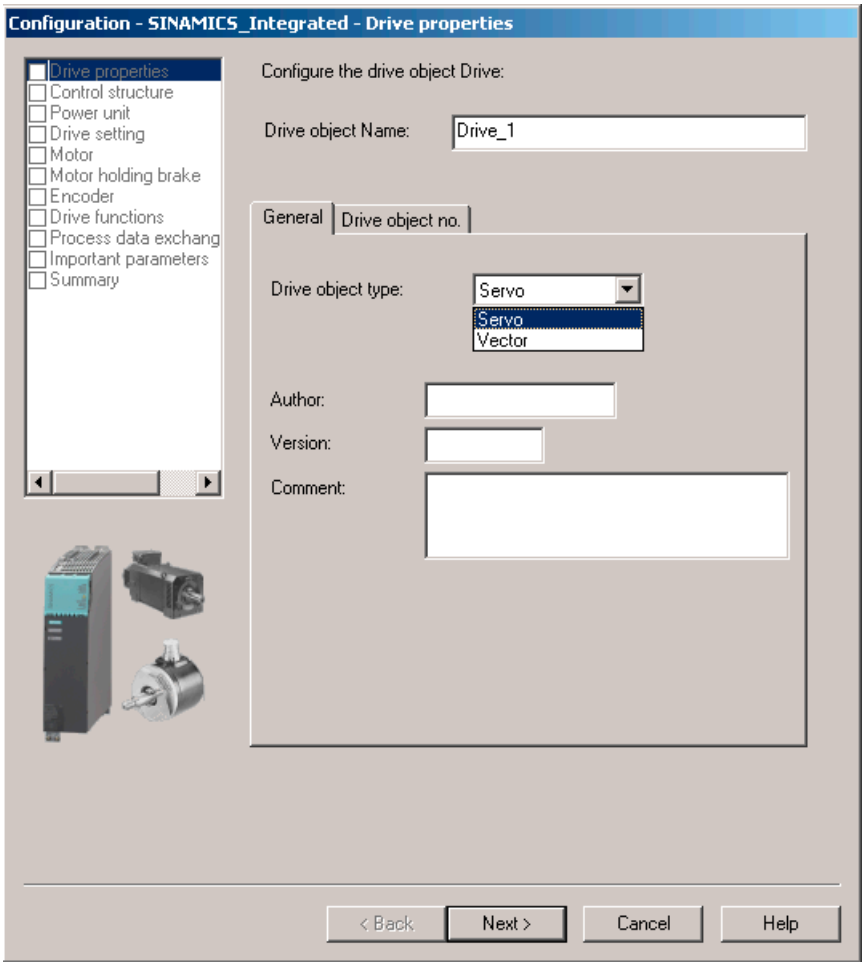

Figure 10-169 Drive properties

2. In the "Control Structure" dialog, you can select the function modules and the control type.

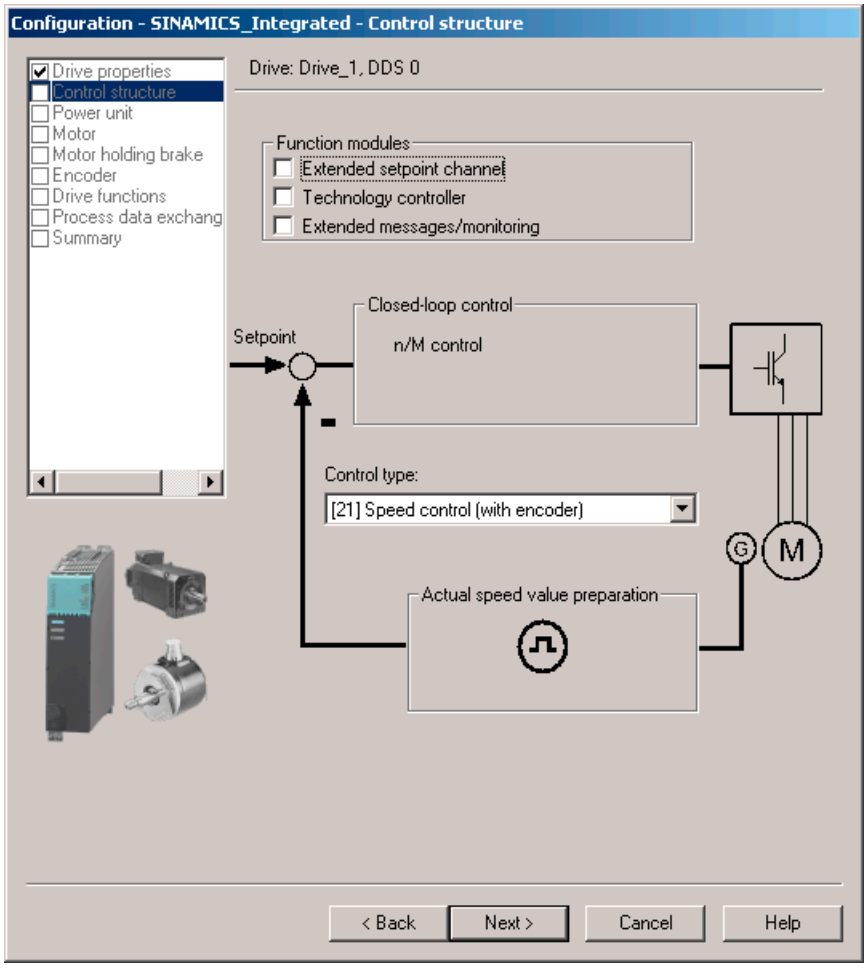

Figure 10-170 Control structure

3. In the "Power Unit" dialog, use the article number to select your power unit from the list.

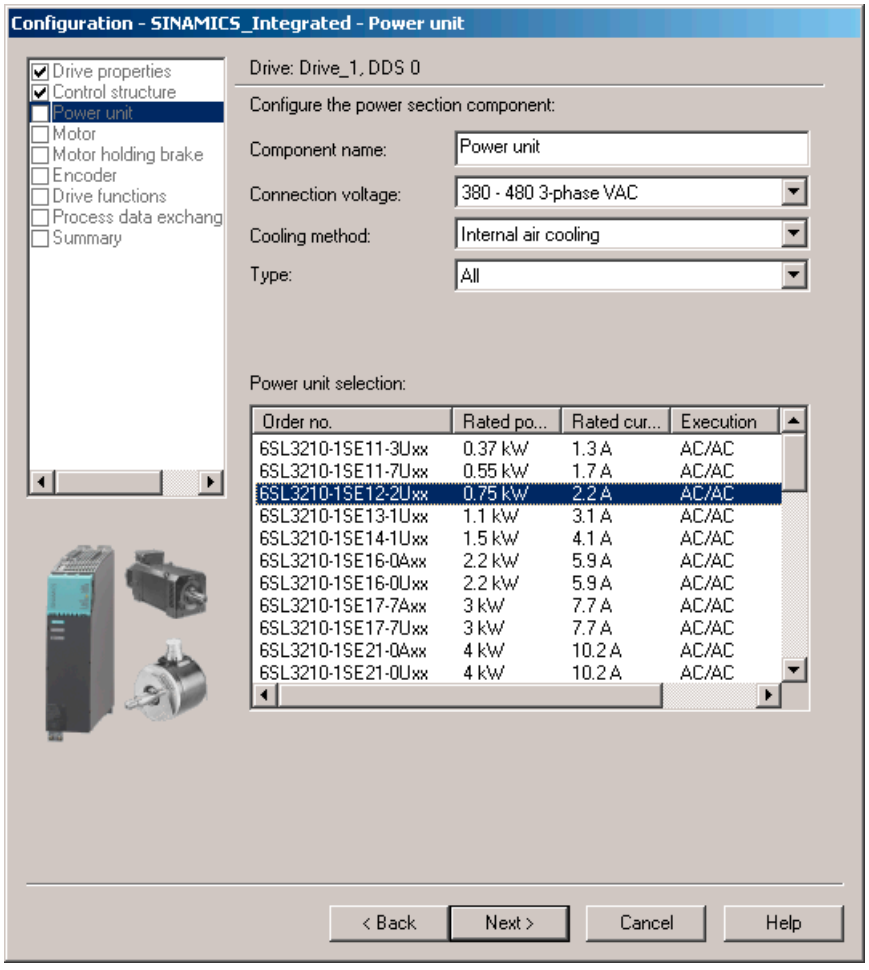

Figure 10-171 Selecting a power unit

4. Select in the "Power Unit Supplementary Data" dialog the component added to the power unit.
   The selection of the component depends on the construction type.
   - SIMOTION D410-2 DP or D410-2 DP/PN: The SIMOTION D410-2 is snapped directly onto the blocksize format Power Module.
   - CUA31 or CUA32: The CUA3x is snapped directly onto the blocksize format Power Module. The SIMOTION D410-2 is mounted separately on a mounting plate. The SIMOTION D410-2 is connected to the CUA3x using a DRIVE-CLiQ cable.

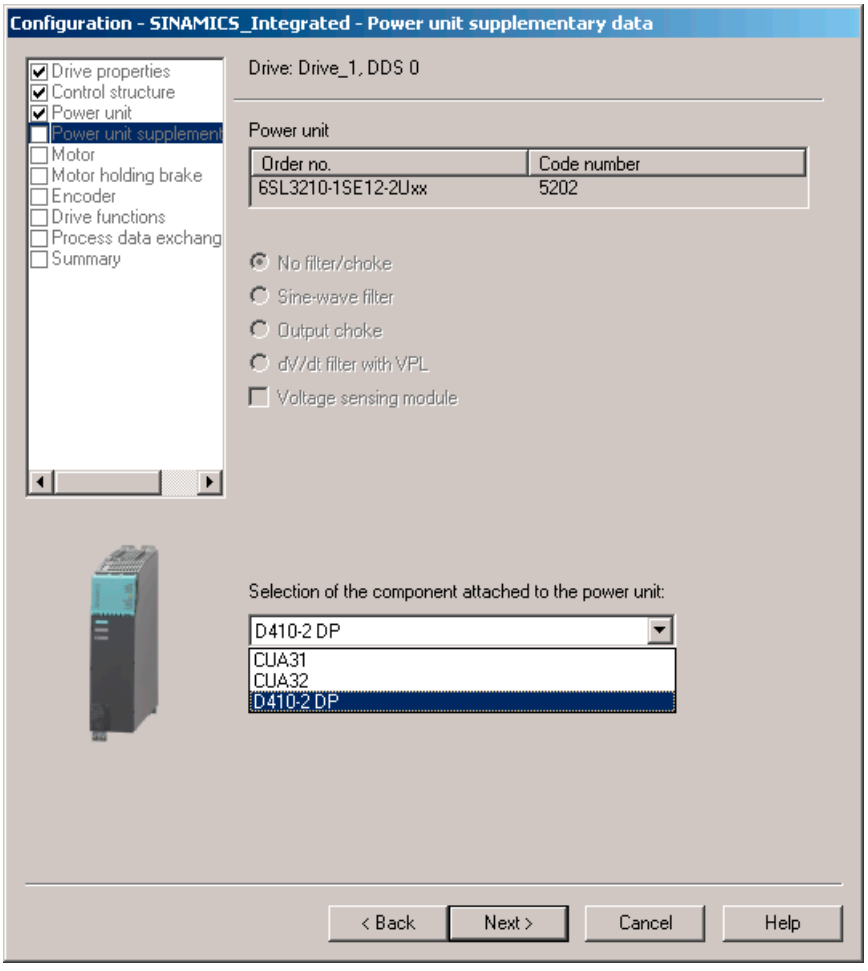

Figure 10-172 Selecting the mounting type

Note

If SIMOTION D410-2 is mounted separately (Power Module in blocksize format connected to SIMOTION D410-2 via CUA31/32), use of the Safety Integrated Extended and Advanced Functions via the onboard terminals (F-DI, F-DO) is not possible.

5. In the next dialog, select the motor and, where applicable, the motor type:
   - Either by selecting a standard motor from the list
   - Or by entering the motor data
   - Or by automatically identifying the motor (motor with DRIVE-CLiQ interface)

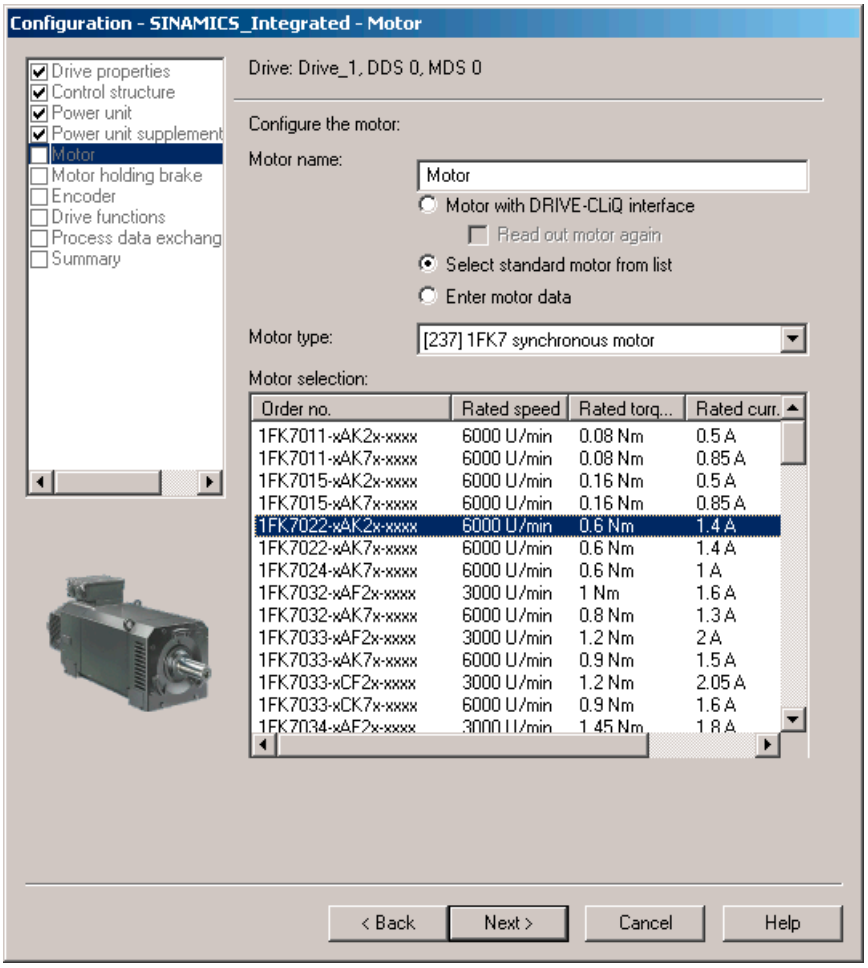

Figure 10-173 Selecting a motor

Note

Motors with DRIVE-CLiQ interface have an integrated encoder evaluation that is connected to the Power Module via a fully digital communication interface (DRIVE-CLiQ).

In this way, motor encoder and temperature signals as well as electronic rating plate data, such as unique article numbers, rated data (voltage, current, torque) can be transferred directly to the Control Unit.

6. Select a motor holding brake (if installed).

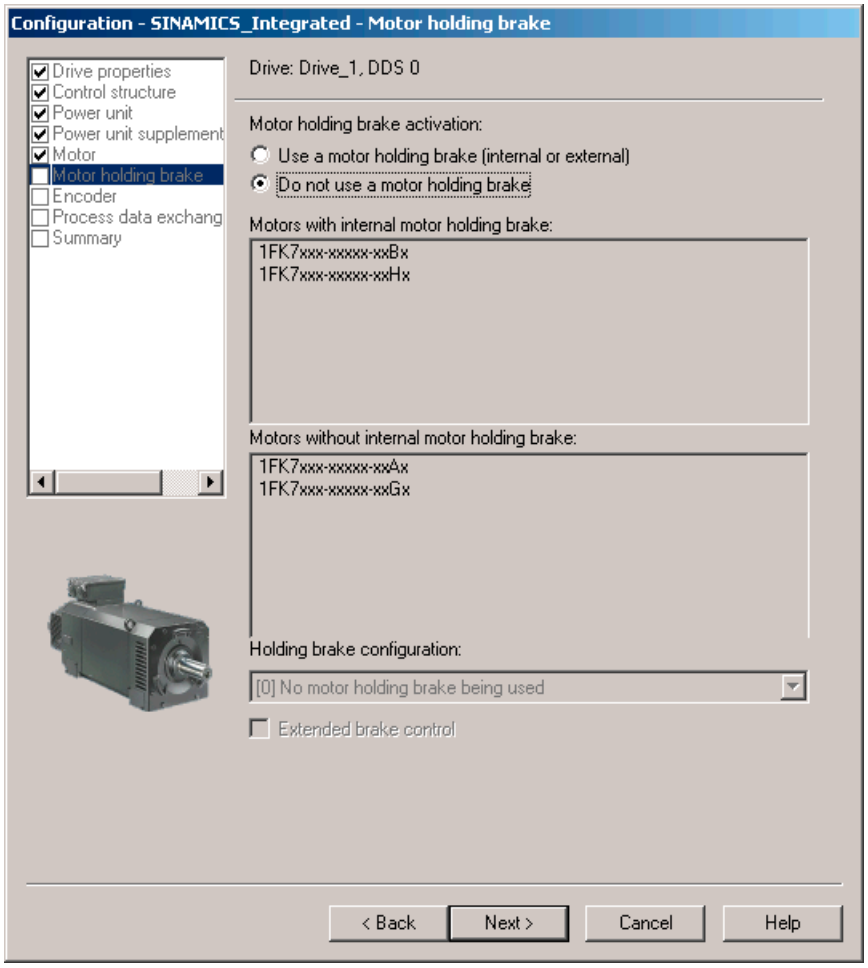

Figure 10-174 Selecting a motor holding brake

7. If you are using a motor that is not equipped with a DRIVE-CLiQ interface, select the encoder order number in the "Encoder Selection via Motor Order Number" dialog box.

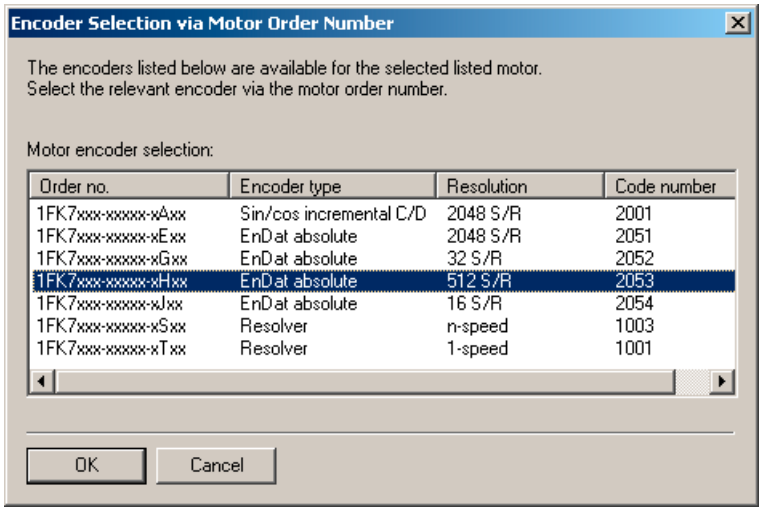

Figure 10-175 Selecting a motor encoder (1)

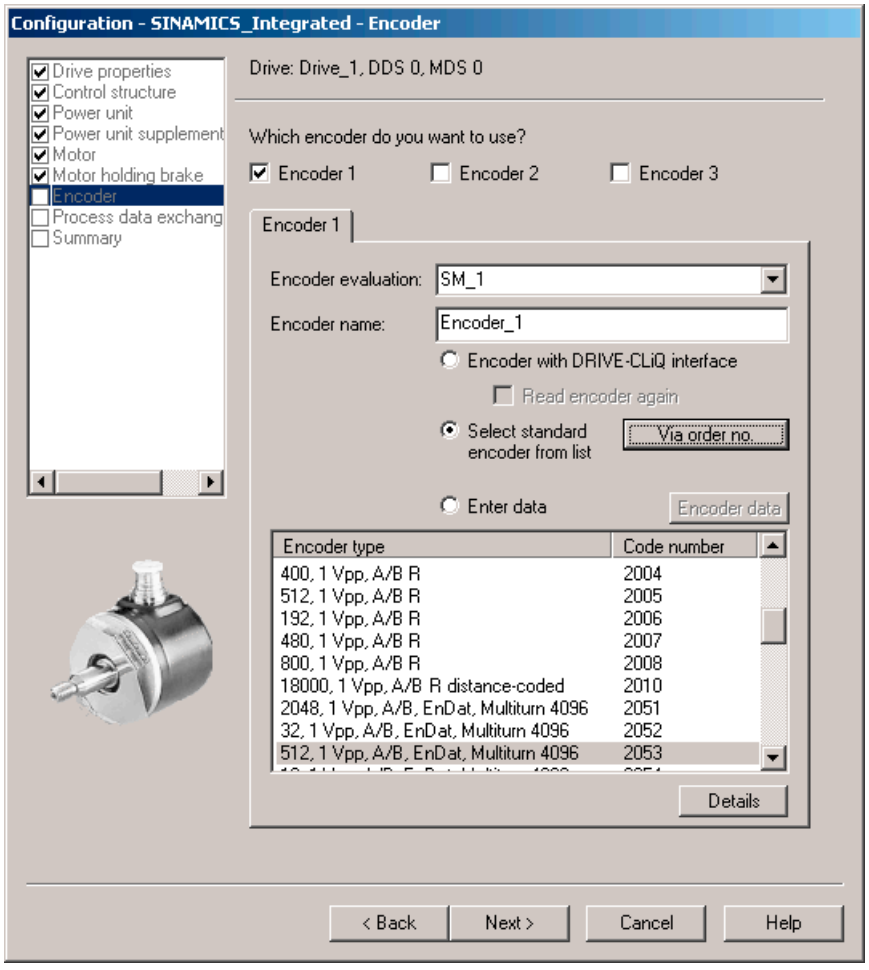

Figure 10-176 Selecting a motor encoder (2)

Note

If required, you can configure a second or third encoder in the "Encoder" dialog box. You can transmit a maximum of two encoder values to SIMOTION via the axis telegram. In the case of motors with a DRIVE-CLiQ interface, the motor encoder is identified automatically. It is not necessary to enter encoder data in such cases (the box for selecting Encoder 1 is grayed out and therefore inactive).

8. The communication for the control of the SINAMICS drive is configured in the following dialog box. It is recommended that these settings be made automatically by the engineering system.

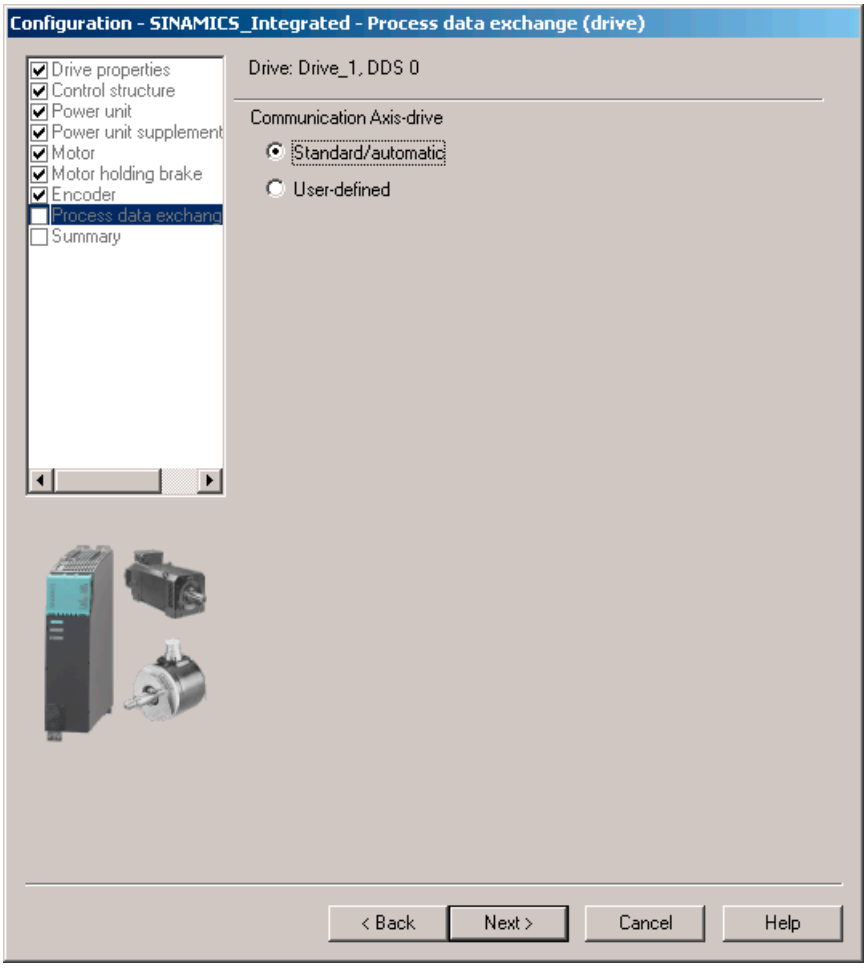

Figure 10-177 Configuring the process data exchange (standard)

You can also make the settings manually for the process data exchange by selecting "User-defined".

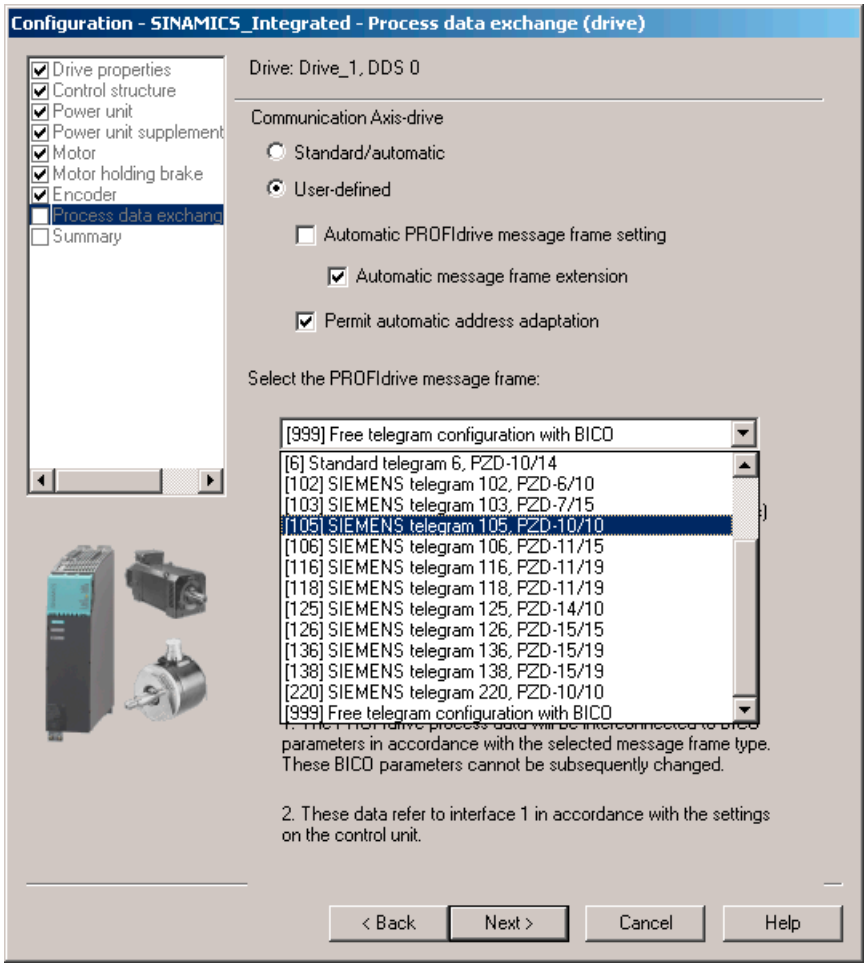

Figure 10-178 Configuring the process data exchange (user-defined)

Information about the manual setting options can be found in the online help and in the manuals for the SINAMICS S120 drive system.

9. After you have configured all of the settings in the drive wizard, the "Summary" dialog box displays a list of all settings. You can now choose to activate your settings by clicking "Finish", or to return to the component configuration for further editing.

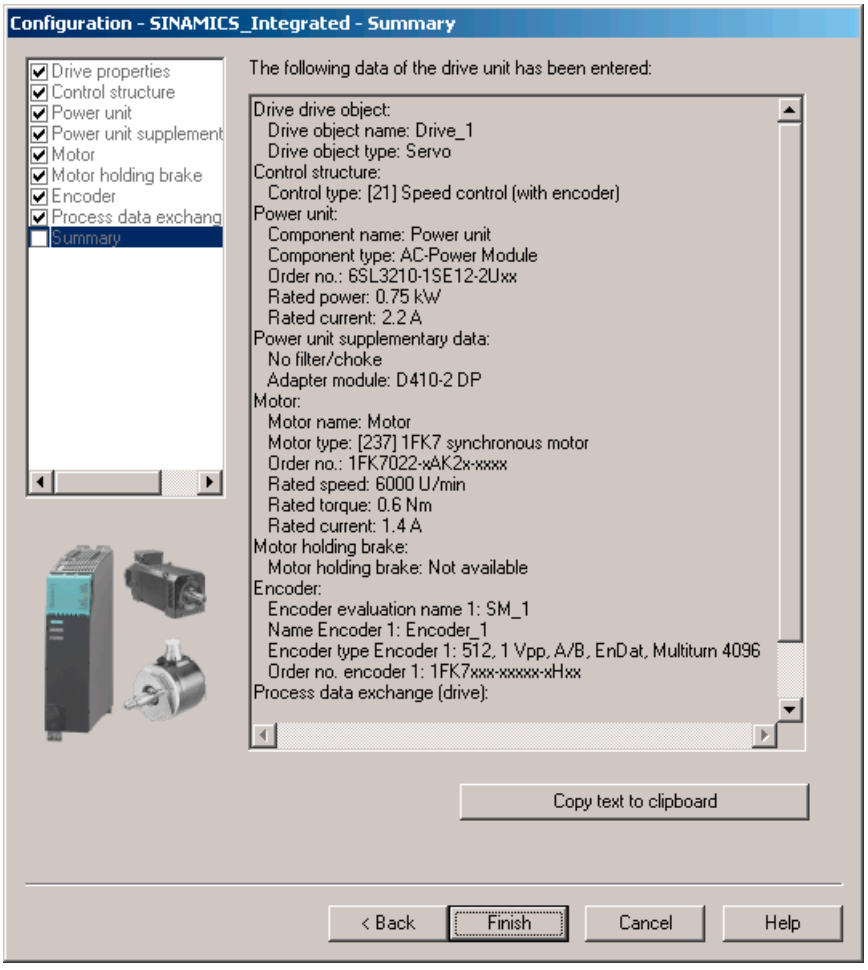

Figure 10-179 Finishing the drive

The configured drive is displayed in the project navigator. An overview of your configured SINAMICS components is available in the "SINAMICS_Integrated" > "Topology" dialog.

Additional references

If you configure the drive telegrams manually, you can find detailed information on the respective telegram types in the following:

- *Motion Control, TO Axis Electric/Hydraulic, External Encoder* Function Manual
- *SINAMICS S120* Function Manual

Downloading the project to the target system

Procedure

1. Save and compile the project.
2. Go online with the SIMOTION D410-2.

3. To load the project, perform "Download project to target system".
   The data must also be saved on the CompactFlash card to ensure that the project is retained in the event of a power failure. The following options are available:
   - Perform the "Copy RAM to ROM..." function manually on the SIMOTION D410-2 and the drive (SINAMICS Integrated).
   - In the "Download to Target System" dialog box, select the option "After loading, copy RAM to ROM". You can change the default setting for this dialog box in "Options" > "Settings" > "Download".
4. To save the parameter calculations of the drive in the project, perform "Target device" > "Load CPU / drive unit to PG" for the drive.

Result

The drive has been assigned parameters and commissioned. You can now test the drive using the drive control panel.

Note

Online access to SINAMICS Integrated is not possible if **HW Config** is not loaded at the time you initially connect to the target system.

Download the data to **HW Config** in order to enable online access to SINAMICS Integrated.

Note

If you have deselected the "Drives" option under "Tools" > "Settings" > "Download" in SIMOTION SCOUT, you must download the configuration separately to each drive (SINAMICS Integrated).

To do this, select the drive (e.g. SINAMICS Integrated) in the project navigator and perform "Download CPU / drive unit to target device".
To work quickly, we recommend that drives be generally deselected and a download only be performed when required.

Loading a project created offline to the CompactFlash card

Procedure

You can use a card reader to write the entire project to the CF card, even in offline mode. In SIMOTION SCOUT, you can call the "Load to file system" function in the context menu of the SIMOTION device.

1. Save and compile the project.
2. Switch off the SIMOTION D410-2.
3. Remove the CF card and insert it in a card adapter. The card adapter must be connected to a PG/PC.
4. In the SCOUT project, select the SIMOTION D410-2 device that you want to download to the CF card.
5. Click "Load to file system" in the context menu. A dialog box opens.

6. In the "Load to File System" dialog box, select the "Save normally" option and click the "Select target" button.
7. Select the target drive.
8. Confirm your entries with "OK". The data is written to the CF card.
9. Remove the CF card and insert it into the slot on the SIMOTION D410-2.
10. Switch on the SIMOTION D410-2.

Note

With "Load to file system", the project data of the controller (including SINAMICS Integrated) is written directly to the CF card. Separate execution of "Load to file system" for the SINAMICS Integrated is not possible.

Result

The SIMOTION D410-2 ramps up with the loaded project.

Note

The components' firmware is automatically updated, depending on the firmware version on the SINAMICS components and on the CF card. During a firmware update, please take note of the messages and alarms in the SIMOTION SCOUT detail window. A FW update on the SIMOTION D410-2 is indicated by the RDY LED flashing yellow, while on the DRIVE-CLiQ components (TM, SMC, etc.) it is indicated by the RDY LED flashing red/green.

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

Components that require a POWER ON after the firmware update will indicate this through a rapidly flashing RDY-LED. Go offline with SCOUT and switch the 24 V supply off/on (POWER ON) at the respective components for initialization.

Downloading the project incl. sources and additional data

Overview

It is possible to download additional data (e.g. sources) to the target device when saving a project to the CF card or downloading to the SIMOTION D410-2.

These data are required for:

- Online object comparison (e.g. additional properties)
- Various detailed comparisons (e.g. ST source file comparison)
- Synchronization with online objects.

In order to be able to load a project's sources and additional data to the PG, this must be specified in the project under "Options" > "Settings" > "Download" > "Store additional data on the target device". Alternatively, this setting can also be made when the data is loaded to the target device/target system.

You can, for example, perform a project comparison with the sources and additional data stored on the CF card (see example below).

Project comparison (example)

You intend to perform servicing work on a commissioned system and have placed a project on your PG/PC. This project is not consistent with the project on the SIMOTION D410-2 cm the system. In order to analyze the differences, perform an object comparison via "Start object comparison".

You have the following options in terms of re-establishing consistency:

- In the object comparison, it is possible to establish consistency in sources and technology objects on an object-granular basis.
- Consistency can be established for the entire Control Unit by loading from the CF card with "Target system" > "Load" > "Load CPU / drive unit to PG...."

Additional references

Detailed information on loading data to the target device can be found in the *SIMOTION Runtime Basic Functions* Function Manual.

Archiving a project on the CompactFlash card (zip file)

Procedure

In SIMOTION SCOUT, you can save the project as a *.zip file to the CompactFlash card.

Proceed as follows to archive the SIMOTION project on the CompactFlash card:

1. Open SIMOTION SCOUT and select the "Project" > "Archive" menu command.
2. In the "Archive" dialog box, select the SIMOTION project and save it to your drive (PG/PC).
3. Open the project.
4. Go online with the SIMOTION D410-2.
5. In the project navigator, select the SIMOTION D410-2 and select the "Target system" > "Load" > "Save archived project to card..." menu command.
6. In the dialog that is displayed, select the project and click "Open". This saves the project to the CompactFlash card as Project.zip in the directory: USER\SIMOTION\HMI\PRJLOG.

Note

If you want to load the current project from the card, select the "Target system" > "Copy archived project from card to PG/PC..." menu command.

Prerequisite is that you have backed up the project with "Save archive project on card..." each time a change was made.

Additional references

Detailed information on loading data to the target device can be found in the *SIMOTION Runtime Basic Functions* Function Manual.

Performing an online configuration

Overview

Introduction

You can configure the plant in online mode after having completed its wiring. You can use the "Automatic configuration" function to load the SINAMICS components connected via DRIVE-CLiQ to your PG/PC. However, this is only possible for initial commissioning.

Note

Components without DRIVE-CLiQ connection must be edited in offline mode. You may need to edit DRIVE-CLiQ components which were detected in the course of automatic configuration (for example, adding encoder data if using SMC modules).

Prerequisites for online configuration

- You have created a project in SIMOTION SCOUT and inserted a SIMOTION D410-2 in the project.
- You have configured the communication between the SIMOTION D410-2 and the PG/PC.
- Your system has been installed and wired.

Procedure

The online configuration involves the following steps:

- Establishing the online connection (Page 7424)
- Starting automatic configuration (Page 7424)
- Reconfiguring SINAMICS components (Page 7427)
- Downloading a project to the SIMOTION D410-2 (Page 7428)

Establishing the online connection

Procedure when commissioning the drive for the first time

To perform an online configuration, you must establish an online connection to the SIMOTION D410-2. In this case, no connection can yet be established to SINAMICS Integrated. An appropriate message is output. Once the hardware configuration has been loaded to the target device, an online connection to the SINAMICS Integrated is established automatically. Proceed as follows:

1. Save and compile the project.
2. Establish an online connection.
3. Select the SIMOTION D410-2 device in the project navigator.
4. Use the "Download CPU / drive unit to target device" function to download the SIMOTION D410-2 device to the target device. The connection to SINAMICS Integrated is activated automatically.

You can now run automatic configuration on the SINAMICS Integrated. For details, see Section Starting automatic configuration (Page 7424).

Additional references

Further information about establishing an online connection to the programming device/PC can be found in the following documentation:

- *SIMOTION SCOUT* Configuration Manual
- *SIMOTION SCOUT* Online Help
- In the FAQ for *SIMOTION Utilities & Applications*
  SIMOTION Utilities & Applications is provided as part of the SIMOTION SCOUT scope of delivery.
- FAQOnline connection to SIMOTION (https://support.industry.siemens.com/cs/ww/en/view/22016709)

Starting automatic configuration

Requirement

You have established the online connection to SINAMICS Integrated.

Procedure

1. In the project navigator, open the "Automatic Configuration" dialog with the "SINAMICS_Integrated" > "Automatic configuration" menu command.

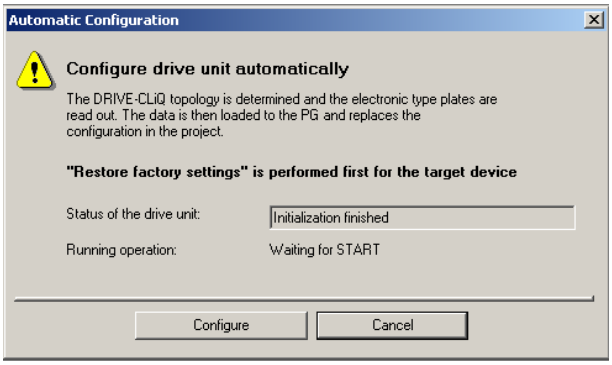

Figure 10-180 Starting automatic configuration

2. Click the "Configure" button.
3. If the drive unit is not in the "First commissioning" state, the factory settings are restored after acknowledging a prompt.
4. The drive object types can now be selected via a further dialog box.

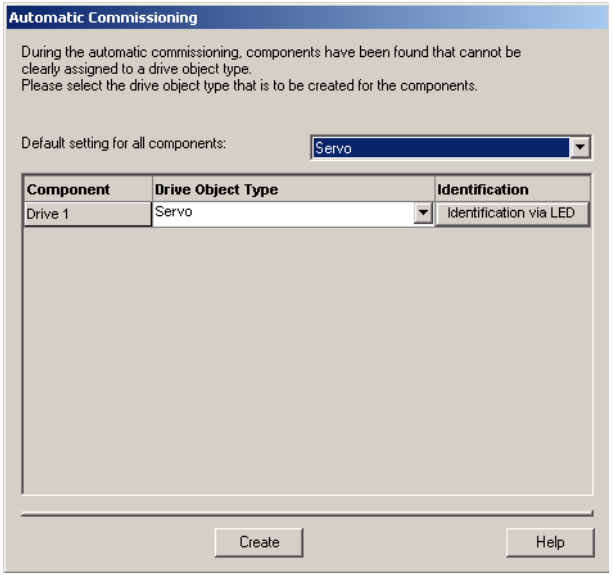

Figure 10-181 Selecting the drive object type

5. Select whether a servo- or vector-type drive object is to be used.

6. Click "Create" to start the automatic configuration.
   The configuration data is uploaded (Load to PG) automatically as soon as automatic configuration is completed.

   Note

   The components' firmware is automatically updated, depending on the firmware version on the SINAMICS components and on the CF card.

   The update procedure can take several minutes and is indicated in the "Automatic Configuration" dialog box by the following message:

   "State of the drive unit: Automatic FW update of DRIVE-CLiQ components".

   A FW update on the SIMOTION D410-2 is indicated by the RDY LED flashing yellow, while on the DRIVE-CLiQ components (TM, SMC, etc.) it is indicated by the RDY LED flashing red/green.

   - FW update running: RDY LED flashes slowly (0.5 Hz)
   - FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

   Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

   Following the automatic configuration, a prompt appears as to whether you want to "Go offline" or "Remain online" with the drive unit.

7. Execute the "Copy RAM to ROM ..." function on the SIMOTION D410-2 and SINAMICS Integrated. This saves the project on the CF card so that it does not need to be reloaded after switching off and on.

Result

The DRIVE-CLiQ components loaded to the user project by means of automatic configuration are displayed in the project navigator.

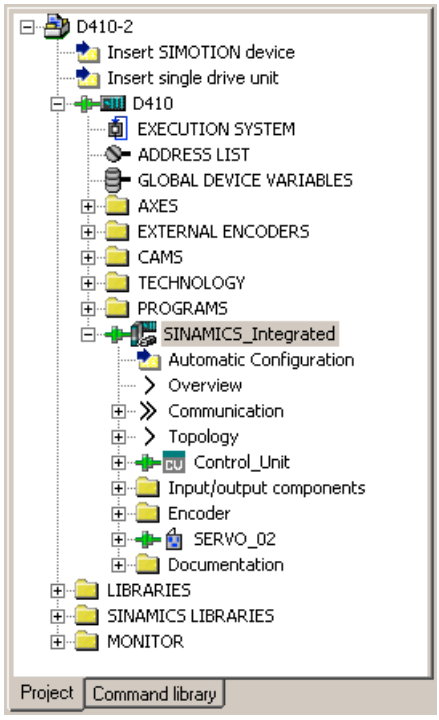

Figure 10-182 Project navigator with the downloaded DRIVE-CLiQ components

You must then

- If required, reconfigure SINAMICS components (e.g. components without a DRIVE-CLiQ interface, such as an encoder connected to the onboard encoder interface).
- Assign the "TO axis" to "Drive".

Reconfiguring SINAMICS components

Requirements

- You have uploaded all connected DRIVE-CLiQ components to the user project.
- You have shut down the connection to the target system (offline mode).

Procedure

Now go ahead and adapt your components to suit the application.

Run through the wizard for all the DRIVE-CLiQ components to be adapted and perform the required reconfigurations.

This procedure corresponds to the description in Section Performing an offline configuration (Page 7406).

The amount of editing work involved depends on the components used. For example, in the case of a motor with a DRIVE-CLiQ interface, the motor and encoder type are identified automatically.

Downloading the project to SIMOTION D410-2

Procedure

After you have performed the reconfigurations, you must download the configuration to the SINAMICS Integrated.

1. Save and compile the project.
2. Go online with the SIMOTION D410-2.
3. To load the project, perform "Download project to target system".
   The data must also be saved on the CompactFlash card to ensure that the project is retained in the event of a power failure. The following options are available:
   - Perform the "Copy RAM to ROM..." function manually on the SIMOTION D410-2 and the drive (SINAMICS Integrated).
   - In the "Download to Target System" dialog box, select the option "After loading, copy RAM to ROM". You can change the default setting for this dialog box in "Options" > "Settings" > "Download".
4. To save the parameter calculations of the drive in the project, perform "Target device" > "Load CPU / drive unit to PG" for the drive.

Result

The drive has been assigned parameters and commissioned. You can now test the drive using the drive control panel.

Note

Online access to SINAMICS Integrated is not possible if **HW Config** is not loaded at the time you initially connect to the target system.

Download the data to **HW Config** in order to enable online access to SINAMICS Integrated. During the "Download to target system" process, SIMOTION SCOUT automatically attempts to establish an online connection to SINAMICS Integrated.

Note

If you have deselected the "Drives" option under "Tools" > "Settings" > "Download" in SIMOTION SCOUT, you must download the configuration separately to each drive (SINAMICS Integrated).

To do this, select the drive (e.g. SINAMICS Integrated) in the project navigator and perform "Download CPU / drive unit to target device".
To work quickly, we recommend that drives be generally deselected and a download only be performed when required.

Additional information on configuring the SINAMICS Integrated

Setting DP Slave properties

Settings in HW Config

Depending on the cycle clock ratios (bus cycle, servo cycle) and the drive used, it may be necessary to adapt the properties of the DP slave (SINAMICS Integrated) on the PROFIBUS Integrated.

Open **HW Config**. Double-clicking the SINAMICS Integrated enables you to display and, if required, change the properties of the DP slave on the "Clock synchronization" tab. Possible changes include:

- Synchronize drive to the equidistant DP cycle
  The SINAMICS Integrated of a SIMOTION D410-2 can only be operated isochronously. For this reason, this option cannot be deactivated.
- Changing the master application cycle (T_{MAPC})
  The master application cycle must always be the same as the servo cycle clock set (setting: in context menu of the D410-2 > "Set system cycle clocks" in the project tree).
  Provided that the DP cycle is not scaled down to the servo cycle, the master application cycle will always be the same as the DP cycle.

Note

The PROFIBUS cycle clock can be scaled down in relation to the servo cycle clock. Down-scaling is only permitted if PROFINET IO with IRT has not been configured.

- Changing the DP cycle (T_{DP})
  Depending on the requirements in terms of the quantity structures and response times, the DP cycle may need to be changed. (See also *SIMOTION Runtime Basic Functions* Function Manual).
  In addition, the minimum DP cycle for vector drives also depends on the speed controller cycle clock, which in turn depends on the used device type. This means that, particularly in the case of vector drives, the DP cycle must be checked and changed if necessary, see Section Using vector drives (Page 7431).

  Note

  After T_{DP} has been changed on the PROFIBUS master, the drive system must be switched on (POWER ON).

- Changing the T_I and T_O times
  A change to T_I/T_O is required in the case of vector drives, for example, where the T_I/T_O time for devices in chassis format depends on the type of device used.

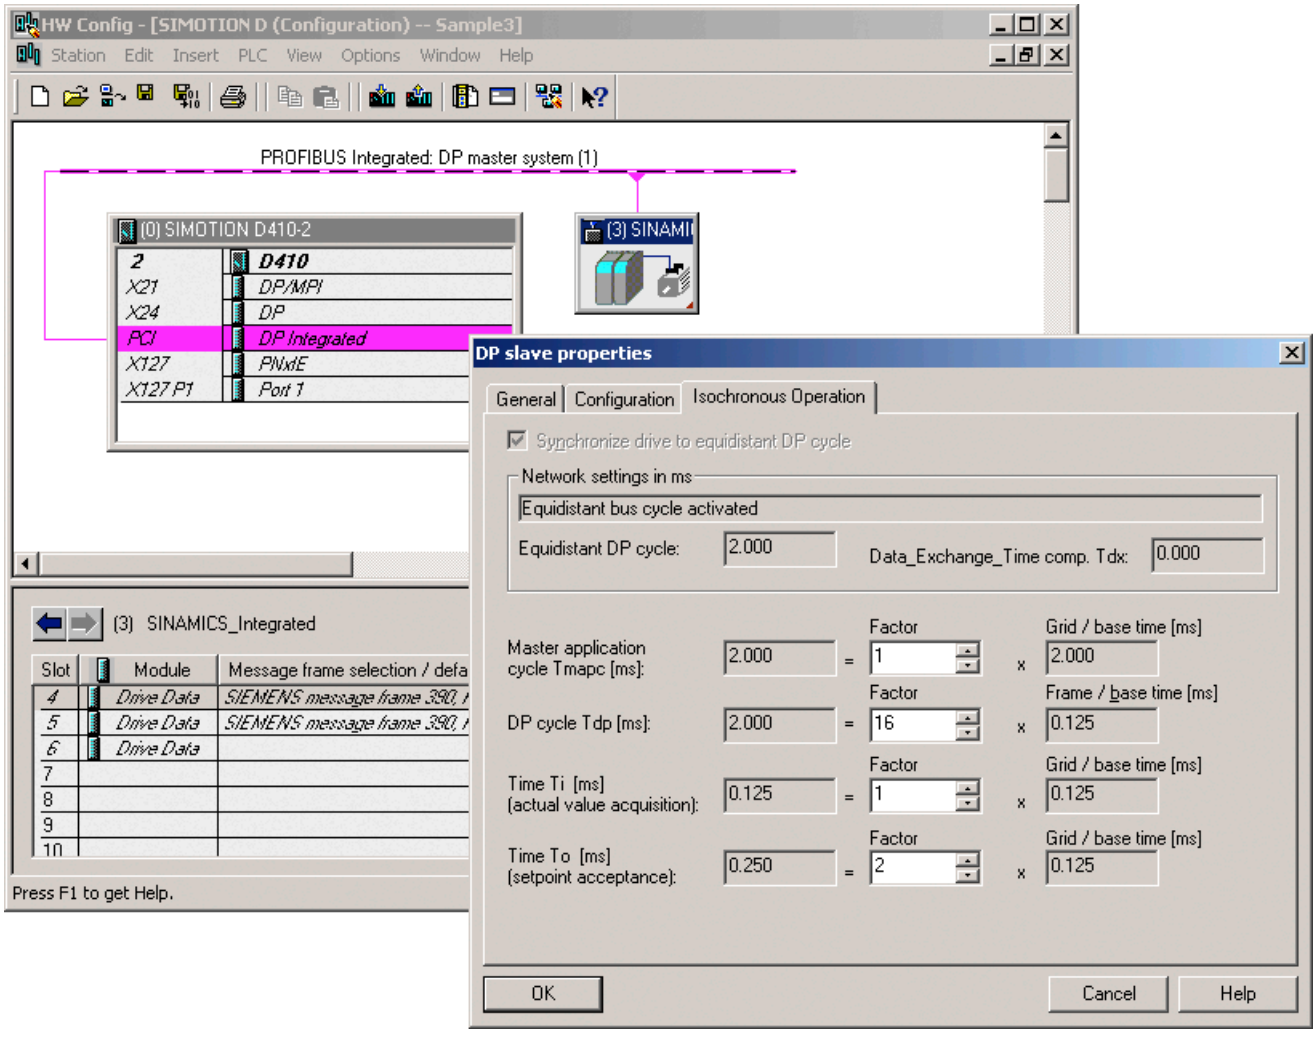

Figure 10-183 HW Config setting

The times are modified by changing the value in the "Factor" field.

SCOUT TIA

In order to parameterize the isochronous cycle clock for the PROFIBUS Integrated in the TIA Portal, proceed as follows:

1. Select the PROFIBUS Integrated in the network view.
2. Select the "General" tab in the Inspector window and click "Equidistance" to display the parameters for the isochronous PROFIBUS. The "Activate isochronous bus cycle" setting is permanently selected and cannot be edited.

The other parameters are set to default settings and can be edited.

Additional information can be found

- In the *SINAMICS S120* Function Manual
- *SIMOTION Runtime Basic Functions* Function Manual
- *SIMOTION SCOUT TIA* Configuration Manual

Using vector drives

Changes need to be made in **HW Config** when SINAMICS vector drives are used. This means, for example, that the T_I/T_O time and the minimum DP cycle for drives in chassis format depend on the type of device used.

Therefore, we recommend adopting the following procedure when using a vector drive with the SIMOTION D410-2.

Procedure

1. Open **HW Config**. By "double clicking" the SINAMICS Integrated, you can change the properties of the DP slave in the "Clock synchronization" tab.
2. For $T_I = T_O =$, enter an integer multiple of the current controller cycle. For the current controller cycle clock, use 375 µs for devices in chassis format and 250 µs or 500 µs for the blocksize devices (PM340, PM240-2).
3. For T_{DP}, enter an integer multiple of the speed controller cycle. For a drive on the SINAMICS Integrated, T_{DP} must be >= T_O in all cases.
4. Enter $T_{MAPC} = T_{DP}$ (exception: You are working with cycle reduction; i.e. servo cycle > DP cycle).
5. Use the "Target system" > "Load" > "Load project to target system" menu command to download the parameterization to the SIMOTION D410-2.

6. After the download has successfully completed, you should determine the current and speed controller cycles of the drive from the drive's expert list, because the cycle clocks are set in the SINAMICS drive unit after a project has been downloaded.
   - p0115[0] current controller cycle clock
   - p0115[1] speed controller cycle clock
7. If the current and speed controller cycles from the expert list are different to the cycles used in steps 2 and 3, you will have to repeat the steps using the most up-to-date values for the current and speed controller cycles.

Note

The described procedure is also required for an online configuration with an automatic configuration.

Table 10-115 Vector drive

Example	Settings
Vector drive (chassis format) Current controller cycle = 375 µs Speed controller cycle = 1.5 ms	$T_I = T_O$ = at least 375 µs T_{DP} = 1.5 ms (... or 3 ms, or 6 ms ....) $T_{MAPC} = T_{DP}$ For the SIMOTION D410-2, a minimum of 1 ms is recommended for the servo cycle clock. For this reason, set $T_{MAPC} = T_{DP}$ = 3 ms or higher.
Vector drive (PM340/PM240-2) Current controller cycle clock = 500 µs (default) Speed controller cycle = 2 ms	$T_I = T_O$ = at least 500 µs T_{DP} = 2 ms (... or 4 ms, 8 ms, ...) $T_{MAPC} = T_{DP}$

Blocksize Power Modules

Current controller cycle clock 500 µs (default)

The default current controller sampling time for SIMOTION D410-2 with PM340/PM240-2 is 500 µs. This current controller cycle is set automatically following project download if p0112 = 3 (default). The sampling times in p0115 are adapted automatically by the system following the download; therefore, they may deviate from the offline values. The system also sets p0112 = 0 (expert) after the download.

Current controller cycle clock 250 µs (manual setting required)

If the current controller cycle clock for SIMOTION D410-2 is to be changed from 500 µs (default) to 250 µs, p0112 = 0 (expert) must be set.

p0112 = 0 enables the individual sampling times to be adjusted in p0115. Moreover, with this setting, the system does not change the current controller sampling time automatically.

Note

SIMOTION D410-2 is a single-processor system. CPU utilization is, therefore, dependent on the SIMOTION configuration (PLC and motion control) and the SINAMICS configuration (drive control).
For more performance on the SIMOTION side, we recommend not setting any unnecessary cycle clocks on the SINAMICS side.

400 µs current controller cycle clock

Vector drives in chassis format can also be operated with a current controller sampling time of 400 µs (amongst other settings).

In the SIMOTION context, the following should be considered:

- A current controller sampling time of 400 µs is only possible if control is via a SINAMICS S120 Control Unit, which is not operated isochronously via PROFIBUS/PROFINET on the SIMOTION D410-2.
- If the bus is operated isochronously, only cycle clocks with an integer multiple of 125 µs are possible (i.e. 375 µs or 500 µs instead of 400 µs, for example).
- The PROFIBUS Integrated of a SIMOTION D410-2 is always isochronous! This means that a current controller sampling time of 400 µs is not possible.
- With CU parameter p0092 = 1, the sampling times are preassigned in a way that enables isochronous operation with a control system.

Output cams / measuring inputs with vector drives

In the case of devices in chassis format, the cycle clock ratios (current controller cycle clock, speed controller cycle clock, input/output sampling time, etc.) also depend on the type of device used.

Note the information in Section Current controller cycle clocks <> 125 µs / use of output cams and measuring inputs (Page 7443).

Additional references

Additional information on quantity structures and cycle clock settings can be found in the *SINAMICS S120* Function Manual.

Setting the SIMOTION time of day

Time on SIMOTION (real-time clock)

SIMOTION D410-2 features an integrated real-time clock. All events on a module (alarms, messages, etc.) are "time-stamped" based on the time shown by this real-time clock.

Procedure

Various options are available to set the clock of the SIMOTION D410-2:

- Setting the clock via the engineering system
  - SIMOTION SCOUT: Select the SIMOTION D410-2 in the project tree and then "Target system" > "Set time" in the menu.
  - SIMOTION SCOUT TIA: Call the "Set time" function at "Online & diagnostics" in the TIA Portal in the project tree.
- Setting the clock using the "rtc" system function block
- Synchronization of the local time with an NTP time server (as of V4.5)

The status of the NTP time synchronization can be determined with the **_getStateOfNTPClockSynchronisation** system function.

For further information on the NTP process, see the *SIMOTION Communication* System Manual and the *SIMOTION SCOUT TIA* Configuration Manual.

Synchronizing the SINAMICS clock

SINAMICS system runtime (operating hours counter)

For SINAMICS S120 Control Units and the SINAMICS Integrated on a SIMOTION D410-2, faults and alarms are "time-stamped" on the basis of the system runtime. This means that events are recorded by default on the basis of operating hours rather than a particular time of day or date.

System runtime

The entire system runtime is displayed in CU parameter p2114.

- r2114[0] indicates the system runtime in milliseconds. After reaching 86,400,000 ms (24 hours), the value is reset.
- r2114[1] indicates the system runtime in days.

The counter value is saved when the power is switched off. After the drive unit has been switched on, the counter continues to run with the value stored when the power was last switched off.

As a result, the drive displays the system runtime from 00:00:00 on 01/01/1992 in both the alarm window in SIMOTION SCOUT and the diagnostic buffer for entries.

If faults and alarms need to be "time-stamped" on the basis of a time of day, "Time-stamp operating hours" needs to be changed to "Time-stamp UTC format" as described below.

Requirements

A telegram 39x is required for the time synchronization. If the automatic PROFIdrive telegram setting is selected for the Control Unit, this telegram is used automatically (see Section Accessing the drive wizard (Page 7407), Standard/Automatic setting).

If the telegrams are specified manually, telegram 39x must be set up. See Section Message frame configuration (Page 7458)

So that drive units can be synchronized with the SIMOTION time, they must support telegram 39x and the UTC (coordinated universal time) time format.

For precise time synchronization, the drive unit must also be operated via an isochronous bus on SIMOTION.
The SINAMICS Integrated with SIMOTION D is always connected isochronously.

The following Control Units support time synchronization:

- SINAMICS Integrated of the SIMOTION D410-2
- SINAMICS S120 CU310, CU310-2, CU320, CU320-2 Control Units connected via PROFIBUS or PROFINET
- SINAMICS S110 Control Units CU305, connected via PROFIBUS or PROFINET (precondition: as from SCOUT V4.4)

Procedure

Proceed as follows to convert the SINAMICS clock to UTC format and to synchronize this with the SIMOTION clock:

1. In the project navigator, call the shortcut menu of the SIMOTION D410-2.
2. Select the "Properties" entry in the context menu.
3. Select the "Perform time synchronization with SINAMICS drive units" option in the "Settings" tab of the "D410-2 Properties" dialog box.

   Note

   This setting is activated automatically and applies to all drive units connected to the SIMOTION D410-2. The SINAMICS clock is automatically synchronized with the SIMOTION clock for all drive units with configured telegram 39x.

The first time synchronization is performed after the SIMOTION D Control Unit has reached the RUN operating mode.

To compensate for deviations between the SIMOTION and SINAMICS clocks, the time of day is automatically resynchronized at regular intervals.

The user program can use the _driveStates.allClocksSynchronized on the device to query whether automatic time synchronization is enabled (=YES) or disabled (=NO).

Before the first synchronization, alarms and messages are stored with the time stamp valid in the SINAMICS at this time, all subsequent alarms and messages with the synchronized time.

The first time synchronization after switching on is entered with the status of the operating hours counter and the time (UTC time, synchronized with SIMOTION) in the diagnostic buffer of the drive (e.g. SINAMICS Integrated).

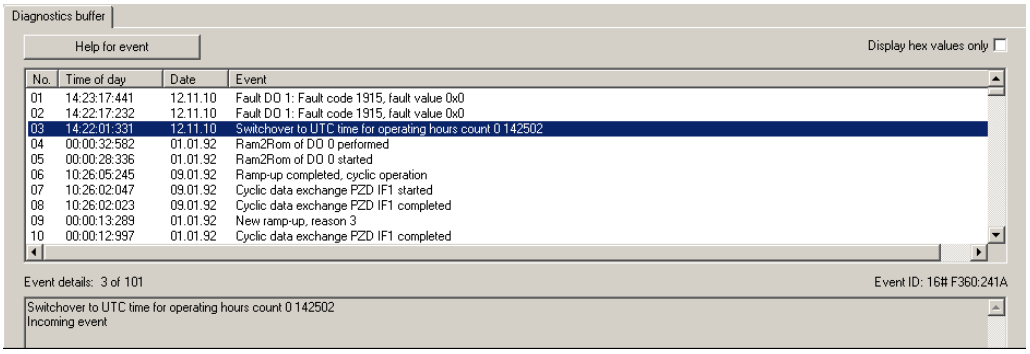

Figure 10-184 Diagnostic buffer entry, time synchronization

Error correction

If problems occur with time synchronization, this may be due to deactivated symbolic assignment to incorrect configuration information (Fast IO configuration).

For more information, see Section Message frame configuration (Page 7458).

Compensation of runtime deviations

To compensate for deviations between the SIMOTION and SINAMICS clocks, the time of day is automatically synchronized at regular intervals.

The following behavior must be taken into consideration when setting the SIMOTION time:

- "Time/date to be set" is after "Time/date on SINAMICS": Time and date are corrected on the SINAMICS.
- "Time/date to be set" is before "Time/date on SINAMICS": The SINAMICS clock must be stopped until the SINAMICS "Time/date" has caught up with "Time/date to be set".

Adopting this procedure ensures that the sequence of SINAMICS diagnostic buffer entries remains the same, even when the runtime differences are aligned.

The SINAMICS clock operates with a resolution of 1 ms. A synchronization accuracy of 1 ms can be achieved for all bus cycle clocks that can be divided exactly by 1 ms (e.g. 1 ms, 2 ms, 3 ms, etc.).

Due to system considerations, a slightly lower synchronization accuracy is achieved for all bus cycle clocks that cannot be divided exactly by 1 ms (e.g. 1.25 ms).

If the drive unit does not have an isochronous connection on SIMOTION, this can result in runtime differences of milliseconds (depending on the set cycle clock ratios).

Resetting the time

Requirement:

- SIMOTION D410-2: As of SIMOTION V4.3
- SINAMICS S120: As of SINAMICS V4.5
- SINAMICS S110: Not available

A threshold value is defined via parameter cu.p3109 and is effective as follows:

- In the case of negative time jumps less than the threshold value (p3109), the time is halted (for details, see "Compensation of runtime deviations")
- In the case of negative time jumps greater than the threshold value (p3109), the time is reset.
  Default setting: cu.p3109 = 100 ms
  This means that in the case of negative time jumps greater than 100 ms, the time is reset. The default value is configured so that normal runtime deviations (drift of the quartzes) are below the threshold value.
  If the SIMOTION clock is reset by more than 100 ms, this is interpreted as a "specific reset of the time" and the time of the drives is also immediately reset.

If the real-time clock is reset by more than 60 seconds, a diagnostic buffer entry is also made in the drive:

Time correction (reset) by **<correction value> seconds**

After a resynchronization (negative time jump greater than the threshold value)

- cu.r3107[0..1] the UTC time after synchronization
- cu.r3107[2..3] the UTC time before synchronization

is displayed in the parameter, whereby [0] and [2] are milliseconds and [1] and [3] are days.

Note

The diagnostic buffer entries are not converted to the new time when the time is changed.

Backing up / restoring / deleting SINAMICS NVRAM data

Requirement

SIMOTION D410-2 as of SIMOTION V4.3

SINAMICS S120 CU310-2/CU320-2 as of SINAMICS V4.5

For other supported SINAMICS Control Units, refer to the SINAMICS manuals.

Saving the NVRAM data

The backup of the SINAMICS NVRAM data is performed by setting parameter p7775 to 1. The following applies:

- Parameter p7775 can also be set to 1 during pulse enable.
- A warm restart is not required.

Note

The consistent backup of the NVRAM data must be ensured by the application.

Make sure that there is no change of the NVRAM contents during the data backup. The greatest possible consistency is achieved when

- Backup is performed during pulse disable or
- The drives are run down to 0 Hz.

The data for the S120 Control Units and the SINAMICS Integrated is stored in the backup file "PMEMORY.ACX" in the folder " ... \USER\SINAMICS\NVRAM" on the CF card.

For the S120 Control Units, the data is stored on the CF card of the S120 Control Unit.

Similar to the non-volatile SIMOTION data, an already existing PMEMORY.ACX file is first renamed as PMEMORY.BAK and then the PMEMORY.ACX file is generated when you save the SINAMICS data.

If an error occurs during backup, the BAK file can be used to restore the data.

Parameter p7775 is set to 0 at the end of the backup.

Restoring the NVRAM data

The SINAMICS NVRAM data can only be restored when none of the connected drives has a pulse enable.

When restoring, the PMEMORY.ACX file is accessed first. If this is available and is error-free, it is loaded. If no PMEMORY.ACX file is available or is corrupt, the PMEMORY.BAK file is loaded (if available and error-free).

Restoration of the NVRAM data can be performed manually and automatically.

Automatic restoration during module replacement

SINAMICS detects whether the Control Unit has been replaced on the basis of the serial number. In this case, the NVRAM of the used Control Unit is deleted first after POWER ON.

The following are not deleted:

- CU operating hours counter
- CU temperature and
- Safety logbook
- Crash diagnostic data

If there is an error-free PMEMORY.ACX or PMEMORY.BAK file on the CF card, the data is then loaded to the NVRAM.

If no error-free backup file is available, ramp-up is as for SINAMICS < V4.5. A fault is not issued and any existing "corrupt" backup files are not deleted.

Manual restoration

The manual restoration of the NVRAM data is performed by setting parameter p7775 to 2.

If the backup file (ACX or BAK) is error-free is, a warm restart is performed. The contents of the NVRAM are deleted first and then the data is loaded from the backup file to the NVRAM.

The following are not loaded:

- CU operating hours counter
- CU temperature
- Safety logbook
- Crash diagnostic data

Parameter p7775 is set to 0 at the end of the backup.

If the backup files are corrupt or no backup exists, the job is acknowledged with an error value in parameter p7775.

Deleting the NVRAM data

The SINAMICS NVRAM data can only be deleted when none of the connected drives has a pulse enable.

The deletion of the NVRAM data is performed by setting parameter p7775 to 3.

A warm restart is then performed automatically.

During the subsequent ramp-up, all NVRAM data on the CU is first deleted.

The following are not deleted:

- CU operating hours counter
- CU temperature and
- Safety logbook
- Crash diagnostic data

At the end of the deletion, the initialization data of the applications is in the NVRAM, similar to after a device automatic commissioning (with the exception of the above-mentioned data).

Parameter p7775 is set to 0 at the end of the deletion.

Explanations for the parameter p7775

The following jobs can be set with the parameter p7775:

Value of the parameter p7775	Job
1	Backup NVRAM data (on CF card)
2	Restore NVRAM data (from CF card)
3	Delete NVRAM data on the Control Unit

The acknowledgement of a parameter job is delayed.

- If the job cannot be executed, it is acknowledged negatively.
- If the job can be executed, it is acknowledged with the value 255.

Table 10-116 Acknowledgments of the parameter jobs

Acknowl-edgement	Description
17	Job cannot be executed because of the operating state
20	Illegal value
107	Write access is not permitted (cause: At least one DO has a pulse enable) Because the SINAMICS must perform a warm restart when restoring and deleting the data, none of the connected drives may have a pulse enable.
132	Parameter change blocked (see p0300, p0400, p0922, p7760, macro being executed)
204	Write access not permitted
255	"OK": Job being executed

If an error is detected during the execution of a parameter job, the error cause is signaled via the parameter itself (no message via the fault buffer).

Table 10-117 Causes of error for parameter jobs

Error	Cause
10	Error occurred while deleting
11	No backup possible: Memory card is not inserted
12	No backup possible: Memory card is full
13	Backup could not be completed (e.g. memory card removed during the backup)
14	Restoration not possible: Memory card is not inserted
15	Restoration not possible: Checksum of the NVRAM data backup file is faulty
16	Restoration not possible: No backup available

Note

The memory card must always remain inserted for the SIMOTION D410-2. For information which SINAMICS Control Units permit the removal of the memory card, refer to the SINAMICS manuals.

Parameter p7775 is only reset automatically to 0 after the successful completion of a job.

Know-how and write protection

Parameter p7775 is not part of the know-how protection. This allows the parameter to be read and written independent of the know-how protection.

Parameter p7775 is part of the write protection. This means the parameter can only be written by the controller that configured a PZD cyclic communication with the SINAMICS when write protection is activated (p7761 = 1).

All other write jobs are acknowledged negatively, e.g.

- SIMOTION SCOUT / STARTER
- For SINAMICS BOP, IOP, AOP Control Units
- Other masters that only communicate acyclically with the SINAMICS

SINAMICS diagnostic buffer

Requirements

The SINAMICS Integrated diagnostic buffer can be displayed in SIMOTION SCOUT.

Procedure

Select the SINAMICS Integrated in the project tree, and then "Target system" > "Device diagnostics" in the menu.

In addition, the SINAMICS diagnostic buffer entries are also displayed in the SIMOTION D410-2 device diagnostics. All SIMOTION D410-2 diagnostic buffer entries are displayed first, and then all diagnostic buffer entries of the the SINAMICS Integrated. The start of the SINAMICS Integrated diagnostic buffer entries is identified by the following entry:

>>>>>> Start of SINAMICS Integrated diagnostic buffer, station address = x <<<<<<

You also have the option of viewing the SIMOTION D410-2 and SINAMICS Integrated diagnostic buffers via SIMOTION IT web server.

Acyclic communication with the drive

Overview

PROFIdrive drive units are supplied with control signals and setpoints by the controller and return status signals and actual values. These signals are normally transferred cyclically (i.e. continuously) between the controller and the drive.

For SINAMICS S110/S120, configure the axis message frames for data exchange (refer to Performing an offline configuration (Page 7406)).

In addition to cyclic data exchange, PROFIdrive drive units feature an acyclic communication channel. In particular, this is used for reading and writing drive parameters (e.g. error codes, warnings, controller parameters, motor data, etc.).

As a result, data can be transferred on an acyclic as opposed to a cyclic basis when required. Acyclic reading and writing of parameters for PROFIdrive drives is based on the DP V1 services "read data set" and "write data set".

The acyclic DP V1 services are transferred while cyclic communication is taking place via PROFIBUS or PROFINET. The PROFIdrive profile specifies precisely how these basic mechanisms are used for read/write access to parameters of a PROFIdrive-compliant drive.

The PROFIdrive standard states that "pipelining" of jobs on PROFIdrive drives is not supported.

- Only one "write/read data record" can be performed at any one time on a drive unit (e.g. SINAMICS S120 control unit or the SINAMICS Integrated of a SIMOTION D).
- However, if several PROFIdrive drive units are connected to a controller, a job can be processed for each of these drive units at the same time. In this case, the maximum total number of jobs will depend on the control system. (for SIMOTION, this is a maximum of 8 jobs at a time).

In the case of acyclic data exchange with SINAMICS drives, this means you will have to coordinate the write/read jobs with one another (buffer management). An interlock must be set in order to prevent the application or different parts of the application from sending overlapping jobs to the same PROFIdrive drive unit.

Additional references

Additional information on how to use DP V1 services can be found in the *SIMOTION Communication* System Manual.

SIMOTION Utilities & Applications also has a DP V1 library with functions that are capable of undertaking coordination tasks commonly associated with acyclic communication. The library not only coordinates access to the system functions (_ReadRecord/_WriteRecord/ _readDriveParameter/_writeDriveParameter/ etc.), but also expands the range of functions for frequently required tasks, e.g. the reading of faults and alarms from the drive unit.

SIMOTION Utilities & Applications is provided as part of the SIMOTION SCOUT scope of delivery.

The functions available in the DP V1 library include:

- Buffer management (coordination of a number of parallel DP V1 services)
- StartUp (function for coordinating startup of the SINAMICS drive with SIMOTION)
- TimeSync (applicative time synchronization: Transfer of SIMOTION time of day to the SINAMICS drives)
- SetActIn (activating/deactivating objects in SIMOTION and SINAMICS)
- RwnPar (reading and writing of drive parameters)
- GetFault (reading errors and warnings from the drive)

Control properties and performance features

With a few exceptions, the integrated drive control of the SIMOTION D410-2 has the same control properties and performance features as the SINAMICS S120 CU310-2 control unit.

However, the following points must be particularly observed:

- The SINAMICS Integrated does not feature a basic positioner (EPOS). EPOS functionality is provided by SIMOTION technology functions.
- It is not possible to connect a BOP20 Basic Operator Panel to the SIMOTION D410-2. The following alternative options are available:
  - Use of SIMATIC HMI devices (e.g. TP177B, configurable with WinCC flexible)
  - Use of the SIMOTION IT web server.
    You can use a Web browser to access the Standard diagnostics pages of the SIMOTION D410-2 (diagnostic and alarm buffer, watch table, SIMOTION variables and read/write drive parameters, access protection, trace function, ...).
    You also have the option of creating your own Web pages, for example, to visualize machine states and to permit service functions. The SIMOTION D410-2 web pages can be accessed, for example, using a PC or PDA via Ethernet. Wireless access is also possible in conjunction with WLAN.
- Not all SINAMICS function modules are supported (e.g. the function modules free function blocks, spindle diagnostics, and CAN are not supported)
- The SINAMICS Integrated of the SIMOTION D410-2 does not support a reset via parameter p0972. A reset via p0972, is only supported by SINAMICS Control Units.

Current controller cycle clocks <> 125 µs / use of output cams and measuring inputs

If current controller cycle clocks <> 125 µs are used, the parameter calculations of the drive must be transferred to the PG, in particular when using cam outputs on the TM15 / TM17 High Feature or for global measuring inputs, so as to regenerate the Fast IO configuration.

A change of the current controller cycle clock will have effects on the sampling times of the I/Os on the drive side (e.g. TM15/TM17 High Feature, p4099 sampling time of I/Os). For the cam outputs and the measuring input inputs (only for global measuring inputs) to function correctly, the sampling times must be known to the engineering system.

Sampling times <> 125 µs occur in the following cases:

- For servo drives with manual change of the current controller sampling time (drive parameters p0112 and p0115[0])
- For vector drives.

Table 10-118 Influence of the current controller cycle clock on the dead time compensation

	Current controller cycle clock has no effect on the function	Current controller cycle clock has an effect on the function
Cam outputs	• SIMOTION D • ET 200MP TM timer DIDQ 16x24V • ET 200SP TM timer DIDQ 10x24V	TM15 / TM17 High Feature
Measuring input inputs (global measuring inputs)	• D4x5-2 (terminal X142) • ET 200MP TM timer DIDQ 16x24V • ET 200SP TM timer DIDQ 10x24V	• TM15 / TM17 High Feature • SIMOTION D (except D4x5-2, terminal X142) • SINAMICS S110/S120 Control Units
Measuring input inputs (local measuring inputs)	-	-

In order that the changed cycle clock ratios are taken into account by the engineering system, proceed as follows:

1. Go online and perform a project download. The SINAMICS performs parameter calculations once.
2. Perform an upload to the PG ("Target system" > "Load" > "Load CPU / drive unit to PG").
3. This transfers the parameter calculations of the drive to the PG. The cycle clock ratios are then known in the engineering system.
4. Go offline.
5. Generate the configuration information (Fast IO configuration) again. To do this, select the SIMOTION CPU in the project tree and right-click to open the context menu "Fast IO" > "Create new configuration".
6. Execute "Project" > "Save and compile all".
7. Go online and download the project to the target system.
8. Save the data on the CF card.

SIMOTION SCOUT uses the described procedure to calculate internal system data that is required for outputting/detecting signals with a high level of position accuracy.

Note

If the cycle clock ratios are not set correctly, an appropriate message is output in the diagnostic buffer.

Licenses for the SINAMICS Integrated

The following SINAMICS functions are licensed via SIMOTION:

- SINAMICS Safety Integrated Extended Functions for SIMOTION D
- SINAMICS Safety Integrated Advanced Functions for SIMOTION D (as of V5.2)
- SINAMICS high output frequency for SIMOTION D

SINAMICS Integrated

SINAMICS Safety Integrated Extended Functions for SIMOTION D

Highly effective protection of personnel and machinery can be implemented with SIMOTION D thanks to the integrated safety functions of SINAMICS S120.

Whereas the Safety Integrated Basic Functions are license-free, the Safety Integrated Extended Functions and Advanced Functions require a license for the SINAMICS Integrated.

- SINAMICS Safety Integrated Extended Functions for SIMOTION D or
- SINAMICS Safety Integrated Advanced Functions for SIMOTION D

The Safety Integrated Extended and Advanced Functions are licensed for the SINAMICS Integrated of SIMOTION D410-2 Control Unit with the licenses. The Safety Integrated Advanced Functions include the Safety Integrated Extended Functions.

SINAMICS high output frequency for SIMOTION D

Because of legal specifications, the output frequency for converter systems is limited to 550 Hz per default.

- SINAMICS S120 Control Units as of firmware V4.7 HF7
- SIMOTION D Control Units as of firmware V4.4 HF6

The **SINAMICS high output frequency for SIMOTION D** license allows users to cancel the output frequency limit if, as a result of the application, output frequencies of more than 550 Hz are required for drives. The license cancels the limitation **for the SINAMICS Integrated** of SIMOTION D410-2 Control Unit.

Note

The display of the Runtime licenses in the SCOUT Licensing dialog is updated after the power-up of the SINAMICS Integrated.

SINAMICS Control Units

SINAMICS Control Units connected via PROFINET or PROFIBUS (e.g. CU310-2, CU320-2) are licensed via the SINAMICS memory card. Licensing via SIMOTION is not possible.

Further information

- Changes to the EC Dual Use regulation and how it impacts SIMOTION
  https://support.industry.siemens.com/cs/ww/en/view/104020777
- SINAMICS S120/S150: Release for delivery, license for high output frequency
  https://support.industry.siemens.com/cs/en/en/view/104020669

Support of motors with PT1000 temperature sensor

Because of the discontinuation of the KTY84-130 temperature sensor, SIMOTICS motors will be equipped with PT1000 temperature sensor in the future.

- Motors with DRIVE-CLiQ interface remain compatible and can be operated on any SW version.
- Motors without DRIVE-CLiQ interface require SIMOTION SCOUT as of V4.5 for the configuration of the PT1000 temperature sensor.

Testing the configured drive using the drive control panel

You can test a configured drive using the drive control panel where you can define a speed value by setting a scaling factor. The drive control panel should only be used for commissioning.

Requirements

- The project has been downloaded to the target system.
- SIMOTION SCOUT is in online mode.
- The drive is not being used by a current project in RUN mode.

⚠ WARNING
Danger to life from unexpected movement of driven machine parts
Make sure this presents no hazard to personnel or property.

Procedure

1. Change to the configured drive in the Project Navigator and open the drive control panel by selecting "Commissioning" > "Control panel". The drive control panel opens in the detail view.

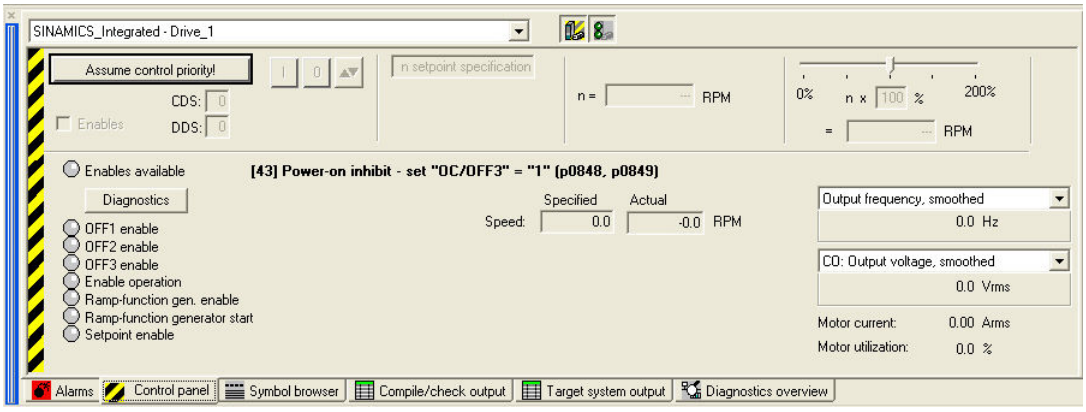

Figure 10-185 Drive control panel

2. To display the control area and axis diagnostics, click the "Show/hide control area" and "Show/hide diagnostics area" buttons.
3. Click "Assume control priority". The "Assume Control Priority" dialog box is opened.

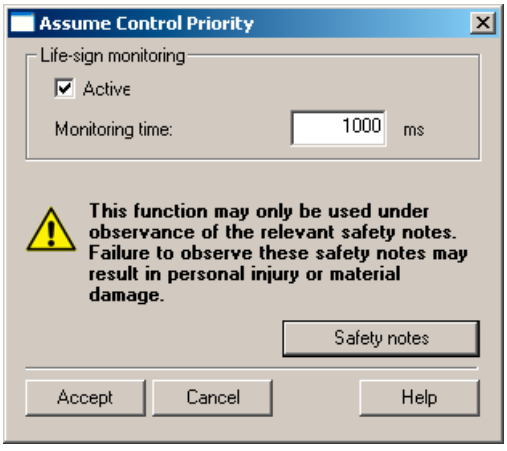

Figure 10-186 Assuming control priority

4. Read the notes and confirm these with "Accept."
5. Activate the "Enables" checkbox to enable the drive.
   All enables are now set with the exception of ON/OFF1.

6. Enter the desired setpoint in the entry field, and, as a safety setting, slide the scaling to 0%.

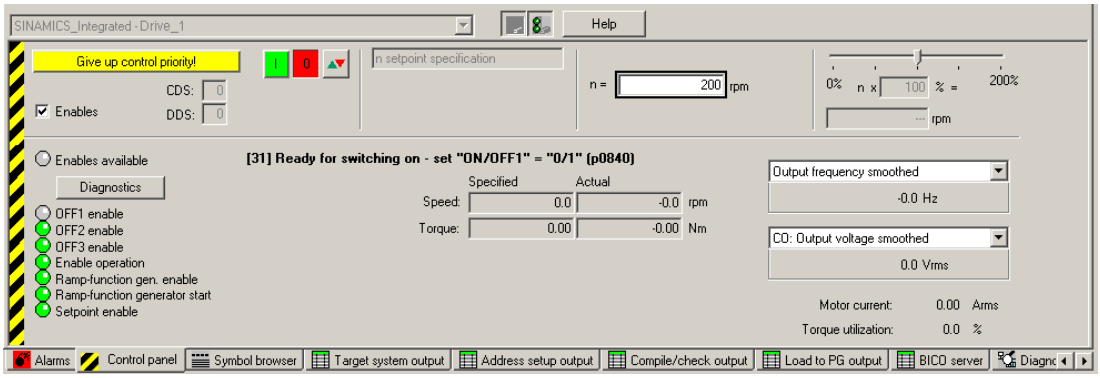

Figure 10-187 Entering a setpoint

7. Click the "Drive On" button. The green "Enable available" LED lights up. If you move the slider to the right, the drive rotates. The current motor speed is displayed in "Actual."
8. Click "Drive Off" to stop the drive after you completed the test.
9. Deactivate the enable and click the "Give up control priority" button to deactivate control from the PG/PC.

Creating and testing axes

Overview of SIMOTION Engineering

Performing engineering with SIMOTION SCOUT

The SIMOTION SCOUT engineering system can be used to insert axes in your project.

1. First, run through the axis wizard to configure the axes and interconnect to the real drive (e.g. SINAMICS Integrated).
2. Provided you have completed the configuration at the drive end, we strongly recommend for faster working that the SINAMICS Integrated is deactivated via "Target system" > "Select target device".
3. Complete your SIMOTION application, for example, by creating axis functions and SIMOTION execution programs.
4. Compile the project and download it to the SIMOTION D410-2.

Creating an axis with the axis wizard

Overview

The TO axis provides the user with the technological functionality and the interface to the drive/actuator. The TO axis processes the motion control commands from the user program (e.g. MCC) and coordinates the interface to the drives. It executes control and motion commands and indicates statuses and actual values.

The TO axis communicates with an actuator (drive or hydraulic valve) via a fieldbus system (PROFIBUS or PROFINET via PROFIdrive protocol) or via a direct setpoint interface (analog ±10 V or pulse/direction).

When running through the axis wizard, the basic settings are made for the axis and the TO axis interconnected to a drive (e.g. SINAMICS Integrated). The following extended options are available when "Use symbolic assignment" has been activated:

- A real axis is interconnected to an already configured drive
- A real axis including drive is created via the axis wizard and the drive interconnected to the axis
- A real axis is created without assigning this to a drive (assignment is made later)

Inserting an axis

1. In the Project Navigator, double-click the entry "Axis" > "Insert Axis."
   This will access the axis wizard. Set the required technology and then click "OK."

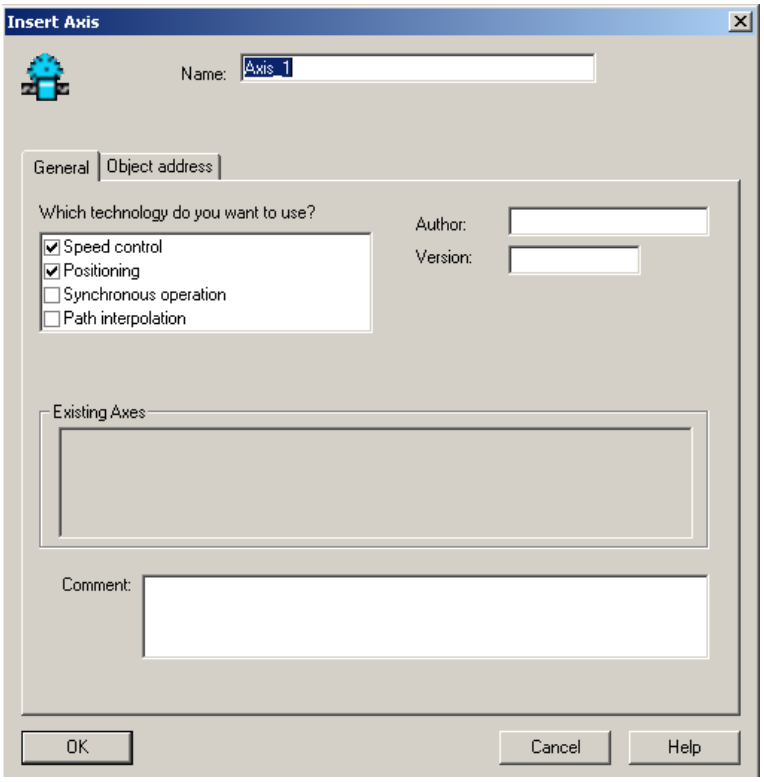

Figure 10-188 Inserting an axis

2. Set an axis type and, if required, configure the units.

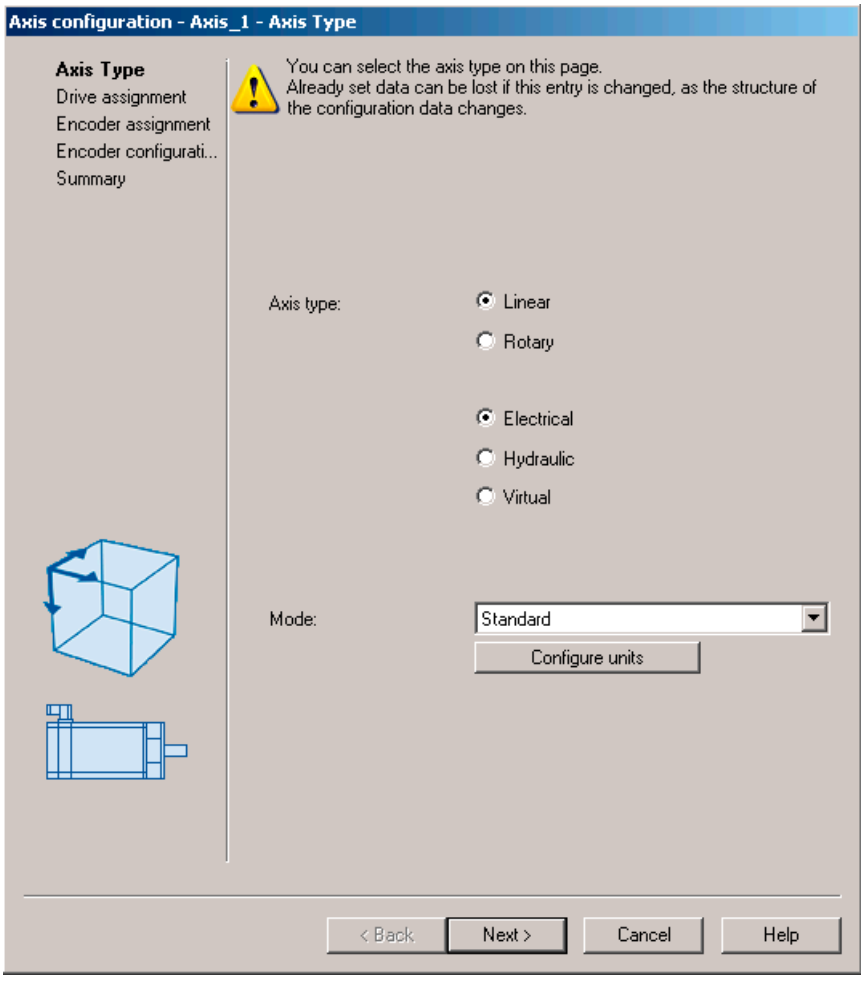

Figure 10-189 Defining the axis type

3. Create a new drive or make the assignment to an existing drive.

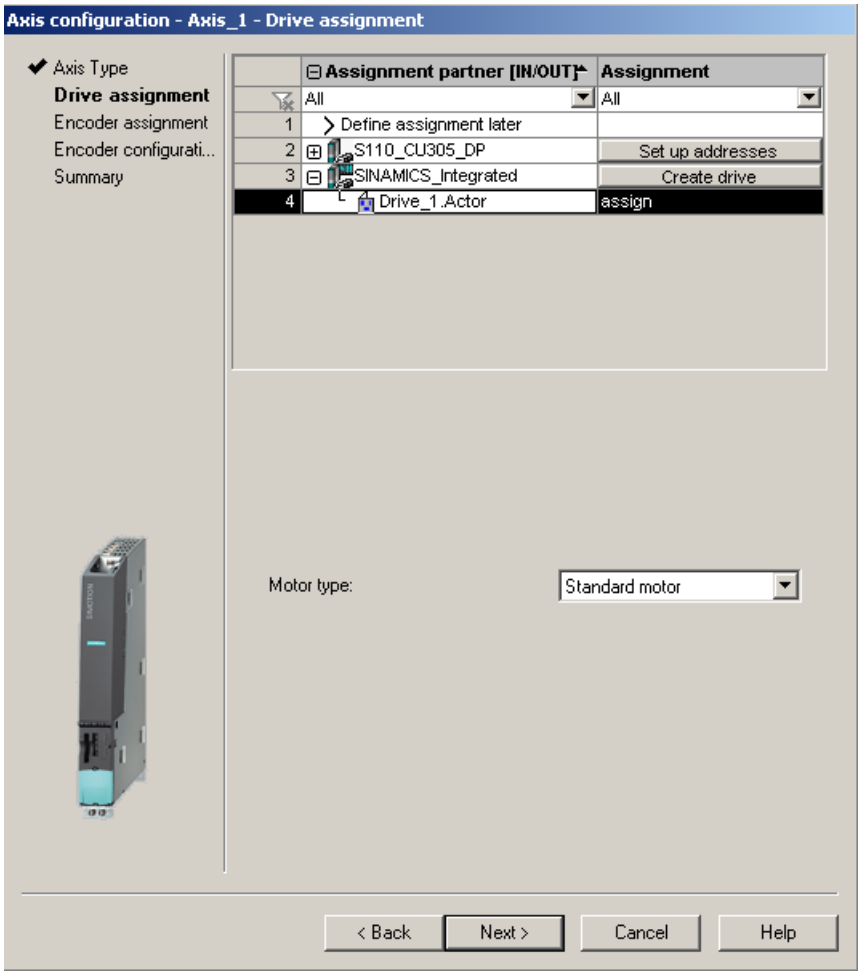

Figure 10-190 Assigning a drive

The following setting options are available for the drive assignment:

- Assigning a drive
  Assigning a previously configured drive.
- Define a subsequent assignment
  The axis should not be assigned to a drive until a later point in time. Accordingly:
  - The PLC and motion control functions to be completely configured by a programmer even without drive know-how using technology objects (e.g. TO axis) and loaded to the device.
  - The drives to be separately configured and optimized by a drive expert.
  - The technology objects to be symbolically assigned later to the drive objects via an interconnection dialog box.

- Creating a drive
  From the Assignment dialog box, a new drive can be created on an existing drive unit (e.g. SINAMICS Integrated) and assigned to the axis. This allows the axis, including the drive, to be created in one operation. It is not necessary to configure a drive before creating an axis.
- Setting up addresses
  If "Use symbolic assignment" has been deactivated, the addresses must be set up manually. This is required, for example, for drive units that do not support symbolic assignment (e.g. SINAMICS S120 with FW version < 2.6.2, MASTERDRIVES, SIMODRIVE, etc.).

The address list in the "All Addresses" view provides an overview of the assignments to all interfaces of the TO axis. From this view, the assignments can also be changed via the Interconnection dialog box (... button).

Note

The symbolic assignment must be deactivated for the drive and axis configuration without symbolic assignment and adaptation.

Run through the wizard and enter the settings of your system. The required axis telegram as well as the addresses used are automatically determined by the engineering system. The telegram is also extended and interconnections in the drive created automatically depending on the selected TO technology (e.g. SINAMICS Safety Integrated).

Click **Finish** to confirm the "Summary" window.

The configured real axis is displayed in the project navigator.

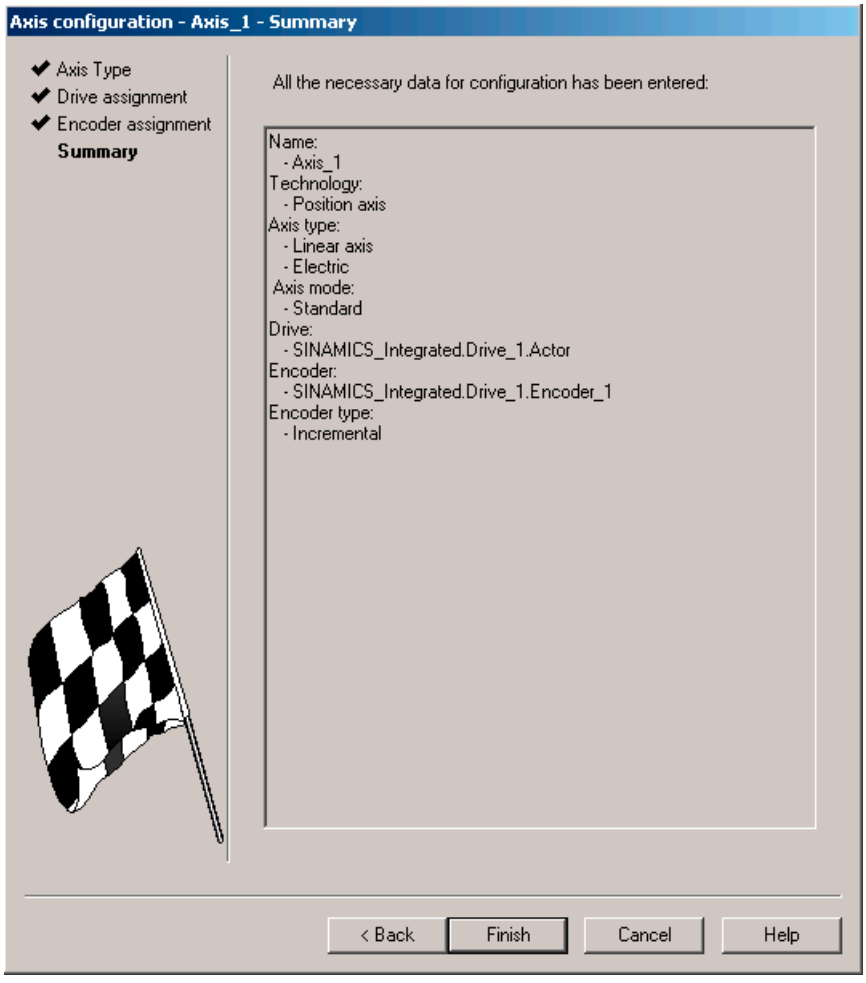

Figure 10-191 Axis wizard summary

Note

During system power-up, reference variables as well as drive and encoder data of the SINAMICS are automatically taken over for the SIMOTION configuration data of the SIMOTION technology objects "TO axis" and "TO externalEncoder".

Encoder assignment

With a position axis, encoder 1 is also created on the TO axis (motor encoder) and automatically assigned to the first encoder on the drive.

If encoder 2 (direct encoder) is created at the TO axis, it is assigned to the second encoder of the drive control.

Result

The configured axis will appear in the project navigator.

Save and compile the project and download it to the target system.

After running through the axis wizard, the symbolic drive assignment is displayed via "Configuration" of the axis as well as via the address list (All addresses view).

The Assignment dialog box can be called again from these dialog boxes using the ... button.

Instead of calling the Assignment dialog box, it is also possible to edit the input field SINAMICS_Integrated.SERVO_02.Actor ... containing the symbolic name directly.

TBD, DSDB, and SIDB

In the "Configuration" dialog box of the TO axis, you can activate the following functions from "Functions" > "Change":

- Technology data block (TDB): for the cyclic exchange of technology data, e.g. actual torque value
- Drive Safety data block (DSDB), V4.4 and higher: to support the SINAMICS Safety Integrated Functions by means of the TO
- Safety Info Data Block (SIDB): Predecessor of the DSDB (for compatibility only)

The assignment is always made to the drive DO of the actuator of the axis. The system automatically generates a telegram extension and the BICO interconnection of the relevant SINAMICS parameters.

Note

The safety data blocks (DSDB or SIDB) are automatically configured by the engineering system and interconnected in the drive.

The PROFIsafe telegram must be configured by the user.

If the activation of the safety functions is to be made using PROFIsafe, configure the PROFIsafe communication to the higher-level SIMATIC F-CPU (see *SINAMICS S120 Safety Integrated* Function Manual).

I/O signals at the TO axis

For the assignment of I/O signals on the TO axis (e.g. the inputs for the homing output cam or hardware limit switches), call the assignment dialog box from the parameterization dialog boxes of the TOs created or from the address list (view of all addresses) by clicking the ... button.

Additional references

See Section Downloading the project to the target system (Page 7419).

For further information about the symbolic assignment, see the *SIMOTION Runtime Basic Functions* Function Manual.

Testing an axis with the axis control panel

Axis control panel

The axis control panel is used exclusively for testing axes.

You can use the axis control panel for the following tasks, for example:

- Testing all system components before the axis movement is controlled by a program.
- Testing as to whether you can move the axis using the axis control panel if a fault is detected.
- Moving the axes for tuning purposes (controller tuning).
- Executing active homing.
- Setting and resetting the axis enable signal.
- Testing the axis that was created.

Requirements

The following requirements must be fulfilled for testing:

- The project has been downloaded to the target system.
- SIMOTION SCOUT is in online mode.

Axis test

1. Open the "AXES" folder in the Project Navigator and click the "Control panel" entry below the axis (for example, Axis_1).
   The axis control panel is displayed.

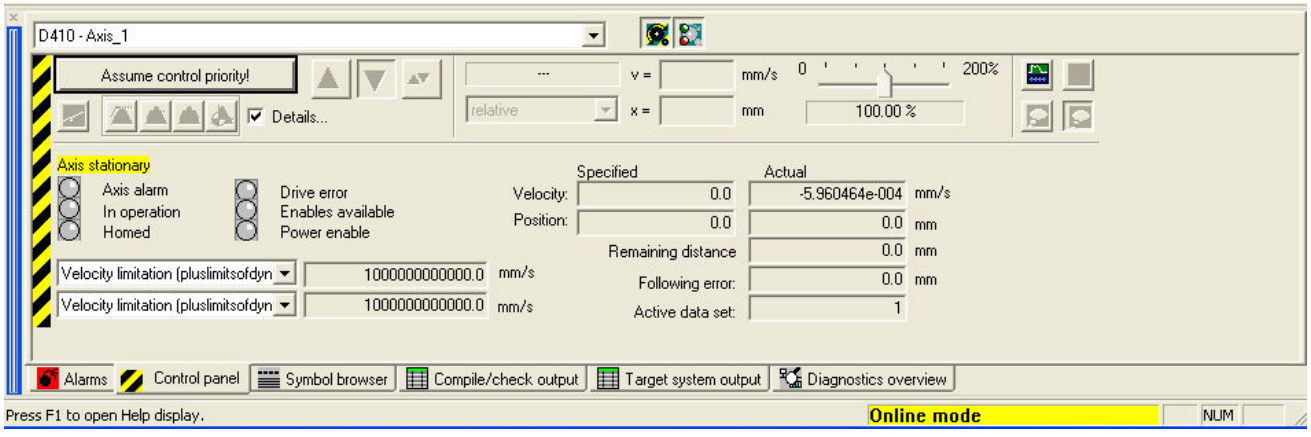

Figure 10-192 Axis control panel

2. To display the control area and axis diagnostics, click the "Show/hide control area" and "Show/hide diagnostics area" buttons.

3. Click "Assume control priority".

Note

In order to move the axis from the PG/PC, you must assume control priority. However, by pressing the SPACER bar, you can stop the axis at any time.

4. The further procedure depends on the CPU status:
   - Case 1: CPU in the STOP/STOPU state
     If the CPU is in the STOP state, a message will appear, indicating that the CPU has been put in the STOPU state.
     A safety message appears in a further dialog box and must be accepted.
     The activated service function is then displayed via the LEDs (RUN/STOP flashing yellow/green with 2 Hz).
   - Case 2: CPU in the RUN state (as of SCOUT/Kernel V4.4)
     Control priority can only be assumed if the axis is not in motion.
     After accepting the safety message, a message is shown on the control panel that the CPU is in the RUN state, that the user program is running, and further axes may be moving. (LED display: RUN).
     If the control priority for a TO is active, commands for the TO from the user program are rejected with an error code. Alarm 30009: reason 0x04 is output.
5. To enable the axis, click "Set/reset enables".
   Confirm the "Switch Axis Enable" dialog box with "OK".

Note

If the control panel is operated in the RUN state, setting/canceling the axis enable can alternatively be controlled via the user program.

6. To traverse the axis, click the "Position-controlled traversing of the axis" button.
7. Enter a velocity and close the dialog box by clicking "OK".
8. Click the "Start movement" button. You can monitor the traversing motion under velocity and position. Use "Stop motion" to stop axis movement again.
9. Click "Set/reset enables" to remove the enable. Confirm the "Remove Axis Enable" dialog box with "OK".
10. Click the "Give up control priority" button to deactivate axis control from the PG/PC. In this operating state, the axes can no longer be controlled from the PG/PC.

Note

For commissioning kinematics transformations, a path control panel is available as of SIMOTION V4.4

Please refer to the additional information in the SCOUT Online Help (Axis control panel index).

Setting up addresses and message frames

Overview

After all SINAMICS components have been configured, addresses must be determined for the process data exchange between the drive and the controller.

This procedure depends on whether **symbolic assignments** are used.

- With symbolic assignment, the addresses are determined automatically by the engineering system; refer to Section Setting up communication for symbolic assignment (Page 7458).
- In the absence of symbolic assignment, addresses must be determined manually; refer to Section Message frame configuration (Page 7458).

Setting up communication for symbolic assignment

The communication for the symbolic assignment can be set up with the following actions:

- From the SCOUT menu
  Call the "Project" > "Setup communication for symbolic assignment" menu.
- At "Download project to target system"
- At "Save project and compile changes"

When setting up the communication, the message frames, BICO interconnections and addresses are set up for the entire project.

Message frame configuration

Requirement

You have configured the drive unit.

On the basis of this configuration, one or more of the following actions should be performed:

- The automatic PROFIdrive telegram setting for a drive object should be activated/deactivated.
- The automatic telegram extension for a drive object should be activated/deactivated.
- The automatic address adaptation for a drive object should be activated/deactivated.
- PROFIdrive telegrams should be configured for drive objects.
- The addresses should be set up.
- Telegrams should be extended manually.

Procedure

In the project navigator, open the "Communication" > "Telegram configuration" entry under "SINAMICS_Integrated."

The "SINAMICS Integrated - Telegram Configuration" dialog box is displayed with the PROFIdrive PZD telegrams tab.

The dialog box lists all the available drive objects. The possible setting options are described in the following.

Note

When using the symbolic assignment, the default setting does not have to be changed or configured.

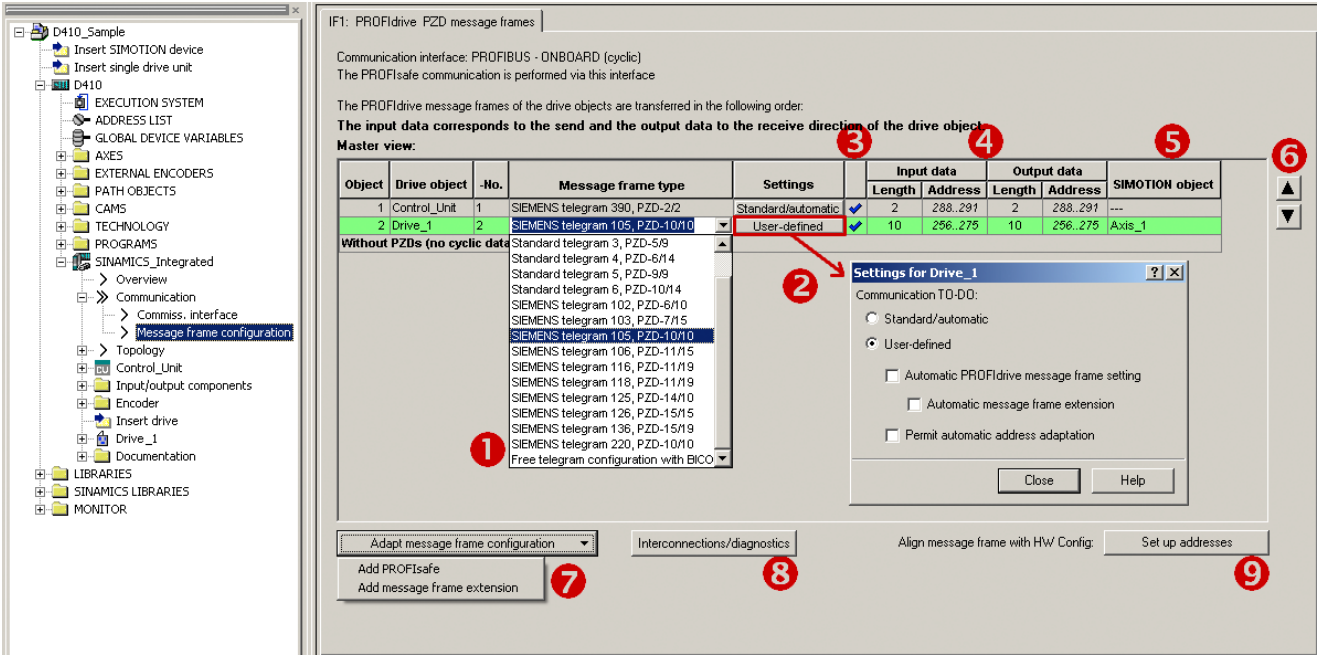

Figure 10-193 Telegram configuration

Table 10-119 Explanation of the figure

No.	Meaning
①	Selection of a telegram • The drive telegrams (telegrams 1 ... 6 and telegram 1xx) are defined in accordance with the PROFIdrive specification and can be selected based on the required functional scope. • You can transfer the signals of the I/Os or the global measuring inputs, for example, via the telegrams 39x. Telegram 39x is also required for the time synchronization between SIMOTION and SINAMICS. • Free telegram configuration with BICO allows you to define your own telegram. • Free telegram configuration with p0915/p0916 (for TM15/17).
②	The "Standard/automatic" and "User-defined" settings are only visible if "Use symbolic assignment" is activated. Using the setting "Standard/automatic" is generally recommended. The "User-defined" setting allows the automatic telegram setting, telegram extension, and address adaptation to be deactivated or activated. • "Automatic PROFIdrive telegram setting" allows the telegram to be set by the system depending on the configured technology (telegram selection, e.g. for drive and control unit incl. onboard I/O). • "Automatic telegram extension" allows the telegram to be extended by the system depending on the configured technology (e.g. if the technology data block is activated in the axis configuration). • "Permit automatic address adaptation" allows addresses to be adapted by the system in the case of address offsets, for example. Address offsets can occur, for example, if a telegram is extended and the adjacent addresses are already occupied by other telegrams. With TM15/TM17 High Feature, "Automatic PROFIdrive telegram setting", "Automatic telegram extension", and "Automatic address adaptation" cannot be deactivated by design, since for these drive objects the telegram is always set up in accordance with the parameterized terminal functionality (DI, DO, output cam, measuring input) and cannot be extended. "Automatic PROFIdrive telegram setting" and "Automatic telegram extension" must be deactivated if the telegrams are to be configured manually for TM15 DI/DO and TM31 and interconnected with BICO. See Section Setting up communication for symbolic assignment (Page 7458).
③	Telegram status (Meaning of the symbols, see table below)
④	Length: Displays the size of the telegram component. Address: Addresses in **HW Config** The addresses will be displayed only if the addresses have been defined.
⑤	Displays the SIMOTION object that is interconnected to the SINAMICS object (e.g. axis or encoder).
⑥	Changing the telegram order Note: Before the alignment, all drive objects without I/O addresses ("---..---") must be moved behind the objects with valid I/O addresses or those still to be aligned ("???..???").
⑦	"Manual" adaptation of the telegram configuration (e.g. when additional data, such as a motor temperature, is to be transferred via the telegram).
⑧	Display of the individual control and status words of the associated telegram.
⑨	Setting up the addresses (alignment of the addresses with **HW Config**) Only the addresses for the respective drive unit are determined (no automatic determination of telegrams / BICO interconnections).

Note

If symbolic assignment is deactivated, the following applies:

If the telegrams for drive objects (drives, Terminal Modules, etc.) change, you must set up the addresses again. The addresses are not updated automatically.

Telegram status

The icons in the status column show the following information:

The telegram differs from the configuration in **HW Config**. You must align the configuration with **HW Config**.

You are using a predefined standard telegram or a free BICO interconnection.

You are using an altered standard telegram that you have extended to include supplementary data.

You are using a telegram for which one of the two telegram lengths is too long. The drive project cannot process this entry.

Error correction (symbolic assignment deactivated)

Based on the 39x telegram, SIMOTION generates further configuration information (FastIO configuration) for the following functions:

- Time-of-day synchronization SIMOTION ⇔ SINAMICS
- Use of onboard I/Os of SIMOTION D, CU, or CX
- Use of cams and global measuring inputs
- System function _setDriveObjectSTW

If the telegrams are defined manually (symbolic assignment is deactivated), a telegram 39x must be set up in the telegram configuration. The telegram then has to be aligned with HW Config via "Set up addresses."

If use of the functions stated above is not possible, generate the FastIO configuration anew. For this purpose select in the project tree the affected SIMOTION D Control Unit, the SINAMICS CU or Controller Extension CX and open the "FastIO" > "Create new configuration" shortcut menu with the right mouse button. Then compile the project and load it into the CPU. Perform a restart.

The FastIO configuration is also used for the telegram of the Terminal Modules TM15 and TM17 High Feature. Proceed in the same way if problems occur.

Linking an additional encoder (optional)

General information

SIMOTION D410-2 features a DRIVE-CLiQ X100 interface for connecting an encoder. SIMOTION D410-2 provides the option of integrating and configuring further encoders in addition to the motor encoder.

The following encoders are supported for operation with SIMOTION D410-2:

- Encoders with a DRIVE-CLiQ interface
- Encoders connected to SIMOTION D410-2 or CUA32 via the onboard encoder interface (X23)
- Encoders connected to SIMOTION D410-2 using an SMx module
- Encoders connected using PROFIBUS or PROFINET

Configuring additional encoders

The second encoder can be used at SIMOTION D410-2, for example, as:

- A machine encoder (second encoder = direct measuring system).
  A direct measuring system measures the technological parameter directly, i.e. without the interference of influences such as torsion, backlash, slip, etc. This may enable improved smoothing of mechanical influences. If you use a second encoder as a machine encoder, you can work with the encoder changeover function.
- An external encoder.
  You can use the external encoder for recording an external master value, for example.
- Encoder for hydraulic axes
- Encoders for the implementation of cam controllers

Configuring tasks

Encoders connected via PROFIBUS/PROFINET are only configured in SIMOTION.

Encoders connected using SMx, DRIVE-CLiQ or the onboard encoder interface must be configured on the drive side (SINAMICS Integrated) and in SIMOTION.

Configure this additional encoder on drive side (SINAMICS Integrated) and in SIMOTION:

1. Configuring additional encoders on the drive (Page 7462)
2. Connecting additional encoders via PROFIBUS/PROFINET (Page 7464)

These steps in configuring are described in the next section.

Configuring additional encoders on the drive

The following options are available for configuring additional encoders on the drive:

- Configuration of a second encoder on the drive
- Configuration of an encoder as drive object (as of SINAMICS firmware V4.3)

Configuring a second encoder on the drive

The configuration of a second encoder on the drive is useful when the second encoder value is also to be used for this drive (e.g. motor or machine encoder). Note that a maximum of only two encoder values can be transferred via PROFIdrive message frames.

In principle, the second encoder value can be freely used (e.g. for acquisition of an external master value), however the use of an encoder as a separate drive object (drive object DO encoder) is preferable because of the clear functional separation.

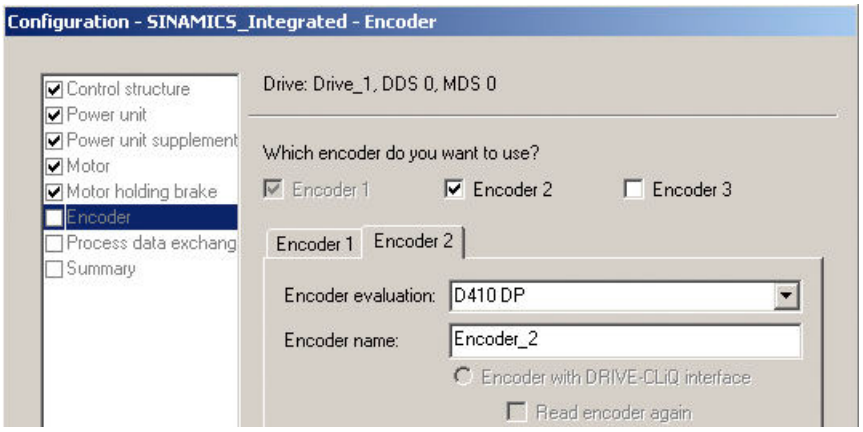

Figure 10-194 Configuration of a second encoder on the drive

Configuring an encoder as drive object

The configuration of an encoder as drive object (drive object DO encoder) has the advantage that this encoder can be used independently of a configured drive (e.g. for acquisition of a master value).

The configuration is performed by inserting an encoder via the project navigator.

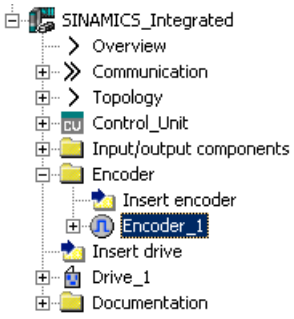

Figure 10-195 Configuration of an encoder as drive object

Note

In the same way as for axes, a "DO encoder" can also be symbolically interconnected to a "TO externalEncoder".

Connecting additional encoders via PROFIBUS/PROFINET

Options

With regard to encoder integration, further encoders can also be connected via PROFIBUS or PROFINET. The following options are available:

- Encoder interconnection using a PROFIdrive message frame (encoder with message frame type 81 and 83)
- Encoder interface as a direct value in the I/O area.

Additional references

Detailed information is contained in the *SIMOTION TO Axis, Electric/Hydraulic, External Encoder* Function Manual

Symbolic assignment of I/O variables

Assignment to the PROFIdrive message frame of the TO axis

I/O variables which you require for purposes such as display and diagnostics can be assigned from the address list to individual components (status word, for example) via the assignment dialog of the PROFIdrive message frame. Only components suitable for the data type of the I/O variable are displayed. If no data type is specified at the I/O variable, this is determined via the assignment partner after the selection.

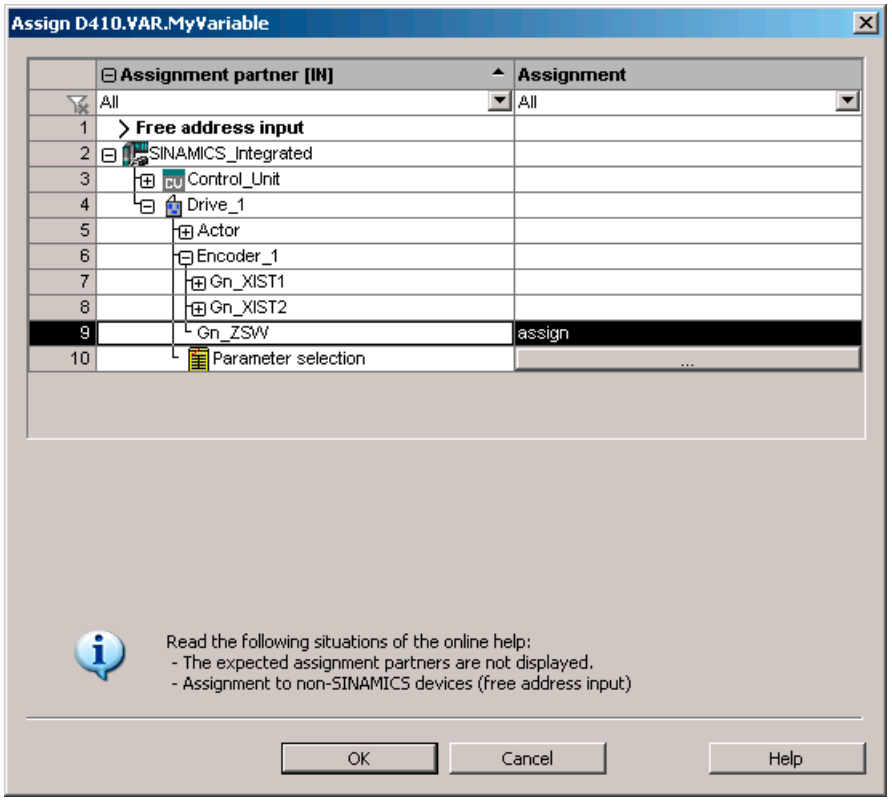

Figure 10-196 Assignment of I/O variables to the PROFIdrive message frame

Assignment to drive parameters

I/O variables from the address list can be assigned to drive parameters using the assignment dialog. Only parameters suitable for the data type of the I/O variable are displayed. If no data type is specified at the I/O variable, this is determined by the parameter selection.

An extension of the standard message frame is created automatically for the transfer of the parameters to/from the drive.

Procedure

1. Open the Assignment dialog box from the address list (view of all addresses).
   The Assignment dialog opens with the corresponding assignment partners.
2. Click the "..." button in the parameter selection line to open the parameter list.

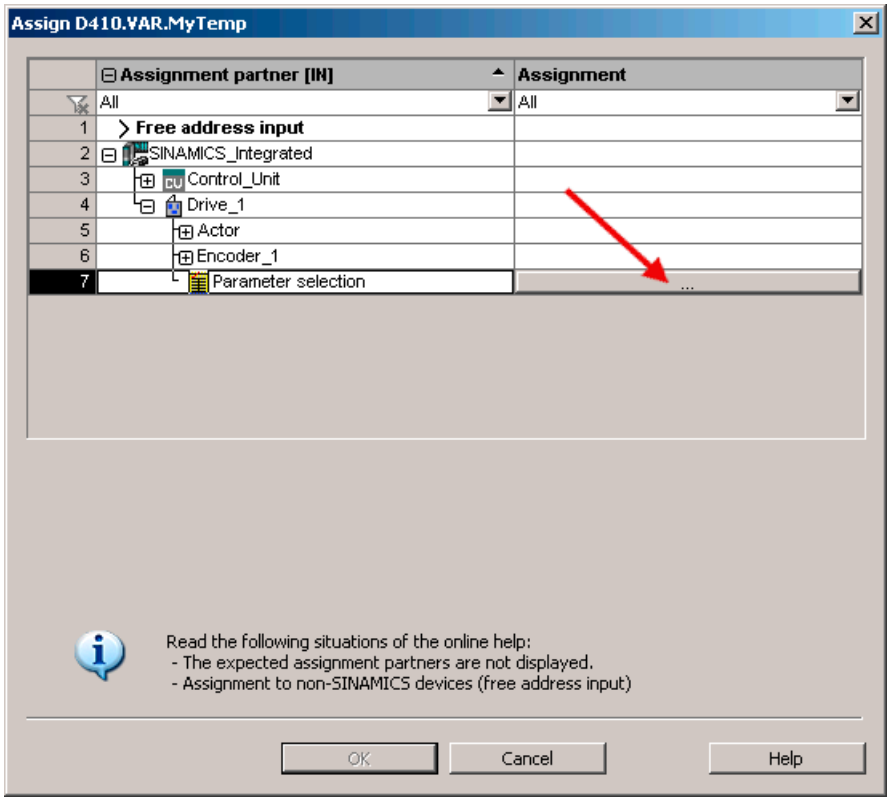

Figure 10-197 Assignment dialog for drive parameters

3. Select the desired signal source (e.g. DO drive). Then select the required parameter.

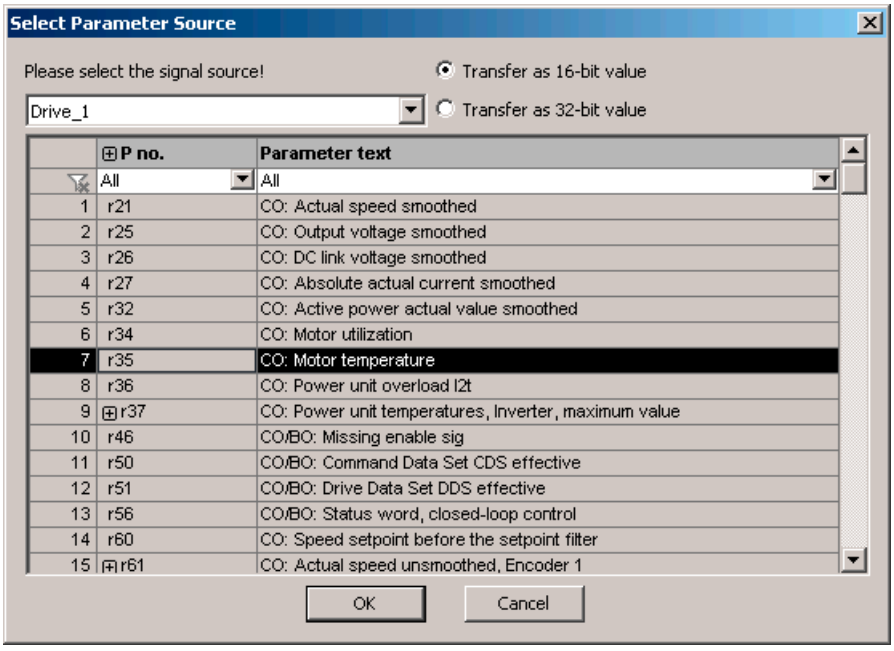

Figure 10-198 Dialog box for the DO and parameter selection

4. Click "OK" to accept the selection.

5. The desired SINAMICS parameter is assigned to the I/O variable in the interconnection dialog box.

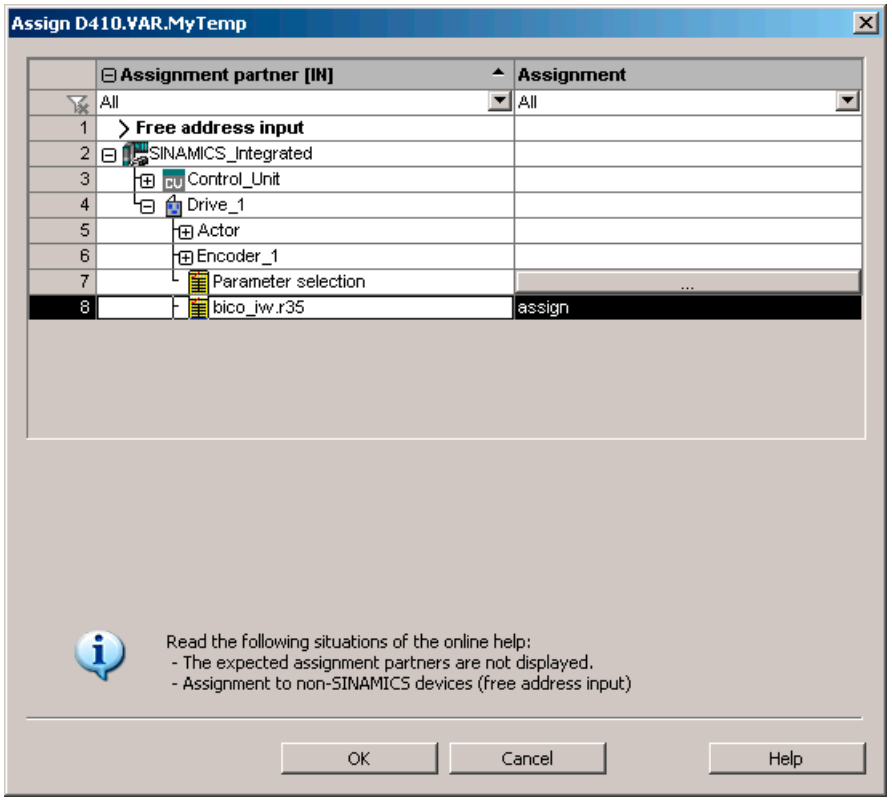

Figure 10-199 Assigned drive parameters

6. Click "OK" to accept the assignment.

The following table shows the possible types of assignment:

Name of the assignment	Data type	Direction	Transferrable BICO parameters
BICO_IW.<parameter number>	WORD	Input	All CO parameters (BICO source)
BICO_QW.<parameter number>	WORD	Output	All CI parameters (BICO sink)
BICO_ID.<parameter number>	DWORD	Input	All CO parameters (BICO source)
BICO_QD.<parameter number>	DWORD	Output	All CI parameters (BICO sink)

Syntax of the assignment names

- A number of parameters (separated by periods) are specified for outputs (SINAMICS side = received data) which can be interconnected with a number of BICO sinks
- If the transferred parameter is on another drive object (DO), the DO name precedes the parameter. "#" is used as a separator between the DO name and the parameter.
- Individually transferred bits of a parameter appear in brackets [x]

Configuring drive-related I/Os

Overview of the symbolic configuration of I/Os

Overview

SIMOTION D410-2 as well as the SINAMICS S110/S120 control units and additional components (TMs) have I/Os that can be used by the drive unit and by SIMOTION.

I/Os originally assigned to SINAMICS can be used by SIMOTION only when they have been interconnected to a message frame.

Symbolic assignment

SIMOTION SCOUT supports by default the symbolic configuration of I/Os, see Section Symbolic assignment / adaptation (Page 7401).

The symbolic assignment simplifies the configuration significantly:

Table 10-120 Comparison of configuration with/without symbolic assignment

Configuration	With symbolic assignment	Without symbolic assignment
Configuring message frames	So that SIMOTION can use SINAMICS I/Os, the required message frames are created automatically	Message frames must be set manually (either predefined message frame (e.g. 39x) or free message frame configuration)
BICO interconnections	The required BICO interconnections are performed automatically (I/Os are interconnected to a message frame)	With predefined message frames (e.g. 39x), the BICO interconnections are made automatically With free message frame configuration with BICO, the interconnection must be made by the user
Parameterization of the I/O functionality (e.g. measuring input)	Parameterization via screen forms	Parameterization via screen forms and partly via parameters in the expert list
Handling of I/O addresses	Handling of addresses is not required because of symbolic assignment	I/O addresses must be determined
Setting up addresses	Addresses are set up automatically, refer also to Section Setting up communication for symbolic assignment (Page 7458)	Addresses must be set up manually, refer also to Section Message frame configuration (Page 7458)

Only the configuration with symbolic assignment is described in the following. For further information on the configuration of drive-related I/Os without symbolic assignment, see Appendix Configuring drive-related I/Os (without symbolic assignment) (Page 7570).

Procedure

The configuration of the I/Os is divided into two basic steps:

1. Configuring I/O terminals (Page 7470)
   The functionality of an I/O channel is configured (e.g. configuration of a DI/DO as digital output).
2. Configuring technology objects and I/O variables (Page 7474)
   The access of technology objects and I/O variables to I/Os is configured. The configuration is symbolical, whereby only "function-compatible" I/O channels are offered for selection.
   Example:
   For the TO measuringInput, only symbolic assignments of the type MI (measuring input) are offered for selection.

The engineering system automatically makes the required message frames and the interconnections to the configured I/Os.

Configuration options

The following table provides an overview of the configuration options for the I/O terminals of various modules.

Table 10-121 Configuration of the I/O terminals overview

Module	Use of the I/Os by		Configuration of the I/O terminals	Supports symbolic assignment
	SIMOTION	SINAMICS		
SIMOTION D410-2 • Terminal X120/X121 • Terminal X130/X131	X [1]	X	On the drive unit (CU)	As of SIMOTION V4.3
SIMOTION D4x5-2 • Terminal X122/X132 • Terminal X142	 X [1] X	 X -	 On the drive unit (CU) On the D4x5-2 (HW Config)	As of SIMOTION V4.2
SIMOTION D4x5	X [1]	X	On the drive unit (CU)	As of SIMOTION V4.2
CX32-2, CX32	X [1]	X	On the drive unit (CU)	As of SIMOTION V4.2
SINAMICS S110 CU305	X [1]	X	On the drive unit (CU)	As of SINAMICS V4.3
SINAMICS S120 • CU310 • CU310-2 • CU320 • CU320-2	X [1]	X	On the drive unit (CU)	 • As of SINAMICS V2.6.2 • As of SINAMICS V4.4 • As of SINAMICS V2.6.2 • As of SINAMICS V4.3
TB30, TM15 DI/DO, TM31	X [1]	X	On the drive unit (TB30 or TM)	Yes
TM41 [2]	X [1]	X	On the drive unit (TM41)	Yes [2]

Module	Use of the I/Os by		Configuration of the I/O terminals	Supports symbolic assignment
	SIMOTION	SINAMICS		
TM15, TM17 High Feature	X	-	On the drive unit (TM15 or TM17)	Yes
Time-based I/O • ET 200MP TM timer DIDQ 16x24V • ET 200SP TM timer DIDQ 10x24V	X	-	On the ET 200 I/O system	As of SIMOTION V4.4 HF6

1) I/Os are originally assigned to a SINAMICS drive unit and can be assigned to SIMOTION via configuration

2) TM41 supports symbolic assignment only for encoder interfaces (not symbolic assignment for DI, DO and AI)

Note

The module hardware for TM15 and TM15 DI/DO is identical. A distinction is only made by the addition of the component in the SIMOTION SCOUT project navigator using "Insert input/output component".

I/Os that are originally assigned to the SINAMICS drive unit can also be used by SIMOTION via configuration.

- An output is always only exclusively available for the SINAMICS drive unit or SIMOTION.
- An input used by SIMOTION can also be interconnected on the drive side.

In the following sections describe in detail how to configure the I/O terminals.

SIMOTION D410-2 Configuring I/Os

Procedure

The onboard inputs/outputs of the SIMOTION D410-2 are assigned to SINAMICS Integrated. The configuration is therefore performed via the drive unit ("SINAMICS_Integrated" > "Control_Unit" > "Inputs/outputs").

The properties of the I/O channel can be configured in the parameterization dialog box. With the bidirectional digital I/Os, for example, an I/O channel can be:

- Parameterized as input or output
- Inverted
- BICO-interconnected (use as drive I/O)
- Used as digital input for SIMOTION with "DI (SIMOTION)"
- Used as digital output for SIMOTION with "DO (SIMOTION)"

- Used as a global measuring input for SIMOTION with "Measuring input (SIMOTION)"
- Used as an output cam output for SIMOTION with "output cam (SIMOTION)"

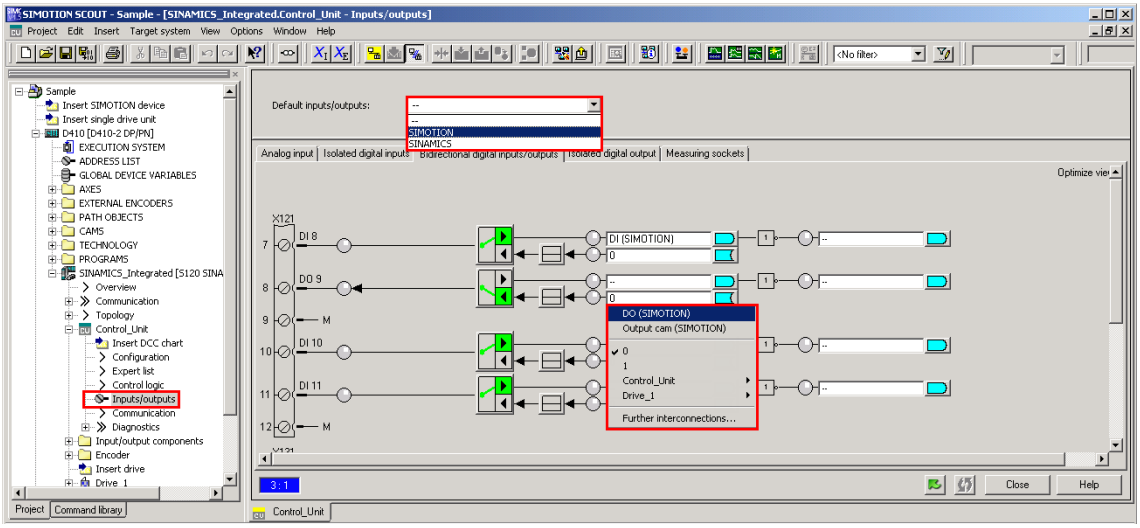

Figure 10-200 Configuration of D410-2 I/Os (terminal X121)

Note

The properties of the I/O channel must be configured offline; Online changes only take effect after a restart (power off/on), provided that the setting has been previously saved retentively with "Copy RAM to ROM".

24 V supply for DO

If no digital outputs are used, the SIMOTION D410-2 can be supplied via the Power Module. A 24 V supply must be connected to terminal X124 for the digital outputs to be used. If a digital output is parameterized and the 24 V supply is not connected (or the level is too low), alarm A03506 is issued on the SINAMICS side (can also be parameterized as a fault).

Data transfer

If the D410-2 onboard I/Os are interconnected using symbols (or if telegram 39x is used for the onboard I/Os), the status information of the DI and DO will be transmitted to cu.p2048 at the PROFIdrive PZD sampling rate. Sampling of the inputs and outputs is also performed in the sampling time parameterized according to cu.p0799.

The same applies if the I/Os are manually interconnected to a drive telegram via a BICO converter.

Transfer of the output values and feedback of the input values is therefore subject to dead times and jitter.

For time-critical applications, use of measuring probes or cams is recommended. Alternately, the isochronous I/Os, I/Os of TM15, TM17, or isochronous ET 200 I/Os can be used.

Configuration of CU3xx/TMxx I/Os

Overview

The configuration is performed in a similar way as for the onboard I/Os for the SIMOTION D410-2, i.e. the I/Os can be

- BICO-interconnected (use as drive I/O)
- Used by SIMOTION

See also Section SIMOTION D410-2 Configuring I/Os (Page 7471)

Note

If symbolic assignment is subsequently activated for a project in which telegrams have already been configured and interconnected, this project can be changed together with the BICO interconnections!

For this reason, make a backup copy of your project before activating the symbolic assignment.

The TM15 DI/DO and the TM31 are particularly affected here (see Section Symbolic assignment / adaptation (Page 7401)).

Configuration of the ET 200SP/MP timer DIDQ

The I/O terminals of the ET 200SP and ET 200MP timer DIDQ can be used as drive-related I/Os for measuring input and output cam applications.

The DI/DQ timers are configured via the hardware configuration of STEP 7 or TIA Portal. The properties of the I/O channel can be configured in the parameterization dialog box, for example

- Timer DI for use of the I/O as measuring input input or
- Timer DQ for use of the I/O as cam output

Note

For the technological use of the timer DIDQ, you must operate the I/O station isochronously on PROFINET:

- ET 200SP timer DIDQ: With SCOUT or SCOUT TIA, IM 155-6 PN HF required
- ET 200MP timer DIDQ: Only with SCOUT TIA, IM 155-5 PN ST or HF required

Operation via PROFIBUS is not possible.

For detailed information on the configuration, see *Technology Modules TM Timer DIDQ for SIMOTION SCOUT and SIMOTION SCOUT TIA* Commissioning Manual

Configuring technology objects and I/O variables

Configuring global measuring inputs

Overview

The type of measuring input must be selected during the configuration of the TO measuring input, see following table.

Table 10-122 Measuring input types

Measuring input types	Explanation
Standard (global measuring input)	Compared with the drive-related local measuring inputs, global measuring inputs have extended functionality and also support a symbolic configuration. They are therefore set as standard.
Drive-related (local measuring input)	The drive-related local measuring inputs are configured via drive parameters, see Section Configuring drive-related I/Os (without symbolic assignment) (Page 7570) in the Appendix.
Listening measuring input	Through the configuration of a listening measuring input, measuring can be performed simultaneously on several axes or external encoders with one measuring input. Detailed information can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs* Function Manual.

A detailed comparison of "local" and "global" measuring inputs as well as an overview of which modules support local or global measuring inputs can be found in Appendix Configuring drive-related I/Os (without symbolic assignment) (Page 7570).

Procedure

If a global measuring input is selected, it must be assigned a hardware input.

Click the "Assign" button ... to open the Assignment dialog box and select a free (i.e. not yet used) I/O.

Note

Only those I/Os are displayed that have the appropriate measuring input functionality (MI_xx [channel name, terminal number]). If no suitable I/Os are displayed, you must first configure the I/Os (I/O must be configured as "measuring input").

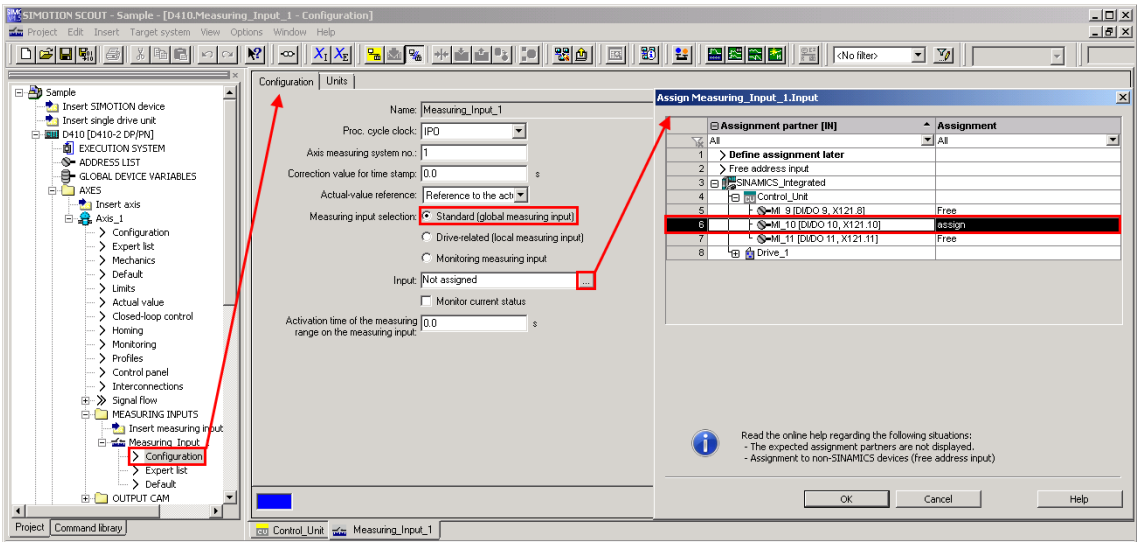

Figure 10-201 Configuration of a global measuring input for SIMOTION D410-2

Additional references

Detailed information on the configuration of the TO measuring input can be found in the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Configuring local measuring inputs

Local measuring inputs are drive-related measuring inputs. The configuration is performed via drive parameters.

For further details, see:

- Configuring drive-related I/Os (without symbolic assignment) (Page 7570) In the Appendix
- *SIMOTION Output Cams and Measuring Inputs* Function Manual

Configuring output cams / cam tracks

Overview

The type of cam output must be selected during the configuration of the TO outputCam and TO camTrack.

The following output types are available:

Table 10-123 TO outputCam / TO camTrack output types

Cam output on...	Explanation
Output cam output (CAM)	The cam output is performed on the basis of an internal time stamp. The temporal resolution of the cam output depends on the hardware used. Supported hardware: • SIMOTION D4x5-2 (terminal X142): Resolution 1 µs • TM17 High Feature: Resolution 1 µs • TM15: Typical resolution 125 µs (DRIVE-CLiQ cycle clock) • SIMOTION D410-2 (DI/DO 8 to 15): Typical resolution 125 µs • ET 200MP TM timer DIDQ 16x24V: Resolution 1 µs • ET 200SP TM timer DIDQ 10x24V: Resolution 1 µs
High-speed digital output (DO)	The cam output is performed via onboard outputs of the SIMOTION CPU. The output is via a hardware timer and the cam output is achieved with a resolution with respect to time < servo cycle. Supported hardware: • SIMOTION D410 (terminal X121) • SIMOTION D4x5 (terminal X122, X132) • SIMOTION C240, C240 PN (terminal X1)
Standard digital output (DO)	The output cam calculations are performed in the processing cycle (IPO or IPO2 cycle or in the servo cycle). Actual cam output is performed in servo cycles. The resolution with respect to time of the cam output is generally reduced by the output cycle of the I/O used. The resolution is therefore dependent as follows: • For the standard I/O (e.g. ET 200), on the cycle time of the bus system (PROFIBUS DP / PROFINET I/O) • For the TM15 / TM17, on the cycle time of the bus system (PROFIBUS Integrated / PROFIBUS DP / PROFINET IO) • For the TM15 DI/DO, TM31, TM41, TB30, on the configured sampling time: – cu.p0799 (CU inputs/outputs sampling time) for the onboard outputs – p4099 (TMxx inputs/outputs sampling time) for TB30, TM15 DI/DO, TM31, and TM41 Supported hardware: • Onboard outputs (SIMOTION D, Controller Extension CX, SINAMICS Control Unit CU3xx) • Centralized I/O (SIMOTION C) • Distributed I/O via PROFIBUS DP / PROFINET IO (e.g. ET 200, etc.) • Drive-related I/O (TM15, TM15 DI/DO, TM17 High Feature, TM31, TM41, TB30)

Procedure

To achieve the best possible output cam resolution on the onboard I/Os of a SIMOTION D410-2, activate the output and select "Cam output on output cam output (CAM)."

Then assign a hardware output. For this purpose, click ... ("assign") to open the Assignment dialog box and select a free (i.e. not yet used) I/O.

Note

Only those I/Os that have the appropriate functionality (DO_xx [channel name, terminal number]) are displayed. If no suitable I/Os are displayed, you must first configure the I/Os (I/O must be configured as "output cam (CAM)")

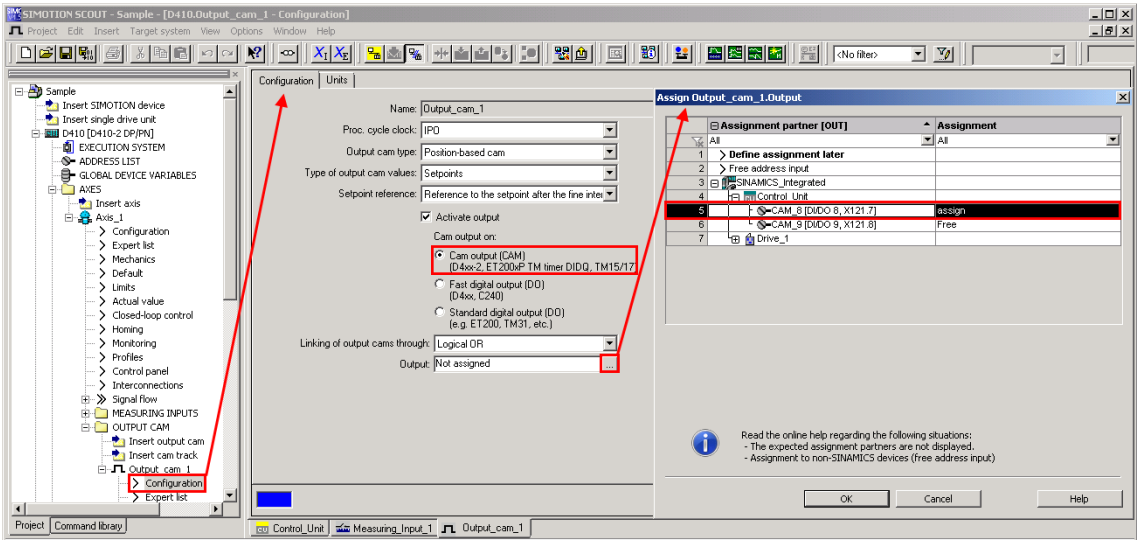

Figure 10-202 Configuration of a cam for SIMOTION D410-2

A maximum of two edges can be output per processing cycle clock of TO outputCam or TO camTrack.

Additional references

Detailed information on configuring the output cam and cam track technology objects can be found in the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Configuring an I/O variable

Overview

You have two ways to assign an I/O variable to I/O terminals:

- Assignment via preferred interconnection (e.g. DI_8 [DI/DO 8, X121.7])
  To do this, you must use the SIMOTION preferred interconnection for the corresponding input/outputs of the SINAMICS DOs. The BICO interconnection is performed automatically.
- Assignment via PZD (e.g. via DI_0_15 or DO_0_15).
  Note that for these signals a message frame of the appropriate length is generated, but the BICO interconnection is not performed.

Interconnection via preferred interconnection

The I/O variables are configured via the address list. Components that support a symbolic assignment can be configured without I/O addresses.
Preferred interconnections are displayed as assignment targets in the Assignment dialog box (e.g. DI_8 [DI/DO 8, X127.7]). The assignment is made by direct selection of the corresponding terminal signal.

Components that do not support symbolic assignment (e.g. standard PROFIBUS I/O) are configured via I/O addresses.

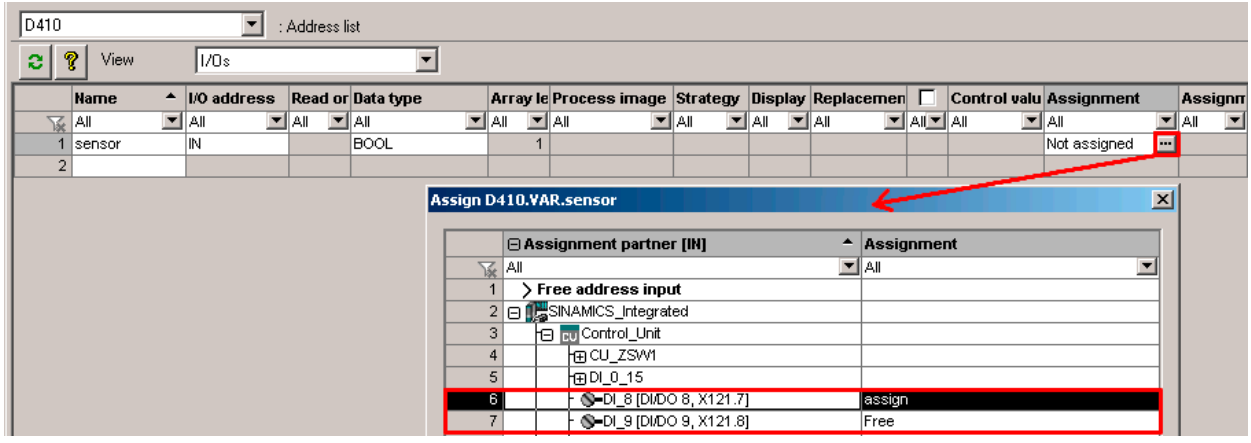

Figure 10-203 Address list

Interconnection via PZD

In principle, an assignment via the PZD is also possible (e.g. via DI_0_15 or DO_0_15). Note that for these signals a message frame of the appropriate length is generated, but the BICO interconnection is not performed.

For this purpose, switch to the "Communication" dialog box of the corresponding SINAMICS DO. You can now see the individual bits of the PZD (e.g. I_Digital or O_Digital) listed there. Interconnect the appropriate bit of the PZD with a signal.

Alternatively, you can assign SIMOTION to an I/O channel during the terminal configuration (e.g. by selecting "DI (SIMOTION)", see Section SIMOTION D410-2 Configuring I/Os (Page 7471)).

TO axis

The symbolic assignment of I/Os is also supported by the TO axis (e.g. for a HW limit switch).

Substitute values for I/O variables

Substitute values cannot be specified for input variables of the BOOL data type. If you do require substitute values however, proceed as follows:

1. Assign a digital input (e.g. SINAMICS_Integrated.Control_Unit.DI_8 [DI/DO 8, X121.7]) to an input variable of the BOOL type (e.g. sensor).
2. Create a global variable (e.g. all_inputs) (at least data type WORD, e.g. SINAMICS_Integrated.Control_Unit.DI_0_15).
3. Configure the substitute value
   The corresponding bit of the substitute value must then contain the substitute value for the BOOL variables.
   In the same way, you can assign a substitute value to a BICO parameter.

For various SINAMICS drive objects, higher-level types are available for the assignment of substitute values.

	Name	I/O address	Read or	Data type	Array le	Process image	Strategy	Display	Replacemen		Control valu	Assignment	Assignm
	All	All	All	All	All	All	All	All	All	All	All	All	All
1	sensor	IN		BOOL	1							SINAMICS_Integrated.Control_Unit.DI_8 [DI/DO ...	4: Set up
2	all_inputs	IN		WORD	1		Substitut...	HEX	16#00_00			SINAMICS_Integrated.Control_Unit.DI_0_15	4: Set up
3													

Figure 10-204 Configuration of substitute values

Creating a DMC20/DME20 DRIVE-CLiQ hub

Hub properties

DRIVE-CLiQ hub characteristics

The DMC20 and DME20 DRIVE-CLiQ hub modules are used to implement point-to-point distribution of a DRIVE-CLiQ line. With the DMC20/DME20, an axis grouping can be expanded with 4 DRIVE-CLiQ sockets for additional subgroups.

- DMC20 is the hub for the control cabinet configuration
- DME20 is the hub for use without a control cabinet (IP67 degree of protection).

The modules are especially suitable for applications which require DRIVE-CLiQ nodes to be removed in groups, without interrupting the DRIVE-CLiQ line and therefore the data exchange.

Application examples

Encoder expansion and hot-plugging are typical applications implemented by means of a DRIVE-CLiQ hub.

- In an encoder expansion, direct measuring systems are connected. For example, these are attached directly to the machine in the control cabinet. Several encoders can be connected to one hub in the cabinet.

  Note

  The SIMOTION D410-2 has just one DRIVE-CLiQ interface. You can use the DMC20/DME20 to evaluate the motor encoder and an additional encoder by means of SMx. The DRIVE-CLiQ hub must be directly connected to the Control Unit.

- Hot plugging is the option for changing motor components while in operation. These components are connected to a star topology using a DRIVE-CLiQ hub. This setup allows their deactivation without impairing downstream components.

Additional references

Additional information on the DMC20/DME20 DRIVE-CLiQ hub is contained in the

- *SIMOTION D410-2* Manual
- *SINAMICS S120 Control Units and Supplementary System Components* Manual

Creating a DRIVE-CLiQ hub

Introduction

You can directly insert a DMC20/DME20 in the project navigator. The hub is not wired when you insert the DMC20/DME20 and is displayed in the topology tree in the component storage. The hub has to be wired manually. Proceed as follows:

Procedure

1. Right-click the "Topology" entry in the Project Navigator.
2. Select the "Insert new object" > "DRIVE-CLiQ Hub" command from the shortcut menu and confirm with "OK".
3. Double-click "Topology" to open the topology tree.
   The hub is saved to the component storage of the topology tree.
4. Drag-and-drop the hub to the required DRIVE-CLiQ interface.
   The components connected to the hub are displayed in the topology tree.

Result

The hub you inserted is displayed as an icon at the "Topology" entry in the Project Navigator. All components connected to a hub are also displayed in the course of automatic configuration.

Creating and programming TM41

TM41 properties

The TM41 terminal module can be used to expand the number of digital I/Os and analog inputs within a drive system. TM41 also returns TTL signals which emulate an incremental encoder, for example, for a master control system.

The emulated encoder signal has the signal characteristic of an incremental TTL encoder (A track, B track, R track). The resolution of the encoder signal can be specified in the configuration.

Note

The digital I/Os and the analog input can be interconnected using the BICO configuration.

The TM41 encoder interface (incremental encoder representation) can

- Be interconnected with a Control Unit encoder signal (from sin/cos incremental encoders, for example), using parameterization. For detailed information, consult the SINAMICS manuals.
- From the SIMOTION viewpoint, be accessed as an axis. This allows you to make the axis position (a master value) available to a second controller as an encoder signal, for example.

Configuring the TM41 involves the following steps:

- Configuring TM41 at SINAMICS Integrated (Page 7481)
- Configuring the TM41 using the axis wizard (Page 7482)

Configuring TM41 at SINAMICS Integrated

Procedure

The TM41 can be configured after you completed the configuration of SINAMICS Integrated. Proceed as follows:

1. Double-click "Insert input output component" at "Input/output component" in the Project Navigator.
2. Select the TM41 from the "Drive object type" field of the "Insert Input/Output Component" dialog box and assign a unique name to the module.
3. Confirm your entry with "OK".

Result

The TM41 is inserted in the Project Navigator by the name you entered.

Configuring the TM41 using the axis wizard

Requirement

After configuring the TM41 for a SINAMICS Integrated device in the project navigator, you can interconnect it with an axis using the Axis Wizard. The Wizard implements the TM41 as drive device.

Procedure

1. Open the Axis Wizard and create a positioning or synchronization axis (electrical).
2. Step the Axis Wizard forward until the "Drive Assignment" dialog box opens.
3. Select "SINAMICS_Integrated" as the drive device and "TM41" as the drive.
   TM41 operates as setpoint sink of the axis with this setup.

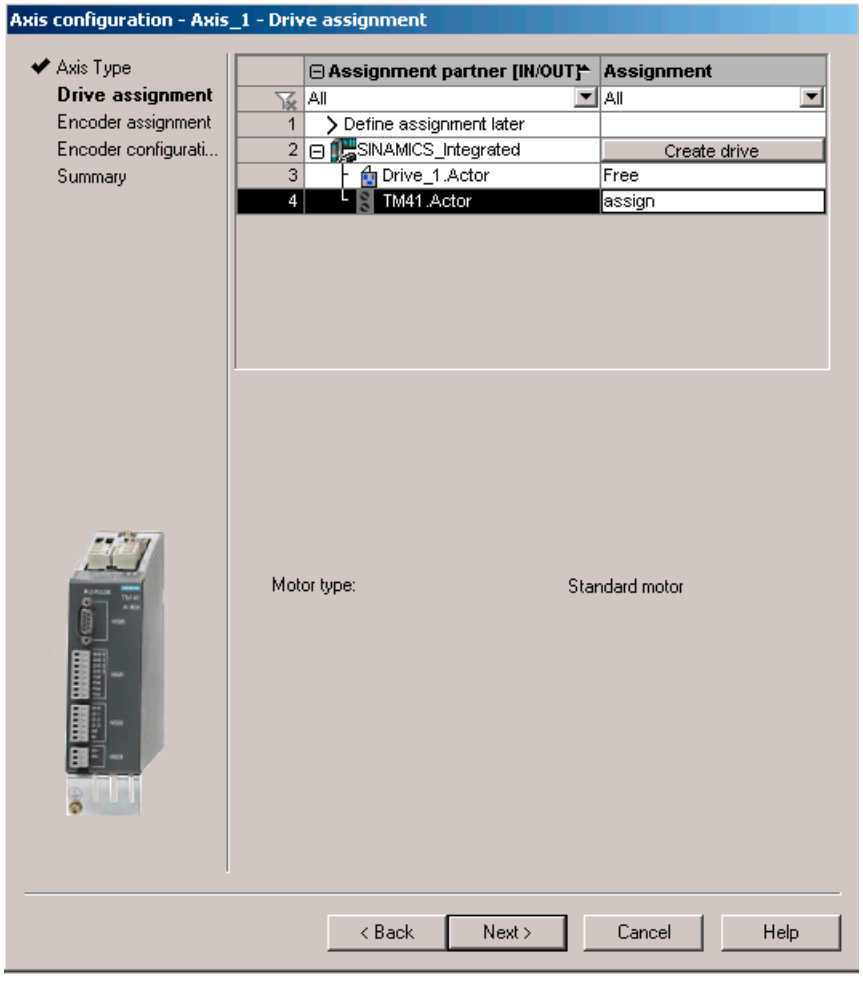

Figure 10-205 Drive assignment

4. Work through the remainder of the Axis Wizard.

Reference

Detailed information on configuring incremental encoder emulation with the TM41 can be found in:

- FAQs at the following
  Internet address (https://support.industry.siemens.com/cs/ww/en/view/27554028)

  SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Optimizing the drive and controller

Overview of automatic controller setting

Overview

The SIMOTION SCOUT engineering system offers a wizard for the automatic controller setting for the controller optimization of the drive.

In the "Automatic Controller Setting" screen form, you can configure an automatic setting for the speed controller and the DSC (dynamic servo control) position controller for SINAMICS drive units. The necessary steps for this calculation can be controlled from this screen form. The calculated parameter values for the speed controller or position controller are displayed and can then be transferred online to the drive or axis on the controller.

The automatic control setting is made from the "Target system" > "Automatic control setting" menu.

A detailed description of the settable parameters can be found in the *SIMOTION SCOUT* Online Help.

Requirements

- You have configured a SINAMICS drive.
- The configured drive is operated in the "Servo" drive object type.
- Closed-loop control takes place with the motor encoder.
- There is an online connection to the relevant drive unit.

Procedure

Automatic controller setting involves the following steps:

1. Setting the speed controller (Page 7484)
2. Setting the position controller (Page 7485)

Note

You can cancel the automatic controller setting by pressing the SPACEBAR.

- The step currently being executed is aborted.
- The drive enable is canceled.

Additional references

Information on the controller structure can be found in the *SIMOTION TO Axis, Electric/ Hydraulic, External Encoder* Function Manual.

In addition to the automatic controller setting, SIMOTION SCOUT also offers the option to optimize the drive and controller manually using the measuring functions, trace, and function generator.

See also

Measuring functions, trace, and function generator (Page 7486)

Manual speed controller optimization (Page 7488)

Automatic speed controller setting

Characteristics

The automatic speed controller setting has the following features:

- Damping of resonances in the speed-controlled system
- Automatic setting of the Kp gain factor and the Tn reset time of the speed controller
- The speed setpoint filter and the reference model are not changed.

Procedure

To perform an automatic setting of the speed controller, proceed as follows:

1. Select the "Target system" > "Automatic controller setting" menu command.
2. Select the drive unit and the drive.
3. Select the "Speed controller" from the "Controller selection".
4. Click "Assume control priority" to assume control priority.
5. Click the "Drive on" button to enable the drive.
   Perform these steps (1 to 4) in automatic mode or as individual steps.
6. Click "Transfer" to transfer the calculated parameter values for the speed controller to the drive.
7. Disable the drive by clicking the "Drive off" button.

8. Click "Give up control priority" to give up control priority of the PG/PC.
9. Save the online parameters.

You can now transfer the automatically set parameters to the project.

Backing up parameters

Proceed as follows to back up the parameters:

1. In the project navigator, select the SINAMICS unit with the drive for which you want to perform the automatic setting.
2. Select "Target device" > "Copy RAM to ROM" in the context menu.
3. Select "Target device" > "Load CPU / drive unit to PG" in the context menu.

If required, the automatic controller settings can be checked using the measuring functions.

Automatic position controller setting

Introduction

In the "Automatic Controller Setting" screen form, you can select the SINAMICS drive unit and the drive for which you want to carry out an automatic DSC position controller setting. The necessary steps for this calculation can be performed from this screen form. The calculated Kv value is displayed and can then be accepted online in the configuration data of the axis that is assigned to the drive.

Requirements

In addition to the General requirements for the automatic controller setting, the following boundary conditions apply for setting the position controller:

- DSC is required for the position controller setting.
  Tip: Activate the project setting "Use symbolic assignment" and select the Standard/ Automatic option for the axis-drive communication when configuring the drives. You automatically use DSC for the servo drives with these settings.
- The speed controller has already been configured (e.g. with the automatic speed controller setting).
- At least one axis is connected to the SINAMICS drive (servo).
- An online connection to the SIMOTION device must be established to transfer the results of the automatic position controller setting.
- The balancing filter is not changed.
- For operation without precontrol, the equivalent time constant of the position controller must be adjusted manually by the user (PositionTimeConstant = 1/Kv).
- Vibration on the load side is not taken into account for the position controller setting.

Procedure

To perform an automatic setting of the position controller, proceed as follows:

1. Select the "Target system" > "Automatic controller setting" menu command.
2. Select the drive unit and the drive (axis).
3. Select the "Position controller (DSC)" from "Controller selection".
4. Click "Assume control priority" to assume control priority.
5. Click the "Drive on" button to enable the drive.
   Perform the steps either in automatic mode or as individual steps.
6. Select the axis data sets to which the Kv factor is to be transferred.
7. Click "Accept values" to transfer the calculated Kv factor to the axis data sets.
8. Disable the drive by clicking the "Drive off" button.
9. Give up the control priority of the PG/PC.
10. Save the online parameters.

You can now transfer the automatically set parameters to the project.

Backing up parameters

Proceed as follows to back up the parameters:

1. In the project navigator, select the SIMOTION unit with the axis for which you want to perform the automatic setting.
2. Select "Target device" > "Copy current data to RAM" in the context menu.
3. Select "Target device" > "Copy RAM to ROM" in the context menu.
4. Select "Target device" > "Load CPU / drive unit to PG" in the context menu.

If necessary, you can check the automatic controller settings using the measuring functions.

Measuring functions, trace, and function generator

Drive optimization

Drive optimization is part of commissioning and can be performed with SIMOTION SCOUT.

Note

Controller optimization may only be performed by skilled personnel with control engineering knowledge.

Controller optimization

Various measuring functions are available for controller optimization of the drive. These measuring functions enable the control of the higher-level control loop to be selectively switched off and the dynamic response of individual drives to be analyzed through simple parameter assignment. The function generator and the trace recorder are used.

The control loop is supplied with the ramp-function generator signal at a specific point (e.g. speed setpoint), and the signal from the trace recorder is recorded at another point (e.g. speed actual value).

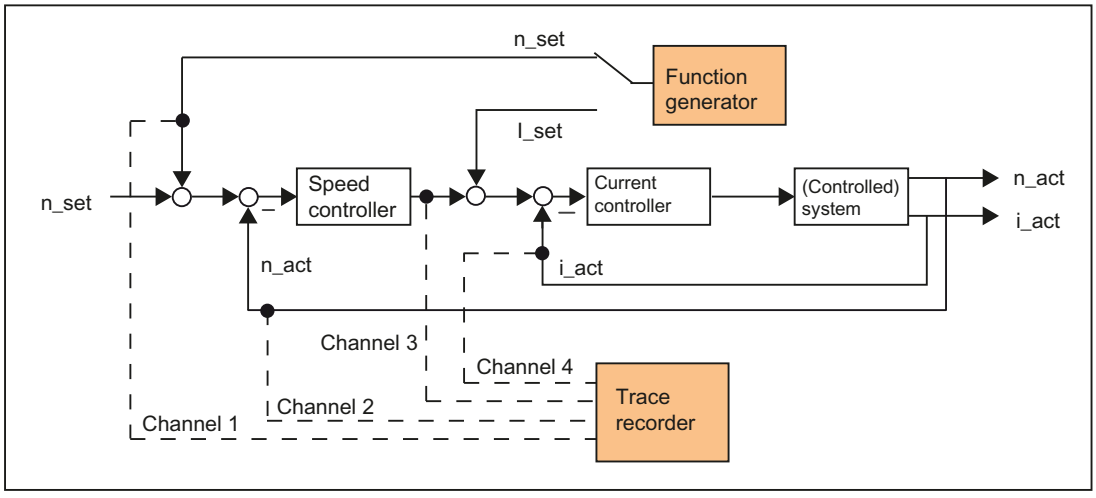

Figure 10-206 Optimizing a controller

Depending on the form of controller optimization to be performed, it is possible to define the quality (e.g. signal form, amplitude, transient recovery time) of the disabled signal, the measuring duration for step functions in the time range, or the bandwidth and number of averaging operations in the frequency range for the trace. The analytical and graphical evaluation can then be performed accordingly (FFT diagram, Bode diagram).

The following measuring functions are available:

- Setpoint jump at current controller
- Reference frequency response at current controller
- Setpoint jump at speed controller
- Disturbance variable jump at speed controller
- Reference frequency response at speed controller
- Disturbance frequency response at speed controller
- Speed-controlled system (input at current setpoint filter)

Additional references

For additional information about drive optimization, consult the *SINAMICS S120* Commissioning Manual.

Additional information on trace and measuring functions, as well as on the function generator, can be found in the *SIMOTION SCOUT* online help.

Manual speed controller optimization

Requirement

You have already created a project and configured an axis and a drive. You can now optimize the speed controller.

Procedure

1. Open the project and go to online mode.
2. Click to call the "Measuring Functions" dialog.
3. Select the drive unit and the drive.
4. Select "Speed controller setpoint jump".
   You can change the values in the following fields: "Settling time", "Amplitude", "Offset", "Ramp-up time" and "Measuring time".

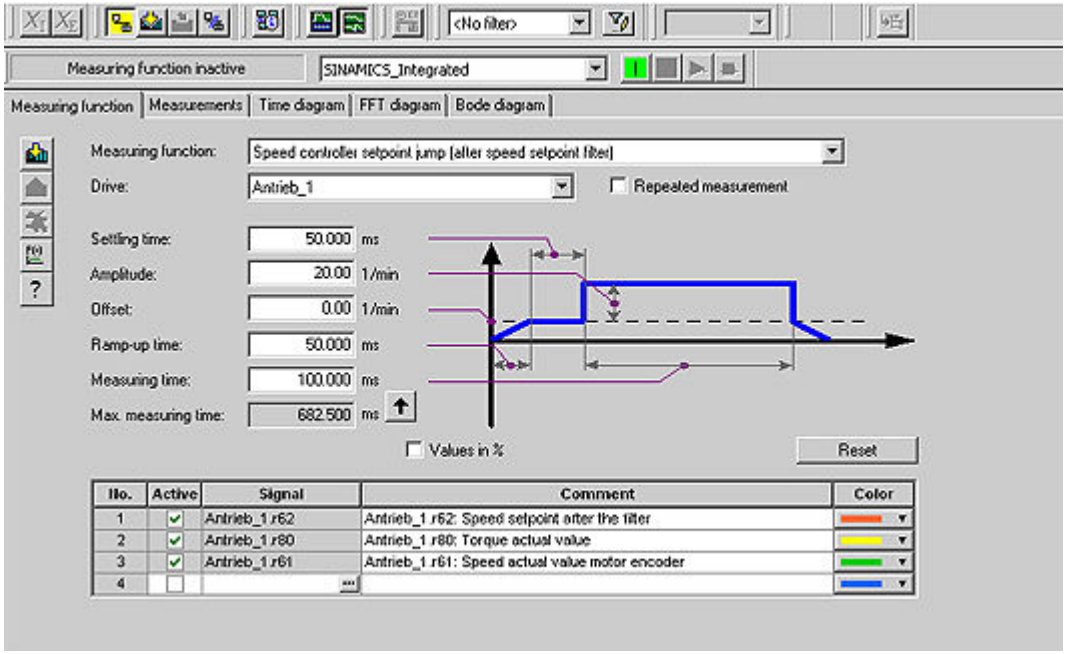

Figure 10-207 Speed controller measuring function

Four channels can be traced. Certain channels are preassigned, depending on the measuring function.

5. Download the changes to the drive by clicking (Download parameter assignment).

Starting the measuring function

1. Click "Assume control priority" to assume control priority.
   Read the notice that appears and click "Accept" to confirm. The activated service function is displayed via the LEDs (RUN/STOP flashing yellow/green with 2 Hz).
2. Click the "Drive on" button to enable the drive.

3. Click (Start measuring function) to start the measuring function.
   The axis is moved during the measurement. For this reason, a safety message that allows the process to be aborted is displayed.
4. The traced signals are represented on the "Time diagram" tab.

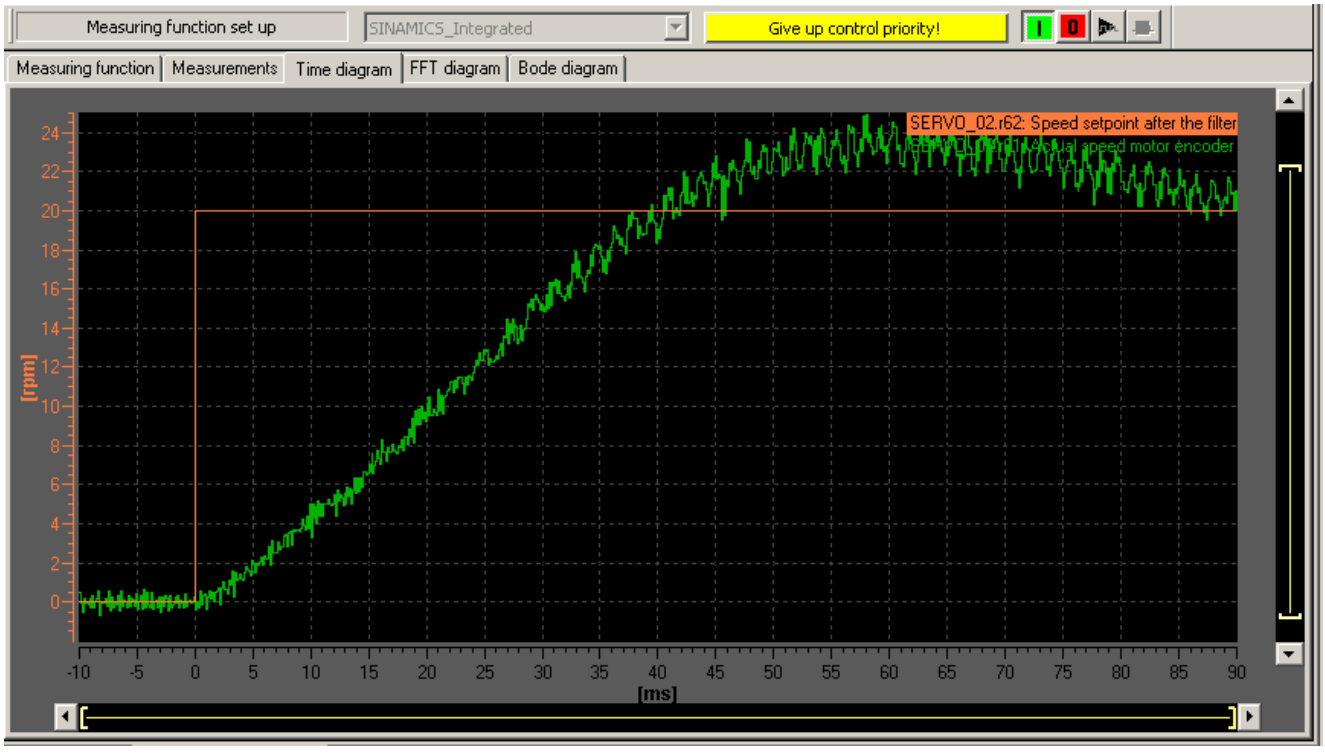

Figure 10-208 Time diagram before parameter change

Adjusting the P-gain

You can adjust the P-gain of the controller to optimize the transient response.

1. In the project navigator under the corresponding drive, for example, Servo_1, use the menu command "Open-loop/closed-loop control" > "Speed controller" to display the "Speed Controller with Encoder" dialog box.
2. Enter an appropriate value in the "P-gain" field and the "Integral time" field.

Note

The values entered take immediate effect.

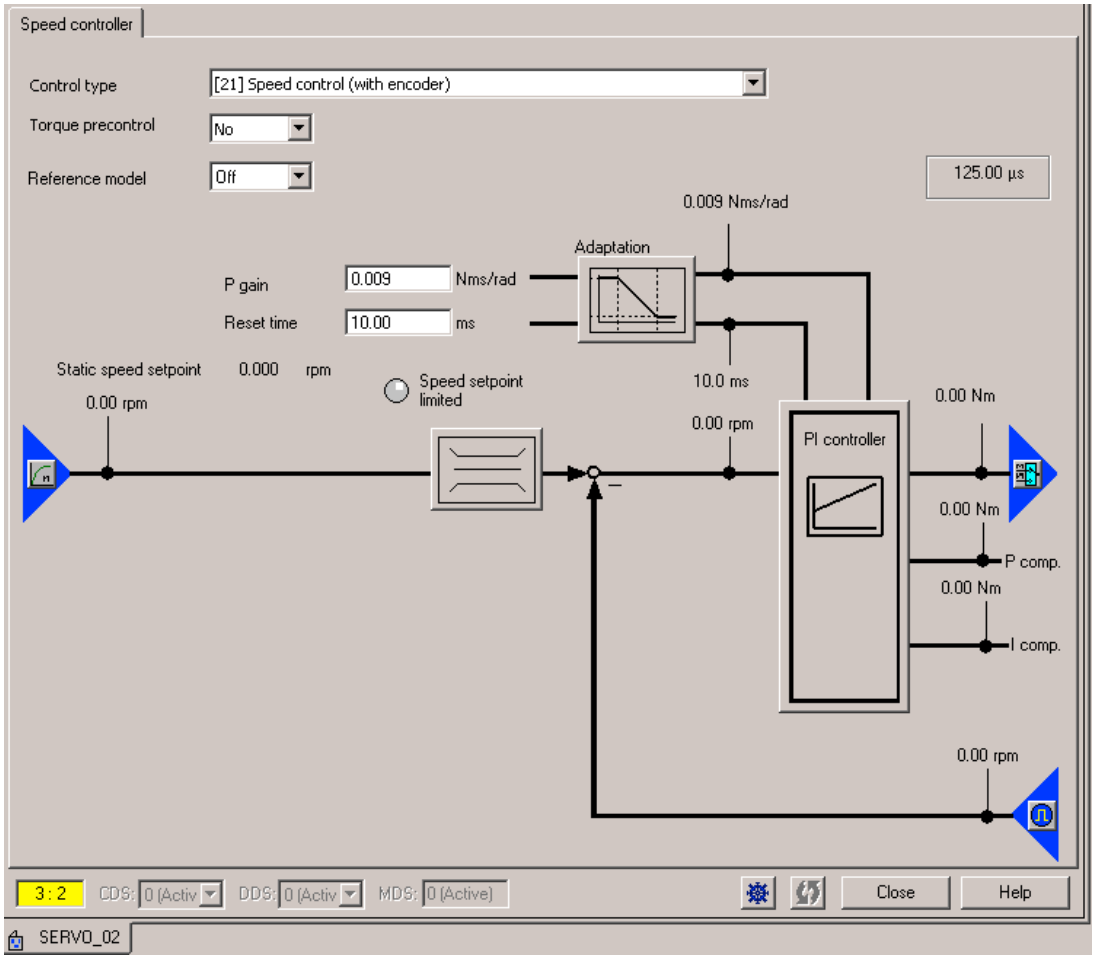

Figure 10-209 Entering P-gain

3. For verification purposes, perform the measurement again.
4. With the modified parameters, the controller displays a much better transient response. If necessary, you can continue changing the value until the transient response is optimal.

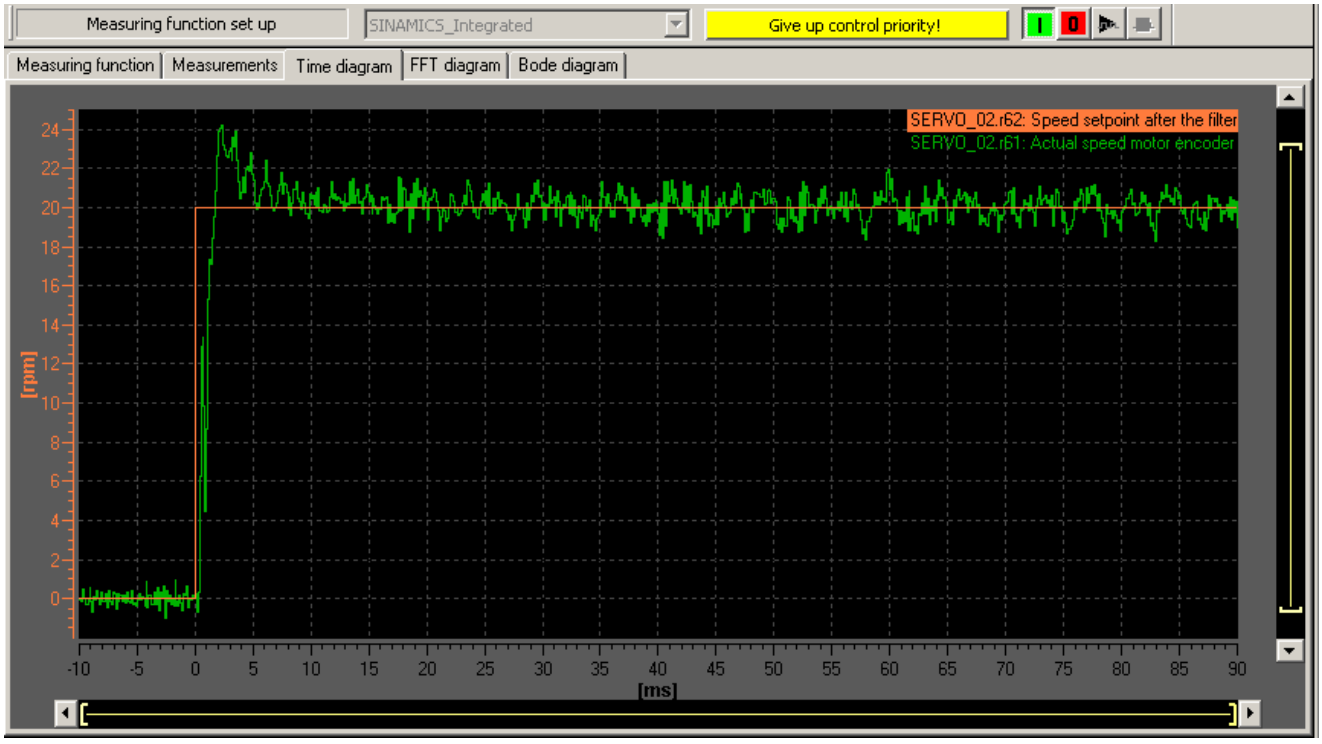

Figure 10-210 Measurement with modified P-gain

Loading and saving SIMOTION user data

Overview

After commissioning the SIMOTION D410-2, we recommend that you back up the SIMOTION user data (programs, configuration data and parameter assignments) on the CF card.

Loading user data

Use the "Target system" > "Load" > "Load to target system" command to transfer the following data from the SIMOTION SCOUT engineering system (ES) to the "non-volatile SIMOTION data" area of SIMOTION D410-2:

- Configuration data
- Programs
- Parameterization
- Technology packages

The hardware configuration of the SIMOTION D410-2 and the retain variables are also stored in the "non-volatile SIMOTION data" area.

Note

Using the menu:

- "Target system" > "Load" > "Load project to target system" loads all of the project data to the target system.
- "Target system" > "Load" > "Load CPU / drive unit to target device" only loads the data of the selected device / drive element to the target device.

After the SIMOTION D410-2 is switched off, the contents of the "volatile SIMOTION data" area are lost.

Additional references

Additional information about the SIMOTION SCOUT engineering system can be found in the *SIMOTION SCOUT* Configuration Manual.

Saving user data

The "Copy RAM to ROM" function is used in SIMOTION SCOUT to save the following data from RAM to the CF card:

- Technology packages and user data (units, configuration data, parameter assignments, task configuration) from the "volatile SIMOTION data" area
- Current data values are copied to the "volatile SIMOTION data" area, depending on the settings in SIMOTION SCOUT.

  Note

  The "Copy RAM to ROM" command **cannot** be used to save the current values of retain variables to the CF card.

You have the following options for backing up the current values of retain variables to the CF card:

- User program
  Use the "_savePersistentMemoryData" system function in the user program.
- Save with the service selector switch or the DIAG button on the SIMOTION D410-2 or using SIMOTION IT web server, see Section Diagnostic data and non-volatile SIMOTION data (Page 7557)

The SCOUT functions "Save variables" and "Restore variables" also give you the option of backing up to your PC and restoring data that was changed during operation and only stored in the runtime system.

Execute the "Copy RAM to ROM" function separately for the SINAMICS Integrated. This requires that the drive element has been selected in the Project Navigator.

See also

Properties of the user memory (Page 7352)

Deleting data

Overview of data deletion

The memory of the SIMOTION D410-2 described in the User memory concept (Page 7351) can be deleted in various granualarities. That is, you can choose to delete all data or only specific parts.

You have the following means of deleting the SIMOTION D410-2 data:

- SIMOTION D410-2 memory reset (Page 7493)
- Deleting user data on CompactFlash card (Page 7496)
- Setting SINAMICS Integrated to the factory settings (Page 7497)
- Restoring the default settings for the SIMOTION D410-2 (Page 7497)
- Deleting/restoring non-volatile SIMOTION data (Page 7564)
- Backing up / restoring / deleting SINAMICS NVRAM data (Page 7437)

SIMOTION D410-2 memory reset

Introduction

During the memory reset, the memory of the SIMOTION D410-2 and the non-volatile SIMOTION data in the NVRAM with the exception of the communication configuration (baud rates, network addresses, etc.), are deleted. The data on the CF card is retained during the memory reset.

Reset the memory on the SIMOTION D410-2 if

- If you want to undo changes made to user data (programs, configuration data, parameter assignments) which you have not backed up by means of the "Copy RAM to ROM" command.
- The RUN/STOP LED is flashing (slowly flashing yellow) to indicate that the SIMOTION D410-2 is requesting a memory reset.
- If the non-volatile SIMOTION data with the project on the CF card do not match and an error occurs (diagnostic buffer entry).

You can perform a memory reset either in offline mode using the mode switch of the SIMOTION D410-2 or in online mode using the SIMOTION SCOUT.

Data deleted on memory reset

The following data are deleted during a memory reset:

- User data (units, configuration data, parameter settings, task configuration)
- Technology packages

- Retain TO (absolute encoder adjustment)
- Retain variables
  Retain variables are variables in the interface or implementation section of a UNIT that are declared with VAR_GLOBAL RETAIN, or global device variables with the RETAIN attribute.

Note

Absolute encoder data are deleted during a memory reset and must therefore be readjusted after the memory reset.

Data retained during memory reset

The following data are retained during a memory reset:

- TCP/IP and DP parameters
- Diagnostic buffer
- Data that was saved with the _savePersistentMemoryData, _saveUnitDataSet or _exportUnitDataSet commands and with the "Copy RAM to ROM" function.
  If backup files (PMEMORY.XML/PMEMORY.BAK) have been created with _savePersistentMemoryData, the data in these files will be backed up again to the non-volatile SIMOTION data after the memory reset. Users can therefore force the restoration of non-volatile SIMOTION data by means of memory reset. This also includes the absolute encoder position.
- Licenses
- SINAMICS NVRAM data

The technology packages and user data (configuration data, programs, parameter assignments) that were previously backed up on the CF card using the "Copy RAM to ROM" menu command will be transferred to the "non-volatile SIMOTION data" area of the SIMOTION D410-2 during the next power-up. Thus, an existing configuration on the CF card is loaded to the SIMOTION device following the memory reset.

Memory reset by means of SIMOTION SCOUT

The SIMOTION device for which overall reset is to be performed must be online.

1. Open the "Control Operating State" dialog box in SIMOTION SCOUT. Select the "Target system" > "Control operating state" menu command. Or click on "Control Operating State" on the toolbar.
2. Switch the SIMOTION device for which memory reset is to be performed to STOP in the "Control Operating State" dialog box.
3. Select the SIMOTION device under "Memory reset (MRES)." Click the "Run" button. Confirm the command by clicking "Yes."
   The memory reset will now be performed.

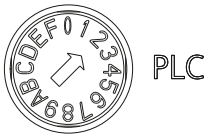
Memory reset with the mode switch

You can perform a memory reset with the mode switch when you are offline with the SIMOTION D410-2.

NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Comply with the ESD rules.

Proceed as follows to reset the memory:

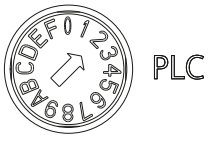
1. Place the mode switch in the STOP position (selector setting 2).



2. When the RUN/STOP LED is steadily yellow, turn the switch to the MRES position (switch position 3).

   The RUN/STOP LED starts to flash slowly (slow yellow flashing).
   Wait until the RUN/STOP LED stops flashing.

3. Turn the selector back to the STOP setting.



4. You must turn the selector back to the MRES position again within 3 seconds.

The memory reset will now be performed.
The SIMOTION D410-2 has completed the memory reset when the RUN/STOP LED is steadily yellow.

Note

Memory reset is canceled if you do not return the mode switch to MRES as specified within 3 seconds. Repeat the procedure in this case.

5. Now move the mode switch back to the required operating mode.

NOTICE
Unintentional restoration of the default settings instead of memory reset
Note that the MRES position (switch setting 3) during power-up causes the default settings to be restored. See Section Restoring the default settings for the SIMOTION D410-2 (Page 7497).
Make sure you do not accidentally switch the power supply OFF/ON in the MRES selector setting, as this restores the default settings instead of performing the desired memory reset.

Deleting user data on CompactFlash card

Overview

Deletion of the user data from the CompactFlash card is necessary, for instance, if you wish to load another (new) project to the CompactFlash card and therefore find it necessary to delete the existing user data for an "old project" (e.g. unit data sets) from the CompactFlash card.

You can delete the user data with SIMOTION SCOUT. The SIMOTION D410-2 must be operating in online mode. The following data is deleted:

- User data from the "volatile data" area
- Non-volatile data, with the exception of IP and DP parameters
- User data on the CompactFlash card (user directories), including the SINAMICS configuration

You can still go online to SIMOTION D410-2 at your PG/PC. The licenses on the CompactFlash card are retained.

Procedure

1. Open the project you want to edit in SIMOTION SCOUT.
2. Go online with the SIMOTION D410-2.

3. Select SIMOTION D410-2 in the Project Navigator and then select the "Delete user data on card" option from the "Target system" menu.
4. Confirm the "Delete user data on card" prompt with "OK".
   The user data is deleted. SINAMICS Integrated goes into offline mode.

Setting SINAMICS Integrated to the factory settings

Requirement

You must be online to SINAMICS Integrated in order to restore its default settings.

Procedure

1. Right-click "SINAMICS_Integrated" in the Project Navigator.
2. Select the "Target device > Restore default settings" command from the shortcut menu.

This restores the delivery state of SINAMICS Integrated.

Restoring the default settings for the SIMOTION D410-2

Overview

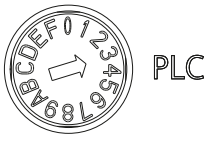
SIMOTION D410-2 is supplied with default parameters such as the transmission rate or PROFIBUS addresses. You can restore the factory settings with the mode selector switch. The following data is deleted:

- Non-volatile SIMOTION data in the SIMOTION device
- The backup copy of non-volatile SIMOTION data on the CompactFlash card (PMEMORY.XML/ PMEMORY.BAK)
- User data in the "volatile SIMOTION data" area and on the CompactFlash card
- The communication configuration (IP and DP parameters) on the CompactFlash card is set to the factory settings.

All licenses on the CompactFlash card are retained.

Restoring factory settings with the mode selector switch

1. The power supply is switched off.
2. Set the mode selector switch on the SIMOTION D410-2 to MRES (switch position 3).



3. Switch on the power supply.
   The NVRAM and the user data is deleted. The factory settings are loaded. SIMOTION D410-2 remains in the STOP operating state.
4. Now use the mode selector switch to change to the desired operating state.

Note

The default communications parameters are now restored. You must re-configure the communication parameters of SIMOTION D410-2.

System shutdown

All axes and system components must be in safe state before you shut down the system. You can set up this safe state by providing a separate motion task, for example.

You can shut down the power supply after the system has reached a standstill state.

Note

You must observe the safety notices for SINAMICS components, which you can find in the corresponding SINAMICS manuals.

Configuring Safety Integrated functions

Overview

Integrated safety functions

When used in conjunction with SIMOTION D, the integrated safety functions of SINAMICS S120 provide highly effective practical protection for personnel and machinery.

- Safety Integrated Basic Functions
- Safety Integrated Extended Functions
- Safety Integrated Advanced Functions

Note

As of SIMOTION V5.2 / SINAMICS Integrated V5.1, a distinction is made between Safety Integrated Extended and Advanced Functions. The Safety Integrated Advanced Functions also include the Safety Integrated Extended Functions.

The safety functions listed here conform to:

- Safety Integrity Level (SIL) 2 according to IEC 61508
- Category 3 according to DIN EN ISO 13849-1
- Performance Level (PL) d according to DIN EN ISO 13849-1

The safety functions correspond to the functions according to DIN EN 61800-5-2 (if they are defined there).

Übersicht der Safety Integrated Functions

If motors without a (safety-capable) encoder are being used, not all Safety Integrated Functions can be used.

Note

Definition: "Without encoder"

When "without encoder" is used in this manual, then this always means that either no encoder or no safety-capable encoder is being used.

In operation without encoder, the actual velocity values are calculated from the measured electrical actual values. Therefore, velocity monitoring is also possible during operation without encoder.

Table 10-124 Overview of the Safety Integrated Functions

	Functions	Abbreviation	With encoder	Without encoder	Brief description
Basic Functions	Safe Torque Off	STO	Yes	Yes	Safe torque off
	Safe Stop 1	SS1 [1)]	Yes	Yes	Safe stop according to stop category 1
	Safe Brake Control	SBC [2)]	Yes	Yes	Safe brake control

	Functions	Abbreviation	With encoder	Without encoder	Brief description
Extended Functions	Safe Torque Off	STO	Yes	Yes[4]	Safe torque off
	Safe Stop 1	SS1[1]	Yes	Yes[4]	Safe stop according to stop category 1
	Safe Brake Control	SBC	Yes	Yes[4]	Safe brake control
	Safe Operating Stop	SOS	Yes	No	Safe monitoring of the standstill position
	Safe Stop 2	SS2	Yes	No	Safe stop according to stop category 2
	Safely-Limited Speed	SLS	Yes	Yes[5][6]	Safe monitoring of the maximum velocity
	Safe Speed Monitor	SSM	Yes	Yes[5][4]	Safe monitoring of the minimum velocity
	Safe Direction	SDI	Yes	Yes[5][4]	Safe monitoring of the direction of motion
	Sicheres Referenzieren	SR	Yes	No	Safe homing
	Safe Acceleration Monitor	SAM	Yes	Yes[4]	Safe monitoring of the drive acceleration
	Safe Brake Ramp	SBR	Yes	Yes[4]	Safe braking ramp
	Safe gear change	–	Yes	No	–
	Safely-Limited Acceleration	SLA[3]	Yes	No	Safely-limited acceleration
	Safe Brake Test	SBT	Yes[5]	No	Safe test of the required holding torque of a brake
Advanced Functions	Safely-Limited Position	SLP	Yes[5]	No	Safely-limited position
	Transfer of safe position values	SP	Yes[5]	Yes[4]	Transfer of safe position values
	Safe Cam	SCA[3]	Yes	No	Safe cams

1) Incl. SS1E (SS1 with external brake). In this variant of SS1, SIMOTION is responsible for the stop response.

2) For SBC, you also need a Safe Brake Relay for SIMOTION D410-2 in conjunction with a Power Module in blocksize format (PM340, PM240-2). A Safe Brake Adapter is required for Power Modules in chassis format.

3) As of SIMOTION V5.2 / SINAMICS Integrated V5.1

4) The use of this safety function without encoder is permitted only for induction motors or synchronous motors of the SIMOTICS A-1FU (previously: SIEMOSYN).

5) As of SIMOTION V4.4 / SINAMICS Integrated V4.7. (SBT: As of V4.4 HF4)

Note

Details on the Safety Integrated Functions, such as information on the configuration of safety functions as well as operating conditions for the encoderless operation can be found in the *SINAMICS S120 Safety Integrated* Function Manual.

Notes

Parameterize the desired Safety Integrated functions and the monitoring with or without encoder and activate them in the safety screen forms of the SIMOTION SCOUT engineering system.

If motors are used without an encoder or with an encoder that is not suitable for Safety Integrated Extended/Advanced Functions, not all Safety Integrated Functions can be used (see previous table, "Without encoder" column).

The safe speed monitoring without encoder also functions at standstill as long as the drive is switched on.

PROFIsafe telegrams

SIMOTION D410-2 supports PROFIsafe telegrams 30, 31, 901, 902 and 903. (902 as of SIMOTION V4.4; only in conjunction with the TIA Portal; 903 as of SIMOTION V5.1 for Safe Cam, SCA).

Telegrams 31, 901, 902 and 903 enable the states of the F-DIs to be routed through to an F-CPU via PROFIsafe. Telegrams 901 and 902 enable you to apply a factor to SLS limit value 1 that has been set in the drive, allowing the SLS monitoring limit to be changed during operation. Moreover, in telegrams 901 and 902, the safe position actual values communicated in the SINAMICS S120 are transferred via PROFIsafe to the F-CPU (function SP).

With telegram 903, the state of up to 30 cams can be transferred.

Direct fail-safe data exchange via telegram 901 is supported as of SIMOTION V4.3 SP1 HF9.

The "Transfer safe position values via PROFIsafe" function is supported as of SIMOTION V4.4.

Activate Safety Integrated functions

Control

The Safety Integrated functions are fully integrated in the drive system. They can be activated as follows:

- Via the onboard terminals (F-DI, F-DO) on the Control Unit
- Via a PROFIsafe telegram using PROFIBUS or PROFINET
- Via the terminals of a connected TM54F
- As of SIMOTION V4.5, the Safety Integrated Basic Functions STO, SS1 and SBC can also be controlled license-free via the TM54F. (Requirement: STARTER V4.4 SP1; STARTER V4.4 SP1 is not part of SCOUT V4.4 - the functionality is therefore only available as of SCOUT V4.5)
- The SLS and SDI functions can also be activated permanently via parameter assignment.
- The SLA Extended Function can only be activated via PROFIsafe.

The Safety Integrated functions are implemented electronically and therefore offer short response times compared to solutions with externally implemented monitoring functions.

The output signals of the SCA Advanced Function can only be output via PROFIsafe.

Note

Although SIMOTION does not contain any safety-related functionality, it provides support for SINAMICS drives that can perform safety-related functions.

The purpose of this support that SIMOTION offers for the safety-related monitoring functions is to prevent fault reactions at the drive end by ensuring that the drive does not exit the operating state being monitored.

Further information about support of the SINAMICS Integrated functions on the TO axis can be found in the *TO Axis Electric/Hydraulic, External Encoder* Function Manual.

The Safety Integrated Basic Functions via the onboard terminals (F-DI 0) and the Safety Integrated Extended/Advanced Functions (via TM54F or PROFIsafe) can be used simultaneously.

Note

Safety Integrated Extended and Advanced Functions can be controlled via:

- The onboard terminals of the Control Unit or
- PROFIsafe or
- TM54F

Mixed operation is not permitted.

Note

If SIMOTION D410-2 is mounted separately (Power Module in blocksize format connected to SIMOTION D410-2 via CUA31/32), use of the Safety Integrated Extended and Advanced Functions via the onboard terminals (F-DI, F-DO) is not possible.

F-DI and F-DO as standard I/Os

Unused F-DI and F-DO can be used as standard I/Os (one F-DI as two standard inputs, the F-DO as a standard output).

Using F-DI through F-CPU

Prerequisite for use of the F-DI by F-CPU:

- With encoder as of SIMOTION V4.3 SP1 HF3
- Without encoder as of SIMOTION V4.4

The onboard F-DIs can be used as F-DI for the F-CPU if these are not used by SIMOTION D410-2.

In "Extended Functions via PROFIsafe and Basic Functions via onboard terminal" mode, the Basic Functions STO or SS1 (with or without SBC) can be controlled locally. At the same time the routing of F-DI 1 and F-DI 2 for the F-CPU is possible.

Filter setting F-DI

The F-DIs of SIMOTION D410-2 have a parameterizable input filter (drive parameter p10017, debouncing time for digital inputs).

With this input filter, unwanted signals (e.g. fault signals or test pulses of F-DO) can be filtered out so that these do not cause any faults.
Failsafe output modules (e.g. ET 200S F-DO) test the outputs at regular intervals. To achieve this, the F-DO modules switch test signals to their outputs in the form of bit patterns to detect a short-circuit, short-circuit to frame, or a short-circuit to ground.
If the filter time of the F-DI is set too small, these test pulses will result in unwanted triggering of the safety function in the case of D410-2.

For setting the input filter, the following rules must therefore be complied with:

- Debouncing time p10017 ≥ 3 x sampling time inputs/outputs p0799
- If 3 x p0799 < 1 ms, then: Debouncing time p10017 = N x 1 ms (N = 1, 2, 3, ...)
- Debouncing time p10017 >> fault pulse time

Unwanted triggering of the safety function can indicate incorrect settings.
Note that the settings also impact the response time of the system.

Example

ET 200S I/O system with F-DO modules
Because of the test pulses, the debouncing time p10017 must be at least 4 ms.

This results in the following setting options, for example:

- p10017 = 12 ms; p0799 = 4 ms **or**
- p10017 = 4 ms; p0799 = 1 ms

You will find additional information on ET 200S test pulses in Internet (https://support.industry.siemens.com/cs/ww/en/view/44452714).

SI monitoring cycle clock

The response times of the various safety functions are derived from the Safety Integrated monitoring cycle clock (r9780).

The value of the Safety Integrated monitoring cycle clock (r9780) is determined automatically - you therefore only see it when you are connected online to the drive. With the SINAMICS Integrated of a SIMOTION D410-2, different values can be determined as for a SINAMICS S120 CU310-2 connected to SIMOTION D410-2 because of the architecture.

The Safety Integrated monitoring cycle can be calculated as follows for the SINAMICS Integrated:

x = 32 x p0115[0] (p0115[0] = current controller cycle clock; for D410-2, typically 125 µs for servo drives)

Case A: For PROFIBUS Integrated cycle clock > x: r9780 = x

Case B: For PROFIBUS Integrated cycle clock ≤ x: r9780 = (rounded up (x/Tdp))* Tdp

For drives connected via CU310-2, case A applies generally.

Example:

Servo drive with current controller cycle clock (p115[0] = 125 µs)

PROFIBUS Integrated cycle clock: Tdp = 3 ms

x = 32 x 125 µs = 4 ms ⇒ case B

r9780 = (rounded up (4 ms / 3ms))*3 ms = 6 ms

For detailed information about Safety Integrated response times, see the *SINAMICS S120 Safety Integrated* Function Manual.

SI monitoring cycle clock

The response times of the various safety functions are derived from the Safety Integrated monitoring cycle clock (r9780).

The value of the Safety Integrated monitoring cycle clock (r9780) is determined automatically - you therefore only see it when you are connected online to the drive.

With the SINAMICS Integrated of a SIMOTION D410-2, different values can be determined as for a SINAMICS S120 CU310-2 connected to SIMOTION D410-2 because of the architecture.

The Safety Integrated monitoring cycle can be calculated as follows for the SINAMICS Integrated:

x = 32 x p0115[0] (p0115[0] = current controller cycle clock; for D410-2, typically 125 µs for servo drives)

Case A: For PROFIBUS Integrated cycle clock > x: r9780 = x

Case B: For PROFIBUS Integrated cycle clock ≤ x: r9780 = (rounded up (x/Tdp))* Tdp

For drives connected via CU310-2, case A applies generally.

Example:

Servo drive with current controller cycle clock (p115[0] = 125 µs)

PROFIBUS Integrated cycle clock: Tdp = 3 ms

x = 32 x 125 µs = 4 ms ⇒ case B

r9780 = (rounded up (4 ms / 3ms))*3 ms = 6 ms

For detailed information about Safety Integrated response times, see the SINAMICS S120 Safety Integrated Function Manual.

Required hardware

Controlling the safety functions requires at least the following hardware versions:

Table 10-125 Required hardware versions

Module	Article number	Required product version
SIMOTION D410-2 DP	6AU1410-2AA00-0AA0	C
SIMOTION D410-2 DP/PN	6AU1410-2AD00-0AA0	B

The hardware requirements of the drive components can be found in the *SINAMICS S120 Safety Integrated* Function Manual.

Safety Integrated functions with PROFIsafe (PROFINET example)

Safety Integrated functions are activated via "PROFIsafe on PROFINET" safe communication. Control (F logic) is via a SIMATIC F-CPU which is connected to PROFIsafe via PROFINET, e.g. a SIMATIC S7-1500 F-CPU.

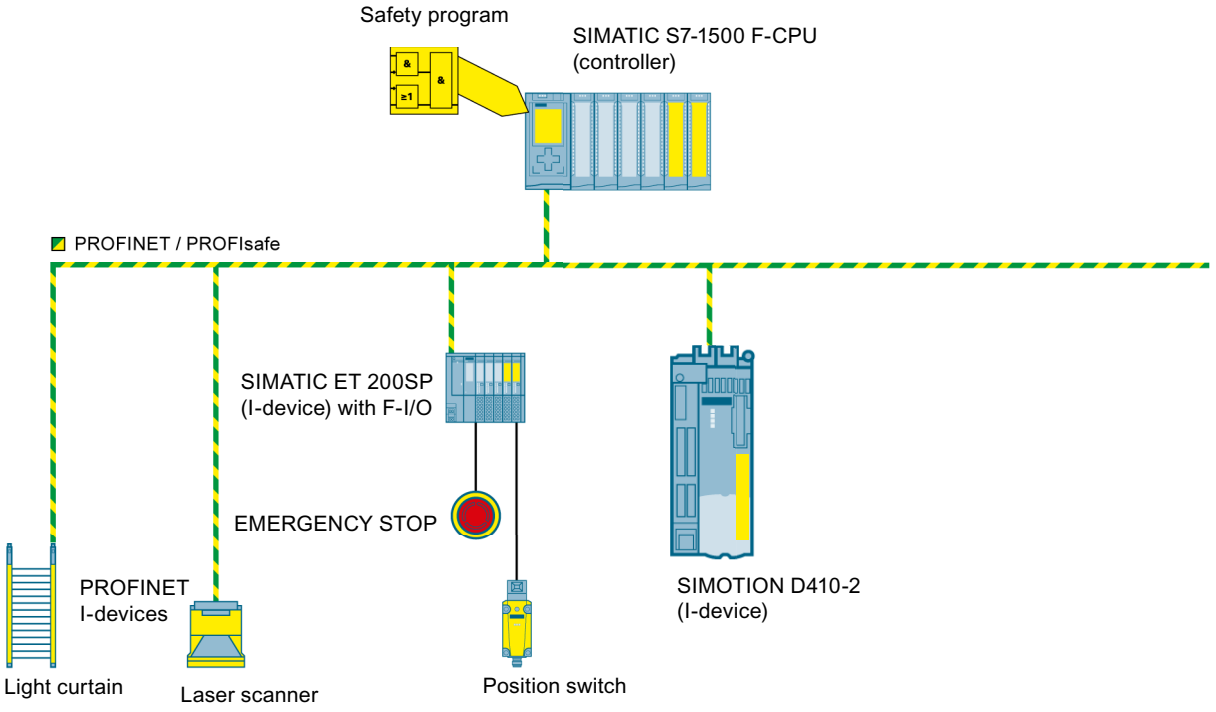


Figure 10-211 SIMOTION D, control of F functions via PROFINET with PROFIsafe

Topologies (F proxy)

The F proxy functionality enables transparent routing of safety telegrams from the SIMOTION I-device (or slave) to the SIMOTION controller (or master).

The topologies that may be used with the SIMOTION D410-2 are listed below. In each case, the description specifies whether the control of Safety Integrated functions is routed through to the drives.

- SIMATIC F CPU (master), connected via PROFIBUS with PROFIsafe to SIMOTION D410-2 (I-slave).
  Note: PROFIBUS not possible configuration via SCOUT TIA
  - Routing to the SINAMICS Integrated drive of SIMOTION D410-2.
  - Routing to drives of CUs that are connected to SIMOTION D410-2.
    The CUs are connected as slaves via PROFIBUS to the DP master interface of the SIMOTION D410-2.
- SIMATIC F-CPU (controller), connected via PROFINET with PROFIsafe to SIMOTION D410-2 DP/PN (I-device)
  - Routing to the SINAMICS Integrated drive of the D410-2 DP/PN.
  - Routing to the drives of a SINAMICS S110/S120 CU connected to the D410-2 DP/PN.
    The CU is connected as a device via PROFINET to the PROFINET interface of the D410-2 DP/PN (= controller) or the CU is connected as a slave via PROFIBUS to the DP master interface of the D410-2 DP/PN.
- The SIMOTION D410-2 is the PROFIBUS master for a direct fail-safe slave-to-slave communication, e.g. between a SIMATIC F-CPU and a SINAMICS S110/S120 CU.
  Direct fail-safe slave-to-slave communication with telegram 901: As of V4.3 SP1 HF9.
  Not for SCOUT TIA (SIMOTION in the TIA Portal)
  See also application example at the following Internet address (https://support.industry.siemens.com/cs/ww/en/view/38701812).

Note

Control for the Safety Integrated functions cannot be routed through to the SINAMICS Integrated of the SIMOTION D410-2 in this configuration.

Topologies (Shared Device)

With the Shared Device functionality, you can configure access to an IO device with several IO controllers using PROFINET. This enables channels/modules to be flexibly assigned to different IO controllers. This option is available for inputs and outputs. You can use this mechanism to access the fail-safe data of a drive configured below a SIMOTION CPU via the F-CPU (e.g. access of an S7-1500 F-CPU to a SINAMICS S120 CU310-2 which is subordinate to a SIMOTION D410-2).

Requirement:

SIMOTION SCOUT (not possible with SCOUT TIA)

Note

When configuring PROFIsafe, it is recommended that you use the I-device F proxy functionality instead of the Shared Device.

Additional references

Additional information on configuring Safety Integrated functions can be found in the

- *SINAMICS S120 Safety Integrated* Function Manual
- *TO Axis Electric/Hydraulic, External Encoder* Function Manual
- *SIMOTION Communication* System Manual
- Internet at the following Internet address (https://www.automation.siemens.com/safety)

Hot plugging

SIMOTION D410-2 is capable of hot plugging, i.e. SIMOTION D410-2 can be unplugged or plugged in again to the PM340/PM240-2 energized.

The following scenarios are therefore possible:

- SIMOTION D410-2 is supplied with power via X124, Power Module is de-energized
- SIMOTION D410-2 is de-energized, Power Module is energized
- SIMOTION D410-2 is supplied with power via X124, Power Module is energized

Unplugging and plugging of a SIMOTION D410-2 is only permitted on one and the same Power Module. If the SIMOTION D410-2 is plugged into a different Power Module (power, type, article number, serial number), then alarm 30074 is issued on the drive side.

SIMOTION D410-2 must always be supplied via X124 **for operation**. There is no warm restart when plugged in again.

If the SIMOTION D410-2 is unplugged from the Power Module, a drive connected to the Power Module stops.

Quantity structures

With SIMOTION D, the SIMOTION PLC and motion control functionalities as well as the SINAMICS S 120 drive software run on a shared control hardware. The IEC 61131-3-compliant PLC integrated in SIMOTION D means that the system is not just capable of controlling sequences of motions, but the entire machine as well.

The **scaling of the PLC and motion control functionality** is performed via Control Units of various performance classes for SIMOTION D

- SIMOTION D410-2 for single-axis solutions and small multi-axis solution with typically 2 to 3 axes
- SIMOTION D425-2 (BASIC performance) for up to 16 axes
- SIMOTION D435-2 (STANDARD performance) for up to 32 axes
- SIMOTION D445-2 (HIGH performance) for up to 64 axes
- SIMOTION D455-2 (ULTRA-HIGH performance) for up to 128 axes or applications with very short control cycle clocks

The possible axis quantity structures depend on the required servo and interpolator cycle clocks and apply for electric, hydraulic and virtual axes.

The **scaling of the drive computing performance** is performed via SINAMICS drive controls for the SIMOTION D410-2. The drive control of a CU310-2 is already integrated (SINAMICS Integrated) for the SIMOTION D410-2. This can be extended with SINAMICS S110/S120 Control Units connected via PROFIBUS or PROFINET.

SIZER

With the SIZER configuration tool, you can easily configure the SINAMICS S110/S120 drive family including SIMOTION. It provides you with support for selecting and dimensioning the components required for a Motion Control task.

- Dimensioning of the PLC and motion control functionality --> selection of the SIMOTION D Control Unit
- Dimensioning of the drive computing performance and the required drive components.

Depending on your performance requirements, SIZER determines the possible number of axes and the resulting utilization on the SIMOTION and SINAMICS side.

Quantity structure of DRIVE-CLiQ components

The following maximum number of DRIVE-CLiQ components can be connected to the SIMOTION D410-2:

- Max. 8 Terminal Modules, of these max.
  - 3 TM15, TM17, TM41
  - 8 TM15 DI/DO, TM31, TM120, TM150
  - 1 TM54F
- Max. 5 encoder systems
  (SMx Sensor Modules or encoders/motors with DRIVE-CLiQ interface)
- Max. 1 DMC20/DME20

You require a DRIVE-CLiQ hub module (DMC20/DME20) or a CUA32 to connect more than one encoder system via DRIVE-CLiQ.

Migration from SIMOTION D410 to SIMOTION D410-2

Upgrade from SIMOTION D410 to SIMOTION D410-2

SIMOTION D410-2 differs both in the structure and in the functionality of a SIMOTION D410.

This has effects that must be taken into account during a changeover.

Change from D410 to D410-2 (upgrade)

The change from SIMOTION D410 to SIMOTION D410-2 is performed with a module replacement in **HW Config**. The procedure when changing is similar to that when changing, for example, from SIMOTION D445-2 DP/PN to SIMOTION D455-2 DP/PN.

The module replacement is started by dragging the new module to the frame of the module rack with the existing module in **HW Config**, see Section Device replacement in HW Config (Page 7530).

The module replacement is performed automatically. During this operation, the technology packages and the device versions are updated. Existing configurations of the SIMOTION D410 are transferred to the SIMOTION D410-2 during the module replacement.

Information on where project adaptations are required or not required when changing from a SIMOTION D410 to a SIMOTION D410-2 can be found in the following sections (see Table "Transfer of existing SIMOTION D410 projects to SIMOTION D410-2").

For further information on generally required measures for project adaptations, see Section Service and maintenance (Page 7515).

Change from D410-2 to D410 (downgrade)

As a SINAMICS drive cannot be downgraded, a module replacement of a SIMOTION D410-2 (SINAMICS Integrated firmware V4.x/V5.x) with a SIMOTION D410 (SINAMICS Integrated firmware V2.x) is not possible.

However, project data can be transferred by means of an XML export/import.

Transfer of existing projects

Existing configurations of the SIMOTION D410 are transferred to the SIMOTION D410-2 during the module replacement.

The following table provides information on where project adaptations are required or not required:

Table 10-126 Transfer of existing SIMOTION D410 projects to SIMOTION D410-2

Keyword	Explanation
PROFIBUS interfaces	The configuration on the PROFIBUS interfaces including any existing PG/PC assignment is retained. Figure: SIMOTION D410 to SIMOTION- D410-2: X21 DP/MPI → X21 DP/MPI One of the differences of SIMOTION D410-2 DP compared to D410 DP is that it has an additional (second) PROFIBUS interface (X24). A key difference of SIMOTION D410-2 DP/PN compared to D410 PN is that it also has a PROFIBUS interface (X21).
PROFINET interface	The configuration on the PROFINET interface, including any existing PG/PC assignment, is retained. Figure: SIMOTION D410 PN to SIMOTION D410-2 DP/PN: X200 → X150 P1 X201 → X150 P2
Message frame configurations	The message frame configurations on the PROFIBUS or PROFINET interface are retained. The same applies for the addresses of the slots/subslots.
SINAMICS Integrated	The SINAMICS Integrated is to be replaced with the new type and its corresponding version. The drive configuration and the assignment of the DRIVE-CLiQ interface are retained.
PG/PC connection / Ethernet interface	In contrast to SIMOTION D410, SIMOTION D410-2 has an Ethernet interface. Due to the significantly improved engineering performance, we recommend that you connect a PG/PC via the Ethernet interface of the SIMOTION D410-2 instead of via PROFIBUS.

Keyword	Explanation
Configuration of the onboard I/Os	The configuration of the onboard I/Os (4 DI, 4 DI/DO) is retained. The new features mean the functionality, quantity structures and terminal designations for the onboard I/Os differ for the SIMOTION D410-2 compared with the SIMOTION D410. The number of onboard I/Os has more than doubled so that previously required terminal modules / I/O modules may no longer be necessary.
Safety	SIMOTION D410-2 has 3 F-DI and 1 F-DO for Safety Integrated Extended/Advanced Functions so that a TM54F used for SIMOTION D410 may be omitted.
CompactFlash card / firmware	SIMOTION D410 and SIMOTION D410-2 have different CompactFlash cards and different card mappers (firmware). A CompactFlash card of the SIMOTION D410/D4x5-x must not be inserted into a SIMOTION D410-2 and vice-versa! 1 GB CompactFlash cards of the SIMOTION D410/D4x5-x can also be used for the SIMOTION D410-2 when a new boot loader is loaded. For details, see Section Boot loader on the CompactFlash card (Page 7547).
Connectable drive components	Like the SINAMICS S120 CU310-2, the SIMOTION D410-2 also no longer supports some older drive components. For details, see Section Permissible combinations (Page 7511)
User program	Although, in principle, a SIMOTION D410 user program can run on a SIMOTION D410-2, modifications may be required because of innovations in the hardware. Examples: • The runtime behavior of the SIMOTION D410-2 changes because of the increased performance. As long as the user program does not contain any "runtime-dependent code", adaptations should not be necessary. • Fan faults for the SIMOTION D410-2 are signaled via a diagnostic buffer entry PeripheralFaultTask and a system variable (fanWarning). For the SIMOTION D410, fan faults were signaled by a warning on the drive side (A1009). • The following additional functions are available for the SIMOTION D410-2: – Backup of the non-volatile SINAMICS data (NVRAM data) via CU parameter p7775 – Automatic detection of a module replacement on the basis of the serial number of the Control Unit
Hardware	Due to the innovative hardware, the following changes have been made for the SIMOTION D410-2 compared with the SIMOTION D410: • The control elements of the SIMOTION D410-2 have been standardized with the SIMOTION D4x5-2 (rotary switch instead of DIP switch for SIMOTION D410, DIAG button, etc.). • The interfaces on the top of the module are positioned differently. • Changed I/O terminals: – Spring-loaded terminals instead of screw terminals – Fitting for the 24 V terminal block – The SIMOTION D410 connector X120 must be re-wired – The wiring of the SIMOTION D410 connector X121 can be taken over exactly for the new connector of the SIMOTION D410-2 (the terminal designation for the reference ground DI 0 - DI 3 changes from M1 to M2) SIMOTION D410-2 has the following additional interfaces: • Additional Ethernet interface • Additional PROFIBUS interface The mounting depth of the SIMOTION D410-2 has been reduced by approx. 15% compared to the SIMOTION D410.

Operations and their effect on the user memory (Page 7354)

Permissible combinations

Some "older" DRIVE-CLiQ components can no longer be used with the SIMOTION D410-2.

Table 10-127 DRIVE-CLiQ components not supported with SIMOTION D410-2

DRIVE-CLiQ components	Article number suffix
SMC30 Sensor Module Cabinet	< 2
TM31/TM41 Terminal Modules	< 1
SME20/25 Sensor Modules External	< 3
CUA31 Control Unit Adapter	< 1
Power Modules (chassis)	< 3

A detailed, regularly updated list of the DRIVE-CLiQ components approved for use with SIMOTION, as well as notes on their use, can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/11886029).

If incorrect components are used, a topology error is signaled
F01360 Topology: Actual topology not permitted.

CompactFlash card and license combinations

CF card

A CF card with D410 firmware / drive software cannot run on a D410-2. The same applies for the reverse situation.

In the event of a fault all 4 LED displays light up yellow.

SIMOTION D410-2 licensing

SIMOTION D410-2 is a compact Control Unit predestined for single-axis applications. SIMOTION D410-2 has an integrated drive control for either a servo, a vector or a V/f axis. One real axis can be used without requiring a license for a SIMOTION D410-2. Speed-controlled axes and virtual axes never require a license.

SIMOTION D410-2 can be extended with additional SINAMICS S110/S120 Control Units (e.g. CU305) and so can also be used for smaller multi-axis applications (e.g. with 2 - 3 axes). These additional axes must be licensed with the single-axis licenses or the "D410-2 MultiAxes Package." See Section "CompactFlash card" in the *SIMOTION D410-2* Manual.

If you need to license one POS axis, use the POS single-axis license; in the case of GEAR/CAM or if you require more than one POS licenses, it is better to use the D410-2 MultiAxes Package,

Note

If you use more than one real axis with SIMOTION D410-2, you must license these additional axes. The axis license with the highest functionality is covered by the inclusive license (a real axis). The functionality has the following granularity: CAM > GEAR > POS.

Example:

You use 2 real axes: 1 POS, 1 CAM.
Because the CAM license has a higher value, and so inclusive, you only need to purchase a POS license.

Licenses are required for runtime functions such as SIMOTION IT Virtual Machine. These can be pre-installed on a CompactFlash card (CF card) or ordered separately.

Note

Path interpolation is supported as of V4.4.

Special functions SIMOTION D410-2

Automatic restart after FAULT state

Overview

A SIMOTION D410-2 can perform a restart automatically after the FAULT operating state has occurred via the system variable **_automaticRestart** available as of V4.4.

The system variable **_automaticRestart** is intended for applications in which an automatic restart is mandatory after a crash caused by an extreme situation, e.g. wind generators after a lightning strike.

The automatic restart causes the device with the project to boot automatically from the CF card.

Note

System variable **_automaticRestart** is visible on all SIMOTION CPUs, but the functionality is only supported by SIMOTION D410-2.

Note

Restart cannot be ensured in all cases, for example, if a hardware fault occurs.

Programming

Table 10-128 System variable _automaticRestart

Value	Response
16#00000000	Automatic restart after FAULT state is not active (default).
16#00000000 < n < 16#FFFFFFFF	Automatic restart after FAULT state is active until the value 0 is reached. On a restart after FAULT state, the value is decremented by 1.
16#FFFFFFFF	Automatic restart after FAULT state. The value remains unchanged.

The system variable can be set to the desired value and decrementing monitored in the user program.

Alternately, the start value can be set manually in the SIMOTION SCOUT symbol browser under "force variable." To ensure the manually set start value remains effective, note the following:

- The start value must be set in the offline project and loaded onto the device by project download.
- The value that is loaded onto the device must differ from the start value that was last loaded onto the device by project download.
  This ensures that the current value of the system variable **_automaticRestart** in the runtime system is not reset on every project download (crash history is not deleted).

The system variable is retentive, its content and therefore the "automatic restart after FAULT state" function is retained after an interruption in the power supply.

An automatic restart after FAULT state that has occurred can be diagnosed by the diagnostic buffer entry **Automatic restart of the CPU performed after FAULT operating state**.

System variable **_automaticRestart** is not backed up with **_savePersistentMemoryData**:

- Because an automatic restart can be caused by hardware problems and this cause is not to be transferred to the new module if a module is replaced.
- Because the user program will decide for itself under what condition system variable **_automaticRestart** will be set to a certain value.

If an error occurs after the automatic restart, there is not special error handling for this case. If this error prevents startup, the SIMOTION device cannot enter the RUN state. An error during startup does not trigger an automatic restart.

Triggering a restart with a user program

A user program of the SIMOTION device can trigger restart of the device via the system function **_restart** available as of V4.4.

This system function, like the system variable **_automaticRestart**, described in Section Automatic restart after FAULT state (Page 7512) is intended for applications in which an automatic restart is mandatory after a crash caused by an extreme situation, e.g. wind generators after a lightning strike.
The system function **_restart** enables a response to non-acknowledgeable drive errors with a

OFF2 reaction, which result in the inability of the drive to move. These drive errors can only be exited via a restart or by power off/on.

Note

The system function **_restart** is provided for all SIMOTION devices, but restart itself is only performed for the D410-2 device.

The restart causes the device with the project to boot from the CF card.

So that, after a restart has been performed, the SIMOTION device enters the RUN state again, the system variable **_startUpData.operationMode** must be on RUN.

The system function **_restart** only supports synchronous command processing.

Return values:

- 16#00000000: Function performed without errors.
- 16#FFFF8091: Functionality is not supported for the device.

If the restart was triggered by the system function **_restart**, the following entry is made in the diagnostic buffer: The SIMOTION device has been switched to STOP and restarted by the user program using the _restart system function.

The user program must ensure that, when the D410-2 restarts, no axis movements or other unwanted influences on the machine by the user program occur.

If an error occurs after the automatic restart, there is not special error handling for this case. If this error prevents startup, the SIMOTION device cannot enter the RUN state. An error during startup does not trigger an automatic restart.

10.1.2.8 Service and maintenance

Overview

Introduction

It is possible to distinguish between the following scenarios when replacing and updating components:

- Replacing modules (spare part scenario)
  - Spare parts replacement for SIMOTION D410-2 (Page 7519)
  - Removing and replacing the SIMOTION D410-2 (Page 7519)
  - Replacing DRIVE-CLiQ components (Page 7521)
  - Replacing the fan (Page 7523)
  - Replacing the CompactFlash card (Page 7525)
- Adapting a project (new device type / new device version)
  The project needs to be adapted if you want to change the type (e.g. D410 DP -> D410-2 DP) or version of the SIMOTION device in your existing project.
  - Creating backup copies (project/CF) (Page 7525)
  - Backing up user data (back up variables) (Page 7526)
  - Upgrading a user project to the new SCOUT version (Page 7527)
  - Platform replacement via XML export/import (Page 7528)
  - Preparing the device replacement (Page 7530)
  - Device replacement in HW Config (Page 7530)
  - Upgrading technology packages (Page 7531)
  - Upgrading the device version of SINAMICS S120 Control Units (Page 7534)
  - Upgrade the libraries (Page 7535)
  - Save project, compile and check consistency (Page 7535)
- Performing a firmware and project update
  - Upgrading the boot loader on the CompactFlash card (Page 7536)
  - Update - preparatory measures (Page 7536)
  - Update via SIMOTION IT web server (Page 7537)
  - Upgrade via device update tool (upgrading SIMOTION devices) (Page 7537)

– Update via CF card
  Backup of CompactFlash card data (Page 7540)
  Firmware update using a CompactFlash Card (Page 7542)
  Upgrading SINAMICS (Page 7542)
  Download project to target system (Page 7544)

Note

Upgrading using the device update tool offers a number of advantages (keeping retain data, option of downgrading, no license key handling, etc.). We would, therefore, recommend using this method for firmware and project updates.

Please also observe the information on handling the CompactFlash card.

- Changing the CompactFlash card (Page 7545)
- Writing to a CompactFlash card (Page 7546)
- Formatting the CompactFlash card (Page 7546)
- Boot loader on the CompactFlash card (Page 7547)
- Recommended method of handling CompactFlash cards (Page 7548)
- Card reader for CompactFlash cards (Page 7549)

Note

This document uses the following terms:

- Upgrade: Denotes upgrading to a higher version of a component/software
- Downgrade: Denotes reverting to a previous version of a component/software
- Update: In general terms, denotes the act of bringing a component/software up-to-date (in isolated cases, this may see an upgrade or downgrade)

Upgrade options

The exact procedure when replacing or updating components depends on various factors.

If a project is upgraded, the procedure depends on the scope of change of the versions.

- Change of the SIMOTION main version
- Change of the SIMOTION service pack or hotfix version
- Change of the PROFINET version
- Change of the SINAMICS version
  (There are SIMOTION versions that contain several SINAMICS versions for a device.)

If a different SIMOTION controller is to be used, the procedure depends on whether a device or a platform replacement is required.

Examples of upgrade scenarios are listed in the following overview table. They are shown in the columns. The lines list the principle measures that have to be performed. Whether the measure

has to be performed in a specific case, must be decided project-specifically.
Grayed-out cells mean that a measure is not required.

Note

If the version is changed and the SIMOTION controller replaced at the same time, then all measures apply; the measures must be performed in the TOP-DOWN sequence according to the table.

Action/Measure	Upgrade project				Replacement of SIMOTION controller		Activity relates to
	Main version	Service pack or hotfix version	PROFINET version	SINAMICS version	Device replacement via HW Config	Platform replacement via XML export/import	
Customize project							
Examples	V4.1 ⇨ V4.2	V4.1 SP2 ⇨ V4.1 SP4	PN2.1 ⇨ PN2.2	V2.5 ⇨ V2.6.2	D445-2 ⇨ D455-2 D4x5 ⇨ D4x5-2 D410-2 DP ⇨ D410-2 DP/PN	C240 ⇨ D445-2 D410-2 ⇨ D445-2 D445 ⇨ D445 (S120) (SM150)	Project/SIMOTION SCOUT
Create backup copy (project/CF)							
Back up user data (back up variables)	Only if required				Only if required	Only if required	
Upgrade user project to new SCOUT version							
Platform replacement via XML export/import	During platform replacement, the target version is specified (= version of the device that is the recipient of the import)						
Prepare device replacement							
Device replacement in HW Config							
Upgrade technology packages (TP)	[4]	[4]			[4]		
Upgrade device version of SINAMICS S120 CUs [3]				For external CUs, only if necessary			
Upgrade library	Libraries are version-dependent				Libraries may be device-dependent	Libraries may be device-dependent	
Save/compile project; check consistency							
Perform a firmware and/or project update							
Upgrade the boot loader on the CompactFlash card	Check whether new version requires a new boot loader [2]				Check whether the new [2] device requires a new boot loader		Memory card/Target hardware
Update - preparatory measures							
Upgrade via IT DIAG	Selection of one of the 3 update methods				Only possible if the CF card contains valid firmware		
Update via device update tool							
Update via CompactFlash Card							
Backup of the CompactFlash card data							
Firmware update using a CompactFlash card							
Upgrade SINAMICS [5]							
Download the project to the target system [1]							

Not relevant Relevant

1) Alternative: Load the project to the CF card using a card reader

2) Refer to the compatibility list (https://support.industry.siemens.com/cs/ww/en/view/18857317)

3) The versions of SINAMICS Integrated and Controller Extensions are upgraded automatically in the **HW Config** during device replacement

4) The technology packages are automatically upgraded. The user can directly specify a TP

5) SINAMICS components are upgraded/downgraded to the component version of the CF card. Observe the LED codes! After the upgrade it is necessary to switch the device off and on.

Figure 10-212 Overview of upgrade options

Replacing modules

Spare parts replacement for SIMOTION D410-2

A replaced module is detected by the controller on the basis of the serial number. This automatically deletes the non-volatile data and transfers the data saved on the CF card to the controller. See Section Replacing modules in the spare part scenario (Page 7361).

Removing and replacing the SIMOTION D410-2

Overview

The following describes the procedure for replacing a module (spare part). In principle, it is also possible to replace the SIMOTION D410-2 when the PM340/PM240-2 is energized.

You will find more information on this in Section Hot plugging (Page 7507).

⚠ WARNING

Danger to life through electric shock

Note that Power Modules with FSB performance rating or higher still carry a residual intermediate voltage after shutdown.

Wait 10 minutes before you remove any screws.

For further information, see the *SINAMICS S120 AC Drive* Manual.

Removing a defective module

How to remove the SIMOTION D410-2 module:

1. Switch off the power supply to terminal X124.
2. Remove the CF card from the card slot.
3. Remove the connections for the power supply (X124).
4. Disconnect the communication interface connectors from the device:
   - DRIVE-CLiQ interface (X100)
   - PROFIBUS DP interface (X21)
   - PROFIBUS DP interface (X24; D410-2 DP only)
   - PROFINET interface (X150 P1 and P2; D410-2 DP/PN only)
   - Ethernet interface (X127)
5. If necessary, disconnect the plug-in connectors to the digital inputs/outputs of the interfaces (X120, X121, X130, X131).

6. Disconnect the plug of any encoder connected to the X23 encoder interface.
7. Depending on the mounting method, disassemble the SIMOTION D410-2 from the Power Module or remove the SIMOTION D410-2 from the mounting plate (see Section Mounting (Page 7311)).

Installing a new module

How to install the new SIMOTION D410-2 module:

Note

Observe the information for installation (Page 7311), wiring and connecting (Page 7316) the SIMOTION D410-2.

1. Install the new SIMOTION D410-2 on the Power Module or on the mounting plate.
2. Connect all previously removed connectors.
3. Terminate the load voltage supply cables at the terminal block.
4. Rewire the shielding of all cables.
5. Insert the original CF card into the card slot of the new SIMOTION D410-2.
6. Switch on the power supply. The new SIMOTION D410-2 is immediately ready for operation.

Replacing SIMOTION D410-2 modules without PG/PC

To enable a module replacement without a PG/PC, you must back up the current non-volatile SIMOTION and SINAMICS data on the CF card during operation.

NOTICE

Loss of data due to failure to make backup copies

Non-backed-up non-volatile SIMOTION data can be lost on hardware replacement (module defect), for example, if the current value of the retain variables have not been backed up and replaced by their initial values again.

Back up the non-volatile SIMOTION data on the CF card.

NOTICE

Repeat referencing necessary after absolute encoder overflow

If an absolute encoder overflow occurs after **_savePersistentMemoryData**, the actual position value is no longer correct after the non-volatile SIMOTION data are restored.

In this case, homing (absolute encoder adjustment) must be repeated.

See also

Hot plugging (Page 7507)

Spare parts replacement for SIMOTION D410-2 (Page 7519)

Operations and their effect on the user memory (Page 7354)

Replacing modules in the spare part scenario (Page 7361)

Replacing DRIVE-CLiQ components

Requirement

DRIVE-CLiQ components not only support replacement in the switched-off state of the machine/system (Power Off), but also replacement during operation. For this, the component to be replaced must be at the end of the DRIVE-CLiQ line.

Removing DRIVE-CLiQ components

1. Deactivate the affected component or drive object.
2. Remove the DRIVE-CLiQ connector.
3. Remove the supply voltage of the component and uninstall the component.

Installing DRIVE-CLiQ components

1. Mount the component and reconnect the supply voltage.
2. Reconnect the DRIVE-CLiQ cable at the same location (port). The cable must have the same length as the old one.
3. Activate the affected component or drive object.

Parameters for topology comparator and component replacement

In the expert list, you can use CU parameter p9906 to specify how the electronic rating plates are compared for all the components of a Control Unit. The type of comparison can be changed subsequently for each individual component by using p9907/p9908 or right-clicking in the topology. All data on the electronic rating plate is compared by default.

- When p9909 = 1, the serial number and the hardware version of the new replacement component are automatically transferred from the actual topology to the target topology, and then saved in the non-volatile memory.
- When p9909 = 0, serial numbers and hardware versions are not automatically transferred.

The setting p9901 = 1 enables the **spare parts / components replacement without tool support** to be carried out. The new serial number of the spare part is automatically transferred from the actual topology to the target topology and saved in non-volatile memory. In order for this to occur, the components that have been replaced must be of the same type and have the same article number, such as "6SL3055-0AA0-5BA0". The last or last two digits of the article number (depending on the component type) are not checked, as the HW version, for example, is coded in these. This mechanism is also applied when several components are replaced.

Modified wiring following module replacement

In the default setting for the topology comparator, modified wiring configurations of the DRIVE-CLiQ components (e.g. a cross-exchange) are not accepted for safety reasons and are generated by a fault.

If a cross-exchange of components is required (i.e. existing components are replaced with other existing components, and no spare parts are used), e.g. for troubleshooting purposes, the topology comparator must be reduced via parameter p9906 or preferably via p9907/p9908; or as an alternative, by right-clicking in the topology.

Note

In this case, incorrect insertion of components is no longer monitored.

Automatic upgrading/downgrading (firmware update)

During the startup, the system automatically upgrades or downgrades all DRIVE-CLiQ components to the version of the component firmware on the CF card. Components that cannot be downgraded to the component firmware version of the CF card (e.g. old firmware on the CF card and new components to which the old firmware cannot be loaded) retain their firmware version. The resulting firmware version combinations are always functional.

The CONTENT.TXT file in the main directory of the CF card contains the component version.

Note

During an automatic FW update, please take note of the messages and alarms in the SIMOTION SCOUT detail window.

A firmware update on the SIMOTION D410-2 is signaled by the RDY LED flashing yellow, while on the DRIVE-CLiQ components (TM, SMC, etc.) it is signaled by the RDY LED flashing red/green.

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

The update function can be deactivated using CU parameter p7826 in the expert list.

For more information on this topic, see the following references:

- *SINAMICS S120* Commissioning Manual
- *SINAMICS S120* Function Manual

Replacing the fan

Overview

The SIMOTION D410-2 fan switches on depending on the internal module temperature.

Fan faults are signaled by a diagnostic buffer entry, system variable and PeripheralFaultTask, see section Fan (Page 7363).

The SIMOTION D410-2 does not have to be removed from the Power Module in blocksize format to replace the fan. A defective fan can also be replaced when the SIMOTION D410-2 is switched on.

Note

The fan/battery module should preferably be replaced when the power is switched off and only when the CPU is in the STOP state. Otherwise you risk an unintentional failure of the machine/system, e.g. through accidental disconnection of cables.

Replacing the fan

The fan is available as a spare part. For the article number, see section "Spare parts and accessories" in the SIMOTION D410-2 Manual.

NOTICE
Damage to device electronics caused by electric fields or electrostatic discharge The fan on the SIMOTION D410-2 may only be replaced by qualified skilled personnel and strictly in accordance with ESD guidelines (Page 7576).

	1) Release the snap hooks on the left and right side of the fan by pressing them inwards.	2) Pull the fan forwards and out of the SIMOTION D410-2 housing.

	3) Locate the centering frame of the replacement fan on the mounting lug of the SIMOTION D410-2.	4) Slide the replacement fan on the mounting lug into the Control Unit. Make sure that the fan connector fits into the centering frame of the the printed circuit board. Engage both snap hooks on the fan in the housing of the Control Unit.

Fan service life

Fans are parts subject to wear. The fan is monitored for SIMOTION D410-2. A failure is signaled in the diagnostic buffer and can be evaluated by the user program (e.g. via the PeripheralFaultTask).

Contamination is the main cause of fan failure. A visual inspection should be made as a first criterion for replacement. If the fan is highly contaminated, it must be replaced.
If no contamination is present, we recommend that the service period is used as criterion. Because the service life of the fans depends greatly on the operating conditions (temperature, humidity, number of operating hours per day, contamination caused by dust, etc.), no fixed limits for all applications are can be specified.
In the field, under average industrial conditions, a replacement interval of 5 to 7 years has proven itself.
We recommend that the maintenance intervals are adapted for the specific application based on empirical values.

Replacing the CompactFlash card

If spare parts are used, you must contact the Technical Support Center to transfer the license key of the defective CompactFlash card to the new CompactFlash card.

Proceed as follows to write your project to the new CompactFlash card:

- Changing the CompactFlash card (Page 7545)
- Writing to a CompactFlash card (Page 7546)

Detailed information about licensing can be found:

- In the *SIMOTION SCOUT* Configuration Manual
- In the FAQs on the Internet (https://support.industry.siemens.com/cs/ww/en/view/73501913)

Customizing the project

Overview

Overview

The project needs to be adapted if you want to replace the type (e.g. D410-2 DP ⇒ D410-2 DP/PN) or version of the SIMOTION device in your existing project.

Procedure

The exact procedure for project adaptations depends on the scope of the target hardware and version changes.

An overview can be found in the Upgrade options overview (Page 7518) figure.

Creating backup copies (project/CF)

Requirement

Before adapting the project, it is essential that you create the following backup copies:

- A backup copy of the project and
- A backup copy of the CF card contents, see Saving CF card data (Page 7540).

See also

Update - preparatory measures (Page 7536)

Backing up user data (back up variables)

Overview

With the SCOUT functions "Save variables" and "Restore variables", you have the option of backing up and restoring data that were changed during operation and only stored in the runtime system. This is necessary if a SIMOTION platform is changed or a version upgraded, for example.

The "Save variables" function creates XML files that can be saved in any folder.

The following types of data can be backed up:

- Remanent global device variables and unit variables, as well as TO retain data located in the NVRAM of the controller
- Data saved with _saveUnitDataSet or _exportUnitDataSet and located on the CF card

Note

During an upgrade, this function is only required for the purpose of backing up and restoring unit data records created with _saveUnitDataSet.

Retain and unit data (saved with _exportUnitDataSet) remain valid even after a version upgrade.

SIMOTION retain data can also be backed up to a memory card without the use of SIMOTION SCOUT. For this purpose, use:

- The _savePersistentMemoryData function or
- The service selector switch or the DIAG pushbutton or SIMOTION IT web server, see Section Non-volatile SIMOTION data (retain data) (Page 7558).

Procedure

The user data must be saved **before** the SCOUT project is upgraded. This can be done regardless of whether the version upgrade is performed with the "old" or the "new" SCOUT version.

The procedure is described below based on the example of a new SCOUT version.

1. Open the project.
   When you open the project, a window appears with a message that the project you are opening was created with a different SCOUT version, as well as a query asking whether you want to perform an upgrade.

Figure 10-213 "Convert project" message

2. Confirm the prompt with "OK". The project will be converted to the current version.

3. A dialog then appears with a prompt asking whether the project should be opened write-protected.

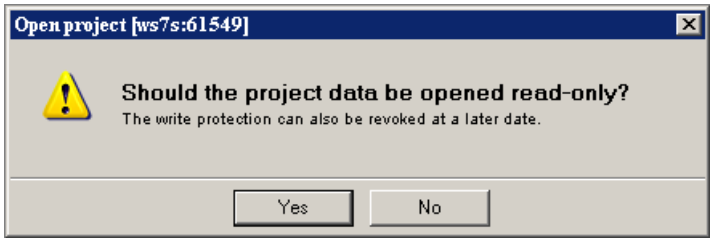

Figure 10-214 Prompt for write-protected opening

4. Confirm this prompt with "Yes" (open write-protected).
5. Set the SIMOTION D410-2 to the STOP operating state.
6. Set the SIMOTION D410-2 to online mode and perform the SCOUT **Save variables** function. The retain variables (interface and implementation) and the user files (with _saveUnitDataSet or _exportUnitDataSet) are saved to the PG/PC.
7. Then close the project.

Note

An online connection is possible only when the PG/PC is configured for the controller.

Update the PG/PC assignment using .

Online connection is now possible.

Additional references

For further information, see the *SIMOTION SCOUT* Configuration Manual.

See also

Diagnostic data and non-volatile SIMOTION data (Page 7557)

Upgrading a user project to the new SCOUT version

Requirement

It is essential that a backup copy be made of the original project before the upgrade, because the data storage of the project is also upgraded during the upgrade. This ensures that you can always return to the original project if the upgrade fails (power interruptions, unexpected faults, incorrect operation, etc.).

Procedure

1. Open the project. A window appears with a message that the project to be opened was created with another SCOUT version as well as a prompt as to whether the upgrade should be performed.

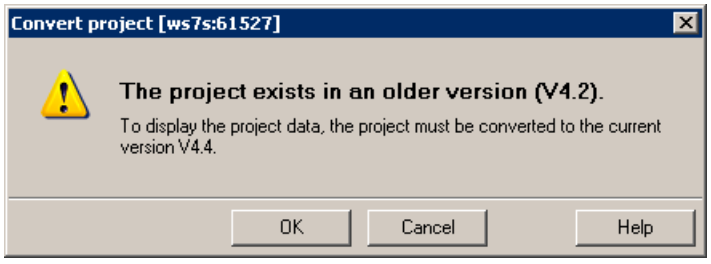

Figure 10-215 "Convert project" message

2. Confirm the prompt with "OK". The project will be converted to the current version.
3. A dialog then appears with a prompt asking whether the project should be opened write-protected.

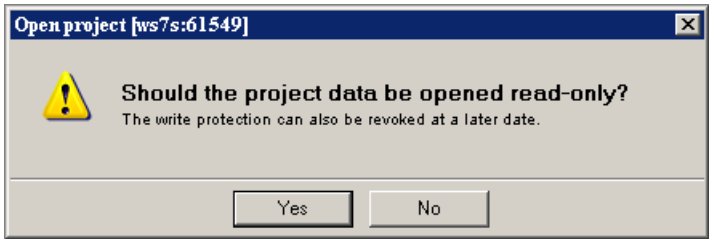

Figure 10-216 Prompt for write-protected opening

4. When upgrading the version, click "No" (open not write-protected).

Note

A project that was last edited with a higher SCOUT version cannot be opened by a SCOUT with a lower version.

Remedy:
Convert the project beforehand with the more recent SCOUT version to the required software version ("Project" > "Old project format" > "Save in old project format"). The project can then be opened with the lower SCOUT version.

Platform replacement via XML export/import

Overview

A platform replacement is always required when an existing project is to be used for another SIMOTION platform. The platform replacement is always performed via an XML export/import.

The following devices can be interchanged via a platform replacement:

- Replacement between SIMOTION C, P and D (e.g. C240 ⇒ D445-2 DP/PN)
- Replacement between D410/D410-2 and D4x5/D4x5-2 (e.g. D410-2 DP/PN ⇒ D445-2 DP/PN)
- Replacement between SIMOTION D (SINAMICS S120 Integrated) ⇒ SIMOTION D (SINAMICS SM150 Integrated)

Platform replacement during project downgrades:

It is not possible to downgrade to a lower SINAMICS version. However, it is possible to transfer project data by means of an XML export/import.

Preparations

Before the platform replacement can be performed, preliminary work may be necessary in the existing project.

If a SIMOTION D4x5-2 is to be imported into a SIMOTION D410-2, then only the permitted quantity structure of the D410-2 may be configured in the D4x5-2. This applies for all components, e.g. not only an infeed, but also the permissible power units.

A SIMOTION D4x5-2 with CU adapter and Power Module in blocksize format can be imported into a SIMOTION D410-2 when the CU adapter is connected to port 0. Otherwise, the topology will be destroyed.

Generally, the success of an import always also depends on the specific configurations of the drive units, and whether the configuration is possible for the device to which the import is to be performed. Also note any error messages that may occur.

Procedure

Proceed as follows:

1. In the project navigator of SIMOTION SCOUT, right-click the SIMOTION controller that is to be replaced.
   Select "Expert" > "Save project and export object" in the context menu.
   "Save project and export object" exports selected data of the selected object in XML format. This data export can then be reimported into other projects. The entire project is not exported, only the data of the selected object (e.g. only the D410-2 or only the SINAMICS Integrated).
2. Specify the desired path and start the XML export.
3. When the export has been performed error-free, delete the device from the project and confirm the prompt.
4. Insert the desired platform as new device in the project navigator of SIMOTION SCOUT. With the selection of the device, you also define the SIMOTION version, and with a SIMOTION D, also the SINAMICS version.
5. Import the data of the original platform into the new device. To do this, right-click the new device and select "Expert" > "Import object" in the context menu.
6. Select the location where the XML export data is to be stored and start the import. Confirm the prompt to continue with the import.

Confirm the message with regard to the import of a "non-compatible type" with "OK".

Preparing the device replacement

Overview

In contrast to the platform replacement, project data can be particularly easily transferred when a device is replaced. The device replacement is performed via **HW Config**, whereas an **XML export/import** is required for a platform replacement.

A device replacement is only possible within SIMOTION D.

The following devices can be interchanged:

- Replacement between generations (D410 ⇒ D410-2)
- Replacement between variants of the generations (D410-2 DP ⇒ D410-2 DP/PN)
- Replacement of SIMOTION, SINAMICS and/or PROFINET version (e.g. D410 V4.1 - PN V2.1 SINAMICS S120 V2.5 ⇒ D410 V4.2 - PN V2.2 SINAMICS S120 V2.6.2).

Note

When replacing a device, note that the SINAMICS version of the new SIMOTION device must be the same or higher.

A downgrade to a lower SINAMICS version (e.g. SIMOTION D410-2 with SINAMICS V4.x to SIMOTION D410 with SINAMICS V2.x) is not possible.

When carrying out a "D410-2 DP/PN ⇒ D410-2 DP" device replacement, the PROFINET IO system is omitted and the bus interface changes. You must reconfigure this after the device replacement. Any existing PROFINET field devices on the PROFINET interface must be replaced with PROFIBUS field devices on the PROFIBUS interface.

Migration D410 ⇒ D410-2

If a SIMOTION D410 is replaced with a SIMOTION D410-2, the SINAMICS Integrated is also automatically changed to a new type and the corresponding version.

Device replacement in HW Config

Procedure

1. Double-click the SIMOTION device to be replaced in the project navigator in SIMOTION SCOUT. **HW Config** opens.
2. Open the "SIMOTION Drive Based" folder in the hardware catalog.

Note

SIMOTION D is modeled as a compact device in **HW Config**. When replacing a module, you must drag the new module to the header of the displayed module rack and **not to slot 2**. Ensure that you do not delete the D410-2 rack!

3. Drag-and-drop the new module to the header of the module rack.
   The old module is replaced.
   Alternatively, you can:
   - Select the rack header and double-click the new module in the module catalog to replace the previous module, or:
   - Right-click the rack header and select the "Replace object" option.

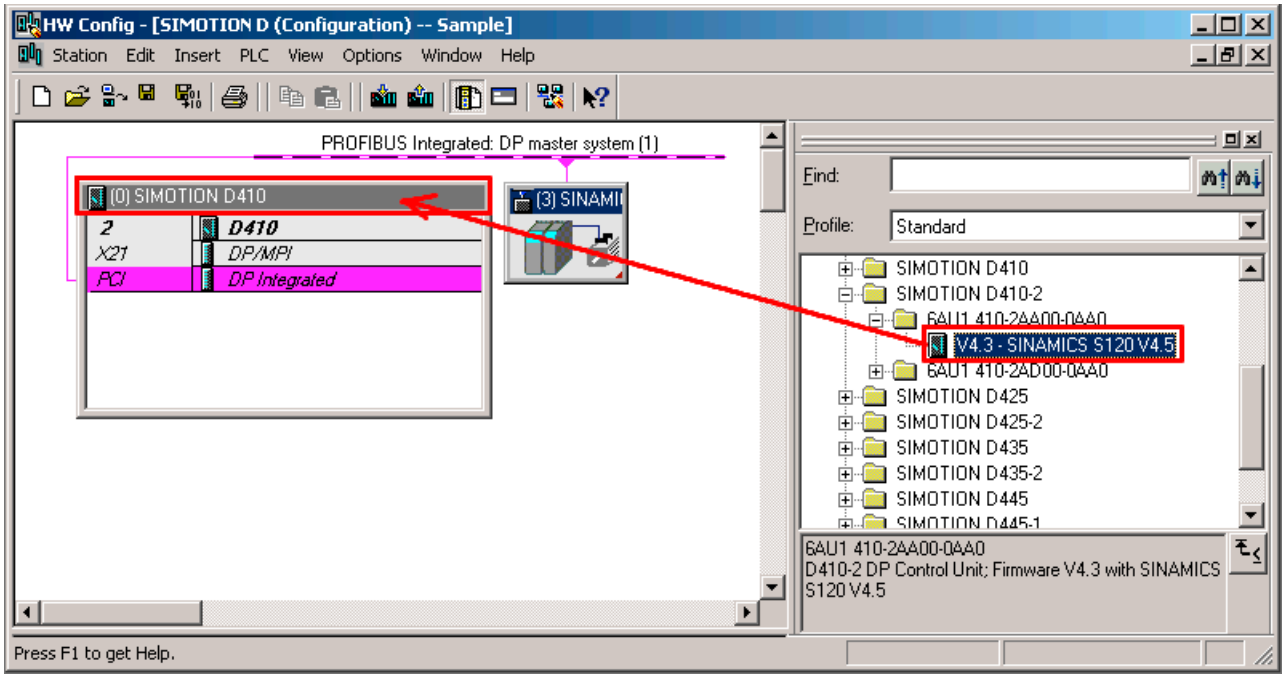

Figure 10-217 HW Config module replacement

4. Confirm the dialog box that appears with "Yes" to replace the SIMOTION device. The module is replaced.
5. Accept the changes made to the hardware configuration with "Station" > "Save and compile".
6. Close **HW Config**.

Note

The engineering system automatically performs the following actions when replacing a module (if necessary):

- Update of the technology packages (TPs)
- Automatic upgrade of the SINAMICS Integrated

The updated data is transferred to the project and the entire project saved.

Upgrading technology packages

Overview

The SIMOTION technology packages (e.g. TP CAM, DCBlib) are available in various versions.

You can only use the functions of the technology objects selected if the technology objects are available in the target system. You can select the technology packages and their version for each SIMOTION device. Each version of SIMOTION SCOUT has a kernel (FW version) for the SIMOTION CPU and an appropriate technology package.

TPs during upgrades

Device replacement (in **HW Config**), platform replacement (XML export/import), or even upgrades may cause versions of SIMOTION technology packages (TPs), which are assigned to individual technology objects (TOs), to change.

- The TP version may change if the main version changes.
  The TP version depends on the relevant main version in all cases; it may, however, remain unchanged through a number of main versions.
- If service packs and hotfixes are installed, there may even be a selection of TP product versions available for the same TP version.

During device replacement (in HW Config) the TP version is automatically updated. If the TP version is changed and more than one version of the new TP version is available, the latest version is automatically installed. If another product version is preferred, this must be set manually (e.g. selection of V4.1.5.3).

During platform replacement (XML Export/Import) , however, the required technology package including the TP version and, if necessary, the product version must be selected manually after the import.

When a SIMOTION CPU is inserted, the TP CAM (latest TP version and product version) is preset by default.

Special displays in the "version" field:

- "Select" means that no TP product version has been selected; this state occurs when older projects, in which the selection of a specific product version was not supported, are upgraded. If the project is loaded to the CPU without having previously made a selection, then the latest available technology package is loaded automatically.
- "---" means that no version can be determined (e.g. for the TP DCBlib or for older CPU versions < V4.1). If no version can be determined, you must select "---".

Selecting the TP product version

The desired technology package is selected with fine granularity in SIMOTION SCOUT at "Target device" > "Select technology packages ...".

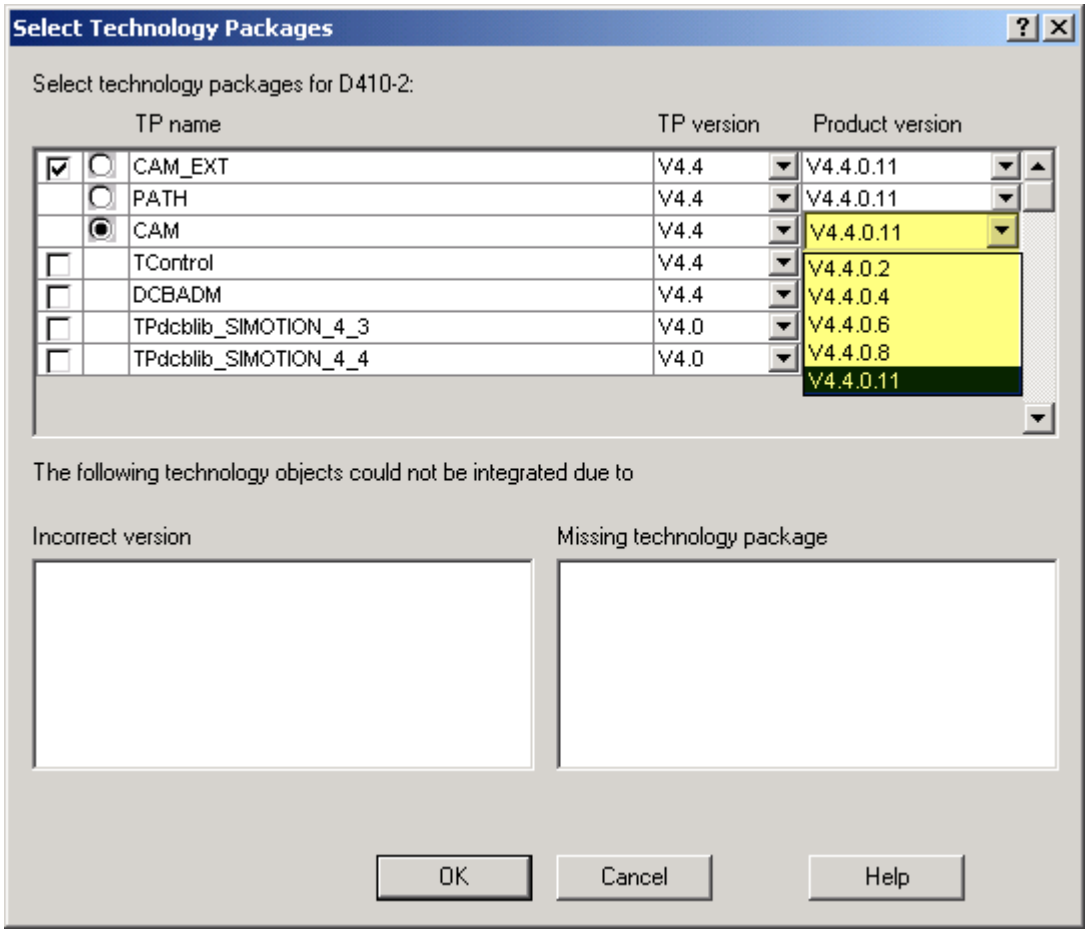

Figure 10-218 Selecting technology packages (based on the example of the D410-2)

Note

Device diagnostics can provide information on which technology package product version has been loaded to a CPU.

Loading technology packages to the target device

Technology packages are only loaded to the target device if no technology package has been loaded so far or if "Load to file system" is executed.

If a technology package version changes, the technology package must be explicitly reloaded to the target device. To do this, proceed as follows:

1. Select "Download project to target system" in SIMOTION SCOUT.
2. Select the "Replace product versions of the technology packages" option at "Additional CPU options" and confirm with "OK".

For further information, please see the online help for SIMOTION SCOUT.

Upgrading the device version of SINAMICS S120 Control Units

Overview

You can upgrade the device versions of SINAMICS S120 Control Units that are connected to the SIMOTION D via PROFIBUS or PROFINET in the SIMOTION SCOUT. The SINAMICS version can only ever be upgraded in a project; it cannot be downgraded.

Note

During device replacement in **HW Config**, the SINAMICS version of the SINAMICS Integrated of the SIMOTION D410-2 is automatically upgraded.

During module replacement in **HW Config**, the selection of a SIMOTION D410-2 module always defines the SIMOTION and the SINAMICS version.

If a SINAMICS S120 Control Unit is connected via PROFIBUS or PROFINET, the SINAMICS version can be selected independently of the SINAMICS Integrated version.

Procedure

To upgrade a SINAMICS drive unit, proceed as follows:

1. Right-click the relevant device, e.g. the SINAMICS S120 CU310-2 DP.
2. Select "Target device" > "Upgrade Device Version/Characteristic" in the context menu. The "Upgrade Device Version/Characteristic" dialog box is displayed. It lists all available firmware versions.

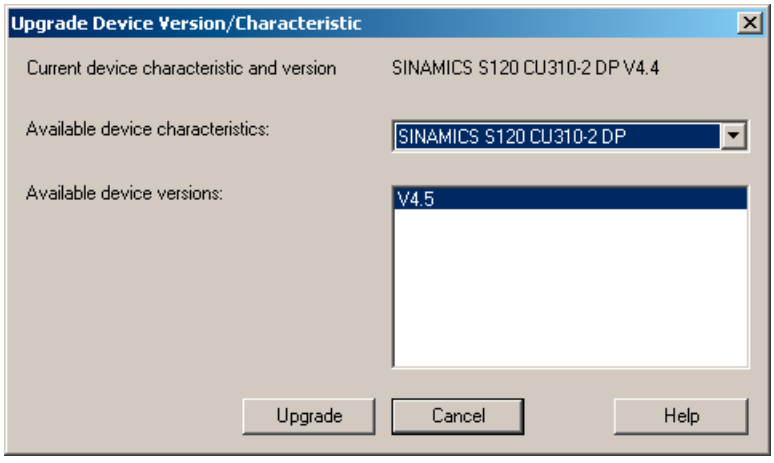

Figure 10-219 Upgrading the device version

3. Select the desired device version/characteristic and click "Upgrade". This upgrades the SINAMICS S120 Control Unit.

Upgrade the libraries

Depending on the configured properties of the libraries used in the project (device-dependent or device-independent), an upgrade of the libraries may be required if the SIMOTION device or the device version changes.

1. Open the LIBRARIES directory in the project navigator.
2. Select a library, right-click to open the context menu, and select "Properties...."
3. Select the "TPs/TOs" tab in the "Properties" window.
4. Select the SIMOTION device and the technology packages for which the library is to be valid.
5. Close the dialog box with "OK".

Note

Please also observe the notes on device-dependencies in the SIMOTION SCOUT online help.

Save project, compile and check consistency

Procedure

1. Save and compile the project from the "Project" > "Save and recompile all" menu.
2. Then perform a consistency check with the "Project" > "Check consistency" menu.

If error messages occur, correct these and repeat the operation.

Note

Note the difference between

- "Save and recompile all" and
- "Save and compile changes"

Save and recompile all

All sources of the entire project are recompiled with this command.

The command is suitable if you are quite sure that all the old data from older SCOUT versions should be removed and replaced with new compilation results.

Use this command if you specifically want to convert a project from an earlier SCOUT version to a newer version. In this way, you take over all error corrections and optimizations.

Save and compile changes

On this command, the whole project is searched for changes. Therefore only the changes are compiled. Use this command for day-to-day operations within a SCOUT version.

Performing a firmware and project update

Upgrading the boot loader on the CompactFlash card

The boot loader may have to be upgraded in the following cases:

- Upgrade of the SIMOTION D
- If a D4x5-2 CF card is to be used for a D410-2 (or vice versa).
- Error corrections and optimizations

Generally, we recommend using the latest boot loader available for the respective CF card.

Upgrading the SIMOTION D410-2 may also render it necessary to upgrade the boot loader of the CF card.

Detailed information on the CF card, boot loader version, SIMOTION D410-2 hardware, and SIMOTION firmware version compatibility relationships can be found in the software compatibility list at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317).

Update - preparatory measures

Upgrading the SIMOTION D410-2

The actions described in this section also apply to downgrading to an older version.

Various options are available for performing a firmware and/or project update on the SIMOTION D410-2:

- Update via CompactFlash card (Page 7540)
- Update via SIMOTION IT web server (Page 7537)
- Firmware and project update using the device update tool (Page 7537)

Note

Upgrading using the device upgrade tool offers a number of advantages (keeping retain data, option of downgrading, no license key handling, etc.).

We therefore recommend using this method for firmware and/or project updates.

Requirement (firmware update)

The current firmware for SIMOTION D can be found on the Internet at Internet address (https://support.industry.siemens.com/cs/ww/en/view/31045047).

Upgrading the SIMOTION D410-2 automatically upgrades the firmware of all connected SINAMICS DRIVE-CLiQ components.

Note

Observe the information in the the Read Me files and the upgrade instructions included in the scope of delivery of new SIMOTION versions.

Use only CF cards that have been approved for use with the SIMOTION D410-2 and whose boot loader version is correct.

You can find the compatibility relationships in the software compatibility list at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317).

NOTICE
The upgrade operation deletes all project data and parameters from the CF card! Back up the data before starting an upgrade.

Requirement (project update)

You have updated your project and, if necessary, adapted the device type and device version. See section Customizing the project (Page 7525).

Update via SIMOTION IT web server

SIMOTION D410-2 has an integrated web server.

In addition to customized web pages and comprehensive device/diagnostic information, SIMOTION IT web server also allows you to update the firmware and project using a standard PC with a web browser.

You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

Upgrade via device update tool (upgrading SIMOTION devices)

Overview

SIMOTION D Control Units and projects can be upgraded using previously created upgrade data.

Performing an upgrade using upgrade data has the following advantages:

- User-friendly creation of upgrade data via SIMOTION SCOUT with the aid of a wizard (at the machine manufacturer's site)
- SIMOTION devices can be upgraded by the machine operator without the SIMOTION SCOUT engineering system
- The machine manufacturer can conveniently send upgrade data via e-mail or post to the machine operator

- There is no need to use license keys, as licenses are retained
- Retain data and unit data is retained when upgrades are performed, even across versions
- An upgrade which has been imported can be discarded again, and the previous configuration restored
- You can upgrade either a single SIMOTION device or multiple devices from one or more SIMOTION projects.
- It is possible to upgrade parts of a configuration only, e.g. Technology Packages only, firmware only, project only, etc.

Handling

Upgrade data is created by the application engineer at the machine manufacturer's premises using SIMOTION SCOUT. The upgrade data can then be handled flexibly depending on both the SIMOTION device in question (SIMOTION C, D, or P) and the customer requirements:

- Creating upgrade data and then copying it to a storage or upgrade medium:
  - CF card
  - USB stick (D4x5/D4x5-2 only; not for D410-2)
  - Upgrade file for the SIMOTION IT web server
- Alternatively, the upgrade data can be created and stored in an archive on the PC, with a view to importing it to an upgrade medium suitable for SIMOTION devices at a later point.
- The process of importing the data to an upgrade medium can be performed at the machine manufacturer's premises; alternatively, if the upgrade archive has been transferred to the machine operator, the service engineer can do this on site.
- The service engineer imports the upgrade data on an operator-guided basis (without any involvement by the application engineer) to the SIMOTION device(s), and upgrades the SIMOTION devices in the process (SIMOTION SCOUT is not required on site).

Note

If a SIMOTION D410-2 is upgraded with an upgrade archive of a SIMOTION D4x5-2, the upgrade and the later downgrade fail. In this case, a correct card image (firmware incl. project) must be loaded to the CF card.

Upgrading with a CF card

1. Switch off the SIMOTION D410-2 to be updated.
2. Insert the CF card into the SIMOTION D410-2.

3. Switch on the SIMOTION D410-2 again. The SIMOTION D410-2 starts to process the upgrade data.
   The SF/BF LED flashes green (0.5 Hz) during the upgrade.
4. Monitor the green flashing of the SF/BF LED.
   - As soon as the upgrade has been completed successfully, the SF LED goes out.
     An automatic power-up with the upgraded configuration is then performed
     (SF/BF LED display then depends on the associated operating state of the device).
   - If the upgrade was not successful, the SF/BF LED flickers red.

Downgrading

If the upgrade has not been successful (for example, the machine is not behaving as desired), the upgrade can be undone as follows:

1. Switch off the SIMOTION D410-2.
2. Set the service selector switch to the switch position B (service mode: downgrade).

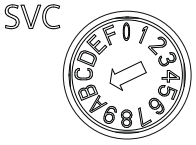

Figure 10-220 Service selector switch, switch position for downgrading

3. Switch the D410-2 on again.
   The flickering green SF/BF LED indicates that restoration is requested.
4. Set the service selector switch back to position "0."
   The system restores the data saved during the upgrade. The data from the upgrade will be deleted.

The downgrade is indicated by a green flashing SF LED (0.5 Hz) and can take several minutes. After successful restoration, the module starts up automatically. (SF/BF LED display will then depend on the respective operating state of the device).
If the restore was not successful, the SF/BF LED will flicker red.

Note

For SIMOTION < V4.4, restoration will start when the module is switched on (step 3). For this, the service selection switch must be rotated to position "0" immediately when the flashing code is displayed (SF/BF LED flashes green with 0.5 Hz).
If the service selector switch is not reset or not reset in good time to "0," this results in fault state "Service selector switch is still set to restore" (SF/BF LED flickers red).
In this case, switch the D410-2 off, reset the service selector switch and switch the D410-2 on again. If the restoration was otherwise successful, the D410-2 boots up with the restored configuration.

Note

The components' firmware is automatically updated, depending on the firmware version on the SINAMICS components and on the CF card. During a firmware update, please heed the messages and alarms in the SIMOTION SCOUT detail window. A firmware update on the SIMOTION D410-2 is signaled by the RDY LED flashing yellow, while on the DRIVE-CLiQ components (TM, SMC, etc.) it is signaled by the RDY LED flashing red/green.

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

Components that require a POWER ON after the firmware update will indicate this through a rapidly flashing RDY-LED. Go offline with SCOUT and switch the 24 V supply off/on (POWER ON) at the respective components for initialization.

Additional references

You will find detailed information for the device upgrade in the *Upgrading SIMOTION Devices* Operating Instructions.

Update via CompactFlash card

Backup of CompactFlash card data

Backing up licenses, retain data, and user data

Prior to upgrading/downgrading firmware, as a precaution we would generally recommend backing up the entire content of the CF card to the PG/PC using the card adapter and Windows Explorer.

How you should proceed to back up and subsequently restore data on the CF card depends on whether the CF data contains any licenses and/or other retain data and user data which will be required again in the future.

Case 1: The CF card contains no licenses and no retain or user data that is still required

You do not need to take any steps in this case. Delete the contents of the CF card and install the firmware as described.

Case 2: The CF card contains licenses (e.g. axis licenses)

Before loading the new firmware, back up the "KEYS" directory to your PC. This can then be copied back to the CF card once you have installed the new firmware.

Note

The license key is stored in the "KEYS" directory on the CF card. When the SIMOTION device starts up for the first time, the license key is saved in the boot sector of the CF card.

A license key saved in the boot sector cannot be deleted by means of a user operation; nor can it be deleted by formatting the CF card or rewriting the boot loader.

If the Keys.txt file is no longer present on the CF card (because the "KEYS" directory has been deleted, for example), it will be written again from the boot sector to the "KEYS" directory while the SIMOTION device is starting up. The license key can be changed at any time (by relicensing, for example). When the device is next started up, the license key will be saved in the boot sector again.

If you lose the license key, you can get it back via the Web License Manager on the Internet, at Internet address (http://www.siemens.com/automation/license). You require the hardware serial number printed on the CF card to do this. In the Web License Manager, you have the option of displaying the associated license key.

Case 3: The CF card contains retain data / user data that is still required in the future

If you are using your application to back up data to the CF card, you must back this up before upgrading the new firmware.

Example:

- Backing up retain data (non-volatile data saved using _savePersistentMemoryData):
  - user\simotion\pmemory.xml
- Backing up SIMOTION IT user files, settings (e.g. trace.xml), task trace data, log files, and Java files (classes, archives, user data system, etc.), stored in the following directories:
  - user\simotion\hmicfg
  - user\simotion\hmi

- Backing up configuration data for modular machines in conjunction with the _activateConfiguration system function, stored in the following directory:
  - install\simotion
- Backing up unit data (data saved on the CF card using _saveUnitDataSet/ _exportUnitDataSet), stored in the following directory:
  - user\simotion\user dir\<unitname>

Note

When a version is changed, you must use the "Save variables" function to back up data saved using _saveUnitDataSet or _exportUnitDataSet in a way that is not dependent on the version. You then have the option of restoring them using "Restore variables."

During an upgrade, the two functions are required only for the backup and restore of unit data records created with _saveUnitDataSet.

Retain and unit data (saved with _exportUnitDataSet) remain valid even after a version upgrade.

Firmware update using a CompactFlash Card

Procedure

Proceed as follows to perform the upgrade:

1. Switch off the power to the SIMOTION D410-2.
2. Remove the CF card from the SIMOTION D410-2 and insert it into the CF card adaptor of your PC.
3. Open Windows Explorer. The CF card must be visible as a removable data carrier in the Windows Explorer under an arbitrary drive letter.
4. If necessary, back up the licenses, retain data and user data on the CF card to your PC (see Backup of CompactFlash card data (Page 7540)).
5. Delete all the data from the CF card.
6. Unzip the firmware file to the CF card using a ZIP file utility such as WinZip. Always maintain the file structure when setting up the unpacking tool.
7. Copy the data saved in step 4 back to the appropriate folder structure on the CF card.
8. Remove the CF card from the CF card adapter on your PG/PC.
9. Insert the CF card into the SIMOTION D410-2.
10. Switch on the power supply for the SIMOTION D410-2. The new firmware is loaded from the CF card to the SIMOTION D410-2 module.

Upgrading SINAMICS

Depending on the settings, the SINAMICS components are also automatically upgraded to the component version of the CF card with a firmware update of the SIMOTION D.

In order for a FW update to be performed for all components, the components must be correctly connected in accordance with the configured topology.

The CONTENT.TXT file in the main directory of the CF card contains the component version.

Upgrading the firmware of SINAMICS components automatically

When starting up, the system automatically upgrades or downgrades all DRIVE-CLiQ components to the version of the component firmware on the CF card. Components that cannot be downgraded to the component firmware version on the CF card (for example, old firmware on the CF card and new components to which the old firmware cannot be loaded) retain their firmware version. The resulting firmware version combinations are always functional.

Note

The components' firmware is automatically updated, depending on the firmware version on the SINAMICS components and on the CF card. During an FW update, please take note of the messages and alarms in the SIMOTION SCOUT detail window. A firmware update on the SIMOTION D410-2 is signaled by the RDY LED flashing yellow, while on the DRIVE-CLiQ components (TM, SMC, etc.) it is signaled by the RDY LED flashing red/green.

- FW update running: RDY LED flashes slowly (0.5 Hz)
- FW update complete: RDY LED flashes quickly (2 Hz), POWER ON required

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

Updating the firmware of the SINAMICS components

The SINAMICS components' firmware is updated automatically, depending on the setting of parameter p7826.

- p7826 = 0: Upgrade/downgrade deactivated
- p7826 = 1: Upgrade and downgrade (factory setting)
- p7826 = 2: Upgrade only

Note

The automatic FW update via p7826 = 1 (upgrade and downgrade) must not be deactivated when Safety Integrated is used.

If you are updating the firmware manually, proceed as follows:

1. Select the SINAMICS component in the Project Navigator, e.g. SINAMICS Integrated.
2. Double-click "Overview" in the Project Navigator.
   The "SINAMICS_Integrated - Overview" dialog box opens with a list of available drive objects.
3. Click "Version overview" to open the list of connected SINAMICS components.
4. Go online and select the devices whose firmware you wish to update.
   The list displays the current firmware version of the devices.

5. Click "Firmware update" to download the new firmware to the devices. To do so, you must select all components whose firmware is to be updated.
6. When the firmware update is complete, switch the 24 V power supply off and back on again. The device is now ready for operation.

Note

The SINAMICS components must be configured for a firmware update to take place. The firmware cannot be updated if the components have not been configured.

You can also update the firmware using the expert list. See the *SINAMICS S120* Commissioning Manual for a description of how to do this.

Download project to target system

Once all the changes required for upgrading your project have been made, you must download the project to the SIMOTION D410-2.

Requirement

The firmware required is located on the CompactFlash card; for information, refer to the section titled Firmware update using a CompactFlash Card (Page 7542).

You have recompiled the project and checked it for consistency. See Section Save project, compile and check consistency (Page 7535).

Procedure

1. Save and compile the project.
2. Click "Connect to selected target systems" to establish a connection to the target system.
3. Execute "Download project to target system" and then "Copy RAM to ROM" to download the upgraded project to the CompactFlash card as well.
4. Because of the automatic follow-up configuration in the SINAMICS Integrated drive, you must now execute "Load CPU / drive unit to PG".
5. Save the project.

Note

When upgrading SINAMICS drive units (e.g. SINAMICS Integrated) only the p parameters (setting parameters) are loaded into the upgraded project. The r parameters (monitoring parameters) are not loaded.

The r parameters in the drive unit are derived or calculated from an automatic subsequent parameterization and must therefore be uploaded to the project.

To do this, execute "Load CPU/drive unit to PG".

If the upload cannot be performed, this can lead to inconsistencies in the drive parameterization dialog boxes.

SIMOTION CompactFlash card

Changing the CompactFlash card

Requirement

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D410-2 device before inserting or removing the CompactFlash card. The SIMOTION D410-2 is in a de-energized state when all the LEDs are OFF.
Comply with the ESD rules.

Procedure

To change the CF card, proceed as follows:

1. Switch off the power supply.
2. Remove the CF card from the plug-in slot on the SIMOTION D410-2.
   To do this, grasp the gripping cavity between your thumb and forefinger and pull the card out.
3. Gently insert the new CF card into the empty plug-in slot until it clicks into place. The direction of insertion of the CF card is indicated by an arrow located on both the plug-in slot and the CF card.
   The properly inserted card does not protrude from the SIMOTION D410-2 housing.
4. Switch the power supply on again.

Writing to a CompactFlash card

Overview

You have the following options of writing data to a CompactFlash card:

- Writing to a CompactFlash card that is inserted in a SIMOTION D
  The PG/PC must be online to SIMOTION D410-2 in order to execute this function.
- Writing to a CompactFlash card without a SIMOTION D module
  This function requires a CompactFlash card adapter.

Note

CompactFlash cards are always shipped in formatted state. It contains the SIMOTION Kernel (SIMOTION D firmware).

Trouble-free operation of the CompactFlash card can only be guaranteed if you do not modify its partitioning.

Writing to a CompactFlash card that is inserted in the SIMOTION D

The CompactFlash card can be used as storage volume for technology and user data (programs, configuration data and parameters) from the "volatile data" area. Proceed as follows:

1. Establish the connection between the SIMOTION D410-2 and the PG/PC (see Section Creating a project and configuring the communication (Page 7367)).
2. Select the "Copy RAM to ROM" command in SIMOTION SCOUT to write the data to your CompactFlash card.

Writing to a CompactFlash card without a SIMOTION D module

A CompactFlash card adapter must be installed on the PG/PC and can be used to write data to the CompactFlash card. Always save your project data to CompactFlash card using the PG/PC before you update the SIMOTION firmware, for example.

Note

Do not use any of the onboard tools in Windows to modify or delete files which were written to the CompactFlash cardCompactFlash card using the "Copy RAM to ROM" function in SIMOTION SCOUT. Such actions may irrevocably destroy your project.

Formatting the CompactFlash card

You can format a faulty CF card, for example.

Before formatting the CF card, please observe the notes in Section Backup of CompactFlash card data (Page 7540).

Proceed as follows to format the CF card:

1. Insert the CF card into a CF card adapter connected to your PG/PC.
2. Format the CF card in Windows (FAT, FAT16 or FAT32 file system).
   The CF card is formatted.
3. If the CF card boot loader is also defective, you will have to rewrite it.

Note

The CF card may not formatted with NTFS.

The following formats are permitted: FAT, FAT16 and FAT32.

Because of the improved memory utilization on the CF card, FAT32 formatting is preferable. SIMOTION D410-2 CF cards are supplied as standard with FAT32 formatting.

Boot loader on the CompactFlash card

Writing a boot loader

A boot loader may need to be written in the following situations:

- A new boot loader is required for the used SIMOTION D410-2 firmware version.
- A new boot loader is required for the used SIMOTION D410-2 hardware.
- The boot loader is defective.
- A D4x5-2 CF card is to be used for SIMOTION D410-2.

The boot loader version can be fetched using SIMOTION SCOUT device diagnostics. If this is not possible, the boot loader version may be incorrect.

A potential fault description could be as follows:
The SIMOTION D410-2 does not power up, the RDY LED flashes red at 0.5 Hz and the RUN/STOP LED lights up red, or all the LEDs remain off.
In this case, replace the boot loader version with the current version.

Use the "Options > Write boot sector..." function to write the boot loader version in SIMOTION SCOUT to the CF card.

Note

You require PG/PC administrator rights to write to the boot sector. If you do not have administrator rights on your PG/PC, an administrator can enter an administrator login for you to use this function at "Options" > "Settings" > "Rights."

Detailed information on the CF card, boot loader version, SIMOTION D410-2 hardware, and SIMOTION firmware version compatibility relationships can be found in the software compatibility list at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317).

Note

Note that the CF cards for SIMOTION D4x5-2 and D410 can have a different boot loader!

Recommended method of handling CompactFlash cards

Handling CF cards correctly

Note the following points when working with the CF card:

- The CF card may only be inserted or removed when the system is de-energized.

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D410-2 device before inserting or removing the CompactFlash card. The SIMOTION D410-2 is in a de-energized state when all the LEDs are OFF.
Comply with the ESD rules.

- CF cards are not designed to be rewritten as many times as the user wishes.
  With this in mind, you should avoid writing user data from the application to the CF card cyclically. Depending on the system, a write operation from the application may trigger one or more write operations on the CF card.
  We therefore recommend that the user program does not make more than 100,000 write accesses over the estimated service life of the application.
- Never switch off the SIMOTION D Control Unit during write accesses to the CF card. If the SIMOTION D Control Unit is switched off during write accesses, this can result in destruction of the data and, in the worst case, to damage to the file system (FAT Table = directory) on the CF card.
  If the FAT table is destroyed, the CF card will have to be reformatted and the firmware/user data reloaded. During this process the licenses remain on the CF card.
  The FAT table can be destroyed if updating the FAT table is interrupted by switching off the SIMOTION D Control Unit. The FAT table is updated, for example, by functions such as **_exportUnitDataSet**, copy RAM to ROM, or save SINAMICS NVRAM data via p7775.
  The FAT table can also be destroyed if you pull a CF card out of a CF card adapter while Windows is accessing the CF card.
- The following functions do not update the FAT table:
  - **_saveUnitDataSet** (writing the data to an existing file)
  - **savePersistentMemoryData** (as of V4.4: writing the data to an existing file)

  Once the backup files have been created with **_saveUnitDataSet** / **savePersistentMemoryData**, this also results in updating the FAT table.

Card reader for CompactFlash cards

Because of the quickly changing market and the large differences in the quality of card readers, no specific recommendation can be made.

If problems occur identifying the CF card, this may be due to an incorrect power up of the card reader.

License key on the CF card

Depending on the type and number of runtime functions used in the project, licenses must be purchased as part of the licensing procedure for SIMOTION.

For further information on the licensing of runtime functions, see (https://support.industry.siemens.com/cs/en/en/view/42014324)

The licenses required for SIMOTION D are assigned to an individual license key for the CF card (license key cannot be transferred to another CF card).

The license key must be stored in the \KEYS\SIMOTION directory in the keys.txt file on the CF card.

Backup in the boot sector

The license key is stored in the "KEYS" directory on the CF card. When the SIMOTION D Control Unit is ramped up for the first time, the license key is backed up in the boot sector of the CF card.

A license key saved in the boot sector cannot be deleted by means of a user operation; nor can it be deleted by formatting the CF card or rewriting the boot loader.

If the keys.txt file is no longer present on the CF card (e.g. because the "KEYS" directory has been deleted), it will be written again from the boot sector to the "KEYS" directory while the SIMOTION D Control Unit is ramping up. The license key can be changed at any time (e.g. through relicensing). At the next power-up, the license key is backed up in the boot sector again.

Loss of the license key

In the event of the loss of a license key, a copy can be obtained via the Web License Manager at the following Internet address (http://www.siemens.com/automation/license). You require the hardware serial number printed on the CF card to do this. You can display the associated license key in the Web License Manager. The license file (Keys.txt) is also offered as download.

Notes for Keys.txt

- If a firmware card image is unpacked on the CF card, a KEYS directory is not available per default.
- If the CF card ramps-up **without a KEYS directory** in a controller, an empty file structure (\KEYS\SIMOTION) is created.
- The keys.txt must be stored in this directory (\KEYS\SIMOTION\keys.txt).
- If the directory contains a keys.txt with an invalid license key, this is deleted from the keys.txt when the controller ramps up, i.e. the keys.txt file exists, but is empty.
- If the directory contains a keys.txt with a valid license key, this is also stored in the boot sector of the CF card as backup when the controller ramps up.

- The keys.txt can be written online via SCOUT, with a CF card reader, or via a set up remote access (FTP).
- When licensing via the Web License Manager, you receive a keys.txt that you must store on the CF card under \KEYS\SIMOTION
- It is also possible to create this text file yourself (without formatting) with a text editor (e.g. Notepad). In this case, make sure that only the license key and a line break (CR/LF) is contained in the file.
- If the SF LED flashes slowly in red (0.5 Hz) after the control has ramped up, then either the keys.txt file is faulty (error in the license key, formatting or file/directory name) or the licensing is not adequate for the used objects that require a license.

10.1.2.9 Diagnostics

Diagnostics via LED displays

Overview

The status LEDs display the operating states or fault states of SIMOTION D410-2. They do so by illuminating, flashing, or flickering in different colors.

Arrangement of LED displays

The front side of the SIMOTION D410-2 has four LED displays arranged vertically one above the other.

Figure 10-221 LED displays: D410-2 DP (pictured on the left), D410-2 DP/PN (pictured on the right)

Legend of the LED states

The LED displays can assume the following illumination states.

Table 10-129 Table with explanation of the LED states

Symbol	Meaning
1	LED static ON
0	LED off
0.5/1	LED flashes at 0.5 Hz:
2/1	LED flashes at 2 Hz:
Λ	LED flickers
x	Any LED state

LED displays

The two tables below provide an overview of all relevant LED display combinations. Every LED can illuminate in yellow, red, or green. The color which corresponds with the LED signal state is also defined.

Table 10-130 SIMOTION D410-2 DP and D410-2 DP/PN: Diagnostics by means of LED display

Meaning	Display priority [1]	RDY	RUN/STOP	OUT>5V OUT>5V/SY [2]	SF/BF:
States during power-up					
Hardware reset Power-up of the D410-2 without a CF card or power-up with a CF card (CF card with incorrect / missing / faulty boot loader or without a valid operating system)	1	1 (yellow)	1 (yellow)	1 (yellow)	1 (yellow)
Firmware error • No or incorrect firmware on the CF card • File system of the CF card is destroyed (e.g through power off during writing operation)	x [3]	2/1 (red)	0	0	2/1 (red)
Firmware checked (checksum incorrect)	x [3]	0.5/1 (red)	0	0	0.5/1 (red)
Firmware being loaded	x [3]	Λ (yellow)	0	0	1 (red)
SIMOTION states

Meaning	Display priority [1]	RDY	RUN/STOP	OUT>5V OUT>5V/SY [2]	SF/BF:
Service operating state (axis control panel in the STOPU/ measuring function)	5	x	2/1 (yellow/green)	x	x
General reset requested by SIMOTION D410-2 or with the mode switch	5	x	0.5/1 (yellow)	x	x
General reset in progress	5	x	0	x	0
General reset stopped (STOP)	6	x	1 (yellow)	x	x
States of the SINAMICS Integrated (LED RDY)					
Updating the firmware of the DRIVE-CLiQ components	6	0.5/1 (yellow)	x	x	x
Firmware update of the connected DRIVE-CLiQ components has been completed (Power OFF/ON of the upgraded/downgraded devices is required)	6	2/1 (yellow)	x	x	x
Detection of the components via LED **Note**: The displayed color combination depends on the p0124[0] parameter =1 yellow/green flashing =0 yellow/red flashing	6	2/1 (yellow/green) (yellow/red)	x	x	x
Commissioning/reset	6	0.5/1 (green)	x	x	x
Write/read SINAMICS access to CF card	6	Λ (yellow)	x	x	x
SINAMICS Integrated ready for operation	6	1 (green)	x	x	x
SINAMICS Integrated in fault state (Check parameterization/configuration)	6	2/1 (red)	x	x	x
Underlicensing SINAMICS functions [6]	6	x	x	x	0.5/1 (red)
SIMOTION IT service mode / switch position 8 for 120 minutes.	6	x	x	x	0.5/1 (red)
Backing up and restoring diagnostic data and non-volatile SIMOTION data					
Backing up diagnostic data and non-volatile SIMOTION data (backup running)	4	x	Λ (yellow)	x	x
Backing up diagnostic data and non-volatile SIMOTION data (backup completed)	4	x	Λ (green)	x	x
Request: "Restore non-volatile data" (with switch position "A")	4	x	x	x	Λ (green)

Meaning	Display priority [1]	RDY	RUN/STOP	OUT>5V OUT>5V/SY [2]	SF/BF:
Upgrading SIMOTION devices (device update tool)					
Restoration requested		x	x	x	Λ (green)
Upgrade/downgrade running		x	x	x	0.5/1 (green)
Upgrade/downgrade completed with error		x	x	x	Λ (red)
Upgrade/downgrade completed without error		x	x	x	0 [4]
Encoder power supply [5]					
The electronics power supply is missing or outside the permissible tolerance range. Power supply ≤ 5 V. Use of an encoder with 5 V power supply.		x	x	D410-2 DP: 0 D410-2 DP/PN: 0 1 2/1 (green)	x
Electronics power supply for measuring system available. Power supply >5 V. **Notice:** Always ensure that you can operate the connected encoder on a 24 V power supply (e.g. HTL encoder). Operation of a 5 V encoder on the 24 V encoder supply may result in the destruction of its electronic components! This setting can be selected in the expert list of the drive in parameter p0405.1.		x	x	D410-2 DP: 1 (yellow) D410-2 DP/PN: 0.5/1 1 2/1 (yellow)	x

1) Priority of the displays: The displays always visualize the state assigned the highest priority. "1" has the highest priority. The state of the next lower priority class is displayed after the cause of the previous signal state was eliminated. If a state does not have any specified priority, no other state other than the associated state can occur.

2) Labeling of LEDs:
D410-2 DP: OUT>5V
D410-2 DP/PN: OUT>5V/SY

3) States occur in succession during power-up.

4) The upgrade or downgrade has been completed when the SF/BF LED goes out. The device then powers up automatically in the upgraded or downgraded configuration (the SF/BF LED display then depends on the operating state of the device).

5) The "OUT>5V" or "OUT>5V/SY" LED display indicates whether the encoder supply level is > 5 V. In the case of SIMOTION D410-2 DP/PN, not only is the configured encoder supply indicated, but also the state of PROFINET interface synchronization to the send cycle clock. See the following table.

6) In the case of SINAMICS licenses (e.g. SINAMICS DCB Extension), underlicensing of SINAMICS Integrated via the flashing SF-LED is indicated on the SIMOTION D Control Unit. An entry is also made in the diagnostic buffer and the underlicensing is displayed in the license dialog box of SIMOTION SCOUT. The licensing is effected (like for SIMOTION licenses) via SIMOTION SCOUT or via the SIMOTION license key on the CF card.

7) PROFINET communication error
As IO controller:

- Failure of a connected I/O device
- At least one of the assigned I/O devices cannot be addressed
- Incorrect or no configuration

As I-Device:
The LED flashes until at least one controller has correctly established communication with this I-Device.
Possible causes:
- IP address is incorrect
- Incorrect configuration / parameterization
- IO controller not available / switched off, but Ethernet connection is established.
- In Shared IDevice operation: All configured IO controllers are not available / switched off, but Ethernet connection is established (link established to a neighboring device)
- Incorrect or missing device name
- The response monitoring interval has elapsed
- The CPU is I-Device and the communication to the higher-level controller fails

Table 10-131 SIMOTION D410-2 DP/PN: SYNC state of the PROFINET IO interface diagnosed via the OUT>5V/SY LED display

Meaning	SYNC state LED display[1)]	
	Encoder supply ≤ 5V	Encoder supply > 5V
The PROFINET interface has not synchronized yet to the send cycle clock of PROFINET IO with IRT, or PROFINET IO with IRT has not been configured (e.g. only PROFINET IO with RT or TCP/IP communication). If IRT data has been configured for SIMOTION, the PROFINET interface generates a local substitute cycle clock as long as there is no synchronization to the send cycle clock of PROFINET IO with IRT: SIMOTION task system has synchronized to the local substitute cycle clock of the PROFINET interface. SINAMICS Integrated and the external isochronous DP interface are synchronized to the local substitute cycle clock of the PROFINET interface.	0	0.5/1 (yellow)
The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT. If isochronous IRT data has been configured for SIMOTION, then the following applies: The task system of SIMOTION has synchronized to the send cycle clock of PROFINET IO with IRT. SINAMICS Integrated and the external isochronous DP interface are synchronized to the send cycle clock of PROFINET IO with IRT. If no isochronous IRT data has been configured for SIMOTION, this state indicates that only the PROFINET interface is synchronized to the send cycle clock of PROFINET IO with IRT. The PROFINET interface is then used to forward the IRT data.	1 (green)	1 (yellow)
The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT If IRT data has been configured for SIMOTION, then the following applies: The task system of SIMOTION has synchronized to the send cycle clock of PROFINET IO with IRT. SINAMICS Integrated and the external isochronous DP interface are not yet synchronized to the send cycle clock of PROFINET IO with IRT.	2/1 (green)	2/1 (yellow)

1) How the colors are assigned differs from the SYNC color code used for other SIMOTION devices.

Additional references

You will find detailed information in the *Upgrading SIMOTION Devices* Operating Instructions.

LED displays of the PROFINET interface

The PROFINET ports X150 P1 and P2 have 2 integrated LEDs each for displaying link and activity.

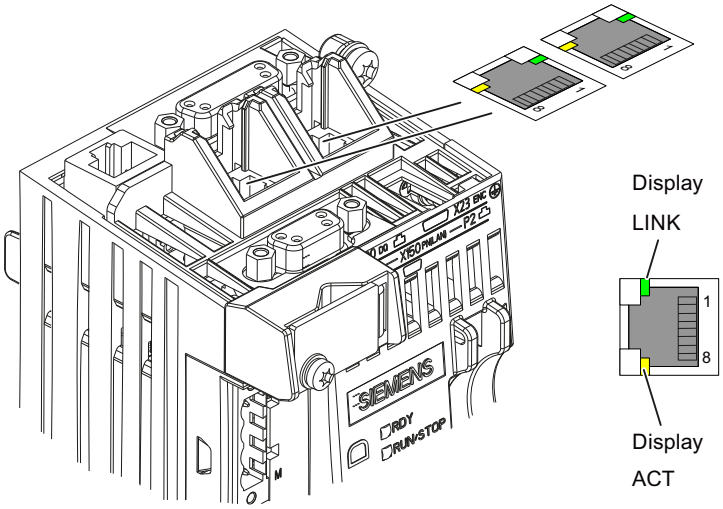

Figure 10-222 PROFINET ports of the D410-2 DP/PN

Table 10-132 State of the Link and Activity LEDs

LED	State	Meaning
LINK	OFF	No or faulty connection
	Lights up green	Transfer rate 10 or 100 Mbit/s: A different device is connected to port x and a physical connection exists
ACT	OFF	No data exchange
	Flickers yellow	Data exchange: Data is being received or sent at port x.

Diagnostic data and non-volatile SIMOTION data

Overview

On the basis of simple operations (e.g. by setting the switch position) and without the need for the SIMOTION SCOUT engineering system, you can

- Back up diagnostic data, including non-volatile SIMOTION data (retain data) on a CF card:
  - Save diagnostic data during running operation (Page 7559)
  - Save diagnostic data during the startup (Page 7560)
- Back up HTML pages (including the most up-to-date content) to the CF card for diagnostic purposes; for information, see Section Diagnostics via HTML pages (Page 7562).
- Restore backed-up non-volatile SIMOTION data (retain data); for information, see Section Delete/restore non-volatile SIMOTION data (Page 7564).

Backup of diagnostic data and non-volatile SIMOTION data

Diagnostics data

Following a fault on a SIMOTION device, diagnostic data (e.g. diagnostic buffer content, up-to-date content of HTML pages, etc.) can provide important information on the cause of the fault. For this purpose, data can be backed up to the CF card with a "simple operator action" (e.g. via service selector switch or DIAG button on the SIMOTION D410-2).

You then have the following options for the diagnostic data:

- Fetching them from the CF card using a card reader
- You can load it with the SIMOTION IT web server or by FTP

You can also use them for diagnostic purposes or provide Technical Support with them for evaluation purposes.

Various options are available to you for backing up diagnostic data:

- Backup during operation (in STOP/STOPU/RUN operating state)
  - with SIMOTION IT web server;
    The web server also offers the possibility of fetching the diagnostic data online.
  - Via the DIAG button
  - Via the service selector switch
- Backup during the module startup
  - Via the DIAG button
  - Via the service selector switch
  - Controlling diagnostic data creation using an INI file stored on the CF card

Non-volatile SIMOTION data (retain data)

In addition to the diagnostic data, non-volatile SIMOTION data (retain data) is also saved on the CompactFlash card. Use the function when the non-volatile SIMOTION data has not been saved on the CompactFlash card using the _savePersistentMemoryData system function but you wish to restore the non-volatile SIMOTION data after a CPU has been replaced.

Note

While the non-volatile SIMOTION data is stored as a "PMEMORY.XML" backup file in the "...USER\SIMOTION" directory using the _savePersistentMemoryData system function, backing up diagnostic data and non-volatile data stores the data in the "...\USER\SIMOTION\HMI\SYSLOG\DIAG" directory.

Save diagnostic data during running operation

Options

The advantage of backing up diagnostic data and non-volatile SIMOTION data during operation is that enhanced diagnostic information via HTML pages and TO alarm information is available.

Data are backed up:

- Using "Diagnostics > Diagnostics Files" in SIMOTION IT web server; see Section Back up diagnostic data and non-volatile SIMOTION data via the web server (Page 7566)
- Via the DIAG button
- Via the service selector switch

Backup of the data via the DIAG pushbutton (preferred solution)

The diagnostic data and non-volatile SIMOTION data can be created in the STOP, STOPU, and RUN operating states.

1. Press the DIAG pushbutton.
   The diagnostic data and non-volatile SIMOTION data are backed up to the CF card.
   The backup task progress is displayed by the RUN/STOP LED flickering yellow.
2. The backup is finished when the RUN/STOP LED flickers green.
   Switch off the SIMOTION D410-2.
3. Remove the CF card.

Backup of the data using the service selector switch (alternative)

The positions of the mode switch are not relevant, i.e. the set operating mode remains unchanged.

The diagnostic data and non-volatile SIMOTION data can be created in the STOP, STOPU, and RUN operating states.

1. Set the service selector switch to "Diagnostics" ("D" position).

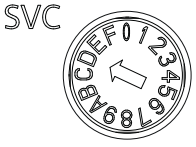

Figure 10-223 Service selector switch (position D)

   The diagnostic data and non-volatile SIMOTION data are backed up to the CF card.
   The backup task progress is displayed by the RUN/STOP LED flickering yellow.
2. The backup is finished when the RUN/STOP LED flickers green.
   Switch off the SIMOTION D410-2.
3. Remove the CF card and reset the service selector switch to its original setting.

Save diagnostic data during the startup

Options

Backing up diagnostic data and non-volatile SIMOTION data during power-up provides you with diagnostic information **without HTML pages / TO alarm information**.

"Backing up during startup" is particularly advisable for SIMOTION devices that cannot run or have crashed.

Diagnostic data and non-volatile SIMOTION data are backed up

- Via the service selector switch
- Via the DIAG button
- Using an INI file saved on the CF card.

Backup of the data using the service selector switch (alternative)

The positions of the mode switch are not relevant, i.e. the set operating mode remains unchanged.

1. Set the service selector switch to "Diagnostics" ("D" position).

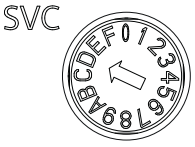

Figure 10-224 Service selector switch (position D)

2. Switch the SIMOTION D410-2 off and on again.
3. Wait for the device to ramp up.
   The diagnostic data and non-volatile SIMOTION data are backed up to the CF card during power-up provided this is still possible and is not prevented by hardware defects, etc.
   The backup task progress is displayed by the RUN/STOP LED flickering yellow.
4. The backup is finished when the RUN/STOP LED flickers green.
   Switch off the SIMOTION D410-2.
5. Remove the CF card and reset the service selector switch to its original setting.

Backup of the data via the DIAG pushbutton (alternative)

1. Switch off the SIMOTION D410-2.
2. Press the DIAG button and hold it down. Switch on the SIMOTION D410-2 again.
3. Wait for the device to ramp up.
   The diagnostic data and non-volatile SIMOTION data are backed up to the CF card during power-up provided this is still possible and is not prevented by hardware defects, etc.
   The backup task progress is displayed by the RUN/STOP LED flickering yellow.
4. The backup is finished when the RUN/STOP LED flickers green.
   Release the DIAG pushbutton and switch the SIMOTION D410-2 off.
5. Remove the CF card.

Note

When backing up data during power-up, the DIAG button must be held down until the backup is completed. As this can easily take 20-30 seconds, it is better to use the service selector switch with switch position "D" for a backup during power-up.

INI file in the main directory of the CF card

1. Use a text editor (such as Notepad) to create a file called **simotion.ini**
2. Add the following text: **DIAG_FILES=1**
   You must use a text editor and may not use any formatting in the text.
3. Copy the simotion.ini file to the main directory of the CF card.
4. Insert the CF card into the module, which is switched off.
5. Switch the SIMOTION D410-2 on and allow the SIMOTION device to start up.
   The diagnostic data and non-volatile SIMOTION data are backed up to the data medium during startup provided this is still possible and is not prevented by hardware faults, etc.
   The backup task progress is displayed by the RUN/STOP LED flickering yellow.
6. The backup is finished when the RUN/STOP LED flickers green.
   Switch off the SIMOTION D410-2.
7. Remove the CF card.

Note

To suppress startup in diagnostics mode again, you must delete the simotion.ini file from the CF card.

Storing the diagnostic data and non-volatile SIMOTION data

You can find diagnostic data and non-volatile SIMOTION data on the CF card in the \USER \SIMOTION\HMI\SYSLOG\DIAG directory.

Copy these data and transfer them to Technical Support when requested to do so. A standard card reader can be used to transfer the diagnostic data from the CF card via standard SIMOTION IT web server pages or via FTP.

The following data are stored:

Table 10-133 Diagnostic data on the CF card

File	Application
DIAGBUF.TXT	Diagnostic buffer in a simple text format: Numerical values; no specific plain text. A text editor is used for evaluation purposes.
PMEMORY.XML	Non-volatile SIMOTION data (retain data) An operator action can be used to restore the backed up non-volatile SIMOTION data after a CPU has been replaced See Delete/restore non-volatile SIMOTION data (Page 7564)
TOALARMS.TXT	Text file containing the pending TO alarms. Only TO IDs, alarm numbers, and associated HEX values. **Note:** The TO alarms are only created if diagnostic data has been created during operation (STOP/STOPU/RUN).
HTML page	If the diagnostic data are backed up, the URLs are requested from the text file (DIAGURLS.TXT) and stored as HTML pages together with their content. See Diagnostics via HTML pages (Page 7562) **Note:** The HTML pages are only stored if diagnostic data are created during operation (STOP/STOPU/RUN).
Other files	All other files stored in the directory are only of relevance to Technical Support.

Note

Use HTML pages if you wish to back up diagnostic data in plain-text format. HTML pages enable user-friendly diagnostics. In addition to the standard SIMOTION IT web server pages, you have the option of creating your own HTML pages (e.g. for the axis status or for machine diagnostics). Customized diagnostics pages are particularly suitable for application problems, as you can define the contents yourself.

Diagnostics via websites

In the "DIAGURLS.TXT" text file, located in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory, you can specify HTML files whose state will be stored on the CF card when diagnostic data is created during operation. For example, "devinfo.mwsl" must be entered for the "devinfo.mwsl" website.

Since the pages in question are stored together with their most up-to-date contents, this enables the latest status information regarding the SIMOTION device, as well as the machine/system, from the point at which diagnostic data was created (e.g. when the service selector switch was activated) to be archived.

In addition to the standard SIMOTION IT web server pages, it is possible to store customized pages. Information on creating pages of this type can be found in, for example, an FAQ of the Utilities & Applications.

A tutorial on the creation of user-defined websites is also contained on the Utilities & Applications-DVD.

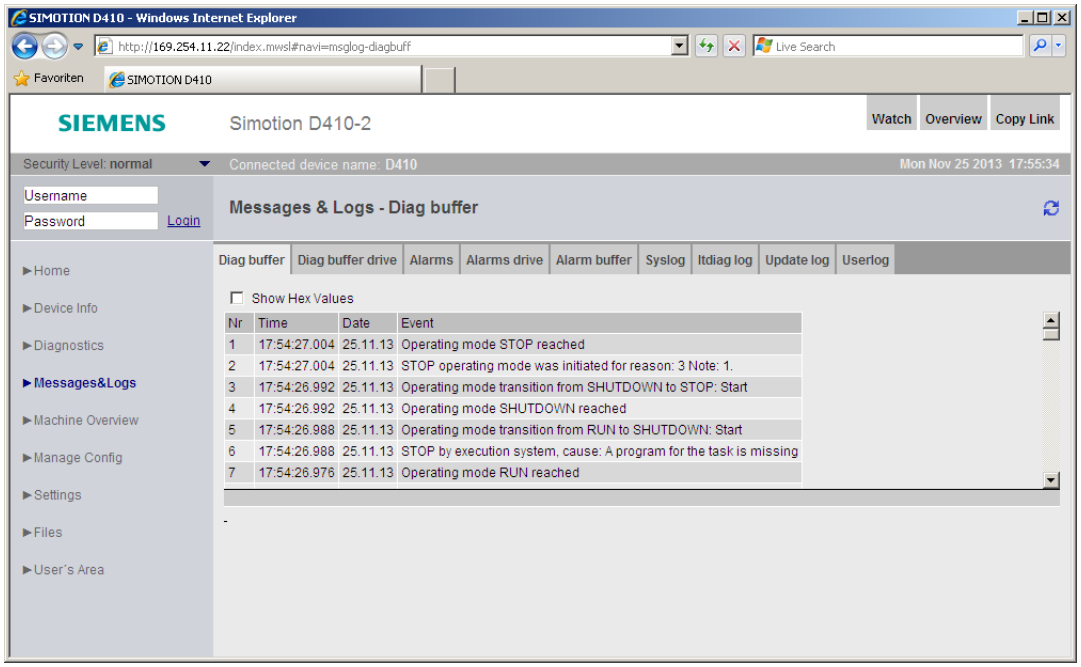

Figure 10-225 Diagnostic buffer at the point when diagnostic data was created

The following points must be noted for the DIAGURLS.TXT file:

- A DIAGURLS.TXT file containing the standard websites is automatically created if you have not stored your own DIAGURLS.TXT file.
- Standard websites are entered "without" specifying a path (e.g. "devinfo.mwsl" for the standard website "devinfo.mwsl").
- User websites (such as "user.mwsl") in the \USER\SIMOTION\HMI\FILES directory on the CF card must contain the FILES/ path specification.
- If you have created subfolders (e.g. "myfolder" in the FILES directory), these must also appear in the path.
- Only one file name may be used per line.
- Empty lines are not permitted (an empty line will be interpreted as the end of the list).

- No distinction is made between upper-case and lower-case letters.
- It does not matter whether you use "\" or "/" in the path name.

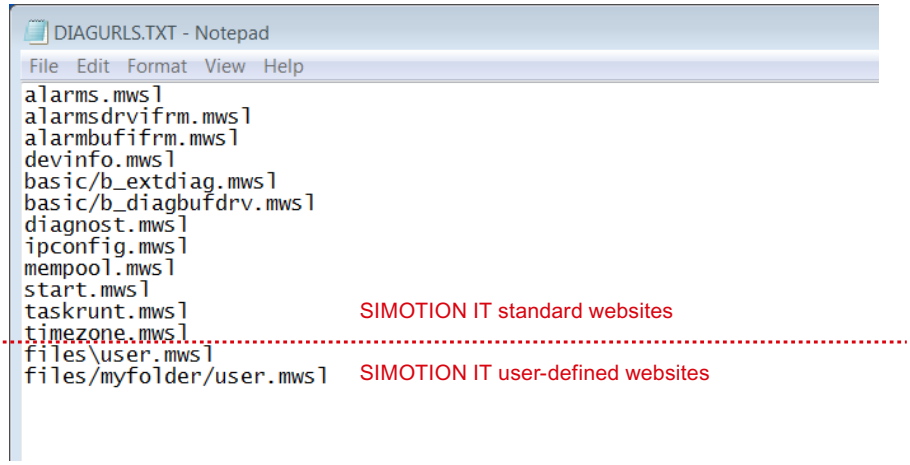

Figure 10-226 Depiction of DIAGURLS.TXT editor

Additional references

You will find detailed information on SIMOTION IT in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

Delete/restore non-volatile SIMOTION data

Overview

Requirement

The non-volatile SIMOTION data have been backed up on the CF card by one of the following methods:

- by system function (_savePersistentMemoryData), see also Section Operations and their effect on the user memory (Page 7354)
- manually by service selector switch / Web server / DIAG button, see Section Backup of diagnostic data and non-volatile SIMOTION data (Page 7558).

Procedure

The non-volatile SIMOTION data is restored automatically during a module replacement, see Section Replacing modules in the spare part scenario (Page 7361). The non-volatile data can also be restored manually (by manual operation).

The CF card may contain backups of non-volatile SIMOTION data in various storage locations:

- data backed up with the system function _savePersistentMemoryData
  Storage location on CF card:
  - /USER/SIMOTION/PMEMORY.XML
  - /USER/SIMOTION/PMEMORY.BAK (backup file)
- manually by service selector switch / Web server / DIAG button, backed-up data
  Storage location on CF card:
  - /USER/SIMOTION/HMI/SYSLOG/DIAG/PMEMORY.XML

On manual restoration, the position of the service selector switch defines which of these data will be preferably restored.

During restoration, the non-volatile SIMOTION data is first deleted and then the non-volatile SIMOTION data is restored via the PMEMORY backup file.

If restoration is not possible (e.g. file does not exist or corrupt), the next file in the priority list is accessed.

Table 10-134 Restoration of the non-volatile SIMOTION data

Position of the service selector switch	Use case	Priority sequence for use of the data backups
1	The data backed up with the system function _savePersistentMemoryData is preferably restored	1. /USER/SIMOTION/PMEMORY.XML 2. /USER/SIMOTION/PMEMORY.BAK 3. /USER/SIMOTION/HMI/SYSLOG/DIAG/PMEMORY.XML
A (as of V4.4)	The data backed up by service selector switch position "D" / Web server / DIAG pushbutton are preferably restored	1. /USER/SIMOTION/HMI/SYSLOG/DIAG/PMEMORY.XML 2. /USER/SIMOTION/PMEMORY.XML 3. /USER/SIMOTION/PMEMORY.BAK

For how to proceed, see Section Restoring data with switch position "1" or "A" (Page 7566).

Note

Firmware / kernel < V4.4

Because switch position "A" is only supported as of V4.4, for < V4.4, restoration must be performed with switch position "1." To force restoration of the data backed up by service selector switch position "D" / Web server / DIAG button, it may be necessary to delete existing files PMEMORY.XML and PMEMORY.BAK in the directory /USER/SIMOTION/ on the CF card.

Note

If the data has been restored once via switch setting "A", this advantage is retained, even when the data should be restored later with "1".

Restoring data with switch position "1" or "A"

Procedure

To restore the non-volatile SIMOTION data, proceed as follows:

Step	Switch position "1"	Switch position "A" (as of V4.4)
1.	Insert the CF card into the new SIMOTION D410-2. The SIMOTION D410-2 must be switched off!	
2.	Set the service selector switch to "**1**." The position of the mode switch is not relevant, i.e. the set operating mode remains unchanged.  Service selector switch (position 1)	Set the service selector switch to "**A**." The position of the mode switch is not relevant, i.e. the set operating mode remains unchanged.  Service selector switch (position A)
3.	Switch on the SIMOTION D410-2.	Switch on the SIMOTION D410-2. The flickering green SF LED indicates that restoration is requested via position "A."
4.	Restoration is started automatically.	Turn the service selector switch to "1" to start restoration.
5.	Once restoration has been completed, the module will start up automatically.	
6.	Switch the module off and turn the service selector switch back to "0."	
7.	Switch on the SIMOTION D410-2 again	

Back up diagnostic data and non-volatile SIMOTION data via the web server

SIMOTION devices provide a web server with already prepared standard web pages. These pages can be displayed via Ethernet using a commercially available browser. Additionally, you have the option of creating your own HTML pages and incorporating service and diagnostic information.

Diagnostic data and non-volatile SIMOTION data can be backed up via the web server. The home page of the web server is opened by entering the IP address of the SIMOTION device in the address line of the browser; e.g. http://169.254.11.22

This opens the home page of the web server. To back up diagnostic data and non-volatile data, call the "Diagnostic files" page from the "Diagnostics" menu.

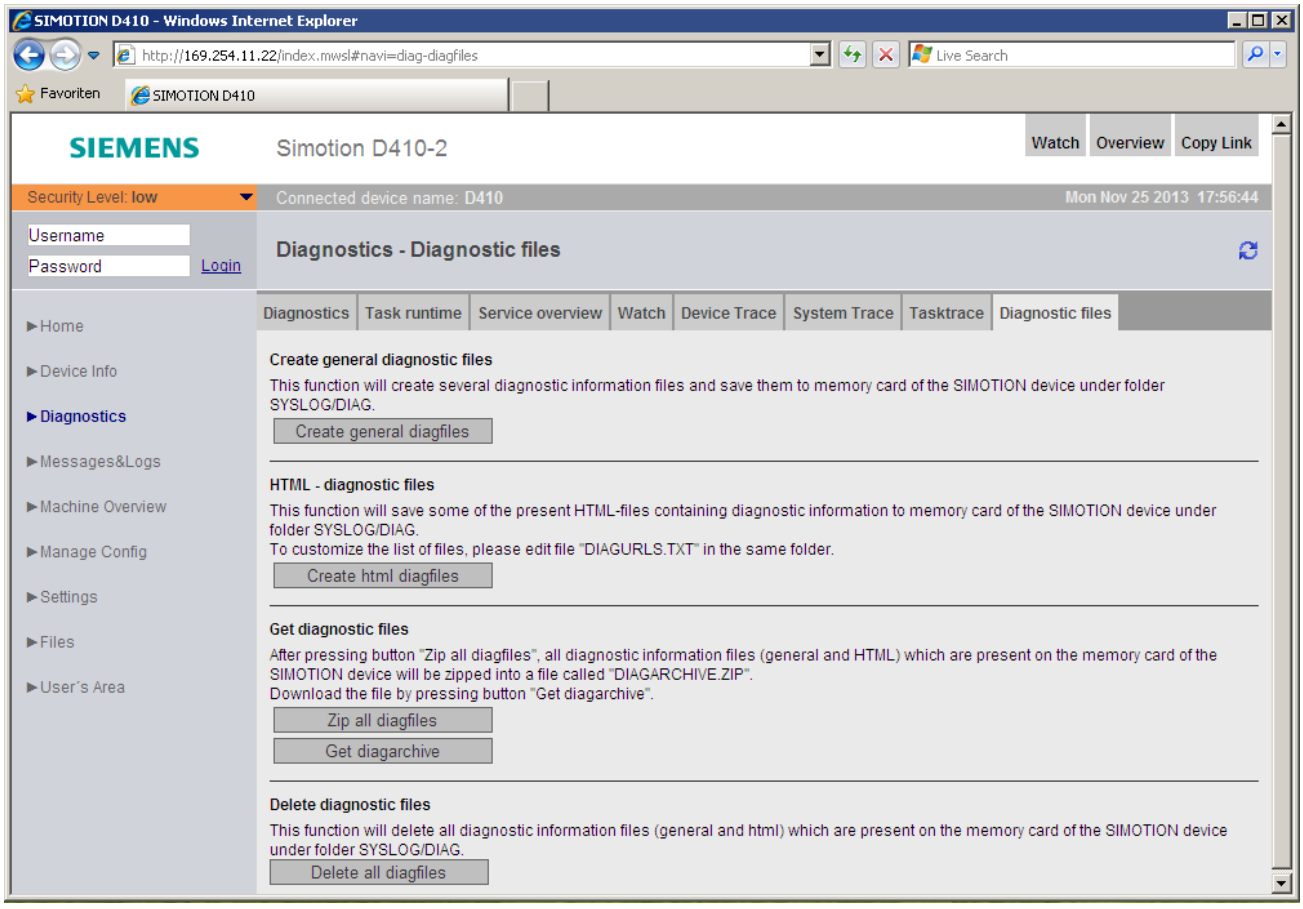

Figure 10-227 SIMOTION IT web server

Table 10-135 Functions on the "Diagnostic files" HTML page

Button	Function
Create general diagfiles	The diagnostic data and non-volatile SIMOTION data are backed up in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory. HTML files used for diagnostics purposes are not saved.
Create html diagfiles	The diagnostic websites are saved on the data medium. Note that only those sites listed in the DIAGURLS.TXT file in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG are saved, see Section Diagnostics via websites (Page 7562).
Zip all diagfiles	The diagnostic files are compressed and stored with their original folder structure in the DIAGARCHIVE.ZIP ZIP file in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory.
Get diagarchive	The ZIP file is saved on a connected PG/PC.
Delete all diagfiles	This button is used to delete all data stored in the ...\USER\SIMOTION\HMI\SYSLOG\DIAG directory; the directory itself is not removed, however.

The diagnostic data and non-volatile SIMOTION data can be found on the CF card in directory: \USER\SIMOTION\HMI\SYSLOG\DIAG

Additional references

You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

Storing diagnostics data and trace on the CF card

As of V4.5, the following data can be saved to the CF card with the **_saveTraceAndDiagnosticFiles** system function:

- Diagnostics data (same data as when the DIAG button is actuated)
- TO trace
- Device trace

The function can be used, for example, to collect diagnostic information (e.g. in the event of a fault) locally on the machine and without backing up SCOUT. The function saves the available data in a ZIP file, whereby the file name and the archive directory can be specified.

The packed data can be accessed, for example, via the web server.

Additional service and diagnostics options

SIMOTION Task Profiler application

The SIMOTION Task Profiler is a dedicated application installed parallel to SIMOTION SCOUT during SIMOTION SCOUT setup. The Task Profiler can be called in online mode using device diagnostics in SIMOTION SCOUT or the Windows application. In the event of a malfunction or error, the Task Trace data can be written to a directory or the CompactFlash card. It can then be processed using the Task Trace Viewer.

Additional references

For detailed information, refer to the *SIMOTION Task Trace* Function Manual.

Diagnostics via the SIMOTION IT web server

SIMOTION D410-2 has an integrated web server. Use is not subject to a license.

In addition to customized websites and the option of performing firmware and project updates, SIMOTION IT web server provides comprehensive device and diagnostic information that can be called using a standard PC with a web browser.

Security concept of HTTP/S, FTP, and Telnet access on the web server

As of version V4.4, access to the SIMOTION IT web server is protected by a multi-level security concept.

The security state of the web server is indicated by the security level on the website. This security level can have three different stages: Low, normal, high.

Security Level Low

The device is supplied with an empty user database. No projects exist yet. The security level is low to allow configuration of the device.

- In this state, access to the web server as an anonymous user is possible to enable use of functions such as the project and firmware update or OPC XML.
- Access to the FTP and Telnet is also possible.
- New users can be entered in the empty user database.

In this state, series commissioning is possible via the web server.

NOTICE
Protecting the device Security level low should only be used for commissioning and service as otherwise the device is not adequately access protected.

Security Level Normal

The controller has a user database. There is a project on the controller; HTTP, HTTPS, FTP, and Telnet have been activated in the HW Config.

User password authentication is mandatory for access to websites with sensitive content (e.g. firmware update watch table, ...), FTP, and Telnet.

Security Level High

High security with maximum access protection:

HTTP, HTTPS, FTP, and Telnet have been deactivated via HW Config. Access to the Ethernet via the various ports of the services is then no longer possible.

State transition from security level low to normal

After taking delivery of the device, the user creates a project and loads it onto the device. This can be done by using the download functions of the SCOUT, by loading it directly onto the memory card (e.g. also via FTP), or via the Manage Config website, Device update tab.

Whichever method is used, the act of loading a project onto the device corresponds to a transition from security level low to security level normal from the point of view of the web server.

Resetting the security level from normal to low

If the user forgets to edit the UserDataBase.xml during initial commissioning, it will no longer be possible to access FTP, web services, or access-protected pages during use.

If there is no mechanical access to the memory card or the device, this can be achieved with the SCOUT function "Delete user data on card". After setting up the user administration, the project must be downloaded again.

Alternatives without SCOUT:

Setting the service selector switch to position "8" restores security level low (SIMOTION IT service mode). Using this method, the device can always be reset to security level low by hardware means.

The following behavior must be taken into account:

- The "Service mode" is activated by turning the SVC switch to position "8".
- If the switch is already set to "8" at ramp-up, it is ignored (protection against forgetfulness).
- The service mode stops immediately when position "8" is exited.
- The service mode stops automatically after 120 minutes.
- It is possible to retrigger 120 minute timeout at any time by turning the switch briefly from "8" to "7" and back, for example.
- The service mode is indicated (as for underlicensing) through slow red flashing of the SF LED.

Note

As an alternative to switch position "8," security level low can also be activated via a simotion.ini file in the main directory of the CF card.

To achieve this, use a text editor (such as Notepad) to create a file called simotion.ini Add the following text: SERVICE_SELECTOR_MODE=8

You must use a text editor and may not use any formatting in the text.

To exit security level low again, undo the changes you have made.

Additional references

You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.

10.1.2.10 Configuring drive-related I/Os (without symbolic assignment)

Overview

The configuration of **local measuring inputs** is fundamentally different to the configuration of **global measuring inputs**.

The assignment of the local measuring inputs is permanently related to the hardware of the control unit and is performed

- On the drive side via the drive expert list and
- During the configuration of the TO measuringInput via the measuring input number.

Local and global measuring inputs have different properties. Detailed information concerning the differences can be found in Section Local and global measuring inputs (Page 7571).

Information about the configuration can be found

- for global measuring inputs (with symbolic assignment) in Section Configuring global measuring inputs (Page 7474)
- for local measuring inputs in the appendix, in Section Configuring local measuring inputs (Page 7573).

Additional references

Further information and programming examples for configuring drive-related I/Os without symbolic assignment can be found

- at Internet address (https://support.industry.siemens.com/cs/ww/en/view/29063656)
- in the SIMOTION Utilities & Applications

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Local and global measuring inputs

Local and global measuring inputs

Depending on the used hardware platform, the following local and global measuring inputs are available for the measuring tasks:

- **Local measuring inputs** are axis-related and implemented in the SINAMICS drive. The measurement records the actual position value.
- **Global measuring inputs** can be freely assigned to the axes and add an internal time stamp to the measurement result for more precise determination of the axis positions.
  The term "central measuring input" is also used within the context of drives.

Table 10-136 Comparison of local and global measuring inputs

	Local measuring input	Global measuring input
Hardware supported	D410, D410-2, D4x5, D4x5-2 (terminal X122/X132), CX32, CX32-2, CU310, CU310-2, CU320, CU320-2	TM15, TM17 High Feature, D410, D410-2, D4x5, D4x5-2 (terminal X122, X132, X142), CX32, CX32-2, CU310, CU310-2,CU320, CU320-2, ET 200SP/MP timer DIDQ
Measurement procedure	With a signal edge at the relevant input, the current actual values of an encoder connected to a Control Unit are measured with positioning accuracy to determine lengths and distances.	With a signal edge at the relevant input, the current actual values of one or more encoders are measured using time stamp functionality with positioning accuracy in order to provide information for determining lengths and distances (possible with any encoders included in the project).
Configuration of the TO measuringInput in SIMOTION SCOUT	The assignment of inputs is always permanent depending on the hardware of the Control Unit and is performed during the configuration of the TO measuringInput using the measuring input number.	The assignment of inputs is not fixed depending on the hardware and is performed during the configuration of the TO measuringInput by means of symbolic assignment or the hardware address.
TO measuringInput setting: Single measurement [1)]	Yes	Yes

	Local measuring input	Global measuring input
TO measuringInput setting: Cyclic measurement [2]	No	Yes **D410, D410-2, D4x5, D4x5-2 (terminal X122, X132), CX32, CX32-2, CU310, CU310-2, CU320, CU320-2:** The minimum interval between 2 measurements is 3 servo cycle clocks (max. 2 edges per measurement). **D4x5-2 (terminalX142), TM17 High Feature, ET 200SP/MP timer DIDQ:** The minimum interval between 2 measurements is 1 servo cycle (max. 2 edges per measurement). **TM15:** No cyclic measurement available
Use of multiple TO measuringInputs on one axis/encoder. They can be active concurrently	No	Yes
Listening TO measuringInput	No	Yes
Measuring on virtual axes	No	Yes
Measuring on axes attached to a different drive unit	No	Yes

[1] Measurement jobs must be issued individually for each measurement. Several interpolation cycle clocks lie between two measurements.

[2] The measuring is activated just once and runs cyclically until deactivated.

SIMOTION Utilities & Applications includes, for example, a tool with the following functions:

- Estimate of the time between initiating a measurement job to the time at which the measuring input job in the drive acts
- Estimate of the minimum time between two measurement jobs.

SIMOTION Utilities & Applications is part of the scope of delivery of SIMOTION SCOUT.

Table 10-137 Measuring inputs - Overview of quantity structures and functionality

Functionality/device	Max. number of measuring input inputs	As local measuring input configurable	As global measuring input configurable
D410-2, CU310-2	8	x	x
D4x5-2 • X122/X132 • X142	 • 8 • 8	 • 8 • 0	 • 8 • 8
CX32-2	4	x	x
D410, CU310, CX32	3	x	x
D4x5, CU320	6	x	x
TM15	24	-	x
TM17 High Feature	16	-	x

Functionality/device	Max. number of measuring input inputs	As local measuring input configurable	As global measuring input configurable
ET 200SP TM timer DIDQ 10x24V	4	-	x
ET 200MP TM timer DIDQ 16x24V	8	-	x

Configuring local measuring inputs

Properties

Local measuring inputs are always permanently assigned to an axis (drive). They are configured separately for each drive. The drive and the measuring input must always be located on the same control unit. The measurement results are transferred using the axis message frame in accordance with the PROFIdrive profile. Message frame 39x does not need to be configured for local measuring inputs.

The settings for the use of the local measuring inputs must be made in the expert list.

Procedure

To use an I/O terminal on the SIMOTION D410-2 or SINAMICS Control Unit as a measuring input, proceed as follows:

1. Double-click the "Inputs/outputs" entry below the control unit in the project navigator.
2. Configure the desired I/O terminal as input in the "Bidirectional digital I/Os" tab. The configuration can also be set channel-granular on the p0728 parameter using the expert list of the control unit.

The specification of the measuring input terminal must be performed at the local measuring inputs in the expert list of the respective drive (refer to the following table).

Table 10-138 Local measuring inputs, required settings in the expert list of the drive

Parameters in the expert list of the drive	Parameterization as	
	D410-2, CU310-2	D4x5-2, CU320-2
p0488[0] (measuring input 1 input terminal, encoder 1)	DI/DO 8 or DI/DO 9 or DI/DO 10 or DI/DO 11 or DI/DO 13 or DI/DO 14 or DI/DO 15	DI/DO 8 or DI/DO 9 or DI/DO 10 or DI/DO 11 or DI/DO 13 or DI/DO 14 or DI/DO 15
p0488[1] (measuring input 1 input terminal, encoder 2)		
p0488[2] (measuring input 1 input terminal, encoder 3)		
p0489[0] (measuring input 2 input terminal, encoder 1)		
p0489[1] (measuring input 2 input terminal, encoder 2)		
p0489[2] (measuring input 2 input terminal, encoder 3)		

Since a maximum of three encoders can be assigned to a drive, the index [0...2] specifies whether the measurement applies to encoder 1, 2, or 3.

The following must be taken into account:

- Two TO measuring inputs can be configured per TO axis or TO external encoder.
- Only one TO measuringInput can be active on a TO axis or TO externalEncoder.

Table 10-139 Local measuring inputs, configuration of the Measuring Input TO

Axis measuring system no.	Under axis measuring system number, enter the number of the used encoder system (namely, encoder 1, 2 or 3). Encoder system 1 is the default setting.
Drive-related (local measuring input)	Activate the checkbox when a local measuring input is used.
Measuring input number	Enter here which measuring input is used (namely, 1 or 2). Input 1 is the default setting.

Detailed information can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs* Function Manual.

10.1.2.11 Standards and approvals

General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

EMC limits in South Korea

	KC registration number: KCC-REM-S49-SIMOTION For sellers or other users, please keep in mind that this device in an A-grade electromagnetic wave device. This device is intended to be used in areas other than home. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

The EMC limits to be observed for Korea correspond to the limits of the EMC product standard for variable-speed electric drives EN 61800-3 of category C2 or the limit class A, Group 1 according to EN 55011. By implementing appropriate additional measures, the limit values according to category C2 or limit value class A, Group 1, are observed. Additional measures, such as the use of an additional RFI suppression filter (EMC filter), may be necessary.

The measures for EMC-compliant design of the system are described in detail in this manual respectively in the Installation Guideline EMC.

Note that the final statement on compliance with the standard is provided by the respective label attached to the individual unit.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (https://support.industry.siemens.com/cs/ww/en/ps/14506/cert).

Marking for Australia and New Zealand

	SIMOTION D410-2 satisfies the requirement of the standard AS/NZS CISPR 16.
or	
	Marking with RCM (Regulatory Compliance Mark) or C-Tick with older components.

Marking for the Eurasian customs union

	EAC (Eurasian Conformity) Customs union of Russia, Belarus and Kazakhstan Declaration of conformity in accordance with the technical regulations of the customs union (TR CU).

Standards that are not relevant

	China Compulsory Certification SIMOTON D does not belong to the validity area of the China Compulsory Certification (CCC).

China RoHS

SIMOTION D complies with the China RoHS directive. You can find more information on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109738656).

Device-specific information

Note regarding SIMOTION D

Note

The product standard EN 61800-3 describes the EMC requirements placed on "Variable-speed drive systems". As such, it defines different limits depending on the location of the drive system.

SINAMICS S120 power units are designed for use in the second environment. The term second environment refers to all locations outside residential areas. These are basically industrial areas which are supplied from the medium-voltage line supply via their own transformers.

It is essential to follow the installation instructions in the SINAMICS S120 Manuals in order to ensure compliance with emitted interference and immunity values.

The same installation instructions apply for the SIMOTION D410-2 Control Unit as for the SINAMICS S120 CU310-2 Control Unit with regard to EMC.

For further information on this topic also refer to the *SIMOTION PM 21* Catalog as well as the SINAMICS Function Manuals.

10.1.2.12 ESD guidelines

ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

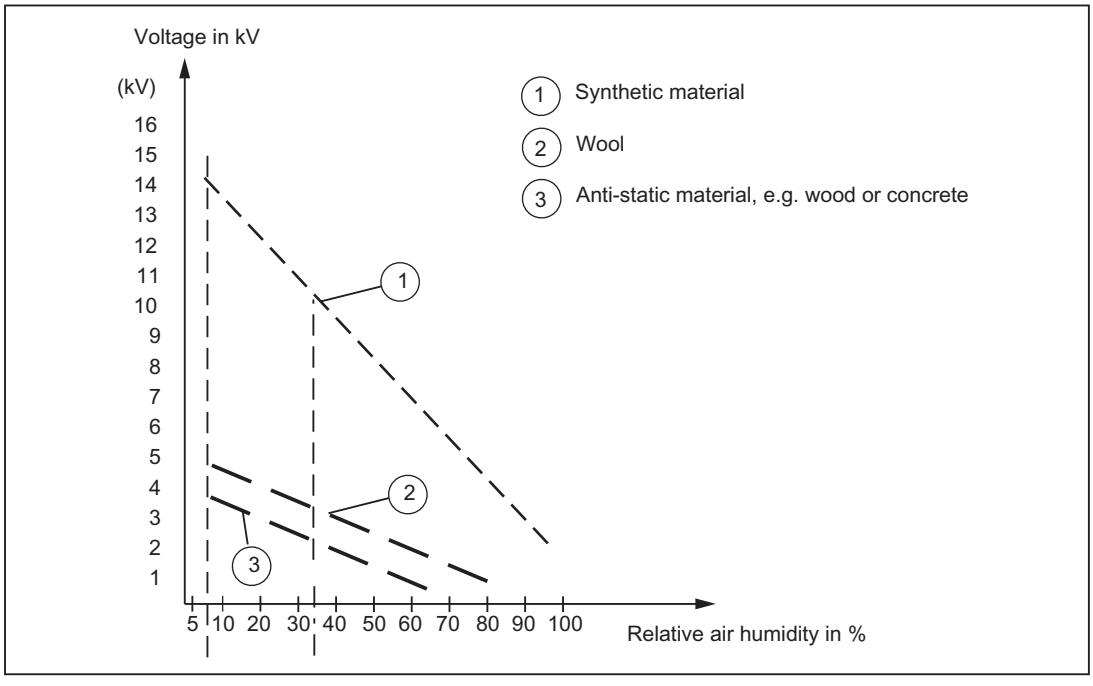

Figure 10-228 Electrostatic voltage that can accumulate on operating personnel

Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

10.2 Equipment Manual

10.2.1 SIMOTION D4x5-2

Preface

Content of the Manual

This **document** is part of the **SIMOTION D documentation package**.

Scope

The *SIMOTION D4x5-2* manual is valid for the SIMOTION D4x5-2 Control Units, as well as the supplementary CX32-2, CBE30-2 and TB30 system components.

A separate *SIMOTION D4x5* Manual is available for the SIMOTION D425, SIMOTION D435 and SIMOTION D445/D445-1 devices including the CX32, CBE30 and TB30 system components.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Content of the manual

The following is a description of the purpose and use of the product manual:

- Description
  Provides information about the SIMOTION system and its integration in the automation environment.
- Operator control (hardware)
  Provides information about the structure and architecture of the devices.
- Interfaces
  Provides information about the different interfaces of the devices, their pin assignment, and possible applications.
- Technical data
  Provides information about the properties and features of the devices.
- Dimension drawings
- Spare parts / accessories
  Provides information about spare parts and accessories of the SIMOTION D4x5-2, CX32-2 and CBE30-2.
- Appendix
  Provides information about the various standards and specifications fulfilled by the device.
- Index for locating information.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Disposal and recycling of the device

SIMOTION D is an environmentally friendly product. It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Identification of plastic materials in accordance with ISO 11469.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The disposal of the products described in this manual should be performed in compliance with the valid national regulations.

The products can be largely recycled owing to their low pollutant content. For environmentally friendly recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner/index.asp

Further information / FAQs

You can find further information on this manual at the following FAQ:

https://support.industry.siemens.com/cs/ww/de/view/27585482

The following information sources are also available:

- SIMOTION Utilities & Applications: SIMOTION Utilities & Applications will be included in the SIMOTION SCOUT scope of delivery and, along with FAQs, also contain free utilities (e.g. calculation tools, optimization tools, etc.) as well as application examples (ready-to-apply solutions such as winders, cross cutters or handling)
- The latest SIMOTION FAQs at https://support.industry.siemens.com/cs/ww/de/ps/14505/faq
- SIMOTION SCOUT online help
- For additional documentation, see the *Overview of SIMOTION documentation* (separate document)

Open source software

Third-party software - License conditions and copyright notes

Copyright notes for the third-party software contained in this product, in particular the open source software, as well as the applicable license conditions, can be found in the READ_OSS.ZIP file on the SIMOTION D CF card or in the corresponding firmware files.

Special note for resellers

The notes and the license conditions contained in the READ_OSS.ZIP file must be passed on to the purchaser in order to avoid the reseller and purchaser from violating the license conditions.

Source code availability

Some license terms of third-party software components used in this product may require us to provide you with the source code and other information for those components. You can find this information directly on or with the product (e.g. on mass storage devices, DVD). If this is not possible for technical reasons, Siemens will be happy to send you this OSS source code in exchange for reimbursement of the processing costs. Please contact the address provided at the end of this section.

10.2.1.1 Safety instructions

Fundamental safety instructions

General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following six steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Electric shock if there is no ground connection

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply

When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage

Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Spread of fire from built-in devices

In the event of fire outbreak, the enclosures of built-in devices cannot prevent the escape of fire and smoke. This can result in serious personal injury or property damage.

- Install built-in units in a suitable metal cabinet in such a way that personnel are protected against fire and smoke, or take other appropriate measures to protect personnel.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Unexpected movement of machines caused by radio devices or mobile phones

The use of radio devices or mobile telephones in the immediate vicinity of the components can result in equipment malfunction. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- If you come closer than around 2 m to such components, switch off any radios or mobile phones.
- Use the "SIEMENS Industry Online Support app" only on equipment that has already been switched off.

⚠ WARNING

Fire due to inadequate ventilation clearances

Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position

The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

⚠ WARNING

Unrecognized dangers due to missing or illegible warning labels

Dangers might not be recognized if warning labels are missing or illegible. Unrecognized dangers may cause accidents resulting in serious injury or death.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, where necessary in the national language.
- Replace illegible warning labels.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions

Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for Safety Integrated functions

If you want to use Safety Integrated functions, you must observe the safety notices in the Safety Integrated manuals.

Malfunctions of the machine as a result of incorrect or changed parameter settings

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Specific safety information for SIMOTION D4x5-2

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Only safety extra low voltage in accordance with EN/IEC 60950-1 may be connected at all connectors and terminals.

⚠ WARNING

Danger to life from electric shock due to insufficient safety isolation

Employing protection against direct contact using DVC A (PELV) is only permissible in areas with equipotential bonding and in dry rooms indoors.

Use other protective measures against electric shock, such as touch protection, if the specified conditions are not met.

⚠ WARNING

Danger to life from unexpected movement of machines on automatic restart

An automatic restart can be programmed for SIMOTION controllers. When the power returns, the axes start automatically.

Make sure this presents no hazard to personnel or property.

NOTICE
Damage to option boards caused by electric fields or electrostatic discharge
Option boards are ESD-sensitive components.
De-energize the SIMOTION D4x5-2 device before inserting or removing the option board. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Comply with the ESD rules.

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D4x5-2 device before inserting or removing the CompactFlash card. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Comply with the ESD rules.

NOTICE
Higher operating temperature if ventilation clearances are too small
The 80 mm clearances above and below the components must be observed.
The unit protects itself from overheating by shutting down.
The ventilation clearance is measured from the lower edge of the module, i.e. the fan/battery module is not included in the dimension.

10.2.1.2 Description

System overview

Overview

SIMOTION D is a drive-based version of SIMOTION based on the SINAMICS S120 drive family.

With SIMOTION D, the SIMOTION PLC and motion control functionalities as well as the SINAMICS S120 drive software run on shared control hardware.

SIMOTION D is available in two versions:

- SIMOTION D410-2 is a compact Control Unit predestined for single-axis applications. The Control Unit is snapped directly on to the SINAMICS Power Module in blocksize format and has an integrated drive control for either one servo, one vector or one *V/f* axis.
- SIMOTION D4x5-2 is a Control Unit for multi-axis applications in SINAMICS S120 booksize format. The following performance versions are offered:
  - SIMOTION D425-2 (BASIC performance) Control Unit for up to 16 axes
  - SIMOTION D435-2 (STANDARD performance) Control Unit for up to 32 axes
  - SIMOTION D445-2 (HIGH performance) Control Unit for up to 64 axes
  - SIMOTION D455-2 (ULTRA-HIGH performance) Control Unit for up to 128 axes or applications with very short control cycles

The SIMOTION D4x5 2 is described in this manual. Separate manuals are available for the SIMOTION D410-2 and the D4x5/D410 predecessor modules.

Like SINAMICS S120, SIMOTION D also follows the Totally Integrated Automation (TIA) concept. TIA is characterized by integrated data management, configuration, and communication for all products and systems. Thus, an extensive toolbox of automation modules is also available for SIMOTION D.

Note

In order to cover all versions of SIMOTION D for multi-axis applications, the product will be referred to as "D4x5-2". Specific product designations will be used for information that applies only to one product version, e.g. D445-2 DP/PN.

SIMOTION D4x5-2 DP describes all PROFIBUS versions, and SIMOTION D4x5-2 DP/PN all PROFIBUS/PROFINET versions of the SIMOTION D4x5-2 Control Units.

Application

The SIMOTION D4x5-2 is ideally suited to applications with many coordinated axes with high clock-pulse rates.

Typical applications include:

- Compact multiple-axis machines
- High-performance applications with short machine cycles
- Compact machines
  - Including the complete machine control in the drive
  - With extensive connection possibilities for communication, HMI and I/O
- Distributed drive concepts
  - Applications with many axes
  - Synchronization of several SIMOTION D Control Units using distributed synchronous operation

Versions

The Control Units are available in the versions SIMOTION D425-2 (BASIC performance), SIMOTION D435-2 (STANDARD performance), SIMOTION D445-2 DP/PN (HIGH performance) and SIMOTION D455-2 DP/PN (ULTRA-HIGH performance). The versions differ in their PLC performance and in their motion control performance. The main distinguishing features are:

Table 10-140 Device versions and features

	SIMOTION D425-2	**SIMOTION D435-2**	**SIMOTION D445-2**	**SIMOTION D455-2**
Maximum number of axes	16	32	64	128
Minimum servo/interpolator cycle clock	0.5 ms	D435-2 DP: 0.5 ms D435-2 DP/PN: 0.25 ms	0.25 ms	0.25 ms 0.125 ms [1]
DRIVE-CLiQ interfaces	4	6	6	6

[1] Only with ET 200SP, SCOUT TIA and Servo_fast / IPO_fast

The Control Units feature PLC and motion control performance (open-loop control and motion control) for up to 16, 32, 64 or 128 axes, as required.

The integrated drive computing performance of the Control Units allows up to 6 servo, 6 vector or 12 *V/f* axes on each D4x5-2 Control Unit (drive control based on CU320-2, firmware version ≥ V4.x).

The drive control supports servo control (for a highly dynamic response), vector control (for maximum torque accuracy) and *V/f* control.

SIMOTION D435-2 DP/PN and D455-2 DP/PN are also available as SIPLUS version for use under extremely harsh environmental conditions, e.g. in toxic atmospheres (for details refer to technical specifications). As BasedOn products, the SIPLUS versions have the same functionality as the standard modules and are configured in the same way.

The SIMOTION D4x5-2 Control Units and their CX32-2, CBE30-2 and TB30 supplementary system components are described in the following.

Note

With the SIZER configuration tool, you can easily configure the SINAMICS S110/120 drive family including SIMOTION.

It provides you with support for selecting and dimensioning the components required for a Motion Control task.

You can also determine the possible number of axes and the resulting load with SIZER in accordance with your performance requirements.

Hardware components

As the central hardware, SIMOTION D uses the SIMOTION D4x5-2 as Control Unit consisting of the SIMOTION runtime system and the SINAMICS drive control. The Control Unit uses the SINAMICS Integrated drive with various SINAMICS S120 drive modules (Line and Motor Modules) to perform open-loop and closed-loop control of the axis grouping. A range of additional SINAMICS S120 components, such as SMx encoder systems or Terminal Modules can also be connected via DRIVE-CLiQ. With a few exceptions (e.g. no basic positioner EPOS, no Basic Operator Panel BOP20, etc.), the drive control integrated in SIMOTION D has the same control characteristics and performance features as the SINAMICS S120 CU320-2 Control Unit. The EPOS functionality is provided by the SIMOTION technology functions. The functionality of SIMOTION D can be expanded with distributed I/O via PROFIBUS or PROFINET IO.
The following figure shows a typical SIMOTION D axis grouping.

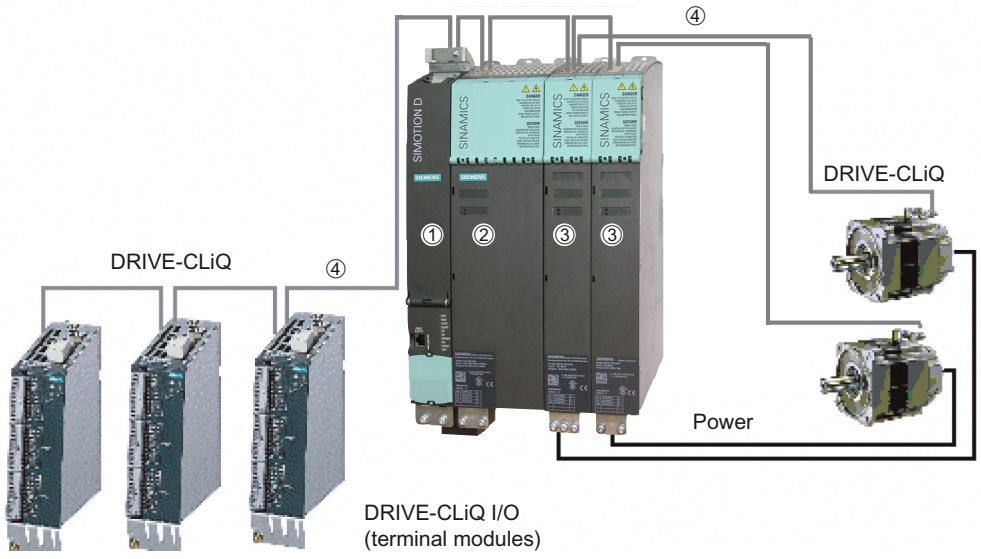

Figure 10-229 Example of an axis grouping with SIMOTION D4x5-2

A SIMOTION D axis grouping generally consists of the following elements:

- **SIMOTION D** (Control Unit) (1)
  This unit contains the programmable runtime system of SIMOTION and the drive software of SINAMICS S120. In principle, SIMOTION D is capable of controlling multiple axes/drives.
- One **SINAMICS infeed** (Line Module) (2)
  This module generates a DC link from the supply system.
- **SINAMICS power units** (Motor Modules) (3)
  These modules are used to control motors.
  It is also possible to operate SINAMICS Power Modules in blocksize format with the SINAMICS Control Unit Adapter (CUA). A separate infeed is then unnecessary.
- **DRIVE-CLiQ components** (4)
  In SINAMICS S120 / SIMOTION D, the individual components of the drive system communicate with each other via DRIVE-CLiQ. In addition to power components, it is also possible to link encoder systems and special DRIVE-CLiQ I/O devices via DRIVE-CLiQ.

Extension of the drive computing performance

The motion control performance of a SIMOTION D4x5-2 can be utilized in full by expanding the computing performance at the drive in two different ways:

- SINAMICS S/G Control Units (e.g. CU320-2, CU310-2, CU305, CU250S-2, etc.) together with further drive components can be connected via PROFIBUS or PROFINET.
- With SIMOTION D4x5-2, the CX32-2 Controller Extension can be connected via DRIVE-CLiQ. This module is extremely compact, does not require a separate CompactFlash card and can control up to 6 servo, 6 vector or 12 *V/f* axes.

Software components

The basic functionality of SIMOTION D is supplied on a CompactFlash card containing the following:

The SIMOTION runtime system with the following functions:

- Freely programmable runtime system (IEC 61131)
- Various runtime levels (tasks)
- PLC and arithmetic functionality
- Motion control functions
- Communication functions

The SINAMICS S120 drive control with the following functions:

- Closed-loop current and torque control
- Closed-loop speed control
- Closed-loop infeed

System components

Central components

SIMOTION D4x5-2 communicates with automation components via the following interfaces:

- PROFIBUS DP
- Ethernet
- PROFINET IO
- DRIVE-CLiQ (DRIVE Component Link with IQ)

SIMOTION D features a SINAMICS Integrated drive element. The communication with the SINAMICS Integrated is performed via PROFIBUS mechanisms (DP Integrated), i.e. the communication is handled, for example, via PROFIdrive telegrams.

Shorter cycle times and greater numbers of addresses for each node are achieved with the "DP Integrated" compared to the "external PROFIBUS DP".

The most important components of the system and their functions are shown below.

Table 10-141 Central components

Component	Function
SIMOTION D4x5-2 controller	... is the central motion control module. This module contains the programmable SIMOTION runtime for the SIMOTION D4x5-2 and the SINAMICS S120 drive software. You can use the integrated high-speed digital I/Os as: • User-addressable process I/Os • Homing inputs • Inputs for measuring inputs • Outputs for fast output cams The measuring sockets can output any analog signals.
System software	The basic functionality of SIMOTION D is supplied on a CompactFlash card containing the following: • SIMOTION runtime (kernel) • Drive software of SINAMICS S120 - implements all drive functions
Power supply	... provides the electronics power supply for SIMOTION D, e.g. via the SITOP power supply.

PROFIBUS DP

The Control Unit can communicate with the following components via the PROFIBUS DP interfaces:

Table 10-142 Components on PROFIBUS DP

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs, and tests with the "SIMOTION SCOUT" engineering system (ES)
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200S	Finely scalable I/O system for cabinet configuration and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.

Component	Function
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related applications with no cabinet; with features such as compact designs, integrated PROFIsafe safety technology, PROFINET connection and live module replacement.
SIMATIC ET 200eco	I/O system with IP65/67 degree of protection for machine-related applications with no cabinet, and with flexible and fast ECOFAST or M12 connection methods.
Other PROFIBUS I/O	
Gateways	• DP/AS-Interface link 20E and DP/AS-Interface link Advanced for the PROFIBUS DP gateway to AS-Interface • DP/DP coupler for connecting two PROFIBUS DP networks
Drive interfaces	• ADI4 (Analog Drive Interface for 4 axes) for connection of drives with analog ± 10 V setpoint interface or for external encoders • IM174 (Interface Module for 4 axes) for connection of drives with analog ± 10 V setpoint interface, for external sensors, or for connection of stepper drives with pulse-direction interface
Drive units with PROFIBUS DP interface (e.g. SINAMICS S120)	... convert speed setpoints into signals for controlling the motors and supply the power required to operate the motors. Also can be operated as an isochronous slave on PROFIBUS DP.
Teleservice adapter	Remote diagnostics

Ethernet

The Control Unit can communicate with the following components via the Ethernet interfaces or be embedded in an automation environment:

Table 10-143 Components on the Ethernet

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs, and tests with the "SIMOTION SCOUT" engineering system (ES)
Master computer	... communicates with other devices via UDP, TCP/IP
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit.

PROFINET IO

The D4x5-2 DP/PN can communicate with the following components via the onboard PROFINET IO interface or via the Ethernet communication board (CBE30-2).

Table 10-144 Components on the PROFINET IO

Component	Function
Programming device (PG/PC)	... configures, parameterizes, programs and tests with the "SIMOTION SCOUT" engineering system (ES).
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit.
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Master computer	... communicates with other devices via UDP, TCP/IP
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data. With the time-based I/Os, signals can be recorded or output to the precise µs.
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety. With the time-based I/Os, signals can be recorded or output to the precise µs.
SIMATIC ET 200S	Finely scalable I/O system for cabinet configuration and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related applications with no cabinet; with features such as compact designs, integrated PROFIsafe safety technology, PROFINET IO connection and live module replacement.
SIMATIC ET 200eco PN	Compact block I/O with IP65/66/67 degree of protection for machine-related applications with no cabinet, and with M12 connection method. Very rugged and resistant encapsulated metal enclosure.
Other PROFINET IO I/O devices	
Drive units with PROFINET IO interface	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors.
Gateways	• IE/AS-Interface link PN IO for the PROFINET IO gateway to AS-Interface • PN/PN coupler for connecting two PROFINET IO networks

DRIVE-CLiQ

The DRIVE-CLiQ interfaces permit a fast connection to the SINAMICS drive components.

DRIVE-CLiQ offers the following advantages within the DRIVE-CLiQ topology rules:

- Expandability of components
- Automatic detection of components by the Control Unit
- Standardized interfaces to all components
- Uniform diagnostics down to the components
- Uniform service through to the components
- Simple mechanical handling

The controller can communicate with the following components via DRIVE-CLiQ:

Table 10-145 Components connected to DRIVE-CLiQ

Component	Function
Control Unit (SINAMICS S110/ S120)	Central control module in which the open- and closed-loop control functions for the drive are implemented.
Line Module (SINAMICS S120)	... generates a DC link from the supply system.
Motor Module (SINAMICS S120)	... controls motors (DC/AC inverters, booksize).
Power Module (SINAMICS S110/ S120)	... controls motors (AC/AC converters, blocksize).
CX32-2 Controller Extension	... enables additional axes to be connected for SIMOTION D4x5-2.
CUA31/CUA32 Control Unit Adapter	... enables a Power Module in blocksize format to be connected to a booksize D4x5-2, CX32-2 or CU320-2 Control Unit.
TM15, TM17 High Feature Terminal Modules	The TM15 and TM17 High Feature Terminal Modules are used to implement inputs of measuring inputs and outputs of output cams. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times.
TM31 Terminal Module	... enables a terminal expansion via DRIVE-CLiQ (additional analog and digital I/Os).
TM41 Terminal Module	... enables a terminal expansion (analog and digital I/Os) and encoder emulation.
TM54F Terminal Module	... enables terminal expansion (fail-safe digital I/Os) for controlling the safe motion monitoring functions of the integrated drives.
TM120 Terminal Module	Four temperature sensors (KTY84-130 or PTC) can be evaluated via the TM120 Terminal Module. The temperature sensor inputs are safely electrically separated from the evaluation electronics in the TM120 Temperature Module and are suitable for evaluating the temperature of special motors, e.g. 1FN linear motors and 1FW6 built-in torque motors.
TM150 Terminal Module	The TM150 Terminal Module can be used to evaluate temperature sensors (KTY, PT100, PT1000, PTC, and bimetal normally closed contact). This means, for example, that other temperatures from the process can be measured in addition to the motor temperature. Temperature sensors can be evaluated using a 2, 3 or 4-wire system. Twelve temperature sensors can be evaluated with 2-wire evaluation and six temperature sensors with 3 and 4-wire evaluation.

Component	Function
SMx Sensor Modules	... enable acquisition of encoder data from connected motors via DRIVE-CLiQ.
Motors with DRIVE-CLiQ interface	... enable simplified commissioning and diagnostics, as the motor and encoder type are identified automatically.
DMC20/DME20 DRIVE-CLiQ hub	... enables the number of DRIVE-CLiQ interfaces to be increased and the creation of a point-to-point topology.

Power Modules via CUA31/32

The following Power Modules are supported:

- PM340
- PM240-2 (as of SIMOTION V4.4 / SINAMICS V4.7)

The mixed operation of a PM240-2 with booksize modules and/or PM340 blocksize modules on a CU320-2/D4x5-2/CX32-2 is possible as of SINAMICS V4.7 HF12 or SIMOTION V4.4 HF6 (SINAMICS Integrated V4.7 HF12).

Note

You will find detailed information on components of the SINAMICS S110/S120 product family in the SINAMICS S110/S120 manuals.

It is possible that older DRIVE-CLiQ components can no longer be used with SIMOTION D4x5-2/CX32-2. You will find detailed information on this topic in the SIMOTION D4x5-2 Commissioning and Hardware Installation Manual at "Migration of D4x5 to D4x5-2" in Section "Permissible combinations".

Optional components

The functionality of the D4x5-2 Control Unit can be expanded with the following components:

Table 10-146 Optional components

Component	Function	D4x5-2 DP	D4x5-2 DP/PN
CBE30-2 Ethernet communication board	Communication via PROFINET IO with IRT and PROFINET IO with RT	No	Yes
TB30 Terminal Board	Terminal expansion, i.e. additional analog and digital I/Os	Yes	Yes

The components are plugged into the option slot of the Control Unit.

I/O integration

Note

Note that not all modules in the ET 200 I/O family are approved for SIMOTION. Moreover, system-related functional differences can come into play when these I/Os or I/O systems are used on SIMOTION vs. on SIMATIC. For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

A detailed, regularly updated list of the I/O modules approved for use with SIMOTION, as well as notes on their use, can be found on the Internet at: (https://support.industry.siemens.com/cs/ww/en/view/11886029)

In addition to the I/O modules enabled for SIMOTION, in principle all certified standard PROFIBUS slaves (DP-V0/DP-V1/DP-V2) and PROFINET IO devices with RT and IRT real-time classes may be connected to SIMOTION D4x5-2. These modules are integrated using the GSD file (PROFIBUS) or GSDML file (PROFINET) provided by the relevant device manufacturer.

Note

Please note that in individual cases further boundary conditions must be fulfilled in order to integrate a standard slave/standard device into SIMOTION. Thus, a few modules require "driver blocks" , e.g. in the form of function blocks, that permit (or simplify) integration.

For modules released with SIMOTION (e.g. SIMATIC S7-300 module FM 350-1, etc.), these driver blocks are part of the SIMOTION SCOUT engineering system command library.

Representation of SIMOTION D425-2 DP and D435-2 DP

The following figure shows the SIMOTION D425-2 DP and D435-2 DP with their interfaces and front panel elements (fault and status displays).

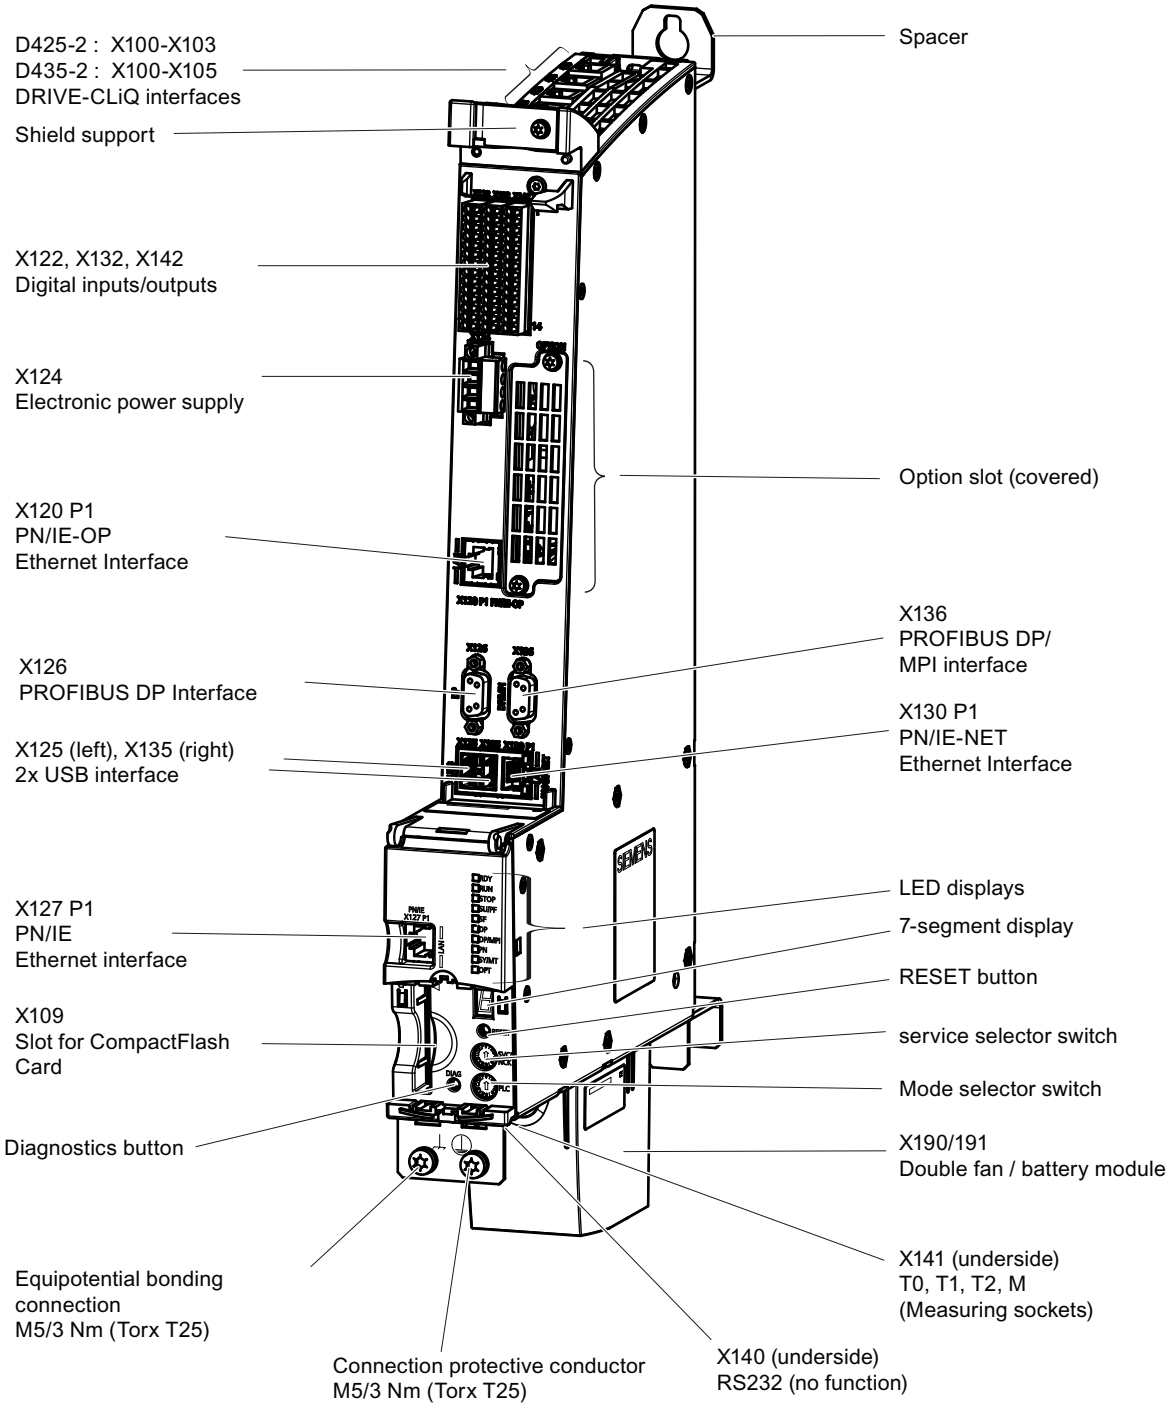

Figure 10-230 D425-2 DP and D435-2 DP representation

Note

SIMOTION D425-2 DP and D435-2 DP must be operated with a double fan/battery module for heat dissipation. Without this module, the Control Units will not start up and cannot be commissioned.

Information on how to install the double fan/battery module can be found in "Supplementary system components", in Section Installing the fan/battery module (Page 7667).

Note

SIMOTION D425-2 DP and D435-2 DP are supplied with pre-assembled spacers. These can be removed if necessary.

For further details, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Representation of SIMOTION D425-2 DP/PN and D435-2 DP/PN

The following figure shows the SIMOTION D425-2 DP/PN and D435-2 DP/PN with their interfaces and front panel elements (fault and status displays).

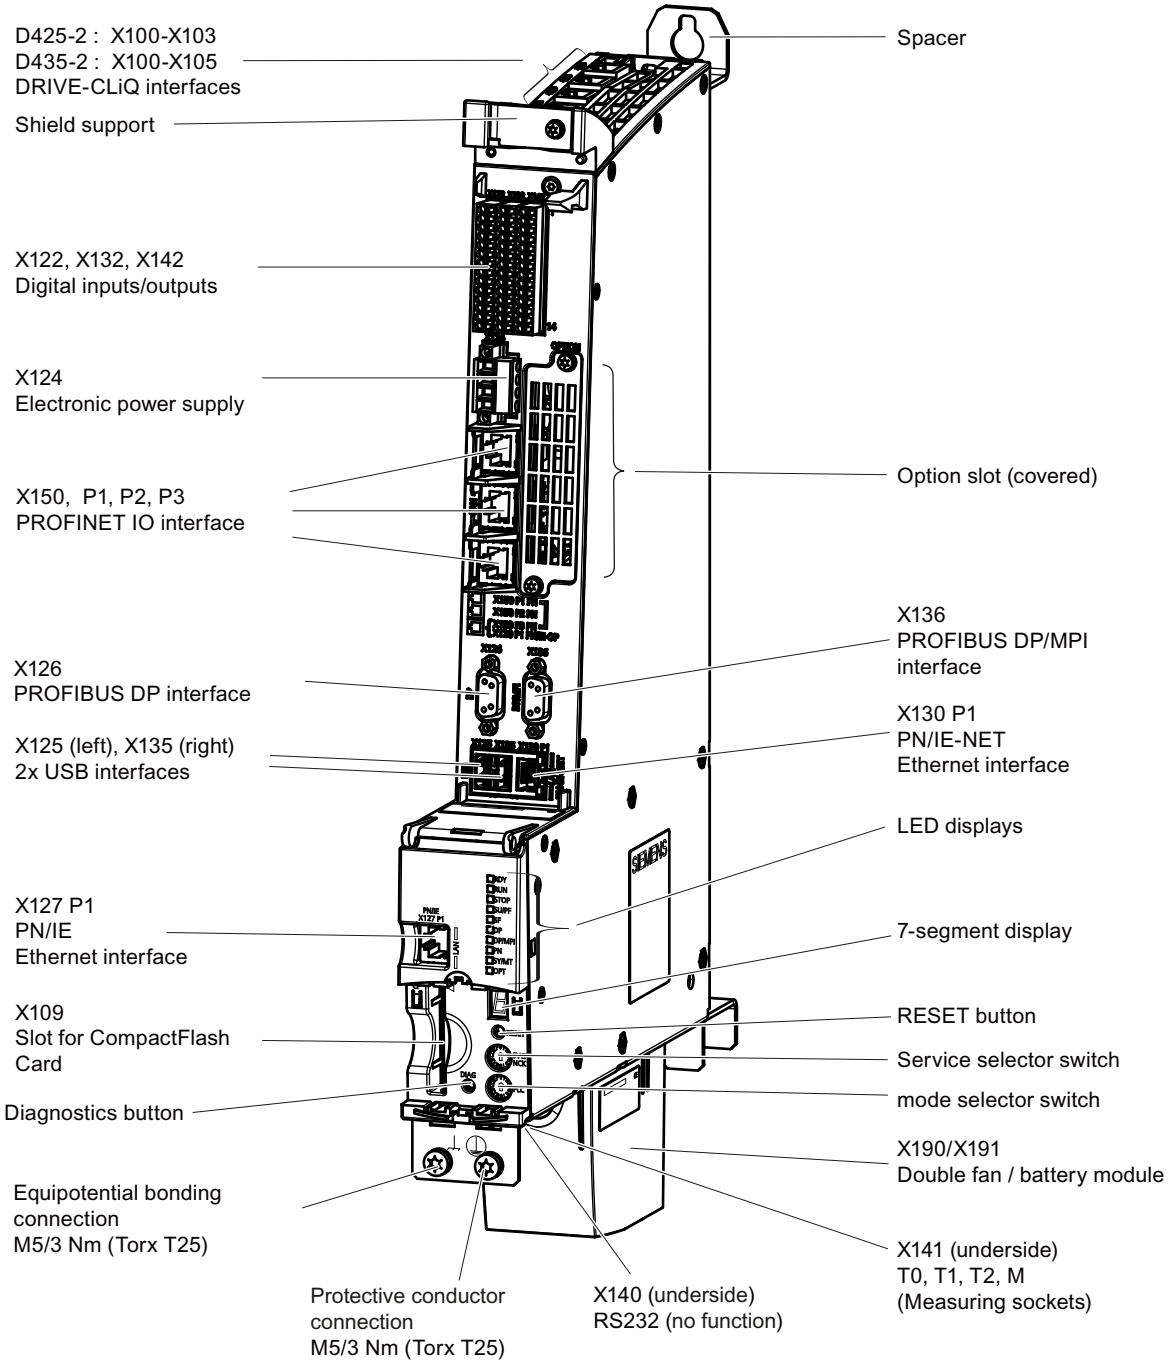

Figure 10-231 D425-2 DP/PN and D435-2 DP/PN representation

Note

SIMOTION D425-2 DP/PN and D435-2 DP/PN must be operated with a double fan/battery module for heat dissipation. Without this module, the Control Units will not start up and cannot be commissioned.

Information on how to install the double fan/battery module can be found in "Supplementary system components", in Section Installing the fan/battery module (Page 7667).

Note

The SIMOTION D425-2 DP/PN and D435-2 DP/PN are supplied with pre-assembled spacers. These can be removed if necessary.

For further details, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Representation of SIMOTION D445-2 DP/PN and D455-2 DP/PN

The following figure shows the SIMOTION D445-2 and D455-2 with its interfaces and front panel elements (fault and status displays).

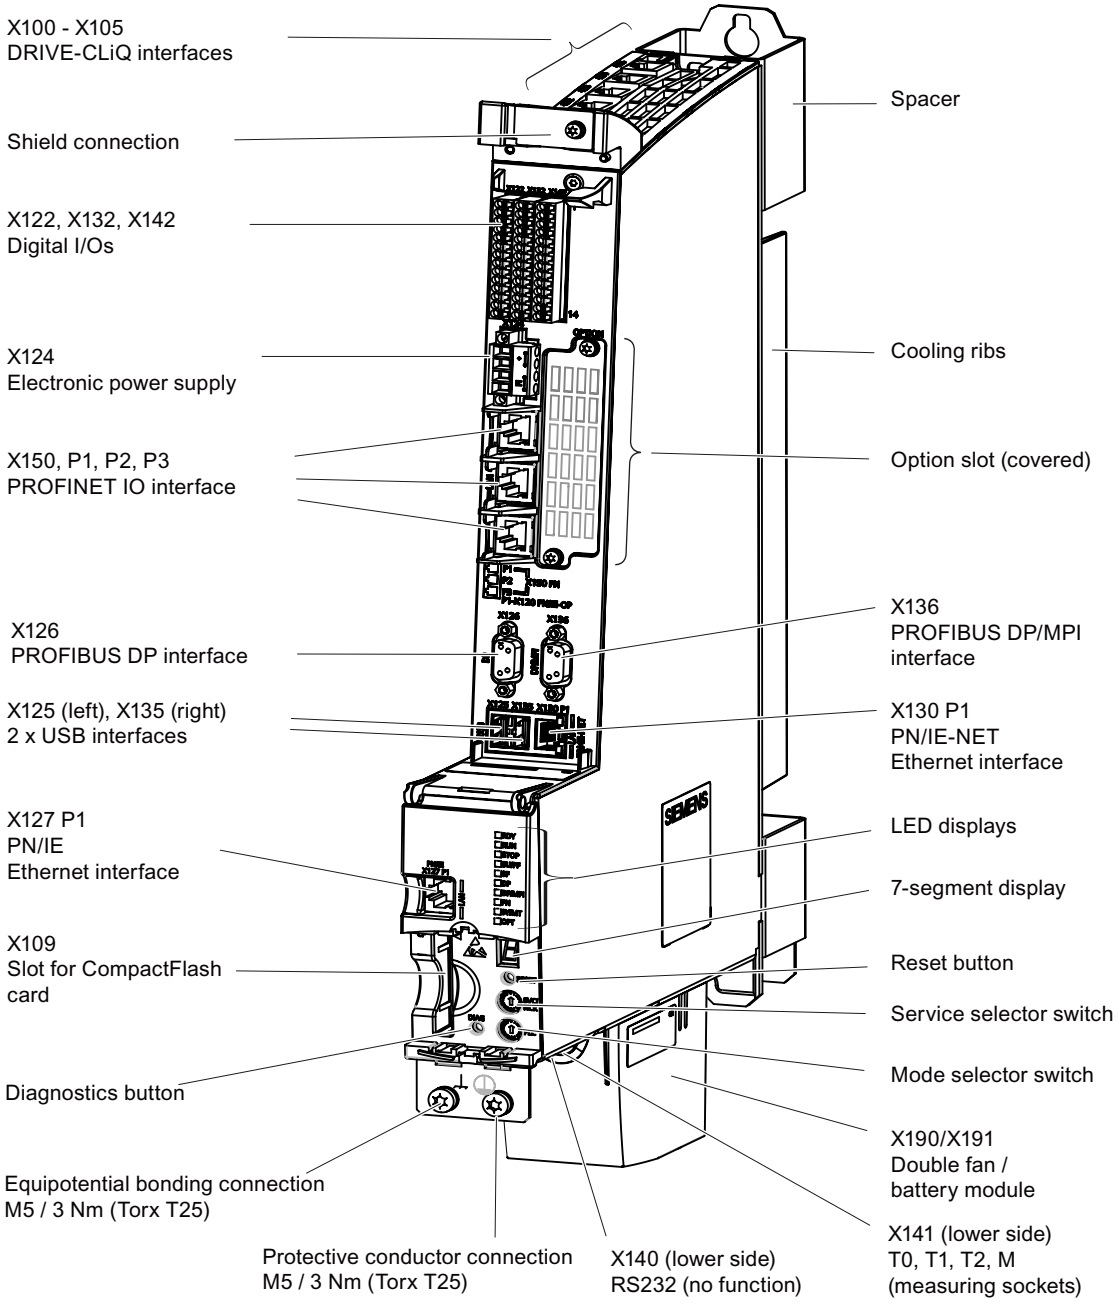

Figure 10-232 View of D445-2 DP/PN and D455-2 DP/PN

Note

SIMOTION D445-2 DP/PN and D455-2 DP/PN must be operated with a double fan / battery module for heat dissipation. Without this module, the Control Units will not start up and cannot be commissioned.

Information on how to install the double fan/battery module can be found in "Supplementary system components", in Section Installing the fan/battery module (Page 7667).

Note

With the D445-2 DP/PN and D455-2 DP/PN, the spacers can only be removed with the "external air cooling" installation method. In this installation method, the cooling fins are inserted through a cutout in the rear cabinet panel.

For further details, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Type plates

Side-mounted rating plate

The following figure shows the information contained on the rating plate mounted on the side of the housing.

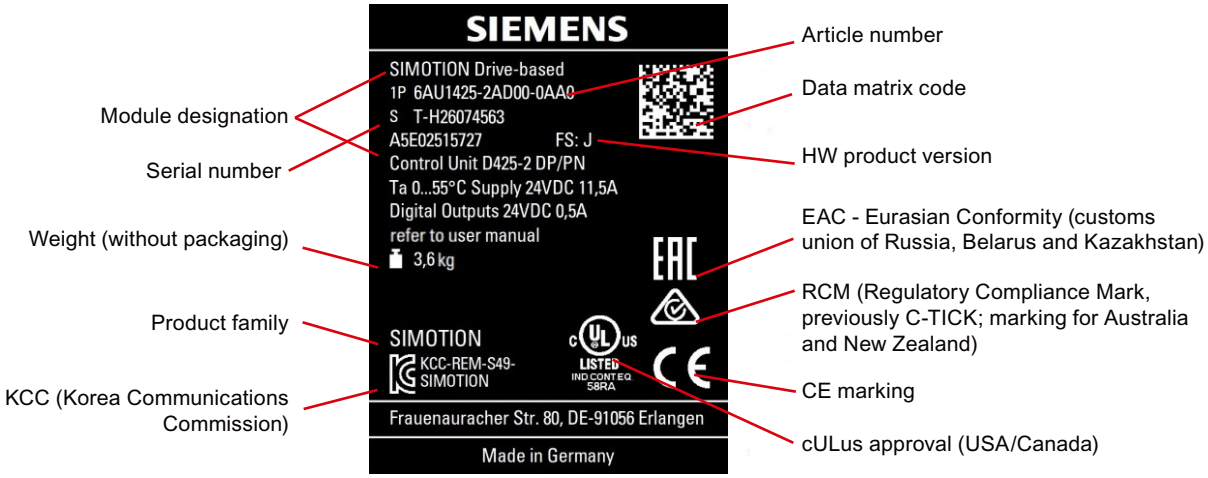

Figure 10-233 Rating plate using the D425-2 DP/PN as an example

Note

The information contained in each field of the rating plate on your actual Control Unit may differ from that presented in this manual (for example, a later product version, approvals and marks that have not yet been earned, etc. may be shown).

Depending on the rating plate, the HW version may be designated as "Version" or "FS" (Function State). Older components are marked with C-Tick instead of RCM. Depending on the module, the serial number is only on the front rating plate, which is also visible when the module is installed.

Front rating plate

A second rating plate for the MAC addresses of the Ethernet interfaces and the PROFINET IO interface is attached to the front of the device. You see this rating plate when you open the front cover of the Control Unit.

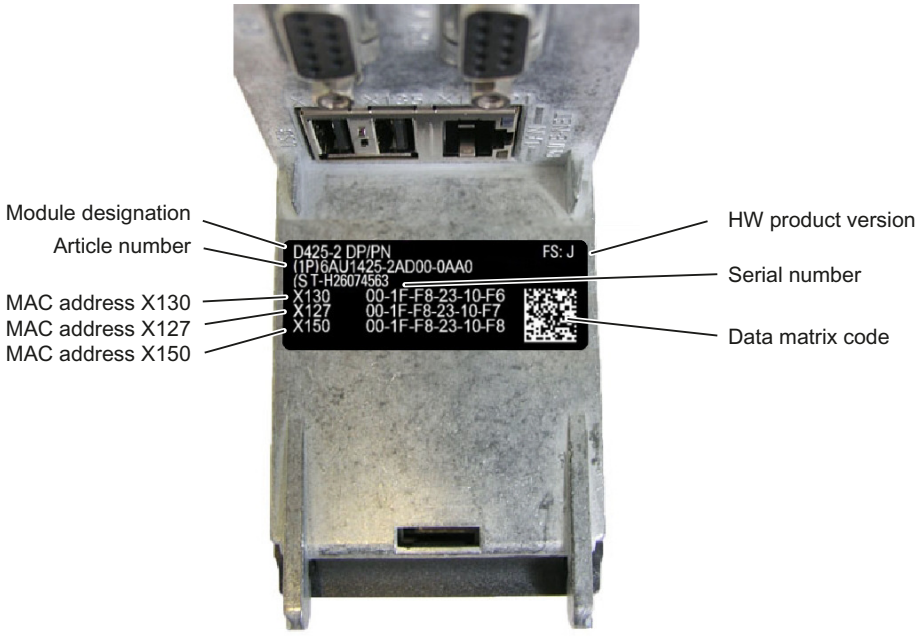

Figure 10-234 MAC addresses of SIMOTION D425-2 DP/PN

Note

For SIMOTION D4x5-2 DP, the MAC address for the X120 interface is printed instead of the MAC address for the X150 interface.

Depending on the rating plate, the HW version may be designated as "Version" or "FS" (Function State).

Industry Online Support app

With our app, you have access to more than 300,000 documents.

Scan the data matrix code and display all the technical information on this product incl. graphic data (CAx data). Link to the app: https://support.industry.siemens.com/sc/en/en/sc/2067

CompactFlash card

Usage and function of the CompactFlash Card

The CompactFlash card (CF card) is inserted in the slot with the designation CF (X109 interface).

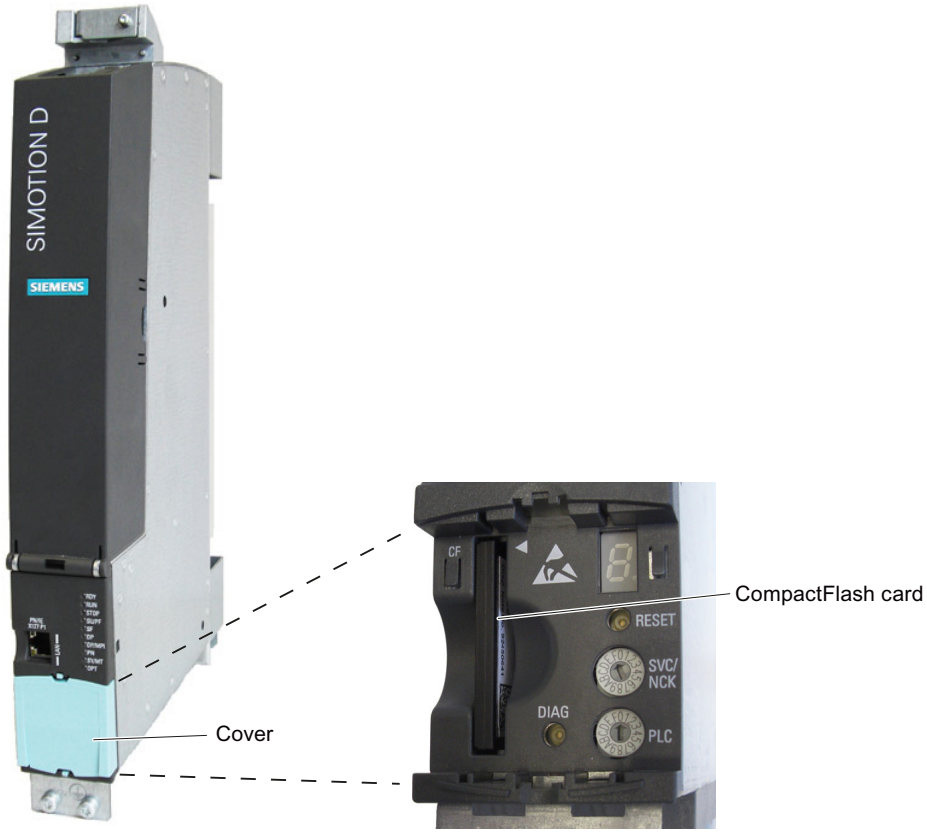

Figure 10-235 Slot for CompactFlash card

The CF card does not extend beyond the housing. An ergonomic recessed grip enables the CF card to be removed.

Characteristics of the CF card

The CF card is essential for operation of the SIMOTION D4x5-2. The CF card is not supplied with the SIMOTION D4x5-2 and must be ordered separately.

The SIMOTION Kernel (SIMOTION D4x5-2 firmware) and the software used to control the drives (SINAMICS firmware) are contained on the CF card.

The CF card is used for

- Backing up the technology packages and user data (programs, configuration data, parameter assignments).
- Update (e.g. SIMOTION firmware update).

The licenses for the technology functions are linked to the serial number of the CF card. This means the CF card can be inserted in a different SIMOTION D without having to change the licenses.

The CF card is supplied in a bootable format with the latest SIMOTION Kernel and drive software. Please note that a CF card with a D4x5 kernel/drive software cannot run on a D4x5-2. The same applies for the reverse situation.

If an error occurs, all LEDs flash yellow with 2 Hz. An entry is also made in the diagnostic buffer and the D4x5-2 does not start.

Licenses purchased for SIMOTION D can be used for both the D4x5 and D4x5-2.

NOTICE
Damage to the CompactFlash card from electrical fields or electrostatic discharge The CompactFlash card is an ESD-sensitive component. De-energize the SIMOTION D4x5-2 device before inserting or removing the CompactFlash card. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off. Comply with the ESD rules.

Additional information

For additional information about inserting, changing, writing and formatting the CF card, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

CompactFlash card

CF card

CF cards with different storage capacities are available for SIMOTION D4x5-2.

- 2 GB CF, article number 6AU1400-2QA20-0AA0
- 1 GB CF, article number 6AU1400-2PA23-0AA0
- 1 GB CF, article number 6AU1400-2PA22-0AA0
- 1 GB CF, article number 6AU1400-2PA21-0AA0

You will find detailed information on the compatibility relationships for the CF card, boot loader version, SIMOTION D hardware and SIMOTION firmware version in the software compatibility list.

This list can be found on the Internet at (https://support.industry.siemens.com/cs/ww/en/view/18857317).

Rating plate information

The following figure shows you all the information contained on the rating plate of the CF card.

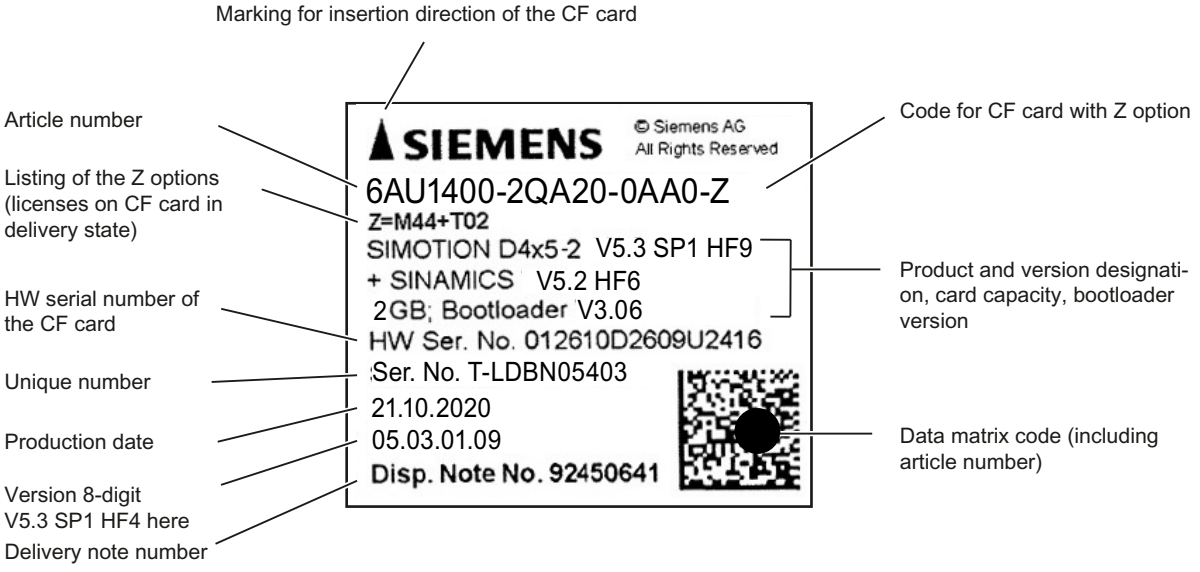

Figure 10-236 Rating plate of the CF card (example of 2 GB CF card)

Pre-installed runtime licenses

The preinstalled licenses are printed on the label as Z option below the article number.

Example

Example with MultiAxes package Z option for D445/D445-1/D445-2/D455-2 + two TControl licenses:

- 6AU1400-2QA20-0AA0-Z

- Z=M44+T02

A maximum of seven different Z options are printed on the label of the CF card. When there are more than seven different Z options, the text "Z = see delivery order" is printed on the CF card in place of the Z options.

Available Z options / licenses for CF cards

- Axis licenses
  - Pxx POS license and number (e.g. P02 = 2x POS licenses)
  - Gxx GEAR license and number (e.g. G03 = 3x GEAR licenses)
  - Cxx CAM license and number (e.g. C01 = 1x CAM license)
- MultiAxes package
  - M00 MultiAxes package license (platform independent)
  - M42 MultiAxes package license for D425/D425-2
  - M43 MultiAxes package license for D435/D435-2 (incl. D425/D425-2)
  - M44 MultiAxes package license for D445/D445-1/D445-2/D455-2 (incl. D425/D425-2 and D435/D435-2).
- MultiAxes and Safety Extended package
  - S42/S43/S44 license as M42/M43/M44 license, but also including licensing of the Safety Integrated Extended Functions for all drives on SINAMICS Integrated/CX32-2 Licenses for Safety Integrated Advanced Functions are not included; they must always be ordered as single licenses.
- TControl temperature control
  - Txx TControl license and number (e.g. T03 = 3x TControl licenses)
- SIMOTION IT
  - SIMOTION IT Virtual Machine J00 license for Java applications
- Safety functions
  - Fxx license for SINAMICS Safety Integrated Extended Functions (for integrated SINAMICS drives and CX32-2 for SIMOTION D) (e.g. F02 = two Safety Integrated Extended Functions)
  - Lxx license for SINAMICS Safety Integrated Advanced Functions (for integrated SINAMICS drives and CX32-2 for SIMOTION D) (e.g. L03 = three Safety Integrated Advanced Functions) The Safety Integrated Advanced Functions also include the Safety Integrated Extended Functions.
- High output frequency
  - H00 license SINAMICS high output frequency for SIMOTION D
- Other SIMOTION licenses
  - B02 Multipurpose Information Interface (MIIF) communication function license
  - B03 license Vibration damping of axes (VIBX Vibration Extinction)
  - B04 license Motion profiles for servo presses (OACAMGEN cam generation)
  - B07 license Compensation of cyclic errors from the production process (LECo - Learning Error Compensation)

SINAMICS licenses

Selected SINAMICS licenses can be used with a SIMOTION D CF card. Only one relicensing is possible. A prelicensing of SIMOTION D CF cards via Z options is not possible with SINAMICS licenses.

Examples:

- SINAMICS S120 Advanced Position Control (APC)
  Article no. 6SL3074-0AA05-0AA0
  License for each drive (on CU, SINAMICS Integrated, CX32-2)
- SINAMICS S120 cogging torque compensation
  Article no. 6SL3074-0AA15-0AA0
  License for each drive (on CU, SINAMICS Integrated, CX32-2)
- SINAMICS Technology Extension "Vibration Extinction" (VIBX)
  Article no. 6SL3077-0AA00-5AB0
  License for a target device (CU, SINAMICS Integrated, CX32-2)
- SINAMICS DCB Extension
  Article no. 6SL3077-0AA00-0AB0
  License for a target device (CU, SINAMICS Integrated, CX32-2)

With SINAMICS licenses, underlicensing of SINAMICS Integrated/CX32-2 is indicated by the flashing SF LED on the SIMOTION D Control Unit. An entry is also made in the diagnostic buffer and the underlicensing is displayed in the License dialog box of SIMOTION SCOUT. The licensing is performed (as for SIMOTION licenses) via SIMOTION SCOUT or via the SIMOTION license key on the CF card.

Data matrix code

SIMOTION D components (e.g. CF cards, Control Units, etc.) have a machine-readable identification in the form of a data matrix code (2D code).

Reader units that support the data matrix code in accordance with ECC 200 are suitable for reading the code used here.

The volume of the information contained in the data matrix code depends on the product and, for example, on the available space.

Analysis

Example of a data string from the reader unit:

1P6AU1400-2QA20-0AA0-Z+ST-LDBN05403+30S012610D2609U2416.

Table 10-147 Machine-readable identification via 2D code

Characteristic	Property (example)
Article number ("1P" identifier to identify the products)	6AU1400-2QA20-0AA0-Z
Serial number ("S" identifier, item number)	T-LDBN05403

Characteristic	Property (example)
Hardware serial number (CF cards only) ("30S" identifier)	012610D2609U2416
Hardware version (identifier 2PE)	Not used in the example
Material number (identifier P)	Not used in the example

In addition to the "serial number", CF cards also have a "hardware serial number".

If licenses are purchased for functions under license, a "license key" is generated from the hardware serial number of the CF card and the serial number of the purchased licenses, which is only valid for the respective CF card.

The data required for the licensing can be read by a reader unit via the bar codes on the license certificates (Certificate of License "CoL") and the 2D code on the CF card in order, for example, to automate the licensing process.

Industry Online Support app

With our app, you have access to more than 300,000 documents.

Scan the data matrix code and display all the technical information on this product incl. graphic data (CAx data). Link to the app: https://support.industry.siemens.com/sc/en/en/sc/2067

10.2.1.3 Operator control (hardware)

Overview of operator control and display elements

The following figure shows the arrangement of the operator control and display elements of a SIMOTION D445-2 DP/PN.

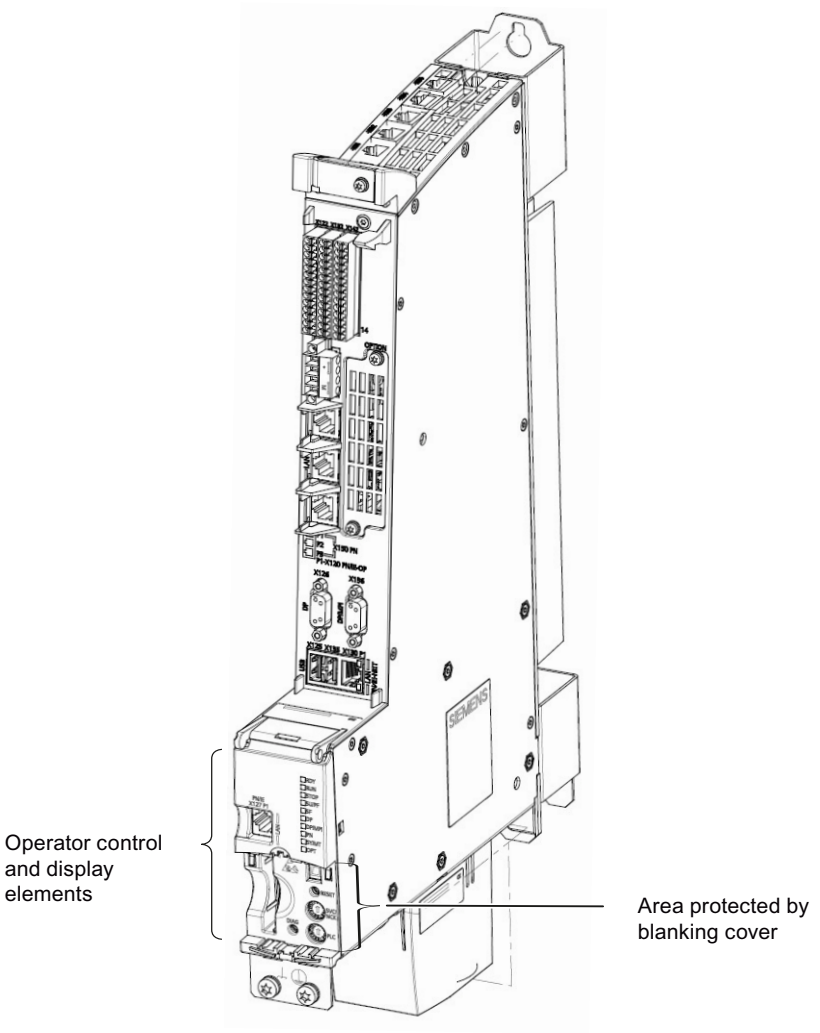

Figure 10-237 Position of operator control and display elements (example of SIMOTION D445-2 DP/PN)

The lower part of the operator control and display elements has a blanking cover during operation. This cover is removed for service work.

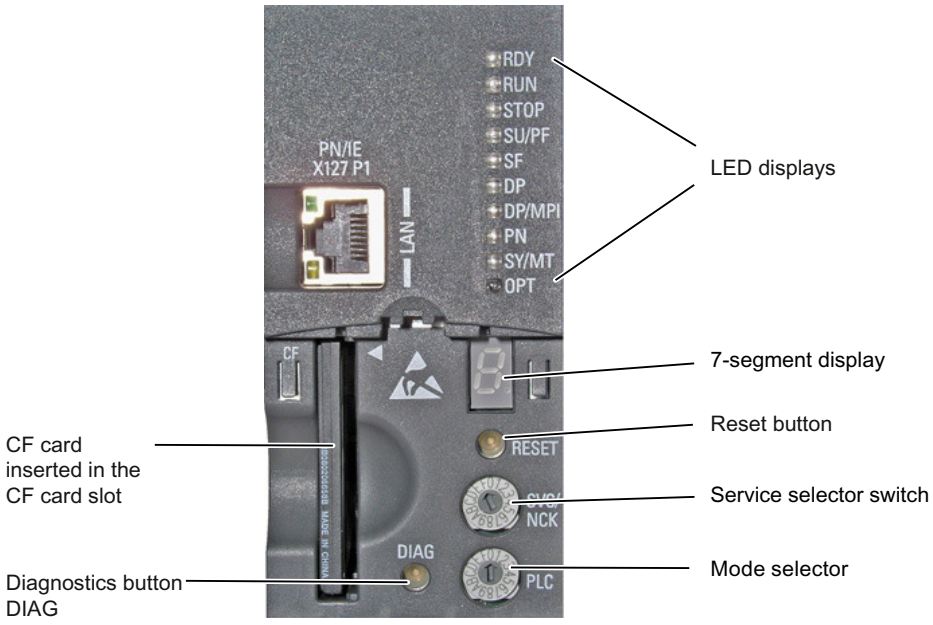

Figure 10-238 Control and display elements of the SIMOTION D4x5-2

Operator controls

Service and operating mode switch

Characteristics of the Service switch and mode switch

SIMOTION D4x5-2 has two selector switches on the lower front side for selection of the service functions and operating modes.

The upper selector switch (labelled SVC/NCK) is for the selection of service and diagnostic functions. In "normal" operation this switch must remain in the 0 position (see figure below).

The lower switch, labelled PLC, is used to set one or more operating modes of the SIMOTION D4x5-2.

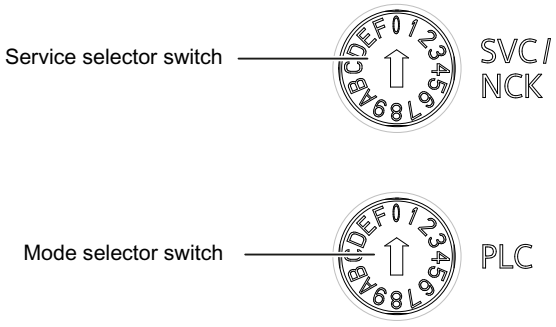

Figure 10-239 Selector switches for service and operating modes of the SIMOTION D4x5-2

NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Comply with the ESD rules.

Mode switch

The following table contains the possible mode switch positions and the associated LED displays. The mode switch positions are explained in the order in which they are arranged on the SIMOTION D4x5-2.

Table 10-148 Mode switch position

Switch position	Meaning	LED
0	RUN	RUN
1	STOPU	SU/PF
2	STOP	STOP
3	MRES	The MRES operating states are indicated on the STOP LED (on/off/ flashing, see *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual)
Other selector positions are not assigned		

The following table contains the states of the SIMOTION D4x5-2 that can be set via the mode switch.

Table 10-149 Mode switch settings

Meaning	Explanations
RUN	SIMOTION D4x5-2 processes the user program and the associated system services: • Reading process image of inputs • Execution of the user programs assigned to the execution system. • Writing process image of outputs The technology packages are active in this state. They can execute commands from the user program.
STOPU	SIMOTION D4x5-2 is not processing a user program. • The technology packages are active. Test and commissioning functions can be executed. The user program is not active. • The I/O modules are in the safe state (this means, for example, digital outputs are "LOW" and analog outputs are de-energized or at zero current).
STOP	SIMOTION D4x5-2 is not processing a user program. • It is possible to load a complete user program. • All system services (communications, etc.) are active. • The I/O modules are in the safe state (this means, for example, digital outputs are "LOW" and analog outputs are de-energized or at zero current). • The technology packages are inactive, i.e. all enables are deleted. No axis motions can be executed.
MRES	Performing a memory reset on the SIMOTION D4x5-2 / restoring the factory setting Using the MRES switch position, you can perform depending on the operating sequence • Memory reset of the SIMOTION D4x5-2 or • Restore the SIMOTION D4x5-2 to its factory setting, depending on the operating sequence. For further details, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Note

It is recommended that SIMOTION SCOUT be used exclusively to switch the operating modes of the module. Therefore, leave the mode switch at position 0 (RUN). The LED display indicates the current mode selection.

For information on how to set the operating state using SIMOTION SCOUT, see the *SIMOTION SCOUT* Configuration Manual.

Service selector switch

The following table shows the possible positions of the service selector switch. The service selector switch positions are explained in the order in which they are arranged on the SIMOTION D4x5-2.

Table 10-150 Switch positions of the service selector switch

Service mode	Switch position	Meaning	
-	0	No service/diagnostic functions activated (default setting)	
Delete/restore non-volatile SIMOTION data	1 or A → 1	When the "Delete/restore non-volatile SIMOTION data" switch setting is selected, the non-volatile data of the D4x5-2 is first deleted and then restored along with the contents of the PMEMORY backup file.	
		Position "1":	The data backed up with the system function _savePersistentMemoryData is preferably restored
		Position "A" → "1": (as of V4.4)	The data backed up by service selector switch position "D" / Web server / DIAG pushbutton are preferably restored
Web server in Security Level Low	8	Switches the SIMOTION IT Web server to Security Level Low for 120 minutes. You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.	
Downgrade (Device Update Tool)	B	SIMOTION D4x5-2 control units and projects can be upgraded using upgrade data created at an earlier point in time. This upgrade data is generated with the Device Update Tool (Menu: "Project>Start Device Update Tool" in SIMOTION SCOUT). If the upgrade process fails to bring about the desired result, the upgrade can be rejected by means of the switch position. This will roll the system back to the previous configuration.	
Backup of diagnostic data and non-volatile SIMOTION data	D	The diagnostic data and non-volatile SIMOTION data can be backed up in STOP, STOPU, and RUN state. The advantage of backing up in RUN state is the availability of enhanced diagnostic information (via HTML pages) and TO alarm information.	

Note

Alternatively, diagnostic data and non-volatile SIMOTION data can also be backed up via the DIAG button, see Section DIAG button (Page 7619).

Additional references

You will find detailed information on the individual topics in the following table:

Table 10-151 References

Subject	Reference
Setting of the operating modes	• *SIMOTION SCOUT* Configuration Manual
Upgrading devices (Device Update Tool)	• *Upgrading SIMOTION Devices* Operating Instructions and • *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual
• Creating diagnostic data and • Saving/restoring non-volatile SIMOTION data	• *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual

DIAG button

Layout

The DIAG button is located behind the blanking cover on the SIMOTION D4x5-2.

Function

The diagnostic data and non-volatile SIMOTION data is backed up on the CompactFlash card via the DIAG button.

The DIAG button function therefore corresponds to the function of switch position "D" of the Service selection switch.

Various options are available for backing up the data:

- Option 1: Backup during operation (in STOP/STOPU/RUN operating state)
- Option 2: Backup during the module startup

With option 1, the DIAG button only has to be pressed briefly to trigger the data backup. The DIAG button is therefore preferable to switch position "D" of the Service selection switch.

With option 2, the DIAG button has to be pressed until the boot procedure is completed. As this can take 20-30 seconds, switch position "D" is preferable here.

Additional references

For detailed information on creating diagnostic data and backing up / restoring non-volatile SIMOTION data, refer to the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

RESET button

Arrangement

The RESET button is located behind the blanking cover on the SIMOTION D4x5-2.

Performing a reset operation

A reset causes the entire system to be reset and requires the system to be ramped-up again. It is similar to a "Power On Reset" except that the 24 V power supply does not have to be switched off.

7-segment and LED displays

Arrangement of the displays

The front side of the SIMOTION D4x5-2 has ten LED displays arranged arranged vertically in one row. There is also a 7-segment display below the blanking cover.

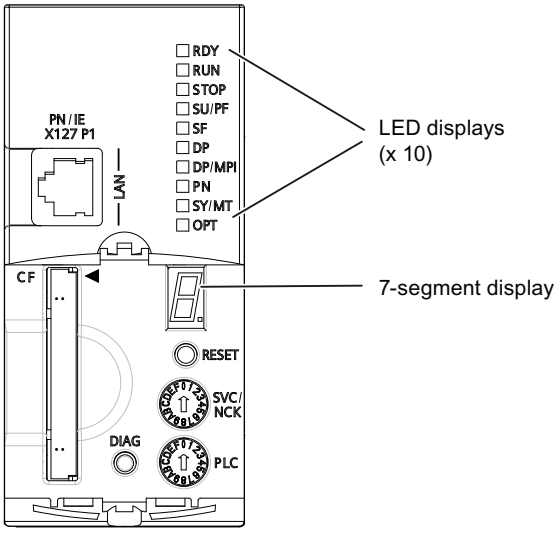

Figure 10-240 7-segment and LED display on the SIMOTION D4x5-2

Meaning of the LED displays

This table describes the LEDs and their meaning. The PN and *SY* LEDs have no function for SIMOTION D4x5-2 DP.

Table 10-152 Error and status displays

LED	Meaning
RDY	Operating states of SIMOTION D incl. SINAMICS Integrated.
RUN	User program is running
STOP	No user program is running. The technology packages are not active
SU/PF	The technology packages are active. The user program is not active
SF	An error state of the SIMOTION D4x5-2
DP	State of the PROFIBUS DP interface
DP/MPI	State of the PROFIBUS DP/MPI interface
PN	State of the onboard PROFINET IO interface (X150)
SY/MT	- Synchronization status (SY) of the onboard PROFINET IO interface (X150) - Maintenance status (MT) of the D4x5-2 (currently without function)
OPT	State of the option module (if available).

Note

While the SIMOTION D4x5-2 is ramping up, all LEDs are briefly illuminated in yellow.

7-segment display

The 7-segment display provides further status information in addition to the LED displays.

The status "6" and a flashing "." indicate that the D4x5-2 has ramped up and communication has been established to the SINAMICS Integrated.

Additional information

You can perform a detailed diagnosis with a PG/PC and the engineering system. Information on the *Diagnostics* via LED displays can also be found in the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual and in the online help of this section via the link under the *Instructions* menu.

10.2.1.4 Interfaces

Interface overview

This section describes the interfaces of the SIMOTION D4x5-2.

The position of the interfaces on the module can be found in the following sections:

- Representation of SIMOTION D425-2 DP and D435-2 DP (Page 7601)
- Representation of SIMOTION D425-2 DP/PN and D435-2 DP/PN (Page 7603)
- Representation of SIMOTION D445-2 DP/PN and D455-2 DP/PN (Page 7605)

Available interfaces

Table 10-153 Overview of available interfaces

Interface	Designation	Connector type
DRIVE-CLiQ interface	X100	DRIVE-CLiQ socket
DRIVE-CLiQ interface	X101	DRIVE-CLiQ socket
DRIVE-CLiQ interface	X102	DRIVE-CLiQ socket
DRIVE-CLiQ interface	X103	DRIVE-CLiQ socket
DRIVE-CLiQ interface (not for SIMOTION D425-2)	X104	DRIVE-CLiQ socket
DRIVE-CLiQ interface (not for SIMOTION D425-2)	X105	DRIVE-CLiQ socket
Ethernet interface PN/IE	X127 P1	RJ45 socket connector
PN/IE OP Ethernet interface (only for SIMOTION D4x5-2 DP)	X120 P1	RJ45 socket connector
Ethernet interface PN/IE-NET	X130 P1	RJ45 socket connector
PROFINET PN IO interface (only for SIMOTION D4x5-2 DP/PN)	X150 (P1, P2, P3)	RJ45 socket connector
Digital I/Os	X122, X132, X142	Mini Combicon, 3.5 mm 3x14-pin
Power supply connector	X124	Combicon, 4-pin
PROFIBUS DP interface	X126	9-pin Sub-D socket
PROFIBUS DP/MPI interface	X136	9-pin Sub-D socket
Measuring sockets (T0, T1, T2, and M)	X141	4-pin, socket
SIMOTION CF plug-in	X109	CompactFlash card connector
Fan/battery module interface	X190/X191	Fan/battery module
1. USB interface	X125	USB socket
2. USB interface	X135	USB socket
Option slot		Sockets

Note

The third port of the PROFINET X150 P3 IO interface has an additional caption for a SIMOTION D4x5-2 DP/PN. It is called X120 PN/IE-OP.

This designation is not relevant for SIMOTION D.

Non-usable interfaces

Table 10-154 Overview of interfaces that cannot be used for SIMOTION D

Interface name	Interface	Connector type
RS232 interface	X140	9-pin Sub-D connector

DRIVE-CLiQ interfaces

DRIVE-CLiQ interfaces

All SINAMICS S120 drive system components, including the motors and encoders, are interconnected by a shared serial interface called DRIVE-CLiQ. The standardized cables and connectors reduce the variety of different parts and cut storage costs.

DRIVE-CLiQ has the following properties:

- Automatic detection of components by the Control Unit
- Standardized interfaces to all components
- Uniform diagnostics down to the components
- Complete service down to the components
- 24 V / 450 mA per DRIVE-CLiQ interface are provided for the connection of encoders and measuring systems.
  Note:
  The DRIVE-CLiQ cable with 24 V supply is used only for components that require this (e.g. motors with a DRIVE-CLiQ interface).

Position of connectors

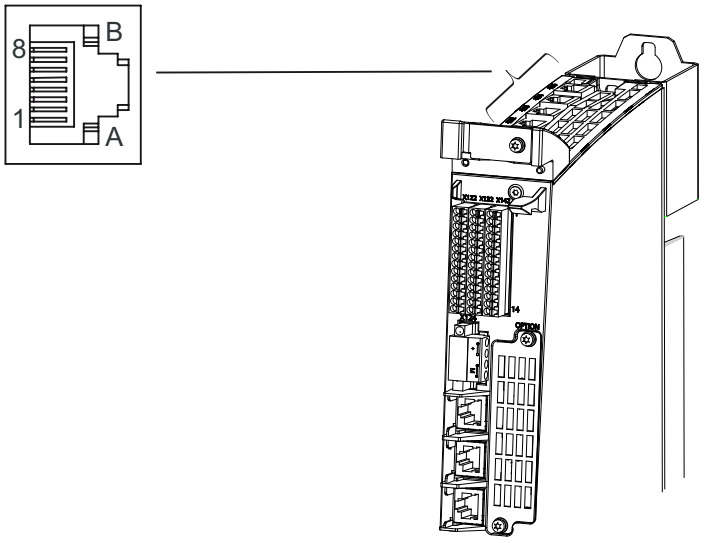

Figure 10-241 The position of the DRIVE-CLiQ interfaces on the D4x5-2 (example of D445-2 DP/PN)

Characteristics

Table 10-155 DRIVE-CLiQ interface X100 – X105 (D425-2: Only X100 - X103)

Characteristic	Type
Connector type	DRIVE-CLiQ connector (RJ45 socket)
Cable type	DRIVE-CLiQ standard (inside the cabinet)
Cable type	MOTION CONNECT (outside the cabinet)
Max. cable length	100 m
Dust protection filler plugs for sealing unused DRIVE-CLiQ ports	Five filler plugs contained in the D4x5-2 scope of delivery Filler plugs (50 pcs) article number: 6SL3066-4CA00-0AA0

DRIVE-CLiQ pin assignment

Table 10-156 DRIVE-CLiQ interface X100 – X105 (D425-2: Only X100 - X103)

PIN	Signal name	Signal type	Meaning
1	TXP	O	Send data +
2	TXN	O	Send data -
3	RXP	I	Receive data +
4	----	----	Reserved, do not use

PIN	Signal name	Signal type	Meaning
5	----	----	Reserved, do not use
6	RXN	I	Receive data -
7	----	----	Reserved, do not use
8	----	----	Reserved, do not use
A	+ (24 V)	VO	Power supply for DRIVE-CLiQ, 450 mA maximum
B	M (0 V)	VO	Ground to 24 V
Signal type: I = Input; O = Output; VO = Voltage Output

PROFINET IO interface (only for SIMOTION D4x5-2 DP/PN)

PROFINET is an open component-based industrial communication system using Ethernet for distributed automation systems.

SIMOTION D4x5-2 DP/PN has a PROFINET interface with three ports (X150 P1-P3) onboard. The PROFINET interface supports operation of a SIMOTION D4x5-2 DP/PN as an IO controller and/or as an I device.

Interface position

The following figure contains information on the PROFINET interface of the control unit. Position of the interface, labeling of the ports and the associated displays are described.

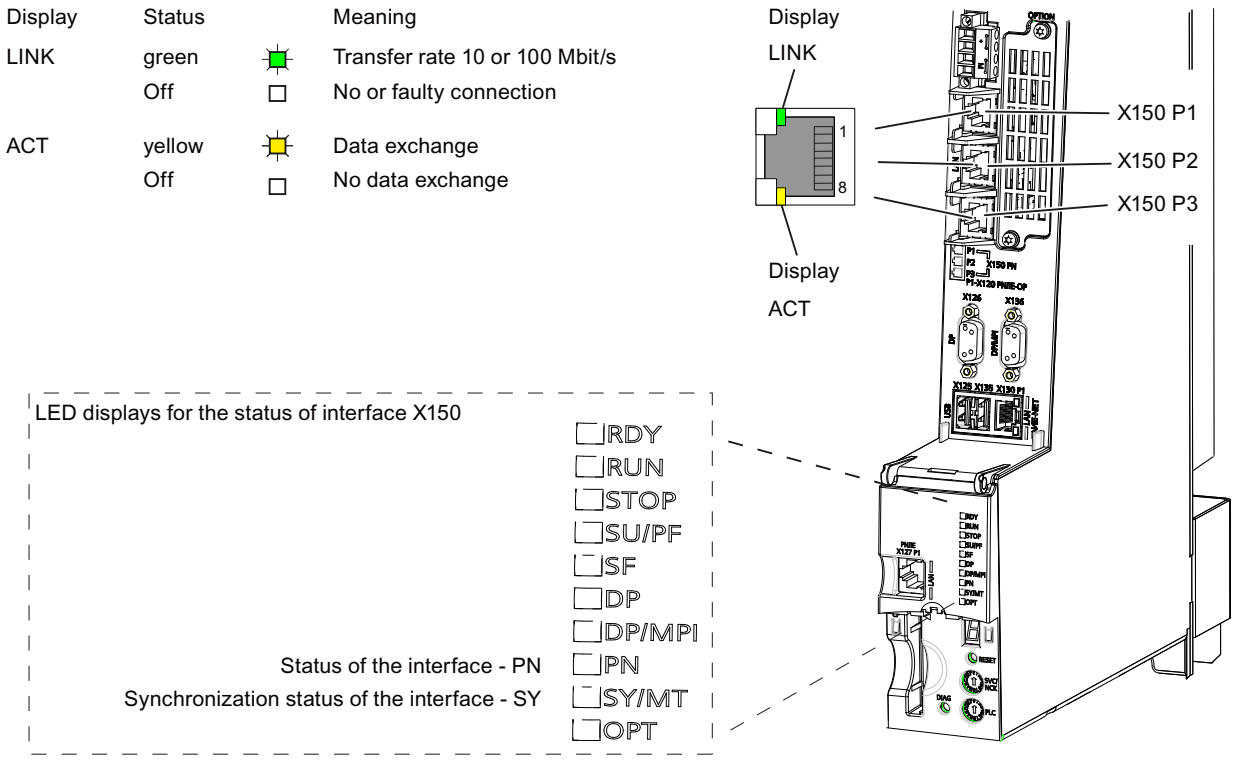

Figure 10-242 The position of the PROFINET X150 P1 to P3 interfaces and their displays (SIMOTION D445-2 DP/PN)

Note

The 3rd port of the PROFINET IO interface X150 P3 is also designated as X120 PN/IE OP. This designation is not relevant for SIMOTION D.

Additional references

Detailed information on the states of the status LEDs can be found in the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual, Section *Diagnostics*.

Interface characteristics

Table 10-157 Ports X150 P1 to P3

Characteristic	Type
Connector type	RJ45 socket connector
Cable type	PROFINET
Maximum cable length	100 m
Minimum send cycle clock	0.25 ms (D455-2 DP/PN: 0.125 ms)
Autocrossing	Yes i.e. both crossed and uncrossed cables can be used
Dust protection filler plugs for sealing unused PROFINET ports	Five filler plugs contained in the D4x5-2 scope of delivery Filler plugs (50 pcs) article number: 6SL3066-4CA00-0AA0

Interface assignment

Table 10-158 Assignment of the ports X150 P1 to P3

Representation	Pin	Name	Description
	1	TXP	Send data +
	2	TXN	Send data -

Connectable devices

The following devices can be connected to the PROFINET IO interface:

- PG/PC programming devices (communication with SIMOTION SCOUT / STEP 7)
- SIMATIC HMI devices
- SIMATIC controllers with PROFINET interface
- Distributed I/O
- Drive units with PROFINET IO interface (standard devices)

The SIMOTION D4x5-2 DP/PN then assumes the role of a PROFINET IO controller and can offer the following functions:

- PROFINET IO controller, I-device (also controller and device simultaneously)
- Supports real-time classes of PROFINET IO:
  - RT (real-time)
  - IRT (isochronous real-time)

The following functions are also supported by Industrial Ethernet:

- Communication between SIMOTION and SIMATIC NET OPC.
  The "SIMATIC NET SOFTNET S7 (S7 OPC server)" software must be installed on the PG/PC for this function.
- Communication with other devices over TCP/IP or UDP communication
- IT communication (e.g. via SIMOTION IT OPC XML-DA)
- Communication based on OPC UA (Unified Architecture)

For further information on the software packages, see Catalog *SIMOTION PM 21*

Note

A list of the modules released with SIMOTION is available at (https://support.industry.siemens.com/cs/ww/en/view/11886029).

The list is updated regularly and contains information on the use of these modules.

Take note of the documentation on the individual modules or devices!

Second PROFINET interface

The Ethernet Communication Board (CBE30-2) provides as option a second PROFINET interface for the D4x5-2 DP/PN Control Units.

The CBE30-2 cannot be used in SIMOTION D4x5 2 DP Control Units.

For details, see Section CBE30-2 Ethernet communication board (Page 7676).

Digital I/Os

Properties

Interface characteristics

The digital I/Os on the X122, X132 and X142 connectors are for the connection of sensors and actuators.

Table 10-159 Wiring of X122, X132 and X142

Features		Type
Connector type		14-way spring-loaded terminal
Number of cables that can be connected		1
Connectable cable types and conductor cross-sections		
	Rigid	0.2 mm² ... 1.5 mm²
	Flexible	0.2 mm² ... 1.5 mm²
	Flexible, with wire-end ferrule without plastic sleeve	0.25 mm² ... 1.5 mm²

Features		Type
	Flexible, with wire-end ferrule with plastic sleeve	0.25 mm² ... 0.75 mm²
	AWG / kcmil	24 ... 16
Stripped length		10 mm
Tool		Screwdriver 0.4 x 2.0 mm
Max. cable length		30 m
Max. current carrying capacity (ground)		6 A

Position of connectors

The following figure shows the position of the interface connectors on the D4x5-2 and the distribution of the various digital I/Os.

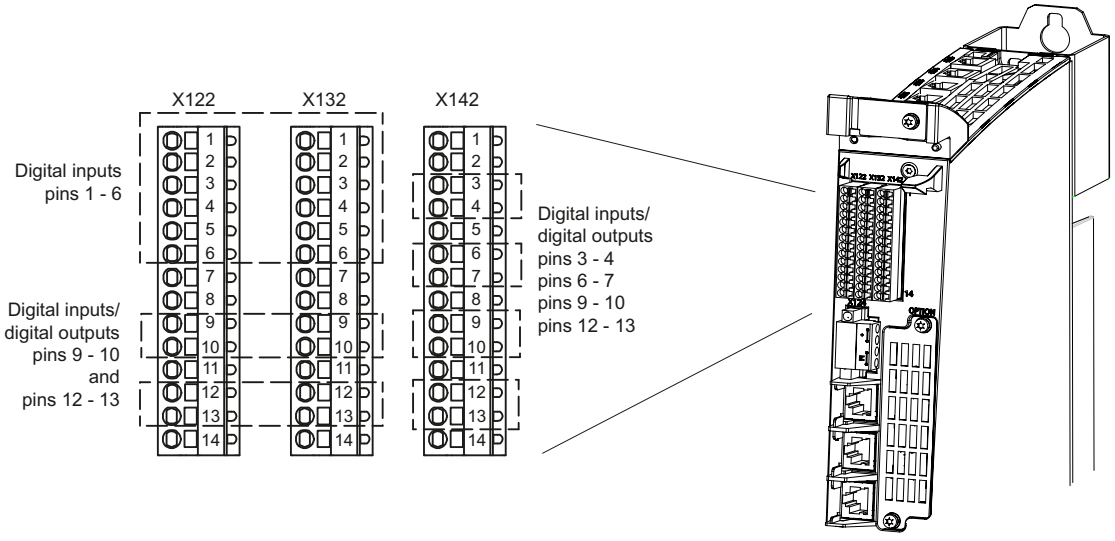

Figure 10-243 Position of the X122, X132 and X142 digital interfaces (example of SIMOTION D445-2 DP/PN)

Connection and circuit diagram for SIMOTION D4x5-2

The following figure shows the wiring and block diagram of the digital inputs as well as the digital input/outputs using the example of a SIMOTION D4x5-2 DP/PN.

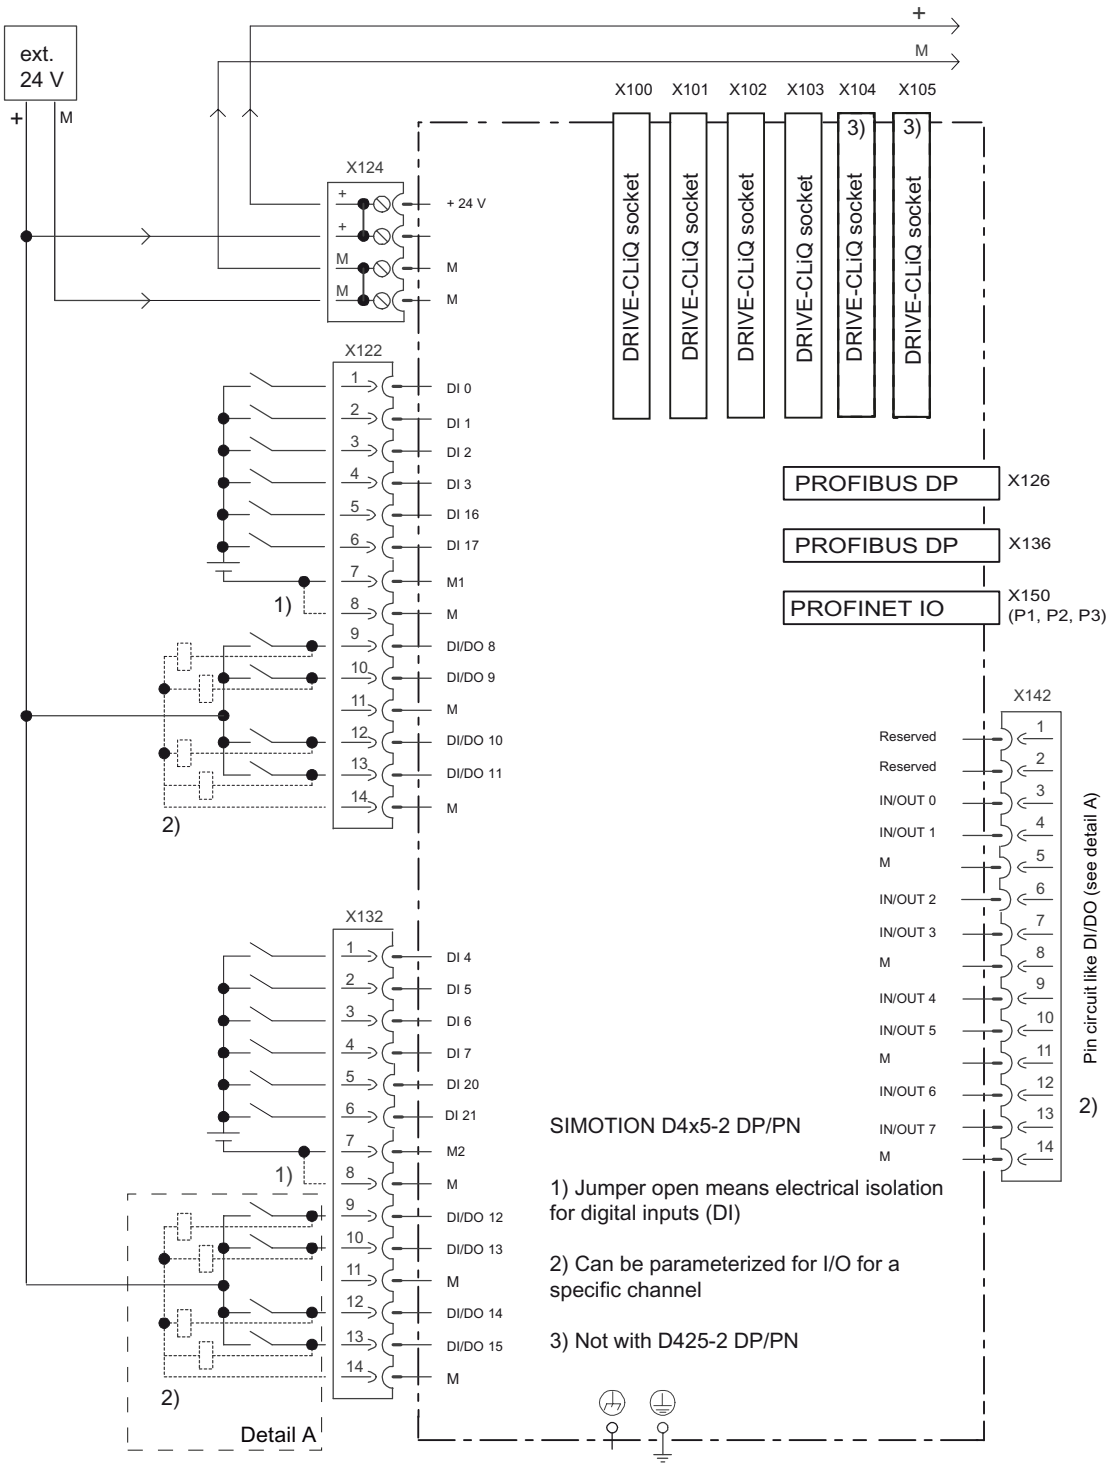

Figure 10-244 Connection and circuit diagram of the digital I/Os

Interface assignment of X122, X132 and X142

Table 10-160 Digital inputs/outputs X122

Pin	Designation [1]	Signal type [2]	Notes
1	DI 0	I	Digital input 0
2	DI 1	I	Digital input 1
3	DI 2	I	Digital input 2
4	DI 3	I	Digital input 3
5	DI 16	I	Digital input 16
6	DI 17	I	Digital input 17
7	M1	GND	Ground for DI 0 – DI 3, DI 16, DI 17 (electrically isolated relative to M)
8	M	GND	Ground
9	DI/DO 8	B	Digital input/output 8 (can also be used as input for measuring input or as input for the external zero mark)
10	DI/DO 9	B	Digital input/output 9 (can also be used as input for measuring input or as input for the external zero mark)
11	M	GND	Ground
12	DI/DO10	B	Digital input/output 10 (can also be used as input for measuring input or as input for the external zero mark)
13	DI/DO 11	B	Digital input/output 11 (can also be used as input for measuring input or as input for the external zero mark)
14	M	GND	Ground

[1] DI: Digital input; DI/DO: Bidirectional digital input/output; M: Electronics ground; M1: Ground reference

[2] B = Bidirectional; I = Input; GND = Reference potential (ground)

Table 10-161 Digital inputs/outputs X132

Pin	Designation [1]	Signal type [2]	Notes
1	DI 4	I	Digital input 4
2	DI5	I	Digital input 5
3	DI 6	I	Digital input 6
4	DI 7	I	Digital input 7
5	DI 20	I	Digital input 20
6	DI 21	I	Digital input 21
7	M2	GND	Ground for DI 4 – DI 7, DI 20, DI 21 (electrically isolated relative to M)
8	M	GND	Ground
9	DI/DO 12	B	Digital input/output 12 (can also be used as input for measuring input or as input for the external zero mark)
10	DI/DO 13	B	Digital input/output 13 (can also be used as input for measuring input or as input for the external zero mark)
11	M	GND	Ground

Pin	Designation [1]	Signal type [2]	Notes
12	DI/DO 14	B	Digital input/output 14 (can also be used as input for measuring input or as input for the external zero mark)
13	DI/DO 15	B	Digital input/output 15 (can also be used as input for measuring input or as input for the external zero mark)
14	M	GND	Ground

[1] DI: Digital input; DI/DO: Bidirectional digital input/output; M: Electronics ground; M2: Ground reference

[2] B = Bidirectional; I = Input; GND = Reference potential (ground)

Note

An open input is interpreted as "low".
To enable the digital inputs to work, terminal M1 or M2 must be connected. The following alternatives are available:

- Connect the carried digital input reference ground to M1 or M2.
- Insert a bridge between terminals M and M1 (or between M and M2).
  This removes the electrical isolation for these digital inputs.

Table 10-162 Digital inputs/outputs X142

Pin	Designation [1]	Signal type [2]	Notes
1	---	---	Reserved, do not use
2	---	---	Reserved, do not use
3	IN/OUT 0	B	Digital input/output 0 (can be used as input of a measuring input or output of an output cam)
4	IN/OUT 1	B	Digital input/output 1 (can be used as input of a measuring input or output of an output cam)
5	M	GND	Ground
6	IN/OUT 2	B	Digital input/output 2 (can be used as input of a measuring input or output of an output cam)
7	IN/OUT 3	B	Digital input/output 3 (can be used as input of a measuring input or output of an output cam)
8	M	GND	Ground
9	IN/OUT 4	B	Digital input/output 4 (can be used as input of a measuring input or output of an output cam)
10	IN/OUT 5	B	Digital input/output 5 (can be used as input of a measuring input or output of an output cam)
11	M	GND	Ground
12	IN/OUT 6	B	Digital input/output 6 (can be used as input of a measuring input or output of an output cam)
13	IN/OUT 7	B	Digital input/output 7 (can be used as input of a measuring input or output of an output cam)
14	M	GND	Ground

[1] IN/OUT: Bidirectional digital input/output; M: Electronic ground

[2] B = Bidirectional; GND = Reference potential (ground)

Using the digital inputs/outputs

Connecting sensors and actuators

Digital I/Os can be used to connect various sensors and actuators to the three 14-pin X122, X132 and X142 front connectors.

The following types of digital I/Os are available:

- Digital inputs (DI)
- Bidirectional digital I/Os (DI/DO, IN/OUT)

Bidirectional digital I/Os can be configured individually as digital inputs or outputs.

Assignment of the I/Os to functions can be parameterized as required. Special functions (e.g. input of measuring input and output for output cam) can also be assigned to the I/Os.

The digital I/Os on the X122 and X132 front connectors can be used by either SIMOTION or SINAMICS (e.g. as enable signal for a drive).
The digital I/Os on the X142 front connector are permanently allocated to SIMOTION.

Table 10-163 Use of the digital I/Os

	DI 0-7, DI 17, DI 18, DI 20, DI 21 (X122, X132)	**DI/DO 8-15 (X122, X132)**	**IN/OUT 0-7 (X142)**
Galvanic isolation	Electrically isolated (ground reference M1 or M2)	Non-isolated (ground reference M)	Non-isolated (ground reference M)
Use as:			
• Freely addressable I/Os for SIMOTION	Yes	Yes	Yes
• I/Os that are assigned to the drive	Yes	Yes	No
• Measuring inputs	No	Yes (global and local measuring inputs)	Yes (global measuring inputs)
• Inputs for the external zero mark	No	Yes	No
• Cam outputs	No	No	Yes
Configuration:			
Assignment	Can be configured channel-by-channel on the drive	Can be configured channel-by-channel on the drive	Can be configured channel-by-channel in HW Config

Note

For optimal noise immunity of the digital inputs, the use of shielded cables is necessary if they are to be used as

- Inputs of measuring inputs or
- Inputs for the external zero mark

Inductive loads

If the digital inputs are used together with inductive loads, it must be ensured that the permissible voltage range of -30 V to +30 V for digital inputs is not exceeded by the switching overvoltage of inductive loads. This is preferably achieved by using auxiliary contacts on the contactor/relay for the digital inputs.
If no auxiliary contacts are available, overvoltage protection must be used. Protective circuits with a freewheeling diode or a diode combination with a Z-diode are possible. RC elements and varistors are not suitable due to the remaining residual voltages.

Additional references

For information on configuring the digital I/Os as freely addressable I/Os, inputs of measuring inputs or outputs of output cams, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

For information on the configuration and function of the measuring input, output cam, and cam track technology objects, refer to the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Power supply

This interface is provided for connection of the external power supply.

Note

When using external power supplies (e.g. SITOP), the ground potential must be connected with the protective ground terminal (PELV).

Note

Ground potential and housing (PE) are connected internally with low impedance.

Note

The 24 V DC cable must be approved for temperatures up to at least 75 °C.
The maximum permissible cable length is 10 m.

Features of the interface

Table 10-164 Interface X124

Features		Type
Connector type		4-way screw-type terminal
Number of cables that can be connected		1
Connectable cable types and conductor cross-sections		
	Rigid	0.2 mm² ... 2.5 mm²
	Flexible	0.2 mm² ... 2.5 mm²
	Flexible, with wire-end ferrule without plastic sleeve	0.2 mm² ... 2.5 mm²
	Flexible, with wire-end ferrule with plastic sleeve	0.2 mm² ... 1.5 mm²
	AWG / kcmil	22 ... 12
Stripped length		6 ... 7 mm
Tool		Screwdriver 0.5 x 3 mm (M2.5)
Tightening torque		0.4 to 0.5 Nm (3.5 ... 4.4 lbf in)
Max. current carrying capacity, incl. loop-through		20 A (15 A per UL/CSA)
Max. cable length		10 m

Interface assignments

Table 10-165 Power supply X124

Pin	Signal name	Meaning
1	+	Power supply 24 V
2	+	Power supply 24 V
3	G	Ground
4	G	Ground

Note

The 24 V is looped through via the 24 V connector. In this case, pin 1 is jumpered with pin 2, and pin 3 is jumpered with pin 4 in the connector. The maximum current can be limited through the current carrying capacity of the cable. The current carrying capacity of the cable depends, for example, on the type of cable installation (cable duct, laying on a cable rack, etc.).

Position of power supply interface

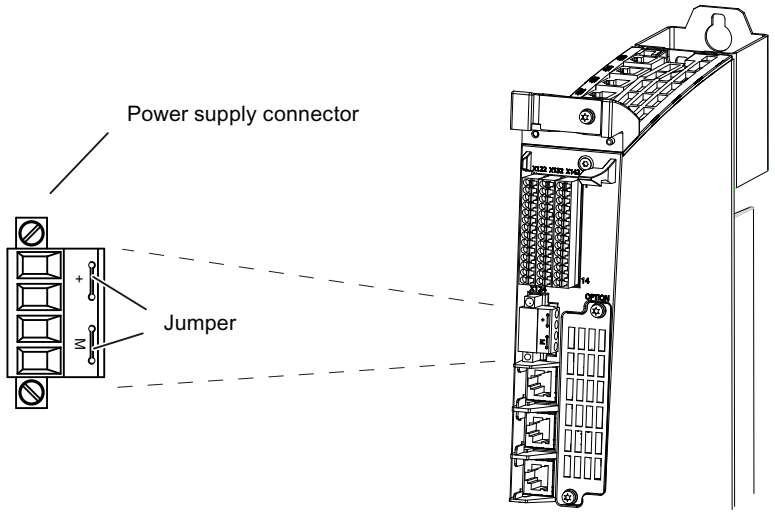

Figure 10-245 Position of the power supply interface (example of SIMOTION D445-2 DP/PN)

Note

The power supply terminal strip must be screwed on tightly using a flat-bladed screwdriver.

Disconnecting 24 V plug-in connections during operation

Observe the following safety instructions when using SIMOTION D4x5-2/CX32-2:

⚠ WARNING

Personal injury and damage to property may occur

Personal injury and damage to property may occur if you disconnect 24 V plug-in connections during operation.
Disconnecting 24 V plug-in connections is only permitted in a de-energized state.

Ethernet interfaces

Interfaces for connection to Industrial Ethernet

Industrial Ethernet is a communications network with a transmission rate of 10/100/1000 Mbit/s.
SIMOTION D4x5-2 offers the following functions via Ethernet interfaces:

- Communication with STEP 7 and SIMOTION SCOUT
- Communication between SIMOTION and SIMATIC NET OPC
  The following software must be installed on the PG/PC for this function:
  "SIMATIC NET SOFTNET-S7 (S7-OPC server)"
- Connection of HMI systems
- Communication with other devices over TCP/IP or UDP communication
- IT communication (e.g. via SIMOTION IT OPC XML-DA).

For further information on the software packages, see Catalog *SIMOTION PM 21*

Position of connectors for SIMOTION D4x5-2 DP

The following figure shows the position of the Ethernet interfaces on the D4x5-2 DP and their displays.

Display	Status		Meaning
LINK	orange		Transfer rate 1000 Mbit/s
	green		Transfer rate 10 or 100 Mbit/s
	Off		No or faulty connection
ACT	yellow		Data exchange
	Off		No data exchange

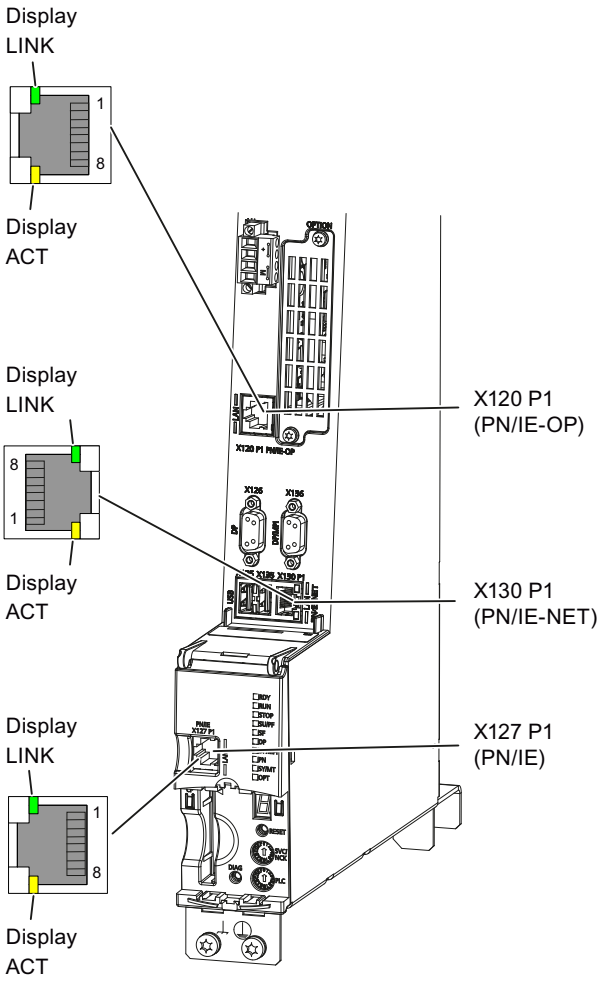

Figure 10-246 The position of the Ethernet interfaces (example of SIMOTION D435-2 DP)

Note

As of V4.3, the three Ethernet interfaces support the PROFINET basic services - they therefore have the designation PN/IE-NET, PN/IE-OP or PN/IE.

These PROFINET basic services (e.g. DCP, LLDP, SNMP) provide uniform functions for the address assignment and diagnostics, but do not provide PROFINET IO communication for the connection of drives, I/O modules, etc.

Position of connectors for SIMOTION D4x5-2 DP/PN

The following figure shows the position of the Ethernet interfaces on the D4x5-2 DP/PN and their displays.

Display	Status		Meaning
LINK	orange	☀	Transfer rate 1000 Mbit/s
	green	☀	Transfer rate 10 or 100 Mbit/s
	Off	□	No or faulty connection
ACT	yellow	☀	Data exchange
	Off	□	No data exchange

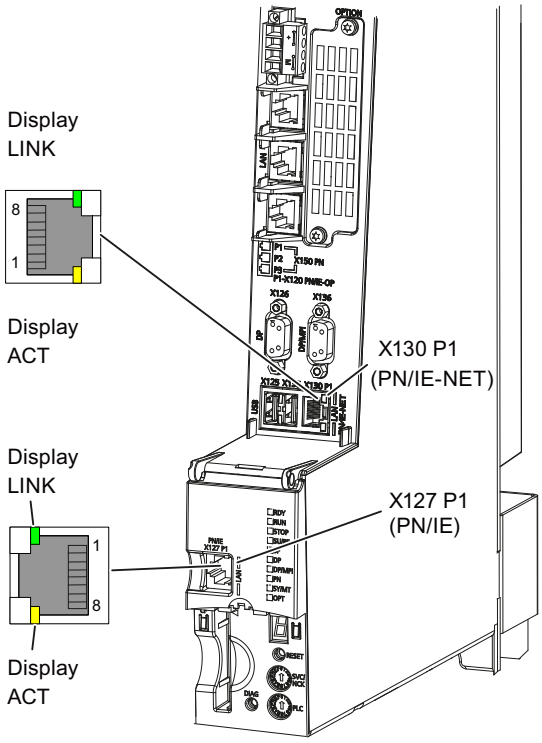

Figure 10-247 The position of the Ethernet interfaces and their displays (example of SIMOTION D445-2 DP/PN)

Note

As of V4.3, the two Ethernet interfaces support the PROFINET basic services - they therefore have the designation PN/IE-NET or PN/IE.

These PROFINET basic services (e.g. DCP, LLDP, SNMP) provide uniform functions for the address assignment and diagnostics, but do not provide PROFINET IO communication for the connection of drives, I/O modules, etc.

Additional references

You will find detailed information on the states of the status LEDs in the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual, Chapter *Diagnostics*.

Interface characteristics

Table 10-166 X127 P1 and X130 P1 (X120 P1 only for SIMOTION D4x5-2 DP)

Characteristic	Type
Connector type	RJ45 socket connector
Cable type	Industrial Ethernet cable • 4- and 8-wire cables can be used for 10/100 Mbit/s • 8-wire cables must be used for 1000 Mbit/s
Max. cable length	100 m
Autocrossing	Yes
Dust protection filler plugs for sealing unused Ethernet ports	Five filler plugs contained in the D4x5-2 scope of delivery Filler plugs (50 pcs) article number: 6SL3 066-4CA00-0AA0
Miscellaneous	X127 P1, X120 P1 and X130 P1 are full-duplex 10/100/1000 Mbit/s Ethernet ports

Pin assignment

Table 10-167 X127 P1 and X130 P1 Ethernet interfaces (X120 P1 only for SIMOTION D4x5-2 DP)

Representation	Pin	Assignment in 10/100 Mbit mode			Assignment in 1 Gbit mode		
Signal name [1]	Signal type	Meaning	Signal name [1]	Signal type	Meaning		
	1	TXP	O	Ethernet send differential signal	DA+	B	Bidirectional pair A+
	2	TXN	O	Ethernet send differential signal	DA-	B	Bidirectional pair A-
	3	RXP	I	Ethernet receive differential signal	DB+	B	Bidirectional pair B+
	4	- - -	- - -	Reserved, do not use	DC+	B	Bidirectional pair C+
	5	- - -	- - -	Reserved, do not use	DC	B	Bidirectional pair C-
	6	RXN	I	Ethernet receive differential signal	DB-	B	Bidirectional pair B-
	7	- - -	- - -	Reserved, do not use	DD+	B	Bidirectional pair D+
	8	- - -	- - -	Reserved, do not use	DD-	B	Bidirectional pair D-
I = Input; O = Output; B = Bidirectional							

[1] Autocrossing functionality (if required, send and receive lines switch over)

Note

The MAC addresses are imprinted on an adhesive label that is located behind the protective cover and can be seen from the front.

PROFIBUS DP interfaces

Characteristics of the interface

Table 10-168 Interfaces X126 and X136

Characteristics	Type
Connector type	9-pin Sub-D socket
Cable type	PROFIBUS cable
Max. cable length	100 m at 12 Mbit/s

Position of connectors

The following figure shows the mounting position and designation of the connectors on the control unit.

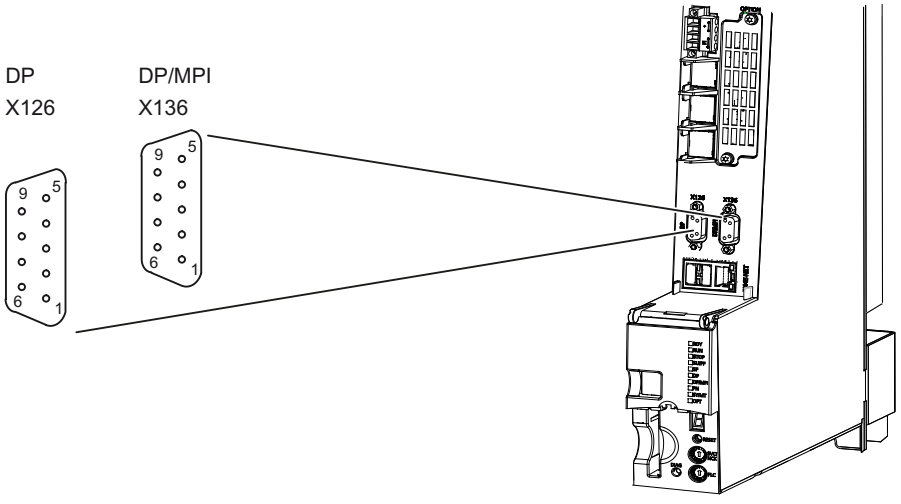

Figure 10-248 The position of the PROFIBUS X126 and X136 interfaces (example of SIMOTION D4x5-2 DP/PN)

Note

For the X126 interface, an adapter connector is available for raising the PROFIBUS connector to make more cabling space. This connector is required in certain wiring scenarios.

For further details, see

- Section Available spare parts and accessories (Page 7702)
- *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual, Section Connecting PROFIBUS DP

Interface assignment for X126

Table 10-169 PROFIBUS DP interface X126

Pin	Signal name	Signal type	Meaning
1	--	--	Reserved, do not use
2	M	VO	Ground to P24_SERV
3	1RS_DP	B	RS-485 differential signal
4	1RTS_DP	O	Request to send
5	1M	VO	Ground to 1P5
6	1P5	VO	5 V power supply for bus terminal, external, short-circuit proof
7	P24_SERV	VO	24 V for teleservice, short-circuit proof, 150 mA maximum
8	1XRS_DP	B	RS-485 differential signal
9	--	--	Reserved, do not use
The 1P5 voltage is provided exclusively for the bus terminal. No OLPs are permitted.			
Signal type: VO = Voltage output (power supply); O = Output; B = Bidirectional			

Interface assignment for X136

Table 10-170 PROFIBUS DP interface X136

Pin	Signal name	Signal type	Meaning
1	--	--	Reserved, do not use
2	M	VO	Ground to P24_SERV
3	2RS_DP	B	RS-485 differential signal
4	2RTS_DP	O	Request to send
5	1M	VO	Ground to 1P5
6	1P5	VO	5 V power supply for bus terminal, external, short-circuit proof
7	P24_SERV	VO	24 V for teleservice, short-circuit proof, 150 mA maximum
8	2XRS_DP	B	RS-485 differential signal
9	--	--	Reserved, do not use

Pin	Signal name	Signal type	Meaning
The 1P5 voltage is provided exclusively for the bus terminal. No OLPs are permitted.			
Signal type: VO = Voltage output (power supply); O = Output; B = Bidirectional			

Connectable devices

The following devices can be connected to the PROFIBUS DP interfaces:

- PG/PC
- SIMATIC HMI devices
- SIMATIC controllers with PROFIBUS DP interface
- Distributed I/O
- Teleservice adapter
- Drive units with PROFIBUS DP interface (standard slaves)

Note

For remote diagnosis, a teleservice adapter can be connected to the PROFIBUS X126 or X136 interface. A teleservice adapter can only be connected to one of the two interfaces.

The power supply for the teleservice adapter (terminals 2 and 7) can accept current loads as high as 150 mA and is sustained short-circuit proof.

Slot for CompactFlash card

Characteristics

Connector type: 50-pin connector

This interface should only be used to insert a special SIMOTION CompactFlash card (CF card).

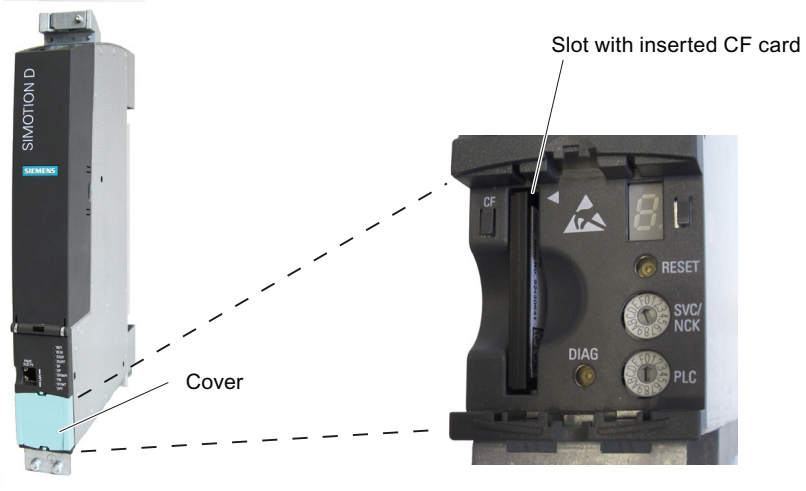

Figure 10-249 Slot for the CompactFlash card

Consult the relevant references for detailed information about the SIMOTION CompactFlash card in Section CompactFlash card (Page 7609).

Measuring sockets

Application

The measuring sockets X141 (T0, T1 and T2) are on the lower side of the module and are used to output analog signals. Any interconnectable signal can be output via SINAMICS on every measuring socket on the control unit.

Interface assignment

Table 10-171 Measuring sockets T0, T1, T2

	Socket	Function	Technical specifications
	T0	Measuring socket 0	Voltage: 0 V to 5 V Resolution: 8 bits Load current: Max. 3 mA Continuous short-circuit-proof Reference potential is G terminal
	T1	Measuring socket 1	
	T2	Measuring socket 2	
	M	Ground	
The measuring sockets are suited for multiple-spring wire connectors with a diameter of 2 mm.			

Note

The measuring sockets support commissioning and diagnostic functions. Connection for normal operation is not permitted.

Measuring socket position

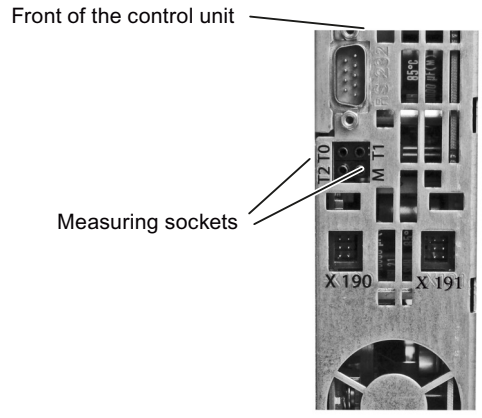

Figure 10-250 Measuring socket position

USB interfaces

The USB interfaces are used for upgrading the SIMOTION D4x5-2 via a USB stick.

Table 10-172 Interfaces X125 and X135

Characteristics	Versions
Connector type	Double USB socket – type A
Version	USB 2.0
Power supply	5 V (short-circuit proof)
Current carrying capacity	0.5 A per channel

The USB interfaces are located on the front of the SIMOTION D4x5-2.

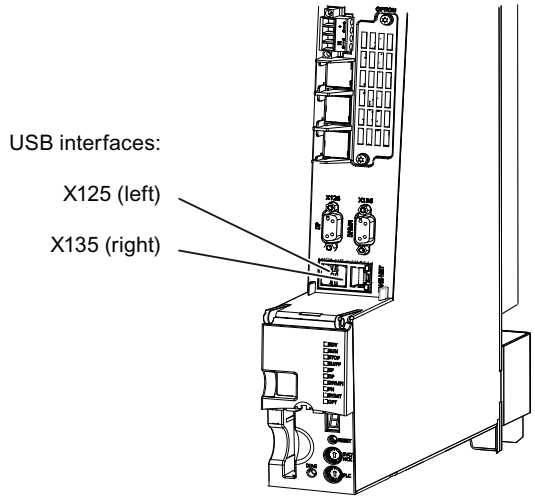

Figure 10-251 The position of the USB X125 and X135 interfaces (example of SIMOTION D4x5-2 DP/PN)

10.2.1.5 Technical data of the D4x5-2

Shipping and storage conditions

Transportation and storage conditions

The following conditions apply to modules that are shipped and stored in the original packaging.

Table 10-173 Transportation conditions

Type of condition	Permissible range/class	
	Transport	**Long-term storage**
Climate class	2K4 according to EN 60721-3-2:1997	1K4 according to EN 60721-3-1:1997
Temperature	From -40° C to +70° C	From -25° C to +55° C
Relative humidity	From 5 to 95%	From 10% to 100%
Height	Max. 4000 m above sea level, For SINAMICS S120 drive components, see SINAMICS Manuals.	
Atmospheric pressure	• > 620 hPa • < 1060 hPa The specified values apply to a transportation altitude of up to 4,000 m	• > 620 hPa • < 1060 hPa The specified values apply to a storage altitude of up to 4,000 m
Biological environmental conditions	Class 2B1 according to EN 60721-3-2:1997	Class 1B1 acc. to EN 60721-3-1:1997
Chemically active environmental conditions	Class 2C2 according to EN 60721-3-2:1997	Class 1C2 according to EN 60721-3-1:1997

Shipping backup batteries

Backup batteries may only be shipped in the original packaging. No special authorization is required to ship backup batteries. The lithium content of the backup battery is approximately 300 mg.

Note

The backup battery is classified as a hazardous substance, Class 9 in accordance with the relevant air-freight transportation regulations.

Notes on handling backup batteries, see Replacing the battery in the fan/battery module.

Storage of backup batteries

Always store backup batteries in a cool and dry place. The batteries have a maximum shelf life of 10 years.

Note

If you have a spare parts inventory, you must not store a SIMOTION D4x5-2 with the fan/battery module mounted. Only connect the fan/battery module if the fan or battery backup voltage is required.

See also

Fan/battery module (Page 7665)

Ambient conditions

Protect the device from environmental effects

SIMOTION D4x5-2 is designed for use in stationary, weather-protected locations.
Protect the device against the following environmental factors:

- Direct sunshine and heat sources
- Mechanical vibration and shock
- Dust
- Humidity
- Strong magnetic fields

Use prohibition

SIMOTION D4x5-2 must not be used in the following applications without additional measures:

- Locations with a high percentage of ionizing radiation
- Locations with extreme operating conditions, e.g.
  - Dust accumulation
  - Corrosive vapors or gases
- Installations requiring special monitoring such as:
  - Elevator installations
  - Electrical installations in particularly hazardous rooms

An additional measure for using SIMOTION D4x5-2 can, for example, be installation in cabinets.

Note

The components must be protected against conductive contamination, e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12.

If conductive contamination can be excluded at the installation site, a lower degree of cabinet protection may be permitted.

See Industrial security (Page 957).

Ambient conditions for operation

SIMOTION D4x5-2 can be used under the following ambient conditions:

Ambient conditions	Fields of application	Remarks
Climatic ambient conditions		
Climate class	3K3	According to EN 60721-3:1995 Ambient conditions better than 3K3
Permissible ambient temperature: During operation when installed vertically	From 0° to 55° C, to 2000 m above sea level	The max. ambient temperature decreases as of an elevation of 2000 m by 7° C per 1000 m increase in elevation. The maximum supply air temperature for all modules is 55° C. The fan/battery module is always required for SIMOTION D4x5-2 Control Units.
Relative humidity	From 5 to 95 %	For SIMOTION D4x5-2
	From 0 to 100 %	For SIPLUS D4x5-2
Condensation, formation of ice, drip, spray, and splash water	Not permissible	For SIMOTION D4x5-2
	Condensation/frost permitted (no commissioning under condensation)	For SIPLUS D4x5-2
Conformal coating	No	For SIMOTION D4x5-2
	Yes	For SIPLUS D4x5-2

Installation altitude	Max. 4000 m above sea level	For SINAMICS S120 drive components, see SINAMICS Manuals.
Atmospheric pressure	620 hPa ... 1060 hPa	Corresponding elevation of 4000 m - 0 m above sea level
Biological, chemical and mechanical influences, pollutants		
Biological ambient conditions:	For SIMOTION D4x5-2 Class 3B1 according to EN 60721-3-3:1995 Mold, mold growth, slime, rodents, termites and other animal vermin are not permissible	
	For SIPLUS D4x5-2 Resistant to biologically active substances, conformity according to EN 60721-3-3. Class 3B2, mold and fungal spores (except fauna) For operation in a harmful gas atmosphere, the plug covers included in delivery must be left on the unused interfaces!	
Chemically active environmental conditions	For SIMOTION D4x5-2 Class 3C1 according to EN 60721-3-3:1995	
	For SIPLUS D4x5-2 Resistant to chemically active substances, conformity according to EN 60721-3-3. Class 3C4 incl. salt spray according to EN 60068-2-52 (severity 3); the plug covers included in delivery must be left on the unused interfaces!	
Mechanically active environmental conditions	Class 3S1 according to EN 60721-3-3:1995, conductive dust not permitted	
Vibratory load - D4x5-2 - CX32-2 - CBE30-2 - S120 (without SME/DME)	Vibratory load during operation according to EN 60721-3-3: Class 3M1 Test values according to EN 60068-2-6 (sinusoidal) • 10 ... 57 Hz: 0.075 mm deflection amplitude • 57 ... 150 Hz: 1 g acceleration amplitude • 10 frequency cycles per axis	
Shock load - D4x5-2 - CX32-2 - CBE30-2 - S120 (without SME/DME)	Shock load during operation according to EN 60721-3-3: Class 3M1 Test values according to EN 60068-2-27 (half-sinusoidal) • 5 g peak acceleration, 30 ms duration • 3 shocks in all three axes in both directions	

SIMOTION D435-2 DP/PN and D455-2 DP/PN are also available as SIPLUS version for use under harsh environmental conditions, e.g. in toxic atmospheres. As BasedOn products, the SIPLUS versions have the same functionality as the standard modules and are configured in the same way.

Permitted mounting positions

The following mounting positions are permitted:

- vertical installation (preferred standard mounting position)
- lying on back (e.g. for applications in which the installation situation makes a low installation height necessary)

For details, see *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual, Section Alternative mounting position.

• With fastening using spacers, without fan/battery module	50 x 380 x 270	50 x 380 x 270
Weight [g] - Without packaging - With packaging	 Approx. 3.7 kg Approx. 4.5 kg	 Approx. 4.3 kg Approx. 5.0 kg

Note

The spacers can be removed for D425-2 and D435-2.

D425-2 and D435-2 do not have any cooling fins.

The presence of cooling fins for D445-2 DP/PN and D455-2 DP/PN means the spacers can be removed only for the "external cooling" installation type. In this installation method, the cooling fins are inserted through a cutout in the rear cabinet panel.

For further details, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Power supply

External 24 V power supply

The control unit is supplied by an external 24 V power supply (e.g. SITOP).

The tolerance range for the input voltage of the SIMOTION D4x5-2 is between 20.4 and 28.8 VDC.

Table 10-176 Power supply data

	D425-2 DP **D435-2 DP**	**D425-2 DP/PN** **D435-2 DP/PN**	**D445-2 DP/PN** **D455-2 DP/PN**
Power supply • Rated value • Permissible range	Safety extra-low voltage DVC A (PELV) 24 VDC (20.4 ... 28.8 V)		
Current consumption, typically [1]	0.7 A	1.0 A	1.9 A
Starting current, typically [1]	5 A	5 A	5 A
Power loss, typically [1]	17 W	24 W	46 W

[1] With no load on inputs/outputs, no 24 V supply via DRIVE-CLiQ and PROFIBUS interfaces

Table 10-177 Input voltage specification

	Maximum current consumption				
Device type	**D425-2 DP**	**D425-2 DP/PN**	**D435-2 DP**	**D435-2 DP/PN**	**D445-2 DP/PN** **D455-2 DP/PN**
Minimum input voltage	12.8 A	13.6 A	13.9 A	14.6 A	18.35 A
Nominal input voltage	10.9 A	11.5 A	11.8 A	12.4 A	15.6 A
Maximum input voltage	9.1 A	9.6 A	9.8 A	10.3 A	13 A

Note

If the D4x5-2 detects undervoltage, the module performs a RESET. If all LEDs are off, either there is no power supply or the voltage level is too low.

When the voltage level is in the permissible range again, the D4x5-2 restarts.

Undervoltages are detected when:

- The voltage level of the 24-V supply falls below the minimum permissible input voltage of the D4x5-2
- A temporary voltage dip (> 3 ms) results in the supply falling below the minimum permissible input voltage on the D4x5-2.

Additional references

Recommended power supply units and tables for calculating the current consumption for the assembly with SINAMICS S120 modules can be found in the "Control cabinet installation and EMC booksize" chapter in the *SINAMICS S120 Booksize Power Units* Manual.

Interfaces and performance features

Memory for system data

Data	SIMOTION D4x5-2
Current consumption typ. at signal level "1"	9 mA at 24 V
Input delay, typ. (hardware)	Signal "0" → "1": 50 µs Signal "1" → "0": 150 µs

1) Reference potential is terminal G1 or G2

2) The digital inputs are protected against polarity reversal up to -30 V

Digital inputs/outputs (parameterizable)

Table 10-185 Digital inputs/outputs on SIMOTION D4x5-2

Data	SIMOTION D4x5-2
Digital inputs/outputs	16 • Max. 16 as measuring input inputs • Max. 8 as output cam outputs
If used as an input	
• Input voltage, rated value	24 VDC
• Input voltage, for signal "1"	15 ... 30 V
• Input voltage, for signal "0" 2)	-3 ... +5 V
Galvanic isolation	No
Current consumption typ. at signal level "1"	9 mA at 24 V
Input delay, typ. (hardware) 3)	Signal "0" → "1": 5 µs Signal "1" → "0": 50 µs
Measuring input input, resolution	1 µs
Measuring input input, reproducibility	5 µs
If used as an output	
• Rated load voltage, permissible range	24 VDC, 20.4 ... 28.8 V
• Galvanic isolation	No
• Current load, max.	500 mA per output
• Residual current, max.	2 mA
• Output delay time, typ./max. (hardware) 1)	Signal "0" → "1": 150/400 µs Signal "1" → "0": 75/150 µs
• Output cam output, resolution terminal X142	1 µs
• Output cam output, reproducibility terminal X142	10 µs
Switching frequency of the outputs, max.	
• With resistive load	4 kHz
• With inductive load	2 Hz

Data	SIMOTION D4x5-2
• With lamp load	11 Hz
Short-circuit protection	Yes

1) Specification for Vcc = 24 V, load 48 Ohm, H = 90% V_{Out}; L = 10% V_{Out}

2) The digital inputs are protected against polarity reversal up to -30 V

3) A filter time of 1 µs or 125 µs can also be set for the X142 inputs.

Max. switching frequency of the DO

The max. switching frequency of the hardware depends on the load. For an ohmic load of 24 V / 0.5 A, it is up to 4 kHz (typical value; low-high ratio = 50:50; short cable lengths).

Logic control of the digital output is also a limiting factor.

- If an X142 DO is set or reset via the TO cam / TO camTrack, up to two edges are possible per servo or ServoFast cycle.
  → with servo cycles of at least 500 µs, a max. switching frequency of 2 kHz is achieved
  → with a ServoFast cycle clock (D435-2 DP/PN to D455-2 DP/PN only) of 250 µs, a max. switching frequency of 4 kHz is achieved
- If an X142 DO is set or reset from the user program, no more than one edge is possible per servo or ServoFast cycle.
  → with servo cycles of at least 500 µs, a max. switching frequency of 1 kHz is achieved
  → with a ServoFast cycle clock (D435-2 DP/PN to D455-2 DP/PN only) of 250 µs, a max. switching frequency of 2 kHz is achieved
- If an X122/X132 DO is set or reset from the user program, no more than one edge is possible per servo cycle.
  → with servo cycles of at least 500 µs, a max. switching frequency of 1 kHz is achieved
  The max. achievable switching frequency can also be limited by the CU parameter p0799[0] (sampling time of the inputs/outputs of the CU) or p2048 (PROFIdrive PZD sampling time).

Reproducibility

The reproducibility at the measuring input input depends on the edge steepness of the measurement signal. Generally, the following is valid: The steeper the edges of the input signal are, the easier it is to reproduce the measurement results. Sloping signals are achieved by switching the signal level to "active". This is typically with rising edges as the signal here is "actively" switched to HIGH by the digital output (example: Output of a TM17 module: Rising edge).

Falling edges typically have less edge steepness (signal level that falls slowly), as the signal level is "not actively" forced to LOW (example: Output of a TM17 module: Falling edge).

Recommendation:
Where the connected components do not have special output drivers, the recommendation is to use the rising edges for measurements.

Further technical data

Table 10-186 Fan, non-volatile data backup, and approvals

Data	SIMOTION D425-2 DP SIMOTION D425-2 DP/PN SIMOTION D435-2 DP SIMOTION D435-2 DP/PN	SIMOTION D445-2 DP/PN SIMOTION D455-2 DP/PN
Fan	Double fan/battery module is included in the scope of delivery	Double fan/battery module is included in the scope of delivery
• Backup time, min. • Charging time, typ.	• 4 days (real-time clock backup) • A few minutes	• 4 days (real-time clock backup) • A few minutes

If a double fan/battery module is used with included battery, the backup time of the real-time clock is at least 3 years.

For further technical data such as the max. number of online connections, HMI devices that can be used as well as a list of tasks available in the execution system, see the function overview in the *SIMOTION PM 21* Catalog.

CompactFlash card

CompactFlash card

Table 10-187 CF card

Memory capacity	2 GB (Article no. 6AU1400-2QA20-0AA0) 1 GB (Article no. 6AU1400-2PA23-0AA0) 1 GB (Article no. 6AU1400-2PA22-0AA0) 1 GB (Article no. 6AU1400-2PA21-0AA0)
Weight	10 g

Clock

Properties of the real-time clock

The following table lists the properties and functions of the SIMOTION D clock.

Table 10-188 Clock properties

Properties	Meaning
Type	Hardware clock (integrated "real-time clock")
Default setting when delivered	12:00 a.m. (date 01.01.2001)
Accuracy • +25° C • -40° C ... +85° C	Max. deviation per day: • ±2 s • ±5 s

Properties	Meaning
Backup time at least	• 4 days (at 0 ... 25° C) • With battery in the double fan/battery module 3 years
Charging time	A few minutes
Backup	Maintenance-free SuperCap or battery in the double fan/battery module

With power OFF

In the POWER OFF state, the SIMOTION D clock continues to run during the backup time (with the exception of the software clock). The backup battery is recharged in the POWER ON state.

An error message is output if the backup function is defective. When the power is switched ON, the clock then resumes at the time set at the factory.
If the SIMOTION D4x5-2 is reset to its factory setting, the clock is also reset to the "default setting when delivered".

Input and output circuit

Protective circuit

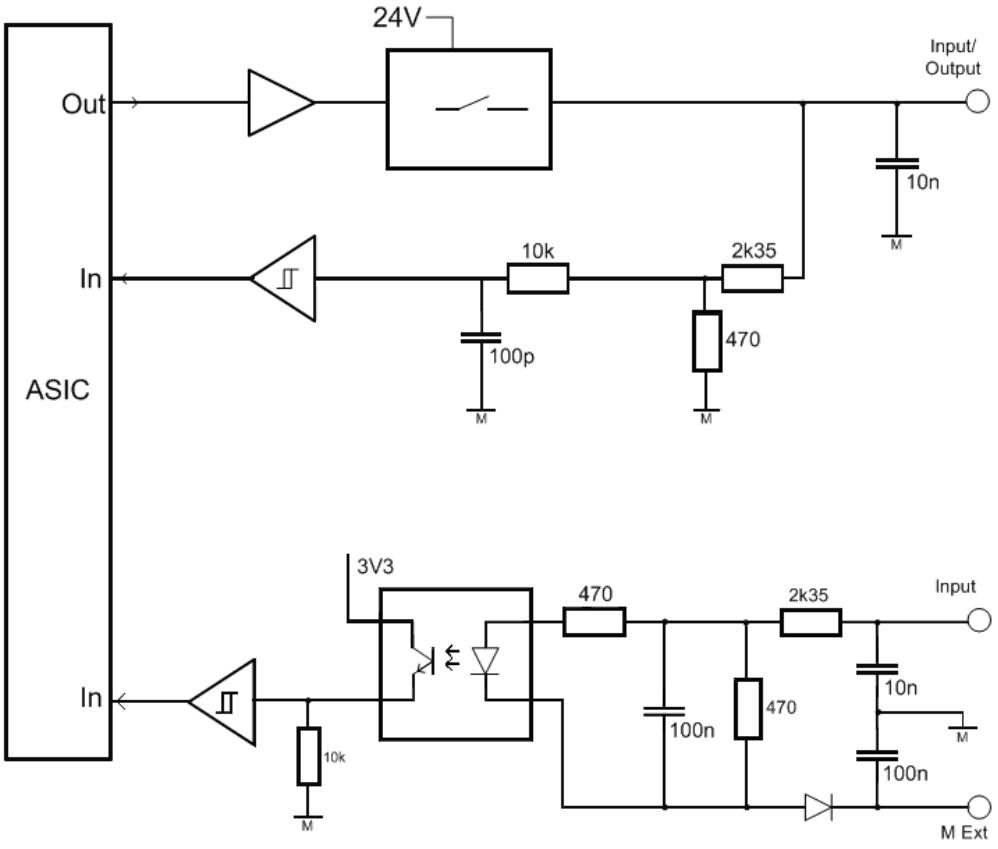

Figure 10-252 SIMOTION D4x5-2/CX32-2 input and output circuits

Certificates, approvals, declarations of conformity

You can find an overview of the certifications available for the SIMOTION D4x5-2 in Appendix A (Page 7705).

You can also find further information on the Internet at:

https://support.industry.siemens.com/cs/ww/en/ps/14513/cert

Note

SIMOTION D435-2 DP/PN and D455-2 DP/PN are also available as SIPLUS version for use under harsh environmental conditions, e.g. in toxic atmospheres.

The SIPLUS versions can have different certifications/approvals. For details, refer to the technical data for the module in the Industry Mall.

https://mall.industry.siemens.com

10.2.1.6 Dimension drawings

D425-2 and D435-2 dimension drawing

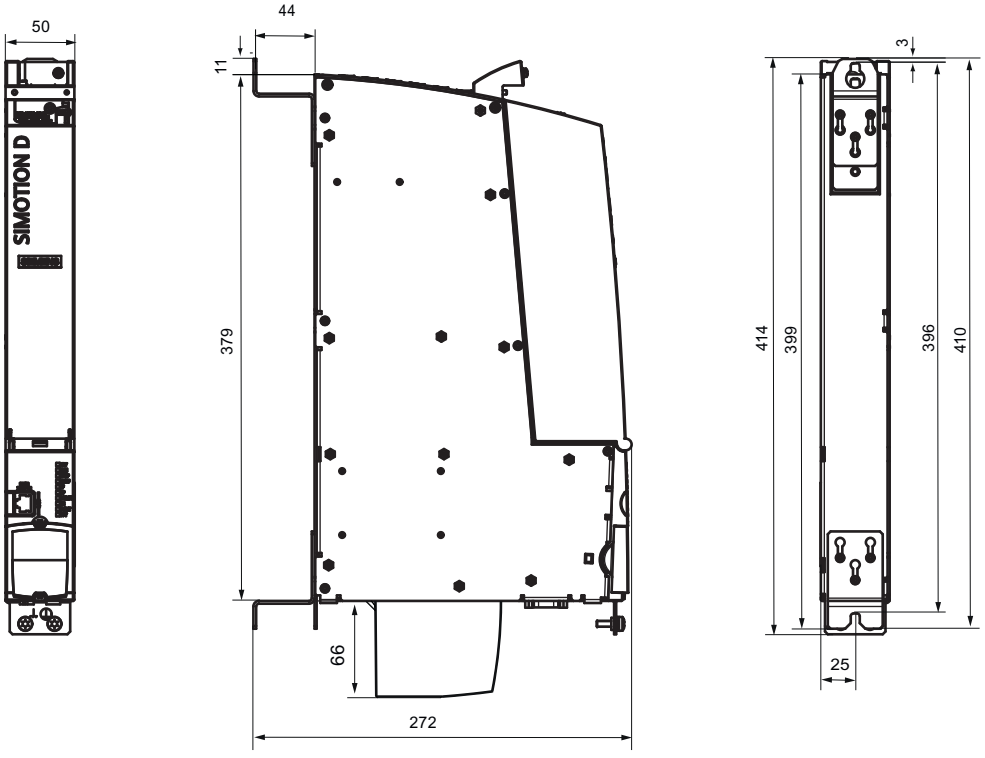

Figure 10-253 D425-2 and D435-2 dimension drawing (dimensions in mm)

SIMOTION D425-2 DP, D425-2 DP/PN, D435-2 DP and D435-2 DP/PN must always be operated with a double fan/battery module.

NOTICE
Higher operating temperature if ventilation clearances are too small
The 80 mm clearances above and below the components must be observed.
The unit protects itself from overheating by shutting down.
The ventilation clearance is measured from the lower edge of the module, i.e. the fan/battery module is not included in the dimension.

D445-2 DP/PN and D455-2 DP/PN dimension drawing

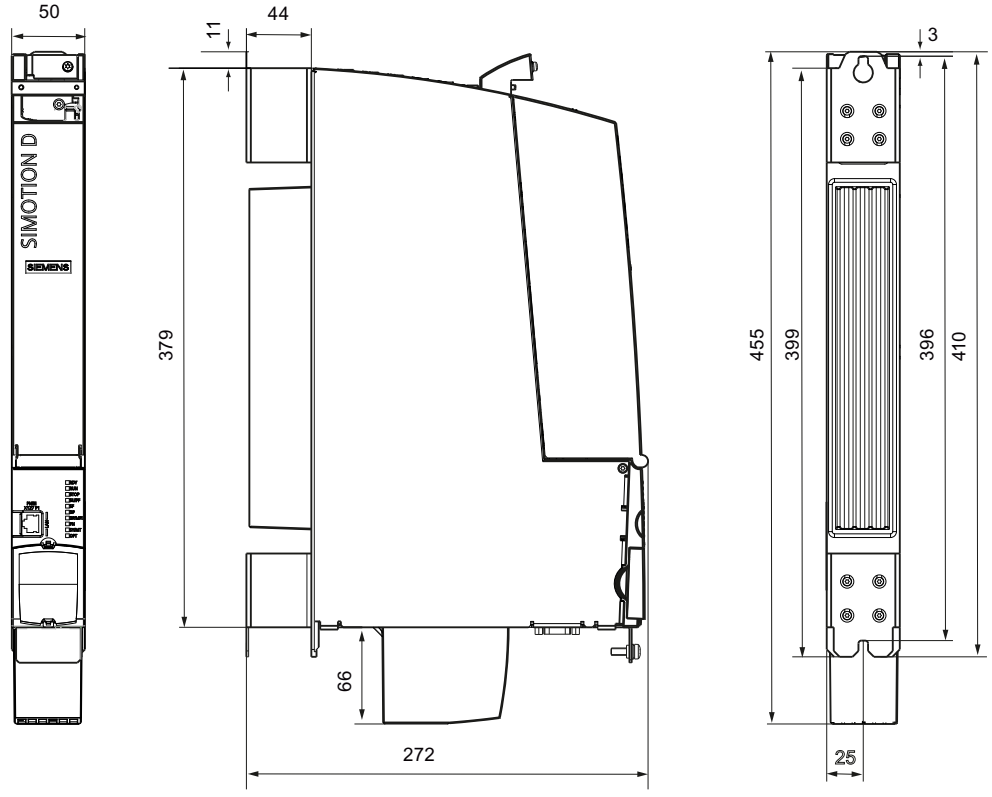

Figure 10-254 D445-2 DP/PN and D455-2 DP/PN dimension drawing (dimensions in mm)

SIMOTION D445-2 DP/PN and D455-2 DP/PN must always be operated with a double fan / battery module.

NOTICE
Higher operating temperature if ventilation clearances are too small
The 80 mm clearances above and below the components must be observed.
The unit protects itself from overheating by shutting down.
The ventilation clearance is measured from the lower edge of the module, i.e. the fan/battery module is not included in the dimension.

CAD data, dimension drawings, and circuit-diagram macros

Dimension drawings and CAD data

Dimension drawings, as well as 2D and 3D CAD data can be found:

- In the CAD Creator (https://support.industry.siemens.com/cs/ww/en/view/30559271)
- In the DT Configurator (http://www.siemens.com/dt-configurator) of the Industry Mall
- Via CAx Download Manager (https://support.industry.siemens.com/my/ww/en/CAxOnline#CAxOnline))

Circuit-diagram macros

EPLAN circuit-diagram macros are available for SIMOTION D. The macros assist you when creating circuit diagrams.

The EPLAN circuit diagram macros can be ordered at the following Internet addresses:

- Drive Technology Configurator (http://www.siemens.com/dt-configurator)
- CAx Download Manager (https://support.industry.siemens.com/my/ww/en/CAxOnline#CAxOnline))
- Product support (https://support.industry.siemens.com/cs/ww/en/view/31622426)

Macros (https://support.industry.siemens.com/cs/ww/en/view/31622426)

10.2.1.7 Supplementary system components

Connection options overview

Supplementary system components

The following figure shows the connection of the supplementary system components. The connection is:

- Directly on the SIMOTION D module (fan/battery module)
- Via the option slot (TB30, CBE30-2)
- Via the DRIVE-CLiQ interfaces (Terminal Modules, Control Unit Adapter, ...).

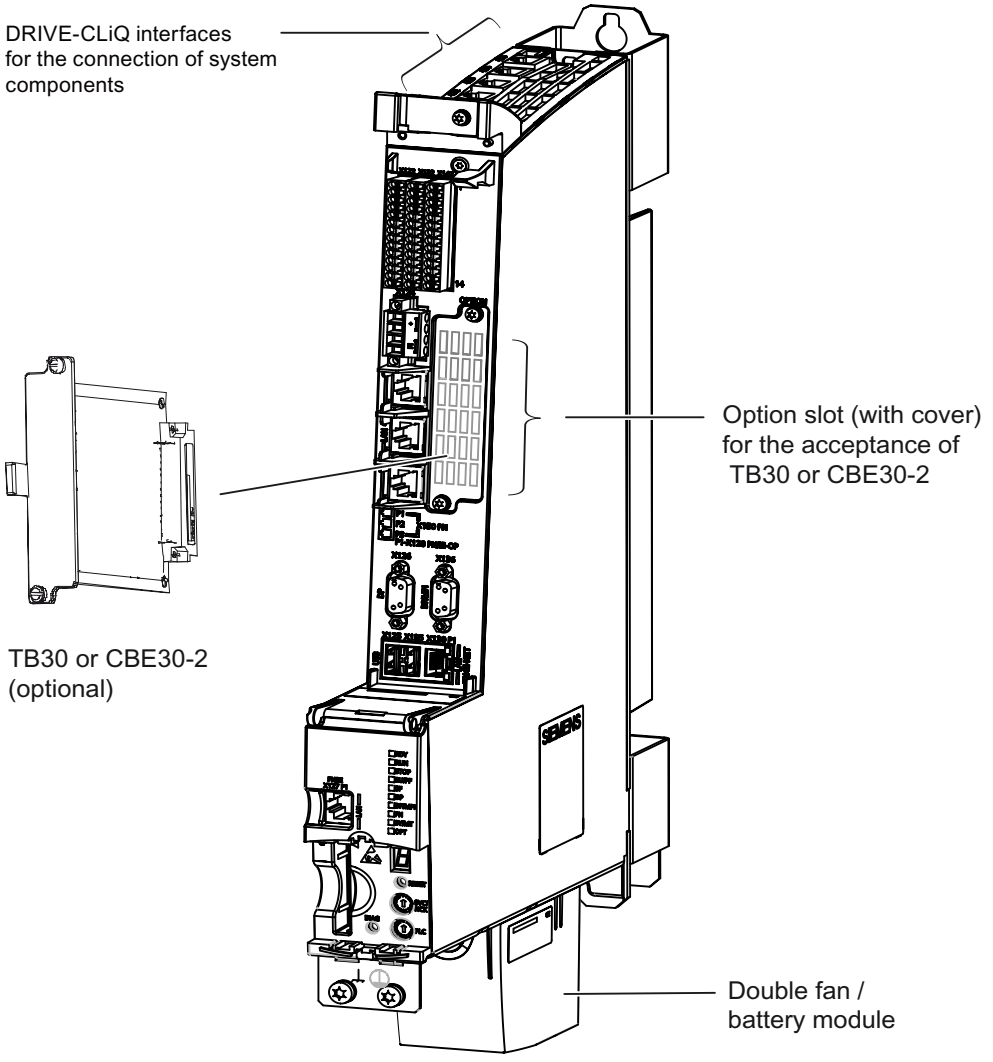

Figure 10-255 Connection of supplementary system components on the D4x5-2

Table 10-189 Applicable option modules

Module	Article number	D4x5-2 DP	D4x5-2 DP/PN
TB30	6SL3055-0AA00-2TA0	Yes	Yes
CBE30-2	6FC5312-0FA00-2AA0	No	Yes (as of V4.3)
CBE30	6FC5312-0FA00-0AA0	No	No

Fan/battery module

Cooling the SIMOTION D4x5-2 and backing up the real-time clock

Functions of a fan/battery module

The fan/battery module has the following tasks:

- CPU cooling
- Backing up the real-time clock if the SuperCap is insufficient.

The Control Unit monitors the temperature and the functioning of the fan.

Cooling the SIMOTION D4x5-2

A fan/battery module is always required for cooling the SIMOTION D4x5-2 Control Unit.

Table 10-190 Fan/battery module for SIMOTION D4x5-2

Property	SIMOTION D425-2 DP SIMOTION D435-2 DP/PN	SIMOTION D435-2 DP SIMOTION D435-2 DP/PN	SIMOTION D445-2 DP/PN SIMOTION D455-2 DP/PN
Fan/battery module	Always required (double fan/battery module included in the scope of supply)		
Usable fan/battery modules	Double fan / battery module, 6FC5348-0AA02-0AA0		
Max. permissible supply air temperature	55° C		
Fan control	Temperature-controlled fan unit will be switched on depending on supply air temperature and CPU load		

The double fan/battery module guarantees sufficient cooling even with just one functional fan.

Note

Use of the fan/battery module **with one fan** (Article No. 6FC5348-0AA01-0AA0) on the D4x5-2 is **not** possible.

An entry is made in the diagnostic buffer when a fan fault occurs (failure of one or both fans in the double fan/battery module). The fan failure is also signaled by the generation of an event in the PeripheralFaultTask and via a system variable.

If only one of the fans fails, the remaining fan continues under full load.

If both fans fail or with overtemperature, the controller switches to the RESET state, whereby the SF LED flashes red/yellow (2 Hz) and the 7-segment display shows the state "8".

Fan faults are detected if through

- A cyclic fan test
- Or when the fan is switched on

a malfunction is detected (fan does not turn or fan turns at too low a speed).

Cooling clearance

NOTICE
Higher operating temperature if ventilation clearances are too small
The ventilation clearances of 80 mm above and below the components must be observed.
The unit protects itself from overheating by shutting down.
The ventilation clearance is measured from the lower edge of the module, i.e. the fan/battery module is not included in the dimension.

Buffering data

For the retentive storage of process variables, the SIMOTION D4x5-2 has an NVRAM memory that permanently backs up the data against a power failure.
The real-time clock is backed up by a SuperCap and continues to run when there is a power failure. This backup is for at least 4 days.
If this backup time is not sufficient, the real-time clock can be backed up by a battery that is inserted in the fan/battery module. The battery is already included in the scope of delivery of fan/battery modules.

Note

The backup time when a battery is used is at least 3 years. For the replacement part case, you should back up the NVRAM data additionally on the CF card via the application ("_savePersistentMemoryData").

Battery

A 3 V lithium battery can be inserted in the fan/battery module. The battery is pre-assembled with an approximately 4 cm long cable with plug connector. The matching mating connector is attached to a small printed circuit board for connection in the fan/battery module.

Available spare parts and accessories (Page 7702)

Replace battery in the fan/battery module

Installing the fan/battery module

Overview

The procedure for installing the double fan/battery module is described below.

Procedure

There are cutouts on the lower side of the control unit to attach the module. Proceed as follows to install the double fan/battery module:

1. If required, insert a battery in the double fan/battery module.
2. Hold the double fan/battery module at an angle to the front with the open side facing up. The battery must be visible.
3. Push the plastic lug into the slot-like cutout on the lower side of the control unit.
4. Tilt the double fan/battery module up until the two latches snap into place at the front. Note the two contact strips that are lead through cutouts of the control unit.
   This establishes the electrical connection between the double fan/battery module and the control unit.

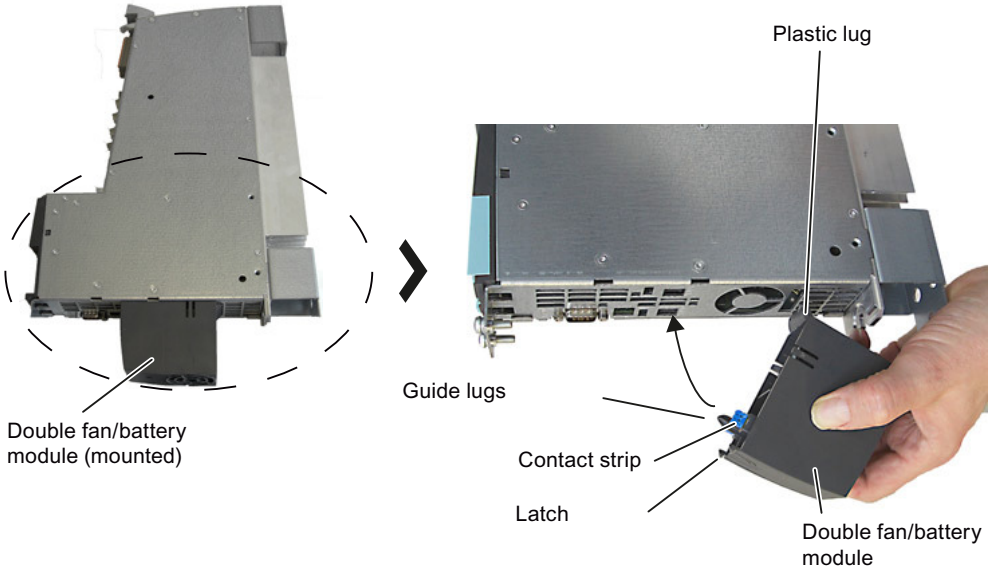

Figure 10-256 Installing the double fan/battery module

TB30 terminal board

Description

The TB30 terminal board is a terminal expansion module for SIMOTION D4x5-2. The module is inserted in the option slot of the D4x5-2 control unit.

Table 10-191 Interface overview of the TB30

Type	Quantity
Digital inputs	4
Digital outputs	4
Analog inputs	2
Analog outputs	2

Safety information for the TB30

NOTICE
Damage to the TB30 caused by electric fields or electrostatic discharge
Option boards are ESD-sensitive components.
De-energize the SIMOTION D4x5-2 device before inserting or removing the option board. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Observe ESD guidelines; for details, see Section ESD guidelines (Page 7707).

Interfaces

Overview

The following figure shows the arrangement of the interfaces on the front of the TB30.

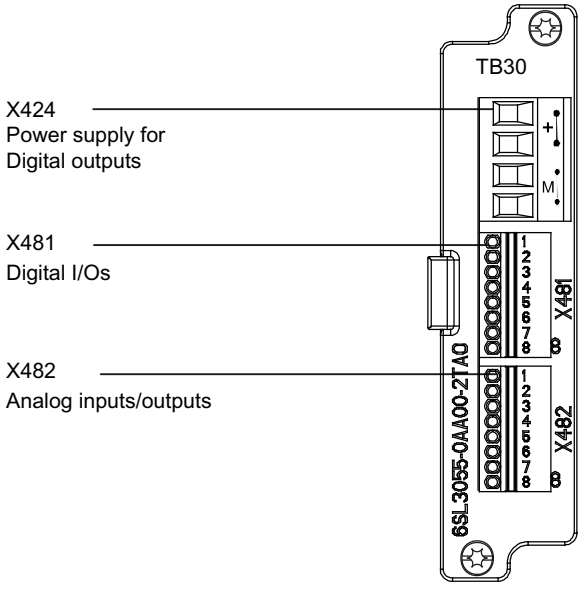

Figure 10-257 Interface arrangement on the TB30

Connection diagram

The following figure shows the schematic diagram of the TB30 as well as its connections for inputs (DI, AI), outputs (DO, AO) and power supply.

	Flexible, with wire-end ferrule with plastic sleeve	0.2 mm² ... 1.5 mm²
	AWG / kcmil	22 ... 12
Stripped length		6 ... 7 mm
Tool		Screwdriver 0.5 x 3 mm (M2.5)
Tightening torque		0.4 to 0.5 Nm (3.5 ... 4.4 lbf in)
Max. current carrying capacity, incl. loop-through		20 A (15 A per UL/CSA)
Max. cable length		10 m

Features

Two "+" terminals and two "M" terminals are available. These are jumpered in the connector. This loops through the power supply.

This power supply is only required for the digital outputs.

The option slot of the D4x5-2 control unit also provides the following power supplies:

- Electronic power supply of the TB30
- Supply of the analog inputs and outputs.

The power supply of the digital outputs and the electronic power supply of the Control Unit are isolated.

Digital I/Os

Number of cables that can be connected	1
Stripped length	8 to 9 mm
Tool	Screwdriver 0.4 x 2.0 mm
Max. cable length	30 m

Note

An open input is interpreted as approximately "0 V."

The power supply of the analog I/Os of the TB30 is via the option slot of the D4x5-2 control unit and not via X424.

The shield is connected to the Control Unit. For more information on "Establishing a shield connection", see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual, Chapter "Connecting I/Os."

NOTICE
Incorrect results of analog-to-digital conversion due to impermissible input voltage
The common mode range must not be violated.
Makes sure that the analog input voltage signals can have a maximum voltage of ±30 V with respect to the reference potential. If the range is infringed, incorrect results may occur during analog/digital conversion.

Working with analog inputs

The following reference contains more information about analog inputs:

- /IH1/ *SINAMICS S120* Commissioning Manual.
- /GH1/ *SINAMICS S120* Control Units and Additional System Components Manual

Commissioning

Information about commissioning can be found in the *SIMOTION D4x5-2*Commissioning and Hardware Installation Manual.

Technical Specifications

Power supply of digital outputs

Table 10-198 Terminal block X424

Characteristic	Value/Range
Power supply	Voltage: 24 VDC (20.4 V – 28.8 V) Current via the option slot of the D4x5-2 (without digital outputs): 0.05 A Max. power consumption: 4 A Max. power consumption per digital output: 0.5 A Power loss: < 3 W
Response time	The response time of digital inputs/outputs and analog inputs/outputs depends on the evaluation on the Control Unit (see function diagram). **References:** SINAMICS S120/S150 List Manual, Section "Function diagrams".

Digital I/Os

Table 10-199 Terminal block X481

Characteristic	Value/Range
Digital inputs	Voltage: - 3 V to 30 V Current input (typical): 10 mA at 24 VDC Ground reference: X424 (G terminal) Input delay: - L ⇒ H: Approx. 20 µs - H ⇒ L: Approx. 100 µs Level (including ripple): - High level: 15 V to 30 V - Low level: -3 V to 5 V
Digital outputs	Voltage: 24 VDC Max. load current per output: 500 mA Ground reference: X424 (M terminal) Continuous short-circuit proof Output delay: - L ⇒ H: Typically 150 µs at 0.5 A ohmic load (500 µs max.) - H ⇒ L: Typically 50 µs at 0.5 A ohmic load Switching frequency: - for resistive load: Max. 100 Hz - for inductive load: Max. 0.5 Hz - for lamp load: Max. 10 Hz Maximum lamp load: 5 W

Analog I/Os

CBE30-2 Ethernet communication board

Overview

Properties of the CBE30-2

A second PROFINET interface can be implemented for the SIMOTION D4x5-2 DP/PN with the CBE30-2 Ethernet communication board.

The CBE30-2 cannot be used with the SIMOTION D4x5-2 DP.

The CBE30-2 offers the following functions:

- PROFINET IO controller, I device (also controller and device simultaneously)
- 100 Mbps full duplex / autocrossing
- Supports real-time classes of PROFINET IO:
  - RT (real-time)
  - IRT (isochronous real-time)

The CBE30-2 has an X1400 interface with an integral 4-port switch based on PROFINET ASICs ERTEC400.

View

The connections and LED displays are located on the front of the CBE30-2.

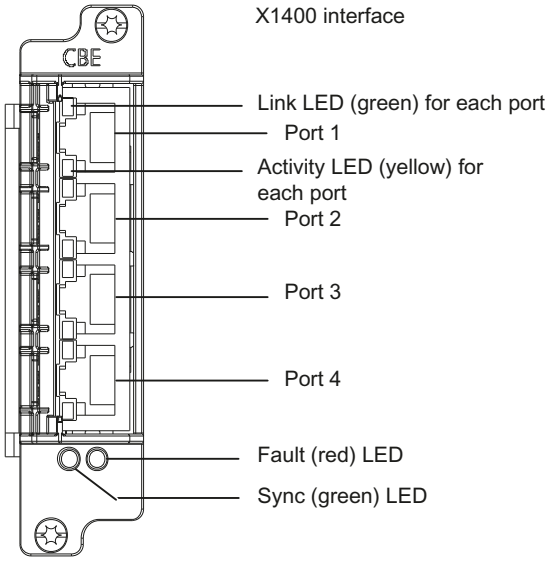

Figure 10-259 CBE30-2 front view

Type plate

Type plate

The figure below contains all the information included on the type plate.

Figure 10-260 CBE30-2 type plate

You might need to access the information provided on the type plate after mounting. Because the type plate is located on the under side of the CBE30-2, we recommend that you note the serial number before installing it.

Note

The contents of the individual type plate fields of the CBE30-2 may differ from those described in this manual (e.g. updated product status, approvals and markings not yet issued, etc.). KCC (Korea Communications Commission) for CBE30-2 is marked with a separately attached plate.

MAC address

A second plate for the MAC address of the PROFINET interfaces is attached to the top side of the board:

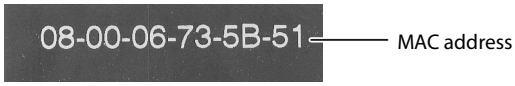

Figure 10-261 CBE30-2 MAC address

This plate is only visible when the CBE30-2 has been removed. You need the MAC address to assign an IP address.

Note

The MAC address is affixed to the top side of the CBE30-2, behind the RJ45 sockets.

Safety information

NOTICE
CBE30-2 damage caused by electric fields or electrostatic discharge
Option boards are ESD-sensitive components.
De-energize the SIMOTION D4x5-2 device before inserting or removing the option board. The SIMOTION D4x5-2 is in a de-energized state when all the LEDs are off.
Observe the ESD guidelines (see Section ESD guidelines (Page 7707)).

Interface description

Properties

The X1400 interface has full-duplex 10/100 Mbit Ethernet ports. The module has an integrated 4-port switch.

Interface characteristics

Table 10-201 X1400 features

Characteristic	Type
Connector type	RJ45 socket
Cable type	Industrial Ethernet cable
Maximum cable length	100 m
Dust protection filler plugs for sealing unused PROFINET ports	Five filler plugs contained in the D4x5-2 scope of delivery Filler plugs (50 pcs) article number: 6SL3066-4CA00-0AA0

Interface assignment

Table 10-202 X1400 interface

Representation	Pin	Name	Signal type	Description
	1	TXP	Output	Ethernet transmit differential signal
	2	TXN	Output	Ethernet transmit differential signal
	3	RXP	Input	Ethernet receive differential signal
	4	--		4 together with 5 via 75 ohm at the 1 nF capacitor to the shield ground
	5	--		4 together with 5 via 75 ohm at the 1 nF capacitor to the shield ground
	6	RXN	Input	Ethernet receive differential signal
	7	--		7 together with 8 via 75 ohm at the 1 nF capacitor to the shield ground
	8	--		7 together with 8 via 75 ohm at the 1 nF capacitor to the shield ground
	Screened backshell	M_EXT		Screen, permanently connected

Position of the ports

The interfaces are located on the front side of the CBE30-2.

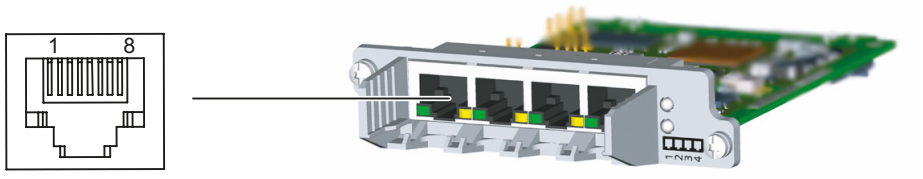

Figure 10-262 CBE30-2 interface

LED displays

Position of the LEDs

The X1400 interface with the four ports has integrated LEDs for displaying the link and the activity for each port. The front panel of the board is also fitted with two LEDs (Fault and Sync), which indicate the bus status.

Table 10-203 Meaning of the LED displays

LED	Meaning
link	... indicates whether a different device is connected to port x and a physical connection exists
Activity	... indicates whether data is being received or sent at port x
Sync	... indicates the synchronization status of the PROFINET IO interface
Fault	... indicates a fault state of the PROFINET IO interface

Additional references

Detailed information on the states of the status LEDs can be found in the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual, Section *Diagnostics*.

Certificates, approvals, declarations of conformity

You can find an overview of the certifications available for the SIMOTION CBE30-2 in Appendix A (Page 7705).

You can also find further information on the Internet at:

https://support.industry.siemens.com/cs/ww/en/ps/14513/cert

CX32-2 controller extension

Overview of CX32-2

Properties

The CX32-2 (Article No. 6AU1432-0AA00-0AA0) is a module in the SINAMICS S120 booksize format. The CX32-2 allows scaling for the drive-end computing performance of the SIMOTION D4x5-2 Control Units.

Each CX32-2 can control up to 6 additional servo, 6 vector or 12 *V/f* axes.
The Controller Extension has 6 DI, 4 DI/DO, and 4 DRIVE-CLiQ interfaces.

Note

The CX32 (Article No. 6SL3040-0NA00-0AA0) cannot be used with the D4x5-2. If an incorrect Controller Extension is used, a topology error will be signaled (F01360 Topology: Actual topology not permitted).

Drive quantity structure

Table 10-206 Drive quantity structure

Characteristic	Quantity structure
Number of CX32-2	D425-2: Max. 3 CX32-2 D435-2/D445-2/D455-2: Max. 5 CX32-2
Maximum number of drives on the SINAMICS Integrated with connected CX32-2	• 6 servo or • 6 vector or • 12 *V/f* incl. an infeed (ALM, BLM, SLM)
Maximum number of drives per CX32-2	• 6 servo or • 6 vector or • 12 *V/f* incl. an infeed (ALM, BLM, SLM)

The maximum quantity structures can be reduced depending on the configuration (for example, for connected Terminal Modules).

Note

In principle, a fourth CX32-2 can be connected to the SIMOTION D425-2 and a sixth CX32-2 connected to the SIMOTION D435-2/D445-2/D455-2.

Note however that no further drives can then be connected on the SINAMICS Integrated of the D4x5-2. Possible fields of application, for example, are modular machine concepts with a central controller.

Note

Mixed operation of servo and vector-controlled drives

Mixed operation of servo and vector-controlled drives is not possible on a CX32-2. Therefore, drives on a CX32-2 must be operated either in servo or in vector mode only. The following mixed operation is possible on a CX32-2:

- Servo and *V/f*-controlled drives
- Vector and *V/f*-controlled drives

This corresponds to the possible mixed operation on the SIMOTION D4x5-2.

V/f-controlled drives

A maximum of 12 *V/f*-controlled drives are supported by each CX32-2.

SIZER

For a detailed estimation of the drive quantity structures, we recommend that you use the SIZER configuration tool.

With SIZER, you can easily configure the SINAMICS S120 drive family including SIMOTION. It provides you with support for selecting and dimensioning the components required for a Motion Control task.

You can also determine the possible number of axes and the resulting load with SIZER in accordance with your performance requirements.

Interfaces

Overview of interfaces

Position of the interfaces

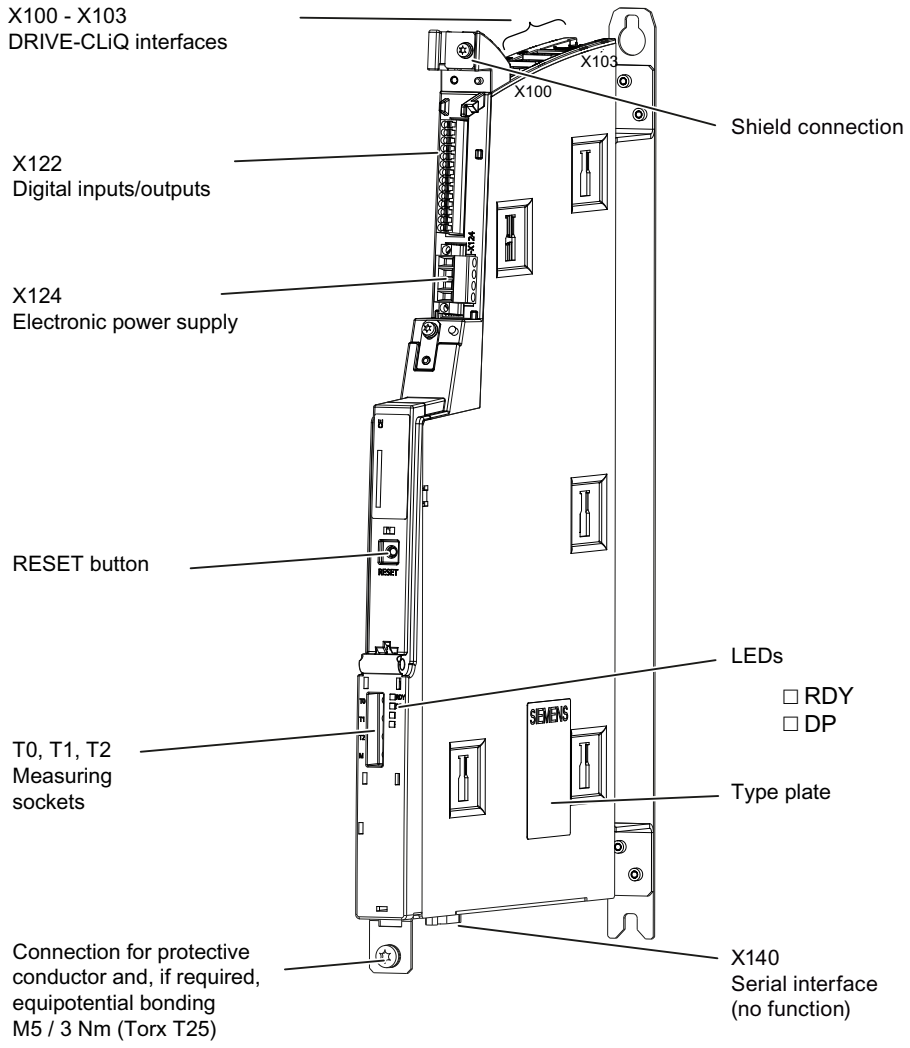

Figure 10-264 CX32-2 (without cover) with interfaces and operator control

NOTICE
Higher operating temperature if ventilation clearances are too small The 80 mm clearances above and below the components must be observed. The unit protects itself from overheating by shutting down. The ventilation clearance is measured from the lower edge of the module, i.e. the fan/battery module is not included in the dimension.

List of interfaces

The CX32-2 has the following interfaces:

- 4 DRIVE-CLiQ interfaces
- 4 digital inputs/outputs
- 6 digital inputs
- Power supply connector

Available interfaces

Table 10-207 Overview of available interfaces

Interface	Designation	Connector type
DRIVE-CLiQ interface	X100	DRIVE-CLiQ socket
DRIVE-CLiQ interface	X101	DRIVE-CLiQ socket
DRIVE-CLiQ interface	X102	DRIVE-CLiQ socket
DRIVE-CLiQ interface	X103	DRIVE-CLiQ socket
Digital inputs/outputs	X122	Mini Combicon, 3.5 mm, 1x14-pin
Power supply connector	X124	Combicon, 4-pin
Measuring sockets (T0, T1, T2, and M)	X131 - X134	Sockets

Non-usable interfaces

Table 10-208 Overview of interfaces that cannot be used for the CX32-2

Interface name	Interface	Connector type
RS232 interface	X140	9-pin Sub-D connector

DRIVE-CLiQ interface

Digital I/Os (X122)

Interface characteristics

Sensors and actuators can be connected to the X122 connector via digital inputs and outputs.

Table 10-210 X122 wiring

Features		Type
Connector type		14-way spring-loaded terminal
Number of cables that can be connected		1
Connectable cable types and conductor cross-sections		
	Rigid	0.2 mm² ... 1.5 mm²
	Flexible	0.2 mm² ... 1.5 mm²
	Flexible, with wire-end ferrule without plastic sleeve	0.25 mm² ... 1.5 mm²
	Flexible, with wire-end ferrule with plastic sleeve	0.25 mm² ... 0.75 mm²
	AWG / kcmil	24 ... 16
Stripped length		10 mm
Tool		Screwdriver 0.4 x 2.0 mm
Max. cable length		30 m
Max. current carrying capacity (ground)		6 A

Position of the connector

The X122 connection is on the front side of the CX32-2 at the top, see appropriate figure in Section Overview of interfaces (Page 7685).

Connection and circuit diagram

The following figure shows the schematic diagram and the connection of the digital I/Os on the CX32-2 and the associated external power supply.

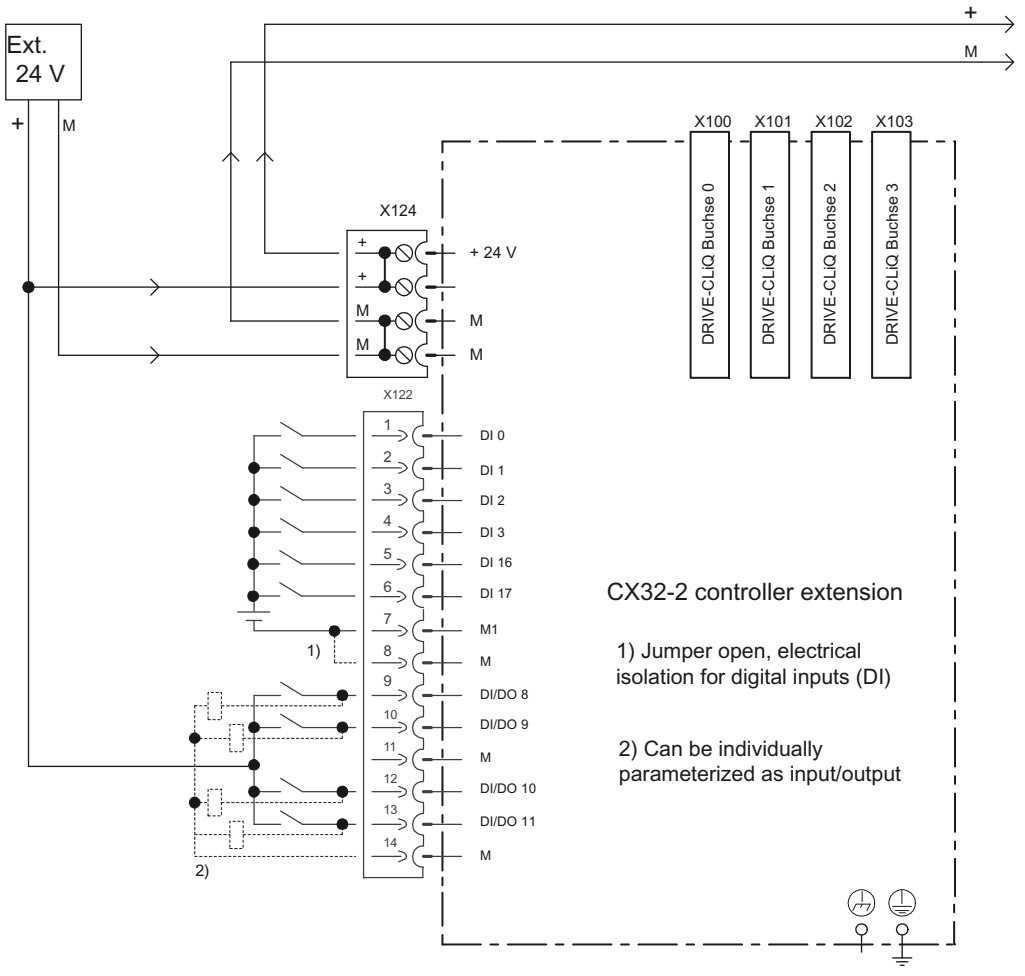

Figure 10-265 Digital I/Os connection diagram

Interface assignment of X122

Table 10-211 Digital inputs/outputs X122

Pin	Designation [1]	Signal type [2]	Notes
1	DI 0	I	Digital input 0
2	DI 1	I	Digital input 1
3	DI 2	I	Digital input 2
4	DI 3	I	Digital input 3
5	DI 16	I	Digital input 16
6	DI 17	I	Digital input 17
7	M1	GND	Ground for DI 0 – DI 3, DI 16, DI 17 (electrically isolated relative to G)
8	G	GND	Ground
9	DI/DO 8	B	Digital input/output 8 (can also be used as a measuring input input or as an input for the external zero mark)
10	DI/DO 9	B	Digital input/output 9 (can also be used as a measuring input input or as an input for the external zero mark)
11	G	GND	Ground
12	DI/DO 10	B	Digital input/output 10 (can also be used as a measuring input input or as an input for the external zero mark)
13	DI/DO 11	B	Digital input/output 11 (can also be used as a measuring input input or as an input for the external zero mark)
14	G	GND	Ground

[1] DI: Digital input; DI/DO: Bidirectional digital input/output; M: Electronics ground; M1: Ground reference

[2] B = Bidirectional; I = Input; GND = Reference potential (ground)

Note

An open input is interpreted as "Low".
Terminal G1 must be connected for the digital inputs to function. The following alternatives are available:

- Connect the incorporated ground reference of the digital input to M1
- Create the bridge between terminal M and terminal M1.
  This removes the electrical isolation for these digital inputs.

Using the digital inputs/outputs

Connecting sensors and actuators

Digital inputs and digital outputs can be used to connect various sensors and actuators to the 14-pin X122 front connector.

The following types of digital inputs/outputs are used:

- Digital inputs (DI)
- Bidirectional digital inputs/outputs (DI/DO)

Bidirectional digital I/Os can be configured individually as digital inputs or outputs.

Assignment of the I/Os to functions can be parameterized as required. Special functions (e.g. input of the measuring input) can be assigned to the I/Os.

The digital inputs/outputs on the X122 front connector can be used by either SIMOTION or SINAMICS (e.g. as enable signal for a drive).

Table 10-212 Use of the digital inputs/outputs

	DI 0-3, DI 16, DI 17 (X122)	**DI/DO 8-11 (X122)**
Galvanic isolation	Electrically isolated (ground reference M1)	Non-isolated (ground reference M)
Use as:		
• Freely addressable I/Os for SIMOTION	yes	yes
• I/Os that are assigned to the drive	yes	yes
• Measuring inputs	no	Yes (global and local measuring inputs)
• Inputs for the external zero mark	no	yes
• Cam outputs	no	no
Configuration:		
Assignment	Can be configured channel-by-channel on the drive	Can be configured channel-by-channel on the drive

Note

For optimal noise immunity of the digital inputs, the use of shielded cables is necessary in certain cases. This is necessary when the digital inputs are to be used as

- Inputs of measuring inputs or
- Inputs for the external zero mark

Additional references

For information on configuring the I/Os as freely addressable I/Os or as measuring inputs, see the *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

For information on the configuration and function of the measuring input, output cam, and cam track technology objects, see the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Power supply

Application

This interface is provided for the connection of an external power supply.

Note

When using external power supplies (e.g. SITOP), the ground potential must be connected with the protective ground terminal (PELV).

Note

Ground potential and housing (PE) are connected internally with low impedance.

Features of the interface

Table 10-213 Interface X124

Features		Type
Connector type		4-way screw-type terminal
Number of cables that can be connected		1
Connectable cable types and conductor cross-sections		
	Rigid	0.2 mm² ... 2.5 mm²
	Flexible	0.2 mm² ... 2.5 mm²
	Flexible, with wire-end ferrule without plastic sleeve	0.2 mm² ... 2.5 mm²
	Flexible, with wire-end ferrule with plastic sleeve	0.2 mm² ... 1.5 mm²
	AWG / kcmil	22 ... 12
Stripped length		6 ... 7 mm
Tool		Screwdriver 0.5 x 3 mm (M2.5)
Tightening torque		0.4 to 0.5 Nm (3.5 ... 4.4 lbf in)
Max. current carrying capacity, incl. loop-through		20 A (15 A per UL/CSA)
Max. cable length		10 m

Interface assignments

Table 10-214 Power supply X124

Pin	Signal name	Meaning
1	P24	Power supply 24 V
2	P24	Power supply 24 V
3	G	Ground
4	G	Ground

Note

The 24 V supply voltage is looped through via the 24 V connector. In this case, pin 1 is jumpered with pin 2, and pin 3 is jumpered with pin 4 in the connector. The maximum current can be limited through the current carrying capacity of the cable. The current carrying capacity of the cable depends, for example, on the type of cable installation (cable duct, laying on a cable rack, etc.)

Note

The power supply terminal strip must be screwed on tightly using a flat-bladed screwdriver.

Measuring sockets

Application

The T0, T1 and T2 measuring sockets are used to output analog signals. Any signal interconnectable via SINAMICS can be output on any measuring socket of the CX32-2.

Note

The measuring sockets should be used exclusively for servicing purposes.

The measurements may only be performed by appropriately trained specialists.

The measuring sockets are suited for multiple-spring wire connectors with a diameter of 2 mm.

Displays of the LEDs

• For signal "1"	15 ... 30 V
• For signal "0" [2]	-3 ... +5 V
Galvanic isolation	Yes, in groups of 6 [1]
Current consumption typ. at High level	3.5 mA at 24 V 9 mA at 24 V [3]
Input delay, typical (hardware)	Signal "0" → "1": 50 µs Signal "1" → "0": 150 µs

[1] The reference potential is terminal M1

[2] The digital inputs are protected against polarity reversal up to -30 V

[3] Up to and including HW version "D"

Digital inputs/outputs (parameterizable)

Table 10-223 Digital inputs/outputs on SIMOTION CX32-2

Data	SIMOTION CX32-2
Number of digital inputs/outputs	4 • Max. 4 as measuring input inputs • Max. 0 as output cam outputs
If used as an input:	
• Input voltage, rated value	24 VDC
• Input voltage, for signal "1"	15 ... 30 V
• Input voltage, for signal "0" [2]	-3 ... +5 V

Data	SIMOTION CX32-2
Galvanic isolation	No
Current consumption typ. at signal level "1"	3.5 mA at 24 V 9 mA at 24 V [3]
Input delay, typical (hardware)	Signal "0" → "1": 5 µs Signal "1" → "0": 50 µs
Measuring input input, resolution	1 µs
Measuring input input, reproducibility	5 µs
If used as an output	
• Rated load voltage, permissible range	24 VDC, 20.4 ... 28.8 V
• Galvanic isolation	No
• Current load, max.	500 mA per output
• Residual current, max.	2 mA
• Output delay time, typical/max. (hardware) [1]	Signal "0" → "1": 150 µs / 400 µs Signal "1" → "0": 75 µs / 100 µs
Switching frequency of the outputs, max.	
• With resistive load	4 kHz
• With inductive load	2 Hz
• With lamp load	11 Hz
Maximum lamp load	5 W
Short-circuit protection	Yes

1) Data for: Vcc = 24 V; load 48 Ohm; H = 90% V_{out}, L = 10% V_{out}

2) The digital inputs are protected against polarity reversal up to -30 V

3) Up to and including HW version "D"

Max. switching frequency of the DO

The max. switching frequency of the hardware depends on the load. For an ohmic load of 24 V / 0.5 A, it is up to 4 kHz (typical value; low-high ratio = 50:50; short cable lengths).
Logic control of the digital output is also a limiting factor.
If an X122 DO is controlled from the user program, no more than one edge is possible for servo cycle clock or CU sampling time of the inputs/outputs (cu.p0799[0]).
With a servo cycle clock of at least 500 µs, a max. switching frequency of 1 kHz is achieved.
The max. achievable switching frequency can also be limited by CU parameter p0799[0] (sampling time of the CU inputs/outputs) or p2048 (PROFIdrive PZD sampling time).

Certificates, approvals, declarations of conformity

You can find an overview of the certifications available for the SIMOTION CX32-2 in Appendix A (Page 7705).

You can also find further information on the Internet at:

https://support.industry.siemens.com/cs/ww/en/ps/14513/cert

CX32-2 dimension drawings

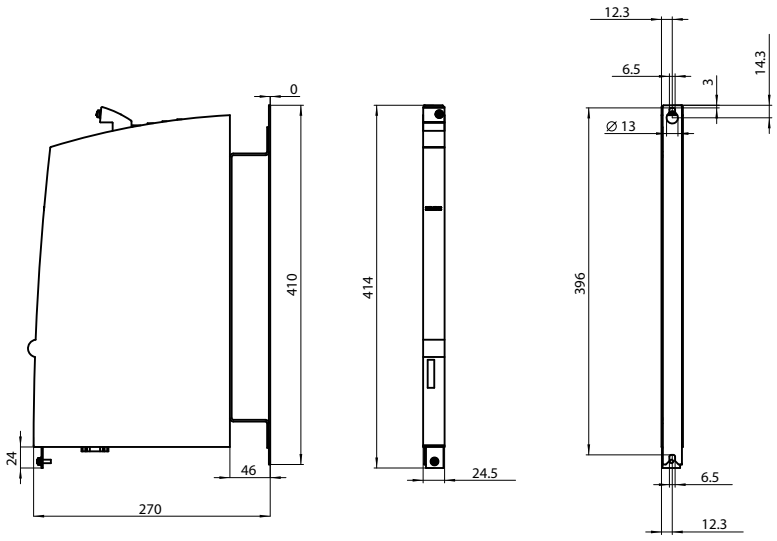

Figure 10-266 CX32-2 dimension drawings (dimensions in mm)

NOTICE
Higher operating temperature if ventilation clearances are too small
The cooling clearances of 80 mm above and below the component must be observed.

Terminal module TM31

Characteristics of the TM31

With the TM31 Terminal Module, the number of available digital inputs/digital outputs and the number of analog input/analog outputs within a drive system can be expanded. The TM31 is connected via DRIVE-CLiQ. It has 2 DRIVE-CLiQ interfaces for this.

The TM31 contains the following terminals:

Table 10-224 Interface overview

Interface	Quantity
Digital inputs	8
Bidirectional inputs/outputs	4
Relay outputs with changeover contact	2
Analog inputs	2
Analog outputs	2
Temperature sensor input (KTY84-130 or PTC)	1

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

You will find detailed information about the TM31 in the

- *SINAMICS S120 Control Units and Additional System Components* Manual
- *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Terminal module TM41

Characteristics of the TM41

With the TM41 Terminal Module, the number of available digital inputs/digital outputs and the number of analog inputs within a drive system can be expanded. In addition, the TTL output can be used for encoder emulation. The TM41 is connected via DRIVE-CLiQ.

The TM41 contains the following terminals:

Table 10-225 Interface overview

Type	Quantity
Digital inputs	4
Digital inputs/outputs	4
Analog inputs	1
TTL encoder output	1

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

You will find detailed information about the TM41 Terminal Module in the

- *SINAMICS S120 Control Units and Additional System Components* Manual
- *SIMOTION D4x5-2* Commissioning and Hardware Installation Manual.

Terminal Module TM54F

Characteristics of the TM54F

The TM54F Terminal Module is a terminal expansion module for snapping on to a DIN EN 60715 mounting rail. The TM54F offers safe digital inputs and outputs for control of Safety Integrated functions of SINAMICS.

No more than one TM54F can be assigned to each drive control (SINAMICS Integrated of a D4x5-2, CX32-2, CU320-2, etc.). Connection is via DRIVE-CLiQ. Each drive control must have its own dedicated TM54F.

TM54 is equipped with the following terminals:

Table 10-226 Interface overview

Type	Quantity
Fail-safe digital outputs (F-DO)	4
Fail-safe digital inputs (F-DI)	10
Sensor [1] power supplies, dynamic response supported [2]	2
Sensor [1] power supplies, no dynamic response	1
Digital inputs for testing the F-DO during test stop	4

[1] Sensors: Fail-safe devices for commanding and detecting, such as emergency stop pushbuttons and safety locks as well as position switches and light arrays / light curtains.

[2] Dynamic response: The sensor power supply is switched on and off during test stop for testing the sensors, the cable routing, and the evaluation electronics of TM54F.

The TM54F has 4 fail-safe digital outputs and 10 fail-safe digital inputs. A fail-safe digital output consists of a P/M-switching output as well as a digital input for reading back the switching state. A fail-safe digital input is made up of two digital inputs.

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

You will find detailed information on the TM54F Terminal Module in the following sources:

- *SINAMICS S120 Control Units and Additional System Components* Manual
- *SINAMICS S120 Safety Integrated* Function Manual

TM15 and TM17 High Feature terminal modules

Features of TM15 and TM17 High Feature

The TM15 and TM17 High Feature Terminal Modules are used to implement inputs of measuring inputs and outputs of output cams for SIMOTION D. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times. TM15 and TM17 High Feature are connected via DRIVE-CLiQ.

TM15

Each of the 24 electrically isolated digital I/Os can be parameterized channel-by-channel as a digital input (DI), digital output (DO), a measuring input input, or an output cam output.

TM15 DI/DO

Each of the 24 isolated digital I/Os can be configured on a channel-specific basis as a digital input (DI) or digital output (DO). The digital I/Os can be interconnected using BICO technology and thus used from the drive side as well. Unlike the TM15, measuring input inputs and cam outputs are not available with the TM15 DI/DO.

Note: The module hardware for TM15 and TM15 DI/DO is identical. A distinction is only made by the addition of the component in the SIMOTION SCOUT Project Navigator using "Inserting input/ output component."

TM17 High Feature (only available as spare part)

Each of the 16 digital I/Os can be parameterized channel-by-channel as a digital input (DI), digital output (DO), measuring input input, or an output cam output.

TM17 High Feature has fewer I/O channels than TM15, but more functionality. TM17 High Feature is distinguished by especially high resolution and accuracy as well as a parameterizable input filter and enabling inputs (max. 6 units). Parameterized enable inputs can enable measuring inputs or outputs of output cams (gate function). Due to their high accuracy, the digital I/O channels of the TM17 High Feature are non-isolated.

Note

NOTICE
Overheating if ventilation clearances are too small
Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component.
Maintain 50 mm ventilation clearances above and below the component.

Additional references

You will find further information on TM15 and TM17 High Feature in the

- *TM15 / TM17 High Feature Terminal Modules* Manual
- *Terminal Modules TM15 and TM17 High Feature* Commissioning Manual

CUA31/CUA32 control unit adapter

Properties of the CUA31/CUA32

You can connect Power Modules in blocksize format via DRIVE-CLiQ to the D4x5-2 Control Units using the CUA31/CUA32 adapter modules.
The CUA32 adapter module also has an additional encoder interface for an HTL, TTL, or SSI encoder.

The following Power Modules are supported:

- PM340
- PM240-2 (as of SIMOTION V4.4 / SINAMICS V4.7)

The mixed operation of a PM240-2 with booksize modules and/or PM340 blocksize modules on a CU320-2/D4x5-2/CX32-2 is possible as of SINAMICS V4.7 HF12 or SIMOTION V4.4 HF6 (SINAMICS Integrated V4.7 HF12).

Table 10-227 Number of interfaces on the adapter modules

Interface	CUA31[1)]	CUA32
DRIVE-CLiQ interface	3	3
EP terminal / temperature sensor connection	1	1
Power Module Interface (PM-IF)	1	1
24 V electronic power supply	1	1
Encoder interface (HTL, TTL, SSI) Only SSI encoders without incremental tracks may be operated.	0	1
DRIVE-CLiQ cable length, max.	100 m	100 m

1) CUA31 with article number 6SL3040-0PA00-0AAx (x ≥ 1 required)

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component. The ventilation openings must not be covered by cables.

Additional references

You will find more information on the CUA31/CUA32 Control Unit Adapter in the *SINAMICS S120 AC Drive* Manual.

DMC20 DRIVE-CLiQ hub

Properties

The DMC20 and DME20 DRIVE-CLiQ hub modules are used to implement point-to-point distribution of a DRIVE-CLiQ line. With the DMC20/DME20, an axis grouping can be expanded with four DRIVE-CLiQ sockets for additional subgroups.

- DMC20 is the hub for the control cabinet configuration
- DME20 is the hub for use without a control cabinet (IP67 degree of protection).

The modules are especially suitable for applications which require DRIVE-CLiQ nodes to be removed in groups, without interrupting the DRIVE-CLiQ line and therefore the data exchange.

Additional references

You will find detailed information about the DMC20/DME20 in the following source:

SINAMICS S120 Control Units and Supplementary System Components Manual

10.2.1.8 Spare parts/accessories

Available spare parts and accessories

Table 10-228 Spare parts and accessories

Parts for the SIMOTION D4x5-2	Article number	Accesso-ries	Spare part
CompactFlash card (CF card) 2 GB CompactFlash card (CF card) with drive software and SIMOTION Kernel (latest CF card at the time of writing)	6AU1400-2QA20-0AA0	x	
Seal for external heat dissipation (only for D445-2 DP/PN and D455-2 DP/PN)	6FC5348-0AA07-0AA0	x	
Double fan/battery module incl. battery The double fan/battery module is already included in the scope of delivery for the SIMOTION D4x5-2.	6FC5348-0AA02-0AA0		x
3 V lithium battery for fan/battery module	6FC5247-0AA18-0AA0		x
Terminal kit, contains • 3 x I/O connectors for X122/X132/X142 • 1 x 24 V connector for X124 • 5 x DRIVE-CLiQ blanking covers for X100-X105	6SL3064-2CB00-0AA0		x

Stripping tool for Industrial Ethernet / PROFINET FastConnect cables			
• IE FC Stripping Tool	6GK1901-1GA00	x	
Dust-proof filler plugs for sealing unused DRIVE-CLiQ, Ethernet, or PROFINET ports			
• Filler plugs (50 pcs)	6SL3066-4CA00-0AA0	x	

[1] Sold by the meter; max. length 1000 m; minimum order 20 m.

You can find order data information for other SINAMICS drive components, such as Line Modules, Motor Modules, DRIVE-CLiQ cables, etc. in Catalog *SIMOTION PM 21*.

Connectors and cables

The adapter plug (Article No. 6FX2003-0BB00) is required for the D4x5-2 when the bus cable has to be looped through the left-hand PROFIBUS interface (X126; two PROFIBUS cables wired to the plug) and also

- Ethernet interface X120, in the case of D4x5-2 DP or
- Port 3 of the PROFINET interface X150 in the case of D4x5-2 DP/PN

has to be wired to a FastConnect plug. When using the adapter plug, the PROFIBUS connector is higher, which creates extra wiring space.

Ethernet interfaces X120, X127 and X130 support 10, 100 and 1000 Mbps. For 1000 Mbps, 8-core cables (4x2) must be used as well as the 1000 Mbit version of the 180° FastConnect plug.

The 145° FastConnect plugs cannot be used for Ethernet interface X130 (cable outlet downward). They also only support a maximum of 100 Mbit/s.

Spares On Web

Spares On Web is an information system that displays which spare parts are available for your device.

Spares On Web (https://www.sow.siemens.com)

In order to view the spare parts, you require the article number and the serial number of the module. Both numbers can be found on the rating plate on the module or the packaging label.

Repair parts

Repair parts (e.g. front flaps, shield connection terminals) have only one material number (A5E... or GWE-...).

In Spares On Web, repair parts are only visible to repair centers.

In the case of SIMOTION D, selected repair parts can also be ordered by customers.

For additional information, see FAQ (https://support.industry.siemens.com/cs/ww/en/view/29727640).

10.2.1.9 Standards and approvals

General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

EMC limits in South Korea

KC	KC registration number: KCC-REM-S49-SIMOTION For sellers or other users, please keep in mind that this device in an A-grade electromagnetic wave device. This device is intended to be used in areas other than home. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

The EMC limits to be observed for Korea correspond to the limits of the EMC product standard for variable-speed electric drives EN 61800-3 of category C2 or the limit class A, Group 1 according to EN 55011. By implementing appropriate additional measures, the limit values according to category C2 or limit value class A, Group 1, are observed. Additional measures, such as the use of an additional RFI suppression filter (EMC filter), may be necessary.

The measures for EMC-compliant design of the system are described in detail in this manual respectively in the Installation Guideline EMC.

Note that the final statement on compliance with the standard is provided by the respective label attached to the individual unit.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (https://support.industry.siemens.com/cs/ww/en/ps/14506/cert)).

Marking for Australia and New Zealand

	SIMOTION D4x5-2 incl. CX32-2 and CBE30-2 satisfy the requirement of the standard AS/NZS CISPR 16.
or	
	Marking with RCM (Regulatory Compliance Mark) or C-Tick with older components.

Marking for the Eurasian customs union

EAC	EAC (Eurasian Conformity) Customs union of Russia, Belarus and Kazakhstan Declaration of conformity in accordance with the technical regulations of the customs union (TR CU).

Standards that are not relevant

	China Compulsory Certification SIMOTON D does not belong to the validity area of the China Compulsory Certification (CCC).

China RoHS

SIMOTION D complies with the China RoHS directive. You can find more information on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109738656).

SIMOTION D4x5-2 device-specific notes

Note regarding SIMOTION D

Note

The product standard EN 61800-3 describes the EMC requirements placed on "Variable-speed drive systems". As such, it defines different limits depending on the location of the drive system.

SINAMICS S120 power units are designed for use in the second environment. The term second environment refers to all locations outside residential areas. These are basically industrial areas which are supplied from the medium-voltage line supply via their own transformers.

The same installation instructions apply for the SIMOTION D4x5-2/CX32-2 Control Units as for the SINAMICS S120 CU320-2 Control Units with regard to EMC.

It is essential to follow the installation instructions in the SINAMICS S120 Manuals in order to ensure compliance with emitted interference and immunity values.

For further information on this topic also refer to the *SIMOTION PM 21* Catalog as well as the SINAMICS Function Manuals.

10.2.1.10 ESD guidelines

ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

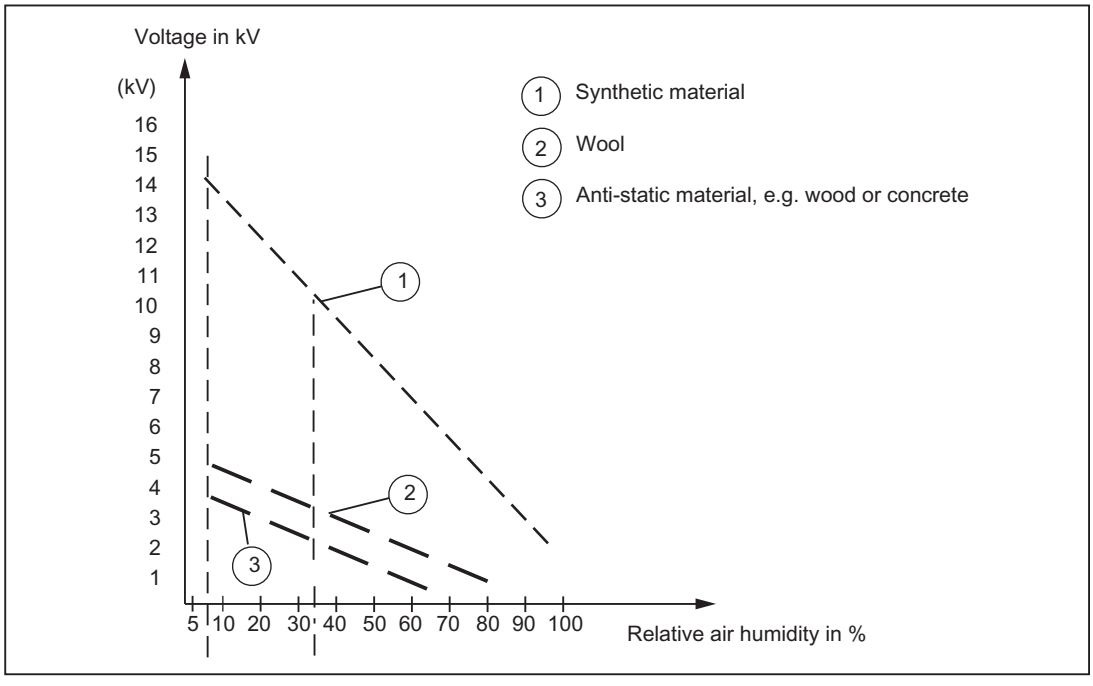

Figure 10-267 Electrostatic voltage that can accumulate on operating personnel

Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

10.2.2 SIMOTION D410-2

Preface

Contents of the Product Manual

This document is part of the **SIMOTION D** documentation package.

Scope

The SIMOTION D410-2 Manual describes the SIMOTION D410-2 DP and SIMOTION D410-2 DP/PN control units.

Note

A separate SIMOTION D410 Manual is available for the SIMOTION D410 DP and SIMOTION D410 PN control units.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Sections in this manual

The following sections describe the purpose and the use of the manual:

- Description
  This section provides information pertaining to the SIMOTION system and its integration in the information landscape.
- Operator control (hardware)
  This section describes the operator control and display elements of the SIMOTION D410-2.
- Interfaces
  This section provides information about the interfaces, their pin assignments and application options.
- Technical data
  This section describes the properties and features of the SIMOTION D410-2.
- Dimension drawings
- Spare parts / accessories
  This section provides information about accessories and spare parts for the SIMOTION D410-2.
- Appendix
  This section provides information about the various standards, approvals and EMC directives that the device complies with.
- Index to locate information

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Disposal and recycling

SIMOTION D410-2 is an environmentally friendly product! It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Identification of plastic materials in accordance with ISO 11469.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The disposal of the products described in this manual should be performed in compliance with the valid national regulations.

The products can be largely recycled owing to their low pollutant content. For environmentally friendly recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner

Further information / FAQs

You can find further information on this manual at the following FAQ:

https://support.industry.siemens.com/cs/ww/de/view/27585482

The following information sources are also available:

- SIMOTION Utilities & Applications: SIMOTION Utilities & Applications will be included in the SIMOTION SCOUT scope of delivery and, along with FAQs, also contain free utilities (e.g. calculation tools, optimization tools, etc.) as well as application examples (ready-to-apply solutions such as winders, cross cutters or handling)
- The latest SIMOTION FAQs at https://support.industry.siemens.com/cs/ww/de/ps/14505/faq
- SIMOTION SCOUT online help
- For additional documentation, see the *Overview of SIMOTION documentation* (separate document).

Open source software

Third-party software - License conditions and copyright notes

Copyright notes for the third-party software contained in this product, in particular the open source software, as well as the applicable license conditions, can be found in the READ_OSS.ZIP file on the SIMOTION D CF card or in the corresponding firmware files.

Special note for resellers

The notes and the license conditions contained in the READ_OSS.ZIP file must be passed on to the purchaser in order to avoid the reseller and purchaser from violating the license conditions.

Source code availability

Some license terms of third-party software components used in this product may require us to provide you with the source code and other information for those components. You can find this information directly on or with the product (e.g. on mass storage devices, DVD). If this is not possible for technical reasons, Siemens will be happy to send you this OSS source code in exchange for reimbursement of the processing costs. Please contact the address provided at the end of this section.

10.2.2.1 Safety instructions

Fundamental safety instructions

General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following six steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Electric shock if there is no ground connection

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply

When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage

Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Spread of fire from built-in devices

In the event of fire outbreak, the enclosures of built-in devices cannot prevent the escape of fire and smoke. This can result in serious personal injury or property damage.

- Install built-in units in a suitable metal cabinet in such a way that personnel are protected against fire and smoke, or take other appropriate measures to protect personnel.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Unexpected movement of machines caused by radio devices or mobile phones

The use of radio devices or mobile telephones in the immediate vicinity of the components can result in equipment malfunction. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- If you come closer than around 2 m to such components, switch off any radios or mobile phones.
- Use the "SIEMENS Industry Online Support app" only on equipment that has already been switched off.

⚠ WARNING

Fire due to inadequate ventilation clearances

Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position

The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

⚠ WARNING

Unrecognized dangers due to missing or illegible warning labels

Dangers might not be recognized if warning labels are missing or illegible. Unrecognized dangers may cause accidents resulting in serious injury or death.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, where necessary in the national language.
- Replace illegible warning labels.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions

Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for Safety Integrated functions

If you want to use Safety Integrated functions, you must observe the safety notices in the Safety Integrated manuals.

Malfunctions of the machine as a result of incorrect or changed parameter settings

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Specific safety information for SIMOTION D410-2

Observe the following safety information when working with SIMOTION D410-2 and its components!

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Only safety extra low voltage in accordance with EN/IEC 609501 may be connected at all connectors and terminals.

⚠ WARNING

Danger to life from unexpected movement of machines on automatic restart

An automatic restart can be programmed for SIMOTION controllers. When the power returns, the axes start automatically.

Make sure this presents no hazard to personnel or property.

NOTICE

Damage to the CompactFlash card from electrical fields or electrostatic discharge

The CompactFlash card is an ESD-sensitive component.

De-energize the SIMOTION D410-2 device before inserting or removing the CompactFlash card. The SIMOTION D410-2 is in a de-energized state when all the LEDs are OFF.

Comply with the ESD rules.

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of systems / devices. Make sure the ventilation clearances of 50 mm are provided above and below the components. The ventilation openings may not be covered by connecting cables.

10.2.2.2 Description

System overview

SIMOTION D

SIMOTION D is a drive-based version of SIMOTION based on the SINAMICS S120 drive family.

With SIMOTION D, the SIMOTION PLC and motion control functionalities as well as the SINAMICS S120 drive software run on shared control hardware.

SIMOTION D is available in two versions:

- SIMOTION D410-2 is a compact Control Unit predestined for single-axis applications.
- SIMOTION D4x5-2 is a Control Unit for multi-axis applications in the SINAMICS S120 booksize format.
  The following performance variants of the SIMOTION D4x5-2 Control Units are offered:

Control Unit	Performance variant	Range of applications
SIMOTION D425-2	BASIC performance	For up to 16 axes
SIMOTION D435-2	STANDARD performance	For up to 32 axes
SIMOTION D445-2	HIGH performance	For up to 64 axes
SIMOTION D455-2	ULTRA-HIGH performance	For up to 128 axes or applications with very short control cycles

Note

The SIMOTION D410-2 is described in this manual.

Separate manuals are available for the SIMOTION D4x5-2 and the SIMOTION D4x5 and SIMOTION D410 predecessor modules.

SIMOTION D is an integral part of the Totally Integrated Automation (TIA) concept. TIA is characterized by integrated data management, configuration, and communication for all

products and systems. Thus, an extensive toolbox of automation modules is also available for the SIMOTION D410-2.

Note

In order to cover all variants of SIMOTION D in blocksize format, the product will be referred to as "D410-2". Specific product designations will be used for information that applies only to one product version, e.g. D410-2 DP/PN.

SIMOTION D410-2

Figure 10-268 SIMOTION D410-2 DP (pictured on left), SIMOTION D410-2 DP/PN (pictured on right)

SIMOTION D410-2 is a compact Control Unit for single-axis applications.

The Control Unit is snapped directly on to the SINAMICS Power Module in blocksize format and has an integrated drive control for either one servo, one vector or one V/f axis.

SIMOTION D410-2 can be extended with additional SINAMICS S110/S120 control units (e.g. CU310-2) and so can also be used for smaller multi-axis applications (e.g. with 2 - 3 axes).

Example of a single-axis application

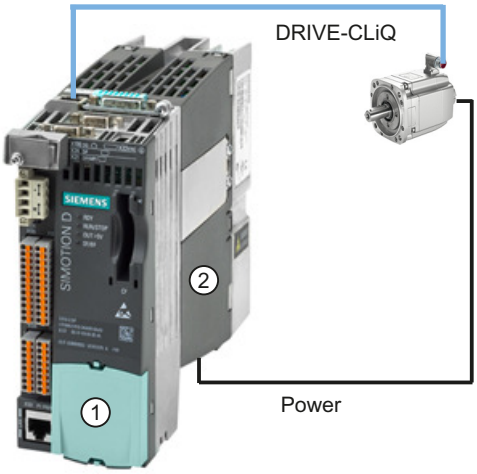

Figure 10-269 Application example with one axis

The example shows a single-axis application, consisting of a SIMOTION D410-2 (Control Unit) ① that is snapped directly on to the SINAMICS Power Module in blocksize format ②. The motors are supplied with power via the Power Module. The encoder is connected by means of DRIVE-CLiQ.

Example of a multi-axis application

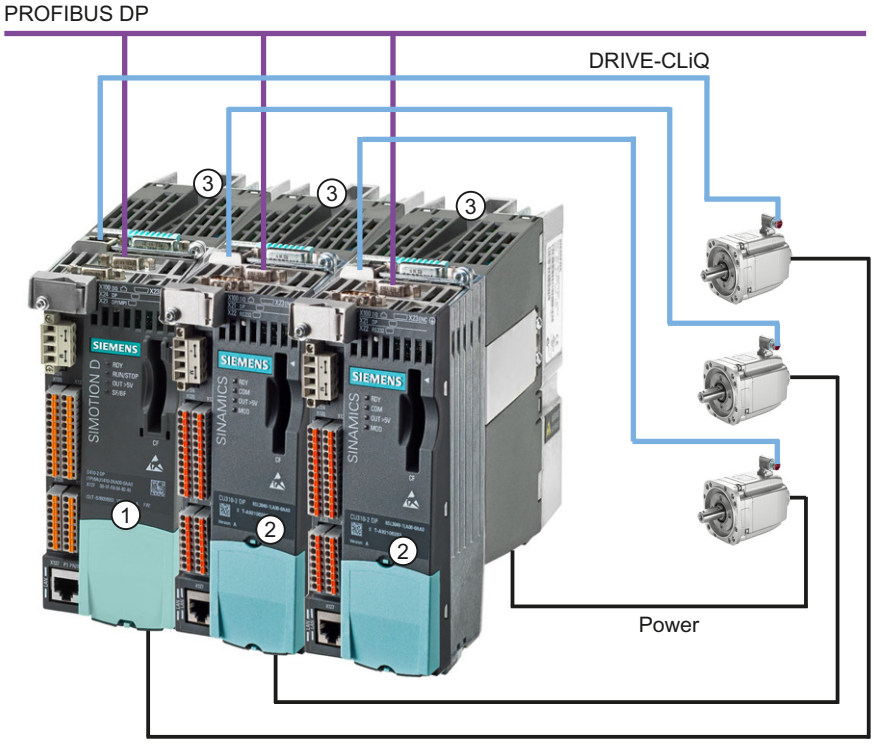

Figure 10-270 Application example with 3 axes

The example shows an application with 3 axes, consisting of:

- One SIMOTION D410-2 DP (Control Unit) ①, snapped on to the Power Module in blocksize format ③
  The SIMOTION D410-2 DP is snapped directly on to the SINAMICS Power Module. The motors are supplied with power via the Power Module. The encoder is connected by means of DRIVE-CLiQ.
- Two SINAMICS S120 CU310-2 DP ②, snapped onto a Power Module in blocksize format ③
  The Control Units are connected to the SIMOTION D410-2 DP via PROFIBUS DP. The two SINAMICS S120 CU310-2 DP are snapped directly on to the SINAMICS Power Module. The motors are supplied with power via the Power Modules. The encoders are connected by means of DRIVE-CLiQ.

Note

Path interpolation is supported as of V4.4.

Application

Combining a Power Module with SIMOTION D410-2 forms a compact single drive for machine and plant engineering.

Applications include:

- Machine concepts with central drive (e.g. presses, printing and packaging machines, etc.)
- Modular machine concepts where the machine modules were broken down into single axes
- Single drives with high accuracy, stability and concentricity requirements (compared with standard drives) in machine and industrial plant engineering
- Single drives for transport tasks (conveying, raising, lowering)
- Single drives with integrated PLC functionality and expanded motion control functionality such as output cams or cams
- Drives without power recovery (wire drawing, extruding)
- Drive connections with high availability requirements (incoming supply failure may not cause all axes to fail)
- Small multi-axis groupings (typically 2 to 3 axes) based on SINAMICS S110/120 blocksize.

Hardware components

As central hardware the SIMOTION D410-2 Control Unit is made up of the SIMOTION runtime system and the SINAMICS drive control.

A range of additional SINAMICS S120 components, such as SMx encoder systems or Terminal Modules can be connected via DRIVE-CLiQ.

With a few exceptions (e.g. no BOP20 Basic Operator Panel, etc.), the drive control integrated in SIMOTION D410-2 has the same control properties and performance features as the SINAMICS S120 CU310-2 Control Unit.

Extension of the drive computing performance

To fully utilize the motion control performance of a SIMOTION D410-2 when required, the drive-side computing performance can be extended by connecting additional SINAMICS S/G Control Units (e.g. CU305, CU310-2, CU320-2, CU250S-2, etc.) via PROFIBUS or PROFINET to the SIMOTION D410-2.

Software components

The basic functionality of SIMOTION D is supplied on a CompactFlash card containing the following:

- The SIMOTION runtime system with the following functions:
  - Freely programmable runtime system (IEC 61131)
  - Various runtime levels (tasks)
  - PLC and arithmetic functionality
  - Motion control functions
  - Communication functions
- The SINAMICS S120 drive control with the following functions:
  - Closed-loop current and torque control
  - Closed-loop speed control

System components

Overview

SIMOTION D410-2 communicates with the components of the automation landscape via the following interfaces:

- PROFIBUS DP (D410-2 DP and D410-2 DP/PN)
- PROFINET IO (D410-2 DP/PN only)
- Ethernet
- DRIVE-CLiQ (DRIVE Component Link with IQ)
- Power Module interface (PM-IF)

SIMOTION D features a SINAMICS Integrated drive element. Communication with the SINAMICS Integrated is via PROFIBUS mechanisms (DP Integrated), via PROFIdrive telegrams.

Shorter cycle times and greater numbers of addresses for each node are achieved with the "DP Integrated" compared to the "external PROFIBUS DP."

The most important components of the system and their functions are shown below.

Table 10-229 System components

Component	Function
SIMOTION D410-2	... is the central motion control module. The module contains the programmable SIMOTION runtime of SIMOTION D410-2 and the SINAMICS S120 drive runtime software. You can use the integrated high-speed I/Os (onboard I/Os) as: • User-addressable process I/Os • Homing inputs • Fail-safe digital inputs • Fail-safe digital output • Inputs for measuring inputs • Outputs for fast output cams • Analog input The measuring sockets can output any analog signals. The DRIVE-CLiQ interface permits a fast connection to the SINAMICS drive components.
System software	The basic functionality of SIMOTION D410-2 is supplied separately on a CompactFlash Card containing the following: • SIMOTION runtime (kernel) • Drive software of SINAMICS S120 The CompactFlash card is not included in the scope of delivery.
Power supply (PS)	... provides the electronic power supply for SIMOTION D410-2 (e.g. SITOP power supply).

PROFIBUS DP

SIMOTION D410-2 can communicate with the following components via the PROFIBUS DP interface.

Table 10-230 Components on PROFIBUS DP

Component	Function
Programming device (PG/PC)	... configures, assigns parameters, programs, and tests using the SIMOTION SCOUT Engineering System (ES).
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of the SIMOTION D410-2.
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.

Component	Function
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200S	Finely scalable I/O system for cabinet installation and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/IP67 degree of protection for machine-related applications with no cabinet; with features such as more compact designs, integrated PROFIsafe safety technology, PROFINET connection, and live module replacement.
SIMATIC ET 200eco	I/O system with IP65/IP67 degree of protection for machine-related applications with no cabinet, with a flexible and fast connection system in ECOFAST or M12.
Other PROFIBUS I/O	
Gateways	• DP/AS-Interface Link 20E and DP/AS-Interface Link Advanced for the PROFIBUS DP gateway to AS-Interface • DP/DP coupler for connecting two PROFIBUS DP networks
Drive interfaces	• ADI4 (Analog Drive Interface for 4 axes) for the connection of drives with analog ±10 V setpoint interface or for external encoders • IM 174 (Interface Module for 4 axes) for the connection of drives with analog ±10 V setpoint interface, external encoders or the connection of stepper drives with pulse/direction interface
Drive units with PROFIBUS DP interface (e.g. CU310-2 DP)	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors. Can also be operated as an isochronous slave on the PROFIBUS DP.
Teleservice adapter	Remote diagnostics

PROFINET IO

The SIMOTION D410-2 DP/PN can communicate with the following components via the onboard PROFINET IO interface.

Table 10-231 Components on the PROFINET IO

Component	Function
Programming device (PG/PC)	... configures, assigns parameters, programs, and tests using the SIMOTION SCOUT Engineering System (ES).
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of a Control Unit.
Other controllers (e.g. SIMOTION or SIMATIC)	... e.g. higher-level controller (plant controller); modular machine concepts with multiple controllers, distributed across individual machine modules.
Master computer	... communicates with other devices via UDP, TCP/IP.
Distributed I/O systems	
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data. With the time-based I/O, signals can be recorded or output to the precise µs.

Component	Function
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-300 packaging system.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety. With the time-based I/O, signals can be recorded or output to the precise µs.
SIMATIC ET 200S	Finely scalable I/O system for cabinet configuration and particularly time-critical applications; including motor starters, safety technology and individual grouping of load groups.
SIMATIC ET 200AL	Modular, distributed I/O system with compact I/O modules in IP65/67; simple installation in all mounting positions even in small spaces; front and transverse screw fastenings on flat surfaces or on aluminum supporting channels; flexible connection to PROFINET or PROFIBUS or simple integration in SIMATIC ET 200SP.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related applications with no cabinet; with features such as compact designs, integrated PROFIsafe safety technology, PROFINET IO connection and live module replacement.
SIMATIC ET 200eco PN	Compact block I/O with IP65/66/67 degree of protection for cabinet-free usage in machines with M12 connection method. Very rugged and resistant encapsulated metal enclosure.
Other PROFINET IO I/O devices	
Drive units with PROFINET IO interface	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors.
Gateways	• IE/AS-Interface link PN IO for the PROFINET IO gateway to AS-Interface • PN/PN coupler for connecting two PROFINET IO networks

Ethernet

The Control Unit can communicate with the following components via the Ethernet interfaces or be embedded in an automation environment:

Table 10-232 Components on the Ethernet

Component	Function
Programming device (PG/PC)	... configures, assigns parameters, programs, and tests using the SIMOTION SCOUT Engineering System (ES).
Master computer	... communicates with other devices via UDP, TCP/IP.
SIMATIC HMI device	... is used for operating and monitoring functions. This is not an essential requirement for the operation of the SIMOTION D410-2.

DRIVE-CLiQ

SIMOTION D410-2 can communicate via the DRIVE-CLiQ interface with the following components:

Table 10-233 Components on DRIVE-CLiQ

Component	Function
SINAMICS S120 AC DRIVE drive units (with CUA31/CUA32)	... convert speed setpoints into signals for controlling the motor and supply the power required to operate the motors. The Power Module is connected via CUA31/CUA32. No more than one Power Module can be connected. The chassis Power Module is connected via DRIVE-CLiQ. **Note**: Components in booksize format are not supported!
TM15, TM17 High Feature Terminal Modules	The Terminal Modules TM15 and TM17 High Feature are used to implement measuring inputs inputs and output cam outputs. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times.
TM31 Terminal Module	... enables terminal expansion via DRIVE-CLiQ (additional analog and digital I/Os).
TM41 Terminal Module	... enables terminal expansion (analog and digital I/Os) and encoder simulation via DRIVE-CLiQ. The TM41 can be connected to a real axis.
TM54F Terminal Module	... enables terminal expansion (fail-safe digital inputs/outputs) for controlling the safe motion monitoring functions of the integrated drive. A TM54F is not usually necessary because the SIMOTION D410-2 has 3 F-DI and 1 F-DO.
TM120 Terminal Module	Four temperature sensors (KTY84-130 or PTC) can be evaluated via the TM120 Terminal Module. The temperature sensor inputs are safely electrically separated from the evaluation electronics in the TM120 Temperature Module and are suitable for evaluating the temperature of special motors, e.g. 1FN linear motors and 1FW6 built-in torque motors.
TM150 Terminal Module	The TM150 Terminal Module can be used to evaluate temperature sensors (KTY, PT100, PT1000, PTC, and bimetal normally closed contact). This means, for example, that other temperatures from the process can be measured in addition to the motor temperature. Temperature sensors can be evaluated using a 2, 3 or 4-wire system. Twelve temperature sensors can be evaluated with 2-wire evaluation and six temperature sensors with 3 and 4-wire evaluation.
SMx Sensor Modules	... enable acquisition of encoder data from connected motors via DRIVE-CLiQ.
Motors with DRIVE-CLiQ interface	... allow simplified commissioning and diagnostics, as the motor and encoder type are identified automatically.
DMC20/DME20 DRIVE-CLiQ hub	... enables the number of DRIVE-CLiQ interfaces to be increased and the creation of a point-to-point topology.

Note

Please note that SIMOTION D410-2 components in booksize format (Controller Extension, Motor Modules, Line Modules, etc.) are not supported.

SIMOTION D410-2 can only be used with the following Power Modules:

- PM340
- PM240-2 as of SIMOTION V4.4/SINAMICS V4.7

Other Power Modules are not supported by SINAMICS G120 (e.g. PM230).

Note

You will find detailed information on components in the SINAMICS S110/S120 family of products in the SINAMICS S110/S120 manuals.

It is possible that older DRIVE-CLiQ components can no longer be used with SIMOTION D410-2. You will find detailed information on this in the SIMOTION D410-2 Commissioning and Hardware Installation Manual in Section "Migration of SIMOTION D410 to SIMOTION D410-2" under "Permissible combinations".

I/O integration

Note

Note that not all modules in the ET 200 I/O family are approved for SIMOTION. Moreover, system-related functional differences can come into play when these I/Os or I/O systems are used on SIMOTION vs. on SIMATIC. For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

A detailed, regularly updated list of the I/O modules approved for use with SIMOTION, as well as notes on their use, can be found at Internet address (https://support.industry.siemens.com/cs/ww/en/view/11886029)

In addition to the I/O modules enabled for SIMOTION, in principle all certified standard PROFIBUS slaves (DP-V0/DP-V1/DP-V2) and PROFINET IO devices with RT and IRT real-time classes may be connected to SIMOTION D410-2. These modules are integrated using the GSD file (PROFIBUS) or GSDML file (PROFINET) provided by the relevant device manufacturer.

Note

Please note that in isolated cases, additional boundary conditions must be fulfilled in order to integrate a module into SIMOTION. Thus, a few modules require "driver blocks" , e.g. in the form of function blocks, that permit (or simplify) integration.

For modules enabled for SIMOTION (e.g. SIMATIC S7-300 module FM 350-1, etc.), these driver blocks are part of the SIMOTION SCOUT engineering system command library.

Type plates

The following figure shows all the information that the rating plate on the module rear contains.

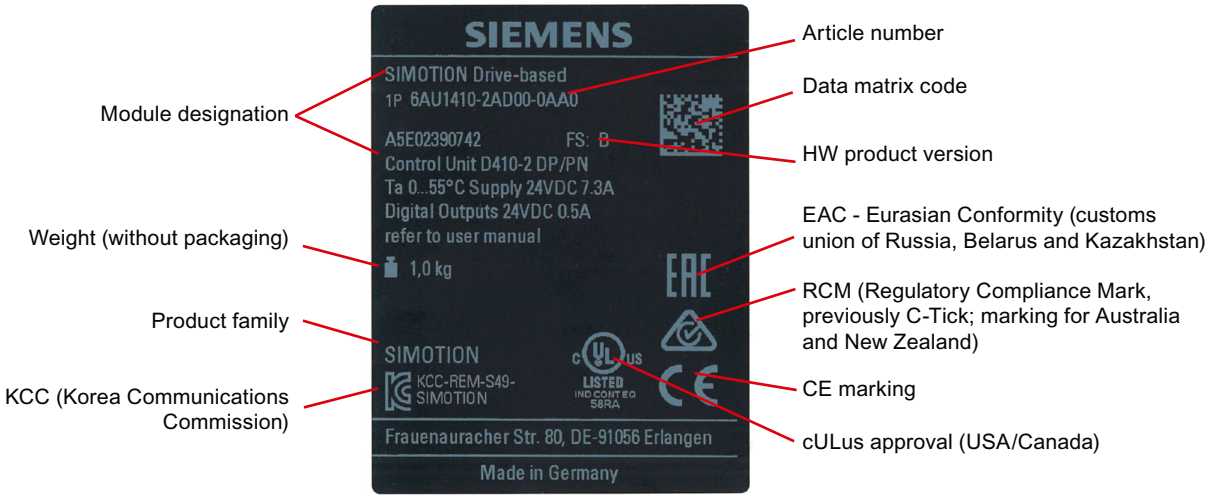

Figure 10-275 Rating plate using the SIMOTION D410-2 DP/PN as an example

Note

The information contained in each field of the rating plate on your actual Control Unit may differ from that presented in this manual (for example, a later product version, approvals and marks that have not yet been earned, etc. may be shown).

Depending on the rating plate, the HW version may be designated as "Version" or "FS" (Function State). Older components are marked with C-Tick instead of RCM.

MAC addresses

A second rating plate for the MAC address of the Ethernet interface and the PROFINET interface (D410-2 DP/PN only) is attached to the front of the device.

Figure 10-276 SIMOTION D410-2 DP/PN MAC addresses

Depending on the rating plate, the HW version may be designated as "Version" or "FS" (Function State).

Industry Online Support app

With our app, you have access to more than 300,000 documents.

Scan the data matrix code and display all the technical information on this product incl. graphic data (CAx data).

Link to the app: https://support.industry.siemens.com/sc/en/en/sc/2067

CompactFlash card

Properties

The CF card is mandatory for operation of the SIMOTION D410-2. The CF card must be ordered as a separate component; it is not included in the SIMOTION D410-2 scope of delivery.

The SIMOTION Kernel (SIMOTION D410-2 firmware) and the software used to control the drives (SINAMICS firmware) are contained on the CF card.

The CF card is used for:

- Backing up the technology packages and user data (programs, configuration data, parameter assignments)
- Update (e.g. SIMOTION firmware update)

The licenses for the technology functions are linked to the serial number of the CF card. This means the CF card can be inserted in different SIMOTION D410-2s without having to change the licenses.

The CF card is supplied in a bootable format with the latest SIMOTION Kernel and drive software.

CF card

Different CF cards are available for SIMOTION D410-2.

- 2 GB CF, article number 6AU1400-1QA20-0AA0
- 1 GB CF, article number 6AU1400-1PA23-0AA0
- 1 GB CF, article number 6AU1400-1PA22-0AA0

You will find detailed information on the compatibility relationships for the CF card, boot loader version, SIMOTION D hardware and SIMOTION firmware version in the software compatibility list.

This list can be found on the Internet at (https://support.industry.siemens.com/cs/ww/en/view/18857317).

CF card rating plate

The following figure shows you all the information included on the rating plate of the CompactFlash card (CF card).

Figure 10-277 CompactFlash card (example for 2 GB CF card)

Pre-installed runtime licenses

The pre-installed licenses are provided as Z option on the label below the article number.

Example with Z option for D410-2 MultiAxes package + two TControl licenses:
6AU1400-1QA20-0AA0-Z
Z=M41+T02

A maximum of seven different Z options are printed on the rating plate of the CF card. When there are more than seven different Z options, the text "Z = see delivery order" is printed on the CF card in place of the Z option.

Available Z options / licenses

The following Z options are available for SIMOTION D410-2:

Table 10-234 Z options / licenses available for the SIMOTION D410-2

Designation	Z option / license	Example
TControl temperature control	Txx - TControl license and number	T03 = three TControl licenses
SIMOTION IT	J00 - SIMOTION IT Virtual Machine license for Java applications	J00
Safety functions	Fxx - SINAMICS Safety Integrated Extended Functions license, specification of the number Lxx - SINAMICS Safety Integrated Advanced Functions license, specification of the number The Safety Integrated Advanced Functions also include the Safety Integrated Extended Functions.	F01 = one license for one drive with Safety Integrated Extended Functions L01 = one license for one drive with Safety Integrated Advanced Functions
High output frequency	H00 - SINAMICS high output frequency for SIMOTION D license	H00
Axis licenses	• Pxx - POS license and number • Gxx - GEAR license and number • Cxx - CAM license and number	• P02 = two POS licenses • G03 = three GEAR licenses • C01 = one CAM license
MultiAxes package	M41 - MultiAxes package license for SIMOTION D410-2	
MIIF	B02 - Multipurpose Information Interface	B02
VIBX	B03 - Vibration Extinction (vibration damping of axes)	B03
OACAMGEN	B04 - Cam generation Motion profiles for servo presses	B04
LECo	B07 - Learning Error Compensation Compensation of cyclic errors from the production process	B07

Note

Path interpolation is supported as of V4.4.

SINAMICS licenses

Selected SINAMICS licenses can be used with a SIMOTION D CF card. Only one relicensing is possible. A prelicensing of SIMOTION D CF cards via Z options is not possible with SINAMICS licenses.

Examples:

- SINAMICS S120 Advanced Position Control (APC)
  Article no. 6SL3074-0AA05-0AA0
  License for each drive (on CU, SINAMICS Integrated)
- SINAMICS S120 cogging torque compensation
  Article no. 6SL3074-0AA15-0AA0
  License for each drive (on CU, SINAMICS Integrated)
- SINAMICS Technology Extension "Vibration Extinction" (VIBX)
  Article no. 6SL3077-0AA00-5AB0
  License for a target device (CU, SINAMICS Integrated)
- SINAMICS DCB Extension
  Article no. 6SL3077-0AA00-0AB0
  License for a target device (CU, SINAMICS Integrated)

With SINAMICS licenses, underlicensing of SINAMICS Integrated is indicated by the flashing SF LED on the SIMOTION D Control Unit. An entry is also made in the diagnostic buffer and the underlicensing is displayed in the License dialog box of SIMOTION SCOUT. The licensing is performed (as for SIMOTION licenses) via SIMOTION SCOUT or via the SIMOTION license key on the CF card.

Data matrix code

SIMOTION D components (e.g. CF cards, Control Units, etc.) have a machine-readable identification in the form of a data matrix code (2D code).

Reader units that support the data matrix code according to ECC 200 are suitable for reading the code used here.

Example of a data string from the reader:
1P6AU1400-1QA20-0AA0-Z+ST-LDBN05403+30S012610D2609U2416

The volume of the information contained in the data matrix code depends on the product and, for example, on the available space.

Table 10-235 Machine-readable identification via 2D code

Characteristic	Property (example)
Article number ("1P" identifier to identify the products)	6AU1400-1QA20-0AA0-Z
Serial number ("S" identifier, item number)	T-LDBN05403
Hardware serial number (CF cards only) ("30S" identifier)	012610D2609U2416
Hardware version (identifier 2PE)	Not used in the example
Material number (identifier P)	Not used in the example

In addition to the "serial number", CF cards also have a "hardware serial number".

If licenses are purchased for licensed functions, a "license key" is generated from the hardware serial number of the CF card and the serial number of the purchased licenses; such licenses are valid only for the associated CF card.

The data required for the licensing can be read by a reader unit via the bar codes on the license certificates (Certificate of License "CoL") and the 2D code on the CF card in order, for example, to automate the licensing process.

Industry Online Support app

With our app, you have access to more than 300,000 documents.

Scan the data matrix code and display all the technical information on this product incl. graphic data (CAx data).

Link to the app: https://support.industry.siemens.com/sc/en/en/sc/2067

Licensing

SIMOTION D410-2 licensing

SIMOTION D410-2 is a compact Control Unit predestined for single-axis applications. SIMOTION D410-2 has an integrated drive control for either a servo, a vector or a V/f axis. One real axis can be used without requiring a license for a SIMOTION D410-2. Speed-controlled axes and virtual axes never require a license.

SIMOTION D410-2 can be extended with additional SINAMICS S110/S120 Control Units (e.g. CU305) and so can also be used for smaller multi-axis applications (e.g. with 2 - 3 axes). These additional axes must be licensed with the single-axis licenses or the "D410-2 MultiAxes Package". See Section CompactFlash card (Page 7735).

The POS single-axis license is available if a POS axis has to be licensed; with GEAR/CAM or more than one POS license, it is better to use the D410-2 MultiAxes Package.

Note

If you use more than one real axis with SIMOTION D410-2, you must license these additional axes. The axis license with the highest functionality is covered by the inclusive license (a real axis). The functionality has the following granularity: CAM > GEAR > POS.

Example:

You use two real axes: 1 POS, 1 CAM.
Because the CAM license has a higher value, and so inclusive, you only need to purchase one POS license.

Licenses are required for runtime functions such as SIMOTION IT Virtual Machine. These licenses can be pre-installed on a CompactFlash card (CF card) or ordered separately.

Additional references

For more information about license management, see the *SIMOTION SCOUT* Configuration Manual. General information on the subject of licensing can be found in the *SIMOTION PM 21* Catalog.

10.2.2.3 Operator control (hardware)

Overview of operator control and display elements

The following figure shows the arrangement of the operator control and display elements on the SIMOTION D410-2.

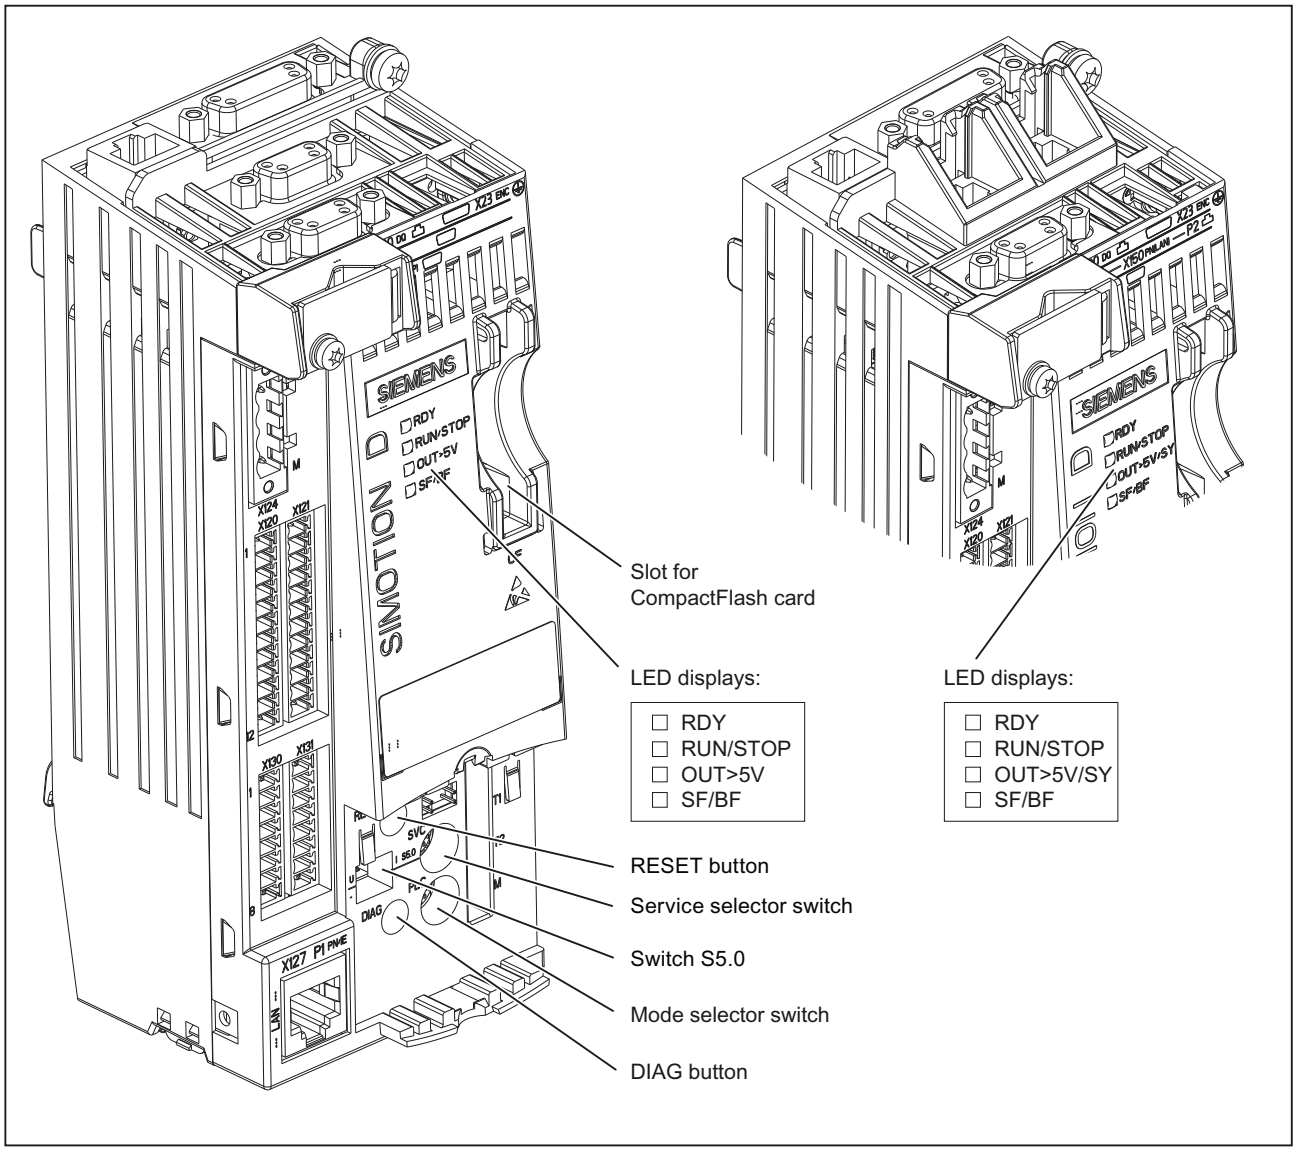

Figure 10-278 Operator control and display elements: SIMOTION D410-2 DP (on the left), SIMOTION D410-2 DP/PN (on the right)

Operator controls

Service selector switch

Layout

SIMOTION D410-2 provides a service selector switch (SVC) behind the blanking cover in the lower area of the front panel.

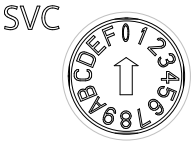

Figure 10-279 Service selector switch, switch position "0"

NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Comply with the ESD rules.

Function

The service selector switch is used to select service functions.

In "normal" operation, this switch must remain in the "0" position.

The following table shows the possible positions of the service selector switch. The service selector switch positions are explained in the order in which they are arranged on the SIMOTION D410-2. The service functions can generally be used in any set operating mode.

Table 10-236 Switch positions of the service selector switch

Position	Service mode	Meaning	
0		No service/diagnostic function activated	
1 or A → 1	Delete/restore non-volatile SIMOTION data	The non-volatile SIMOTION data of the SIMOTION D410-2 is first deleted and then restored with the contents of the PMEMORY backup file.	
		Position "1"	The data backed up with the system function _savePersistentMemoryData is preferably restored
		Position "A" → "1" (as of V4.4)	The data backed up by service selector switch position "D" / Web server / DIAG pushbutton are preferably restored
8	Web server in security level low	Switches the SIMOTION IT Web server to Security Level Low for 120 minutes. You will find detailed information in the *SIMOTION IT Diagnostics and Configuration* Diagnostics Manual.	

Position	Service mode	Meaning
B	Downgrade (Device Update Tool)	SIMOTION D410-2 Control Units and projects can be upgraded using upgrade data created previously. These upgrade data is generated with the Device Update Tool ("Project > Start Device Update Tool" menu in SIMOTION SCOUT). If the upgrade process fails to bring about the desired result, the upgrade can be rejected by means of the switch position. This will roll the system back to the previous configuration.
D	Backup of diagnostic data and non-volatile SIMOTION data	The diagnostic data and non-volatile SIMOTION data can be backed up in STOP, STOPU, and RUN state. The advantage of backing up in RUN state is the availability of enhanced diagnostic information (via HTML pages) and TO alarm information.

Note

Alternatively, diagnostic data and non-volatile SIMOTION data can also be backed up via the DIAG button. See Section DIAG button (Page 7744).

Mode selector switch

Layout

SIMOTION D410-2 provides a mode switch (PLC) behind the blanking cover in the lower area of the front panel.

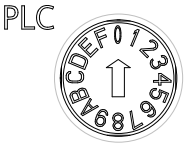

Figure 10-280 Mode switch, switch position "0"

NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Comply with the ESD rules.

Function

The following table contains the possible mode switch positions and the associated operating mode.

Table 10-237 Mode switch positions

Position	Operating mode	Meaning
0	RUN	SIMOTION D410-2 executes the user program and the associated system services: • Read process image of inputs. • Execution of the user programs assigned to the execution system. • Write process image of outputs. The technology packages are active in this state. They can execute commands from the user program.
1	STOPU	SIMOTION D410-2 does not execute any user program. • The technology packages are active. Test and commissioning functions can be executed. The user program is not active. • The I/O modules are in a secure state, i.e. the digital outputs have the status "LOW" and the analog outputs are at zero current/voltage.
2	STOP	SIMOTION D410-2 does not execute any user program. • It is possible to load a complete user program. • All system services (communications, etc.) are active. • The I/O modules are in a secure state, i.e. the digital outputs have the status "LOW" and the analog outputs are at zero current/voltage. • The technology packages are inactive, i.e. all enables are deleted. No axis motions can be executed.
3	MRES	Module memory reset / reset the SIMOTION D410-2 to the default settings. Using the MRES switch position, you can perform depending on the operating sequence • Memory reset of the SIMOTION D410-2 or • Restore the SIMOTION D410-2 to the default settings. For additional details on the operating sequence, see the *SIMOTION D410-2* Commissioning and Hardware Installation Manual.

Note

In the "RUN" setting, you can also control the SIMOTION D410-2 operating mode from the SIMOTION SCOUT engineering system. This means that it is not necessary to adjust the mode switch to change the operating mode.

Additional references

Detailed information

- For information on setting the operating modes, see the *SIMOTION SCOUT* Configuration Manual.
- For device upgrade (device update tool), see *Upgrading SIMOTION Devices* Operating Instructions.

DIAG button

Layout

The DIAG button is located on the SIMOTION D410-2 behind the blanking cover on the front.

Figure 10-281 DIAG button

Function

The diagnostic data and non-volatile SIMOTION data is backed up on the CompactFlash card via the DIAG button. The DIAG button function therefore corresponds to the function of switch position "D" of the Service selection switch.

The following options are available to backup the diagnostic data and the non-volatile SIMOTION data:

- Backup during operation (in STOP/STOPU/RUN operating state)
  A short pressing of the DIAG button suffices to initiate the backup of the data. The DIAG button is therefore preferable to switch position "D" of the Service selection switch.
- Backup during the module startup
  The DIAG button must be kept pressed until the boot process has completed. Since this can take between 20 and 30 seconds, the switch position "D" of the Service selector switch is preferable in this case.

Additional references

For detailed information on creating diagnostic data and backing up / restoring non-volatile SIMOTION data, refer to the *SIMOTION D410-2* Commissioning and Hardware Installation Manual.

RESET button

Layout

The RESET button is located behind the blanking cover on the SIMOTION D410-2.

Figure 10-282 RESET button

Function

The entire system is reset when the RESET button is pressed and a new power-up of the system forced.

Switch S5.0

Layout

SIMOTION D410-2 provides the S5.0 switch behind the blanking cover in the lower area of the front panel.

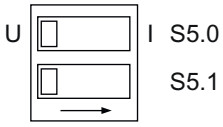

Figure 10-283 Switch S5.0

Function

The DIP switch is used for switching the analog input (X131 connector) as voltage or current input.

Table 10-238 S5.0 switch positions

Position	Function
U	The analog input is used as voltage input.
I	The analog input is used as current input.

See also

Interface assignment (Page 7759)

SIMOTION CompactFlash card

Function

The SIMOTION Kernel (SIMOTION D410-2 firmware) and the software used to control the drives (SINAMICS firmware) are contained on the CF card.

The CompactFlash card (CF card) is used to

- Backup technology packages and user data
- Update (e.g. SIMOTION firmware update)

Slot for CompactFlash card

The CF card is inserted into the plug-in module over the blanking cover (see Overview of operator control and display elements (Page 7740)).

NOTICE
Impermissible use of the CompactFlash card
The CF card of the SIMOTION D410-2 must not be used in a SIMOTION D410, D4x5 or D4x5-2!

NOTICE
Elektrostatisch gefährdete Bauelemente
The CompactFlash card is an ESD-sensitive component.
De-energize the SIMOTION D410-2 device before inserting or removing the CompactFlash card. The SIMOTION D410-2 is in a de-energized state when all the LEDs are OFF.
Comply with the ESD rules.

Additional information

For more information on writing and formatting the CF card, see the *SIMOTION D410-2* Commissioning Manual.

Error and status displays

Arrangement of LED displays

The LED displays are located next to the CompactFlash card plug-in slot on the SIMOTION D410-2.

Figure 10-284 LED displays: D410-2 DP (on the left), D410-2 DP/PN (on the right)

Meaning of the LED displays

This table describes the LEDs and their meaning.

Table 10-239 Error and status displays

LED		Meaning
D410-2 DP	**D410-2 DP/PN**	
RDY	RDY	Status indicator of the SINAMICS Integrated
RUN/STOP	RUN/STOP	SIMOTION D410-2 operating states
OUT>5V	–	Encoder current supply > 5 V (TTL/HTL)
–	OUT>5V/SY	Encoder current supply > 5 V (TTL/HTL) Synchronization status (SY) of the onboard PROFINET IO interface (X150)
SF/BF:	SF/BF:	Group error / bus fault

Additional information

You can perform a detailed diagnosis with a PG/PC and the engineering system. For information about diagnostics using LED displays, refer to the *SIMOTION D410-2* Commissioning and Hardware Installation Manual, Section "Diagnostics using LED displays".

10.2.2.4 Interfaces

Overview of interfaces

This section describes the interfaces of the SIMOTION D410-2. Information on the arrangement of the interfaces on the module can be found in Sections SIMOTION D410-2 DP representation (Page 7731) and SIMOTION D410-2 DP/PN drawing (Page 7733).

Available interfaces

Table 10-240 Overview of available SIMOTION D410-2 interfaces

Interface	Type	Connector type
X100	DRIVE-CLiQ interface (DQ)	8-pin RJ45plus socket to connect DRIVE-CLiQ nodes
X21	PROFIBUS DP/MPI interface	9-pin SUB-D socket to connect to PROFIBUS DP or MPI
X24	PROFIBUS DP interface (SIMOTION D410-2 DP only)	9-pin SUB-D socket to connect to PROFIBUS DP
X150 P1, P2	PROFINET IO interface (SIMOTION D410-2 DP/PN only)	8-pin RJ45 socket to connect to PROFINET IO
X23	Encoder interface (ENC)	15-pin SUB-D socket for connecting HTL, TTL and SSI encoders
X120	Temperature sensor connection, fail-safe digital inputs	12-pin spring-loaded terminal
X121	Isolated digital inputs, fast digital I/Os	12-pin spring-loaded terminal
X130	Isolated digital input, fail-safe digital output	8-pin spring-loaded terminal
X131	Fast digital I/Os, analog input	8-pin spring-loaded terminal
X124	Power supply connection	4-pin screw-type terminal connection
X127 P1	Ethernet interface (PN/IE)	8-pin RJ45 socket for Ethernet connection (LAN)
T0, T1, T2 and G	Measuring sockets	Sockets to output analog signals
PM-IF	Power module interface	8-pin direct connector to connect to a blocksize power module

Non-usable interfaces

Table 10-241 Overview of non-usable SIMOTION D410-2 interfaces

Interface	Designation	Connector type
Interface for BOP	BOP	8-pin multipoint connector

DRIVE-CLiQ interface

Properties

DRIVE-CLiQ has the following properties:

- Automatic detection of components by the Control Unit
- Independent expansion of components possible
- Standardized interfaces to all components
- Uniform diagnostics down to the components
- Complete service down to the components
- Mechanical parts are easy to use

For the DRIVE-CLiQ interface, 24 V / 450 mA are available to connect encoders and measuring systems.

Interface characteristics

Table 10-242 Interface X100

Characteristic	Type
Connector type	DRIVE-CLiQ connector
Maximum cable length	100 m
Data rate	100 Mbits
Connector type: RJ45 socket; blanking cover for DRIVE-CLiQ interface included in the scope of delivery; blanking cover (50 pieces) Article number: 6SL3066-4CA00-0AA0)	

Interface assignment

Table 10-243 Interface assignment X100

Representation	Pin	Name	Signal type	Description
	1	TXP	O	Transmit data +
	2	TXN	O	Transmit data -
	3	RXP	I	Receive data +
	4	Reserved, do not use	-	-
	5	Reserved, do not use	-	-
	6	RXN	I	Receive data -
	7	Reserved, do not use	-	-
	8	Reserved, do not use	-	-
	A	+ (24 V)	VO	Power supply
	B	M (0 V)	VO	Electronic ground
Signal type: I = Input; O = Output; VO = Voltage Output				

Connectable devices

The following table contains the components that can communicate with SIMOTION D410-2 via the DRIVE-CLiQ interface. Note the max. number of nodes that can be connected to the DRIVE-CLiQ!

Note

Note also the topology rules of the SINAMICS S120, see *SINAMICS S120* Function Manual, Chapter "Rules for wiring with DRIVE-CLiQ".

Table 10-244 DRIVE-CLiQ connection topology

Component	Max. number of connectable nodes
Drive	Max. 1 drive from the following: • Blocksize Power Module (D410-2 directly snapped on) • Blocksize Power Module (D410-2 issued via CUA31/CUA32) • Chassis Power Module AC/AC
Motors with DRIVE-CLiQ interface, DRIVE-CLiQ encoder and SMx Sensor Modules	Max. 5 encoder systems via DRIVE-CLiQ: • Sensor Modules (SMx) for transferring an encoder signal to DRIVE-CLiQ • Encoders with DRIVE-CLiQ interface • Motors with DRIVE-CLiQ interface You require a DRIVE-CLiQ hub module (DMC20/DME20) or a CUA32 to connect more than one encoder system via DRIVE-CLiQ.
Terminal expansion modules	Max. 8 Terminal Modules (TM), of which • Up to 3 TM15, TM17 High Feature, TM41 • Up to 8 TM15 DI/DO, TM31, TM120, TM150 • Maximum one TM54F
DRIVE-CLiQ hub module 20 (DMC20/DME20)	Max. 1 DMC20 or DME20 **Note:** Because an SMx Sensor Module and a motor with a DRIVE-CLiQ interface have only one DRIVE-CLiQ interface, a DMC20/DME20 must be used with a second encoder on the DRIVE-CLiQ. If a CUA31/CUA32 is used, the DMC20/DME20 is not required. Alternatively, a second encoder can also be connected via the X23 encoder interface.

Additional information

For information on the components that can be connected via DRIVE-CLiQ (setup, connection, configuration, etc.) see

- *SINAMICS S120 Control Units and Additional System Components* Manual
- *SINAMICS S120 for AC Drives* Manual
- *SINAMICS S120* Commissioning Manual
- *SINAMICS S120 Safety Integrated* Function Manual

- *TM15/TM17 High Feature SIMOTION Terminal Modules* Commissioning Manual
- *SIMOTION Terminal Modules TM15 / TM17* Manual

PROFIBUS DP interfaces

Properties

SIMOTION D410-2 provides the following interfaces for connection on the PROFIBUS DP:

Table 10-245 SIMOTION D410-2 PROFIBUS interfaces

	D410-2 DP	D410-2 DP/PN
PROFIBUS DP/MPI interface	X21	X21
PROFIBUS DP interface	X24	–

The interfaces can be run asynchronously or isochronously, equidistant.

SIMOTION D410-2 includes master and I-slave functionality.

Interface characteristics

Table 10-246 X21 and X24 interfaces

Characteristics	Type
Connector type	9-pin sub D socket
Cable type	PROFIBUS cable
Max. cable length	100 m at 12 Mbit/s
Max. data rate	12 Mbit/s

Interface assignment X21

Table 10-247 PROFIBUS DP/MPI interface (X21)

Representation	Pin	Signal name	Signal type	Meaning
	1	-	-	Reserved, do not use
	2	M	VO	Ground to P24_SERV
	3	1RS_DP	B	RS-485 differential signal
	4	1RTS_DP	O	Request to send
	5	1M	VO	Ground to 1P5
	6	1P5	VO	5 V power supply for bus terminal, external, short-circuit proof
	7	P24_SERV	VO	24 V for teleservice, short-circuit proof, 150 mA maximum
	8	1XRS_DP	B	RS-485 differential signal
	9	-	-	Reserved, do not use

The 1P5 voltage is provided exclusively for the bus terminal.

No OLPs are permitted.

Signal type: VO = Voltage output (power supply); O = Output; B = Bidirectional

X24 interface assignment

Table 10-248 PROFIBUS DP interface X24 (SIMOTION D410-2 DP only)

Representation	Pin	Signal name	Signal type	Meaning
	1	--	--	Reserved, do not use
	2	M	VO	Ground to P24_SERV
	3	2RS_DP	B	RS-485 differential signal
	4	2RTS_DP	O	Request to send
	5	1M	VO	Ground to 1P5
	6	1P5	VO	5 V power supply for bus terminal, external, short-circuit proof
	7	P24_SERV	VO	24 V for teleservice, short-circuit proof, 150 mA maximum
	8	2XRS_DP	B	RS-485 differential signal
	9	--	--	Reserved, do not use

The 1P5 voltage is provided exclusively for the bus terminal.

No OLPs are permitted.

Signal type: VO = Voltage output (power supply); O = Output; B = Bidirectional

Connectable devices

The following devices can be connected to the PROFIBUS DP interfaces:

- PG/PC
- SIMATIC HMI devices

- SIMATIC controllers with PROFIBUS DP interface
- Distributed I/O
- Teleservice adapter
- Drive units with PROFIBUS DP interface (standard slaves)

Note

For remote diagnosis, a teleservice adapter can be connected to the PROFIBUS X21 or X24 interface. A teleservice adapter can only be connected to one of the two interfaces.

The power supply for the teleservice adapter (terminals 2 and 7) can accept current loads as high as 150 mA and is sustained short-circuit proof.

PROFINET IO interface (SIMOTION D410-2 DP/PN only)

Properties

PROFINET is an open component-based industrial communication system using Ethernet for distributed automation systems.

SIMOTION D410-2 DP/PN has a PROFINET interface with two ports (X150 P1-P2) onboard. The PROFINET interface supports operation of a SIMOTION D410-2 DP/PN as an IO controller and/or as an I device.

Interface characteristics

Table 10-249 Ports X150 P1 to P2

Characteristic	Type
Connector type	RJ45 socket connector
Cable type	PROFINET
Maximum cable length	100 m
Minimum send cycle clock	0.25 ms
Autocrossing	Yes i.e. both crossed and uncrossed cables can be used
Dust protection filler plugs for sealing unused PROFINET ports	One filler plug contained in the D410-2 scope of delivery Filler plugs (50 pcs) article number: 6SL3066-4CA00-0AA0

Interface assignment

Table 10-250 Assignment of the ports X150 P1 to P2

Representation	Pin	Name	Description
	1	TXP	Send data +
	2	TXN	Send data -
	3	RXP	Receive data +
	4	-	Reserved, do not use
	5	-	Reserved, do not use
	6	RXN	Receive data -
	7	-	Reserved, do not use
	8	-	Reserved, do not use

LED displays of the PROFINET interface

The PROFINET ports X150 P1 and P2 have two integrated LEDs each for displaying link and activity.

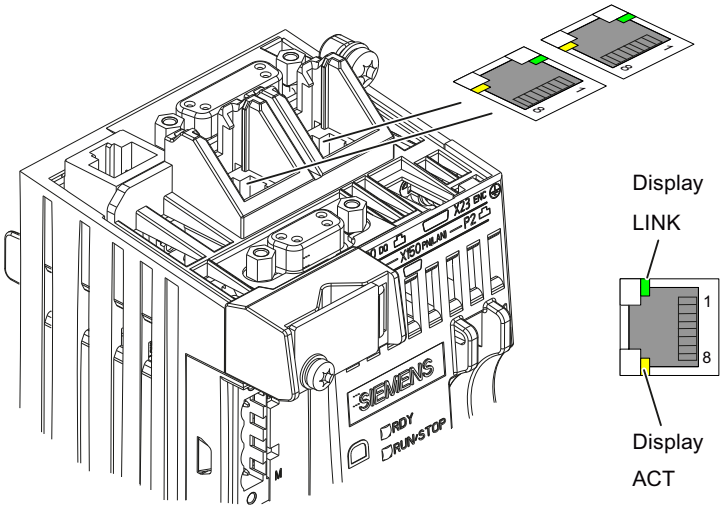

Figure 10-285 PROFINET ports of the D410-2 DP/PN

Table 10-251 State of the Link and Activity LEDs

LED	State	Meaning
LINK	OFF	No or faulty connection
	Lights up green	Transmission rate 10 or 100 Mbit/s: A different device is connected to port x and a physical connection exists
ACT	OFF	No data exchange
	Flickers yellow	Data exchange: Data is being received or sent at port x.

Connectable devices

The following devices can be connected to the PROFINET IO interface:

- PG/PC programming devices (communication with SIMOTION SCOUT / STEP 7)
- SIMATIC HMI devices
- SIMATIC controllers with PROFINET interface
- Distributed I/O
- Drive units with PROFINET IO interface (standard devices)

The SIMOTION D410-2 DP/PN then assumes the role of a PROFINET IO controller and can offer the following functions:

- PROFINET IO controller, I-device (also controller and device simultaneously)
- Supports real-time classes of PROFINET IO:
  - RT (real-time)
  - IRT (isochronous real-time)

The following functions are also supported by Industrial Ethernet:

- Communication between SIMOTION and SIMATIC NET OPC.
  The "SIMATIC NET SOFTNET S7 (S7 OPC server)" software must be installed on the PG/PC for this function.
- Communication with other devices over TCP/IP or UDP communication
- IT communication (e.g. via SIMOTION IT OPC XML-DA)
- Communication based on OPC UA (Unified Architecture)

For further information on the software packages, see the *SIMOTION PM 21* Catalog.

Encoder interface (HTL/TTL/SSI)

The HTL/TTL/SSI encoder interface is used to connect external encoders.

Interface characteristics

Table 10-252 Interface X23

Characteristic	Type
Encoder interface	• TTL or HTL incremental encoders (with adjustable parameters) • Absolute encoder SSI
Connector type	15-pin sub D connector
Measuring current via temperature sensor connection	2 mA

NOTICE
Destruction of the encoder electronics Operation of a 5 V encoder on the 24 V encoder supply may result in the destruction of its electronic components! Make sure that you can operate the connected encoder on a 24 V power supply (e.g. HTL encoder). This setting can be set in the expert list of the drive in parameter p0400 and in the following parameters.

Interface assignment

Table 10-253 Interface assignment X23

Representation	Pin	Name	Description
	1	+Temp	KTY, PT1000 or PTC input
	2	SSI_CLK	SSI clock positive
	3	SSI_XCLK	SSI clock negative
	4	P_Encoder 5 V / 24 V	Encoder power supply
	5	P_Encoder 5 V / 24 V	Encoder power supply
	6	P_Sense	Sense input encoder power supply
	7	G_Encoder (G)	Ground for sensor power supply
	8	-Temp (G)	Ground for KTY, PT1000 or PTC
	9	G_Sense (G)	Ground sense input
	10	RP	R track positive
	11	RN	R track negative
	12	BN	B track negative
	13	BP	B track positive
	14	AN_SSI_XDAT	A track negative / SSI data negative
	15	AP_SSI_DAT	A track positive / SSI data positive

For Pin 1 / Pin 8: The associated temperature channel (T1) can be assigned parameters as an individual channel or together in combination with the second temperature channel (T2) at interface X120. (For parameterization, see the *SINAMICS S120* Commissioning Manual).

For Pin 6 / Pin 9: At an encoder supply of 5 V, the voltage drops on the encoder supply cables are recorded and compensated by means of the sense cables. For this purpose, the sensor supply is corrected on the SIMOTION D410-2.

NOTICE

Motor overheating due to an incorrectly connected KTY temperature sensor

A sensor connected with the incorrect polarity cannot detect the motor overheating.

Connect the KTY temperature sensor with the correct polarity.

For more information on the temperature sensors and how to use them, see the *SINAMICS S120* Commissioning Manual, in Chapter Temperature sensors for SINAMICS components.

Note

There are two ways of connecting the temperature sensor:
1. Via X120, terminal 1 and 2
2. Via X23, pins 1 and 8

Table 10-254 Specification of measuring systems that can be connected

Parameter	Designation	Threshold	Min.	Type	Max.	Unit
Permissible signal level in the bipolar mode (parameter p0405.1=1); (TTL, SSI, HTL bipolar at X23) [1), 2)]	U_{diff}		2,0		V_{CC}	V
Permissible signal frequency	f_S		-		500	kHz
Required edge clearance	t_{min}		100		-	ns
Permissible zero pulse (with $T_s = 1/f_s$)	Length		¼ · T_s		¾ · T_s	
	Center of the pulse position		50	135	220	Degrees
Switching threshold in the unipolar mode (parameter p0405.0=0) and signals AN_SSI_XDAT, BN, RN at X23 connected to M_Encoder [3)]	$U_{(Schalt)}$	High [4)] (p0405.4=1)	8,4	10,6	13,1	V
		Low (p0405.4=0)	3,5	4,8	6,3	V
Switching threshold in the unipolar mode (parameter p0405.0=0) and signals AN_SSI_XDAT, BN, RN not connected to X23	$U_{(Schalt)}$	High [4)] (p0405.4=1)	9	11,3	13,8	V
		Low (p0405.4=0)	5,9	7,9	10,2	V

1) Other signal levels according to the RS422 specification.

2) The absolute level of the individual signals varies between 0 V and VCC of the measuring system.

3) See SINAMICS S120/S150 List Manual for setting the mode.

4) See SINAMICS S120/S150 List Manual for setting the threshold.

Note

We recommend that bipolar encoders are used

When using unipolar encoders, the unused negative track signals can either be connected or connected to ground. This results in different switching thresholds.

Note

Prefabricated cable for 5 V - TTL encoder

If a 5 V - TTL encoder (6FX encoder) is used, the connecting cable 6FX8002-2CR00-... must be used.

Digital I/Os / temperature sensor / analog input

Properties

The onboard I/Os (Onboard I/Os) of the SIMOTION D410-2 are assigned to the SINAMICS Integrated. An appropriate configuration allows the I/Os also to be used by SIMOTION.

Digital I/Os

The digital I/Os at the X120, X121 and X130, X131 connectors are provided for the connection of sensors and actuators.

Following types of digital I/Os are available on the SIMOTION D410-2:

- Three fail-safe electrically-isolated digital inputs (F-DI)
  (can be used alternatively as six standard digital inputs, DI 17 can also be used as EP terminal)
- One fail-safe electrically-isolated digital output (F-DO)
  (can be used alternatively as one standard digital output)
- Five electrically-isolated digital inputs (DI)
- Eight high-speed non-isolated digital I/Os (DI/DO)

Assignment of the I/Os to functions can be parameterized as required. Special functions (e.g. input of measuring input and output for output cam) can also be assigned to the I/Os.

Note

For optimal noise immunity of the digital inputs, the use of shielded cables is necessary if they are to be used as

- Inputs of measuring inputs or
- Inputs for equivalent zero mark

Analog input

The analog input at connector X131 can be parameterized as voltage or current input.

Switching between the voltage or current input using a DIP switch, refer to Switch S5.0 (Page 7745).

Interface characteristics

Table 10-255 Interface characteristics

Features		Type
Connector type (X120, X121)		12-pin spring-loaded terminal
Connector type (X130, X131)		8-pin spring-loaded terminal
Number of connectable conductors		1
Connectable cable types and conductor cross-sections		
	Rigid	0.2 mm² ... 1.5 mm²
	Flexible	0.2 mm² ... 1.5 mm²
	Flexible, with wire-end ferrule without plastic sleeve	0.25 mm² ... 1.5 mm²
	Flexible, with wire-end ferrule with plastic sleeve	0.25 mm² ... 0.75 mm²
	AWG / kcmil	24 ... 16
Stripped length		10 mm
Tool		Screwdriver 0.4 x 2.0 mm
Max. cable length		30 m

Note

To prevent an incorrect connection, the X120, X121, X130 and X131 connectors are supplied coded. The terminal and pin numbers are also inscribed on the connectors.

Interface assignment

The following tables contain the pin assignments of the onboard I/Os.

X120

Table 10-256 Interface assignment X120

Representation	Pin	Designation		Notes
	1	+Temp		Motor temperature sensor input. Temperature sensors: KTY84–1C130 / PT1000 / PTC Measuring current via temperature sensor connection: 2 mA
	2	-Temp		
	3	F-DI 0 [2]	DI 16	Fail-safe digital input 0 or digital inputs 16 and 17 EP function (Enable Pulses) when using Safety Integrated Basic Functions via terminal
	4		DI 17+ / EP +24 V3 (Enable Pulses)	
	5		DI 17- / EP M3 (Enable Pulses) [1]	
	6	F-DI 1 [2]	DI 18	Fail-safe digital input 1 or digital inputs 18 and 19
	7		DI 19+	
	8		DI 19- [1]	
	9	F-DI 2 [2]	DI 20	Fail-safe digital input 2 or digital inputs 20 and 21
	10		DI 21+	
	11		DI 21- [1]	
	12	M1		Reference potential for: • DI 16, DI 18 and DI 20 (or F-DI 0 to F-DI 2; first shutdown path) • DO 16+ (or F-DO 0)

[1] Reference potential for DI 17+ / DI 19+ / DI 21+ (or F-DI 0 to F-DI 2; second shutdown path)

[2] Functionality depends on the parameterized Safety Integrated functions.

The functionality of the digital inputs DI 16 to DI 21 depends on the parameterized Safety Integrated functions.

Table 10-257 Safety Integrated functions using onboard terminals

Safety Integrated functions	Relevant digital inputs	
Basic Functions	Control takes place via two switch-off signal paths:	
	1st switch-off signal path	via D410-2 terminals DI 0 ... DI 3, DI 16 (X121.1...4 and X120.3) The desired input terminal is selected via BICO interconnection (BI: p9620[0]).
	2nd switch-off signal path	via EP terminal • D410-2: X120.4 and X120.5 • Power Module Blocksize with CUA3x: X210.3 and X210.4 • Power Module Chassis: X41.1 and X41.2 on the Control Interface Module (CIM)
Extended Functions	Control takes place via the 2-channel F-DI of the SIMOTION D410-2: F-DI 0 ... F-DI 2 (X120.3...11) A fail-safe digital input is made up of two digital inputs. If SIMOTION D410-2 is mounted separately (Power Module connected to SIMOTION D410-2 via CUA31/32), use of the Safety Integrated Extended and Advanced Functions via the onboard terminals (F-DI, F-DO) is not possible.	

Note

Using the "STO" safety function via the Power Module terminals for the PM240-2 (FSD, FSE and FSF). With enabled Safety Integrated functions of the D410-2, a simultaneously active STO function via Power Module terminals results in error messages being output (e.g. fault F30600, reason 1005).

- Deactivate the function "STO via Power Module terminals" by setting both the DIP switches for the interface STO_A/STO_B to the "0" position. Further information, see SINAMICS S120 Manual for AC Drives, section Power Modules Blocksize (PM240-2)

The X120 interface has a connection for the motor temperature sensor.

You can use the temperature sensor connection to connect the temperature sensing via KTY84-1C130 (special temperature sensor) or PTC (positive temperature coefficient). The temperature sensing provides thermal motor protection by detecting critical motor conditions.

For more information on "thermal motor protection", see the *SINAMICS S120* Commissioning Manual.

NOTICE

Motor overheating due to an incorrectly connected KTY temperature sensor

A sensor connected with the incorrect polarity cannot detect the motor overheating.

Connect the KTY temperature sensor with the correct polarity.

For more information on the temperature sensors and how to use them, see the *SINAMICS S120* Commissioning Manual, Section Temperature sensors for SINAMICS components.

The maximum length of the temperature sensor cable is 300 m. The cables must be shielded. For cable lengths >100 m, cables with a cross-section of ≥1 mm² must be used.

⚠ DANGER

Danger to life from electric shock due to insufficient safety isolation

Only temperature sensors that meet the safety isolation specifications stipulated in EN 61800-5-1 may be connected to terminals "+Temp" and "-Temp".

Use a Sensor Module External (SME120 or SME125) or Terminal Module TM120 if safe electrical separation cannot be guaranteed (for linear motors or third-party motors, for example).

X121

Table 10-258 Interface assignment X121

Representation	Pin	Designation	Notes
	1	DI 0	Isolated digital input 0
	2	DI 1	Isolated digital input 1
	3	DI 2	Isolated digital input 2
	4	DI 3	Isolated digital input 3
	5	M2	Ground reference for DI 0 ... DI 3
	6	M	Ground reference of the electronics [1]
	7	DI/DO 8	High-speed digital I/O 8, not isolated
	8	DI/DO 9	High-speed digital I/O 9, not isolated
	9	M	Ground reference of the electronics [1]
	10	DI/DO 10	High-speed digital I/O 10, not isolated
	11	DI/DO 11	High-speed digital I/O 11, not isolated
	12	M	Ground reference of the electronics [1]

[1] Reference potential for the digital inputs/outputs and analog input

Note

An open input is interpreted as "low".

The use of the digital inputs (DI 0 ... DI 3) requires terminal M2 be connected. This is achieved by:

- Providing the reference ground of the digital inputs, or
- a jumper to terminal M. This removes the electrical isolation for these digital inputs.

X130

Table 10-259 X130 interface assignment

Representation	Pin	Designation		Notes
	1	DI 22+		Isolated digital input 22
	2	DI 22- [2]		Reference potential for DI 22+
	3	M2		Ground reference for DI 0 ... DI 3
	4	M		Ground reference of the electronics [1]
	5	M1		Reference potential for: • DI 16, DI 18 and DI 20 (or F-DI 0 to F-DI 2; first shutdown path) • DO 16+ (or F-DO 0)
	6	24 V1		Power supply for DO 16+ (or F-DO 0)
	7	F-DO 0 [4]	DO 16+ [3]	Fail-safe digital output 0 or digital output 16
	8		DO 16- [5]	

[1] Reference potential for the digital inputs/outputs and analog input

[2] Reference potential for DI 20+

[3] The proper functioning of the DO 16 requires that the terminals 5/6 be connected.

[4] F-DO 0 for Safety Integrated Extended and Advanced Functions

[5] For applications "without safety function", DO 16- does not function

Note

An open input is interpreted as "low".

Note

If M1 or M2 is connected with M, the electrical isolation no longer exists.

If the digital output (DO 16) cannot be set by the signal source despite being set, an alarm A03507 (digital output not set) is issued. This alarm can also parameterized as a fault.
The possible cause may be missing power supply (X130.6) or a short-circuit. For further details, see the *SINAMICS S120/S150 List Manual*, Section List of faults and alarms.

Note

If the 24 V supply is briefly interrupted, the digital output is deactivated until the interruption has been rectified.

X131

Table 10-260 X131 interface assignment

Representation	Pin	Designation	Notes
	1	DI/DO 12	High-speed digital I/O 12, not isolated
	2	DI/DO 13	High-speed digital I/O 13, not isolated
	3	M	Ground reference of the electronics [1]
	4	DI/DO 14	High-speed digital I/O 14, not isolated
	5	DI/DO 15	High-speed digital I/O 15, not isolated
	6	M	Ground reference of the electronics [1]
	7	AI 0+	Analog voltage or current input
	8	AI 0-	

[1] Reference potential for the digital inputs/outputs and analog input

NOTICE

Incorrect results of analog-to-digital conversion due to impermissible input voltage

The common mode range must not be violated.

Makes sure that the analog input voltage signals can have a maximum voltage of ±12 V with respect to the reference potential. If the range is infringed, incorrect results may occur during analog/digital conversion.

Note

A 24 V supply voltage must be connected to terminal X124 for the digital outputs to be used.

If momentary interruptions in the voltage occur in the 24 V supply, the digital outputs are deactivated until the interruption has been rectified.

If a digital output (DO 8 ... DO 15) is parameterized and the external 24 V power supply is not connected (or the level is too low), the alarm A03506 will be issued. This alarm can also be parameterized as a fault.
For further details, see the *SINAMICS S120/S150 List Manual*, Section List of faults and alarms.

SIMOTION D410-2 DP/PN connection examples (Page 7773)

Use of the interfaces

Fail-safe digital I/Os (F-DI/F-DO)

The SIMOTION D410-2 provides three fail-safe isolated digital inputs (F-DI) and one fail-safe isolated digital output (F-DO):

- An F-DI consists of a digital input and a second digital input to which the cathode of the optocoupler is connected.
  Each of the F-DIs can also be used as two standard digital inputs, e.g. the use of the F-DI 0 as DI 16 and DI 17.
- The F-DO 0 can also used as a standard digital output.
  The F-DO 0 consists of a high-side switch and a low-side switch. For applications without the safety function, the high-side switch may be used as an additional digital output. The low-side switch is not available.

Note

The following safety functions are available for SIMOTION D410-2:

- Safety Integrated Basic Functions via the EP terminals
- Safety Integrated Extended and Advanced Functions via onboard I/Os (3 F-DI and 1 F-DO)
- Safety Integrated Extended and Advanced Functions with TM54F
- Safety Integrated Basic and Extended/Advanced Functions via secure communication from "PROFIsafe on PROFIBUS"
  Control (F logic) is via a SIMATIC F-CPU which is connected to PROFIsafe via PROFIBUS (not SCOUT TIA).
- Safety Integrated Basic and Extended/Advanced Functions via secure communication from "PROFIsafe on PROFINET" (only for SIMOTION D410-2 DP/PN)
  Control (F logic) is via a SIMATIC F-CPU which is connected to PROFIsafe via PROFINET (e.g. an S7-1500 F-CPU).

For further information on Safety Integrated, see the *SINAMICS S120 Safety Integrated* Function Manual.

EP terminal

The pulse inhibit function (EP) is only available when Integrated Basic Functions are enabled.

Digital inputs (DI)

The SIMOTION D410-2 provides five digital inputs (DI).

The electrically isolated inputs can be used as freely addressable inputs.

Note

An open input is interpreted as "low".

For the DI 22 digital input to function correctly, the coupled reference potential (DI 22-) must be connected. The following options are available:

- Connect the coupled reference potential of the digital input to M1, M2 or M.
  This assigns the input to the potential of the associated pin.
- Create a bridge between terminal M and terminal M1 or M2.
  Caution: This will cancel the electrical isolation for this digital input!

Bidirectional digital I/Os (DI/DO)

The SIMOTION D410-2 provides eight bidirectional digital I/Os (DI/DO) that can be parameterized channel-specific as digital input or output.

This produces the following usage options for the parameterization of the DI/DO:

Table 10-261 DI/DO usage options

DI/DO	Interface	Use
Parameterization of the DI/DO as digital inputs:		
DI/DO 8 to DI/DO 15	X121, X131	"Fast inputs" for measuring inputs [1] or homing inputs
DI/DO 8 to DI/DO 15	X121, X131	Freely addressable inputs
Parameterization of the DI/DO as digital outputs:		
DI/DO 8 to DI/DO 15	X121, X131	"High-speed" outputs of output cams
DI/DO 8 to DI/DO 15	X121, X131	Freely addressable outputs

[1] With a signal edge at the relevant input, the current actual values of one or more encoders are measured with positioning accuracy to determine lengths and distances. The assignment of the inputs is not fixed, and the special use is activated in the SIMOTION SCOUT engineering system.

Note

An additional external electronics power supply via terminal X124 is required in two cases:

- If the digital outputs DO 8 to DO 15 are in use, the power supply needs to be connected to X124.
- The Power Module provides the electronics power supply of the SIMOTION D410-2. If the SIMOTION D410-2 needs to remain functional when the Power Module is switched off, X124 must be used for the electronics power supply.

Inductive loads

If the digital inputs are used together with inductive loads, it must be ensured that the permissible voltage range of -30 V to +30 V for digital inputs is not exceeded by the switching overvoltage of inductive loads. This is preferably achieved by using auxiliary contacts on the contactor/relay for the digital inputs.

If no auxiliary contacts are available, overvoltage protection must be used. Protective circuits with a freewheeling diode or a diode combination with a Z-diode are possible. RC elements and varistors are not suitable due to the remaining residual voltages.

Additional references

For information on configuring the digital I/Os as freely addressable I/Os, inputs of measuring inputs or outputs of output cams, see the *SIMOTION D410-2* Commissioning and Hardware Installation Manual.

For information on the configuration and function of the measuring input and output cam technology objects, refer to the *SIMOTION Output Cams and Measuring Inputs* Function Manual.

Power supply

The X124 interface is provided for connection of the external power supply.

Note

When using external power supplies (e.g. SITOP), the ground potential must be connected with the protective ground terminal (PELV).

Note

Ground potential and housing (PE) are connected internally with low impedance.

Note

The 24 V DC cable must be approved for temperatures of up to 75 °C.

The maximum permissible cable length is 10 m.

Interface characteristics

Table 10-262 Interface X124

Features		Type
Connector type		4-way screw-type terminal
Number of connectable conductors		1
Connectable cable types and conductor cross-sections		
	Rigid	0.2 mm² ... 2.5 mm²
	Flexible	0.2 mm² ... 2.5 mm²
	Flexible, with wire-end ferrule without plastic sleeve	0.2 mm² ... 2.5 mm²
	Flexible, with wire-end ferrule with plastic sleeve	0.2 mm² ... 1.5 mm²
	AWG / kcmil	22 ... 12
Stripped length		6 ... 7 mm
Tool		Screwdriver 0.5 x 3 mm (M2.5)
Tightening torque		0.4 to 0.5 Nm (3.5 ... 4.4 lbf in)
Max. current carrying capacity, incl. loop-through		20 A (15 A per UL/CSA)
Max. cable length		10 m

Interface assignments

Table 10-263 Power supply X124

Representation	Terminal	Designation
	+	Electronic power supply
	+	Electronic power supply
	G	Electronic ground
	G	Electronic ground

Note

The power supply terminal strip must be screwed on tightly using a flat-bladed screwdriver.

Note

The 24 V is looped through via the 24 V connector. In this case, pin 1 is jumpered with pin 2, and pin 3 is jumpered with pin 4 in the connector. The maximum current can be limited through the current carrying capacity of the cable. The current carrying capacity of the cable depends, for example, on the type of cable installation (cable duct, laying on a cable rack, etc.).

Disconnection of 24 V plug-in connections during operation

Observe the following safety notice when using SIMOTION D410-2:

⚠ WARNING

Personal injury and damage to property can occur

Personal injury and property damage can occur if 24 V plug-in connections are disconnected during operation. Disconnection of 24 V plug-in connections is only permitted when the power is off.

Ethernet interface

Properties

SIMOTION D410-2 has an X127 interface for connection to Industrial Ethernet.
Industrial Ethernet is a communication network with a transmission rate of 10/100 Mbit/s.

SIMOTION D410-2 offers the following functions via the Ethernet interface:

- PROFINET basic services (e.g. DCP, LLDP, SNMP)
  Although these PROFINET basic services provide uniform functions for the address assignment and diagnostics, they do not provide PROFINET IO communication for the connection of drives or I/O modules, for example.
- Communication with STEP 7 and SIMOTION SCOUT
- Communication between SIMOTION and SIMATIC NET OPC
  The "SIMATIC NET SOFTNET-S7 (S7-OPC server)" software must be installed on the PG/PC for this function.
- Connection of HMI systems
- Communication with other devices over TCP/IP or UDP communication
- IT communication (e.g. via SIMOTION IT OPC XML-DA)

For further information on the software packages, see the *SIMOTION PM 21* Catalog.

Interface characteristics

Table 10-264 X127 interface

Characteristic	Type
Connector type	RJ45 socket connector
Cable type	Industrial Ethernet cable
Maximum cable length	100 m
Autocrossing	Yes, i.e. both crossed and uncrossed cables can be used
Blanking cover for Ethernet interface included in the scope of delivery; blanking cover (50 units), article number: 6SL3066-4CA00-0AA0	

Interface assignment

Table 10-265 X127 interface assignment

Representation	Pin	Signal name	Signal type	Meaning
	1	TXP	Output	Ethernet send differential signal
	2	TXN	Output	Ethernet send differential signal
	3	RXP	Input	Ethernet receive differential signal
	4	-	-	Reserved, do not use
	5	-	-	Reserved, do not use
	6	RXN	Input	Ethernet receive differential signal
	7	-	-	Reserved, do not use
	8	-	-	Reserved, do not use

Note

The MAC address is on a printed label visible from the front.

Measuring sockets

Properties

The T0 - T2 measuring sockets are used to output analog signals. Any interconnectable signal can be output via SINAMICS on every measuring socket on the control unit.

Note

The measuring sockets are suited for multiple-spring wire connectors with a diameter of 2 mm.

Interface characteristics

Table 10-266 T0, T1 and T2 interfaces

Characteristic	Type
Connector type	2 mm sockets
Voltage	0 V to 5 V
Resolution	8-bit
Load current	max. 3 mA
Sustained short-circuit proof Reference potential is M terminal	

Interface assignment

Table 10-267 Interface assignments T0, T1 and T2

Representation	Pin	Designation
	T0	Measuring socket 0
	T1	Measuring socket 1
	T2	Measuring socket 2
	M	Ground

Note

The test sockets are provided as a support to commissioning and diagnostics; they must not be connected for normal operation.

Power Module Interface

SIMOTION D410-2 can be connected to a SINAMICS Power Module in blocksize format via the Power Module interface.

Power Modules PM340 and PM240-2 (PM240-2 as of SIMOTION V4.4/SINAMICS V4.7) can be used.

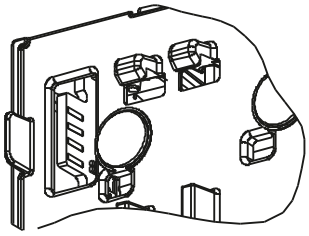

Figure 10-294 SIMOTION D410-2 interface to the Power Module interface (PM-IF)

Note

SIMOTION D410-2 can only be connected to a SINAMICS Power Module in blocksize format via the Power Module interface. A Power Module in chassis format must be connected via the DRIVE-CLiQ interface (see *SIMOTION D410-2* Commissioning and Hardware Installation Manual).

A SIMOTION D410-2 cannot be operated with SINAMICS G120 (PM2x0) Power Modules. Booksize Motor Modules can likewise not be connected.

10.2.2.5 Technical data

Shipping and storage conditions

The following conditions apply to modules that are shipped and stored in the original packaging.

Table 10-268 Shipping and storage conditions

Type of condition	Permissible range/class	
	Transport	Long-term storage
Climate class	2K4 according to EN 60721-3-2:1997	1K4 according to EN 60721-3-1:1997

Type of condition	Permissible range/class	
Vibration and shock stressing (in transport packaging)	EN 60721-3-2:1997, class 2M3	EN 60721-3-1:1997, class 1M2
Permissible ambient temperature	-40° C ...+70° C	-25° C ...+55° C
Relative humidity	5 ... 95%	10 ... 100%
Height	Max. 4000 m above sea level	
Atmospheric pressure	620 hPa ... 1060 hPa The specified values apply to a transportation altitude of up to 4000 m.	620 hPa ... 1060 hPa The specified values apply to a storage altitude of up to 4000 m.
Biological environmental conditions	Class 2B1 according to EN 60721-3-2:1997	Class 1B1 according to EN 60721-3-1:1997
Chemically active environmental conditions	Class 2C2 according to EN 60721-3-2:1997	Class 1C2 according to EN 60721-3-1:1997

Ambient conditions

Conditions of use

SIMOTION D410-2 meets the conditions of use for Class 3C3 according to DIN EN 60721-3-3:1995 (operating locations with high traffic densities and in the immediate vicinity of industrial equipment with chemical emissions).

Protect the device from environmental effects

SIMOTION D410-2 is designed for use in stationary, weather-protected locations.

Protect the device against the following environmental effects:

- Direct sunshine and heat sources
- Mechanical vibration and shock
- Dust
- Humidity
- Strong magnetic fields

Use prohibition

Without additional measures, SIMOTION D410-2 must **not** be used in

- Locations with a high percentage of ionizing radiation
- Locations with extreme operating conditions, e.g.
  - Dust accumulation
  - Corrosive vapors or gases
- Installations requiring special monitoring such as:
  - Elevator installations
  - Electrical systems in particularly hazardous rooms

An additional measure for using SIMOTION D410-2 can, for example, be installation in cabinets.

Note

The components must be protected against conductive contamination, e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12.

If conductive contamination can be excluded at the installation site, a lower degree of cabinet protection may be permitted.

See Industrial security (Page 957).

Ambient operating conditions for the operation

SIMOTION D410-2 can be used under the following ambient conditions:

Table 10-269 Environmental requirements

Ambient conditions	Fields of application	Remarks
Climatic ambient conditions		
Climate class	3K3	According to EN 60721-3:1995 Ambient conditions better than 3K3
Permissible ambient temperature	0 to +55° C, up to 2000 m above sea level	As of an altitude of 2000 m, the maximum ambient temperature decreases by 7 °C every 1000 m increase in altitude.
Maximum installation altitude	2000 m to max. 4000 m above sea level	
Relative humidity	5 to 95%	
Condensation, icing, drip, spray and splash water	Not permissible	
Atmospheric pressure	620 to 1060 hPa	Corresponding height 4000 m - 0 m above sea level.
Mechanical ambient conditions		
Pollution degree	2 according to EN 60664-1:2008	
Biological ambient conditions:	Class 3B1 according to EN 60721-3-3:1995	Mold, mold growth, slime, rodents, termites and other animal vermin are not permissible

Ambient conditions	Fields of application	Remarks
Chemically active environmental conditions	Class 3C1 according to EN 60721-3-3:1995	
Mechanically active environmental conditions	Class 3S1 according to EN 60721-3-3:1995	Conductive dusts are not permitted.
Vibratory load - D410-2 - S120 (without SME/DME)	Vibratory load during operation according to EN 60721-3-3: Class 3M1	Test values according to EN 60068-2-6 (sinusoidal) • 10 ... 57 Hz: 0.075 mm deflection amplitude • 57 ... 150 Hz: 1 g acceleration amplitude • 10 frequency cycles per axis
Shock load - D410-2 - S120 (without SME/DME)	Shock load during operation according to EN 60721-3-3: Class 3M1	Test values according to EN 60068-2-27 (half-sinusoidal) • 5 g peak acceleration, 30 ms duration • 3 shocks in all three axes in both directions

Note

Observe the fields of application of the Power Modules along with their derating. Refer to *SINAMICS S120 for AC Drives* Manual.

Vibration reduction

If SIMOTION D410-2 is subjected to larger shocks or vibrations, you must use suitable measures to reduce the acceleration or the amplitude.

We recommend installation on shock-absorbing material (e.g. rubber-metal vibration dampers).

Other data

Condition	Field of application
Protection against the ingress of foreign matter and water	IP20 degree of protection according to EN 60529
Class of protection	Class 1 (with protective conductor system) and class 3 (PELV) according to EN 61800-5-1:2007

System data, connection values, dimensions and weight

General technical data

The SIMOTION D410-2 has an integrated fan.

Table 10-270 General technical data

Dimensions and weight	
Dimensions W x H x D D410-2 DP D410-2 DP/PN	 73 x 186.8 x 74.4 mm 73 x 190.7 x 74.4 mm
Weight • Without packaging • With packaging	 • 830 g • 1,000 g
Electrical connection values	
Power supply	24 VDC (permissible range: 20.4 ... 28.8 V)
Ripple	Max. 5% at 24 VDC
Non-periodic overvoltage	Max. 35 VDC (Condition: Max. 500 ms, 50 s recovery time, max. 10 results/h)
Current consumption, typically [1)]	< 0.8 A
Starting current, typically [1)]	3.0 A
Power loss, typically [1)]	< 20 W

[1)] With no load on I/Os and no 24 V supply via DRIVE-CLiQ or PROFIBUS interface

Memory

Table 10-271 Technical data for memory

RAM (work memory)	120 MB (as of V5.3 SP1) 96 MB (V4.4 - V5.2 SP1) 48 MB (V4.3 SP1)
RAM disk (load memory)	60 MB (as of V5.3 SP1) 47 MB (V4.4 - V5.2 SP1) 31 MB (V4.3 SP1)
Retentive memory (retain variables)	At least 108 KB
Persistent memory (user data on CF card)	2 GB CF card: At least 1.5 GB 1 GB CF card: At least 300 MB
Work memory for Java applications	20 MB
Non-volatile data buffering buffer time, min.	 Unlimited (maintenance-free backup)
Memory for system data	
Diagnostic buffer (non-volatile)	100 messages (SIMOTION) 100 messages (SINAMICS Integrated)

Note

The memory sizes may be increased for the current version after the time for going to press for the documentation. The latest values can be found at Internet address (https://support.industry.siemens.com/cs/ww/en/view/18857317)

CompactFlash card

Table 10-272 CF card

Memory capacity	2 GB (article number 6AU1400-1QA20-0AA0) 1 GB (article number 6AU1400-1PA2*-0AA0)
Weight	10 g

Mounting plate

Table 10-273 Mounting plate data

Dimensions W x H x D	74.5 x 236 x 36.5 mm
Weight - Without packaging - With packaging	 380 g 450 g

Further technical data

For further technical data such as the max. number of online connections, HMI devices that can be used as well as a list of tasks available in the execution system, see the function overview in the *SIMOTION PM 21* Catalog.

Interfaces and performance features

PLC and motion control performance

Number of axes and clock cycles

Table 10-274 Maximum number of axes and minimum cycles for SIMOTION D410-2

PLC and motion control performance	
Maximum number of axes	8 axes [1)]
Minimum PROFIBUS cycle clock	0.5 ms PROFIBUS Integrated 1 ms PROFIBUS external

Minimum PROFINET send cycle clock (D410-2 DP/PN only)	0.25 ms
Minimum position control/interpolator cycle clock	0.5 ms (1 ms when using the TO axis and the integrated drive control)

1) Path interpolation is supported as of V4.4.

Integrated drive control

Table 10-275 Controls for integrated drives

Max. number of axes for integrated drive control (servo/vector/V/f)	1 / 1 / 1 (alternative) Drive control based on SINAMICS S120 CU310-2, firmware version V4.x/V5.x

Communication

Interfaces

Table 10-276 Interfaces

DRIVE-CLiQ interface	1
Ethernet interface	1
PROFIBUS interface	1 (D410-2 DP/PN) 2 (D410-2 DP) • Isochronous • Can be configured as master or slave
PROFINET interface	One interface with two ports (D410-2 DP/PN only) • Supports PROFINET IO with IRT and RT • Can be configured as PROFINET IO controller and/or device

Address space

Table 10-277 Address space

Logical I/O address space of the Control Unit		16 KB (as of V4.5) 8 KB (up to V4.4)
Physical I/O address space for each interface, one each for inputs and outputs		
	PROFIBUS Integrated	4 KB
	PROFIBUS	1 KB
	PROFINET (D410-2 DP/PN only)	6 KB (as of V4.5) 4 KB (up to V4.4)
Permanent process image for BackgroundTask (I/O variables)		64 bytes

Additional configurable process image for each cyclic task (I/O variables)		yes
Address space for each PROFIBUS DP station		244 Byte
SINAMICS Integrated (PROFIBUS Integrated) address space		512 Byte
Address space for each PROFINET device		1400 Byte
Maximum consistency range Onboard PROFINET interface X150		
	For controller-controller direct data exchange	254 bytes
	For I-device	1024 bytes (as of V4.4) 254 bytes (< V4.4)

Logical address space: Logical addresses can be assigned in STEP 7 within this space.

Physical address space: Address space with assigned data.

The address space contains all the logical addresses, i.e. also diagnostic addresses, I-device, etc.

Number of slaves/devices

Table 10-278 Number of slaves/devices

Maximum number of slaves per PROFIBUS interface	64
Maximum number of devices for PROFINET	64

Onboard I/Os

Digital inputs

Table 10-279 Technical data for digital inputs

Number of inputs	5
Input voltage • Rated value • For signal "1" • For signal "0" [2]	 • 24 VDC • 15 ... 30 V • -3 ... +5 V
Electrical isolation [1]	Yes (via optocoupler)
Current consumption typical at 1 signal level	3.5 mA at 24 V 5 mA at 24 V [3]
Input delay, typical (hardware) • Signal "0" → "1" • Signal "1" → "0"	 • 50 µs • 150 µs

Permissible quiescent current	2 mA
Protection	Protected against polarity reversal

1) Reference potential for DI 0 ... DI 3 is terminal M2 (X121, X130), reference potential for DI 22+ is terminal DI 22- (X130)

2) The digital inputs are protected against polarity reversal up to -30 V

3) Up to and including hardware version "C" for D410-2 DP or "B" for D410-2 DP/PN

Digital inputs/outputs

Table 10-280 Technical data regarding the digital inputs/outputs with adjustable parameters

Number of digital inputs/outputs	8 • Max. 8 as measuring input inputs • Max. 8 as cam outputs
If used as an input	
Input voltage • Rated value • For signal "1" • For signal "0" 2)	 • 24 VDC • 15 ... 30 V • -3 V ... +5 V
Galvanic isolation	No
Current consumption typical at 1 signal level	3.5 mA at 24 V 5 mA at 24 V 3)
Input delay, typ. (hardware): • Signal "0" → "1" • Signal "1" → "0"	 • 5 µs • 50 µs
Measuring input input, resolution	1 µs
Measuring input input, reproducibility	Typ. 5 µs
If used as an output	
Rated load voltage, permissible range	24 VDC, 20.4 ... 28.8 V
Galvanic isolation	No
Current load, max.	500 mA per output
Residual current, max.	2 mA
Output delay time, typ./max. (hardware) 1) • Signal "0" → "1" • Signal "1" → "0"	 • 150 µs / 400 µs • 75 µs / 100 µs
Output cam output, resolution	Typ. 125 µs
Output cam output, reproducibility	Typ. 125 µs

Switching frequency of the outputs, max. • With resistive load • With inductive load • With lamp load (max. 5 W)	 • 4 kHz • 0.5 Hz • 10 Hz
Protection	Short circuit, ground fault and overload proof Automatic restart after overload tripping

1) Data for: V_{cc} = 24 V; load 48 Ω; high ("1") = 90% V_{out}; low ("0") = 10% V_{out}

2) The digital inputs are protected against polarity reversal up to -30 V

3) Up to and including hardware version "C" for D410-2 DP or "B" for D410-2 DP/PN

Max. switching frequency D410-2

The max. switching frequency of the hardware depends on the load and is up to 4 kHz for an ohmic load of 0.5 A (typical value; low-high ratio = 50:50; short cable lengths).

Logic control of the digital output is also a limiting factor.

- If a DO 8...15 is set or reset via the TO cam/TO cam track, up to 2 edges are possible per servo cycle
  → with servo cycles of at least 500 µs, a max. switching frequency of 2 kHz is achieved
- if a DO 8...15 is set or reset from the user program, no more than 1 edge per servo cycle is possible.
  → with servo cycles of at least 500 µs, a max. switching frequency of 1 kHz is achieved

The max. achievable switching frequency can also be limited by the CU parameter p0799[0] (sampling time of the inputs/outputs of the CU) or p2048 (PROFIdrive PZD sampling time).

Reproducibility

The reproducibility at the measuring input input depends on the edge steepness of the measurement signal.

Generally, the following is valid: The steeper the edges of the input signal are, the easier it is to reproduce the measurement results.

Sloping signals are achieved by switching the signal level to "active". This is typically with rising edges as the signal here is "actively" switched to HIGH by the digital output (example: Output of a TM17 module: Rising edge).

Falling edges typically have less edge steepness (signal level that falls slowly), as the signal level is "not actively" forced to LOW (example: Output of a TM17 module: Falling edge).

Recommendation: Where the connected components do not have special output drivers, the recommendation is to use the rising edges for measurements.

Fail-safe digital inputs/outputs

Table 10-281 Technical data for fail-safe digital inputs (F-DI)

Number of inputs	3 F-DI (or as 6 DI)
Input voltage • Rated value • For signal "1" • For signal "0" [1]	 • 24 VDC • 15 ... 30 V • -3 ... +5 V
Electrical isolation [2]	Yes (via optocoupler)
Current consumption typical at 1 signal level	3.5 mA at 24 V 5 mA at 24 V [3]
Input delay, typical (hardware) • Signal "0" → "1" • Signal "1" → "0"	 • 50 µs • 150 µs
Protection	Short circuit, ground fault and overload proof

1) The digital inputs are protected against polarity reversal up to -30 V

2) Reference potential for DI 16, DI 18, DI 20 and DO 16 is terminal M1 (X120, X130)

3) Up to and including hardware version "C" for D410-2 DP or "B" for D410-2 DP/PN

Table 10-282 Technical data for fail-safe digital output (F-DO)

Number of outputs	1 F-DO (or as 1 DO)
Rated load voltage, permissible range	24 VDC, 20.4 ... 28.8 V
Electrical isolation	Yes (via optocoupler)
Current load, max.	500 mA
Residual current, max.	2 mA
Output delay time, typ./max. (hardware) [1] • Signal "0" → "1" • Signal "1" → "0"	 • 150 µs / 400 µs • 75 µs / 100 µs
Permissible quiescent current	2 mA
Protection	Short circuit, ground fault and overload proof Automatic restart after overload tripping

1) Data for: V_{cc} = 24 V; load 48 Ω; high ("1") = 90% V_{out}; low ("0") = 10% V_{out}

Analog input

Table 10-283 Technical data for the analog input

Number of inputs	1
Galvanic isolation	No
Common-mode range	-12 ... +12 V

Integration time / conversion time (per channel) • Parameters can be assigned • Integration time	 Yes ≥ 62.5 µs
Operational limit (across temperature range, in relation to the end value of the measuring range in the input range) • Voltage input • Current input	 ±0.65% ±1.1%
Basic error limit (operational limit at 25° C, in relation to the end value of the measuring range in the input range) • Voltage input • Current input	 ±0.5% ±0.5%
Linearity error (with reference to the input range)	±0.05%
Repeatability (in steady state at 25° C, with reference to input range)	±0.05%
When used as analog voltage input	
Input voltage range	-10 ... +10 V
Resolution	12-bit + sign (based on ± 11 V)[1)]
Input resistance (R_i)	> 100 kΩ
Temperature error (with reference to the input range)	±0.005%
When used as analog current input	
Input current range	-20 ... +20 mA
Resolution	11-bit + sign (based on ± 22 mA)[1)]
Input resistance (R_i)	250 Ω
Temperature error (with reference to the input range)	±0.02%
[1)] The maximum controllable area is approx. ± 11 V or ± 44 mA The resolution refers to the specified area (irrespective of the engineering settings).	

Onboard encoder interface

Table 10-284 Technical data of the encoder interface

Encoder interface	• TTL or HTL incremental encoders (with adjustable parameters) • Absolute encoder
Power supply	24 VDC / 0.35 A or 5 VDC / 0.35 A Short-circuit and overload proof
Limit frequency	500 kHz
SSI baud rate	100 ... 1000 kBaud

Resolution absolute position SSI	30 bit
Max. cable lengths	
• For TTL incremental encoder	• 100 m (bipolar signals only) [1), 3)]
• For HTL incremental encoder	• 100 m (for unipolar signals) • 300 m (for bipolar signals) [1), 2)]
• For SSI absolute encoder	• 100 m (depending on the baud rate) [4)]

1) Signal lines twisted in pairs and shielded.
Because the transmission technology is more robust, the bipolar connection should always be used.
The unipolar connection should only be used if the encoder type does not output push-pull signals.

2) As of a cable length of 200 m, use a power supply cable with a cable cross-section ≥ 0.75 mm²!

3) 100 m with remote sense

4) For the cable length, see the diagram "Maximum cable lengths depending on the SSI baud rate for SSI encoders"

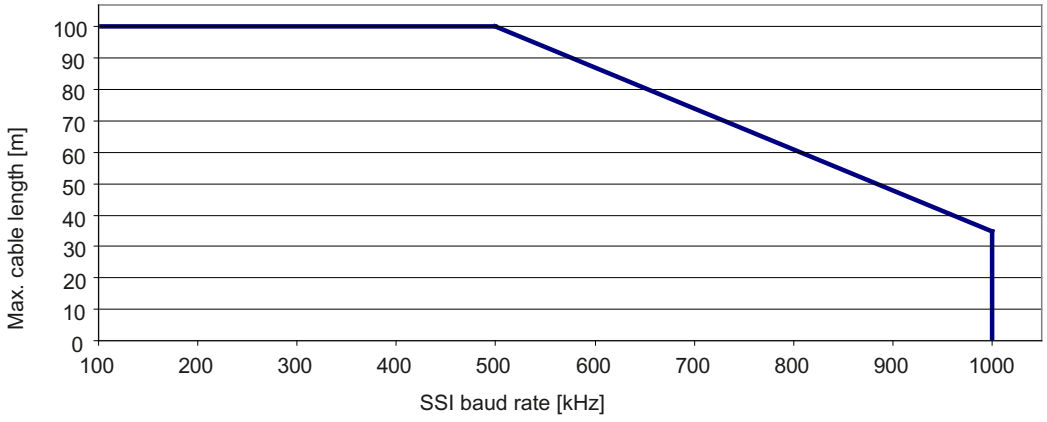

Figure 10-295 Maximum cable length depending on the SSI baud rate for SSI encoders

Note

The CUA32 control unit adapter also provides an encoder interface for an HTL, TTL or SSI encoder.

The technical data of the CUA32 adapter module can be found in the *SINAMICS S120 AC Drive* Manual.

Clock

Properties of the real-time clock

The table below contains the features and functions of the Control Unit clock.

Table 10-285 Clock properties

Properties	Meaning
Type	Hardware clock (integrated "real-time clock")
Default setting when delivered	DT#1992-01-01-00:00:00

Properties	Meaning
Maximum deviation per day for supply voltage switched on and switched off at 0° to 55° C	±5 s
Backup time	At least 5 days (at 0 to 55° C)
Charging time	1 h

With power OFF

The Control Unit clock continues to operate with the POWER OFF for the duration of the battery backup time (excluding software clock). The buffer is recharged in the POWER ON state. If the real-time clock backup time is exceeded, the time is reset. If the SIMOTION D410-2 is reset to its factory settings, the clock is also reset to the "default setting when delivered".

Certificates, approvals, declarations of conformity

You can find an overview of the certifications available for the SIMOTION D410-2 in Appendix A (Page 7805).

You can also find further information on the Internet at:

https://support.industry.siemens.com/cs/ww/en/ps/14513/cert

10.2.2.6 Dimension drawings

SIMOTION D410-2 DP dimension drawing

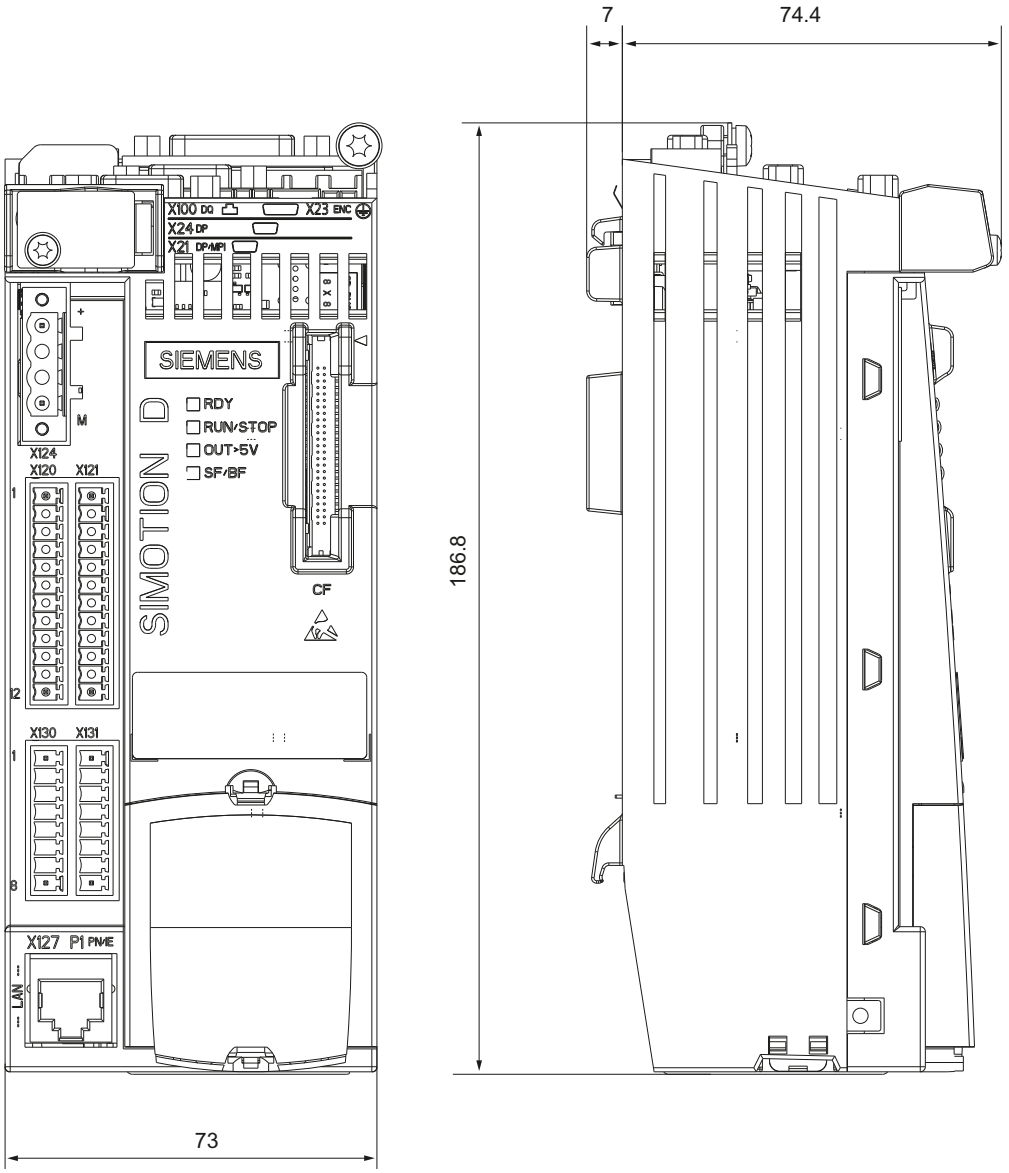

Figure 10-296 SIMOTION D410-2 DP dimension drawing (dimensions in mm)

Note

Overheating if ventilation clearances are too small

Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened service life of the component.

Maintain 50 mm ventilation clearances above and below the component.

SIMOTION D410-2 DP/PN dimension drawing

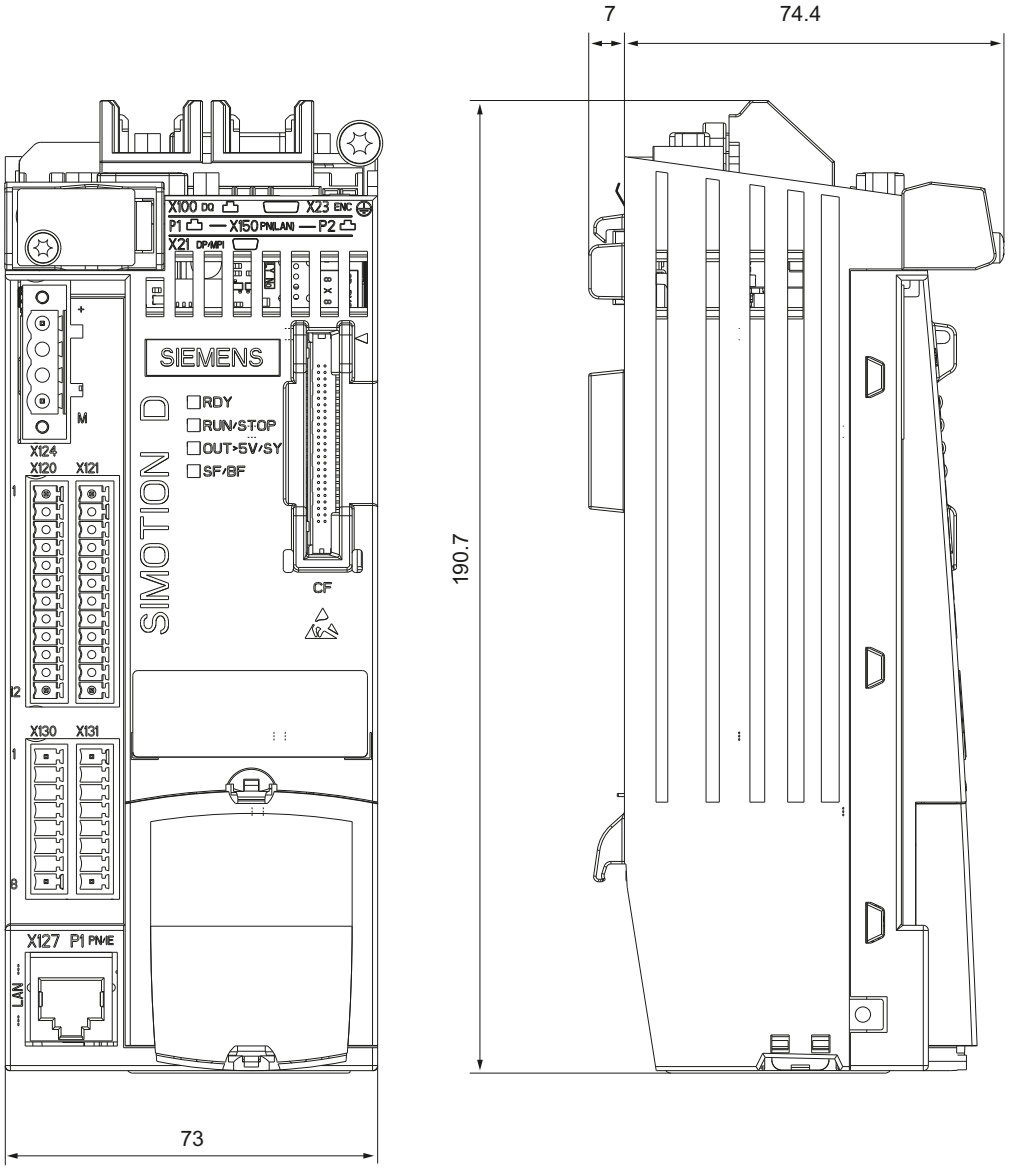

Figure 10-297 SIMOTION D410-2 DP/PN dimension drawing (dimensions in mm)

Note

Overheating if ventilation clearances are too small

Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened service life of the component.

Maintain 50 mm ventilation clearances above and below the component.

Mounting plate dimension drawing

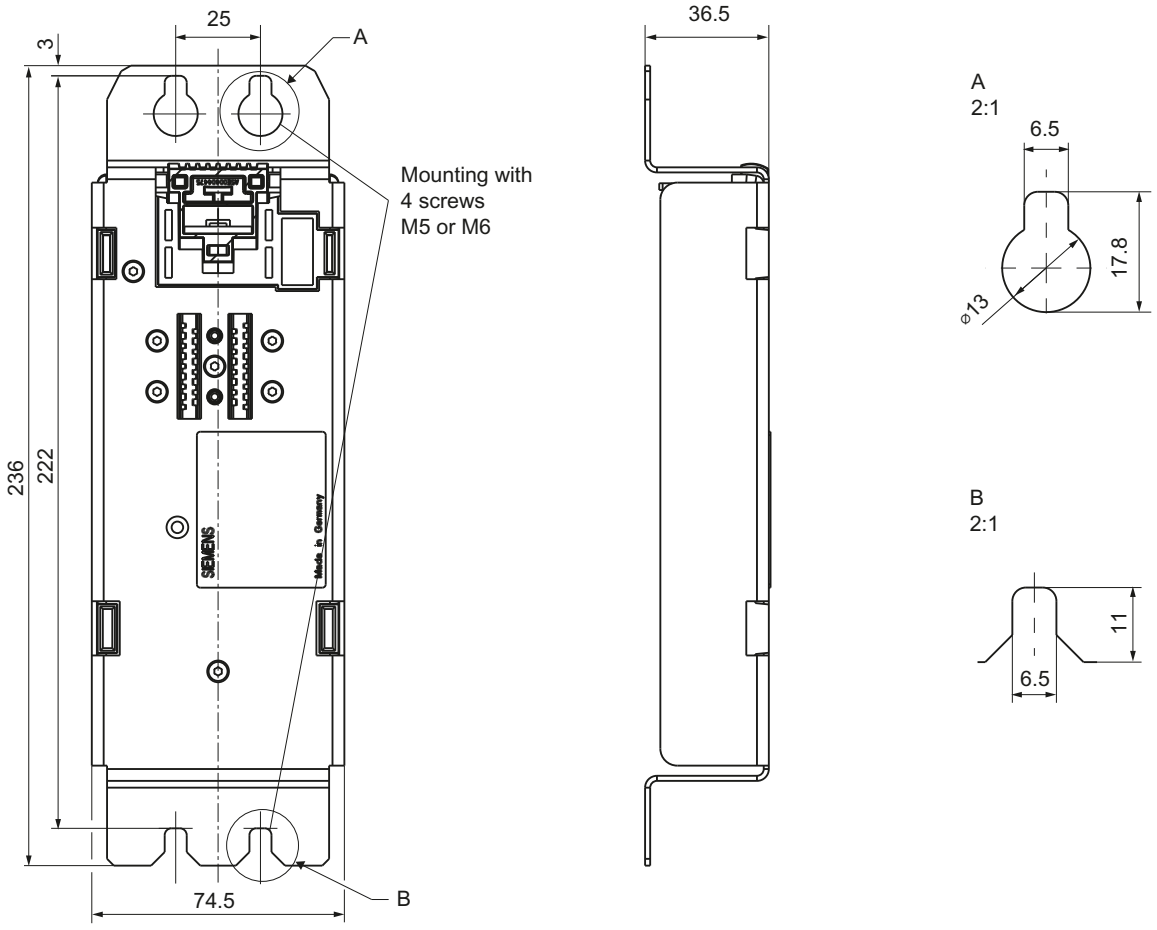

Figure 10-298 Mounting plate dimension drawing (dimensions in mm)

CAD data, dimension drawings, and circuit-diagram macros

Dimension drawings and CAD data

Dimension drawings, as well as 2D and 3D CAD data can be found:

- In the CAD Creator at the following Internet address (https://support.industry.siemens.com/cs/ww/en/view/30559271).
- In the DT Configurator of the Industry Mall (http://www.siemens.com/dt-configurator).
- Via CAx Download Manager (https://support.industry.siemens.com/my/ww/en/CAxOnline#CAxOnline).

Circuit-diagram macros

EPLAN circuit-diagram macros are available for the SIMOTION D410-2. The macros assist you when creating circuit diagrams.

The EPLAN circuit diagram macros can be ordered at the following Internet addresses:

- Drive Technology Configurator Industry Mall (http://www.siemens.com/dt-configurator)
- CAx Download Manager (https://support.industry.siemens.com/my/ww/en/CAxOnline#CAxOnline)
- Product support Support (https://support.industry.siemens.com/cs/ww/en/view/31622426)

10.2.2.7 Spare parts / accessories

Available spare parts and accessories

Table 10-286 Spare parts and accessories

Parts for SIMOTION D410-2	Article number	Accessories	Spare part
2 GB CompactFlash card (CF card) (latest CF card at the time of publication of this documentation)	6AU1400-1QA20-0AA0	X	-

Reference

You can find order data information for other SINAMICS drive components, such as Line Modules, Motor Modules, DRIVE-CLiQ cables, etc. in Catalog *SIMOTION PM 21*.

Note

The procedure for replacing the SIMOTION D410-2 fan is described in the *SIMOTION D410-2* Commissioning and Hardware Installation Manual.

Spares On Web

Spares On Web is an information system that enables you to find out which spare parts are available for your device. For information, visit the following Internet address (https://www.sow.siemens.com).

In order to view the spare parts, you require the article number and the serial number of the module.

Both numbers can be found on the rating plate on the module or the packaging label.

TM31 terminal module

Characteristics

The TM31 Terminal Module allows you to expand the number of available digital I/Os as well as the number of analog I/Os within a drive system. The TM31 is connected via DRIVE-CLiQ. It has 2 DRIVE-CLiQ interfaces for this.

Interfaces

The TM31 contains the following terminals:

Table 10-287 Interface overview of the TM31

Interface	Quantity
Digital inputs	8
Bidirectional inputs/outputs	4
Relay outputs with changeover contact	2
Analog inputs	2
Analog outputs	2
Temperature sensor input (KTY84-130 or PTC)	1

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

For further information on the TM31 Terminal Module, see the *SIMOTION D410-2* Commissioning and Hardware Installation Manual.

TM41 terminal module

Characteristics

The TM41 Terminal Module can be used to expand the number of digital I/Os and analog inputs within a drive system. In addition, it enables the use of the TTL output for encoder simulation. The TM41 is connected via DRIVE-CLiQ.

Interfaces

The TM41 contains the following terminals:

Table 10-288 TM41 interface overview

Type	Quantity
Digital inputs	4
Digital I/Os	4
Analog inputs	1
TTL encoder output	1

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

For further information on the TM41 Terminal Module, see the *SIMOTION D410-2* Commissioning and Hardware Installation Manual.

TM54F terminal module

Characteristics

The TM54F Terminal Module is a terminal expansion module for snapping on to a DIN EN 60715 mounting rail. The TM54F offers safe digital inputs and outputs for control of Safety Integrated functions of SINAMICS.

A SIMOTION D410-2 can be assigned exactly one TM54F which is connected via DRIVE-CLiQ.

The TM54F Terminal Module is an alternative to using Safety Integrated functions via the onboard terminals (F-DI, F-DO) or via PROFIsafe.

Interfaces

Table 10-289 The following terminals are located on the TM54F:

Type	Quantity
Fail-safe digital outputs (F-DO) [1]	4
Fail-safe digital inputs (F-DI) [2]	10
Sensor power supplies, can be made dynamic [3], [4]	2
Sensor power supply, cannot be made dynamic [3]	1
Digital inputs for testing the F-DO during test stop	4

1) A fail-safe digital output consists of a P/M-switching output as well as a digital input for reading back the switching state.

2) A fail-safe digital input consists of two digital inputs.

3) Sensors: Fail-safe devices for commanding and detecting, such as emergency stop pushbuttons and safety locks as well as position switches and light arrays / light curtains.

4) Dynamic response: The sensor power supply is switched on and off during test stop for testing the sensors, the cable routing, and the evaluation electronics of TM54F.

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

You find detailed information on the TM54F Terminal Module in the *SINAMICS S120 Safety Integrated* Function Manual.

See also

DRIVE-CLiQ interface (Page 7749)

TM15 and TM17 High Feature terminal modules

Characteristics

The TM15 and TM17 High Feature Terminal Modules are used to implement inputs of measuring inputs and outputs of output cams for SIMOTION D. In addition, these Terminal Modules provide drive-related digital I/Os with short signal delay times. TM15 and TM17 High Feature are connected by means of DRIVE-CLiQ.

TM15

Each of the 24 electrically isolated digital I/Os can be parameterized channel-by-channel as a digital input (DI), digital output (DO), a measuring input input, or an output cam output.

TM15 DI/DO

Each of the 24 isolated digital I/Os can be configured on a channel-specific basis as a digital input (DI) or digital output (DO). The digital I/Os can be interconnected using BICO technology and thus used from the drive side as well. Unlike the TM15, measuring input inputs and cam outputs are not available with the TM15 DI/DO.

Note

The module hardware for TM15 and TM15 DI/DO is identical. A distinction is only made by the addition of the component in the SIMOTION SCOUT project navigator using "Inserting I/O component".

TM17 High Feature (only available as spare part)

Each of the 16 digital I/Os can be parameterized channel-by-channel as a digital input (DI), digital output (DO), measuring input input, or an output cam output.

TM17 High Feature has fewer I/O channels than TM15, but more functionality. TM17 High Feature is distinguished by especially high resolution and accuracy as well as a configurable input filter and enabling inputs (max. 6 units). Parameterized enable inputs can enable measuring inputs or outputs of output cams (gate function). Due to their high accuracy, the digital I/O channels of the TM17 High Feature are non-isolated.

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

Detailed information about the TM15 and TM17 High Feature can be found in the *SIMOTION Terminal Modules TM15 / TM17 High Feature* Commissioning Manual.

CUA31/CUA32 control unit adapter

Properties

You can connect a Power Module in blocksize format to the DRIVE-CLiQ interface using the CUA31 adapter module. The CUA32 adapter module also provides an encoder interface for an HTL, TTL or SSI encoder.

Interfaces

Table 10-290 Overview of the interfaces for the adapter modules

Interface	CUA31 [1]	CUA32
DRIVE-CLiQ interface	3	3
EP terminals/temperature sensor connection	1	1
Power Module Interface (PM-IF)	1	1
24 V electronic power supply	1	1
Encoder interface (HTL, TTL, SSI) Only SSI encoders without incremental tracks may be operated.	0	1
Maximum DRIVE-CLiQ cable length	100 m	100 m

[1] CUA31 with article number 6SL3040-0PA00-0AAx (x ≥ 1 required)

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component.

Additional references

You will find more information on the CUA31/CUA32 Control Unit Adapter in the *SINAMICS S120 AC Drive* Manual.

DMC20/DME20 DRIVE-CLiQ hub

Characteristics

The DMC20 and DME20 DRIVE-CLiQ hub modules are used to implement point-to-point distribution of a DRIVE-CLiQ line.

- DMC20 is the hub for the control cabinet configuration
- DME20 is the hub for use without a control cabinet (IP67 degree of protection).

The modules are particularly well suited to applications that require DRIVE-CLiQ link nodes to be removed in groups without interrupting the DRIVE-CLiQ link and therefore the data exchange.

The DMC20/DME20 is also used with a SIMOTION D410-2 when a second encoder is required. As an SMx Sensor Module and a motor with DRIVE-CLiQ interface only have one DRIVE-CLiQ interface, a DMC20/DME20 must be used for a second encoder via DRIVE-CLiQ. If a CUA31/ CUA32 is used, the DMC20/DME20 is not required. Alternatively, a second encoder can also be connected via the X23 interface on the SIMOTION D410-2.

NOTICE
Overheating if ventilation clearances are too small Insufficient ventilation clearances result in overheating and therefore in more failures and a shortened life of the component. Maintain 50 mm ventilation clearances above and below the component. The ventilation openings may not be covered by connecting cables.

Additional references

You will find detailed information about the DMC20/DME20 in the *SINAMICS S120 Control Units and Additional System Components* Manual.

10.2.2.8 Standards and approvals

General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

EMC limits in South Korea

	KC registration number: KCC-REM-S49-SIMOTION For sellers or other users, please keep in mind that this device in an A-grade electromagnetic wave device. This device is intended to be used in areas other than home. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

The EMC limits to be observed for Korea correspond to the limits of the EMC product standard for variable-speed electric drives EN 61800-3 of category C2 or the limit class A, Group 1 according to EN 55011. By implementing appropriate additional measures, the limit values according to category C2 or limit value class A, Group 1, are observed. Additional measures, such as the use of an additional RFI suppression filter (EMC filter), may be necessary.

The measures for EMC-compliant design of the system are described in detail in this manual respectively in the Installation Guideline EMC.

Note that the final statement on compliance with the standard is provided by the respective label attached to the individual unit.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (https://support.industry.siemens.com/cs/ww/en/ps/14506/cert)).

Marking for Australia and New Zealand

	SIMOTION D410-2 satisfies the requirement of the standard AS/NZS CISPR 16.
or	
	Marking with RCM (Regulatory Compliance Mark) or C-Tick with older components.

Marking for the Eurasian customs union

	EAC (Eurasian Conformity) Customs union of Russia, Belarus and Kazakhstan Declaration of conformity in accordance with the technical regulations of the customs union (TR CU).

Standards that are not relevant

	China Compulsory Certification SIMOTON D does not belong to the validity area of the China Compulsory Certification (CCC).

China RoHS

SIMOTION D complies with the China RoHS directive. You can find more information on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109738656).

Device-specific information

Note regarding SIMOTION D

Note

The product standard EN 61800-3 describes the EMC requirements placed on "Variable-speed drive systems". As such, it defines different limits depending on the location of the drive system.

SINAMICS S120 power units are designed for use in the second environment. The term second environment refers to all locations outside residential areas. These are basically industrial areas which are supplied from the medium-voltage line supply via their own transformers.

It is essential to follow the installation instructions in the SINAMICS S120 Manuals in order to ensure compliance with emitted interference and immunity values.

The same installation instructions apply for the SIMOTION D410-2 Control Unit as for the SINAMICS S120 CU310-2 Control Unit with regard to EMC.

For further information on this topic also refer to the *SIMOTION PM 21* Catalog as well as the SINAMICS Function Manuals.

10.2.2.9 ESD guidelines

ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

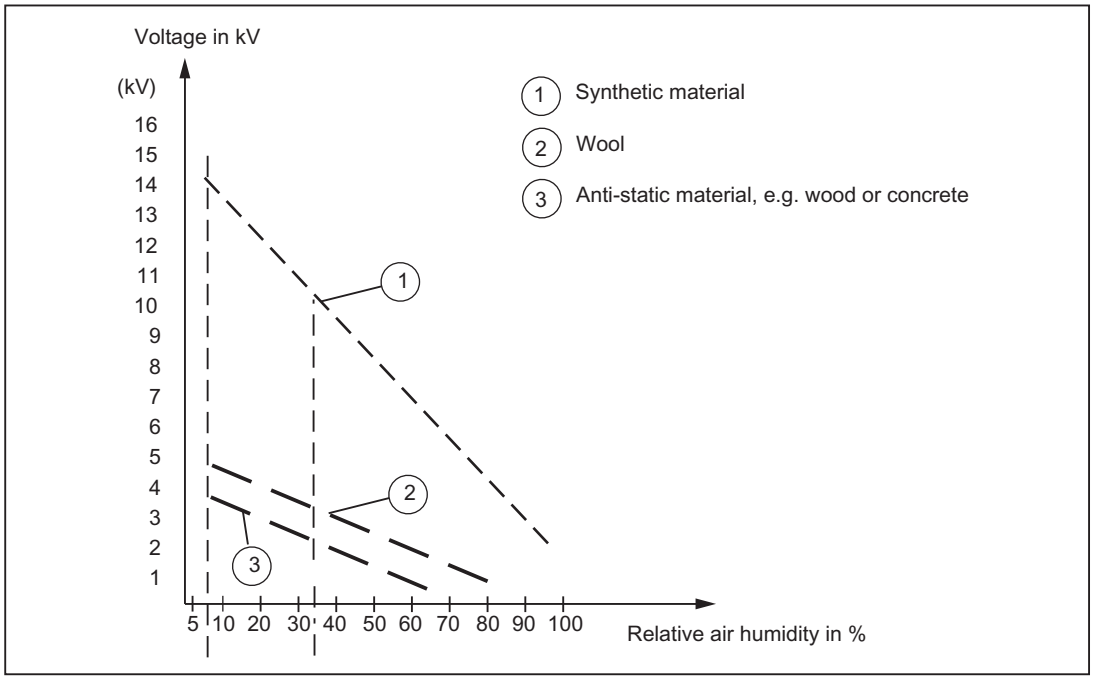

Figure 10-299 Electrostatic voltage that can accumulate on operating personnel

Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

SIMOTION P 11

11.1 Commissioning Manual

11.1.1 SIMOTION P320-4 E / P320-4 S

Preface

Preface

This document is part of the **SIMOTION P documentation package**.

This documentation describes the SIMOTION P320-4 hardware platform which can be delivered in the SIMOTION P320-4 E and SIMOTION P320-4 S hardware versions:

- SIMOTION P320-4 E with the Windows Embedded Standard 7 32-bit operating system and real-time expansion for SIMOTION.
  Successor to SIMOTION P320-3.
- SIMOTION P320-4 S with the Windows 7 Ultimate 32-bit operating system and real-time expansion for SIMOTION.
  Successor to SIMOTION P350-3.

References

The following documents contain the descriptions for the SIMOTION P hardware platform:

- SIMOTION P320-4 E / P320-4 S, Manual, Edition 10/2016
- SIMOTION P320-4 E / P320-4 S, Commissioning and Hardware Installation Manual, Edition 10/2016

Validity range

This Commissioning and Hardware Installation Manual is valid for the SIMOTION P320-4 E and SIMOTION P320-4 S devices as of product level SIMOTION V4.5.

Standards

The SIMOTION system has been developed in accordance with ISO 9001 quality guidelines.

Sections in this documentation

The following sections describe the purpose and the use of this documentation:

- Safety instructions
  This section contains fundamental safety instructions for SIMOTION and specific safety instructions for the SIMOTION P320-4.
- Industrial Security
  You can find important information on industrial security here. What is industrial security? Which specific measures can be taken to protect your system from threats.
- Description
  System overview and product description for the SIMOTION P320-4.
  The communication versions are displayed.
- Application planning
  Points to note in advance:
  Upon delivery, the permitted installation positions, environmental and ambient conditions and electromagnetic compatibility.
  You will find this information in the manual SIMOTION P320-4 E / P320-4 S.
- Installation
  Description of the installation, mounting and assembly of the SIMOTION P320-4.
- Connection
  This section describes the requirements for connecting and the connection overview for the SIMOTION P320-4, and information on the connection of PROFINET, PROFIBUS and Ethernet.
- Power on and software installation
  Information on the first power-up of the SIMOTION P320-4 and additional software for HMI.
- Operation (hardware)
  Detailed description of the SIMOTION P State application.
- Parameter assignment / addressing
  This section contains the requirements for parameter assignment / addressing and an overview of the factory settings.
  One section describes the SIMOTION P Control Manager.
  Communication with Ethernet and PC internal is described.
  References are supplied for the PROFINET and PROFIBUS communication.
- Commissioning (software)
  This section contains information, notes and requirements for the commissioning and a recommended sequence for the first commissioning of the SIMOTION P320-4.
  The topics data backup, data storage concept and SIMOTION P general reset are described.
- Service and maintenance
  Information on the recording of diagnostics data, restoring factory settings, installing and removing the backup battery.
  Description of special power-up situations.
- Alarm, fault, and system messages
  Information on diagnostics via LED displays.
  Description of possible alarm and fault messages.
- Troubleshooting/FAQs
  List of possible errors and their remedies.

- Appendix
  The appendices contain information on standards and approvals, on the ESD guideline as well as a list of abbreviations.
- Index
  Alphabetical directory for locating information.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.2:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

11.1.1.1 Safety notes

Fundamental safety instructions

General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Specific safety instructions for SIMOTION P320-4

General safety instructions for the SIMOTION P320-4

⚠ WARNING

Life-threatening voltages are present with an open control cabinet

When you install the device in a control cabinet, some areas or components in the open control cabinet may be carrying life-threatening voltages.

If you touch these areas or components, you may be killed by electric shock.

Switch off the power supply to the cabinet before opening it.

System expansions

NOTICE

Damage through system expansions

Device and system expansions may be faulty and can affect the entire machine or plant.

The installation of expansions can damage the device, machine or plant.

Device and system expansions may violate safety rules and regulations regarding radio interference suppression.

If you install or exchange system expansions and damage your device, the warranty becomes void.

Note the following for system expansions:

- Only install system expansion devices designed for this device. Contact your technical support team or where you purchased your PC to find out which system expansion devices may safely be installed.
- Observe the information on electromagnetic compatibility (Page 7989).

NOTICE

"Open Type" UL508

Note that the device is classified as "Open Type" for use in the area of Industrial Control Equipment (UL508). Installation of the device in an enclosure according to UL508 is conditional for approval or operation according to UL508.

Battery and rechargeable battery

⚠ WARNING

Risk of explosion and release of harmful substances

Improper handling of lithium batteries can result in an explosion of the batteries.

Explosion of the batteries and the released pollutants can cause severe physical injury. Worn batteries jeopardize the function of the device.

Note the following when handling lithium batteries:

- Replace used batteries in good time, see the section "Replacing the backup battery" in the Commissioning and Hardware Installation Manual.
- Replace the lithium battery only with an identical battery or types recommended by the manufacturer (Article No.: A5E30314053).
- Do not throw lithium batteries into fire, do not solder on the cell body, do not recharge, do not open, do not short-circuit, do not reverse polarity, do not heat above 100°C and protect from direct sunlight, moisture and condensation.

High frequency radiation

NOTICE

Unintentional operating situations

High frequency radiation, e g. from a cellular phone, interferes with device functions and can result in malfunctioning of the device.

Persons are injured and the plant is damaged.

Avoid high-frequency radiation:

- Remove radiation sources from the environment of the device.
- Switch off radiating devices.
- Reduce the radio output of radiating devices.
- Observe the information on electromagnetic compatibility (Page 7989).

ESD Guideline

Electrostatic sensitive devices can be labeled with an appropriate symbol.

NOTICE
Electrostatic sensitive devices (ESD) When you touch electrostatic sensitive components, you can destroy them through voltages that are far below the human perception threshold. If you work with components that can be destroyed by electrostatic discharge, observe the ESD Guideline.

Further information

You can find more detailed information about the **EGB Guideline** in Annex B in the section with the same name.

Notes on use

⚠ WARNING
Hazards on an unprotected machine or plant According to the results of a risk analysis, hazards can occur on an unprotected machine. The hazards can result in personal injury. According to the risk analysis, the risk of personal injury can be avoided with the following measures: • Additional protective devices on the machine or plant. With this, especially the programming, configuration and wiring of the inserted I/O modules have to be executed, in accordance with the necessary risk analysis identified safety performance (SIL, PL or Cat.). • The correct use of the device has to be verified with a function test on the system. This test can detect programming, configuration and wiring errors. • Documentation of the test results that you can enter in the relevant safety records when required.

NOTICE

Ambient conditions

Ambient conditions for which the device is not suitable can cause faults or damage the device.

Note the following:

- Operate the device only in closed rooms. Failure to comply nullifies the warranty.
- Operate the device only in accordance with the ambient conditions specified in the technical specifications.
- Protect the device against dust, moisture and heat.
- Do not expose the device to direct sunlight or other strong sources of light.
- Without additional measures, such as a supply of clean air, the device may not be used in locations with harsh operating conditions caused by acidic vapors or gases.
- Observe the permissible mounting positions of the device.
- Do not obstruct the venting slots of the device.

Note

Use in an industrial environment without additional protective measures

This device was designed for use in a normal industrial environment according to IEC 60721-3-3.

11.1.1.2 Industrial security

Security concept for SIMOTION P320-4

Security

Note

Observe the general security information in this documentation for Industrial security (Page 957).

Regular change of the Windows password

Note

Changing the Windows password

For security reasons, the Windows password should be changed regularly.

It is essential that the AutoLogin is also adapted for this purpose.

You can find instructions in the following sections:

- Changing the Windows user password (Page 7837)
- AutoLogin for SIMOTION P (Page 7841).

Unlocking Windows

Note

Windows locked

Windows may be accidentally locked, e.g. through shortcut key Windows + L.

If you do not know the password for the SIMOTION P320-4, please contact the Siemens Industry Online Support (https://support.industry.siemens.com).

Windows firewall

Note

Windows firewall

To allow the Windows IP to be accessed externally, this must be set as an exception in the Windows firewall **File and Printer Sharing**. Otherwise, there is only limited access to Windows from outside.

Security and networks

Note

You will find information on the security of networks in Section General security measures (Page 7828).

Remote desktop connection

Note that for the SIMOTION P320-4 with Headless operation, you require a user name and password for a remote desktop connection. Per default, the remote desktop connection is already set up.

Note

Deactivating the remote desktop connection

If you do **not** use the remote desktop connection, it must be deactivated for security reasons.

See Section Deactivating the remote desktop connection (Page 7848)

SIMOTION IT

Note

Security concept

Note the security concept of HTTP/S, FTP and Telnet access on the Web server when working with SIMOTION IT.

You will find information in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual or the SIMOTION online help in Section Security concept.

Note

User administration

Note the information on the user administration when working with SIMOTION IT.

You will find information in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual or the SIMOTION online help in Section User administration.

Information on industrial security

The following sections are taken from the Motion Control Industrial Security Configuration Manual:

- Why is industrial security so important? (Page 7826)
- General security measures (Page 7828)
- Product-specific measures (virus scanners) (Page 7836)

You can view the entire document in the Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/108862708).

Why is industrial security so important?

The topic of data security and access protection (security) is becoming more and more important in industrial environments. The progressive networking of entire industrial plants, the vertical integration and networking of the individual levels of a company, and new technologies, such as remote maintenance and remote access, are leading to increased requirements for protecting industrial plants.

The threats are diverse and the consequences far-reaching.

Possible threats:

- Espionage of data, recipes, etc.
- Sabotage of production plants
- System stoppage, e.g. due to virus infection and malware

- Manipulation of data or application software
- Unauthorized use of system functions

Possible effects of a security incident

- Loss of intellectual property
- Loss of production or reduced product quality
- Company image and economic damage
- Catastrophic environmental influences
- Danger to persons and machines

Trends in the IT sector

Overview

There are many new trends which affect industrial security:

- Cloud computing in general
  The number of network connections across the world is constantly increasing. This enables innovations such as cloud computing and the applications that go hand in hand with it. In conjunction with cloud computing, there has been a massive increase in the number of mobile devices, such as mobile phones and tablet PCs.
- Wireless technology
  On the other hand, the increasing use of mobile devices has only become possible thanks to the ubiquitous availability of mobile networks. Wireless LAN is also becoming increasingly available.
- Smart Grid
  Networking is not only limited to data networks, it also influences our energy infrastructure.
- Worldwide remote access to plants, machines and mobile applications
- The "Internet of things"
  Millions of electronic devices are becoming network-capable and are communicating via the Internet, such as onboard computers in cars, which send warranty information to dealers, or water meter sensors that transmit water consumption data to municipal water suppliers via radio.

However, in order for everything from cloud computing to sensors to work without service disruptions, you need reliable network infrastructures that are well protected against attacks from malware and hackers.

Possible corporate security holes

Possible security holes or weak points

The security chain of a company is only as strong as its weakest link. Security holes can exist at numerous points. The following list gives only a few examples:

- Employees
- Production plants
- Network infrastructure
- Data centers
- PC workstations
- Laptops
- Tablet PCs
- Printers
- Smartphones
- Portable storage media
- Guidelines and regulations

For this reason, a holistic approach is required to deal with the issue of security. Coordinated guidelines and regulations are required that cover all areas: Devices, systems, processes and employees.

General security measures

Overview

In the following section you will learn about the general security measures you can take in order to protect your system from threats. All of the measures are recommended.

Additional specific security measures for SINUMERIK, SIMOTION and SINAMICS products can be found in Section Product-specific security measures (Page 7836).

Basically, the measures should be coordinated with one another and correspond to the ring-shaped principle of the "Defense in Depth" strategy. The measures are structured according to the "onion" principle and each measure forms an additional protective layer around the core: the production plant.

Figure 11-1 Defense in depth strategy

- **Plant security**
  Plant security represents the outermost protective ring. Plant security includes comprehensive physical security measures, e.g. entry checks, which should be closely coordinated with protective measures for IT security.
- **Network security**
  The measures, grouped under the keyword "Network security", form the core of the protective measures. This refers to the segmentation of the plant network with limited and secure communication between subnetworks ("secure islands") and the interface check with the use of firewalls.
- **System integrity**
  "System integrity" represents the combination two major measures. PC-based systems and the control level must be protected against attacks. Steps include the following measures:
  - User authentication for machine or plant operators with individual authorization levels
  - Integrated access protection mechanisms in the automation components to prevent unauthorized changes via the engineering system or during maintenance
  - The use of antivirus and whitelisting software to protect PC systems against malware
  - Maintenance and update processes to keep the automation systems up-to-date (e.g. patch management, firmware updates, etc.)

Plant security

Physical protection of critical production areas

Unauthorized persons may be able to enter the production site/building and damage or alter production equipment as a result of gaps in a company's physical security. Confidential information can also be lost. This can be prevented if both the company's site and the production areas are protected accordingly.

Company security

The company's physical security can be ensured via the following measures:

- Closed off and monitored company premises
- Entry control, keys / card readers and/or security personnel
- Escorting of external personnel by company employees

Physical production security

The physical security of a production location can also be ensured via the following measures:

- Separate access control for production areas.
- Installation of critical components in securely lockable cabinets / switching rooms including monitoring and alarm signaling options
- Prohibited production areas with restricted access rights
- Configuration of the radio field to restrict the WLAN range so that it is not available outside the defined areas (e.g. factory building).
- Guidelines that prevent the use of third-party data storage media (e.g. USB sticks) and IT devices (e.g. notebooks) classified as insecure on the control.

Further information

Further information on integrated security solutions can be found on the Surveillance page (http://www.buildingtechnologies.siemens.com/bt/global/en/security-solution/Pages/security-solution.aspx).

Network security

Network segmentation

Separation between production and office networks

One important protective measure for your control is the strict separation of the production networks and the other company networks. This separation creates protection zones for your production networks.

Note

The products – drives, controllers, commissioning tools (e.g. STARTER or Startdrive) – described in this manual must only be operated in protection zones.

Separation by means of a firewall system

In the simplest scenario, separation is achieved by means of an individual firewall system which controls and regulates communication between networks.

Separation via a DMZ network

In the more secure version, the coupling is established via a separate DMZ network. In this case, direct communication between the production network and the company network is completely prevented by firewalls and only takes place indirectly via servers in the DMZ network.

Note

The production networks should also be divided into separate automation cells in order to protect critical communication mechanisms.

General security measures

Observe the general security measures even within protection zones, for example:

- Virus scanners (Page 7834)
- Reduction of attack points (Page 7834)

Network segmentation with SCALANCE S

Siemens provides SCALANCE S security modules to meet network protection and network segmentation requirements.

SCALANCE S security modules

SCALANCE S security modules with Security Integrated provide:

- Stateful inspection firewall
  In order to implement user-specific control and logging, firewall rules can also be specified that only apply to certain users.
- VPN via IPsec (data encryption and authentication)
  This establishes a secure tunnel between authenticated users whose data cannot be intercepted or manipulated. The most important aspect is the protection against external access via the Internet.
- NAT/NATP (address translation)
- Router functionality (PPPoE, DDNS) for broadband Internet access (DSL, cable)
- S623 with additional VPN port (DMZ) enables the secure connection of an additional network for service and remote maintenance purposes. S623 also permits the secure, redundant connection of subordinate networks by means of routers and firewall redundancy.

Principle

This application example shows cell segmentation by several SCALANCE S modules, each of which is upstream of the automation cell. The data traffic to and from the devices within automation cells can be filtered and controlled with the SCALANCE S firewall. If required, the traffic between the cells can be encrypted and authenticated. Secure channels and client access from the PCs to the cells can be established via SOFTNET Security Client, VPN client software for PCs.

System integrity

System hardening

Reduction of attack points

Network services and ports

Activated services represent a risk. To minimize the risk, only the necessary services for all of the automation components should be activated. Ensure that all activated services are taken into account (especially web servers, FTP, remote maintenance, etc.) in the security concept.

A description of the ports used can be found in the Manuals and Function Manuals of the respective products.

User accounts

Any active user account allows access to the system is thus a potential risk. Therefore, take the following security measures:

- Reduction of configured/activated user accounts to the actually needed minimum
- Use of secure access data for existing accounts
- Regular checks, especially of the locally configured user accounts
- Regular change of passwords

Passwords

NOTICE
Changing default passwords The misuse of passwords can also represent a considerable security risk. We recommend that default passwords be changed during the commissioning and changed at regularly defined intervals as required.

Virus scanner

The use of a virus scanner must not impact the production operations of a plant. As the last consequence, this will lead to even a virus-infected computer not being permitted to immediately shut down if this would cause the control of the production process to be lost.

In order to be used on industrial control components, a virus scanner should therefore meet the following requirements:

Virus scanner requirements

- If a local firewall that has been adapted to the production operations is used, it must be possible to install the virus scanner without its own firewall.
- The virus scan clients can be divided into (product- and task-specific) groups and configured separately.
- It must be possible to deactivate the automatic distribution of the virus signatures and other updates.
- It must be possible to carry out the distribution of the virus signatures and updates manually and in groups.
- It must be possible to conduct a file scan and system scan manually and in groups.
- For the virus detection scenario, a message can be configured without a file action such as "Delete", "Clean", etc. being automatically carried out.
- It must be possible to log all of the messages on the virus scan server.
- On a virus scan client, it must be possible to suppress the local message window because it could obscure important messages from the production process.

Note

Installation of software

The installation of software is often a process which represents a serious and complicated change to the respective system. The storage location of the files to be installed must always be free of viruses (e.g. a file server with its own virus scanner or DVD checked for viruses).

Patch management

Microsoft security updates

The **WSUS** (Windows Server Update Service) system functionality provided by Microsoft is available for current Windows systems. WSUS supports administrators by providing Microsoft updates in large local networks. WSUS automatically downloads update packages from the Internet (Microsoft Update) and offers them to the Windows clients for installation.

The fully automatic update process ensures that Microsoft security updates are always available on Siemens clients.

Product-specific measures

Virus scanners, Windows security patches, SIMOTION P

General information on virus scanners

Once an industrial PC system is connected to the Internet, either directly or via an internal company network, there is a danger that it can become infected with a virus. However, malicious software is not only able to reach the system via the Intranet/Internet, but also, for example, via a removable storage device (such as a USB memory stick) attached to the system for backing up data.

SIMOTION P320-4 virus scanners

A virus scanner that runs on Microsoft Windows, as used in office or home computers, has a deep impact on a system's processes. There are, for example, processes such as real-time scans or regular system scans. Such interventions can cause performance issues for the system, and as a result, for the SIMOTION Runtime software. Although the SIMOTION Runtime software runs in a real-time environment, it still depends on the available system resources.

Note

Because of the resulting performance impairments, the installation and use of a standard virus scanner on a SIMOTION P320-4 during system runtime does not make sense and is not permitted.

Using a virus scanner

As a standard virus scanner cannot be used for SIMOTION P320-4, an alternative procedure is followed. The virus scanner is installed to a separately bootable Windows PE operating system. It is started, for example, from a CD or a USB storage device and then performs a virus scan.

Note

FAQ in Industry Online Support

More information on using a virus scanner on a SIMOTION P320-4 can be found in the FAQ "How can a virus scanner be used on a SIMOTION P320-4?" (https://support.industry.siemens.com/cs/ww/en/view/59381507), which is available as a download from the Industry Online Support portal.

Windows security patches

A brief test is performed when a new SIMOTION version is released. During this brief test, a check is performed to establish whether the installation of the security update has affected any basic functions.

Changing the Windows user password

Permitting the Windows password to be changed

Before the Windows password can be changed, it must be permitted for the user.

If the following procedure is not observed, an error message is issued and the Windows password cannot be changed.

Note the following procedure:

1. Select the entry point **Control Panel** > **All Control Panel Items** > **Administrative Tools** > **Computer Management**.
   Double-click **Computer Management**.

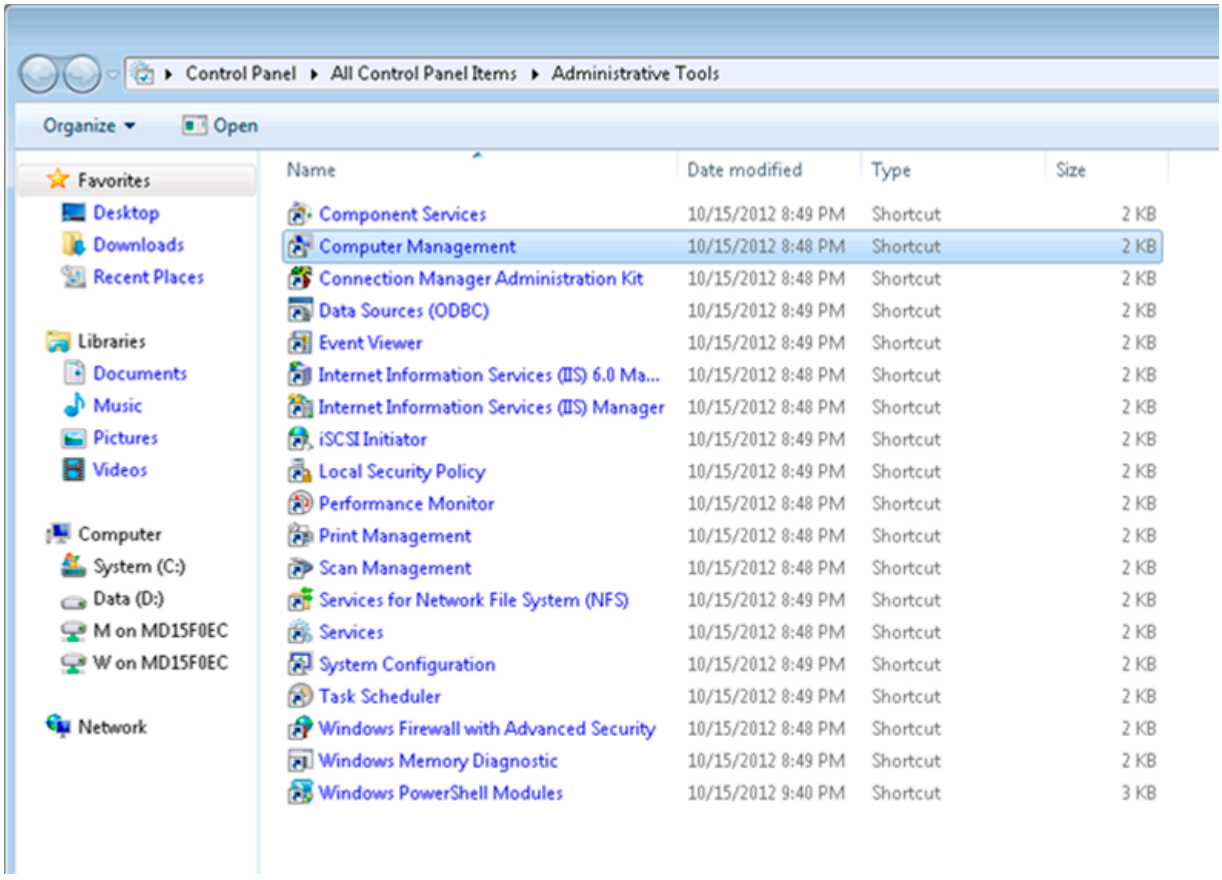

Figure 11-2 Homepage:

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

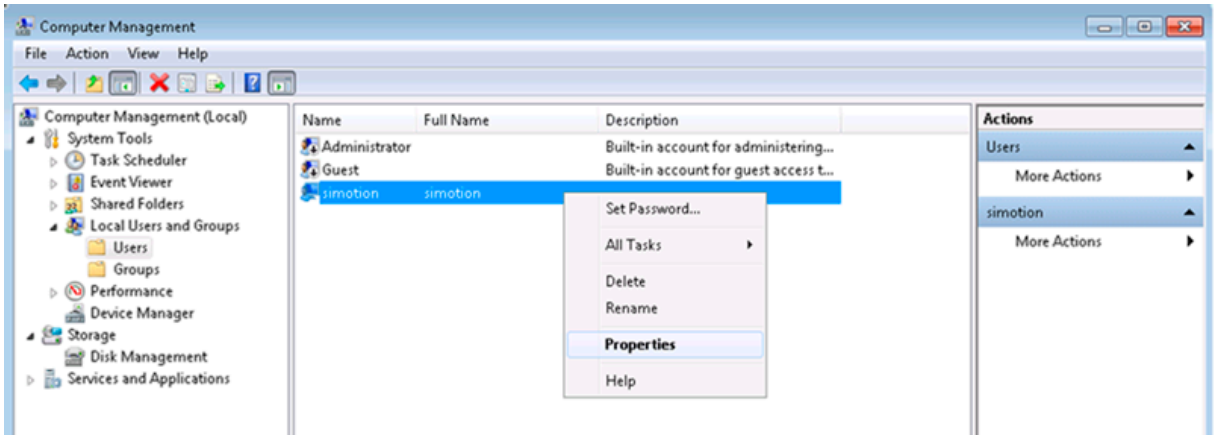

Figure 11-3 Computer management

3. With the selection of **Users simotion**, you can display the properties via **Properties**.
4. Deactivate the "**User cannot change password**" checkbox in the **General** tab on the **simotion Properties** dialog box.
   This checkbox must be deactivated for the user to change the Windows password.

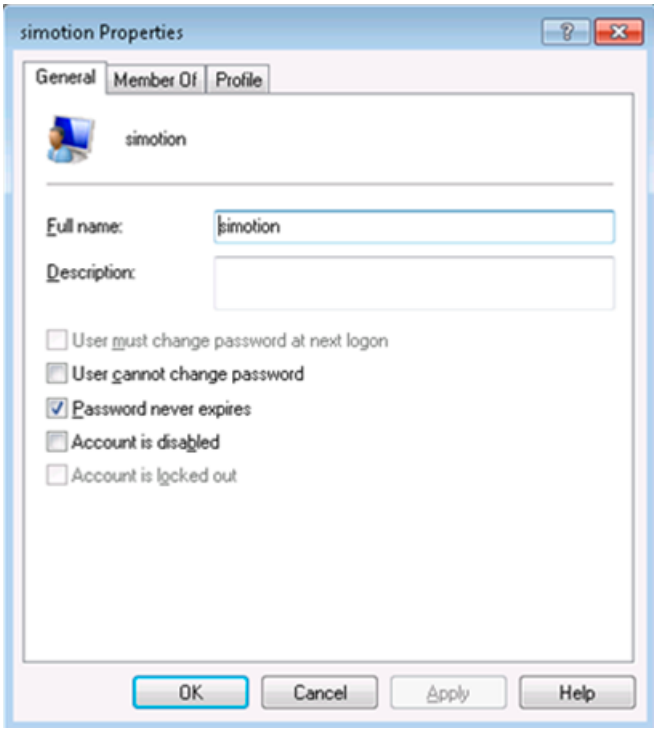

Figure 11-4 SIMOTION properties

Changing the Windows password

You can find general information on the Windows password on the website at Microsoft - Changing des Windows-password (http://windows.microsoft.com/en-us/windows/change-windows-password#change-windows-password=windows-7).

To change the Windows password, proceed as follows:

1. Press Ctrl+Alt+Del. The following Windows window opens.

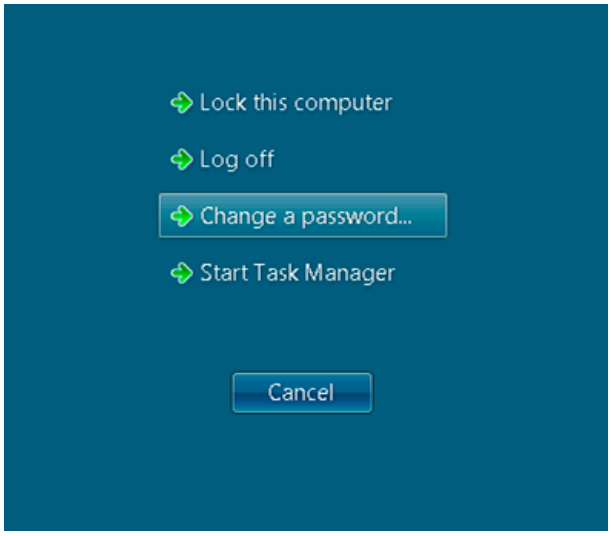

Figure 11-5 Changing the Windows password

2. After you have confirmed **Change a password...** , the Windows window to change the Windows password opens.
First enter your current password and then the new Windows password. You must enter the new Windows password a second time for confirmation.

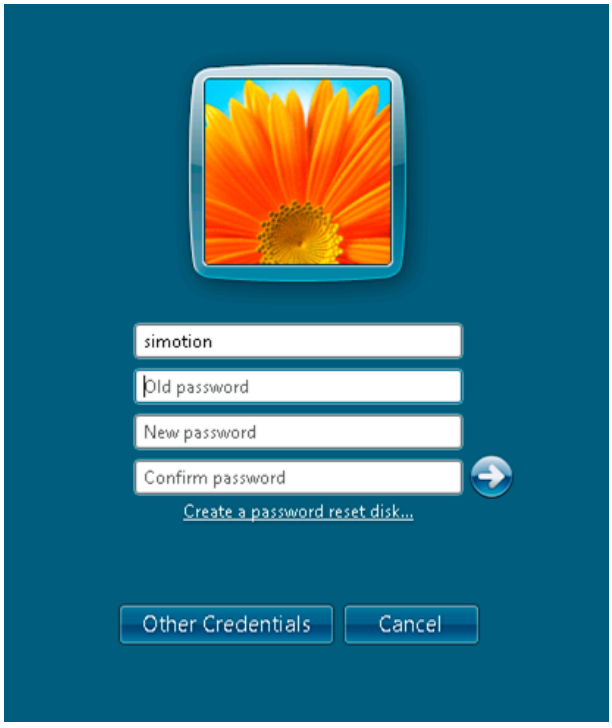

Figure 11-6 Entering the new Windows password

3. The password was changed successfully.

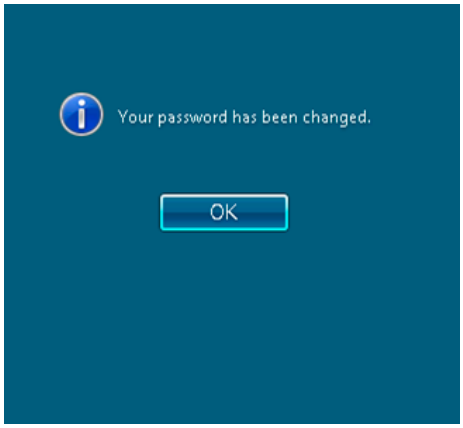

Figure 11-7 Confirmation of change

4. In the event of an error when the "User cannot change password" checkbox is activated, the following error message is displayed.
The Windows password has not been changed.

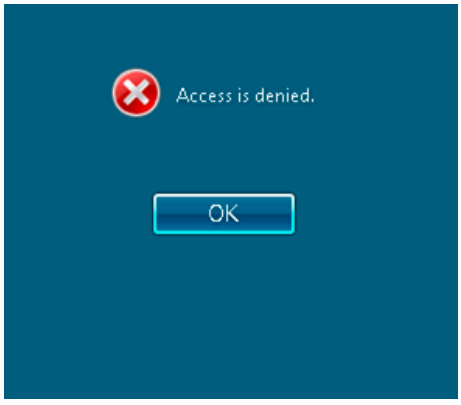

Figure 11-8 Error message when changing the Windows password has not been permitted.

Changing the AutoLogin

SIMOTION P AutoLogin

The password for the AutoLogin must be changed when the user has changed the Windows password.

The Windows user password is changed in the normal way, e.g. "Change Password" screen. See also Section Changing the Windows user password (Page 7837).

Automatically Log On

SIMOTION P320-4 is preset so that the user does not have to enter the user name and the password to log on.

Preparation for changing the AutoLogin

In order that an AutoLogin still functions after changing the Windows password, the password for the AutoLogin must be changed.

The required procedure is shown in the following so that the change of the AutoLogin for SIMOTION P320-4 can be prepared:

1. Open the **Computer Management** window via **Control Panel** > **All Control Panel Items** > **Administrative Tools** .

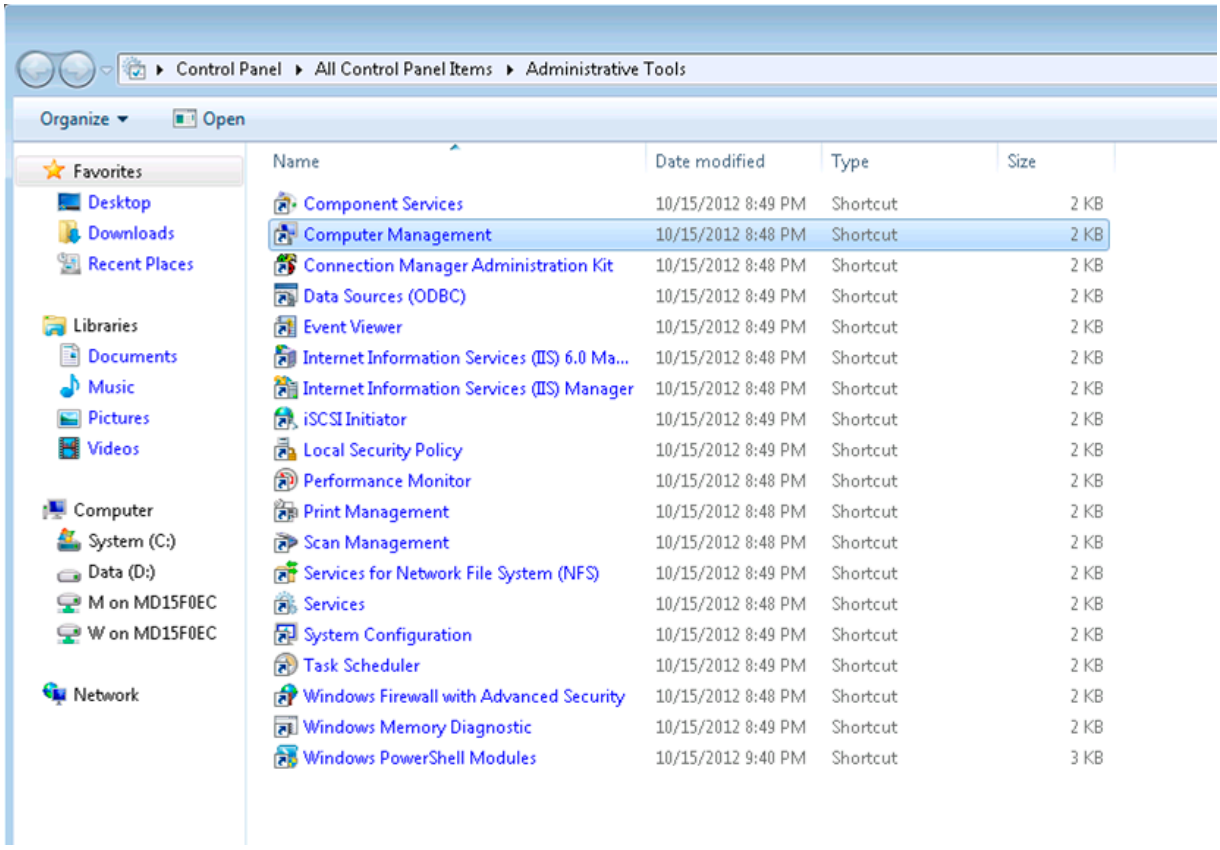

Figure 11-9 Computer Management entry point

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

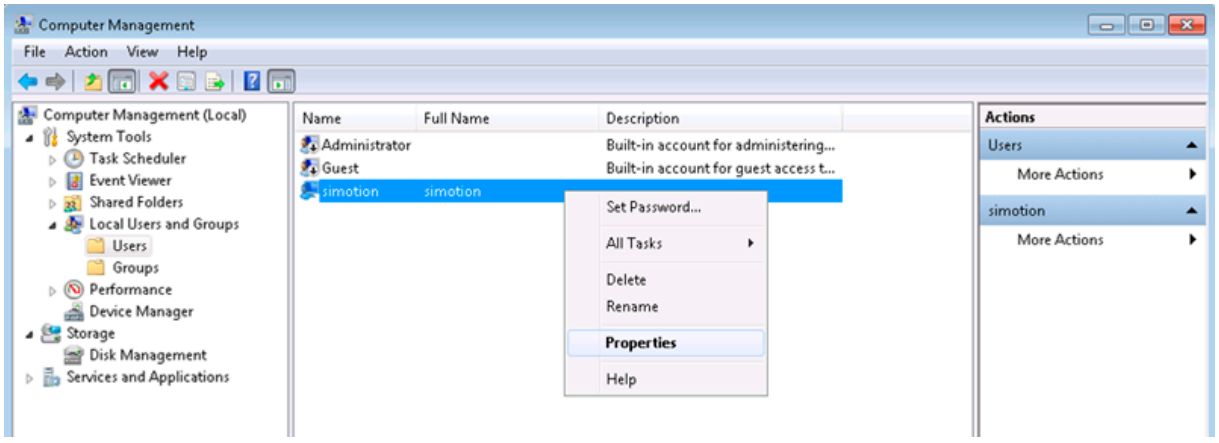

Figure 11-10 Computer Management - Users

3. With the selection of **Users**> **simotion**, you can display the properties via **Properties**.

4. Deactivate the **User cannot change password** checkbox in the **simotion Properties** dialog box.

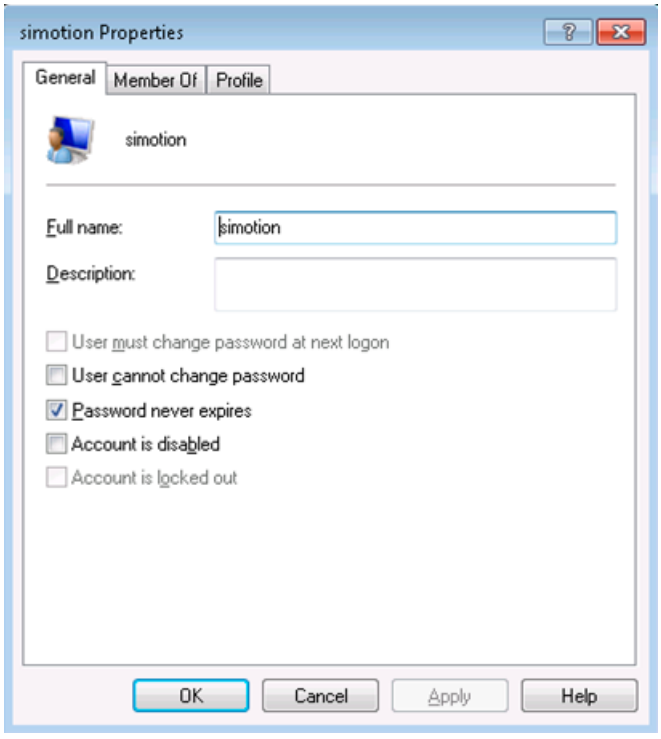

Figure 11-11 simotion Properties - General dialog box

5. Confirm with **OK.**

Changing the password for AutoLogin

To change the password for the AutoLogin, proceed as follows:

1. Open the search via **Windows-Start** and enter: **netplwiz**

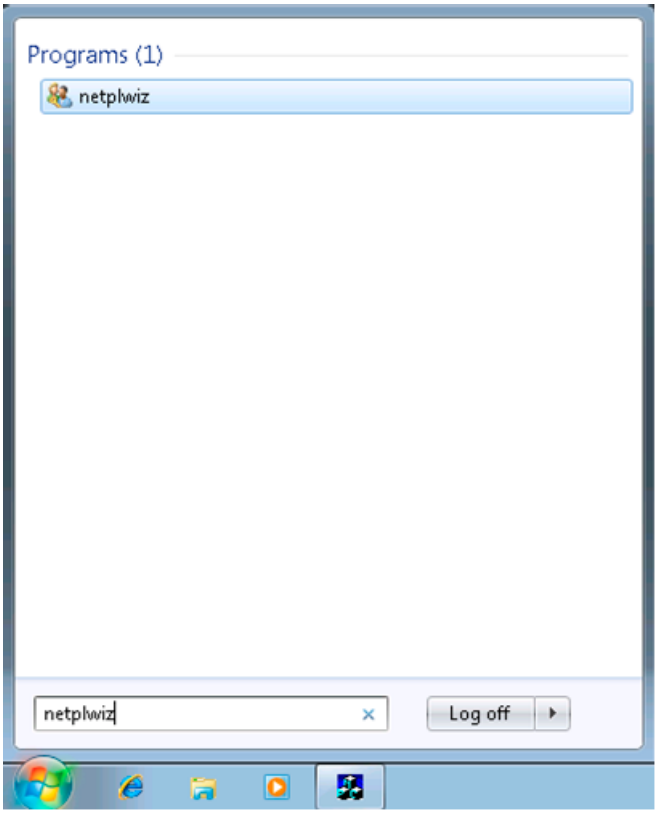

Figure 11-12 Programs netplwiz

2. The following **User Accounts** dialog box opens.

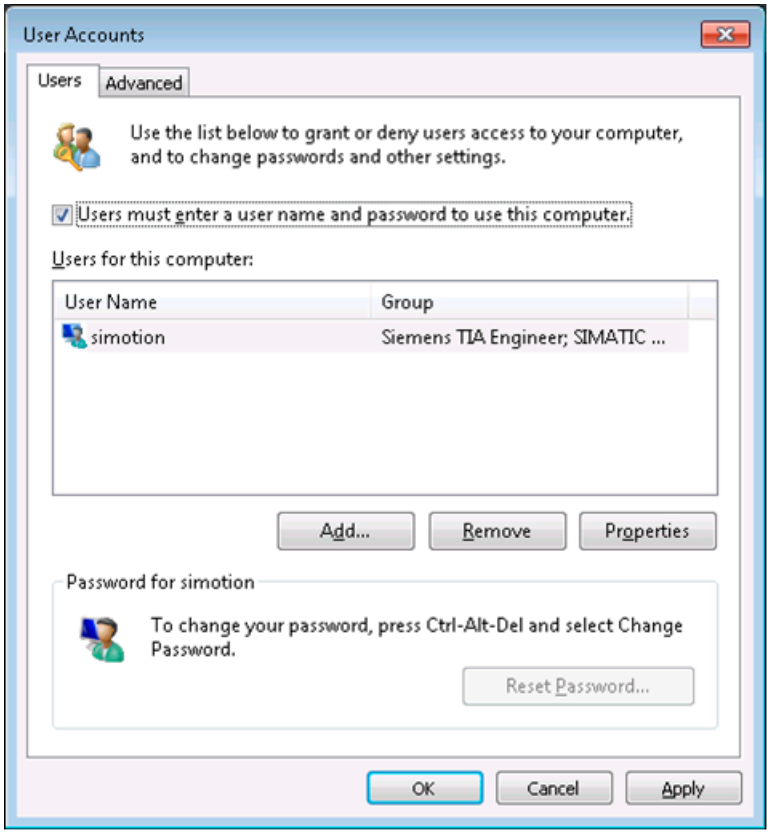

Figure 11-13 User Accounts

3. In the **Users** tab, activate the **Users must enter a user name and password to use this computer** checkbox.
   The **Apply** button is now active. Deactivate the checkbox and accept the changes now with the **OK** or **Apply** button.
   This is necessary so that the **Automatically Log On** dialog box is subsequently displayed.

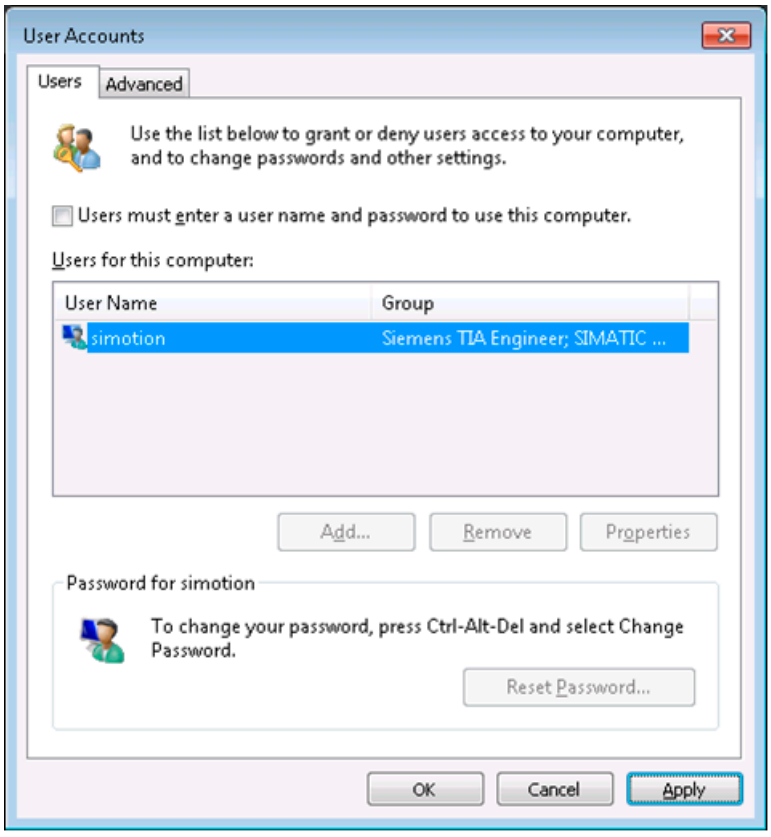

Figure 11-14 User accounts

4. Enter your changed Windows user password in the **Automatically Log On** dialog box and confirm it by entering it a second time.

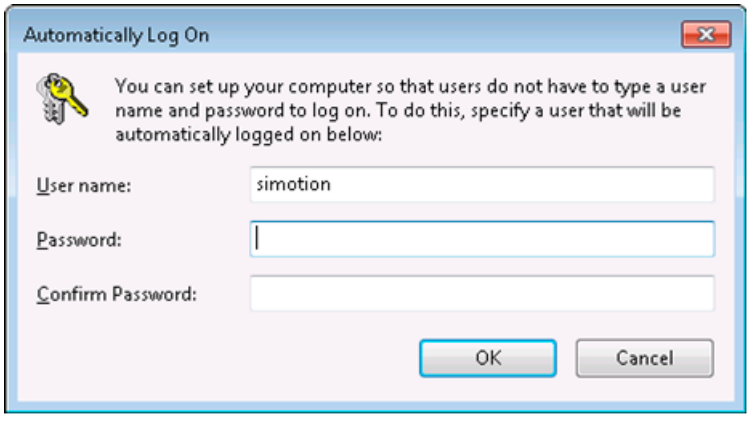

Figure 11-15 Automatically Log On dialog box

5. Confirm the password with **OK**.

Deactivating the remote desktop connection

Deactivating the remote desktop connection

If you do not use the headless mode and do not require a remote desktop connection, we recommend that you explicitly disable the remote desktop connection.

NOTICE
Deactivating the remote desktop connection
To ensure that the remote desktop connection is not used, it must be explicitly deactivated.

Procedure for deactivating the remote desktop connection

1. Using the Control Panel, select **System** > **Remote settings**.

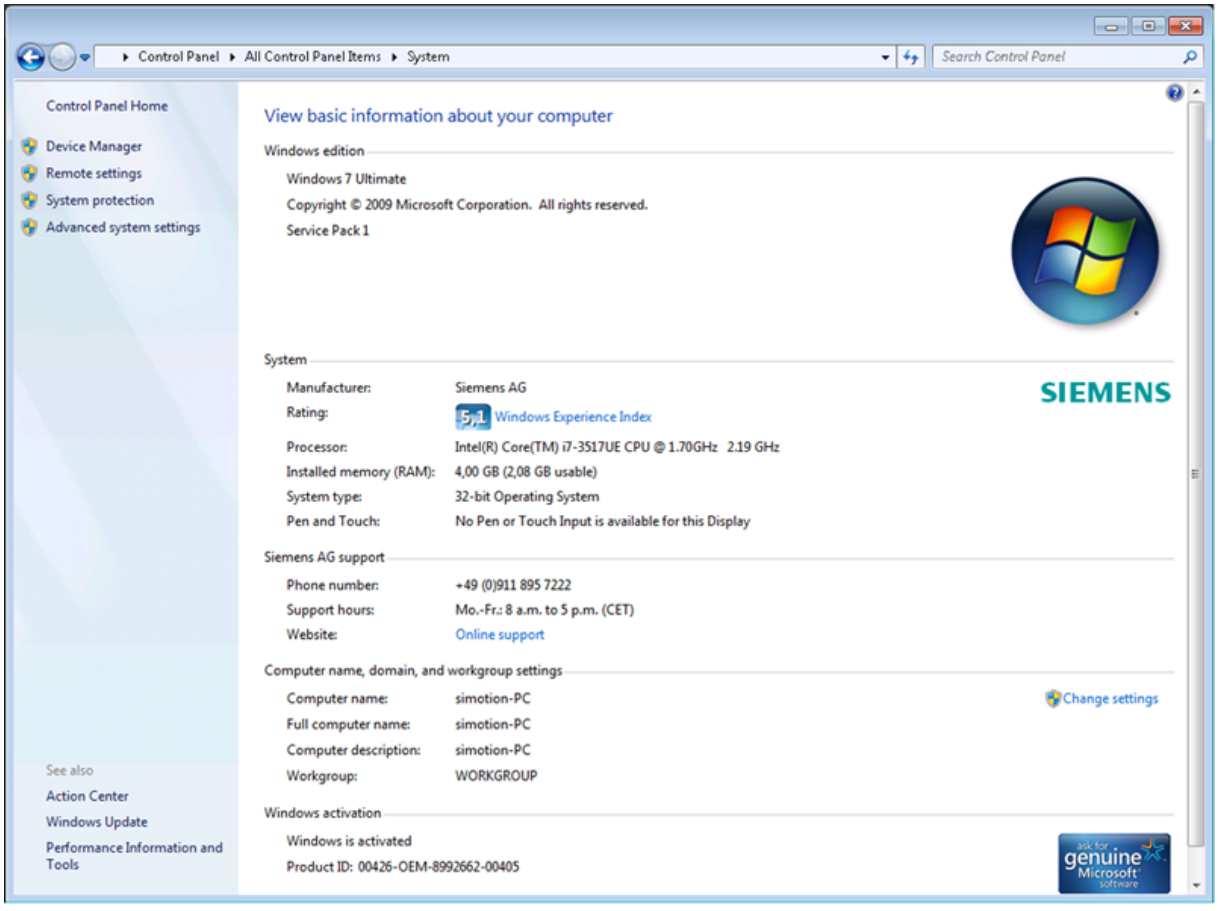

Figure 11-16 Remote settings

2. Select the **Remote** tab in the **System Properties** dialog box.

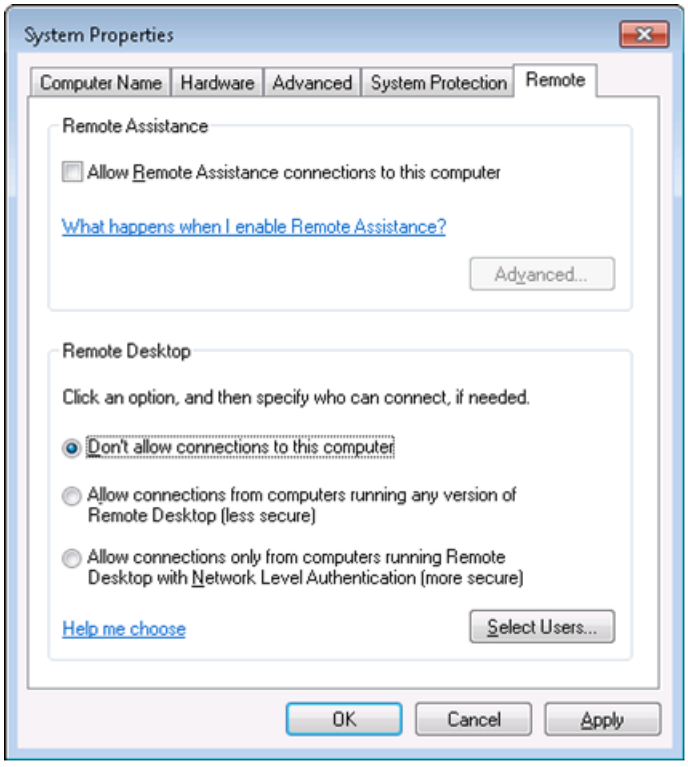

Figure 11-17 System Properties dialog box

3. Select the **Don't allow connections to this computer** option at **Remote Desktop**.
4. Confirm with **OK**.

Any remote desktop access is deactivated with this operation.

11.1.1.3 Description

System overview

Overview

SIMOTION P is a PC-based, open Motion Control System from SIMOTION.
Control, motion control, and HMI functions are executed together with standard PC applications on the SIMOTION P hardware platform. SIMOTION P combines the compatibility of the Windows operating system with real-time capability of SIMOTION P Runtime.

The fully independent SIMOTION P Runtime runs in parallel to Windows on SIMOTION P. This real-time expansion makes it possible to implement demanding motion control applications with high performance requirements on platforms of the SIMOTION P range. The hardware consists of a computing unit with innovative Intel technology, which is ready for operation at the time of delivery.

The drives and I/O devices are connected either via PROFINET onboard or IsoPROFIBUS board (optional).

The SIMATIC Flat Panel IFP1500, IFP1900 and IFP2200 can be used for the operation of the SIMOTION P320-4 hardware platform in a distributed configuration.

SIMOTION P320-4 versions

The SIMOTION P320-4 can control various I/O systems and HMI components via PROFINET onboard or the optional IsoPROFIBUS board.
If required, a USB DVD drive can be connected, for example.

The following versions of the SIMOTION P320-4 are available:

- SIMOTION P320-4 E
  with the Windows Embedded Standard 7 32-bit operating system and real-time expansion for SIMOTION.
- SIMOTION P320-4 S
  with the Windows 7 Ultimate 32-bit operating system and real-time expansion for SIMOTION.

Application

The SIMOTION P320-4 applications are directed at machines that require a high level of integration of PLC, motion control and technology functions on account of the increasing use of servo drives:

- Packaging machines
- Plastic and rubber processing machines
- Presses, wire-drawing machines
- Textile machines
- Printing machines
- Machines for processing wood, glass, ceramics, and stone
- Production lines in the renewable energy sector, e.g. solar technology, wind power installations

SIMOTION P320-4 product description

SIMOTION P320-4 overview

The SIMOTION P320-4 provides high-level industrial performance. It features:

- Compact design
- Maintenance-free operation
- High degree of ruggedness
- Long-term availability

Figure 11-18 SIMOTION P320-4 view

Figure 11-19 SIMOTION P320-4 (open perspective) with plugged-in optional IsoPROFIBUS board

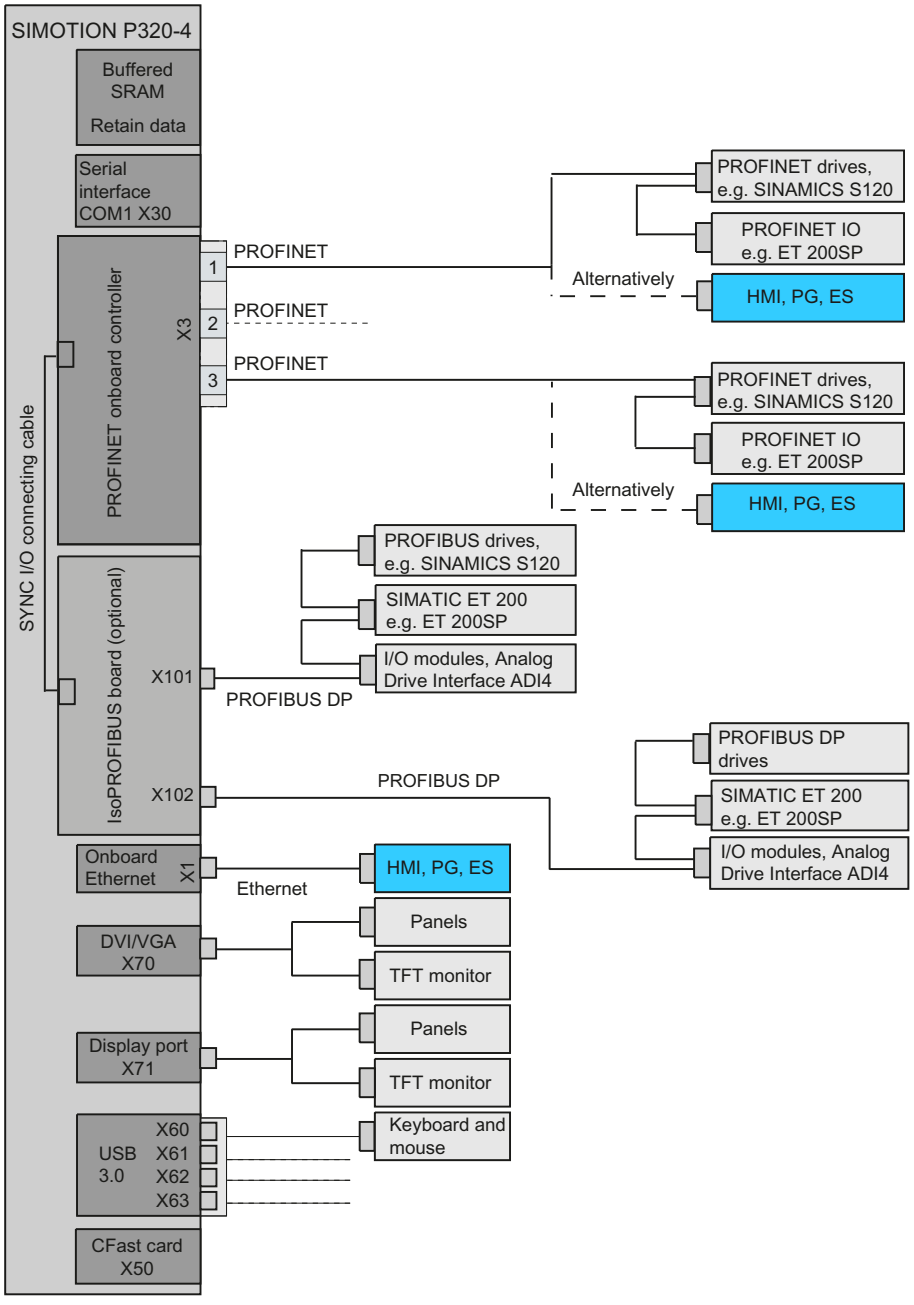
Features

Basic data	
Installation	• Standard rail mounting • Vertical mounting
Processor	
P320-4 E **P320-4 S**	Intel Core i3-3217UE, 2 x 1.6 GHz, 3 MB cache Intel Core i7-3517UE, 2 x 1.7 GHz, 4 MB cache
Main memory	4 GB DDR3 RAM
Optional IsoPROFIBUS board (PROFIBUS DP)	2 x SUB-D socket with configurable baud rates (9.6 Kbit/s - 12 Mbps)
Graphics	• Integrated Intel HD2000 or HD4000 • DVI resolution of 640 × 480 pixels up to 1920 × 1200 pixels • Display port resolution max. 1920 × 1200 pixels • Graphics memory is occupied in the main memory (dynamic UMA)
Power supply	24 VDC (-20%/+20%) max. 4 A
Operating conditions	Operation without fan
Drives and storage media	
CFast card or SSD (Solid State Disk)	Depending on the hardware version of the SIMOTION P320-4
P320-4 E	**2 x CFast card** Internal interface: CFast External interface: CFast
P320-4 S	**SSD (Solid State Disk)** Internal interface: SSD **CFast card** External interface: CFast
USB stick	External, can be connected via USB interface
Interfaces	
Serial	COM (RS 232)
Graphics	DVI-I: Suitable for use as DVI or VGA DPP++: Display port, DVI via DPP-to-DVI adapter
USB	4 × USB 3.0, simultaneous operation of high current, backward compatible with USB 2.0/1.1
Ethernet	1 × RJ45 (10/100/1000 Mbps)
PROFINET I/O	3 × RJ45 (100 Mbps)
Keyboard, mouse	Can be connected via USB interface

Software	
Operating systems	
P320-4 E	Windows Embedded Standard 7 32-bit
P320-4 S	Windows 7 Ultimate 32-bit

SIMOTION P320-4 (hardware) structure

The following figure shows the integration of the SIMOTION P320-4 with integrated PROFINET onboard and optional IsoPROFIBUS board in a target system.



HMI Human Machine Interface

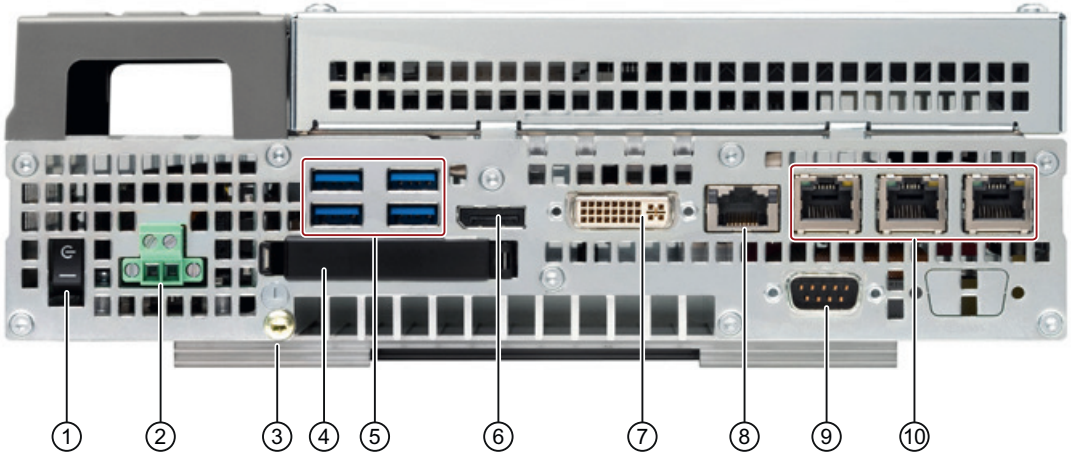
PG Programming device

ES Engineering system

Figure 11-20 SIMOTION P320-4 system overview

Interfaces and operating elements

SIMOTION P320-4



①	On/off switch	Position **OFF** is the delivery state. The on/off switch does not isolate the device from the power supply.
②	24 V DC	Power supply connection
③	Protective conductor	Protective conductor terminal
④	Memory card slot	Cover for the CFast card
⑤	4 × USB 3.0	USB 3.0 high current, backward compatible with USB 2.0/1.1
⑥	Display port	Display port connection for digital monitor
⑦	DVI-I	DVI connector for CRT or LCD monitor with DVI interface
⑧	Ethernet	RJ45 Ethernet connection for 10/100/1000 Mbps
⑨	COM1	Serial interface
⑩	3 × PROFINET	PROFINET ports with three RJ45 sockets

SIMOTION P Runtime (software) structure

SIMOTION P Runtime contains the SIMOTION P Kernel which performs the motion control and interface control.

A SIMOTION project is planned, configured, assigned parameters, commissioned and programmed via the SIMOTION SCOUT engineering system (ES).

The user data can be stored on the data media of the SIMOTION P320-4 .

Siemens WinCC flexible software can be used to visualize operational sequences or to operate the machine. Third-party systems can be linked via the OPC interface.

SIMOTION P Runtime

With the SIMOTION P320-4, the PLC and motion control functionality (starting from position controller upwards) is located centrally in a strictly deterministic task outside the Windows operating system.

Its main field of application is centralized motion control and control tasks requiring close coordination between multiple axes and/or input/output modules.

Functionality ranges from simple positioning to high-performance synchronous operation.

SIMOTION SCOUT

The SIMOTION SCOUT engineering system can be installed on the SIMOTION P320-4 S or connected via the interfaces integrated in SIMOTION P320-4 .

SIMOTION SCOUT TIA

As of version V4.5, the SIMOTION SCOUT TIA engineering system no longer supports the Windows 7 32-bit operating system and therefore cannot be installed.

HMI software

HMI/Runtime software can be operated on the same PC, e.g. the Siemens WinCC flexible software. Other software packages can be linked by means of the OPC interface.

The **HMI software** is used as the general term in the following.

Internal communication

A locally installed HMI can use the local communication to access the following:

- Variables in SIMOTION RT
- Drives on PROFINET IO or PROFIBUS DP
- Other SIMOTION devices on PROFINET IO or PROFIBUS DP

Scope of delivery

The system software supplied with the SIMOTION P320-4 is either already installed on the SIMOTION P320-4 storage medium or is ready to be installed:

- SIMOTION P Kernel
- SIMOTION IT
- SIMOTION IT VM Virtuell Machine (subject to license)

Components

The most important components of the SIMOTION P320-4 and their functions are listed below.

Distributed I/O systems (PROFINET)

Table 11-1 Components for distributed I/O

Component	Function
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities.
SIMATIC ET 200S	Finely modular I/O system for cabinet installation including motor starters, safety technology, and individual grouping of the load groups.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; SIMATIC ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200eco	I/O system with IP67 degree of protection for machine-related, cabinet-free applications, featuring a flexible and fast connection system in ECOFAST or M12.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related, cabinet-free applications, including motor starters.

Note

Note that not all modules of the above-mentioned I/Os or I/O systems have been released for SIMOTION.

There may also be system-dependent functional differences with regard to the use on SIMOTION and on SIMATIC.
For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

For a detailed and routinely updated list of I/O modules enabled with SIMOTION as well as application information, visit us online at:

SIEMENS Industry Online Support - Product support - Supplementary system components (https://support.industry.siemens.com/cs/de/en/view/11886029)

Further modules are integrated via the GSD file of the device's manufacturer.

Note

Note that in individual cases, additional supplementary conditions must be fulfilled.

Drive systems (via PROFINET IO)

Table 11-2 List of typically connected drive systems

Component	Function
SINAMICS S120	Servo drives, innovative single-axis and multi-axis solution

Optional components

Table 11-3 Optional components

Centralized I/O	Function
IsoPROFIBUS board	PROFIBUS connection
UPS	Uninterruptible Power Supply The drivers for the UPS are not pre-installed on the PC. Install the current drivers that are supplied with the UPS.

Note

An IsoPROFIBUS board may be inserted in addition to the PROFINET onboard.

HMI and SIMOTION SCOUT

HMI and SIMOTION SCOUT Overview

The operational sequences on the SIMOTION P320-4 are either monitored via the HMI system (Human Machine Interface) or the SIMOTION SCOUT engineering system.

The HMI or ES software can be connected using the following versions:

- Local (Page 7858)
- via PROFINET (Page 7871)
- via Ethernet (Page 7872)
- via IsoPROFIBUS (optional) (Page 7873)

Local communication of the HMI/ES

If HMI or ES is installed locally on the SIMOTION P320-4, **PC internal** can establish a connection to the local **SIMOTION P Runtime** . Only a local connection is permitted.

See section Local HMI or ES on SIMOTION P320-4 (Page 7858)

Communication of the HMI / ES via PROFINET / Ethernet / PROFIBUS

By using one of these communication versions, you can control and monitor several SIMOTION devices.

Local HMI or ES on SIMOTION P320-4

The model described below is used for the communication of the SIMOTION P320-4 with a local HMI or ES. The SIMOTION SCOUT engineering system or the HMI system can be installed directly on the **SIMOTION P320-4 S**.

For this model, you must set the communication (access point) to **TCP/IP** .

The SIMOTION P320-4 is already configured for this communication version at the time of delivery.

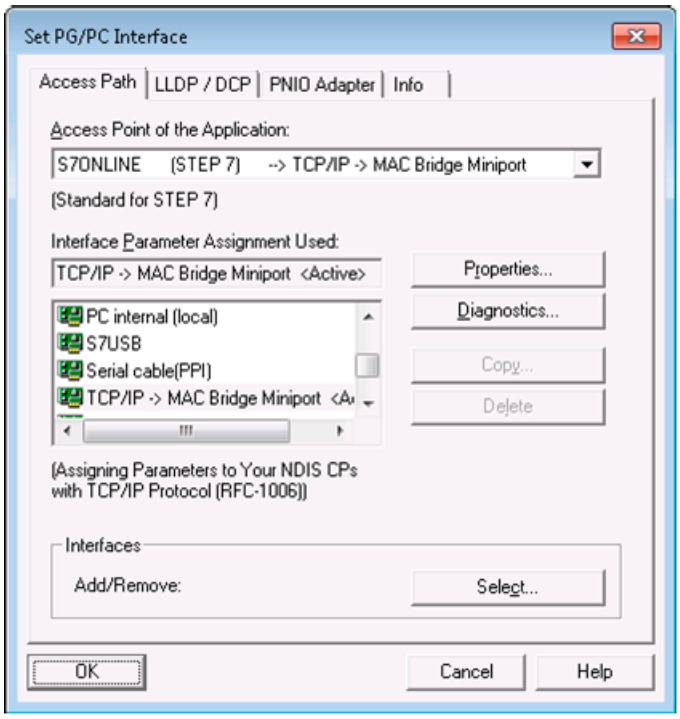


Figure 11-21 Set PG/PC Interface - TCP/IP -> MAC Bridge Miniport dialog box

Note

Local communication via Ethernet (TCP/IP)

For the communication via Ethernet (TCP/IP) to function locally, a link must be available to the Ethernet interface or a LAN cable must be connected **or** the MAC bridge set up.

Note

Setting up the MAC bridge miniport

See also Section Setting up a network bridge - MAC bridge miniport (Page 7860)

Note

Only HMI-Runtime can be installed on the **SIMOTION P320-4 E** version.

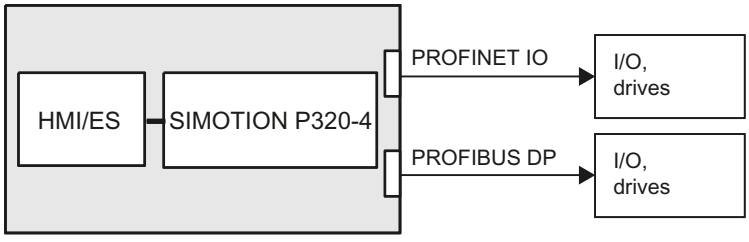

Figure 11-22 Model: Local HMI or ES

Alternatively to TCP/IP , SIMOTION SCOUT can also communicate locally via PC internal (local) .

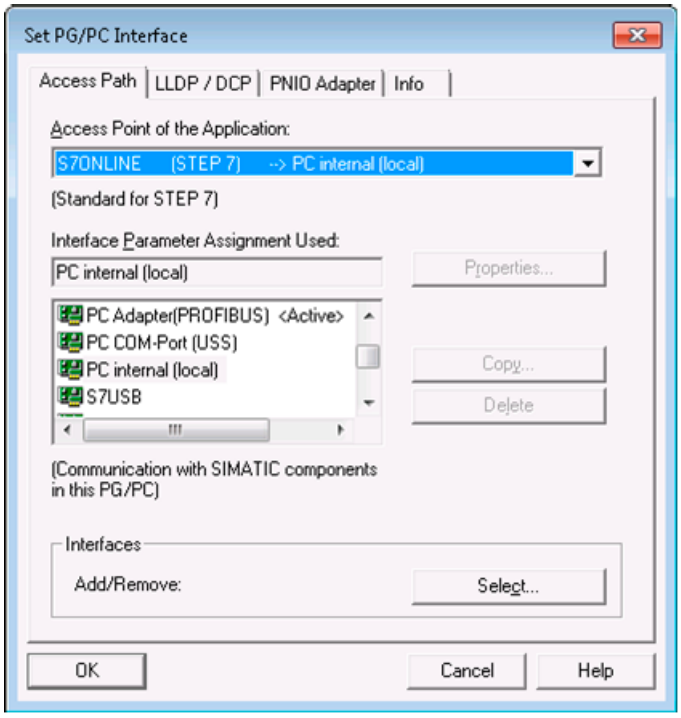

Figure 11-23 Set PG/PC Interface - PC internal (local) dialog box

Setting up a network bridge - MAC bridge miniport

Note

If you are working with SIMOTION P320-4 version V4.5, the Network Bridge is already preset.

The network bridge must be preset, configured via script and set up as described in the following. Note that the MAC address of the network bridge is different to the MAC address of the Ethernet adapter.

The following is a step-by-step description of how the network bridge **MAC Bridge Miniport** is set up.

Network connections initial situation

Open the **Network and Internet** via the Control Panel.

- Select **Control Panel** > **All Control Panel Items** > **Network and Sharing Center** > **Change adapter settings**.
- Open the **Network and Internet** > **Network Connections** dialog box.
  The network connections of your PC are shown here.

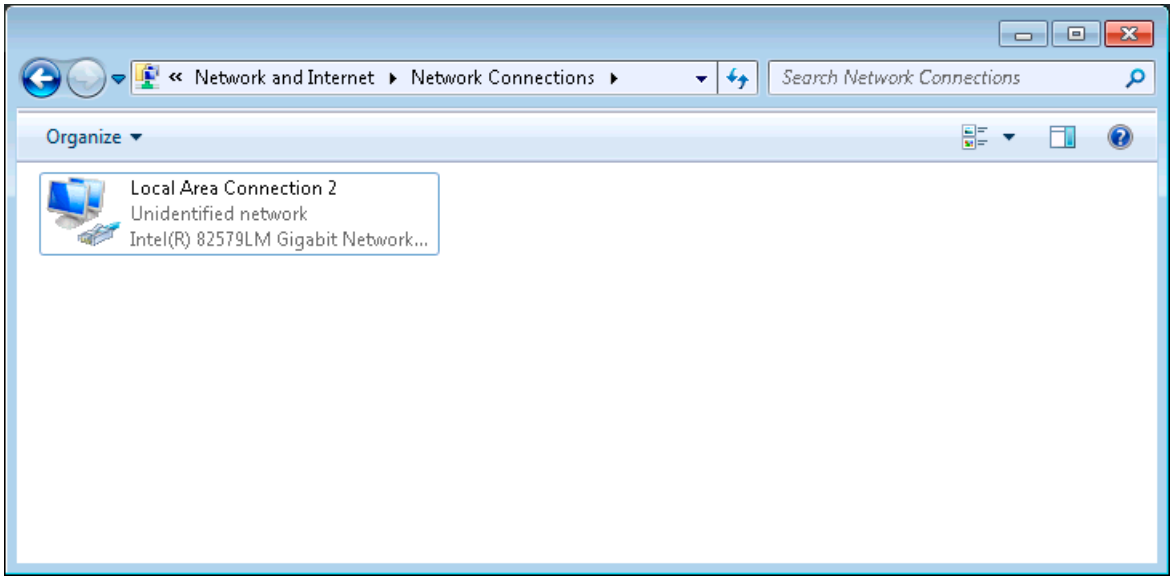

Figure 11-24 Initial situation - Network connections

Device Manager

Open the Device Manager via the Control Panel:

Control Panel > **All Control Panel Items** > **System** > **Device Manager**.

1. Select the **Network adapters** in the dialog box below the "SIMOTION PC". The available network connections are shown here.

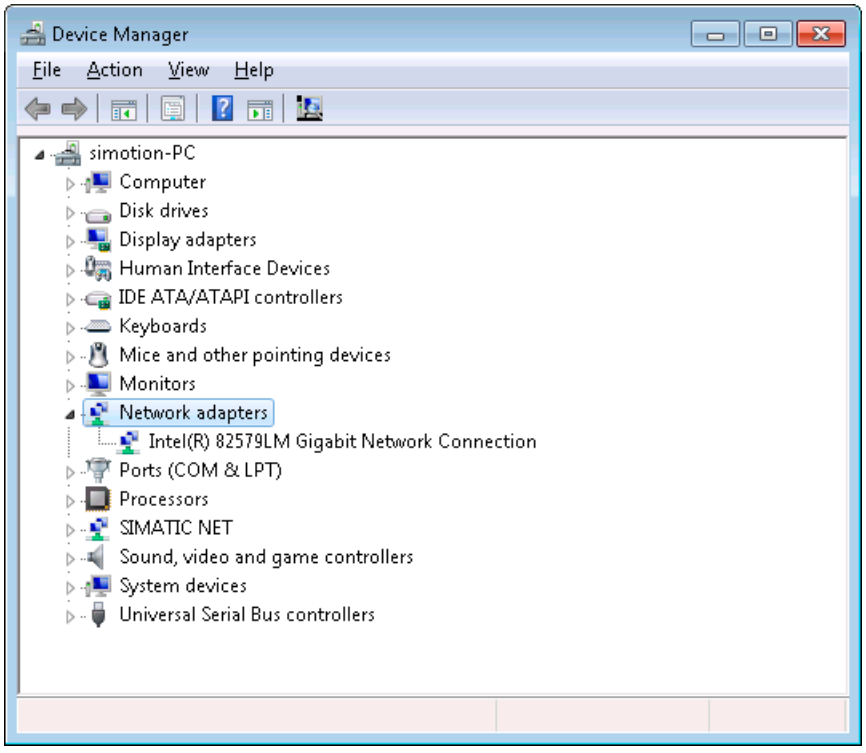

Figure 11-25 Opening the Device Manager

2. Install the **Microsoft Loopback Adapter** via the Device Manager.
3. To do this, select the menu **Action** > **Add legacy hardware**. The **Add Hardware Wizard** then opens.

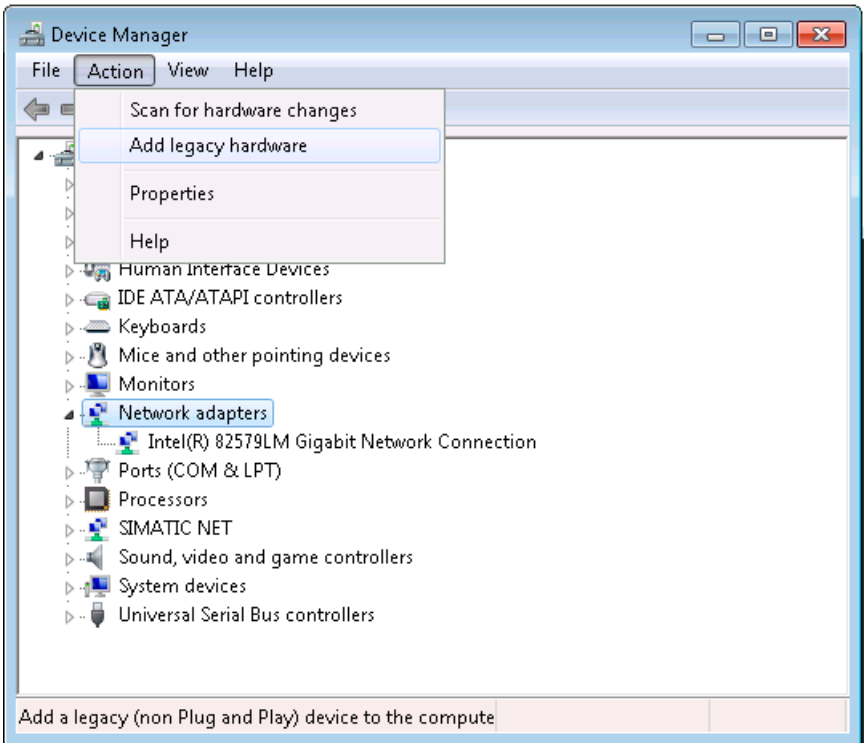

Figure 11-26 Device Manager - Action menu

Add Hardware Wizard

Use the **Add Hardware Wizard** to install the network bridge.

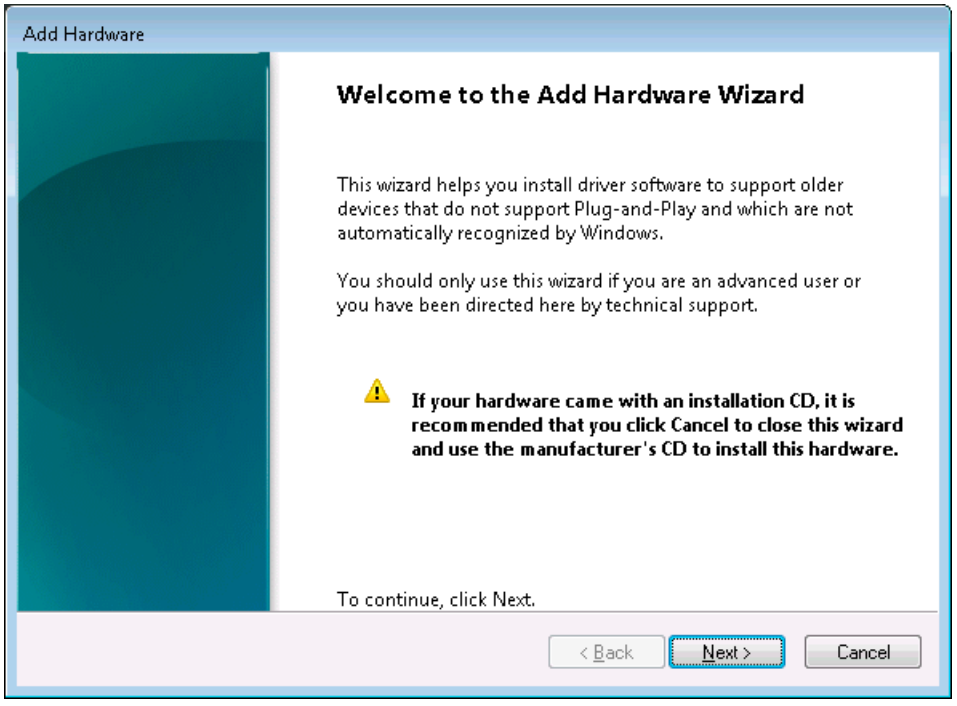

Figure 11-27 Add Hardware - Starting the wizard

1. Click **Next** to start the software wizard.
2. Select the option: **Install the hardware that I manually select from a list (Advanced)** and continue in the wizard with **Next**.

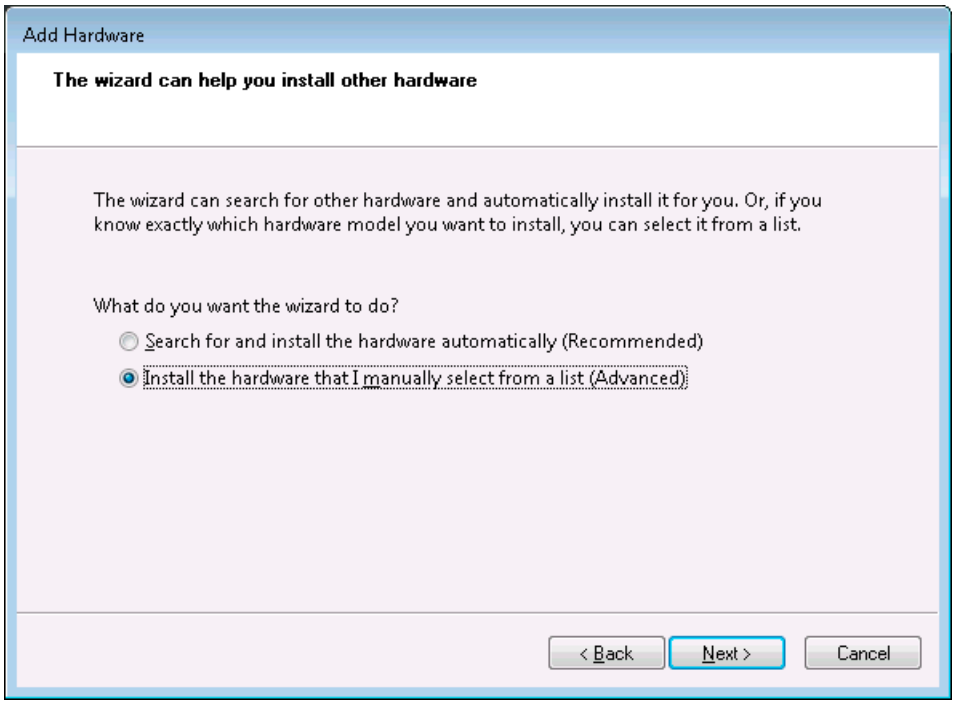

Figure 11-28 Add Hardware - Manual selection from a list

3. Select **Network adapters** in the dialog box now open and continue in the wizard with **Next**.

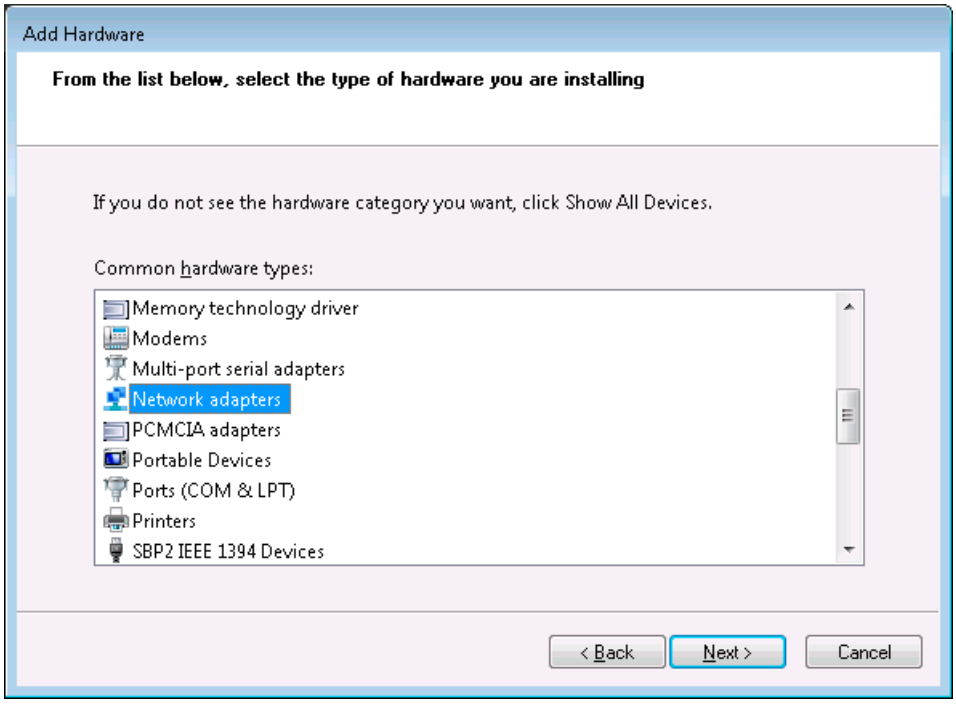

Figure 11-29 Select Add Hardware - Network adapters

4. In the following dialog box, select the **Microsoft Loopback Adapter**.
5. To do this, select Microsoft at **Manufacturer** and the Microsoft Loopback Adapter at **Network Adapter**.

6. Continue in the wizard with **Next**.

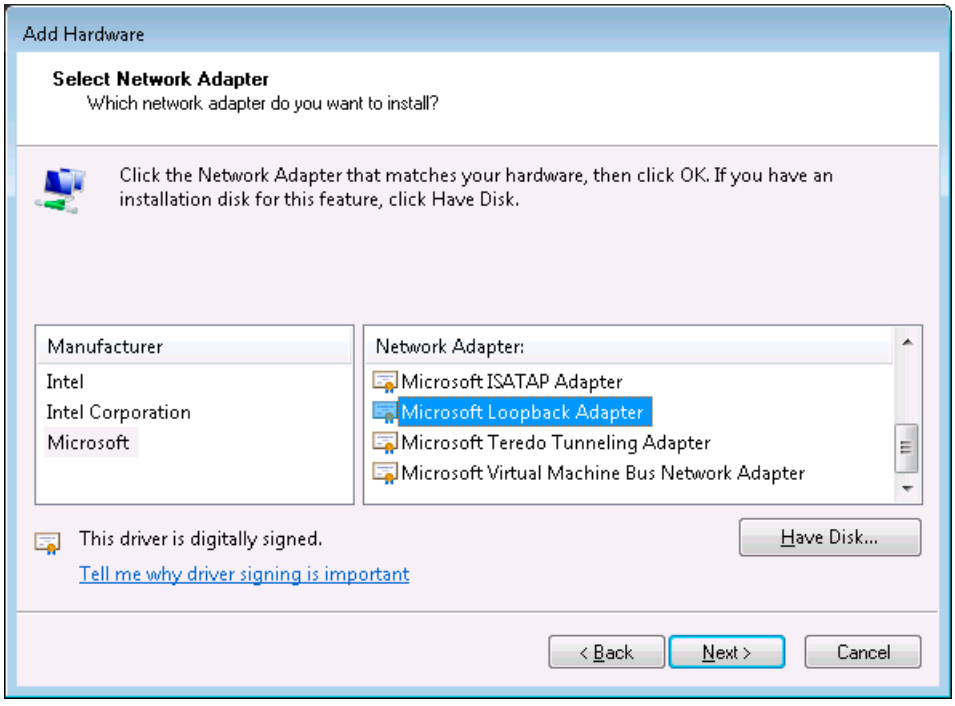

Figure 11-30 Add Hardware - Selecting the desired Network Adapter

7. The selected Network Adapter is shown in the following dialog box.
   Click **Next** to confirm and install.

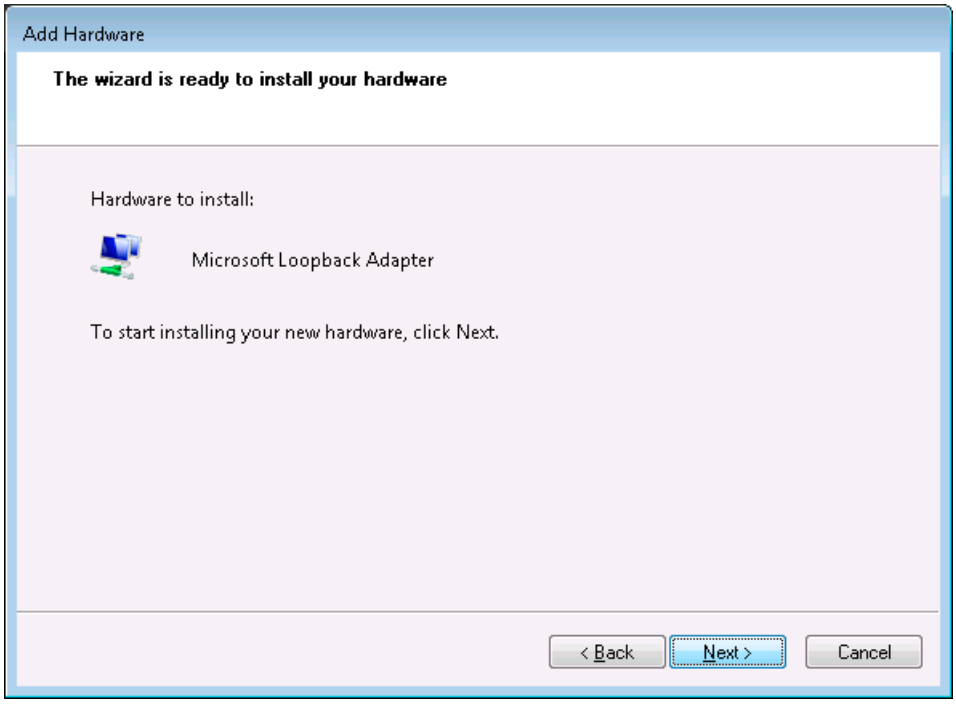

Figure 11-31 Add Hardware - Selected Network Adapter can be installed

8. After finishing the installation, the following dialog box is displayed.
   Exit the wizard with **Finish**.

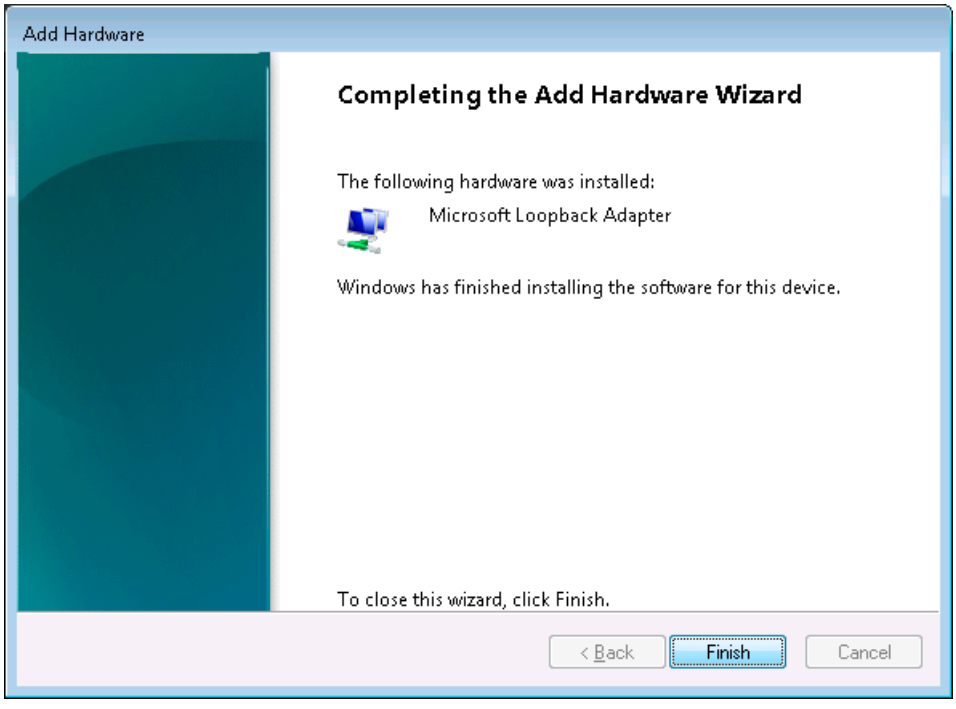

Figure 11-32 Add Hardware - Installation of the Microsoft Loopback Adapter is finished

Checking the installation of the network adapter

You can check the successful installation of the **Microsoft Loopback Adapters** in the

- Device Manager
- Internet connections

Device Manager

The Microsoft Loopback Adapter is displayed at **Network adapters** in the Device Manager.

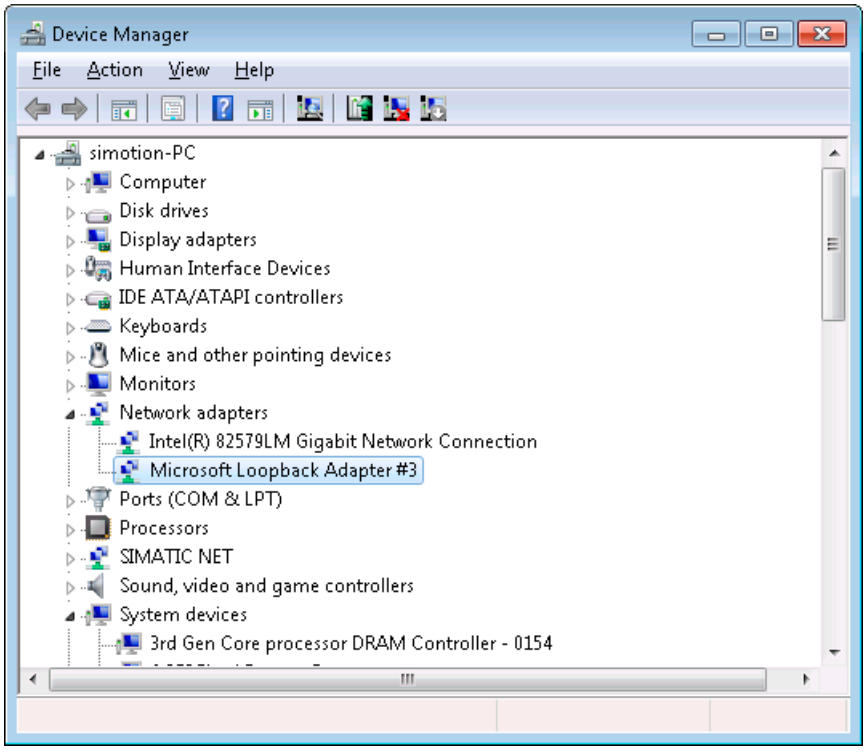

Figure 11-33 Device Manager - Microsoft loopback adapter

Network connections

The newly installed Microsoft Loopback Adapter is also displayed at **Network Connections**.

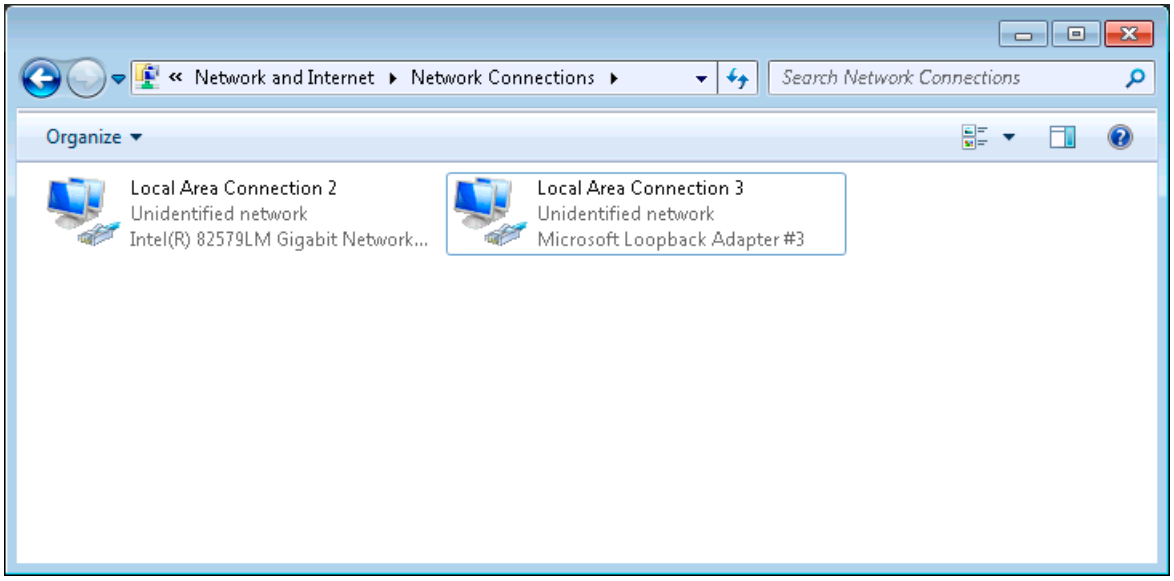

Figure 11-34 Network connections - Display of the newly installed Microsoft loopback adapter

Creating the network bridge

To activate the network bridge, proceed as follows:

1. Select both adapters at Network Connections
2. Select Bridge Connections via the context menu.

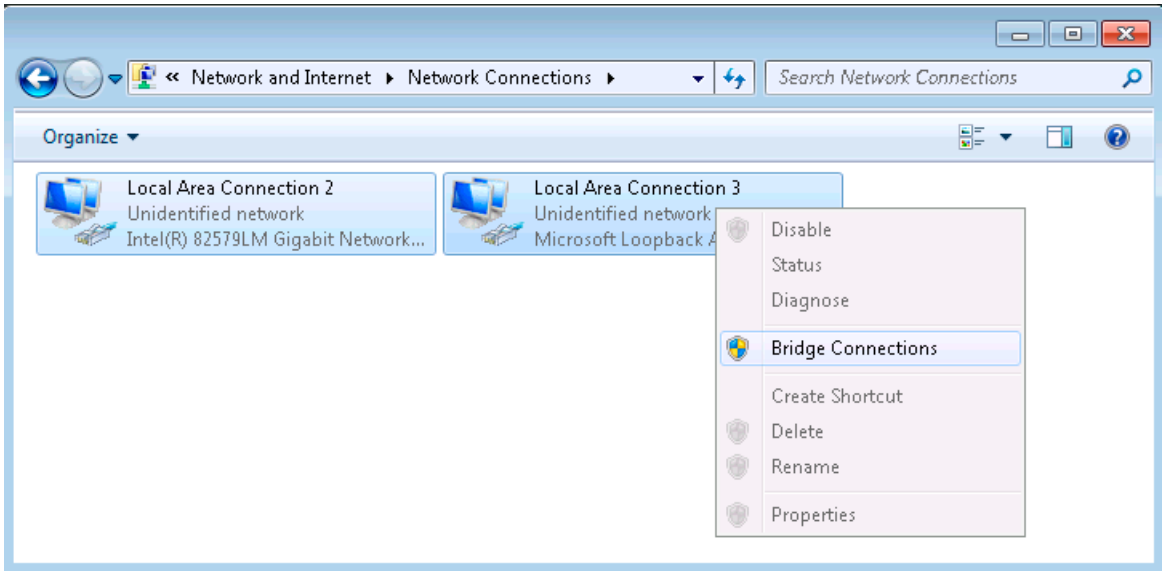

Figure 11-35 Network Connections - Setting the Bridge Connection

3. The Network Bridge MAC Bridge Miniport is displayed.

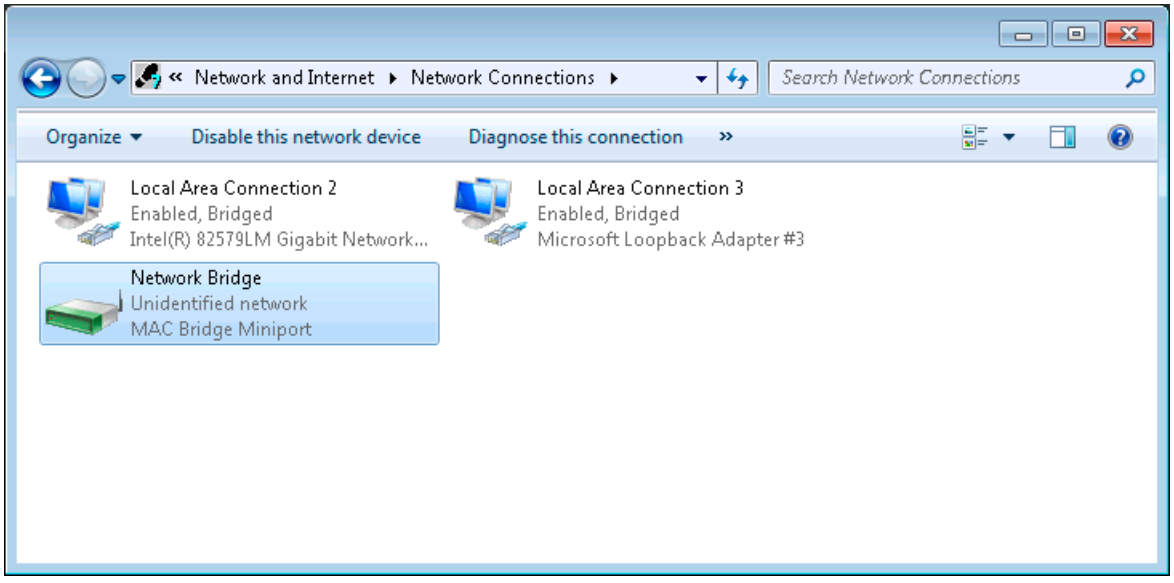

Figure 11-36 Network Connections - Display of the Network Bridge MAC Bridge Miniport

4. To initialize the network bridge, execute the **sp_bridge.cmd** Windows command script.
   The additional script can be found at C:\SiMotion\tools\sp_bridge.cmd
   After executing the batch file, the network bridge has been set up.

Setting "Set PG/PC interface"

Now open the PG/PC interface to complete the setting for the **Network Bridge** .

1. Open the **Set PG/PC Interface** dialog box via the **Control Panel** entry point.
2. Deactivate the **MAC Bridge Miniport DCP** checkbox in the **LLDP / DCP** tab.
   If you do not deactivate the MAC Bridge Miniport DCP, the SIMOTION P320-4 may not be found via Accessible nodes.

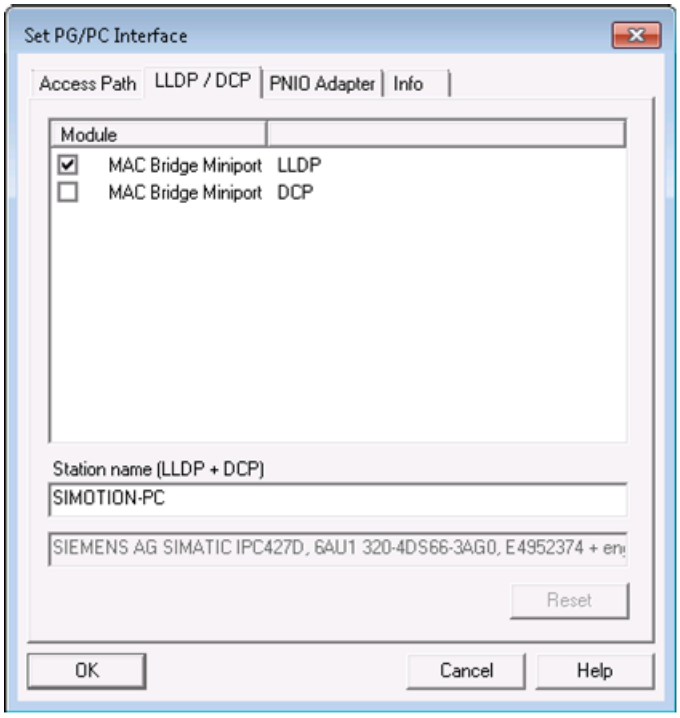

Figure 11-37 Set PG/PC interface

The settings for the network bridge have now been completed.

HMI or ES via PROFINET

Networking via PROFINET

PROFINET is the innovative and open Industrial Ethernet standard (EN 61158) for industrial automation. With PROFINET, devices can be linked up from the field level through to the management level.

With PROFINET, an external HMI or ES can also be integrated into the network and data can be exchanged directly with the SIMOTION P320-4 device.

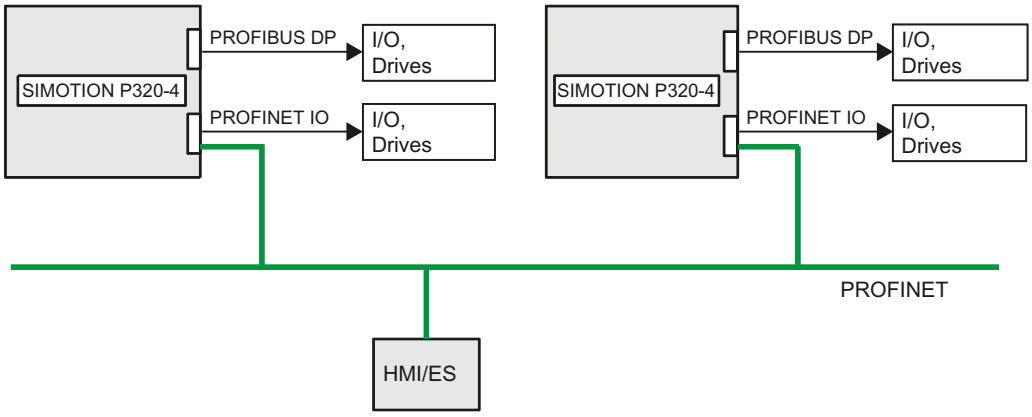

Figure 11-38 Model: Networking via PROFINET

References

You can find further information on the HMI in the documentation:

- SIMOTION Runtime Basic Functions, Section HMI (Human Machine Interface) coupling.
- SIMOTION SCOUT, Configuration Manual
- SIMOTION SCOUT TIA, Configuration Manual
- SIMOTION SCOUT TIA Device Proxy, Configuration Manual

HMI or ES via Ethernet

Networking via Ethernet

A complex interconnection with several HMIs or ESs is only possible using an Ethernet communication. This allows both an external HMI or ES to access several SIMOTION devices or one SIMOTION device to access another one, for example, to display the production data.

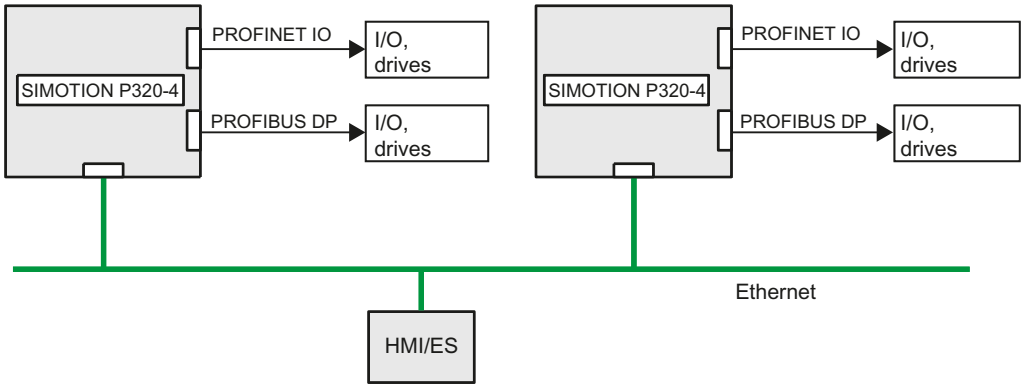

Figure 11-39 Model: Networking via Ethernet

The following services are possible on a SIMOTION device via Ethernet:

- HMI software
  WinCC flexible or the OPC server can use Ethernet to access one or more SIMOTION devices.
- SIMOTION SCOUT Engineering System
  SIMOTION SCOUT can also use Ethernet to access one or more SIMOTION devices.
- SIMOTION IT
  SIMOTION P320-4 offers communication with standard IT protocols (HTTP) over the integrated Ethernet interface.
  This makes it possible to access data or diagnostic information in the SIMOTION P320-4 from any location via intranet or the Internet.
- HTTP (browser, OPC XML)
  Setting in WebCFG.xml - default 80
- HTTPS (browser, OPC XML)
  Setting in WebCfg.xml - default 443
- FTP 21
- Telnet

References

You can find further information in the documentation for SIMOTION IT:

- SIMOTION IT Diagnostics and Configuration
- SIMOTION IT Programming and Web Services
- SIMOTION IT Virtual Machine and Servlets

HMI or ES via IsoPROFIBUS (optional)

Networking via PROFIBUS DP

If you connect a central HMI via PROFIBUS DP, the X101 and X102 interfaces of the IsoPROFIBUS board are available.

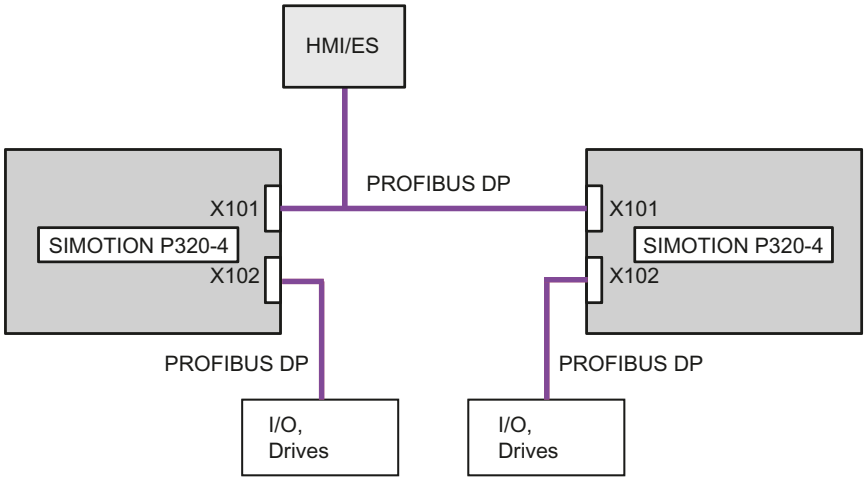

Figure 11-40 Model: Networking via PROFIBUS DP

References

You can find further information on the HMI in the documentation:

- SIMOTION Runtime Basic Functions, section HMI (Human Machine Interface) coupling.

11.1.1.4 Use planning

The use planning is described in the SIMOTION P320-4 E / P320-4 S manual.
There you receive the following information:

- Unpacking and checking the delivery
- Device identification data
- Information about the permitted mounting positions

- Environmental conditions
- Electromagnetic compatibility
  Link to further information about relevant standards for electromagnetic compatibility (EMC).

11.1.1.5 Mounting

Installation overview

The SIMOTION P320-4 is installed in a cabinet or in a controller housing.

Unlocking Windows

Note

Windows locked

Windows may be accidentally locked, e.g. through shortcut key Ctrl+L. If you do not know the password for the SIMOTION P320-4, please contact the Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/).

Operating mode

Two operating modes are available for the installation of a SIMOTION P320-4:

- SIMOTION P320-4 - Headless operation (Page 7874)
- Distributed configuration of the SIMOTION P320-4 with a remote panel (Page 7877)

Headless operation

SIMOTION P320-4 - Headless operation

The SIMOTION P320-4 is operated without a screen, e.g. SIMATIC panel, SIMOTION P320-4 is installed in a cabinet.

The maintenance and configuration is performed via a computer that accesses the SIMOTION P320-4 by means of remote desktop.

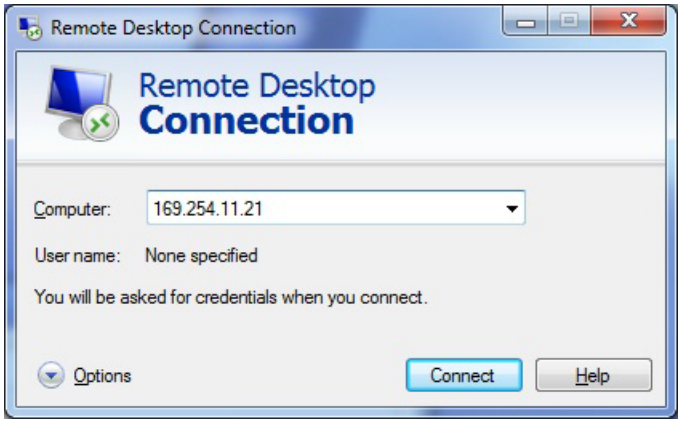

Figure 11-41 Headless to be accessed by means of remote desktop connection

Note

Headless operation or remote desktop connection

To log in via a remote desktop connection, you require a user name and a password.

If you do not have a password, please contact the hotline.

Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/)

Deactivating the remote desktop connection

Deactivating the remote desktop connection

If you do not use the headless mode and do not require a remote desktop connection, we recommend that you explicitly disable the remote desktop connection.

NOTICE
Deactivating the remote desktop connection To ensure that the remote desktop connection is not used, it must be explicitly deactivated.

Procedure for deactivating the remote desktop connection

1. Using the Control Panel, select **System** > **Remote settings**.

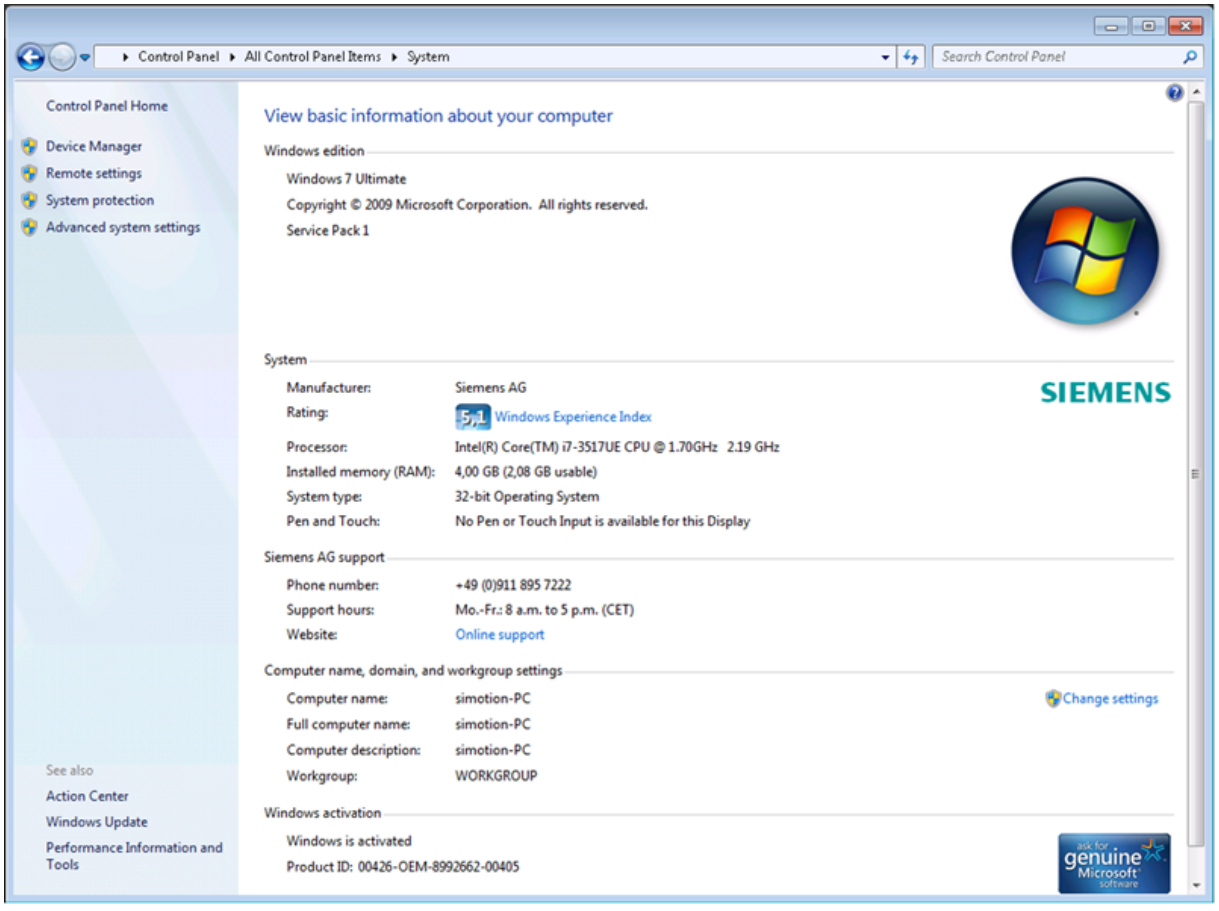

Figure 11-42 Remote settings

2. Select the **Remote** tab in the **System Properties** dialog box.

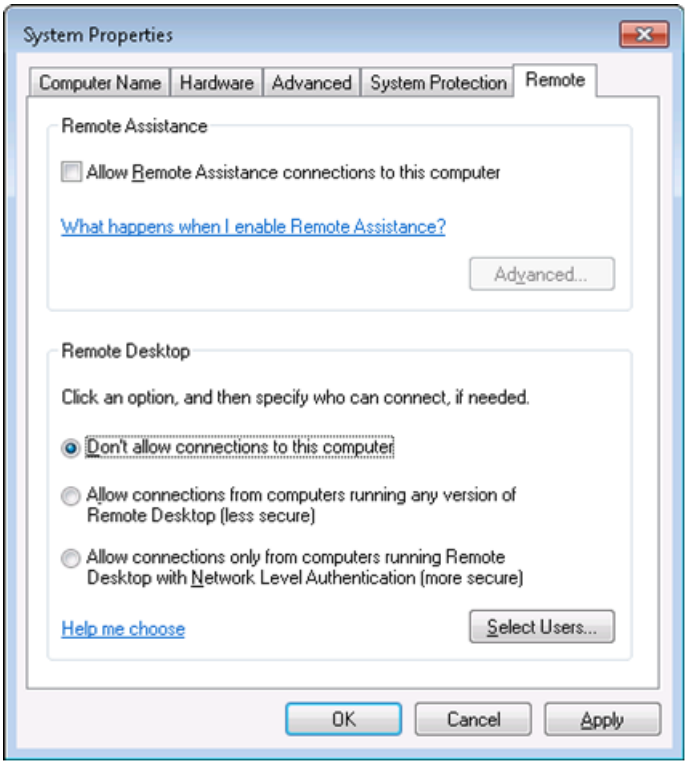

Figure 11-43 System Properties dialog box

3. Select the **Don't allow connections to this computer** option at **Remote Desktop**.
4. Confirm with **OK**.

Any remote desktop access is deactivated with this operation.

Decentralized structure

Distributed configuration of the SIMOTION P320-4 with a remote panel

The distributed configuration provides greater flexibility in terms of location and enables the SIMOTION P320-4 to be positioned in non-critical areas of the plant (e.g. cabinet).

The distributed configuration of a panel with the SIMOTION P320-4 can be performed via the DisplayPort or DVI connection. Please note the cable lengths that are supported for the panel.

Important information about installation

When installing the unit in an enclosed housing, make sure that sufficient space is available for air circulation.

Ensure that the clearance to other components or the sides of cabinets is at least 50 mm above and 100 mm below the device.

The maximum ambient temperature of the SIMOTION P320-4 depends on the mounting position:

- Horizontal (preferred position): Maximum +55° C (in RAL)
- Vertical (power supply at the top): Maximum +45° C
- Suspended: Maximum +40° C
- Vertical mounting: Maximum +45° C

RAL = Restricted Access Location (installation of device in operating facilities with restricted access, for example, a locked control cabinet)

Further information can be found in the SIMOTION P320-4 E / P320-4 S Manual.

Withdrawing/inserting the CFast card

SIMOTION P320-4 has an external slot for a CFast card on the interface side. Always use SIMATIC IPC CFast cards for industrial applications.

The CFast card is mandatory for operation of the SIMOTION P320-4. The CFast card is supplied with the SIMOTION P320-4.

NOTICE
Damage to the device The CFast and CompactFlash connections are not compatible. The device will be damaged. Use the slot described in this section only for a CFast card.

Note

Note the version of the CFast card

Note the following:

- **Always** insert a CFast card as of production version 02.
- Always replace a CFast card with a CFast card of the same or higher production version.
- The production version can be found on the CFast card (see marking).

CFast card - ordering data			
Designation	**Article number**	**Further information**	
CFast	6ES7648-2BF10-0XG0	4 GB	INDUSTRIAL GRADE

Note

Only use the CFast card specified with the article number above for the external interface.

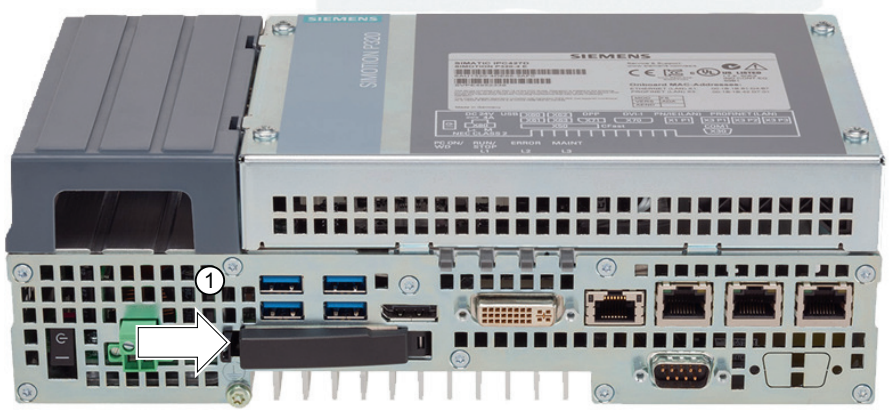
Requirement

- The device is switched off.
- SIMATIC IPC CFast card approved for industrial applications.

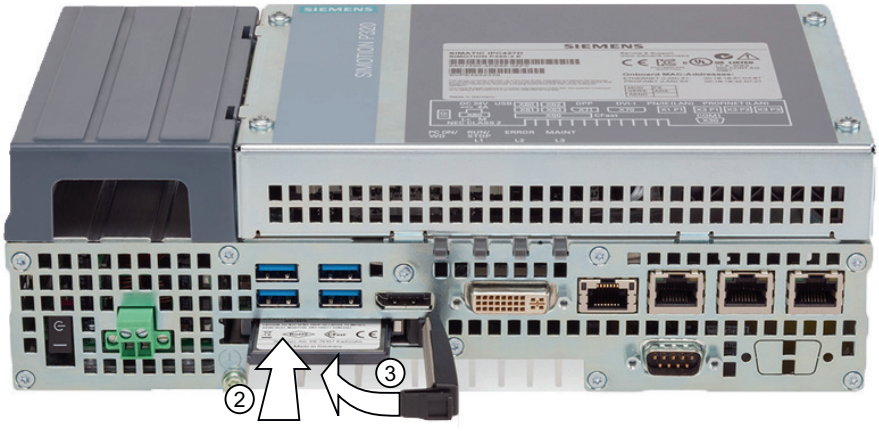
Withdrawing the CFast card

To withdraw the CFast card, proceed as follows:

1. Release the lock of the cover. Push against the cover in the direction indicated.
   Open the cover completely.



2. Remove the CFast card from the memory card slot by pushing it in until it is ejected by about 5 mm (ball-point pen mechanism).
   Then withdraw the CFast card from the memory card slot.



3. After removing the CFast card, close and lock the cover.

Inserting the CFast card

NOTICE
Inserting the CFast card If you insert a CFast card into a built-in SIMOTION P320-4 in a system, observe the safety regulations for working with electrical systems. Insert the CFast card carefully into the slot, and without applying excess force.

To insert the CFast card into the memory card slot again:

Push the CFast card into the memory card slot until it locks into place (ball-point pen mechanism).

Automatic restart for SIMOTION P Runtime

Note

Not a Windows restart

Note that this is not a Windows restart!

Starting the SIMOTION P320-4 with withdrawn CFast card

Power-up of the SIMOTION P Runtime is **not** possible without the CFast card. A prompt referring to the missing CFast card is displayed. The prompt is displayed until the CFast card is inserted. The power-up is then continued and the prompt closed automatically.

The automatic restart of the SIMOTION P Runtime is performed when the **Enabled** checkbox is activated in the **SIMOTION P Control Manager** in the **Administration** tab at **Automatic Restart By Plug-In External Memory Card**.

Figure 11-44 Prompt about the missing CFast card - automatic restart Enabled

Note

The prompt does not close automatically after inserting the CFast card.

If the prompt shown above is not automatically closed after inserting the CFast card and there is no automatic restart of the SIMOTION P Runtime, check the BIOS settings.

See Section Hotplug Enabled BIOS settings (Page 7985).

If the **Disabled** status has been selected in the SIMOTION P Control Manager, there is no automatic restart of the SIMOTION P Runtime after the CFast card has been inserted. In this case, the following prompt is displayed.

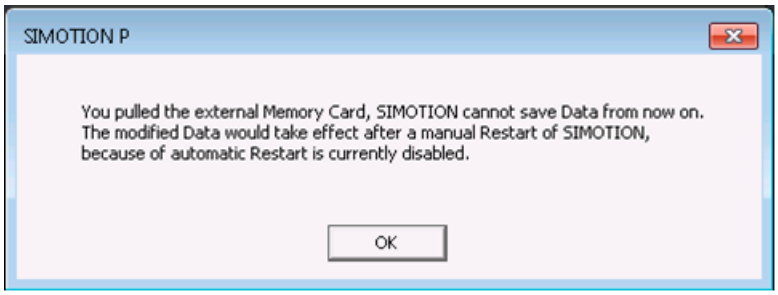


Figure 11-45 Prompt about the missing CFast card - automatic restart Disabled

CFast card withdrawn during operation

If the CFast card is withdrawn during normal operation, the SIMOTION P Runtime goes into the **General reset request** state.

This state can be exited through MRES (general reset) on the mode selector or a restart via SIMOTION P State.

In addition to the general reset request, a prompt is also displayed informing about the withdrawn CFast card and whether an automatic restart of the SIMOTION P Runtime will be performed.

Note

Automatic restart for SIMOTION P Runtime setting

The automatic restart settings are made in the SIMOTION P Control Manager.

The default setting in the Administration tab at Start SIMOTION P is Enabled.

Further information can be found in Section **SIMOTION P Control Manager** > **Administration tab** > Automatic Restart By Plug-In External Memory Card (Page 7921).

Installing the SIMOTION P320-4 in the control cabinet

Notes on installation

Requirement

Before you install the device, observe the following installation notes:

NOTICE
Observe the DIN/VDE requirements Adhere to the relevant DIN/VDE requirements or the country-specific regulations when installing in cabinets.

NOTICE
Observe UL508 For use in the area of **Industrial Control Equipment** (**UL508**), remember that SIMOTION P320-4 is classified as **Open type**. Installation of the device in an enclosure according to **UL508** is conditional for approval or operation according to **UL508**.

Types of installation

The following SIMOTION P320-4 installation types are permitted and described in the following sections:

- Standard rail mounting (Page 7882)
- Vertical mounting (Page 7885)

Standard rail mounting

Mounting the SIMOTION P320-4 on a standard rail

Note

Use of Siemens 35 mm standard mounting rail is recommended.

Mounting the standard mounting rail clip

Before you can install the device on a standard mounting rail, you will need to attach the standard mounting rail clip included in the scope of delivery.

The fasteners and screws required are supplied with the device for mounting depending on the order number.

Requirement

- 1 standard mounting rail clip
- 2 screws
- 1 T20 screwdriver

Use the two screws to mount the standard mounting rail clip on the SIMOTION P320-4 enclosure.

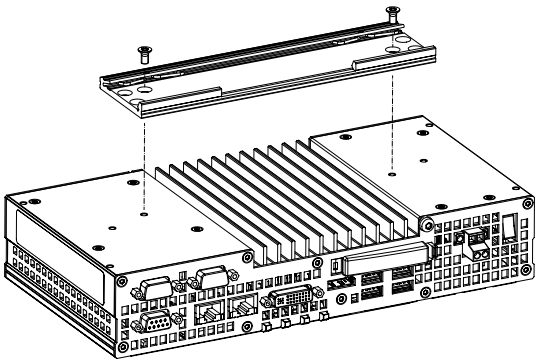

Figure 11-46 Mounting the standard mounting rail clip

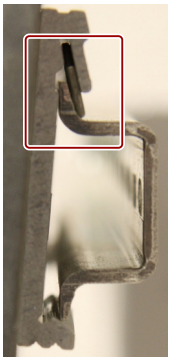
Standard rail mounting

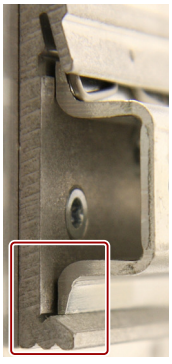
Steps for mounting on standard rail

Proceed as follows:

1. First place the SIMOTION P320-4, which is equipped with rail clips, at an angle on the upper rail guide.



2. Press the SIMOTION P320-4 slightly downward.
3. Swivel the SIMOTION P320-4 completely onto the rail until both clamps lock completely into place.
   Ensure that the locking into place of the SIMOTION P320-4 is audible.



Note

To ensure secure vertical mounting on standard rails, a standard rail ground terminal should be mounted beneath the device.

Mounting/installing the device

Examples of mounting types		
Material	**Bore diameter**	**Fixing**
Concrete	8 mm diameter 60 mm depth	Wall plug: 8 mm diameter 50 mm length Screws: 4 mm diameter 50 mm length
Plasterboard (min. 13 mm thick)	14 mm diameter	Cavity fixings: 4 mm diameter 50 mm length
Metal (min. 2 mm thick)	5 mm diameter	Metal screws M 4: 4 mm diameter 15 mm length

NOTICE

Observe the total weight of the SIMOTION P320-4

Ensure that the wall can hold four times the total weight of the device (including mounting rail and additional expansion modules).

Removing the device from the mounting rails

- Push the device down until the bottom clamp releases the device.
- Swing the device away from the rails.

Additional references

Further information on standard rail and vertical mounting can be found in the SIMOTION P320-4 E / P320-4 S Manual.

Vertical mounting

The optionally available vertical mounting front kit allows a space-saving installation.

Note

Vertical mounting front kit - SIMOTION P320-4

Only use the mounting kit that is specified for SIMOTION P320-4.

Mounting kits for previous versions cannot be used.

Fixing the vertical mounting bracket to the device

Note

Information on installation and operation is available in the supplement of the accessories.

Spare parts and accessories			
Parts for the SIMOTION P320-4	**Article number**	**Scope of delivery**	**Accessories**
Vertical mounting front kit	6ES7648-1AA20-0YP0	-	x

You can order the vertical mounting front kit via the Siemens Industry Mall (https://mall.industry.siemens.com).

Additional references

Further information on standard rail mounting and vertical mounting can be found in the SIMOTION P320-4 E / P320-4 S Manual.

SIMOTION P AutoLogin

The password for the AutoLogin must be changed when the user has changed the Windows password.

The Windows user password is changed in the normal way, e.g. "Change Password" screen. See also Section Changing the Windows user password (Page 7837).

Automatically Log On

SIMOTION P320-4 is preset so that the user does not have to enter the user name and the password to log on.

Preparation for changing the AutoLogin

In order that an AutoLogin still functions after changing the Windows password, the password for the AutoLogin must be changed.

The required procedure is shown in the following so that the change of the AutoLogin for SIMOTION P320-4 can be prepared:

1. Open the **Computer Management** window via **Control Panel** > **All Control Panel Items** > **Administrative Tools** .

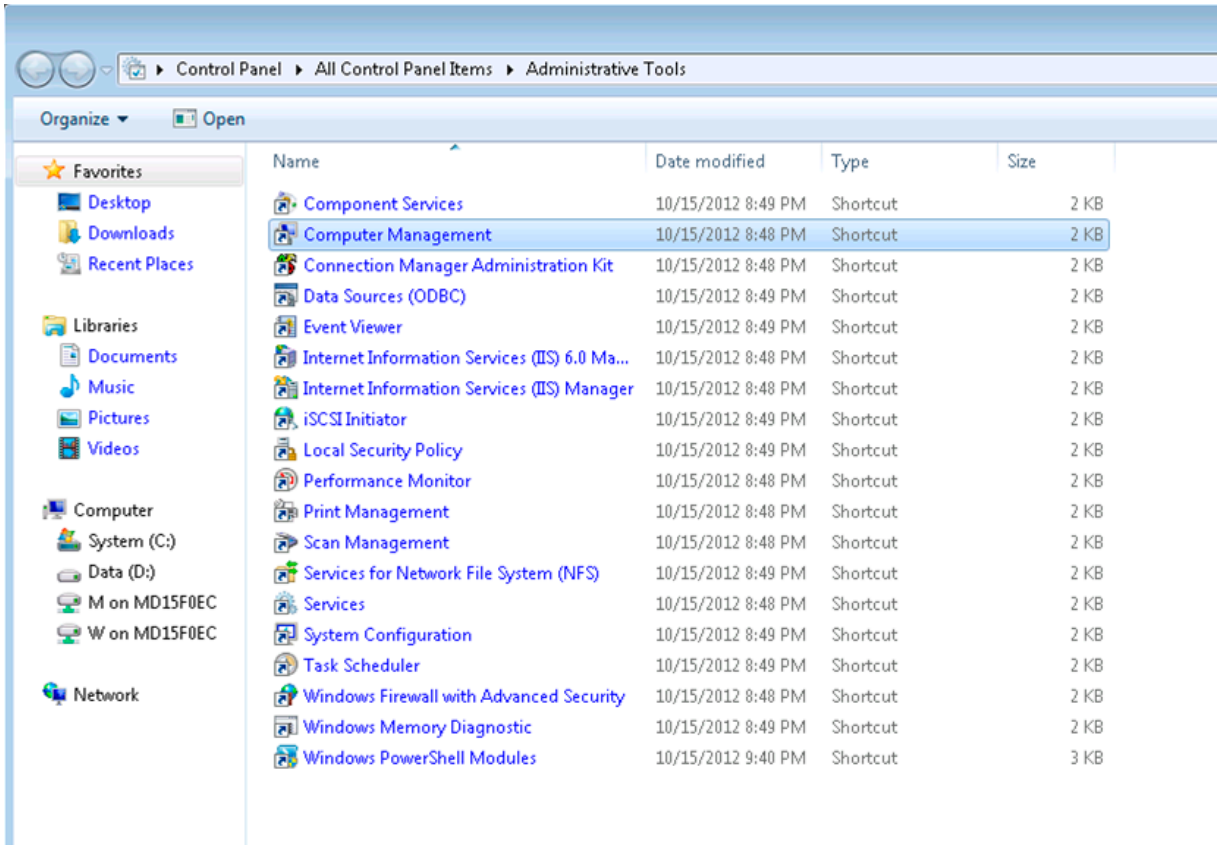


Figure 11-47 Computer Management entry point

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

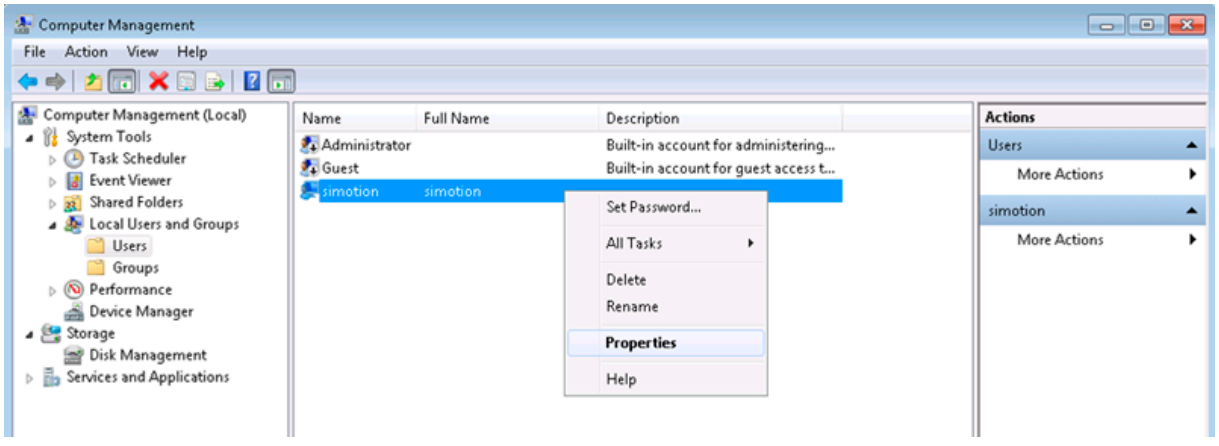

Figure 11-48 Computer Management - Users

3. With the selection of **Users**> **simotion**, you can display the properties via **Properties**.

4. Deactivate the **User cannot change password** checkbox in the **simotion Properties** dialog box.

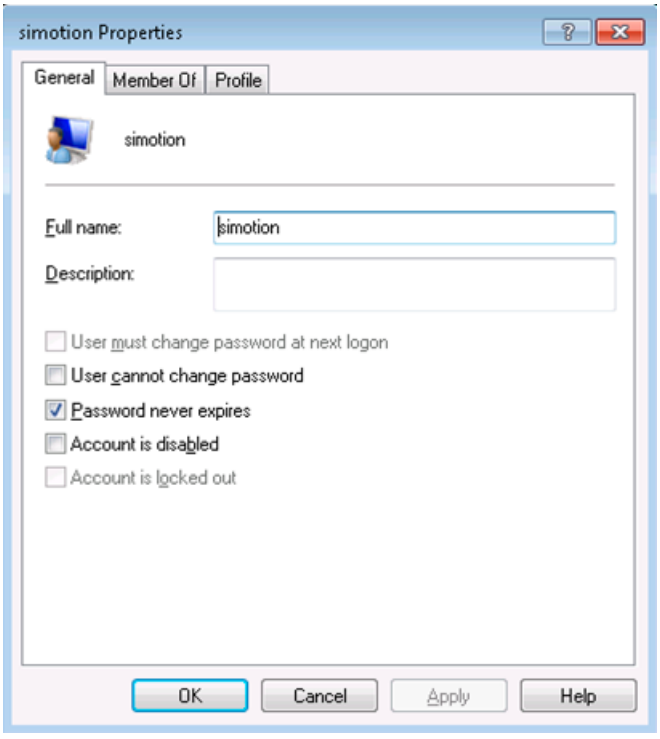

Figure 11-49 simotion Properties - General dialog box

5. Confirm with **OK.**

Changing the password for AutoLogin

To change the password for the AutoLogin, proceed as follows:

1. Open the search via **Windows-Start** and enter: **netplwiz**

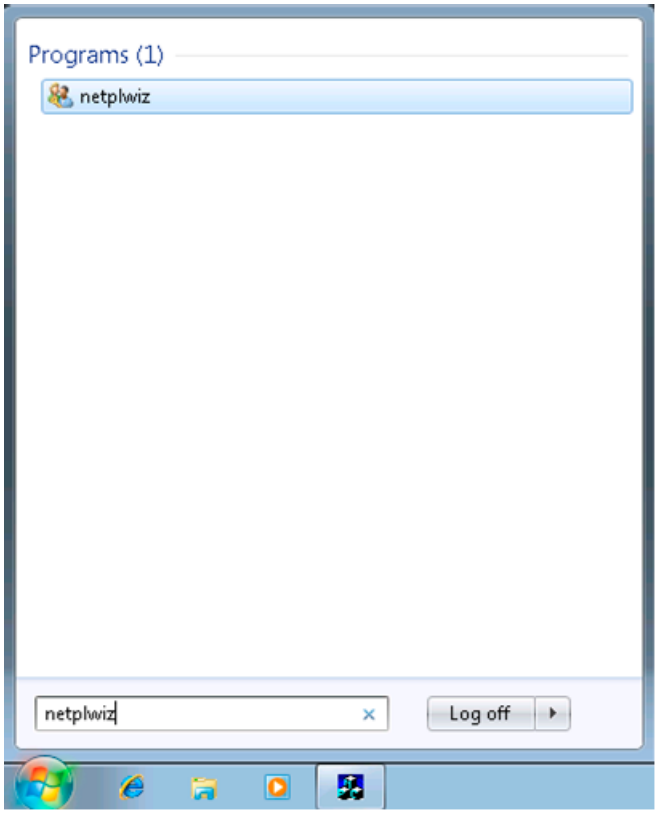

Figure 11-50 Programs netplwiz

2. The following **User Accounts** dialog box opens.

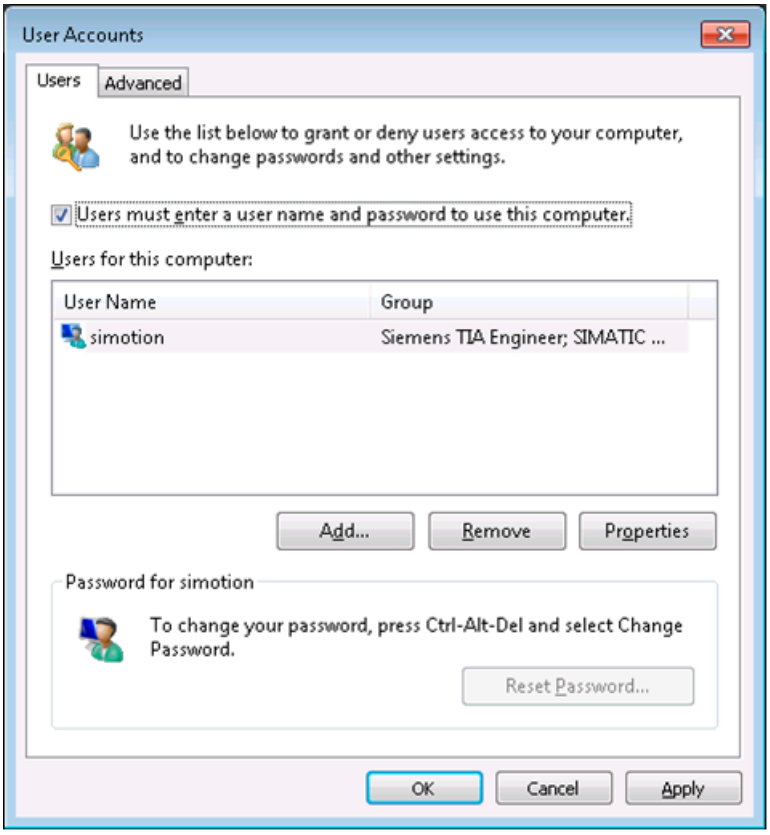

Figure 11-51 User Accounts

3. In the **Users** tab, activate the **Users must enter a user name and password to use this computer** checkbox.
   The **Apply** button is now active. Deactivate the checkbox and accept the changes now with the **OK** or **Apply** button.
   This is necessary so that the **Automatically Log On** dialog box is subsequently displayed.

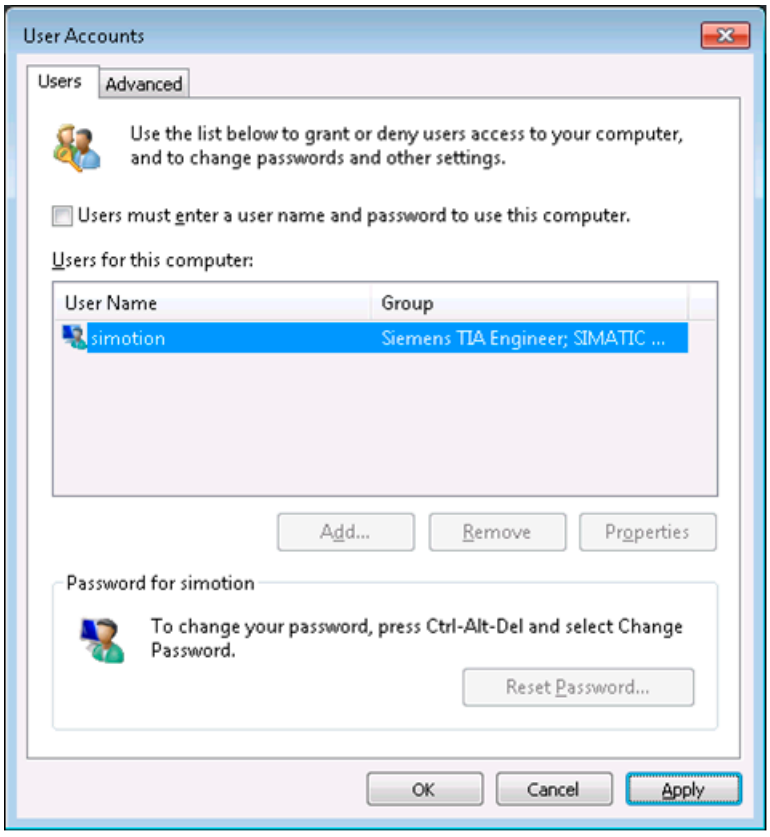

Figure 11-52 User accounts

4. Enter your changed Windows user password in the **Automatically Log On** dialog box and confirm it by entering it a second time.

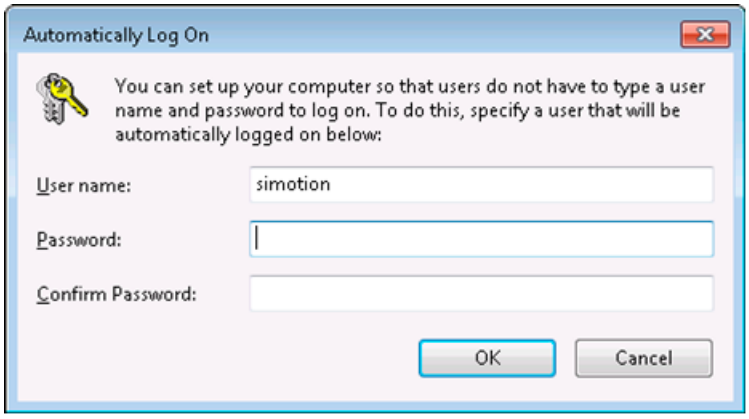

Figure 11-53 Automatically Log On dialog box

5. Confirm the password with **OK**.

11.1.1.6 Connection

Connection requirements

In this section it is described how the components of SIMOTION P320-4 are connected and the elements for communication prepared.

During the installation of SIMOTION modules, you must pay attention to the electrical configuration design.

You obtain information on wiring and networking a complete SIMOTION system.

Requirement

The SIMOTION P320-4 is already installed in a cabinet or in a controller housing.

Open equipment

These modules are open equipment. Therefore, only install modules in housings, cabinets, or in electrical equipment rooms that can only be entered or accessed with a key or tool. Only instructed or authorized personnel have access.

Observe the following points during installation:

- The device may only be connected to 24 VDC power supplies that meet the requirements in accordance with SELV. The cable cross-section must be chosen large enough to ensure that no damage can result from cable overheating in the event of a short-circuit in the SIMOTION P320-4.
- Protect the device against dust, moisture, heat and severe vibration.
- Do not subject the SIMOTION P320-4 to direct sunlight.
- Install the device in such a way that it cannot present a hazard (e.g. by toppling).
- Ensure that the clearance to other components or the sides of cabinets is at least 50 mm above and 100 mm below the device.

Overview of connections

Below the SIMOTION P320-4 interfaces to which the I/O devices can be connected are shown.

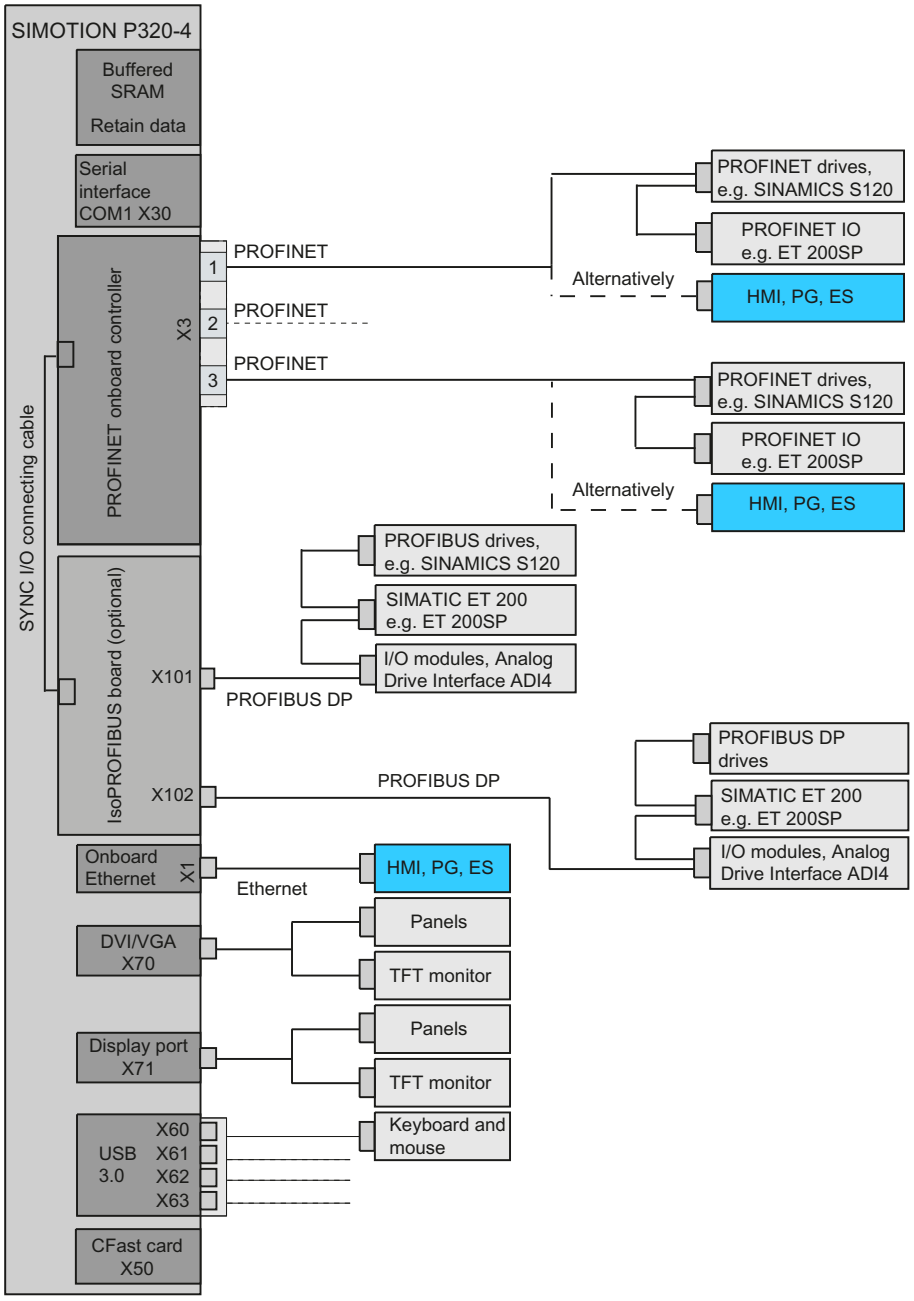

Figure 11-54 System overview SIMOTION P320-4 (hardware)

The cabling for all elements and components of the complete system must only be carried out when disconnected from the mains.
It does not matter in which order connection takes place.

The connection of the individual elements is described in the following sections:

- Connecting PROFINET (Page 7893)
- Inserting IsoPROFIBUS (Page 7896)
- Connecting Ethernet (Page 7904)
- Connecting keyboard/mouse (Page 7905)
- Connecting the power supply (Page 7905)

Connecting PROFINET

PROFINET onboard

The system is connected to the Real-time Ethernet (PROFINET IO with RT and IRT) using the permanently integrated PROFINET interface. The device has a PROFINET interface with 3 ports.

The PROFINET IO with IRT allows IT services to be performed in parallel to the real-time communication on an Ethernet cable, where the PROFINET IO with IRT has a reserved area that provides a decoupling from the standard communication.

Note

PROFINET onboard is not a plug-in board. Instead, it is integrated in the SIMOTION P320-4.

Connection

Connection example

The figure shows a connection example of a PROFINET application with SIMOTION P320-4, SINAMICS S120 (CU320-2) and ET 200 PN.

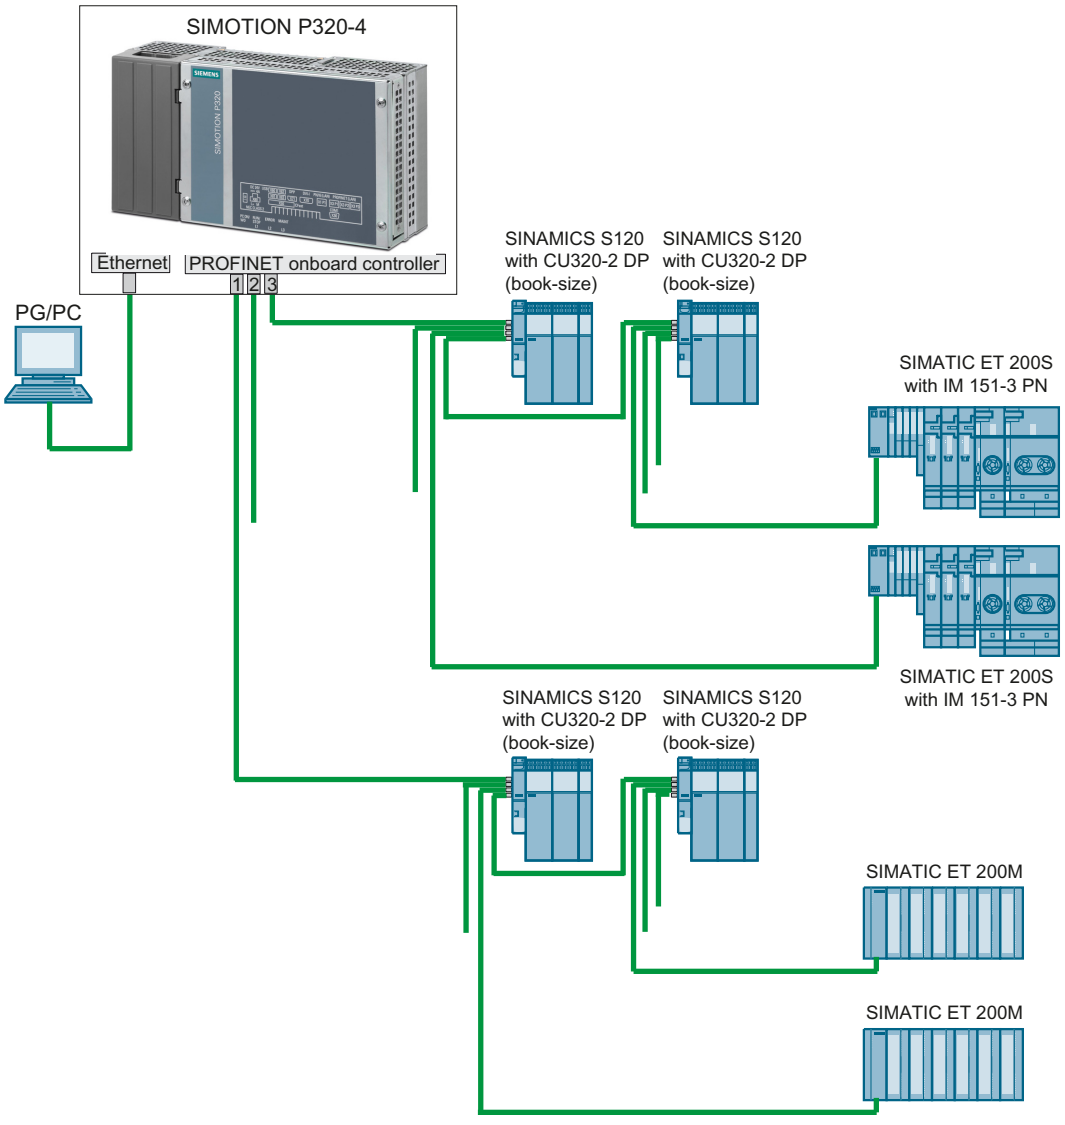

Figure 11-55 Example for a PROFINET application

Note

If the integrated ports of SIMOTION P320-4 and SINAMICS are not sufficient, an external SCALANCE switch can be used.
If PROFINET IO with IRT communication is to be enabled downstream of the switch, then a suitable switch (which supports IRT) must be used.

Cable

4-wire, shielded installation cables are used as PROFINET cables for IE FC RJ45.

Connector

RJ45 PN connectors with straight or angled exit can be used. Standard RJ45 connectors cannot be used.

Strain relief

When inserted, a PROFINET cable will cause unwanted forces to be exerted on the sockets of the PROFINET onboard (strain, lateral pressure). In order to prevent the sockets being subjected to these forces, you must install the strain-relief bracket and attach the cable tie supplied in the accessory kit.

For further information see Mounting a strain relief (Page 7895).

Additional references

You can find further information on the website www.siemens.com/simotion (www.siemens.com/simotion):

- Drives and I/O modules that are released for SIMOTION
- You will also find current brochures and catalogs

Mounting a strain relief

A strain relief for SIMOTION P320-4 is included in the scope of delivery.

The strain relief is designed to prevent the lines connected to the device from being accidentally pulled out.

Note

One cable tie is required for each interface. The cable ties are not included in the scope of delivery and must be ordered separately.

Requirement

- 1 strain relief
- 2 screws
- 1 T10 screwdriver

Procedure

Proceed as follows to secure the strain relief:

1. Remove the marked countersunk screws of the SIMOTION P320-4.

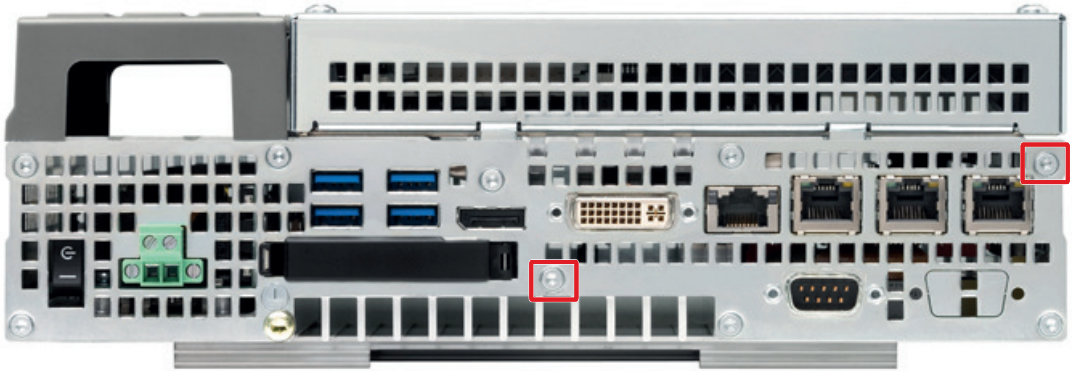

Figure 11-56 Strain relief - marking of the screws

2. Secure the strain relief at the marked points.
   Only use the enclosed lens head screws for securing the strain relief.

Connecting PROFIBUS

Requirement

- SIMOTION P320-4 is switched off and disconnected from the mains
- IsoPROFIBUS board (Article No. 6AU1390-0AA00-0AA1)

SYNC I/O connecting cable / Plugging in the IsoPROFIBUS board

To be able to plug in the IsoPROFIBUS board, the device must be opened and the SYNC I/O connecting cable must be rerouted:

1. Remove the screws of the upper cover plate and open the SIMOTION P320-4.
   At the factory, the SYNC I/O connecting cable is secured in the device using an adhesive tape.

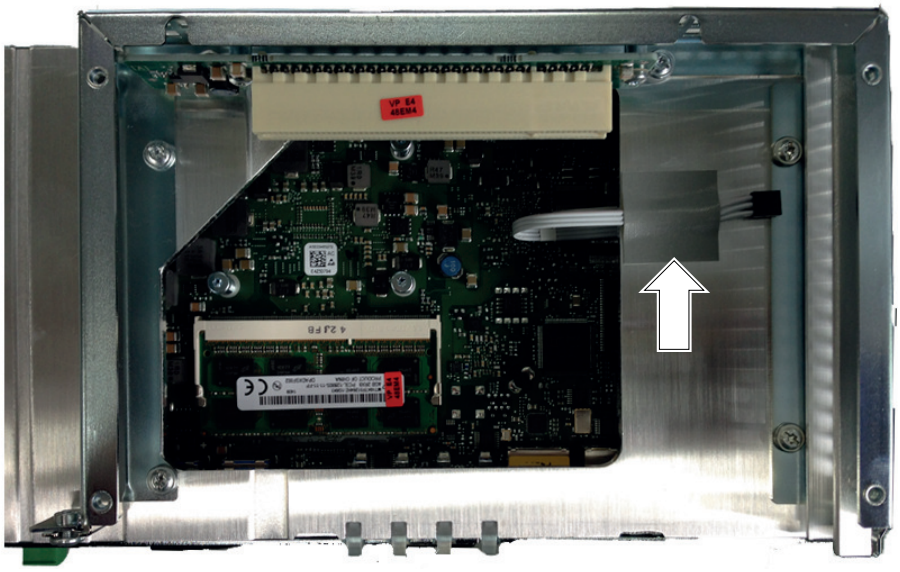

Figure 11-57 Opened SIMOTION P320-4 with SYNC I/O connecting cable as delivered ex works

2. Remove the adhesive tape and change the position of the SYNC I/O connecting cable as follows:
   the SYNC I/O connecting cable is routed to the interface side of the device and secured there again.

Figure 11-58 SIMOTION P320-4 with changed position of the SYNC I/O connecting cable

3. Remove the slot plate on the left side to expose the cutout for the interfaces of the IsoPROFIBUS board.
4. The IsoPROFIBUS board is inserted in the next step:
   Slide the IsoPROFIBUS board on the left into the guide rail of the previously removed slot plate and push it backward guided by the rail.

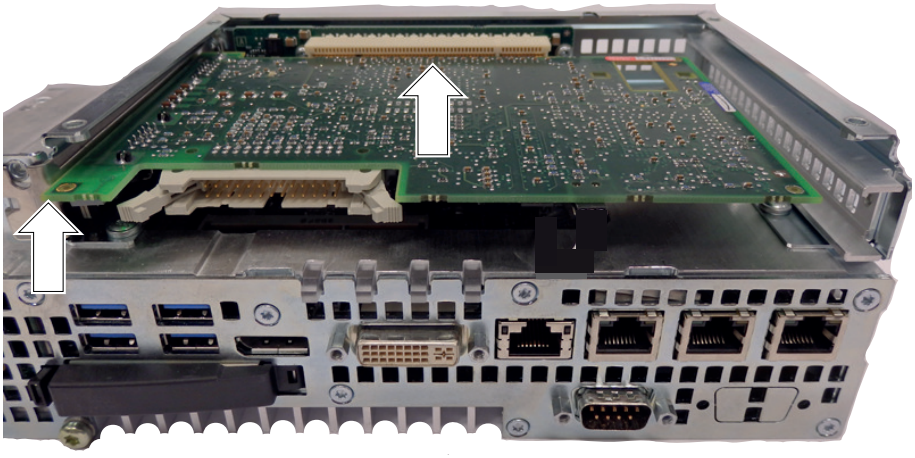

Figure 11-59 Inserting the IsoPROFIBUS board

5. The IsoPROFIBUS board is inserted into the rear PCI slot by applying slight pressure.
6. Then the SYNC I/O connecting cable is connected to the IsoPROFIBUS board.
   The cable is plugged directly into the 3-pole socket on the IsoPROFIBUS board for this purpose.

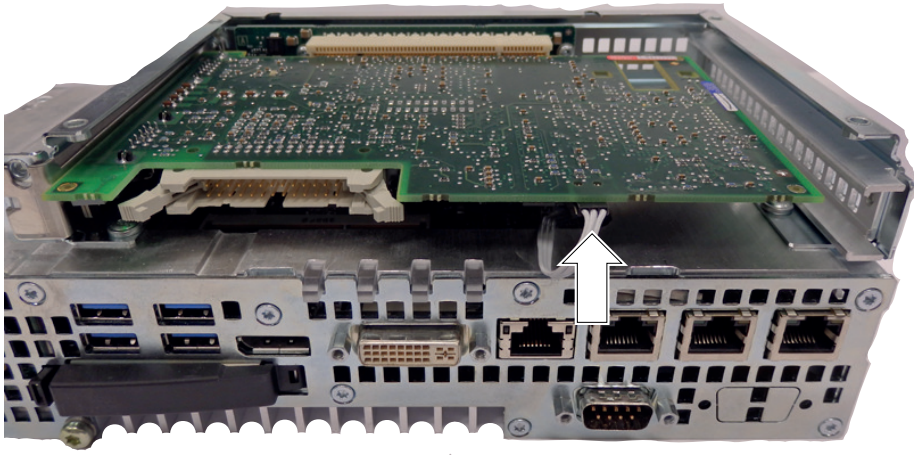

Figure 11-60 Plugging in the SYNC I/O connecting cable

7. Close the cover plate of the SIMOTION P320-4 and fasten the screws.

Connecting the IsoPROFIBUS board

The interface for the optional IsoPROFIBUS board is protected by a cover. There are two holes in the cover for wiring.

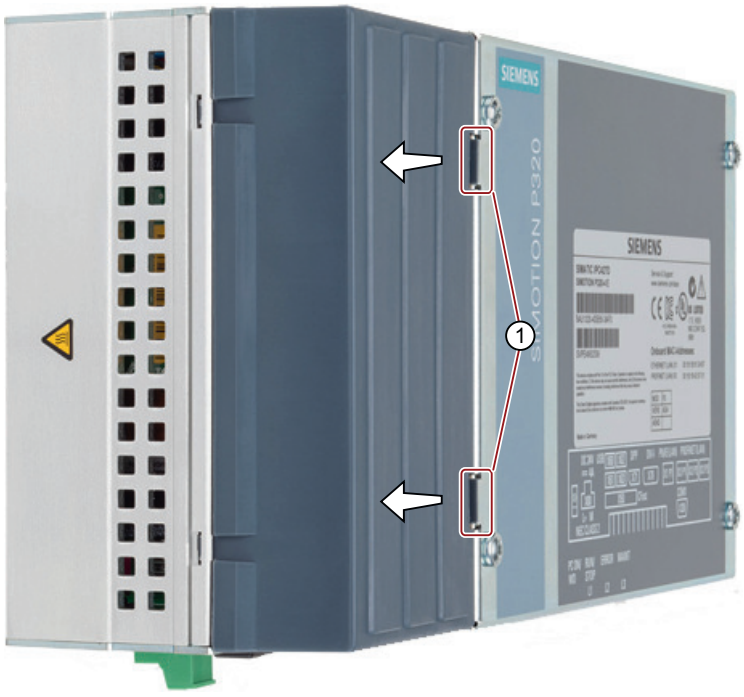
Requirement

The device is switched off.

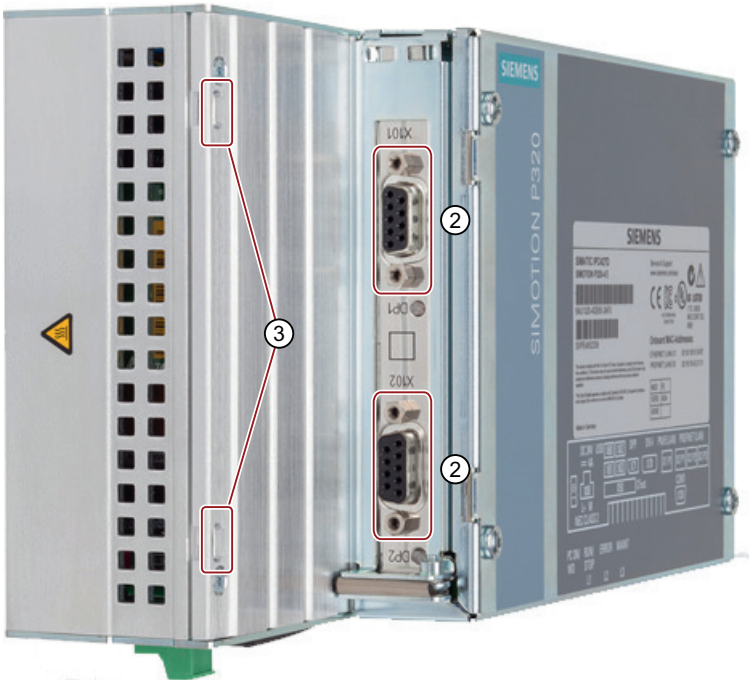
Procedure

To connect the IsoPROFIBUS board, proceed as follows:

1. Unlock the cover by pushing the latches in the direction of the arrow;
   swivel the released cover in the direction of the arrow and remove it. The interfaces for the optional IsoPROFIBUS board are then free.



2. Connect the IsoPROFIBUS board to the slots shown.



3. Place the cover on the positions shown and close it.
   Make sure that the latches engage to secure the cover in its position.

IsoPROFIBUS board and PROFIBUS DP

PROFIBUS DP connection example

Both interfaces of the IsoPROFIBUS board can be used as PROFIBUS DP interfaces. The following screen shows an example of a PROFIBUS application.

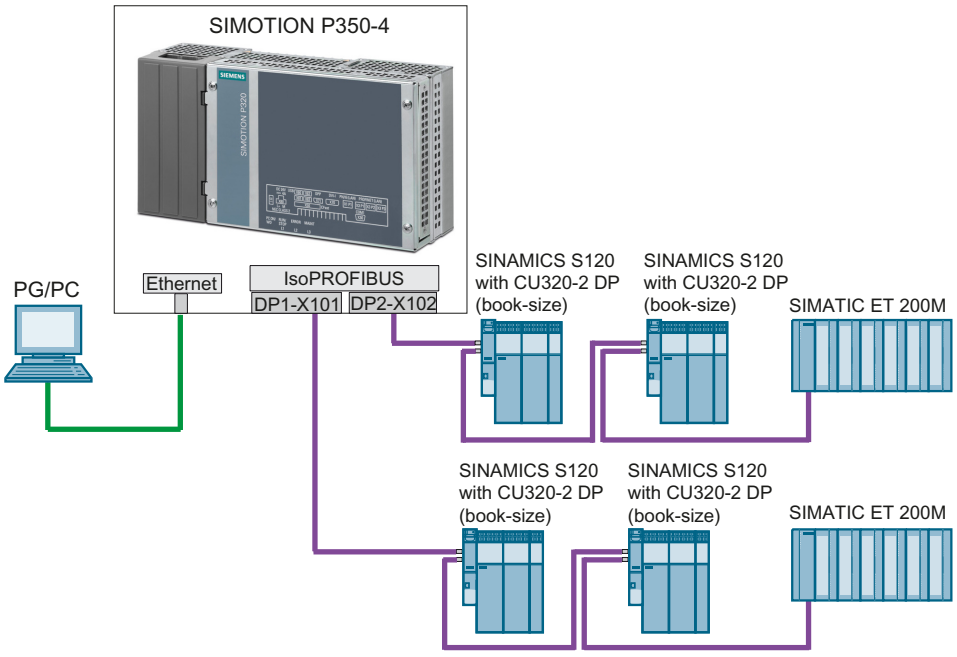


Figure 11-61 Example for a PROFIBUS application

Connecting the bus connectors for the X101 and X102 interfaces (IsoPROFIBUS)

The bus connector is used to connect the PROFIBUS cable to the IsoPROFIBUS interface (X101, X102). thus establishing a connection to additional stations.

Connecting the bus connector

Proceed as follows to connect the bus connector:

1. Plug the bus connector into the IsoPROFIBUS interface on the module.
2. Screw the bus connector onto the interface.
3. If the bus connector is located at the start or end of a segment, you must connect the terminating resistor (switch position "ON").

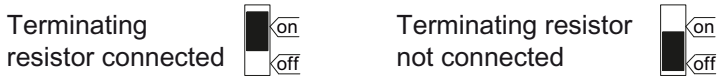

Figure 11-62 Bus connector: Terminating resistor switched on and off

⚠ WARNING

Data exchange on the bus can be interrupted!

A bus segment must always be terminated with the terminating resistor at both ends. This is not the case, for example, if the last node with a bus connector is de-energized. Because the bus connector takes its voltage from the station, this terminating resistor is ineffective.

Make sure that the stations at which the terminating resistor is connected are always energized.

PROFIBUS cable

Properties of the PROFIBUS cable

The PROFIBUS cable is a two-stranded, twisted, and shielded cable.

Table 11-4 Properties of the PROFIBUS cable

Features	Values
Surge impedance	Approximately 135 to 160 Ω (f = 3 to 20 MHz)
Loop resistance	≤ 115 Ω/km
Operating capacity	30 nF/km
Attenuation	0.9 dB/100 m (f = 200 kHz)
Permitted strand cross-section	0.3 mm^2 to 0.5 mm^2
Permissible cable diameter	8 mm ± 0.5 mm

Rules for laying

When you install a PROFIBUS cable, you must not:

- Twist
- Stretch
- Or compress it.

When installing the indoor bus cable, you should also remember the following boundary conditions (d_A = outer diameter of the cable):

Table 11-5 Boundary conditions for indoor routing of bus cable

Features	General conditions
Bending radius for a single bend	≥ 80 mm (10 × d_A)
Bend radius for multiple bends	≥160 mm (20 × d_A)
Permissible temperature range for installation	- 5° C to + 50° C
Temperature range for storage and stationary operation	- 30° C to + 65° C

Note

The length codes for the pre-assembled cables can be found on the website www.siemens.com/simotion (www.siemens.com/simotion).

Connecting Ethernet

Procedure

Plug the LAN cable into the Ethernet interface of the SIMOTION P320-4. You must hear the connection engage properly.

Cables

Standard shielded twisted pair cables are used for the networking in this case.

The following connection cables are recommended:

- SIMATIC NET, ind. Ethernet TP XP CORD RJ45/RJ45, TP CORD assembled with 2 RJ45 connectors, send and receive cables crossed (cross-over)
  Order no.: 6XV1850-2H*)
- SIMATIC NET, ind. Ethernet TP CORD RJ45/RJ45, TP CORD assembled with 2 RJ45 connectors
  Order no.: 6XV1850-2G*)

*) Length code		Dimensions
	E50	0.5 m
	H10	1 m
	H20	2 m
	H60	6 m
	N10	10 m

Note

Further information on the use of these cables can be found in the SIMATIC NET Twisted-Pair and Fiber-Optic Networks Manual (https://support.industry.siemens.com/cs/ww/en/view/8763736).

Connecting the keyboard and mouse

USB interfaces

You can connect the keyboard and the mouse to the USB interfaces of the SIMOTION P320-4.

Connecting the power supply

Safety rules

Basic rules

Only the basic rules for electrical installation can be described in this section on account of the diverse applications possible. At a minimum, you must comply with these basic rules to ensure problem-free operation.

Rules for safe operation

In order to ensure safe operation of your equipment, implement the following measures, adapting them to suit your conditions:

- An EMERGENCY OFF concept in accordance with the generally accepted rules of current engineering practice (e.g. European standards EN 60204, EN 418, and similar).
- Additional measures for limiting the end position of axes (e.g. hardware limit switches).
- Equipment and measures for protection of motors and power electronics in accordance with the SIMOTION installation guidelines.
  In order to identify hazards, we also recommend that a risk analysis be conducted on the entire system in accordance with the basic safety requirements set out in Appendix 1 of EU machinery directive.

Additional references

- Guidelines on Handling Electrostatic Sensitive Devices (ESD), see Appendix ESD Guidelines (Page 7990).
- For installing a system with SIMATIC ET 200 I/O (e.g. ET 200S, ET 200M, etc.), refer to the documentation for the relevant ET 200 I/O systems.

Standards and Regulations

VDE guideline compliance

During wiring, you must observe the appropriate VDE guidelines, in particular VDE 0100 and VDE 0113 for tripping devices and short-circuit and overload protection.

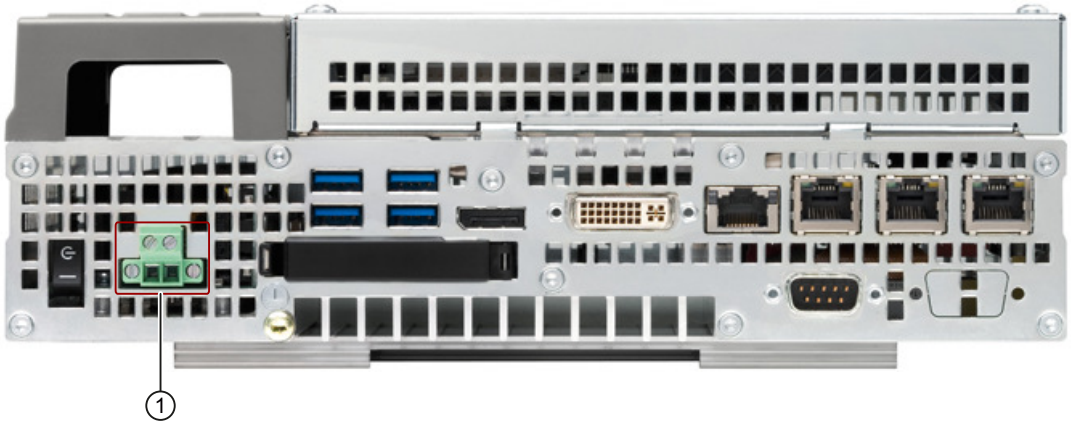
System start-up after specific events

The following list identifies considerations required for startup of a system following certain events.

- If the system starts up again following a voltage drop or power failure, all hazardous operating states must be prevented from occurring. If necessary, force an EMERGENCY OFF.
- If the system starts up again after the EMERGENCY OFF apparatus is released, the startup must not be unchecked or undefined.

Connecting the power supply

Connect your power supply (e.g. SITOP smart 24 V / 10 A) directly to the power-supply socket of the SIMOTION P320-4.



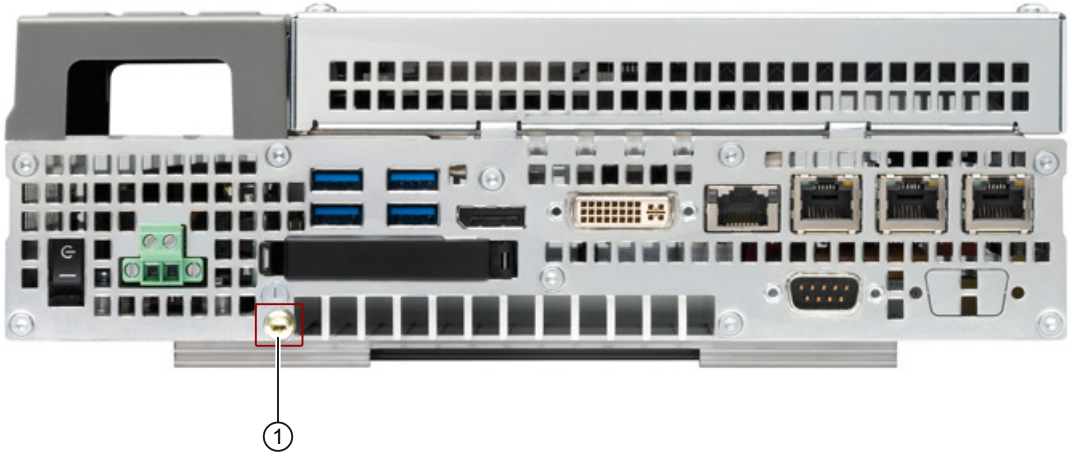
① 24 VDC power supply

Figure 11-63 Power supply connection

⚠ WARNING
On/Off switch
The On/Off switch does not disconnect the device from the power supply system.
To remove power from the device, the power supply plug must be removed.

Protective conductor connection and potential equalization

Connect the equipotential bonding strip on the SIMOTION P320-4 (large surface, large-area contact) with the central grounding point of the cabinet or system in which the devices are installed.
The protective conductor must not have less than a minimum core cross-section of 2.5 mm^2.



① Protective conductor connection / potential equalization

11.1.1.7 Power on and software installation

Power-up

SIMOTION P320-4 is supplied with pre-installed software modules. After activation, Windows with SIMOTION P is powered up automatically.

The SIMOTION P320-4 issues the following message after successful power-up:

Figure 11-64 SIMOTION P320-4 after power-up

The SIMOTION P320-4 responds in this way to every subsequent power-up.

Additional software for HMI

Note

Action before installing additional software

Before installing additional software, make sure that you terminate the runtime of the SIMOTION P.

You terminate SIMOTION P in the application SIMOTION P State using the button **Terminate SIMOTION P**.

If required, the following software can be installed directly on the SIMOTION P320-4:

- WinCC flexible Runtime
- WinCC flexible engineering system for P320-4 S
- OPC client from other manufacturers
- Utilities of the OEMs
- SIMATIC NET

This software must be purchased separately and is not contained in the SIMOTION P320-4 scope of delivery.

Please refer to the documentation supplied with the software for details regarding the procedure for installing the respective software.

Customer-specific software

To ensure high-quality and reliable working of the device, SIMOTION P320-4 is fully configured and ready for operation at the time of delivery.

For this purpose, the system components used are subject to a certification procedure with Siemens as the system manufacturer. The certification process establishes and documents the real-time features of the complete system.

NOTICE
Changes or expansions of PC components (hardware or software) by a third party If PC components (hardware or software) are modified or expanded by a third party, compliance with product features cannot be guaranteed. The OEM or user involved must assume sole responsibility for such components. Compliance with product features can only be guaranteed by SIEMENS.

11.1.1.8 Operator Control (hardware)

SIMOTION P state application

SIMOTION P State application overview

The LEDs, mode selector, and CF card handling indicators, which are implemented as hardware on other SIMOTION platforms, are visualized on the screen for SIMOTION P320-4.

The display is performed by the **SIMOTION P State** application. The following figures show SIMOTION P State in the started state with/without inserted IsoPROFIBUS board.

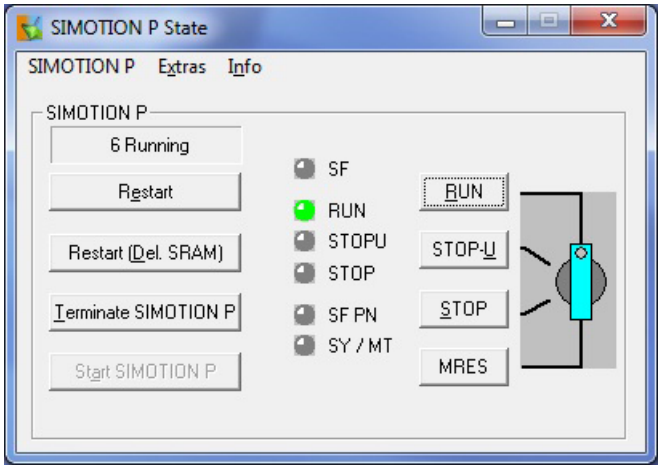


Figure 11-65 SIMOTION P State - PROFINET onboard

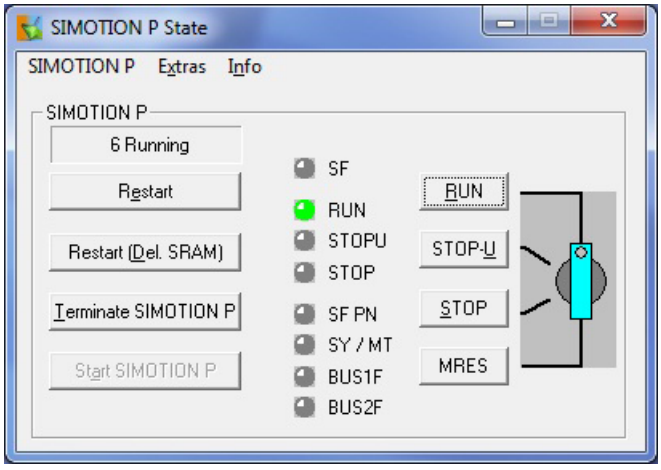

Figure 11-66 SIMOTION P State - PROFINET onboard and additionally with optional IsoPROFIBUS board

Note

The SIMOTION P State application is in English.

Generally, only English is supported on the SIMOTION P320-4, this also applies for the Win7 operating system.

LED display

Meaning of LEDs

The meaning of the LEDs and their colors is described in the table below.

LED display		Meaning	Description
SF	Red	Fault	The fault state of the SIMOTION P320-4 is displayed.
RUN	Green	SIMOTION P320-4 in RUN mode	The user program is running.
STOPU	Yellow	SIMOTION P320-4 in the STOP User Program	The technology packages (e.g. synchronous operation, cam) are active. Test and commissioning functions can be executed without a user program. The user program is not active.
STOP	Yellow	SIMOTION P320-4 in STOP mode	There is no user program running. The technology packages are not active.
SF PN	Red	PROFINET bus fault	A fault state is displayed on the PROFINET interface (X3).
SY/MT	Yellow	Sync of the PROFINET interface	It is displayed whether the PROFINET interface has been synchronized.
BUS1F	Red	Group fault	A fault state is displayed on the IsoPROFIBUS interface (X101).
BUS2F	Red	Group fault	A fault state is displayed on the IsoPROFIBUS interface (X102).

Note

LEDs for IsoPROFIBUS board

The LEDs BUS1F and BUS2F are **only** shown if an IsoPROFIBUS board is connected.

Additional references/information

You can find additional information at:

- Diagnostics via LED displays (Page 7975) (for a more accurate diagnosis of an LED state)
- Operating displays (SIMOTION P320-4 E / P320-4 S Manual: Information on display modes, of the SF PROFINET LEDs only displayed on the hardware side, in the operating displays section)
- PROFINET bus error occurs (Page 7981)

Mode selector

Mode selector in SIMOTION P State

Use the mode selector to set the SIMOTION P320-4 to different states. The controller can be switched in **RUN** or **STOP** / **STOPU** mode and perform an overall reset.

The change of the operating state with the mode selector has **priority** over a state selected via SIMOTION SCOUT.

Note

Setting the operating state via the mode selector

The **STOP/STOPU** switch position cannot be set to **RUN** via the SIMOTION SCOUT.

To change the operating state, use the mode selector.

Further information

Further information can be found in Section Overall reset with the mode selector (on the screen) (Page 7959).

Current operating status

The current state of the SIMOTION P320-4 is displayed in the upper left area of the **SIMOTION P State** application.

Table 11-6 The following state displays are possible:

Not started	SIMOTION P320-4 is not started.
0 ... 5	The progress of the SIMOTION P320-4 power-up is displayed.

6 Running	SIMOTION P320-4 has completed power up and the cyclic tasks are activated.
Disabled	SIMOTION P320-4 is deactivated.

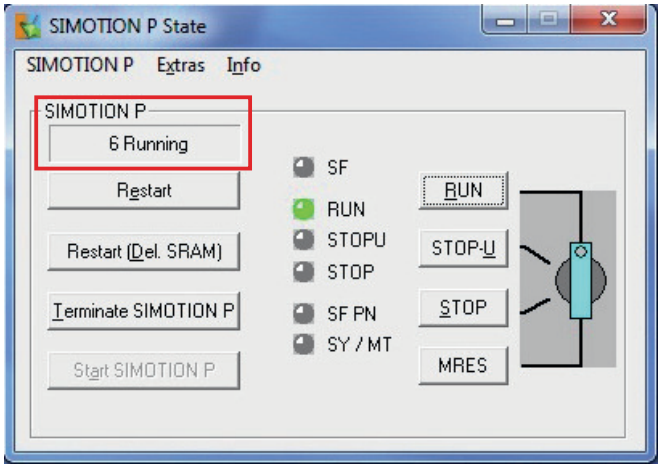

Figure 11-67 SIMOTION P State - state display

The status LEDs and the current operating state are also displayed in the Windows task bar:

RUN state: Green

STOP state: Yellow

NOT STARTED state: Gray

Note

FAQs can be found in Section Troubleshooting/FAQs (Page 7983).

Function elements

Functions of the buttons

Below the current SIMOTION P320-4 status display, you will find a selection of buttons which can only be operated with administrator rights.

Description of the button functions:

Table 11-7 Function of the buttons in SIMOTION P State

Button	Function
Restart	Restarting SIMOTION P320-4. The information in the SRAM is retained. If RamToRom is called beforehand, the project backup is restored. **Note** This is only possible if SIMOTION P320-4 has been powered up (status not "0" to "5", "not started").
Restart (Del. SRAM)	Restarts SIMOTION P320-4 and deletes the information in the SRAM. If RamToRom is called beforehand, the project backup is restored. **Note** This is only possible if SIMOTION P320-4 has been powered up (status not "0" to "5", "not started").
Terminate SIMOTION P	Stop SIMOTION P320-4. **Note** This is possible only if SIMOTION P320-4 has powered up.
Start SIMOTION P	Start SIMOTION P320-4. **Note** This is possible only if SIMOTION P320-4 has not been started

Resetting to the delivery condition

SIMOTION P320-4 can be reset to the default settings at the time of delivery (Page 7966) via SIMOTION P State.

SIMOTION P State - menus

The menus of the SIMOTION P State application are described below:

- SIMOTION P
- Options
- Info

SIMOTION P menu

SIMOTION P	Description
Temperature	Display of the temperatures in the device, monitoring of the threshold value. An alarm (Page 7979) is issued when a threshold value is reached or exceeded.
Set Diagnostic Switch	Diagnostic switch for recording diagnostic data and backing up the non-volatile SIMOTION data on the external CFast card. Diagnostics data can be recorded during power-up and during operation for the error diagnostics. The diagnostics switch is automatically reset after writing the data. **See also the following sections**: Recording diagnostic data (Page 7964). Backing up non-volatile SIMOTION data (retain data) (Page 7951)
Webserver	Access to the SIMOTION IT Web server is protected by a multi-level security concept. Upon delivery, the security level is low to allow configuration of the device. The security state of the Web server can be set here. The following selection options are available: • Security Level: normal • Security Level: low

Temperature specifications

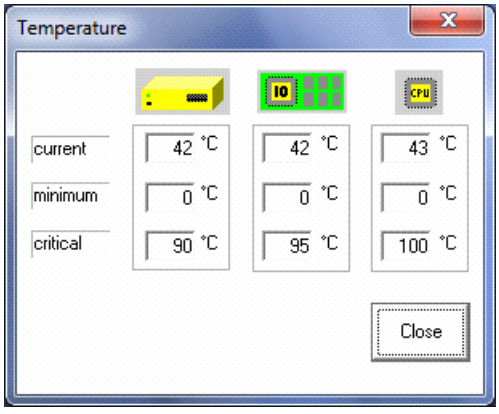

Figure 11-68 Dialog Temperature

The temperature specifications for the SIMOTION P320-4 can be found at **SIMOTION P > Temperature**.

The current, the minimum and the critical temperature are determined at the housing, mainboard and CPU measuring points and displayed in this dialog box.

Options menu

Options	Description
Reset to factory default	Restore the factory default. This will delete the following data: • The non-volatile SIMOTION data (retain data) in the SIMOTION device • The backup of the non-volatile SIMOTION data on the external CFast card (PMEMORY.XML/PMEMORY.BAK) • The user data from the "Volatile SIMOTION data" area (RAM) and on the external CFast card (ROM) • The communication configuration (IP and DP parameters) on the external CFast card is set to the factory settings. The licenses on the CFast card are retained.

Note

Station Configurator settings

Settings made with the Station Configurator are reset to the default values at the time of delivery as well.

Further information

can be found in Section Defined states > Restore the factory settings using SIMOTION P State (Page 7955)

Info menu

Info	Description
Hardware Version	Display of the hardware information.
Software Version	Display of the software versions.
Info about SIMOTION P State	Display of the SIMOTION P version.

Note

The versions in the **Info** menu only become visible after the Windows power-up after the SIMOTION P320-4 has been started once.

11.1.1.9 Parameter assignment/addressing

Parameter assignment / addressing requirements

The following actions should be completed before you start parameterizing or addressing:

- The SIMOTION P320-4 and the other hardware are installed.
- The devices are connected.

- The required software is installed.
- The SIMOTION P320-4 has been switched on.

The actual state should be saved after the parameterization.

Factory settings

Factory settings overview

Requirement

You have obtained information about the various communications models. Further information can be found under HMI and SIMOTION SCOUT (Page 7858).

You are familiar with the Windows Control Panel.

Resetting the factory settings

It is possible to reset SIMOTION P320-4 to the factory settings (see section Resetting the SIMOTION P to the initial state (Page 7966)).

Ethernet - TCP/IP local

SIMOTION P320-4 delivery state

Local communication in the SIMOTION P320-4 between Windows programs such as HMI and the SIMOTION P Runtime software is handled via the preset **TCP/IP** Ethernet communication.

As an alternative to TCP/IP, the **PC internal (local)** communication can also be used. Further information on how to check the settings in the Windows Control Panel can be found in Section Check PC internal settings (Page 7926).

SIMOTION P control manager

Requirement

NOTICE
SIMOTION P Control Manager
Because the settings made via the SIMOTION P Control Manager change the factory default parameters, they should only be made by authorized persons.

SIMOTION P Control Manager overview

The SIMOTION P Control Manager is used to configure the SIMOTION P software.

Call

The SIMOTION P Control Manager is only used by the **administrator**. Only the administrator is authorized to make changes.

The **SIMOTION P Control Manager application** is called by means of the operating system's Control Panel.

Properties

SIMOTION P Control Manager has the following features:

- The following settings take effect immediately after a change:
  - Start SIMOTION P
  - Automatic Restart By Plug-In External Memory Card
  - Ethernet-IP address
- The values to be set are generally required only by the administrator.
  These are:
  - License handling
  - IP addresses

Calling SIMOTION P Control Manager from the control panel

You can call the SIMOTION P Control Manager in the Windows Control Panel (Start > Control Panel).

The call can only be made as administrator. If you are not logged on as administrator, a prompt will appear notifying you of this fact.

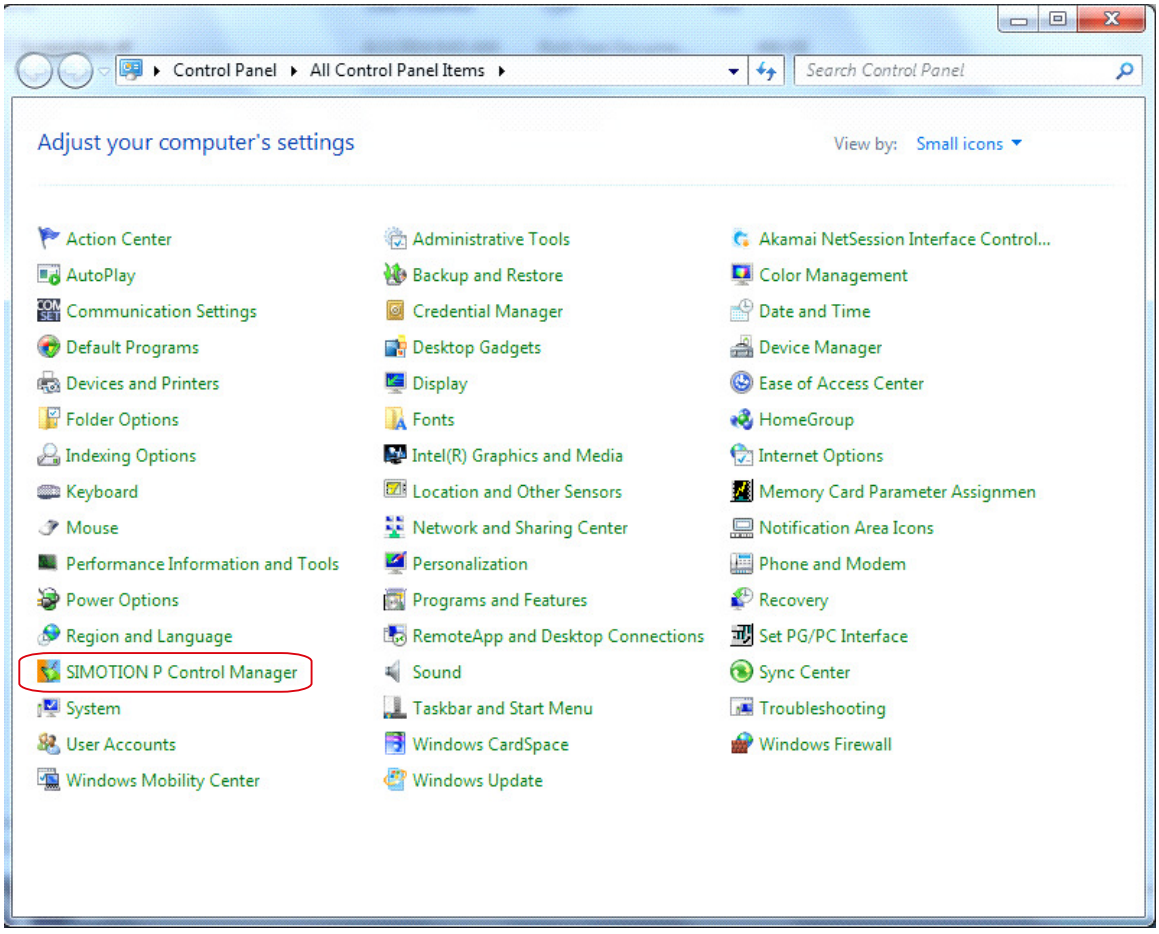

Figure 11-69 Calling the SIMOTION P Control Manager

If the call was successful, the **SIMOTION P Control Manager** dialog, **Administration** tab, is displayed.

The SIMOTION P Control Manager application is in English.

Administration tab

The **Administration** tab contains:

- Start SIMOTION P (Page 7920)
- Automatic Restart By Plug-In External Memory Card (Page 7921)
- Runtime Network Connections (Page 7922)

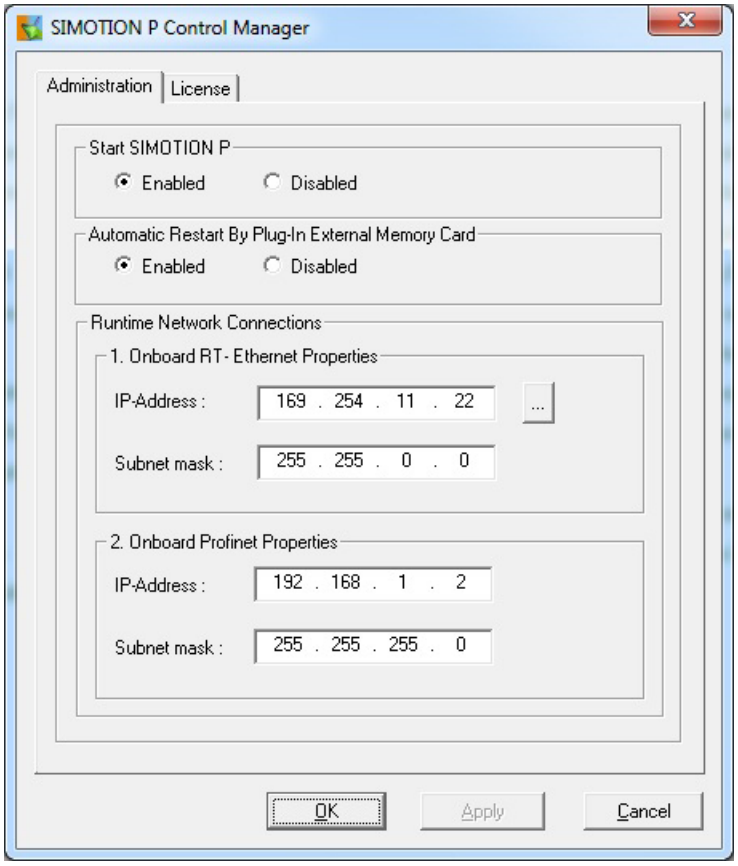

Figure 11-70 SIMOTION P Control Manager - Administration tab

Start SIMOTION P

The following settings are possible:

- **Enabled**
  Immediately cancels the lock set with **Disabled**. The SIMOTION P320-4 must be booted to automatically start SIMOTION P.
  SIMOTION P can also be started by means of the SIMOTION P State application using the **Start SIMOTION P** button.
- **Disabled**
  Prevents the automatic starting of SIMOTION P while the Windows system is booting up. SIMOTION P cannot be started until this lock is canceled.

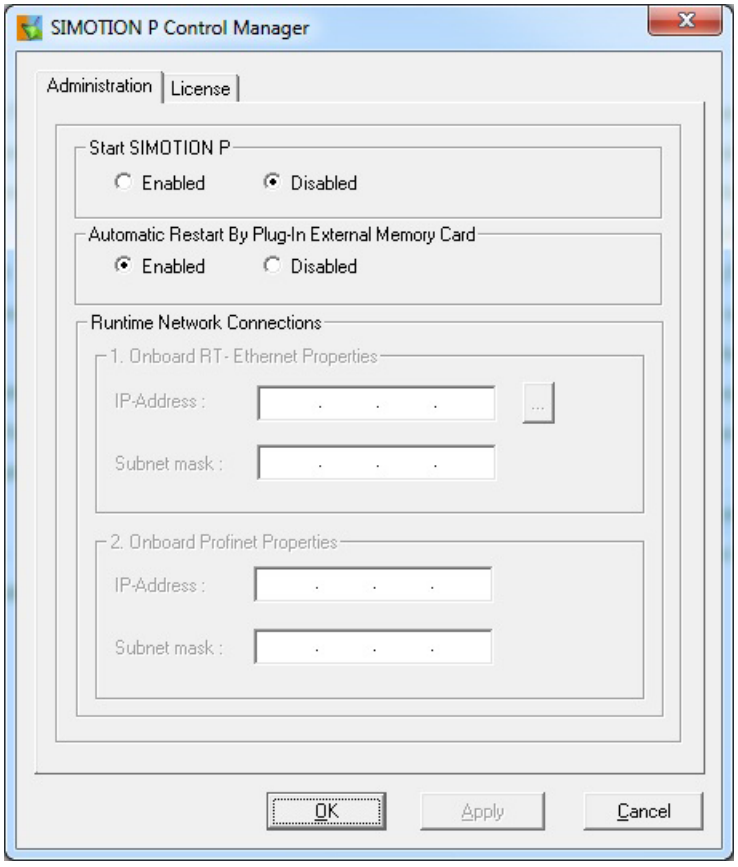

Figure 11-71 Start SIMOTION P - Disabled

SIMOTION P State display

If "Disabled" is selected in the **Administration** tab at **Start SIMOTION P**, the "Disabled" status is also displayed at **SIMOTION P State** .

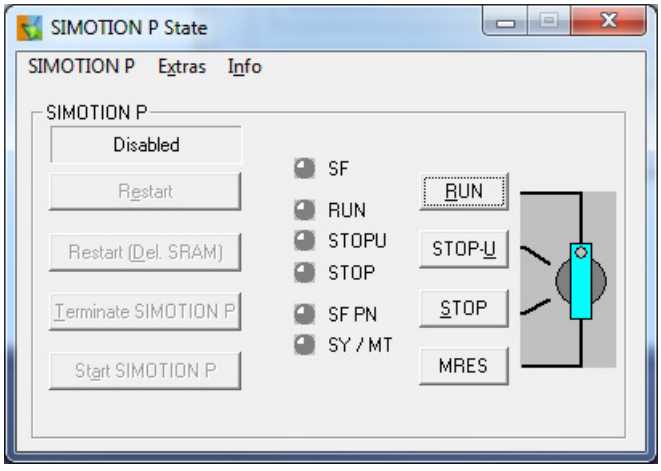

Figure 11-72 SIMOTION P State - Disabled status

Automatic Restart By Plug-In External Memory Card

Note

Not a Windows restart

Note that this is not a Windows restart!

The following settings are possible:

- **Enabled**
  An automatic restart of the SIMOTION P Runtime is performed at the start of the SIMOTION P320-4 with withdrawn CFast card or for a CFast card withdrawn during operation. The automatic restart of the SIMOTION P Runtime for the Enabled default setting is performed when the CFast card is inserted.

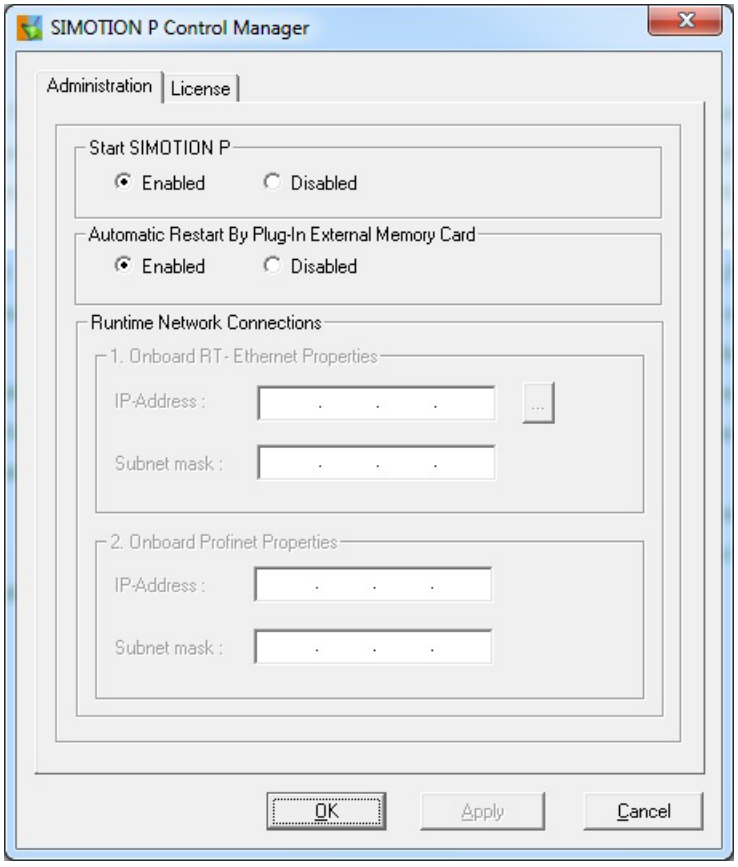

Figure 11-73 Administration tab - Automatic Restart By Plug-In External Memory Card

- **Disabled**
  The automatic restart of the SIMOTION P Runtime is prevented after inserting the CFast card.

Note

Behavior with withdrawn CFast card

Further information on the behavior of the SIMOTION P320-4 with withdrawn CFast card can be found in Section Automatic restart of the SIMOTION P Runtime (Page 7880).

Runtime Network Connections

The Ethernet interface of the SIMOTION P320-4 is displayed here. It can be addressed via the SIMOTION P Runtime.

The IP address can be set here, however, it is not permanent.

The IP address set here loses its validity when the following actions are carried out:

- Booting of the SIMOTION P320-4
- Downloading a project to the SIMOTION P320-4
- Exiting the SIMOTION P Runtime (Terminate SIMOTION P)
- Restarting SIMOTION P Runtime (Restart)

The IP address in SIMOTION SCOUT can be changed permanently using the HW Config or user program.

Changing the IP address

You can change the IP settings after selecting the button, the **Onboard RT - Ethernet Properties** dialog box opens.

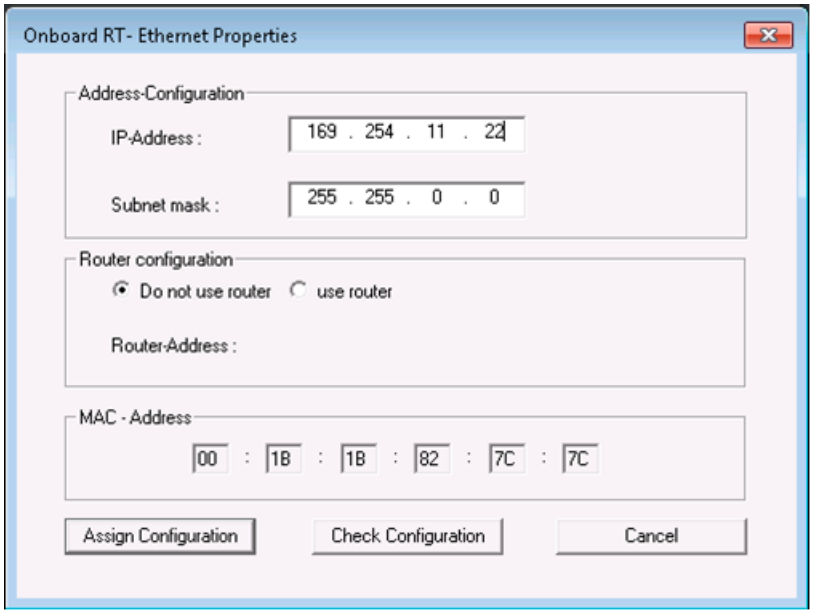

Figure 11-74 Onboard RT - Ethernet Properties

Click **Check Configuration** to validate the settings of the Runtime Ethernet configuration and check for agreement with the Windows Ethernet interface.
You can find further information about this in Section Ethernet communication overview (Page 7929).

Click **Assign Configuration** to also check the settings and accept them.

Note

The IP data is only displayed when the SIMOTION P320-4 is started.

License tab

The **License** tab can be used

- To view currently installed licenses
- To enter new License Keys.

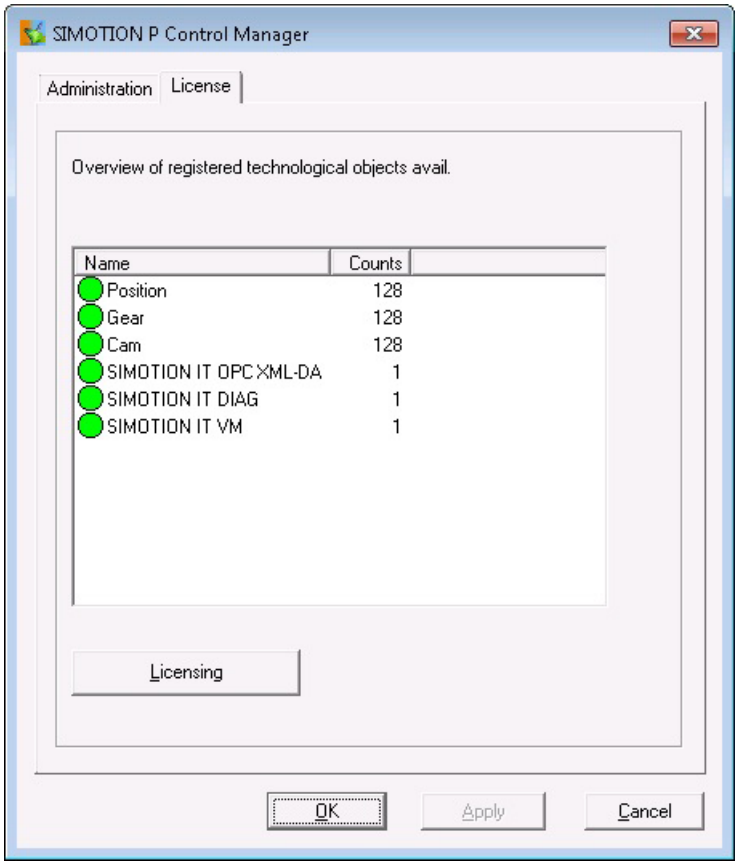

Figure 11-75 License tab

This tab displays the licenses currently installed on this hardware. If you wish to modify the licensing of this hardware, click the **Licensing** button.

The **License Manager** dialog box is displayed; here you enter a new **License Key**.

License Manager

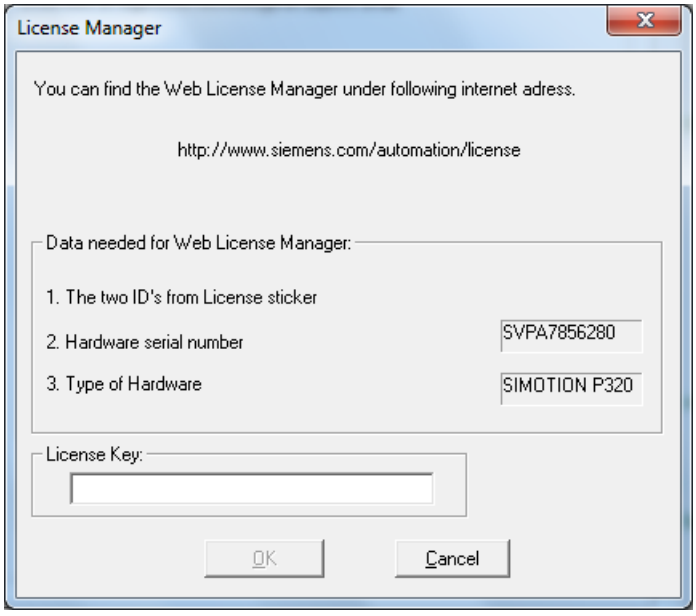

Figure 11-76 Dialog License Manager

Impact of hardware replacement on licensing:

The replacement of the SIMOTION P320-4 means that the License Keys which were generated for the previous SIMOTION P320-4 must be regenerated and transferred to the new SIMOTION device.

In this case, contact the hotline: http://support.automation.siemens.com

Note

You must restart the SIMOTION P320-4 after licensing. To do this, in SIMOTION P State press

- either the **Restart** button
- or the "**Terminate SIMOTION P**" button and then **Start SIMOTION P**.

Note

For more information on licensing, see the SIMOTION SCOUT Configuration Manual.

Local communication via PC internal

Local communication (PC-internal) overview

Local communication in the SIMOTION P320-4 between Windows programs such as HMI and the SIMOTION P runtime software is handled by the PC's internal communications mechanisms.

Checking the PC-internal settings

Configuration in the Windows Control Panel of the SIMOTION P320-4

To enable local communication the following settings must have been made:

You can access the settings via the Control Panel of Windows:

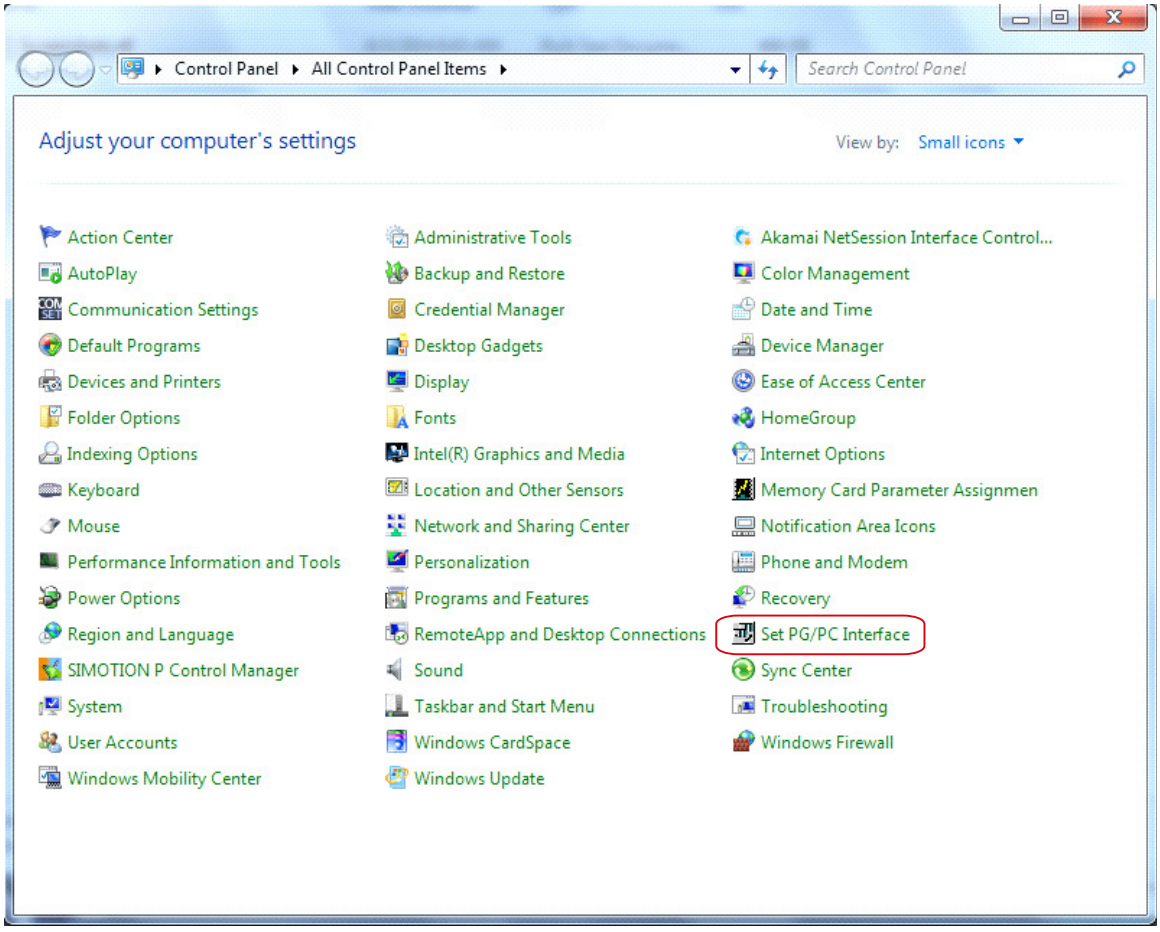

Figure 11-77 Control Panel - Set PG/PC Interface

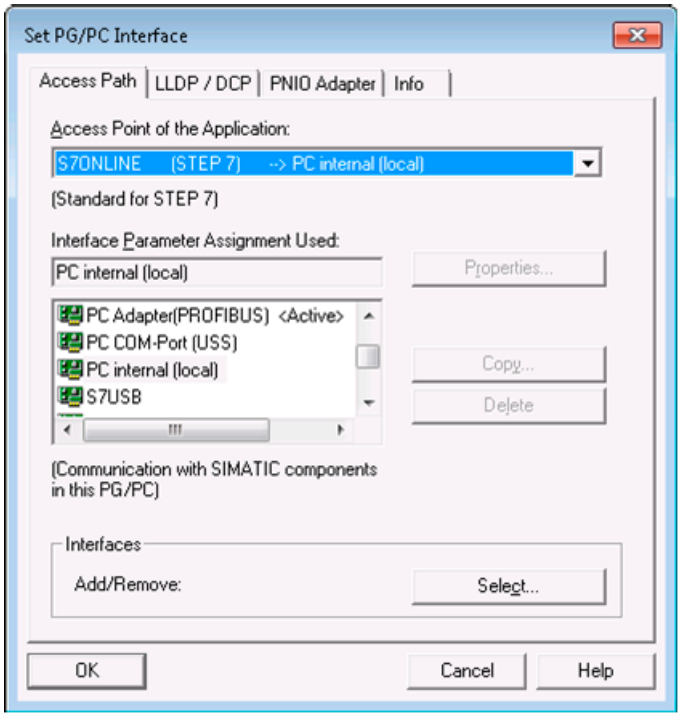
Procedure

Proceed as follows to set the local communication to "PC internal (local)":

1. Call **Set PG/PC Interface**.
2. In the **Access Path** tab, set the field **Interface Parameter Assignment Used** to **PC internal (local)**.



3. Confirm with **OK**.

Note

SIMOTION P320-4 delivery condition

The preset communication version for the SIMOTION P320-4 is TCP/IP.

Further information can be found in Section Local HMI or ES on SIMOTION P320-4 (Page 7858).

Station Configurator

The **Station Configurator** is required to configure the communication paths for the HMI software.

The Station Configurator is provided directly as desktop icon of the SIMOTION P320-4.

Figure 11-78 SIMOTION desktop with Station Configurator

Note

Changes via Station Configurator

If you want to make changes via the **Station Configurator** , it is essential that you terminate SIMOTION P before calling the function (with **Terminate SIMOTION P** in the SIMOTION P State application).

Observe uniform configuration

Check if the offline configuration set via SIMOTION SCOUT (HW Config) corresponds exactly to the online configuration set in the Station Configurator :

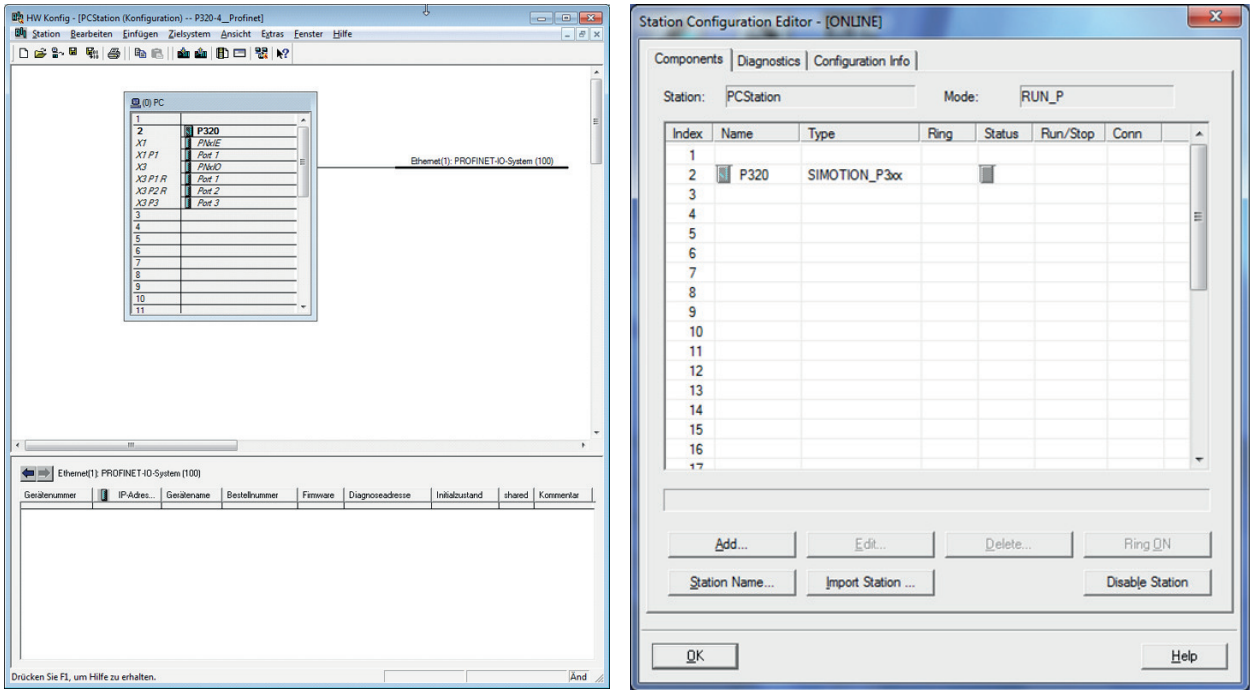


Figure 11-79 Illustration of the offline HW Config (left) - online Station Configurator (right)

Ethernet communication

Ethernet communication overview

SIMOTION P320-4 has one onboard Ethernet interface.

NOTICE
SIMOTION P Runtime During SIMOTION P Runtime, the onboard Ethernet interface must be **activated** under Windows. The onboard Ethernet interface must not be deactivated or activated during operation.

You can connect Industrial Ethernet to the Ethernet interface X1.

Industrial Ethernet is a communication network with a transmission rate of 10/100/1000 Mbps.

Note

Operating Ethernet locally

The SIMOTION P320-4 is configured for the **TCP/IP** communication version in the delivery condition.

See also Local HMI or ES on SIMOTION P320-4 (Page 7858).

Ethernet interface

SIMOTION P320-4 has an onboard Ethernet interface.

An Ethernet interface can always have two IP addresses, one for Windows and one for the access from SIMOTION.

Table 11-8 Ethernet ports overview

Ethernet ports	Access to/from the SIMOTION P Runtime	Access to/from Windows
Onboard Ethernet 1	X	X
PROFINET onboard	X	-

The IP addresses have been set to the default values.

- Onboard Ethernet interface X1 reserved for Windows/SIMOTION (see section Default IP addresses for Windows and SIMOTION P (Page 7931))
  - Windows setting: Default address
  - SIMOTION P Runtime: Default address

If the Windows IP address is taken from a DHCP server, the assignment of the runtime IP address and runtime subnet mask must also be selected in accordance with the default setting of the DHCP server.

The following applies (see Section Communication via an Ethernet interface (Page 7932)):

- Windows IP address ≠ runtime IP address
- Windows IP address and runtime IP address must be in the same subnet

Ethernet interface for SIMOTION P Runtime

The IP address of the **Ethernet interface for SIMOTION P Runtime** can be:

- Displayed and changed via SIMOTION SCOUT
- Displayed in the **Administration** tab via the SIMOTION P Control Manager application. Here, however, the IP address can only be changed temporarily.
  Its validity ends with:
  - Booting, downloading, as well as terminating or restarting of SIMOTION P Runtime.
    Further information can be found in Section Administration tab (Page 7918).

Ethernet interface for Windows

The IP address of the **Ethernet interface for Windows** can **only** be modified via the Windows Control Panel > Network and Sharing Center.

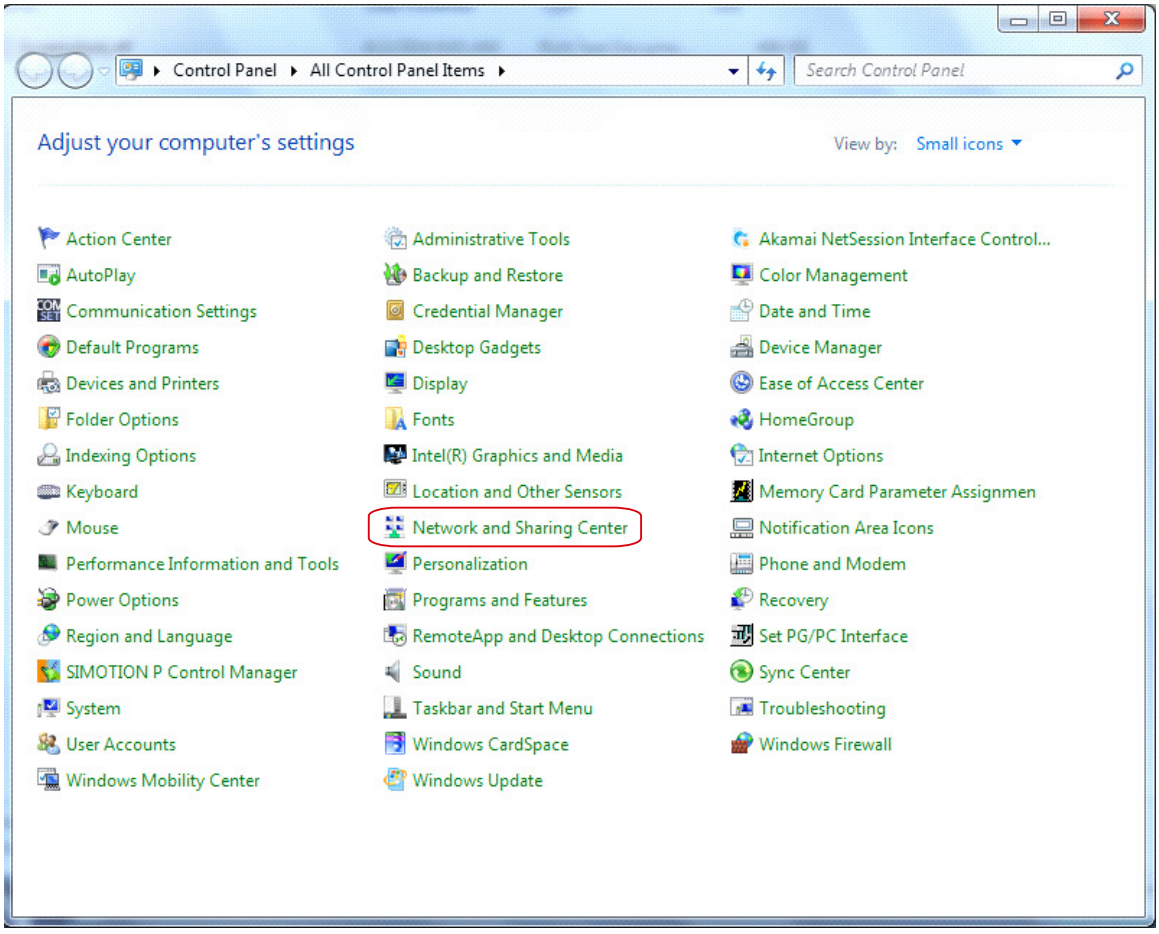

Figure 11-80 Windows Control Panel-Network and Sharing Center

Note

Windows Firewall

To allow the Windows IP to be accessed externally, this must be set as an exception in the Windows firewall **File and Printer Sharing**. Otherwise, there is only limited access to Windows from outside.

Default IP addresses for Windows and SIMOTION P Runtime

Default Ethernet addresses for use from Windows and SIMOTION P are preset.

Table 11-9 Default Ethernet address for Windows and SIMOTION P Runtime

Ethernet interface	Windows	SIMOTION P Runtime
Onboard Ethernet 1	169.254.11.21	169.254.11.22

The default IP address for Windows can result in IP addresses being assigned twice, e.g. during series commissioning (see Troubleshooting/FAQs (Page 7983)).

If DHCP is set under Windows, the IP addresses for Windows are determined automatically.

Communication via an Ethernet interface

If both Windows and SIMOTION use the onboard Ethernet interface X1, the following configuration is present:

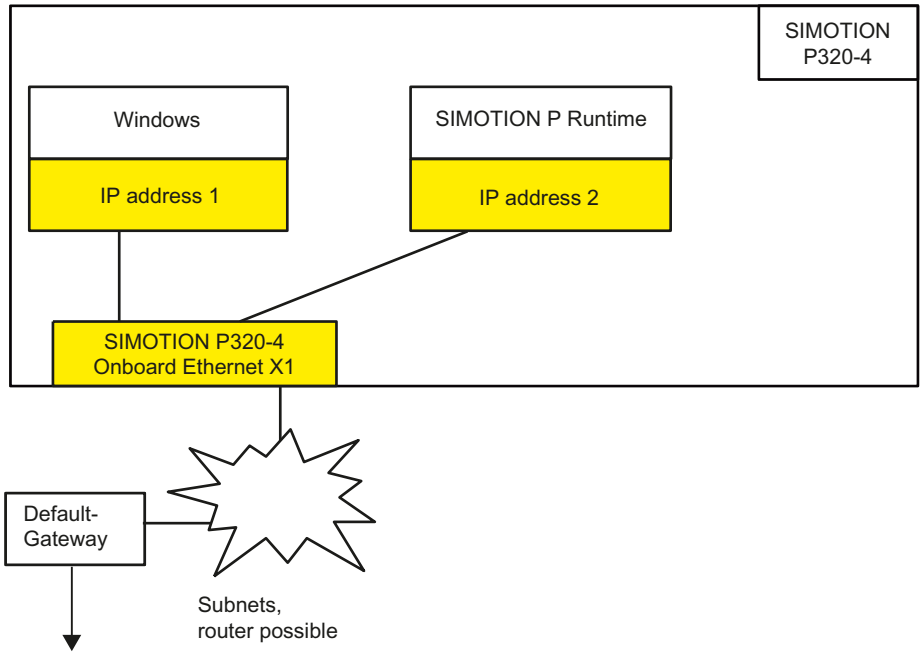

Figure 11-81 Distribution of the IP addresses for Windows and SIMOTION P Runtime

Note

If no change of the default IP addresses is desired, all conditions with the default IP addresses are fulfilled and no change is required.

The following conditions apply:

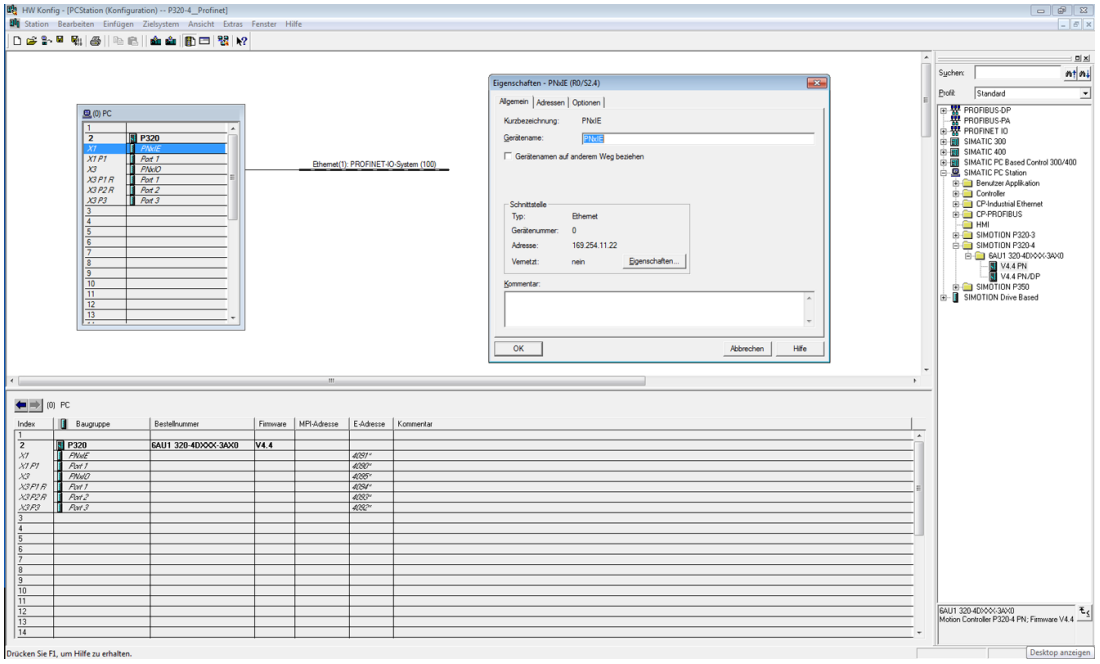
- IP address 1 ≠ IP address 2
- IP address 1 is in the same subnet as IP address 2
- IP address 1 is configured as of Windows 7 under > Control Panel > Network and Sharing Center.

Note

The setting for the default gateway must be identical for the IP addresses 1 and 2.

Procedure in HW Config to change the default IP addresses

1. Double-click **PNxIE** of the PC station. The following dialog box is opened.



2. Click the **Properties...** button of the Properties - PNxIE dialog box.
3. Enter the **IP address** for SIMOTION in the entry field (the default IP address is shown here).

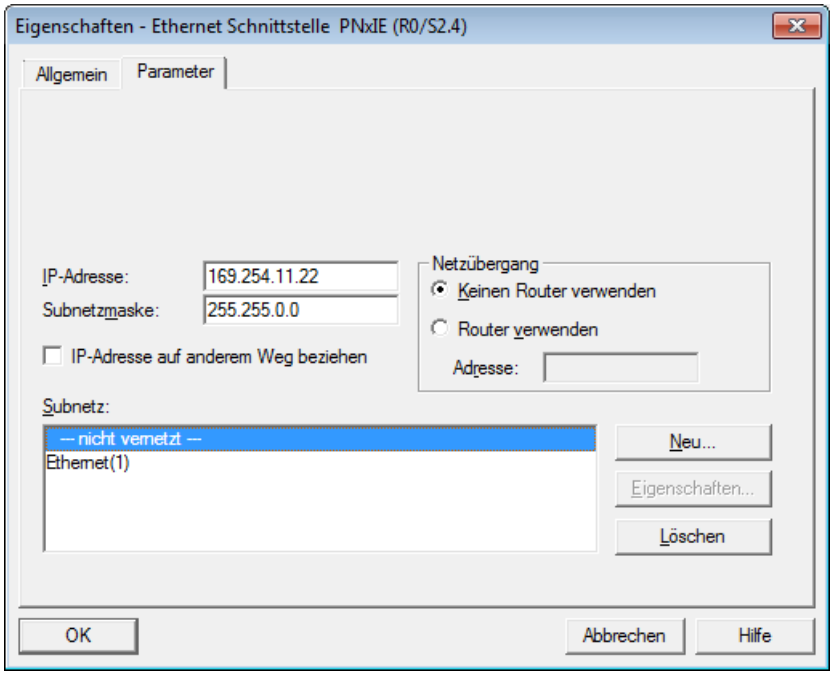


Figure 11-82 Changing the RT address for onboard Ethernet (1) - Properties dialog box

4. Enter the desired subnet mask in the **Subnet mask** entry field and, if required, a router that is to be used as default gateway.
5. Confirm with **OK**.

Activation state of the onboard Ethernet interfaces

The onboard Ethernet interface must be activated for the SIMOTION P Runtime (default setting = activated).

You can check the activation via the **Administration** tab of the **SIMOTION P Control Manager** (accessible via the Windows Control Panel with Start > Control Panel).

The **Activate Device** checkbox is displayed after selecting the button  for **Onboard RT - Ethernet Properties**.

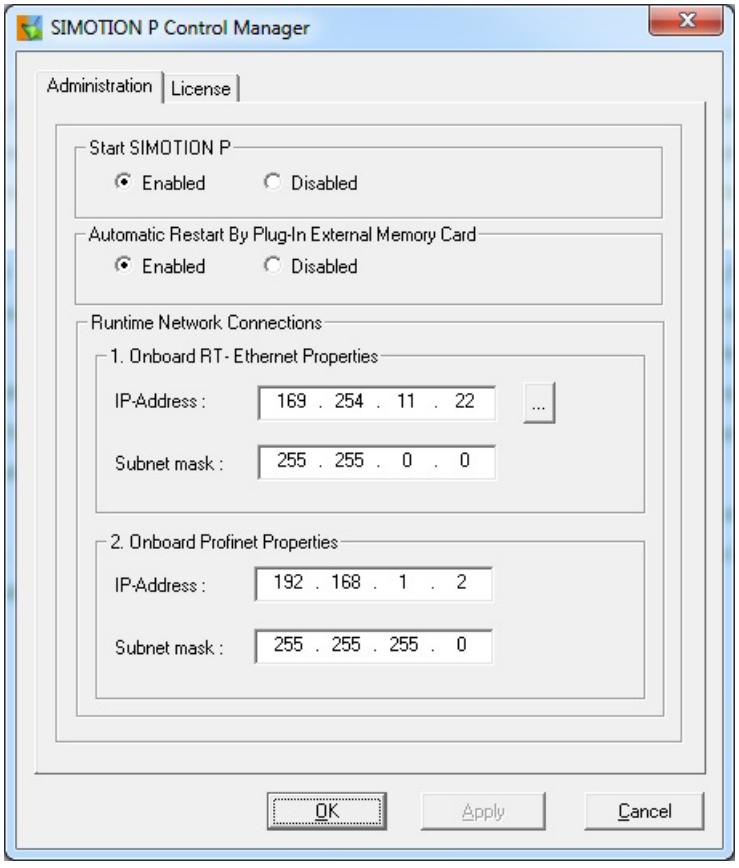

Figure 11-83 SIMOTION P Control Manager - Administration

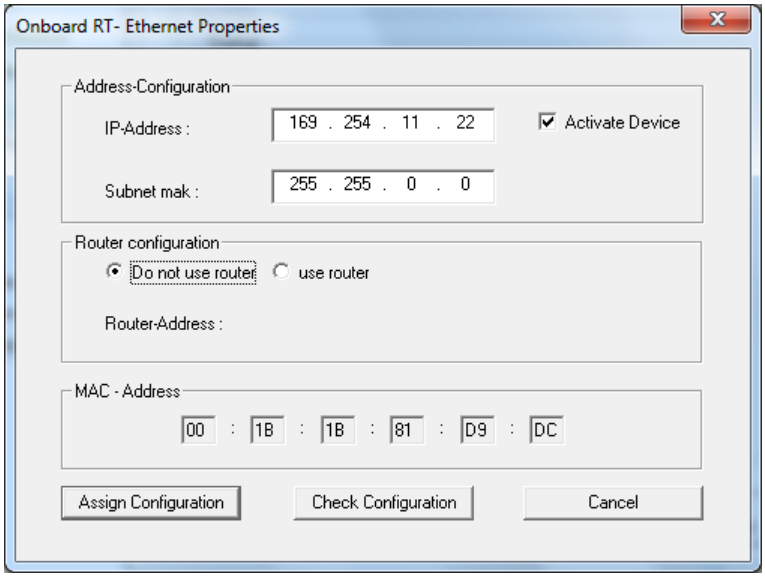

NOTICE
SIMOTION P Runtime During the runtime of SIMOTION P, the Windows settings must be **activated** for the onboard Ethernet interface. The onboard Ethernet interface must not be deactivated or activated during operation.

Establishing the active flag for an external PG/PC

Requirement

A PG/PC is required to create projects and download them to the target device. SIMOTION SCOUT can only be installed on the SIMOTION P320-4 S.

Note

Observe the online access point for SIMOTION P320-4 S

For SIMOTION P320-4 S, use **S7ONLINE** as access point to avoid inconsistencies.

Procedure

Proceed as follows to open NetPro and assign an interface in the PG/PC:

1. Open the project in SIMOTION SCOUT.
2. Click the button **Open NetPro**.
   NETPRO is accessed, and the configured network is graphically displayed. The PG/PC connection to the configured network is shown not bold and in a color **other than** yellow.

3. Double-click on the PG/PC that you would like to configure.
   The **Properties - PG/PC** dialog box is displayed with the **Assignment** tab in the foreground.
4. In the field **Assigned:** select the interface and activate S7ONLINE access by clicking the corresponding checkbox.
5. Accept the settings by clicking **OK**.
   The PG/PC connection to the configured network is now displayed in **bold** and **yellow**.
6. Save the changes via **Network** > **Save and compile** and upload them to SIMOTION P320-4.

Result

Now you can go online via the PG/PC.

PROFINET communication

Documentation

Description of PROFINET communication

A detailed description of PROFINET communication can be found in:

- SIMOTION Communication System Manual or
- SIMOTION SCOUT Online Help under **Basics** > **Communication** > **PROFINET IO**.

PROFIBUS communication

Documentation

Description of PROFIBUS communication

A detailed description of PROFIBUS communication can be found in:

- SIMOTION Communication System Manual or
- SIMOTION SCOUT Online Help under **Basics** > **Communication** > **PROFIBUS DP**.

Project download

Requirement

The **P320-4 PN** and **P320-4 PN/DP** modules have the same article number. For this reason, there is no distinction between the device during a download.

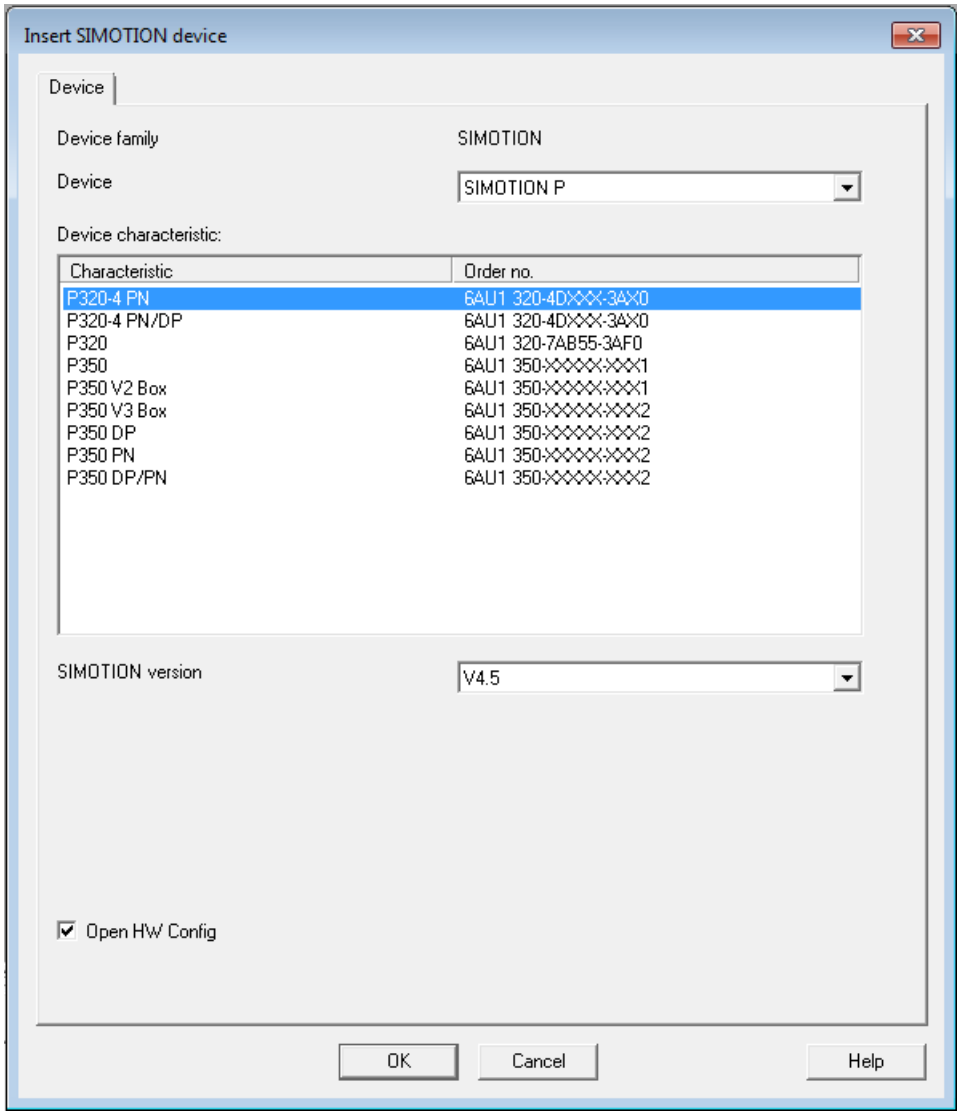

Figure 11-84 Inserting a SIMOTION device - selecting the device version

Behavior of the P320-4 PN device with the P320-4 PN/DP module

- If a **P320-4 PN** device with created PN line is loaded to a **P320-4 PN/DP module**, the project runs exactly as on a **P320-4 PN module**.

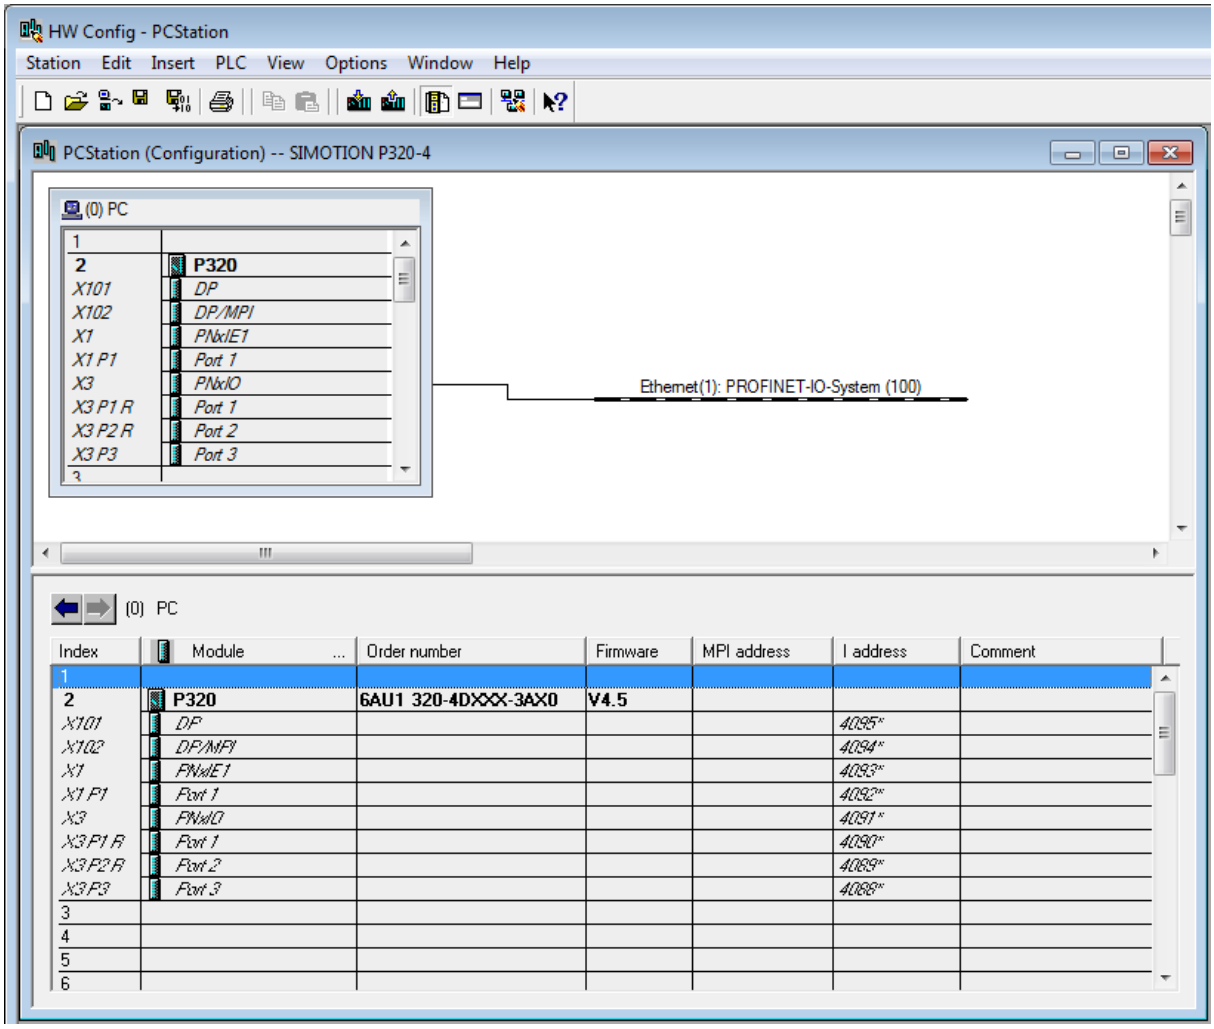

Figure 11-85 P320-4 PN/DP with created PN line (PROFINET-IO system)

- If a **P320-4 PN** device without created PN line is loaded to a **P320-4 PN/DP module**, there is no guarantee that the module runs with the configured base cycle clock.

Behavior of the P320-4 PN/DP device with the P320-4 PN module

Note

A **P320-4 PN/DP** device generally does not run on a **P320-4 PN module**.

The following message is displayed in the diagnostic buffer:

"Source 0 could not be loaded (inconsistency)".

The loaded configuration is not suitable.

Battery monitoring

The installed buffer battery has a service life of at least 5 years. The status can be checked with two-tier battery monitoring.

When the first warning level is reached, the remaining service life of the battery for buffering CMOS data and buffered SRAM is at least 1 month.

You will find further information on the battery warning at: Two-stage battery monitoring (Page 7969)

Lithium battery - ordering data		
Designation	**Article number**	**Further information**
Lithium battery	A5E30314053	Spare part

11.1.1.10 Commissioning (software)

Note before commissioning

Delivery condition

SIMOTION P320-4 is delivered with:

- Windows operating system
- SIMOTION P Runtime application

NOTICE
Risk of damage to the SIMOTION P320-4
If condensation has developed, wait at least 12 hours before commissioning the device.

Basic commissioning - initial startup

Requirement

The following requirements must be met before initial commissioning:

- The device is connected to the 24 VDC power supply.
- Equipotential bonding is connected.

Commissioning requirements

Prior activities

You have already performed the following actions:

- Your system has been installed and wired.
- The installation and parameterization has been completed.
- When networking via PROFINET, the PROFINET addresses of the bus nodes with which the SIMOTION P320-4 communicates are set.

See also

Connection requirements (Page 7891)

Parameter assignment / addressing requirements (Page 7915)

Notes on commissioning

Starting up communications

The following components must be commissioned:

- SIMOTION P320-4
- PROFINET component

Commissioning is performed either via the programming device or by installing the software required for commissioning on the SIMOTION P320-4.

If a panel is used, it must be connected.

Commissioning the components

Please refer to the relevant documentation for the commissioning of the components used with SIMOTION P320-4:

- ET 200 PN I/O
- PROFINET IO drives,

Recommended order for first commissioning

The individual steps for first commissioning are listed below in the recommended order.

1. The complete system is connected mechanically and electrically, and has been verified.
   - SIMOTION P320-4
   - Drives
   - Motors
   - SIMATIC S7 I/O components
   - HMI user interfaces
2. The article numbers of the drives and SIMATIC S7 I/O components should be available. You need these order numbers when setting up a SIMOTION project to verify that the components selected from the hardware catalog in the **HW Config** application correspond to the ones used in the system.
3. Prepare the drives for communication on the PROFINET IO.
4. Commission the drives via PROFINET IO.
   Literature: Function description of the associated drives
5. Carry out a test run for all axes.
6. Perform the optimization of the drives.
7. Switch on and power up the SIMOTION P320-4; all the basic settings are made automatically.

License tab (Page 7924)

Data backup

Memory media

The storage media of the SIMOTION P320-4 are divided into internal and external memories on drives C: and D:.

The SIMOTION P Kernel and Windows system software are located on the internal storage medium on drive C:.

Media

The following figure shows the partitioning of the storage medium in the delivery state, depending on the version of the SIMOTION P320-4.

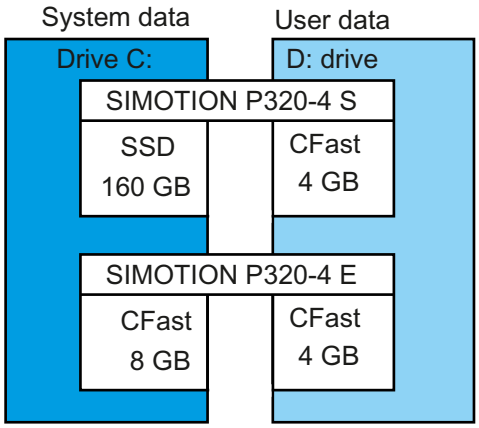

Figure 11-86 Storage media of the SIMOTION P320-4

Drive C:

Drive C: reserved for the Windows system software, SIMOTION P kernel, etc.

NOTICE
Compression for drive C: Not permissible Compression must not be activated for files and folders on drive C: for correct operation of the SIMOTION P320-4.

Drive D:

Drive D: contains the **user data**, e.g. programs, configuration data, parameter assignments of SIMOTION P Runtime.

Note

Storage of user data

It is recommended that only the user data be saved on drive D:.

SIMATIC data backup

Data backup under Windows Embedded Standard 7 32-bit / Windows 7 Ultimate 32-bit

For backing up data under Windows Embedded Standard 7 32-bit and Windows 7 Ultimate 32-bit, we recommend the software tool **SIMATIC IPC Image & Partition Creator** (as of V3.3.1). This tool allows the easy backing up and quick restoration of entire memory cards.

The SIMATIC IPC Image & Partition Creator only supports the burning of DVD media.

This software is available via the online ordering system Siemens Industry Mall (http://www.siemens.com/industrymall). You can find more accurate information about the tool in the associated product documentation.

Restore DVD

SIMOTION P320-4 is supplied with pre-installed hardware and software and is therefore ready for connection and operation.

The delivery kit includes a restore DVD. Using the restore DVD, you can restore the delivery state of the SIMOTION P320-4, e.g. in case of a problem when installing additional software packages such as HMI software.

It is recommended that you create a data backup after commissioning by the OEM. Save the data backup on an external hard disk or a USB flash drive.

The fundamentals of the data storage concept and the various types of data back-ups of the SIMOTION P320-4 are described in the section on the Data storage concept (Page 7944).

Note

SIMOTION licenses

SIMOTION Runtime licenses are retained (e.g. axis licenses) when the SIMOTION P320-4 is restored to its delivery state.

Only the licenses of the **Automation License Manager** are deleted (e.g. for the SIMOTION SCOUT engineering system).

Power-up of the SIMOTION P Kernel

The SIMOTION P Kernel is started by default when Windows is booting. It is therefore available after each power-up of the SIMOTION P320-4. The startup process is triggered by an installed service, the **SIMOTION P Startup Service**. This service ensures that the SIMOTION P Kernel starts automatically during the Windows power-up.

SIMOTION P320-4 is started with the project last saved from RAM to ROM and starts running immediately if the operating state was set to RUN when the system was switched off.

If you want to explicitly terminate the SIMOTION P320-4 without exiting Windows, use the **SIMOTION P State** application.

To do this, you must be logged on with administrator privileges. Only the administrator is offered the button for the **Terminate SIMOTION P** function.

After explicitly terminating the SIMOTION P Kernel via the SIMOTION P State application, the SIMOTION P Kernel can be restarted via this application (Start SIMOTION P button). A restart of Windows also results in a restart of the SIMOTION P Kernel.

You can find more detailed information about SIMOTION P State in Section SIMOTION P State application (Page 7909).

Data storage concept

Data storage concept overview

Overview

The backup possibilities described in the following section can be used to backup and restore the complete SIMOTION P320-4 installation with the current configuration and customization.

The SIMOTION version on the target device does not need to match the version of the device on which the backup was created.
Under certain preconditions, e.g. identical hardware for storage medium image, series commissioning can also be carried out using these backup and restoration mechanisms.

Storage medium image

With a storage medium image, the entire storage medium can be backed up and restored. This allows series commissioning to be performed (requirement: identical hardware!).

A storage medium image must be created both for the internal storage medium (Drive C) and for the external CFast card (Drive D). When creating the image with the **SIMATIC IPC Image Creator**, an image can be created jointly for one internal and one external storage medium.

When loading an image, be aware that the images for the internal and external storage media must be loaded separately and that the wizard must therefore be run twice. It is not possible to load the image onto both drives in a single process.

The restore DVD contains a storage medium image of the plant with which the delivery state of the SIMOTION P320-4 can be restored.

Various mechanisms are available for backing up and restoring data for the SIMOTION P320-4.

These mechanisms are described in the following sections, starting with the largest possible scope of a backup to the backing up of variables.

Although the backup/restore of data in many cases is initiated by the user, it is sometimes also performed automatically or started by the user program.

In addition to restoring defined states and updating/reloading a project in the target device, data backups are also needed to prevent data loss resulting from a hardware defect or failure of the backup battery.

Project update

The Project update (Page 7946) section describes options for updating/retransferring or backing up a SIMOTION project.

Application

- Transfer of a project to the newly installed SIMOTION P320-4
- Series commissioning

Advantage

Series commissioning is also possible without a programming device or using remote maintenance.

Disadvantages

The SIMOTION version on the target device must exactly match the version of the device on which the backup was created.

Single backups

The Single backups (Page 7950) section describes the options for backing up and restoring retain variables, retain TOs, unit variables, and global device variables.

Application

- Data backup when replacing the SIMOTION P320-4
- Restore the SRAM after a failed consistency check (battery failure,...)
- Backup the data for Unit variables and device-global variables from the RAM
- Backup values (variables) from the RAM
- Restore a defined state of the machine

Advantages

- The user program can use system functions to perform a backup
- Version-independent restoration of the retain data (non-volatile SIMOTION data)

Disadvantages

No complete backup

Defined states

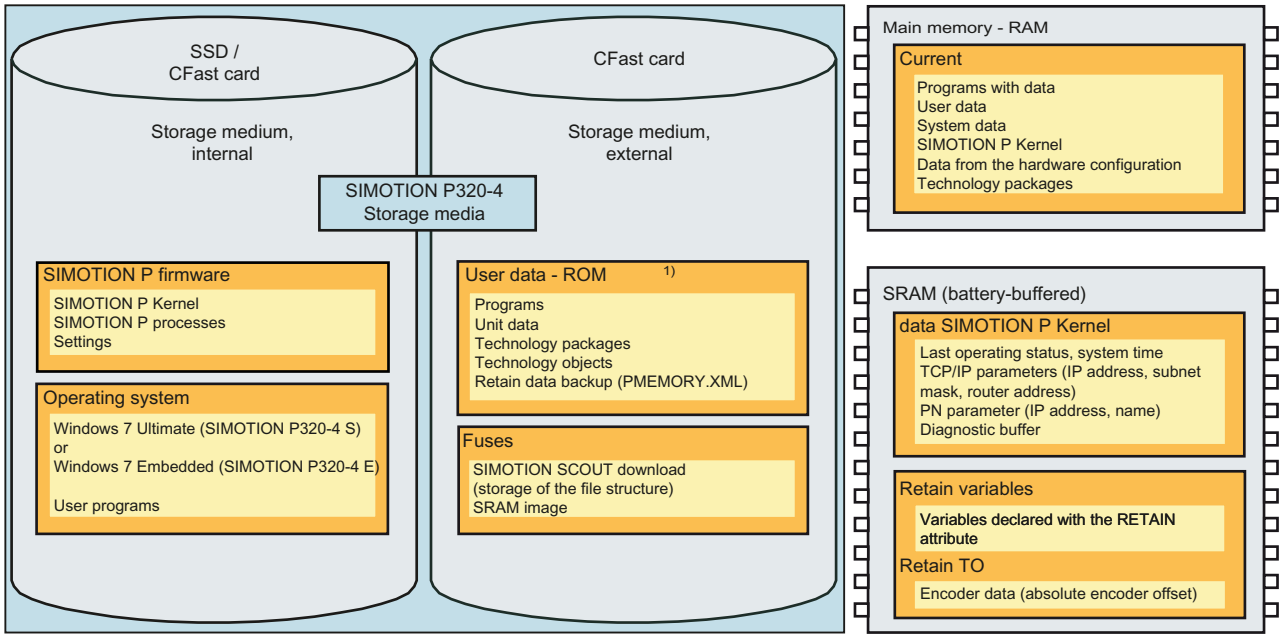
The Defined states (Page 7954) section describes the options for restoring a defined state / initial state.

Application

- System defect
- Windows defect
- Restore a defined initial state, for example, during commissioning

Memory model

The following figure shows which data memories are used by SIMOTION P320-4 and which data is saved in them.



1) The user data must not be written by Windows during runtime (SIMOTION P State = RUN).
User data can be written from the Explorer or other applications in the **Terminate SIMOTION P** state.

Figure 11-87 SIMOTION P320-4 memory model

Project update

Overview

The backup possibilities described in the following section can be used to update, retransmit or back up a SIMOTION project.

The **download of project data** (file structure or ZIP file) via **SIMOTION SCOUT** can be used to perform series commissioning of a SIMOTION project.

SIMOTION IT allows series commissioning using remote maintenance via a web browser. Supported web browsers are, for example, Internet Explorer or Mozilla Firefox.

Detailed information about the backup options for the project update can be found at:

- SIMOTION Project Download online (Page 7947)
- SIMOTION SCOUT - download of the project data (file structure) (Page 7947)
- SIMOTION SCOUT - download of the project data with SIMOTION IT (ZIP file) (Page 7948)
- Backing up and restoring project data (file structure) (Page 7949)

SIMOTION Project Download online

The project data is loaded from a programming device with engineering system to the work memory (RAM) and selected parameters (e.g. TCP/IP) to the SRAM or exchanged between SRAM and work memory (RAM).

The explicit import of user data into the external CFast card is initiated by SIMOTION SCOUT (**Copy RAM to ROM**).

Note

Identical names in SIMOTION SCOUT / Station Configurator are essential

It is essential for the download that the name of the station is identical in the engineering system (SIMOTION SCOUT) and in the Station Configurator of the SIMOTION P320-4.

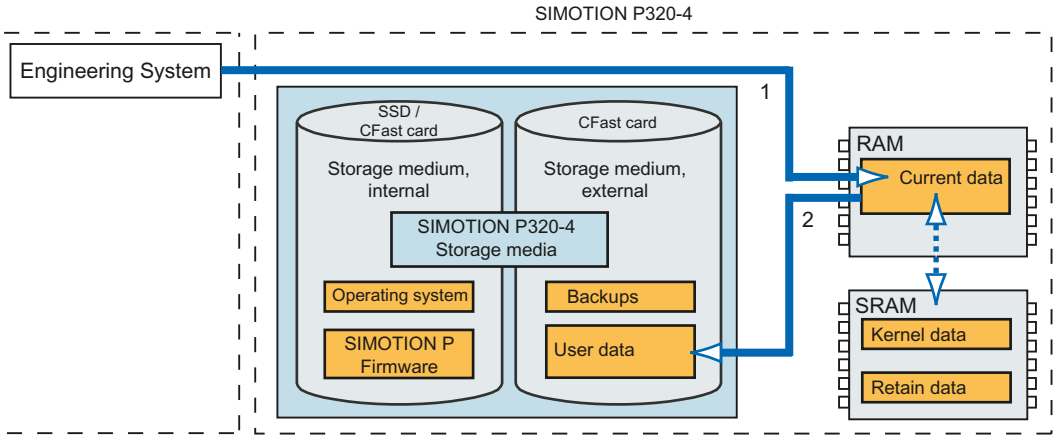


Figure 11-88 SIMOTION SCOUT download from the engineering system

SCOUT project download online process

1. Load the project data via **SIMOTION SCOUT**, menu **Target system > Load > Load project into target system...**, into the working memory of the SIMOTION P320-4.
2. To transfer the data to the external storage medium, use the menu **Target system > Copy RAM to ROM** in SIMOTION SCOUT.

The project data is transferred to the controller.

SIMOTION SCOUT - download of the project data (file structure)

The project data is saved by SIMOTION SCOUT in the form of the file structure in a file system (e.g. a programming device with an engineering system).
The user copies this file structure to the external CFast card of the SIMOTION P320-4.

This permits a series commissioning of SIMOTION programs.

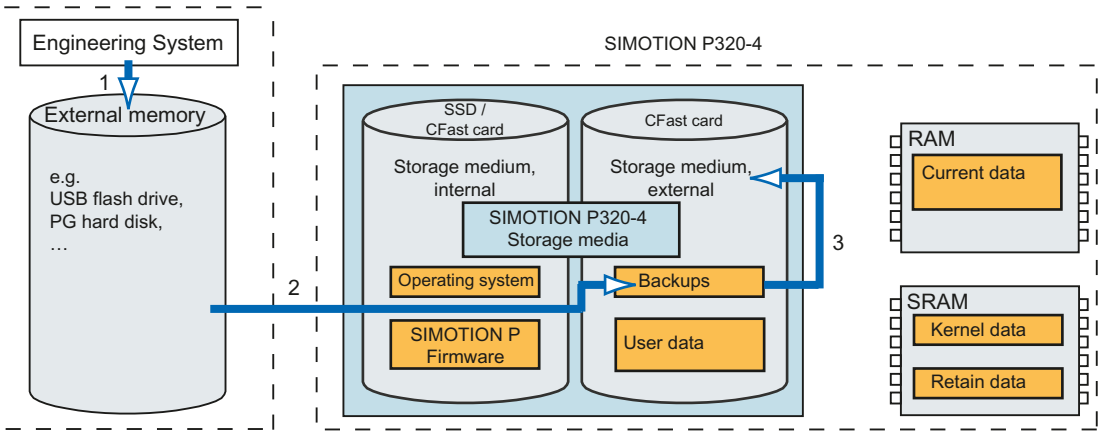

Figure 11-89 SCOUT download (file structure)

Download of the project data process (file structure)

1. Save the data via SIMOTION SCOUT, menu **Edit > Load to file system ...** (option **Save normally**), on the file system of your programming device.
2. Copy this data (file structure) to the external CFast card (drive D) of SIMOTION P320-4 (e.g. with USB memory stick and Windows Explorer).
   SIMOTION P must be in the **terminated** state for this.

Note

Note the SIMOTION version

The SIMOTION version on the target device must exactly match the version of the device on which the backup was created.

SIMOTION SCOUT - download of the project data with SIMOTION IT (ZIP file)

SIMOTION SCOUT stores the project data in the form of a ZIP file to a file system (e.g. a programming device with engineering system). This ZIP file can be transferred by the user to the SIMOTION IT web server with the web browser and it is then automatically imported into the user data.

This permits a project download using remote maintenance or series commissioning.

Note

Note the SIMOTION version

The SIMOTION version on the target device must exactly match the version of the device on which the backup was created.

After the upload of a SIMOTION project into the SIMOTION P320-4 (SIMOTION device update), the time stamps in the user data and the SIMOTION SCOUT project are different.
The project is shown as inconsistent in SIMOTION SCOUT.
The consistency can be established via a project download or a download of the HW Config in the SIMOTION SCOUT.

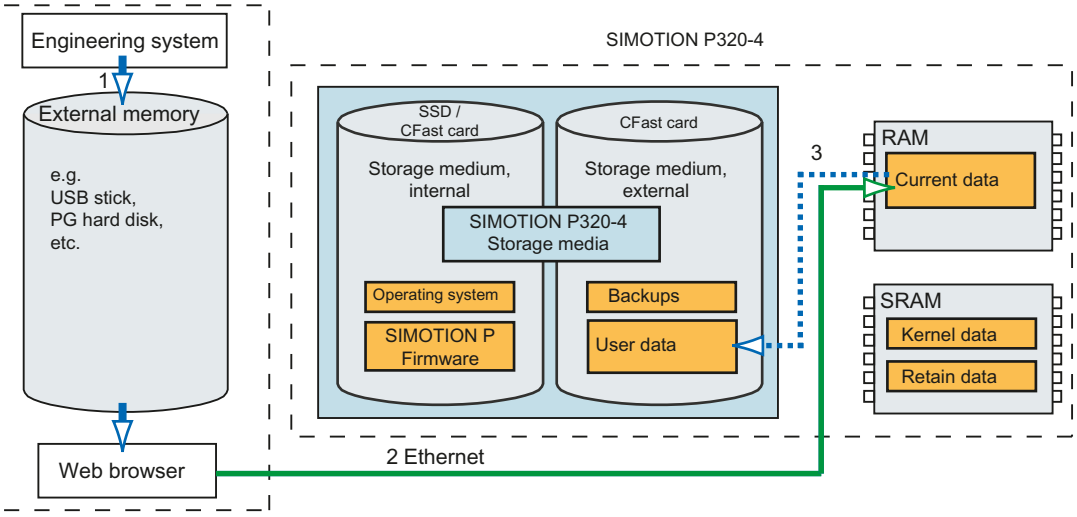

Figure 11-90 SIMOTION SCOUT download (ZIP file)

Download of the project data process (ZIP file)

1. Save the data via SIMOTION SCOUT, menu **Edit > Load to file system ...** (option Save compressed), on the file system of your programming device.
2. Transfer the ZIP file via the web browser and the project download of SIMOTION IT**:** **Manage Config** > [Login dialog] > **Device Update** > **Send new update data (*.ZIP)**
3. The unpacking and the import of the data into the user data on the external CFast card is performed automatically.

Note

SIMOTION IT

You can find further information about SIMOTION IT in the following documentation:

- SIMOTION IT Diagnostics and Configuration Diagnostics Manual
- SIMOTION IT Programming and Web Services Programming Manual
- SIMOTION IT Virtual Machine and Servlets Programming Manual

Backing up and restoring project data (file structure)

The project data (file structure) is located in the **USER** directory on the **external CFast card** (drive D) of the SIMOTION P320-4.

1. To save the project data, copy the USER directory from the external CFast card, e.g. to a storage medium of the SIMOTION P320-4 or to a USB flash drive.
2. To restore the project data, copy the USER directory, e.g. from a storage medium of the SIMOTION P320-4 or a USB flash drive, to the external CFast card and replace the existing directory.

This also enables series commissioning without a programming device or SIMOTION SCOUT.

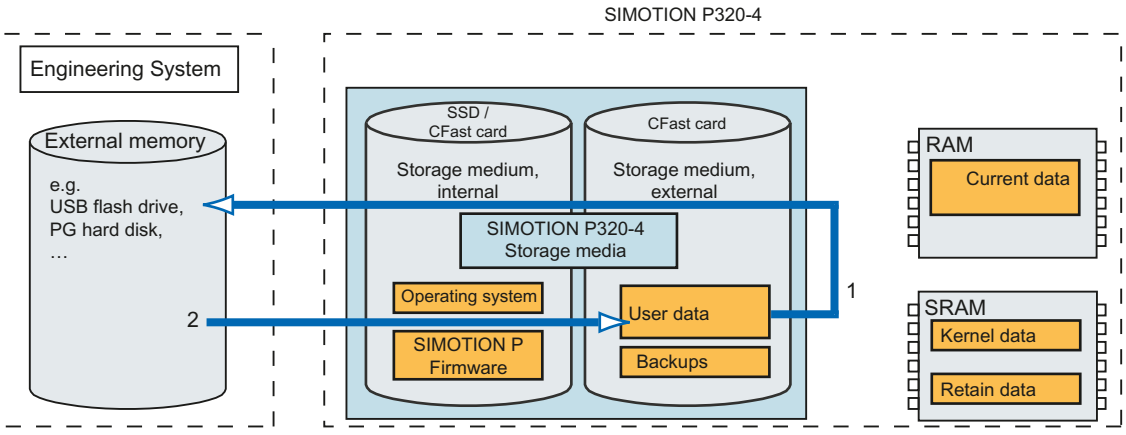

Figure 11-91 Backing up and restoring a file system

Sequence of a series commissioning

Copy the **USER** directory from a storage medium to the external CFast card (Drive D) of the SIMOTION P320-4 to be newly commissioned.

SIMOTION P320-4 must be in the **terminated** state for this.

Single backups

Overview

The backup options described in the following section can be used to back up and restore retain variables, retain TOs, unit variables and global device variables.

If the consistency check results in an SRAM error (because of a power failure if the battery has fallen below the threshold value) or the SIMOTION P320-4 is replaced, the backup can be used to restore the contents of the SRAM.

A user program can use system functions to initiate a backup.

Unit variables and global device variables can be backed up from the RAM to allow them to be recovered in the event of a power failure, for example.

This allows the initial state of the machine (reference points, sensor values, ...) to be restored.

Detailed information about the individual backup options can be found under:

- Backup/restore SRAM (Page 7951)
- Backing up non-volatile SIMOTION data (retain data) (Page 7951)
- Restoring non-volatile SIMOTION data (retain data) (Page 7953)
- Backing up unit variables and global device variables (Page 7954)

Back up/restore SRAM

The correct shutdown of Windows automatically initiates **Terminate SIMOTION P** (SIMOTION P State). This automatically saves the retain data from the SRAM to the external CFast card.

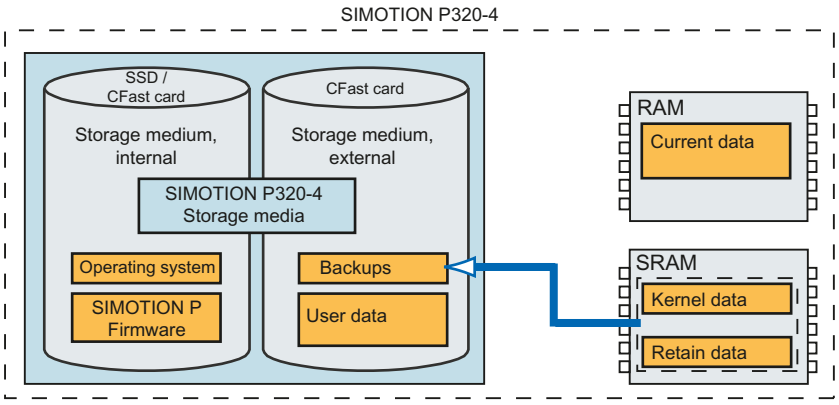

Figure 11-92 Saving SRAM with Terminate SIMOTION P

A consistency check of the SRAM is performed at each SIMOTION power-up. If an error is detected here, the SRAM data will be restored from the backup.

If, for example, the SIMOTION P320-4 needs to be replaced, this backup/restore mechanism allows the data to be transferred to the SIMOTION P320-4.

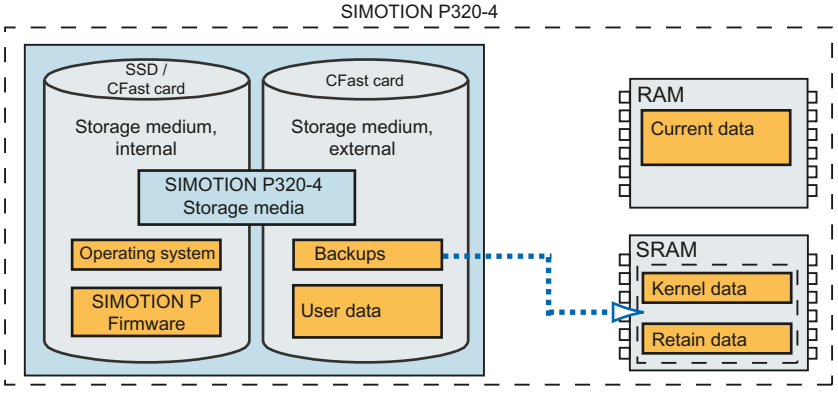

Figure 11-93 SRAM restore at startup

Further information

can be found in the section Non-volatile data and SRAM handling (Page 7972).

Backing up non-volatile SIMOTION data (retain data)

The non-volatile SIMOTION data (retain data) can be backed up from the user program and via SIMOTION SCOUT.

You can use the backup to restore the retain data independent of the version after an update or a hardware replacement (SIMOTION P320-4) or to create a current backup to use in the event of an inadvertent deletion.

You can save the retain data as follows:

- From the user program with the **_savePersistentMemoryData()** system function
  The contents are saved to the "PMEMORY.XML" backup file in the "USER\SIMOTION" directory.
  The data is saved in the PMEMORY.XML file on the external CFast card.
- To back up the retain data via SIMOTION SCOUT , go online and in the context menu of a created source, execute **Save variables...**.
  The data is saved in the **unitdata.xml** file on the computer with SIMOTION SCOUT .
- Alternatively, the retain data is saved via the **SIMOTION P State** application, via the **SIMOTION P > Set Diagnostic Switch** menu.
  The contents are saved to the "PMEMORY.XML" backup file in the "USER\SIMOTION\HMI \SYSLOG\DIAG" directory.
- To restore the retain data via SIMOTION SCOUT, go online and execute **Restore variables...** in the menu.
  Restores the saved variables, also over different versions.

On the system side, the **_savePersistentMemoryData()** system function ensures that a consistent overall image of the non-volatile SIMOTION data is always available the next time the device is switched on, even if there is a power failure during backup.

An already existing backup file is renamed to "PMEMORY.BAK" before a new backup file is generated. If the save operation to the new backup file fails (e.g. because the capacity of the external CFast card is insufficient), this backup copy of the backup file is used the next time an attempt is made to restore the non-volatile SIMOTION data content. If the new file is successfully created, the backup copy of the backup file is deleted.

NOTICE
Loss of data due to failure to make backup copies Back up the non-volatile SIMOTION data on the CFast card. Non-backed-up non-volatile SIMOTION data can be lost on hardware replacement (module defect). For example, failing to back up the current values of the retain variables will result in them being lost and reset to their initial values.

NOTICE
Homing required again after absolute encoder overflow If an absolute encoder overflow occurs after _savePersistentMemoryData, the actual position value is no longer correct after the non-volatile data is restored. In this case, homing (absolute encoder adjustment) must be repeated.

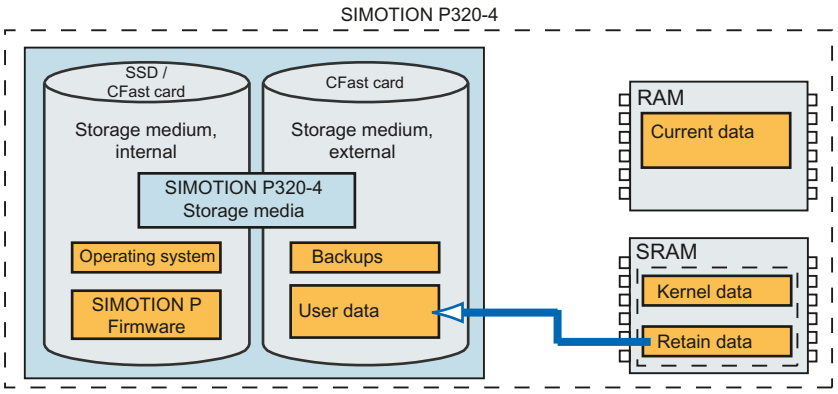

Figure 11-94 Save retain data

Restoring non-volatile SIMOTION data (retain data)

The backup of the non-volatile SIMOTION data (variables declared as retain) is restored in the memory if a data inconsistency is detected after a power failure (the backup battery has fallen below a threshold value) or a general reset has been performed on the CPU. This means that the user can perform a general reset to force the data to be reloaded.

Condition for restoring is that the **PMEMORY.XML** file is present on the external CFast card and the content of this backup file matches the project on the external CFast card.

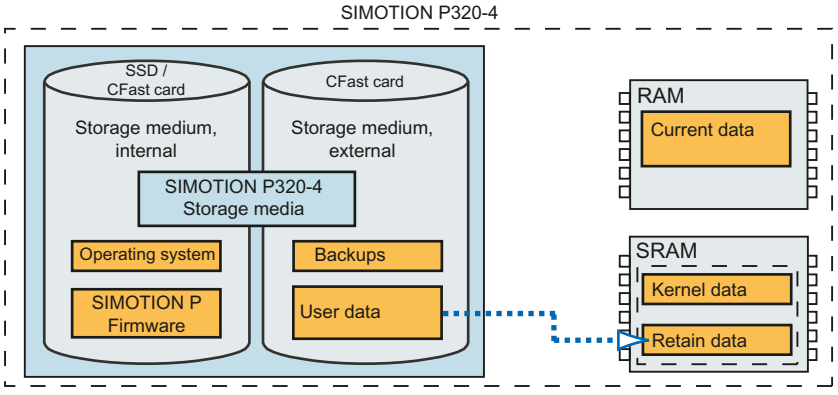

Figure 11-95 Restore retain data

Note

In the event of a power failure of the SIMOTION P320-4, the retain data in PMEMORY.XML will **not** be restored automatically.

Note

If a data inconsistency exists in the event of a power failure because the backup battery has fallen below a threshold value, the data backup from PMEMORY.XML will be written back into the SRAM.

Save unit variables and global device variables

Unit variables and global device variables are never retentive; the data will be lost in the event of a power failure.

If the unit variables and global device variables which have not been declared as retain variables are to be recovered after a power failure, the user program can use system functions to save this data to data sets (files on the external CFast card).

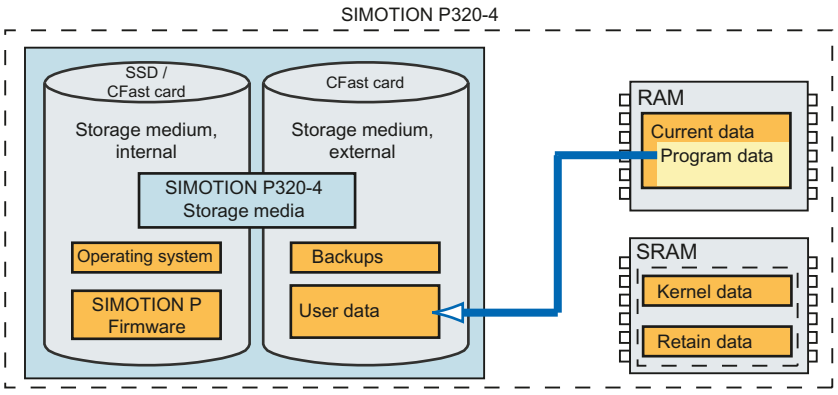

Figure 11-96 Saving unit variables and global device variables

System functions for backing up / restoring unit variables and global device variables:

- _loadUnitDataset()
- _saveUnitDataset()
- _importUnitDataset()
- _exportUnitDataset()

With unit variables, however, generally only unit variables of the interface section can be saved. In addition, all variables of the unit declared as retain variables will be saved.

Save variables... SIMOTION SCOUT function:

- The data is saved in the unitdata.xml file on the SIMOTION SCOUT computer.

Restore variables... SIMOTION SCOUT function:

- Restores the saved retain variables, also across different versions.

Defined states

Overview

An initial state can be restored by loading data backups, as described in the section Project update (Page 7946), or via the reset functions of the **SIMOTION P State** application.

Transfer backup from the file system

Download backups that were stored on the file system using the backup mechanisms described previously.

For further information see Single backups (Page 7950).

Detailed information about the backup options for detailed states can be found at:

- Restore the factory setting using SIMOTION P State (Page 7955)
- Overall reset using SIMOTION P State - operating mode switch setting MRES (Page 7956)
- Delete SRAM via SIMOTION P State - button Restart (Del. SRAM) (Page 7956)

Restore the factory setting using SIMOTION P State

The condition on delivery is restored via the menu item **Extras > Reset to factory default**.

Note

The SRAM and the PMEMORY.XML file will also be deleted.

The controller is restarted automatically.

Any licenses on the card will not be deleted.

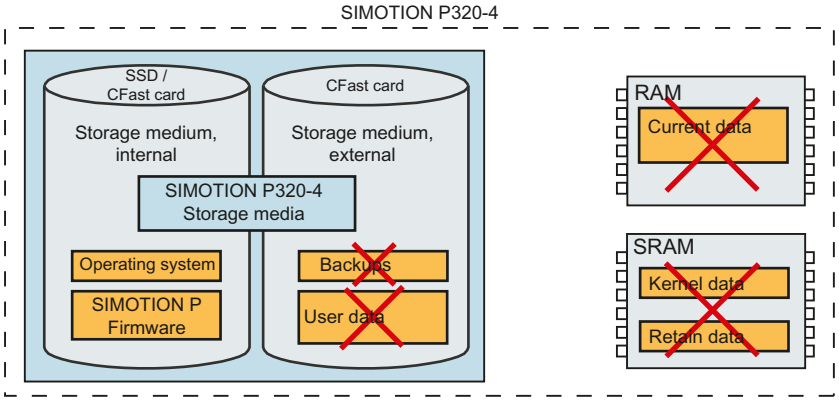

Figure 11-97 Restoring factory settings

Further information

on the SIMOTION P State - menus (Page 7913)

Overall reset using SIMOTION P State - operating mode switch setting MRES

A general reset deletes the non-volatile SIMOTION data and retain data.

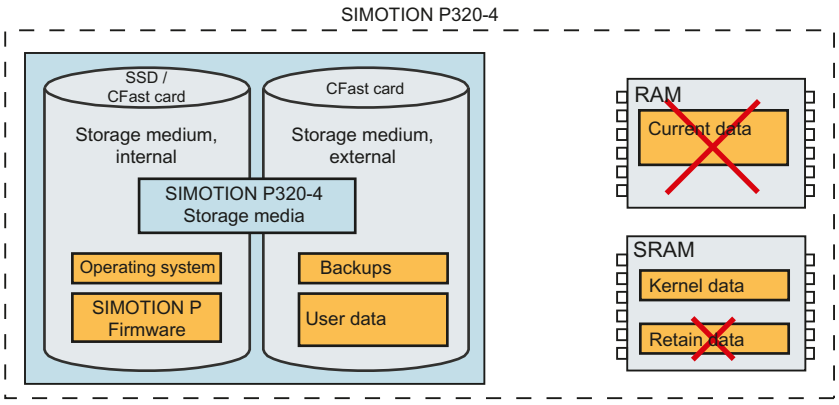

Figure 11-98 General reset

If a backup of the retain data (PMEMORY.XML) exists, this data will be accepted after the general reset. Thus, the user can perform a general reset to force the saved retain data to be restored.

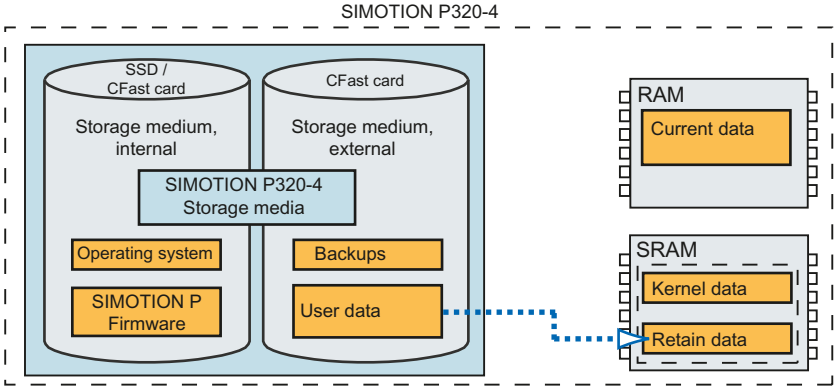

Figure 11-99 Restore retain data

Delete SRAM via SIMOTION P State - button Restart (Del. SRAM)

SIMOTION P320-4 will be restarted and the data in the SRAM will also be deleted.

The loading of a backup allows the SIMOTION P320-4 to be returned to a defined initial state. The backed up program variables and retain variables and thus the encoder values, homing data will be restored.

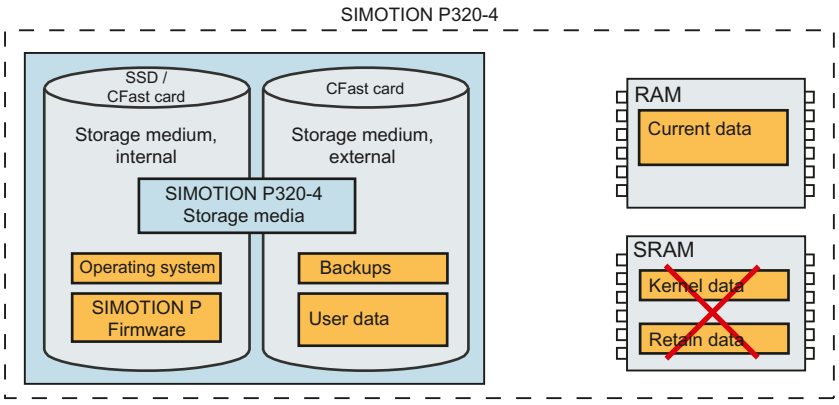

Figure 11-100 Delete SRAM - Restart (Del. SRAM)

If the SIMOTION SCOUT function **Target system > Copy RAM to ROM** was called previously, the saved project will be reloaded.

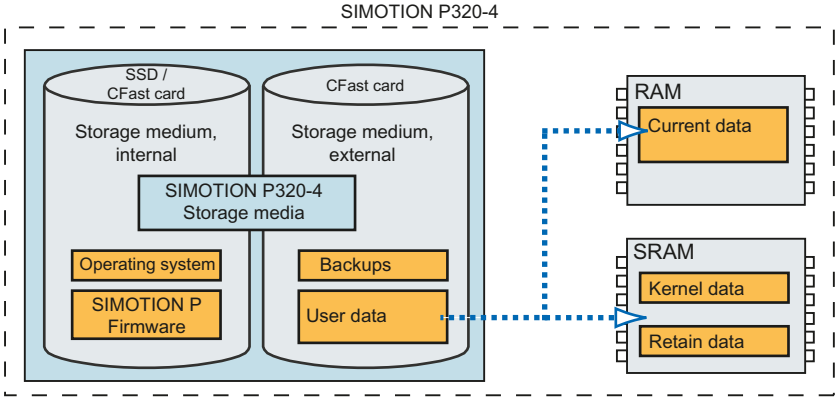

Figure 11-101 Load project after Restart (Del. SRAM)

Further information

on the SIMOTION P State buttons can be found in the Function elements (Page 7912) section.

SIMOTION P overall reset

SIMOTION P overall reset overview

Introduction

When a general reset is performed, the RAM on the SIMOTION P320-4 will be cleared along with any non-volatile data in the SRAM - with the exception of the communication configuration (e.g. baud rates and network addresses). For further information see Non-volatile data and SRAM handling (Page 7972).

Below is a list of the data that is either capable or not capable of withstanding a general reset. Data on the external CFast card is retained.

When must a general reset be performed on SIMOTION P320-4?

If you wish to undo changes in your user data (programs, configuration data, parameter assignments) in the **volatile data** area of the SIMOTION P320-4.

NOTICE
Differences when performing a general reset in connection with the RAM to ROM function
The following generally applies:
If **no** RAM to ROM was executed before the general reset, all programs and parameter assignments are considered as **data deleted on general reset**.
If data was backed up **with** RAM to ROM before the general reset, this data is considered as **data not deleted on general reset**.

Data deleted on general reset

The following data is deleted on the SIMOTION P320-4:

- Configuration data
- Programs
- Parameter assignments
- Technology packages
- Data from absolute encoders (absolute encoder adjustment, cyclic range overflows)

  Note

  Absolute encoder data is deleted during a general reset operation and must, therefore, be readjusted after the general reset.

- Retain variables
  Retain variables are variables that are defined as **non-volatile data** in the user program by the key word **Retain**.

Data not deleted on general reset

The following data is retained:

- Baud rate
- PROFINET IP address / name of the SIMOTION P320-4
- IP addresses
- Contents of the diagnostics buffer

- Data that was saved with the _savePersistentMemoryData(), _saveUnitDataSet(), _exportUnitDataSet() commands and with RAM to ROM.
  If the retain data is backed up (with _savePersistentMemoryData()), this data is backed up again to the non-volatile data after the general reset. Thus, the user can perform a general reset to force the saved retain data to be restored.
- Licenses

The technology packages and user data (configuration data, programs, parameter assignments) previously backed up to an external CFast card by means of the **Copy RAM to ROM** menu command are transferred to the **volatile data** area of the SIMOTION P320-4 after the general reset.
Thus, an existing configuration on the external CFast card is loaded to the SIMOTION device following the general reset.

Further information

Data storage concept overview (Page 7944)

Overall reset using the mode selector (on screen)

For SIMOTION P320-4, the overall reset using a simulated mode selector is performed using the SIMOTION P State application.

Note

MRES mode switch position

If you set **MRES** via the SIMOTION P State application, the SIMOTION P320-4 automatically goes into the **STOP** operating state.

Proceed as follows to initiate an overall reset:

1. Turn the mode selector to **MRES** and keep **MRES** pressed until the **STOP** LED stops flashing. When the LED permanently lights up yellow, the **STOP** operating state has been reached.

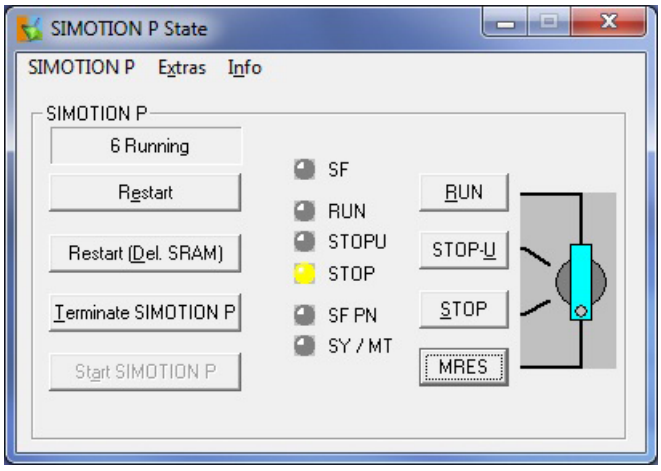

Figure 11-102 SIMOTION P State - STOP operating state

2. When you release **MRES**, the mode selector points to the **STOP** position again.

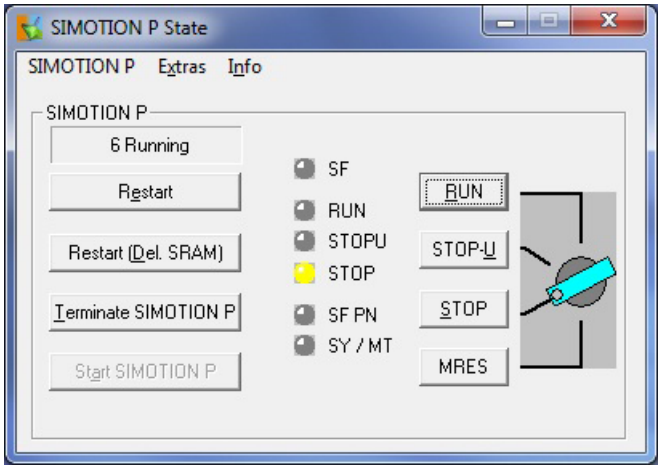

Figure 11-103 SIMOTION P State - Mode selector from position MRES to STOP

3. You must turn the switch back to the **MRES** position within three seconds.
   MRES is then displayed in the status.

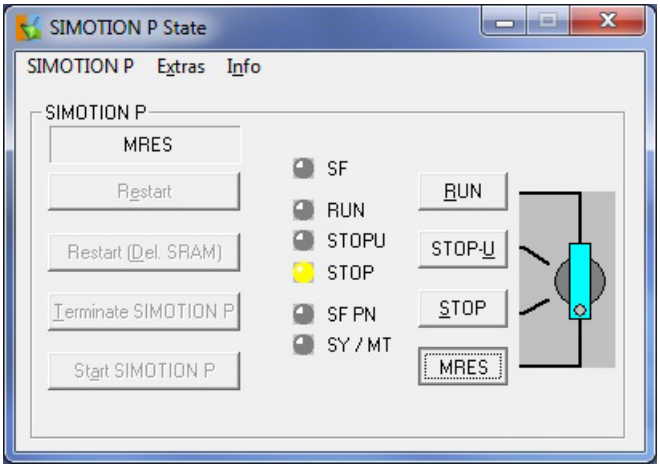

Figure 11-104 SIMOTION P State - status MRES

The mode selector then goes into the **STOP** position.

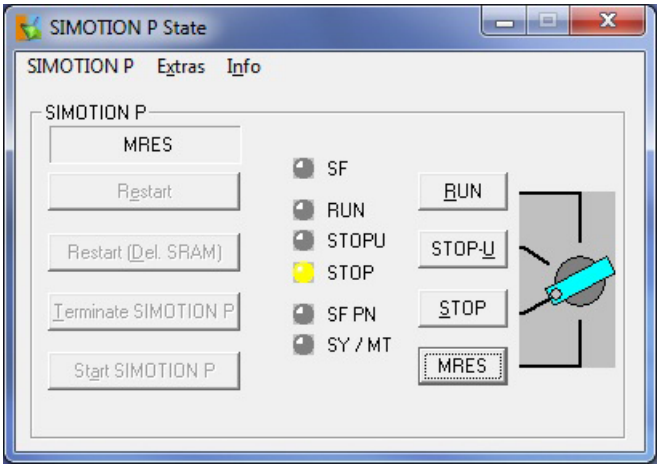

Figure 11-105 SIMOTION P State - status MRES, mode selector STOP

4. The SIMOTION P320-4 then restarts automatically.

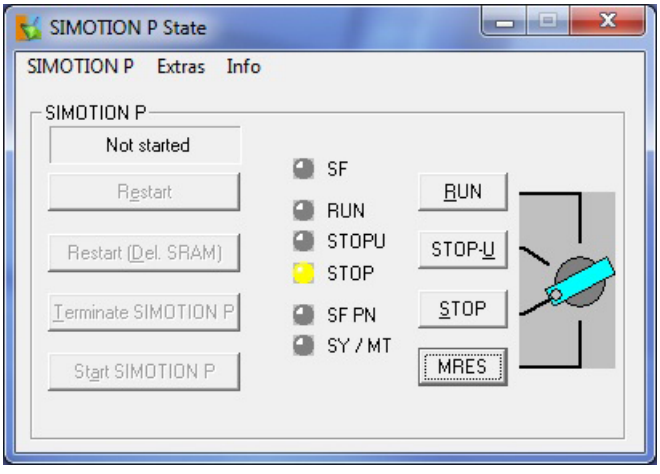

Figure 11-106 SIMOTION P State - status before the automatic restart

Deleting user data on the CFast card

Requirement

You can delete the user data with SIMOTION SCOUT. The SIMOTION P320-4 must be online. The user data in the RAM, the persistent data in the SRAM (except for the communication configuration), and the user data on the CFast card are deleted. You can thus continue to access the SIMOTION P320-4 with your PG/PC.

Procedure

To delete the user data:

1. In SIMOTION SCOUT, open the project you want to edit.
2. Go online with SIMOTION P320-4.
3. Select **Target system > Delete user data on card...**.

The data is deleted.

Switching off

Windows

To ensure the safe operation of the SIMOTION P320-4, Windows must be properly shut down before the SIMOTION P320-4 is switched off.

Note

Use the Windows start menu to correctly shut down the Windows system: **Start > Shut down**

If Windows is not shut down properly, the Windows installation may become damaged to the extent that it may no longer be possible to run the SIMOTION P320-4.

Note

Only applies to the SIMOTION P320-4 E

SIMOTION P320-4 E is delivered with deactivated EWF (Enhanced Write Filter).

After commissioning the SIMOTION P320-4 E, activate the EWF for drive C:, which ensures:

- An extended service life for the **internal** CFast card
- No data loss on the **internal** CFast card when switching the device off via the line side switch or through disconnection from the power supply

NOTICE
Do not protect external CFast cards with EWF Drive D: - the **external** CFast card - must not be protected with EWF as otherwise the functionality of SIMOTION cannot be assured.

NOTICE
Threat of data loss **Always** shut down SIMOTION correctly as otherwise there is a threat of data loss.

SIMOTION P320-4

If Windows is shut down properly, the SIMOTION P320-4 will also be shut down properly.

If the SIMOTION P320-4 is switched off before Windows is shut down correctly, the POWER FAIL functionality causes the following events to occur.

- SIMOTION P320-4 is stopped correctly
- The SIMOTION P retain variables are saved in the non-volatile memory of the SIMOTION P320-4.

When SIMOTION P320-4 powers up again, the backed-up user data will be available once more.

This means that the SIMOTION P320-4 is ready to run immediately without loss of data,

provided that the Windows installation was not damaged by the switch-off.

Behavior with Shut down, Logoff or Restart

If a Windows Shutdown, Logoff or Restart is initiated although the SIMOTION P320-4 is still in the **Running** state, the SIMOTION P320-4 is terminated automatically.

With large projects, a black screen may be displayed in Windows with the message **Waiting for SIMOTION P – Please wait - SIMOTION P is terminating**.

The termination of the SIMOTION P Runtime can vary depending on the size of the project.

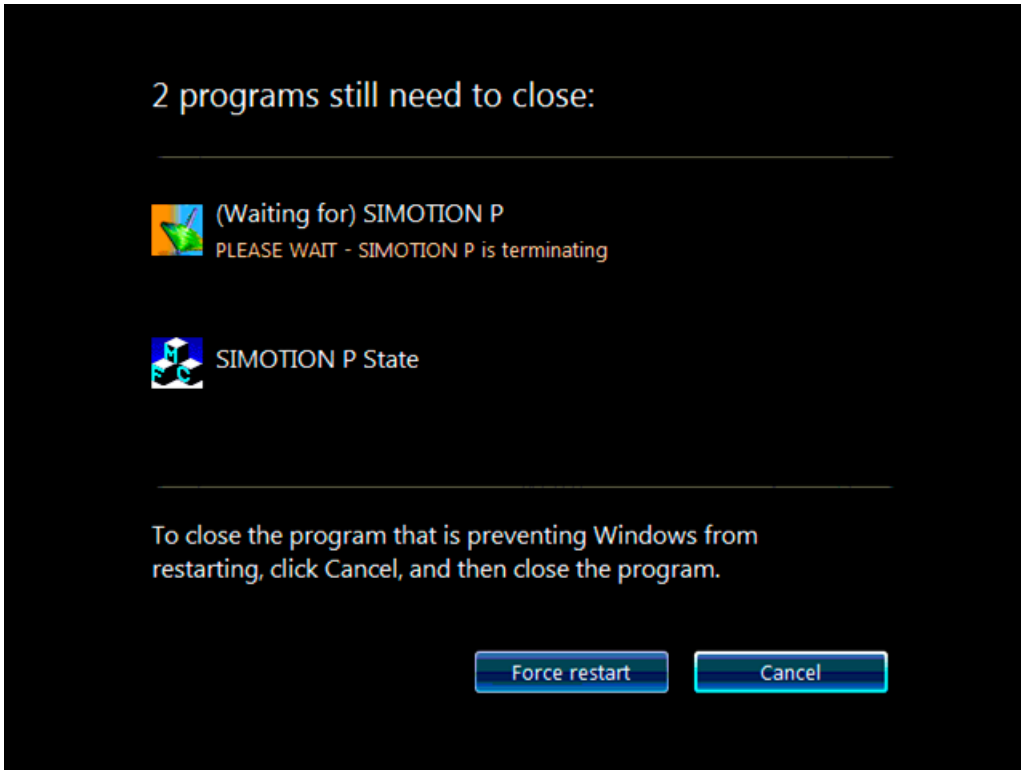

Figure 11-107 Black screen

11.1.1.11 Service and maintenance

Recording diagnostic data

Diagnostics data can be recorded during power-up and operation for the diagnostics and error analysis.

Saving diagnostic data during power-up

1. Terminate the SIMOTION P320-4 via the **Terminate SIMOTION P** button of the **SIMOTION P State** application.
2. Activate the diagnostics switch via the following option:
   SIMOTION P State, menu item **SIMOTION P > Set Diagnostic Switch**.
   The diagnostic data is recorded during power-up and the **SIMOTION P > Set Diagnostic Switch** switch automatically reset after writing the data.
3. After writing the diagnostic data, **SIMOTION P** must be terminated (RUN LED flashes continuously green).

Saving diagnostic data during operation

1. Make sure that the SIMOTION P320-4 has been started and powered up, e.g. with SIMOTION P State.
2. Activate the diagnostics switch via the following option:
   SIMOTION P State, menu item **SIMOTION P > Set Diagnostic Switch**

The diagnostic data is recorded during operation and the **SIMOTION P > Set Diagnostic Switch** switch automatically reset after writing the data.

Backing up diagnostic data

Following a fault on a SIMOTION device, diagnostic data (e.g. diagnostic buffer content, current content of website, etc.) can provide important information on the cause of the fault. The diagnostic data can be recorded during power-up or operation and backed up on the external CFast card by means of a simple operation as described below.

External CFast card

You can copy the backed-up data from the external CFast card.

Path: D:\USER\SIMOTION\HMI\SYSLOG\DIAG

SIMOTION IT / FTP

You can load the backed-up diagnostic data by means of SIMOTION IT or FTP:

You can find more detailed information at:

- SIMOTION IT Diagnostics and Configuration Diagnostics Manual
- SIMOTION online help

Evaluating diagnostic data

You can also use the diagnostic data for diagnostic purposes or forward it to Technical Support for evaluation purposes.

Diagnostics via LED displays (Page 7975)

Single backups (Page 7950)

Restoring factory settings

Overview of restoring the factory settings

Note

When the factory settings are reset/restored, licenses are retained.

Resetting the SIMOTION P320-4 to the delivery status

The **SIMOTION P State** application is used for this function.

Procedure

Proceed as follows to restore the delivery status of SIMOTION P320-4:

1. First, terminate SIMOTION P320-4 via the **Terminate SIMOTION P** button of the SIMOTION P State application.
2. Then select **Extras** > **Reset to factory default** in the menu.

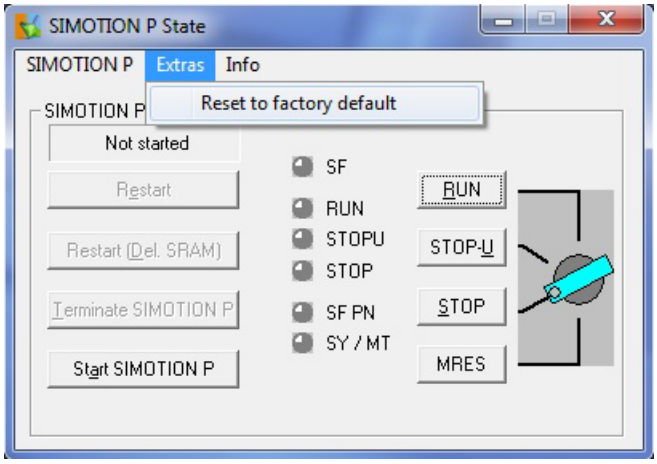

Figure 11-108 Restoring the delivery status

NOTICE
Note the consequences of user changes!
All data and settings for SIMOTION P320-4 changed by the user will be deleted!
The settings made using the **Station Configurator** will also be reset to the delivery status.

Reset SIMOTION P320-4 to the initial state

If an error occurred during parameter assignment, download, or when other settings were configured or if you are not sure whether you have specified all the information correctly, it may be useful or necessary to reset the SIMOTION P320-4 to its state prior to parameter assignment.

Requirements

You have saved an image of the memory medium on a remote computer/remote medium.

You can now use this image to reset the SIMOTION P320-4 to the factory settings. Note that the changes made on the SIMOTION P320-4 will be lost in the process.

NOTICE
Retain data
Once the image has been loaded, the user may have to delete the retain data.

Procedure

Use the **Restart (Del. SRAM)** function from the SIMOTION P State application to reset.

Further information

Function elements (SIMOTION P State) (Page 7912)

Upgrading runtime and firmware

As of the SIMOTION P320-4 Box, the current software version is always supplied. The previous version is available on the included restore DVD.

The upgrade to the latest hotfix (HF) can be performed via a setup.

Procedure

Possible types of upgrade:

- Upgrade with external DVD drive.
  First, the upgrade software must be copied to an external DVD or USB memory stick.
- Upgrade using a remote computer in the network (connect the SIMOTION P320-4 to the drive of the remote computer via the network)

Start the upgrade by calling the **Setup.exe** file.

See also

Further information on upgrading can be found in the following documentation:

- Updating SIMOTION devices
- SIMOTION online help

Installing/removing the back-up battery of the SIMOTION P320-4

Preventive maintenance

To maintain high system availability, we recommend the preventative exchange of those PC components that are subject to wear. The table below indicates the intervals for this exchange.

Component	Exchange interval:
CMOS backup battery	4 years

Replacing the backup battery

Note

The service life of the backup battery is approximately 5 - 8 years, depending on the environmental conditions.

To be noted before you replace the battery

NOTICE

Risk of damage!

The lithium battery may only be replaced with an identical battery or with a type recommended by the manufacturer (article number: A5E30314053)

⚠ WARNING

Risk of explosion and release of harmful substances!

Therefore, do not throw lithium batteries into an open fire, do not solder or open the cell body, do not short-circuit or reverse the polarity, do not heat to above 100° C, dispose of them in accordance with regulations, and protect them from direct exposure to sunlight, humidity, and condensation.

Note

A backup battery maintains the contents of the SRAM data on the SIMOTION P320-4 after the supply power is switched off.

Battery monitoring

The 3 V lithium battery to back up the SRAM and the clock module is monitored in two stages:

Table 11-10 Two-stage battery monitoring

Battery voltage	Message
2.7 V ± 0.1 V	Diagnostic buffer entry: Battery warning Battery warning threshold reached
2.25 V ± 0.25 V	Diagnostic buffer entry: Battery error Voltage below limit

In order to prevent data being lost, the battery should be replaced once the **Battery warning** entry appears in the diagnostics buffer or, at the very latest, the first time the **Battery error** entry appears in the diagnostics buffer.

Disposal

NOTICE
Dispose of batteries properly Batteries must be disposed of in accordance with local regulations.

Preparation

Note

The configuration data and contents of the SRAM in the device are buffered for at least 30 seconds when the battery is replaced.

Preparation – make a note of the BIOS settings

Note

Note specific BIOS setup settings if changes have been made.

Preparation – save SRAM data

As a result of replacing the battery (SRAM not backed up during this time), data loss may occur in the SRAM of the SIMOTION P320-4 if the battery replacement takes longer than 30 seconds.

1. To avoid a lengthy repeat of the commissioning procedure, ensure that a backup of the non-volatile data is available before changing the battery. This is performed, for example, automatically when Windows is shutdown correctly.
2. Shut down the SIMOTION PP320-4 or Windows correctly via:
   Windows taskbar: **Start > Shut down**
3. Isolate the device from the power supply and disconnect all connecting cables.

Note

If Windows was not shut down properly before backup battery replacement, loss of bit values in SRAM memory cells during battery replacement cannot be detected reliably.

SIMOTION P320-4 must then undergo an overall reset.

Tools

You will need a T10 screwdriver to open the battery compartment.

Replacing the battery

NOTICE
Switch off the device before replacing the battery The battery can also be exchanged when the device is operating. However, we recommend switching off the device beforehand.

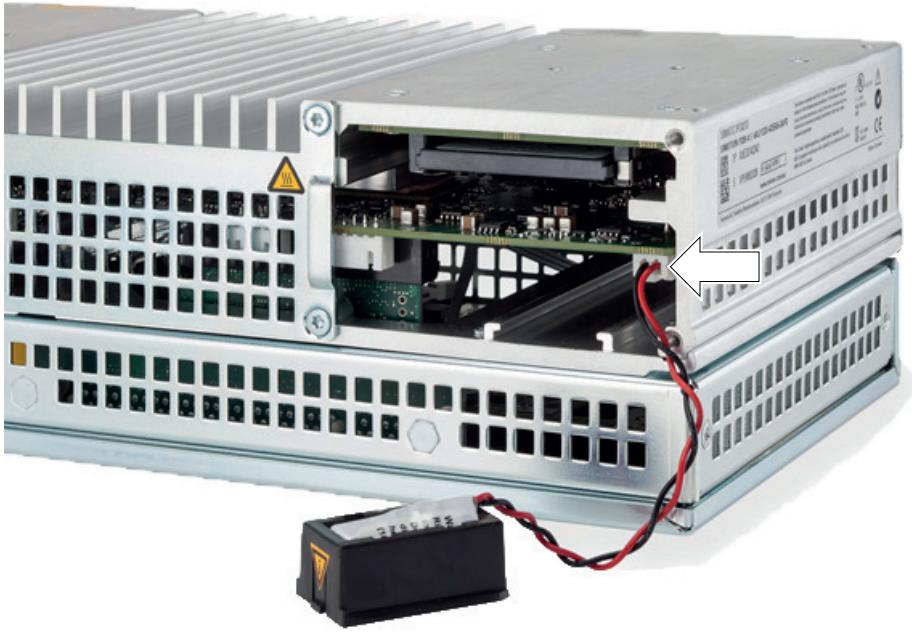
NOTICE
Time setting is lost If the battery change takes longer than 30 seconds, the time setting is deleted. The time on the device is no longer synchronized. Time-controlled programs no longer run or they run at the wrong time. This can damage the system. Set the device time again.

Procedure

Steps for replacing the battery:

1. Open the battery compartment.

2. Remove the battery holder.
3. Unplug the battery connector.



4. Connect the battery plug to the new battery.
5. Remove the old battery from the holder.
6. Secure the new battery in the holder.
7. Close the battery compartment.

Reconfiguring the BIOS Setup

The battery change does not take longer than 30 seconds with the device switched off, the BIOS settings are retained.

The SRAM and CMOS data of the SIMOTION P320-4 is certainly deleted only when the battery is disconnected for a longer period of time (more than 15 minutes) and in the switched-off state.

The BIOS Setup must be performed again if the data has been cleared. The CMOS data must be restored to the default values; the date, time, and any special settings must be set again.

Note

Exception:

If the CMOS data has been saved previously with a USER profile, only the date and the time may be set again. All other settings will be made automatically. This means that the default values may **not** be loaded in this special case.

Special power-up situations

Special startup situations overview

The special power-up situations are described in the following:

- Non-volatile data and SRAM handling (Page 7972)
- After new installation / update of the SIMOTION P Kernel (Page 7974)
- After importing a backup copy (Page 7974)
- After a power failure/POWER FAIL (Page 7974)

Requirements

You are familiar with the user storage concept of the non-volatile data on the SIMOTION P320-4.

Non-volatile data and SRAM handling

Non-volatile data, also called retain data, is retained when SIMOTION P320-4 suffers a power failure. The data is buffered with the battery in the static memory area (SRAM) on the SIMOTION P320-4.

SRAM handling

If the serial number of the SIMOTION P320-4 is known:

The serial number of the SIMOTION P320-4 corresponds to the one that was last saved on the SIMOTION P320-4.

SRAM image (storage medium) or SRAM backup (storage medium) is **OK**, if:

- The SIMOTION software release of the SRAM image/backup matches the installed software release.
- Windows has been shut down properly (the POWER FAIL mechanism of SIMOTION P does not suffice here).
- The checksum test on the SRAM image/backup was successful.
- The battery status was good when the SRAM image was backed up.

Table 11-11 SRAM handling if the serial number is known

SRAM "OK"?	SRAM image (storage medium) "OK"?	SRAM backup (storage medium) "OK"?	User data used	Note
Yes	Not applicable	Not applicable	Board [1]	Normal statup
No	Yes	Not applicable	IMAGE [2]	No message box or alarms
No	No	Yes	BACKUP [3]	No message box or alarms
No	No	No	Overall reset	Required

[1] The user data backed up in the SRAM of the SIMOTION P320-4 is used.

[2] The user data backed up in the SRAM image on the storage medium of the SIMOTION P320-4 is used.

[3] The user data backed up in the SRAM backup on the storage medium of the SIMOTION P320-4 is used.

If the serial number of the SIMOTION P320-4 is not known:

The serial number of the SIMOTION P320-4 does not correspond to the one that was last saved on the SIMOTION P320-4, for example, after the replacement of the SIMOTION P320-4.

SRAM image (storage medium) or SRAM backup (storage medium) is **OK**, if:

- The SIMOTION software release of the SRAM image/backup matches the installed software release.
- Windows has been shut down properly (the POWER FAIL mechanism of SIMOTION P does not suffice here).
- The checksum test on the SRAM image/backup was successful.
- The battery status was good when the SRAM image was backed up.

Table 11-12 SRAM handling if the serial number is unknown

SRAM "OK"?	SRAM image (storage medium) "OK"?	SRAM backup (storage medium) "OK"?	User data used	Note
Yes	Yes	Not applicable	Board [1] or IMAGE [2]	Query made
Yes	No	Yes	Board [1] or BACKUP [3]	Query made
Yes	No	No	Board [1]	No message box
No	Yes	Not applicable	IMAGE [2]	No message box

SRAM "OK"?	SRAM image (storage medium) "OK"?	SRAM backup (storage medium) "OK"?	User data used	Note
No	No	Yes	BACKUP [3]	No message box or alarms
No	No	No	Overall reset	Required

[1] The user data backed up in the SRAM of the SIMOTION P320-4 is used.

[2] The user data backed up in the SRAM image on the storage medium of the SIMOTION P320-4 is used.

[3] The user data backed up in the SRAM backup on the storage medium of the SIMOTION P320-4 is used.

After new installation / update of the SIMOTION P Kernel

If a compatible SIMOTION P Kernel is installed on an already commissioned SIMOTION P320-4, the user data backed up in the SRAM is retained.

However, the current software version of the SIMOTION PP320-4 must be identical to the software version with which the backed-up user data of the SRAM was created.

Now SIMOTION P320-4 is immediately ready to run again.

Note

If you do not want the backed up user data to be used again, you will have to recommission the SIMOTION P320-4.

Note

Restart of SIMOTION P320-4 required

After a new installation or update of the SIMOTION P Kernel, a restart of the SIMOTION P320-4 is generally required.

If the device is not restarted, the new SIMOTION P Kernel is not activated and you continue to work with the old firmware.

After restoring a backup copy

If a backup copy (storage medium image) of a commissioned SIMOTION P320-4 is reloaded, the backed-up user data stored in the SRAM of the SIMOTION P320-4 is used.

Now SIMOTION P320-4 is immediately ready to run again.

After a power failure/POWER FAIL

Case 1: SRAM saved

In the event of a power failure, the POWER FAIL detection feature integrated in the SIMOTION P320-4 will automatically cause the SIMOTION P firmware to save the user data in the SRAM of the SIMOTION P320-4. An SRAM image, however, cannot be created any more in this case.

When the power supply returns or when the system is booted again, the data is available again.

Now SIMOTION P320-4 is immediately ready to run again.

Note

Backup of the user data in the SRAM of the SIMOTION P320-4 in case of power failure is only guaranteed if the SIMOTION P320-4 is operated within its defined specifications.

Case 2: SRAM not saved

If the hardware of the SIMOTION P320-4 was operated outside of the defined specifications, the user data might not have been backed up in the SRAM of the SIMOTION P320-4 under certain circumstances.

11.1.1.12 Alarm, error and system messages

Diagnosis using the LEDs

Each LED can assume various states, such as ON, OFF, flashing. The status of the respective LED indicates the current status of the device.

Table 11-13 Diagnostics LEDs of the SIMOTION P320-4

LED display		Meaning	Meaning
SF	Red	**System fault**	This LED indicates that a fault has occurred on SIMOTION P320-4.
LED	On		An interrupt which can be acknowledged is present (alarm, message, note). (See Diagnostics Guide)
LED flashing	0.5 Hz		No license exists for technology/optional objects under license. Licensing must be performed to correct the fault, see License tab.
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).
LED	Off		SIMOTION P320-4 works error-free.
RUN	Green	**SIMOTION P in RUN mode**	This LED indicates the state of the user program.
LED	On		The user program is running.
LED flashing	2 Hz		When the **RUN** operating state is selected, the LED will flash until the operating state is actually attained.
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).

LED display		Meaning	Meaning
STOPU	Yellow	**SIMOTION P in the STOP user program**	This LED indicates that the technology packages are active. No user program is being executed.
LED flashing	2 Hz		When the **STOPU** operating state is selected, the LED will flash until the operating state is actually attained.
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).
STOP	Yellow	**SIMOTION P in STOP mode**	This LED indicates that no user program is running.
LED	On		The technology packages are not active.
LED flashing	0.5 Hz		An overall reset request is indicated by slow flashing, see Overall reset with the mode selector (on the screen) (Page 7959).
	2 Hz		When the **STOP** operating state is selected, the LED will flash until the operating state is actually attained.
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).
SF PN		**PROFINET bus error**	
LED	Red		This LED indicates a fault at the PROFINET interface.
LED	Off		PROFINET onboard interface is operating without error; the data exchange to all configured I/O devices is running.
LED	On		Bus fault
LED flashes	2 Hz		Failure of a connected I/O device. At least one of the assigned I/O devices cannot be addressed. Configuring error.
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).
SY/MT		**Sync of PROFINET interface**	
LED	Yellow		This LED indicates whether the PROFINET interface has been synchronized.
LED	Off		The PROFINET interface has not yet synchronized with the send cycle clock of PROFINET IO with IRT, or PROFINET IO with IRT has not been configured.
LED	On		The PROFINET interface has synchronized to the send cycle clock of PROFINET IO with IRT.
LED flashes	2 Hz		A PROFINET firmware download is in progress.
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).

LED display		Meaning	Meaning
BUS1F **BUS2F**	X101 X102	**Status of IsoPROFIBUS interface**	
LED	Red		If this LED is red, it indicates a fault at the IsoPROFIBUS interface.
LED	On		Bus fault Parameter assignment error
LED	Green		If this LED is green, it indicates the bus status of the IsoPROFIBUS interface.
LED	On		Cyclic data exchange
LED flashes	2 Hz		Bus status "Clear"
	5 Hz		FAULT state SIMOTION software does not run in the FAULT state (all LEDs flash simultaneously).
LED	Off		No fault or no interface configured.

LED combinations

STOP

When the user program reaches a breakpoint, SIMOTION P320-4 then assumes the **HALT** state. A LED display indicates this state. The **HALT** state is also left when the breakpoint is left.

Table 11-14 LED combinations

LED	SF	RUN	STOPU	STOP	SF PN	SY/MT	BUSF1	BUSF2
STOP	x	0.5	1	1	x	x	x	x

x Not applicable

0.5 Flashes with a frequency of 0.5 Hz.

1 ON

DCP flashing

The DCP flashing function checks the correct assignment of a module and its interfaces.

The DCP flashing function is accessed via:

- Accessible nodes
- HW Config
- NetPro

Start the **Accessible nodes** function in SIMOTION SCOUT . Select a device and "Flashing" or "Stop flashing" is selected via the context menu.

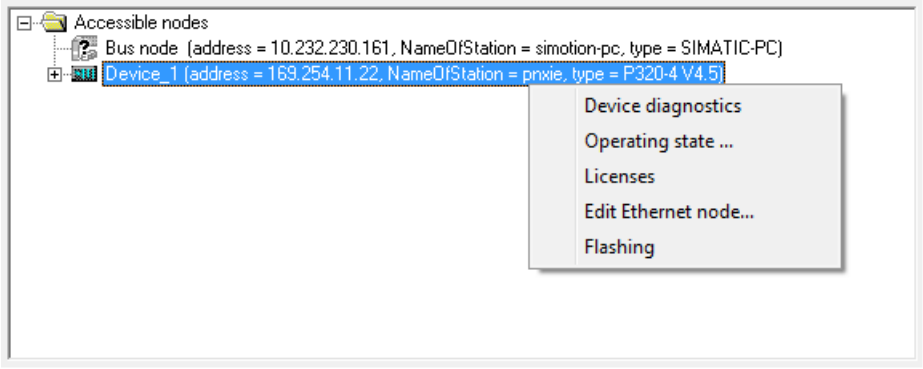


Figure 11-109 Accessible nodes

Alternatively, you can also activate the DCP flashing function in **HW Config** or in **NetPro** under the following path:

Target system > Ethernet > Edit Ethernet node... via the **Browse...** button, in the **Search Network** dialog box via the **Flashing** button of STEP 7.

The LED combination flashes as long as the dialog box is open and the **Flashing** function has not been deactivated.

If the dialog box is closed without deactivating the **Flashing** function, the previous state of the LED becomes active again.

Table 11-15 LED combinations

LED	SF	RUN	STOPU	STOP	SF PN	SY/MT	BUSF1	BUSF2
DCP flashing	x	2 (green/ yellow)	x	x	x	x	x	x

x Not applicable

1 ON

2 Flashes with a frequency of 2 Hz.

Note

You can carry out a detailed diagnosis using a PG/PC and the Engineering System.

FAULT

A fault has occurred to which the user program cannot respond.

The following actions may be required to rectify the fault:

- Power OFF/ON
- Recommissioning

Table 11-16 LED combinations

LED	SF	RUN	STOPU	STOP	SF PN	SY/MT	BUSF1	BUSF2
FAULT	5 (red)	5 (red)	5 (red)	5 (red)	5 (red)	5 (red)	5 (red)	5 (red)

5 Flashes with a frequency of 5 Hz.

Temperature alarm

For SIMOTION P320-4, two different temperatures are monitored in the device as regard to whether they reach their respective threshold value.

System variables

_cpudata.temperature

_cpudata.moduletemperature

Error response

An I/O alarm is activated.

Cause of error / troubleshooting

One of the two monitored temperatures has reached or exceeded its threshold.
The temperature must fall below the threshold value before the alarm is reset.

If the temperature alarm is issued, the user and/or the machine manufacturer (user program) must decide whether or not processing should be interrupted and SIMOTION P320-4 exited and switched off.

The user can program a customized response to this and allow the program to continue, if appropriate.

The default response is for the operating mode to switch to **STOP**.

Note

Further information on programming alarm responses can be found in the SIMOTION Runtime Basic Functions Function Manual.

Battery alarm

When the critical battery status is reached, the battery must be replaced as quickly as possible. Because the SIMOTION P320-4 often cannot be shut down at short notice during operation, it is important to perform a programmable response to this battery state.

For this case, the system variable

- persistentdatapowermonitoring.warningbatteryvoltagelevel1

can be used to catch the complete loss of the retain data if the battery cannot be replaced fast enough.

Users should periodically save their retain data (e.g. with the _savePersistentMemoryData function). This ensures that the operating state established after the next start up represents the most current status of the retain data possible.

⚠ WARNING

System variable persistentDataPowerMonitoring

If no response to this system variable has been programmed, there is the danger of the complete loss of retain data if a power failure occurs before the battery can be replaced.

In this case, only the retain data for the last back up, normally the last shut down of the SIMOTION P320-4, is available after the next power-up.

Power failure / POWER FAIL

In the event of a power failure, the consequences described below must be considered separately.

SIMOTION P Runtime

If a power failure occurs, the POWER FAIL functionality of the SIMOTION P Runtime will perform the following steps:

- SIMOTION P Runtime is shut down correctly
- The user data marked as retain is saved in the non-volatile memory of the SIMOTION P320-4

The backed-up user data is available again at the next power-up of the SIMOTION P Runtime. SIMOTION P Runtime is therefore ready for operation again without any data loss.

Note

Backup of the user data in the SRAM of the SIMOTION P320-4 in case of power failure is only guaranteed if the SIMOTION P320-4 is operated within its defined specifications.

The message **POWER FAIL** is displayed if the supply voltage for SIMOTION P320-4 falls below 20.4 V. In this case, check the voltages in the external power supply:

1. Check if the input voltage (mains voltage) for the external power supply has the rated value.
2. If so, check the output voltage of the external power supply. If the voltage is not within the limits for the supply voltage of the SIMOTION P320-4 (19.2 ... 28.8 VDC), then change the external power supply.

Windows

If the SIMOTION P320-4 is shut down during operation, the Windows installation may be damaged.

The consistency of Windows applications cannot be guaranteed during a power failure.

In these cases, we strongly recommend use of an EWF or a UPS system.

NOTICE
Do not protect external CFast cards with EWF Drive D: - the **external** CFast card - must not be protected with EWF as otherwise the functionality of SIMOTION cannot be assured.

Note

Only applies to the SIMOTION P320-4 E

SIMOTION P320-E is delivered with deactivated EWF (Enhanced Write Filter).

After the device is commissioned, activate the EWF for drive C: because this ensures:

- An extended service life for the **internal** CFast card
- No data loss on the **internal** CFast card when switching the device off via the line side switch or through disconnection from the power supply

NOTICE
Data loss on the external CFast card **Always** shut down SIMOTION correctly as otherwise there is a threat of data loss on the **external** CFast card. See also Section: Switching off (Page 7962).

PROFINET bus error occurs

The flashing red **SF PN** LED on the SIMOTION P320-4 indicates a problem of an I/O device on the bus or a configuring error.

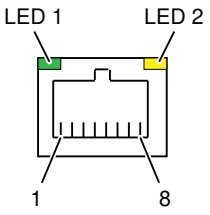
Information about further display modes of the LED can be found under SIMOTION P State application > LED display (Page 7910).

Error causes with flashing

- Failure of a connected I/O device
- At least one of the assigned I/O devices cannot be addressed
- Incorrect or no configuration.

PROFINET (LAN) X3 Port P1, P2, P3

The two LEDs on the respective PROFINET ports also provide information on the current connection status:

PROFINET interface		
		


LED 1	On	Lights up green: Link
	Off	No physical connection available. Troubleshooting: Check for loose connector, defective cable, etc.
LED 2	On	Lights up yellow: Activity
	Off	No logical connection, i.e. no Ethernet telegrams are exchanged. Troubleshooting: Check IP configurations, parameterize required router, etc.

Under-licensing

Error

The red system error LED (**SF**) flashes at 0.5 Hz.

Cause

No license exists for technology/optional objects under license.

Licensing must be performed to correct the error.

Note

Further information for the licensing of technology/option objects can be found in the SIMOTION SCOUT Configuration Manual.

Boot error messages

During power-up (the boot process), the BIOS first performs a **P**ower **O**n **S**elf **T**est (POST) and checks as to whether certain functional units of the PC are operating correctly. The boot sequence is immediately interrupted if critical errors occur.

If the POST does not return an error, the BIOS initializes and tests further functional units. In this startup phase, the graphics controller is initialized and any error messages are output to the screen.

The following lists the error messages from the system BIOS. For information on error messages output by the operating system or programs, refer to the corresponding manuals.

Error messages on the screen

Error message on the screen	Meaning / suggestions
Operating system not found	Possible causes: • No operating system present • Incorrect active boot partition • Wrong drive settings in SETUP

11.1.1.13 Troubleshooting/FAQs

Error correction

This section provides you with tips on how to locate and troubleshoot common problems.

FAQs / error correction	Possible cause	Possible remedy
The device is not operational.	There is no power supply to the device.	• Check whether the 24 VDC power supply is connected. See SIMOTION P320-4 E / P320-4 S Manual, Section Connecting the power supply (24 VDC). • Check whether the line side switch is activated. See SIMOTION P320-4 E / P320-4 S Manual, Section Operator controls.
SIMOTION P does not start after connecting the CFast card.	BIOS settings are not set to Hotplug Enabled.	You can find out how to check and correct the BIOS settings in Section Hotplug Enabled BIOS settings (Page 7985).
SIMOTION P does not start after a reboot.	The user is not logged in automatically.	Set the password for the AutoLogin (Automatically Log On). See Section SIMOTION P AutoLogin (Page 7885).
The monitor remains dark.	The monitor is switched off.	Switch on the monitor.
	The monitor is in "power-save" mode.	Press any key on the connected keyboard.
	The brightness button has been set to dark.	Set the monitor brightness button to obtain more light. For detailed information, refer to the monitor operating instructions.
	The power cord or the monitor cable is not connected.	• Check whether the power cord has been properly connected to the monitor and to the system unit or to the grounded shockproof outlet. • Check whether the monitor cable has been properly connected to the system unit and to the monitor.
		If the monitor screen still remains dark after you have performed these checks, please contact your technical support team.

FAQs / error correction	Possible cause	Possible remedy
The mouse pointer does not appear on the screen.	The mouse driver is not loaded.	Check whether the mouse driver is properly installed and present when you start the application program. For more detailed information on the mouse driver, refer to the documentation for the mouse or application programs.
	The mouse is not connected.	Check whether the mouse is properly connected to the system unit. If you use an adapter or extension on the mouse cable, also check the connectors.
		If the cursor still does not appear on the screen after you have performed these checks and measures, please contact your technical support team.
Error message on the screen: Operating system not found	• No operating system present. • Incorrect active boot partition. • Incorrect drive entries in the SETUP.	Check whether one of the specified causes is present:
Wrong time and/or date on the PC.	-	• Press <ESC> during the boot sequence to open BIOS Setup. Detailed information on the BIOS setup can be found in the section Starting Bios settings Hotplug Enabled - BIOS Setup (Page 7985). • Set the time and date in the setup menu.
Although the BIOS setting is OK, the time and date are still wrong.	The backup battery is empty.	Replace the backup battery. See Section Service and maintenances > Replacing the back-up battery (Page 7968). If the problem cannot be resolved by replacing the battery, then contact your technical support team.
UPS does not function.	The operating system does not have a suitable driver for the UPS.	Install a suitable driver; the correct driver can often be downloaded from the homepage of the device's manufacturer. See also Section Customer-specific software (Page 7909).
IP address assigned twice (e.g. through series commissioning).	Default IP address for Windows See Default IP addresses for Windows and SIMOTION P (Page 7931).	Assign a new IP address for Windows. The IP address must be different to the previous specified IP address and must not have been assigned already in the network.
The display in the BIOS for the PROFINET MAC address is incorrect (00:00:00:00:00:00).	-	The correct MAC addresses can be taken from the rating plate on the housing. See also Manual SIMOTION P320-4 E / P320-4 S Manual, Section Device identification data, MAC addresses.

Hotplug Enabled BIOS settings

Starting the BIOS setup

Proceed as follows:

1. Reset the SIMOTION P320-4 (warm or cold restart).
   Depending on the device version, the default settings may differ from the following figures.
2. After completing the startup test, you can start the program setup with BIOS.
   The following message is shown on the display:

Figure 11-110 SIEMENS Press Esc boot options

Press **Esc**.

3. After booting, the BIOS selection menu is displayed:

Figure 11-111 BIOS selection menu

4. The following buttons are available in the BIOS selection menu:

Button	Function
Continue	Exit BIOS menu, continue with the startup process
Boot Manager	Selection of the boot drive
Boot From File	Starting from a .EFI file
SCU	Device configurator (Setup Configuration Utility)
BIOS Update	BIOS update from USB stick
MEBx	Start the Intel Management Engine BIOS Extension

5. Select the **SCU** device configurator.

6. In the BIOS window, select the **Advanced** tab using the arrow keys and then select **IDE Configuration**.
   Press Enter to confirm the selection.

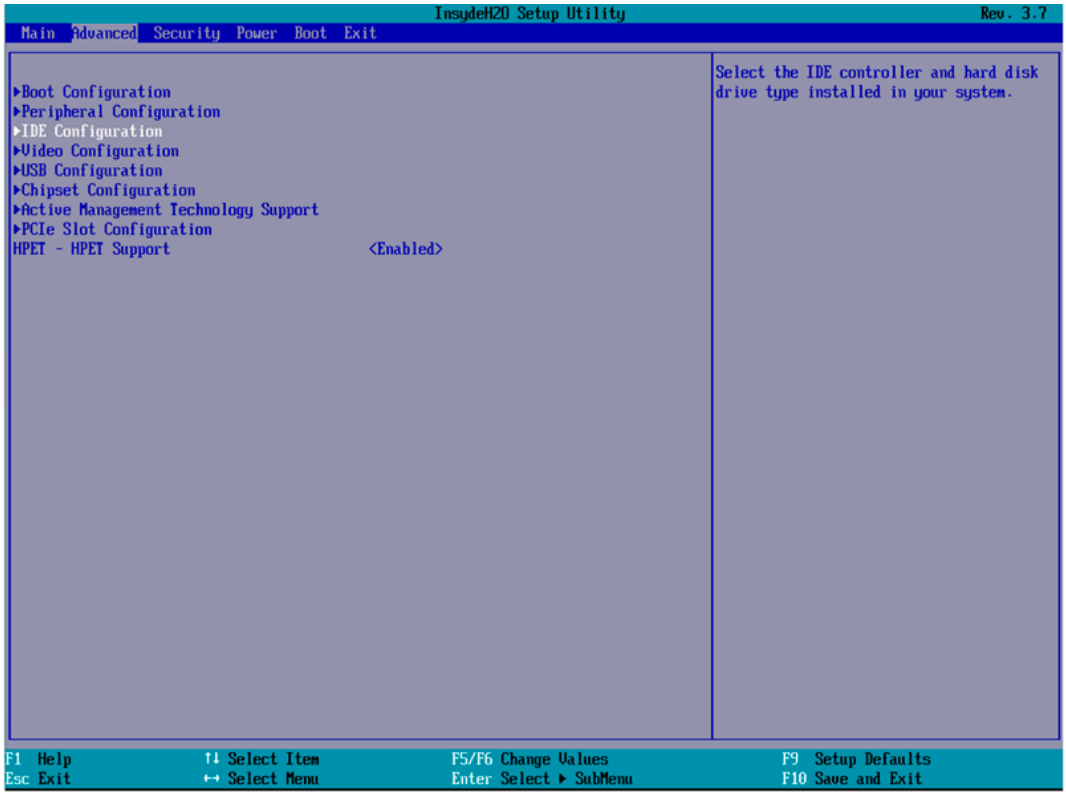


Figure 11-112 Advanced > IDE configuration

7. In the **IDE Configuration** window, select **SATA Port 2 HotPlug**.

8. Change the **Disabled** selection shown here to **Enabled**.

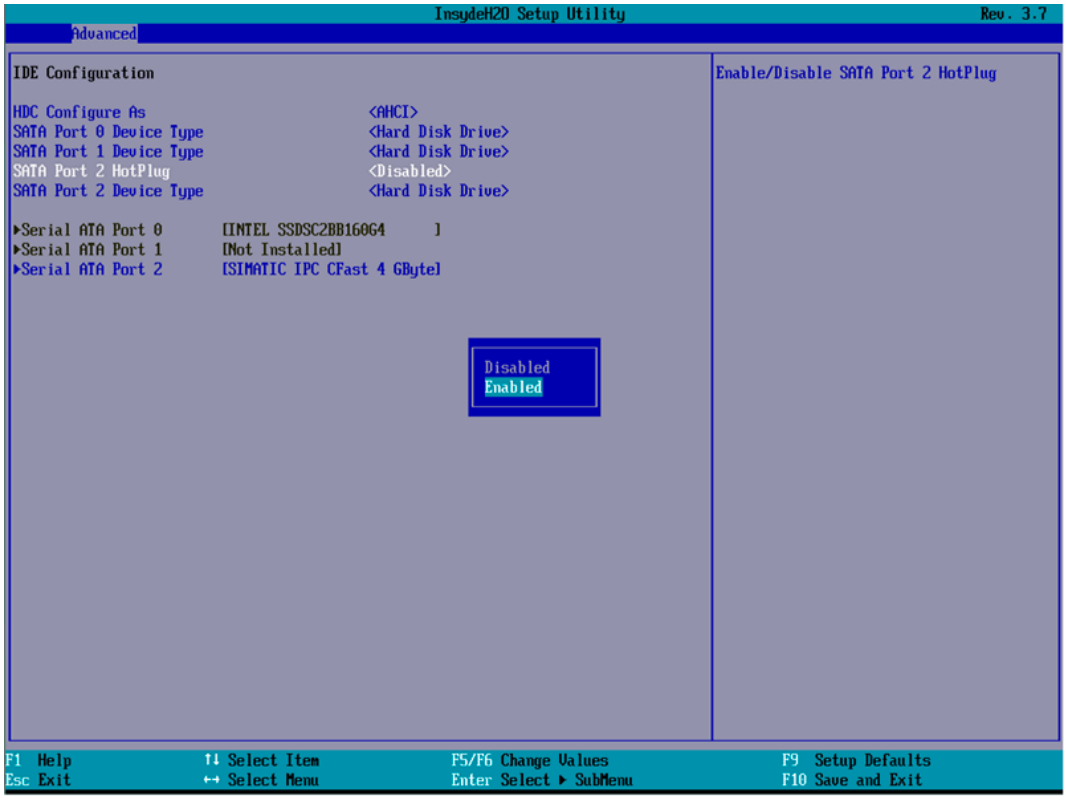

Figure 11-113 IDE Configuration > SATA Port 2 HotPlug

9. Press **F10** Save and Exit. The new entries are accepted.
10. Confirm the subsequent prompt to save the settings and exit the BIOS setup with **Yes**.

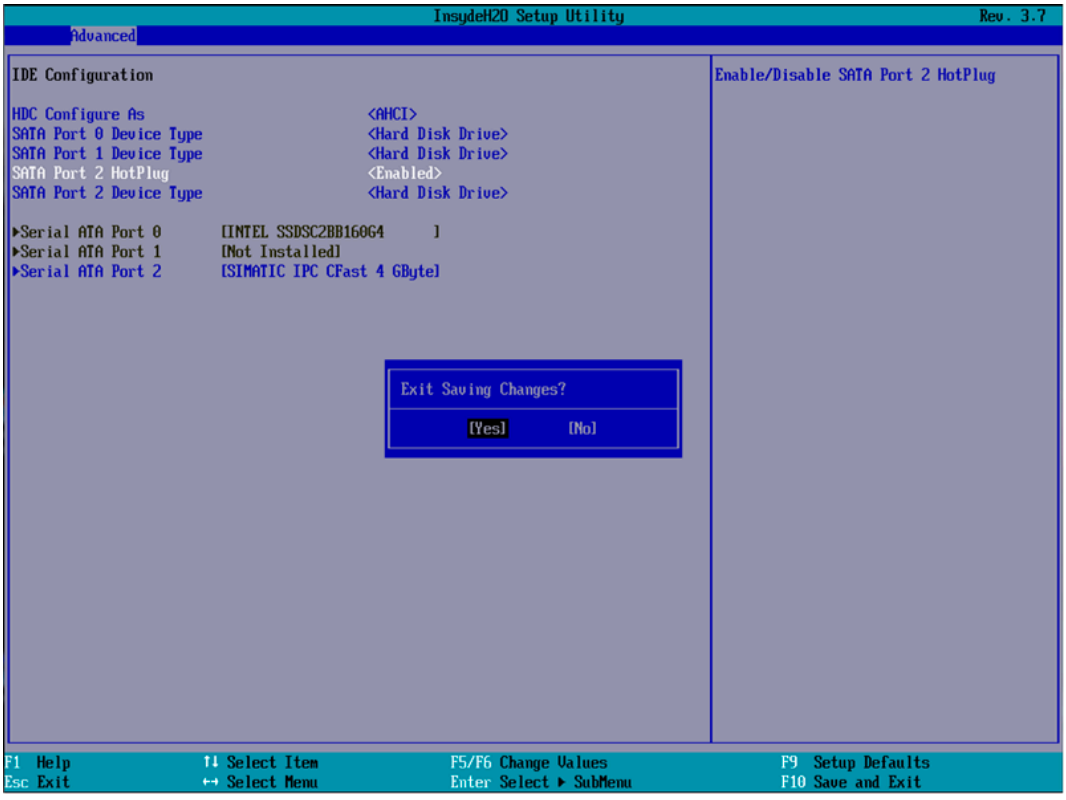

Figure 11-114 Confirming SATA Port 2 HotPlug > Enabled

11.1.1.14 Standards and approvals

General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

Korea certification

	KC registration number: KCC-REM-S49-SIMOTION Note that this device complies with limit class A with regard to the emission of radio frequency interference. This device can be used in all areas except residential areas. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (http://support.automation.siemens.com/WW/view/en/10805446/134200).

11.1.1.15 ESD guidelines

ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

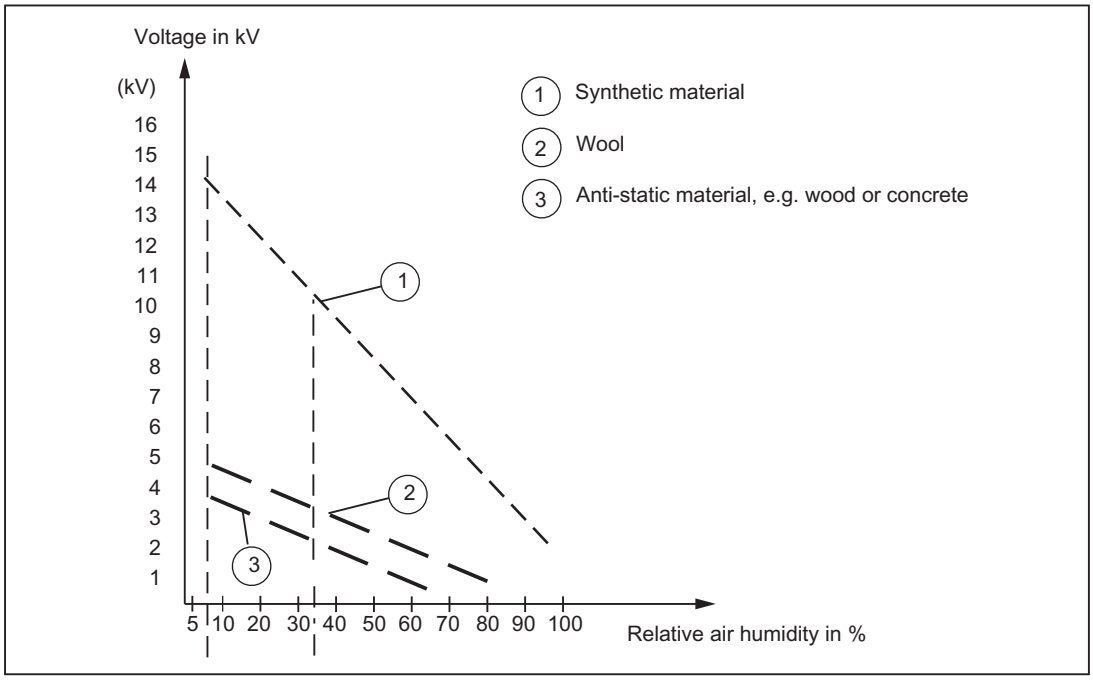

Figure 11-115 Electrostatic voltage that can accumulate on operating personnel

Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

11.1.1.16 List of abbreviations

Commissioning Manual, Abbreviations

Abbreviation	Term	Meaning
CE	Communauté Européenne (CE-Symbol)	The product is in conformance with all applicable EC directives.
CMOS	Complementary Metal Oxide Semiconductor	Complementary metal oxide semiconductors
COM	Communications Port	Term for the serial interface
CPU	Central Processing Unit	CPU
CRT	Cathode Ray Tube	-
CSA	Canadian Standards Association	Canadian organization for tests and certifications according to own or binational standards (with UL / USA) standards
CTS	Clear To Send	Clear to send
DRAM	Dynamic Random Access Memory	Dynamic RAM
DC	Direct Current	DC current
DMA	Direct Memory Access	Direct memory access
DP	Distributed I/O	-
DQS	Deutsche Gesellschaft zur Zertifizierung von Management-Systemen	-
DSR	Data Set Ready	Ready for operation
DTR	Data Terminal Ready	Data terminal is ready
DVI-I	Digital Visual Interface	Digital display interface with digital and VGA signals
ESD	Components sensitive to electrostatic charge	-
EN	European standard	-
EWF	Enhanced Write Filter	Configurable write filter (SIMOTION P320-4 E)
FAQ	Frequently Asked Questions	FAQs

Abbreviation	Term	Meaning
GND	Ground	Chassis ground
HMI	Human Machine Interface	User interface
HW	Hardware	-
I/O	Input/Output	Data input/output on computers
IEC	International Electronical Commission	-
IP	Ingress Protection	Degree of protection
IRQ	Interrupt Request	Interrupt request
LAN	Local Area Network	Computer network that is limited to a local area.
LCD	Liquid Crystal Display	Liquid crystal display
LED	Light Emmitting Diode	Light emitting diode
MUI	Multilanguage User Interface	Language localization in Windows
NC	Not Connected	Not connected
OPC	OLE for Process Control	Standardized interface for industrial processes
PC	Personal Computer	-
PCI	Peripheral Component Interconnect	High-speed expansion bus
PE	Protective Earth	Protective conductor
PG	Programming device	-
POST	Power On Self Test	-
RAL	Restricted Access Location	Installation of device in operating facilities with restricted access, for example, a locked switchgear cabinet
RAM	Random Access Memory	RAM
ROM	Read-Only Memory	-
RTS	Reliable Transfer Service	Request to send
RxD	Receive Data	Data transfer signal
SDRAM	Synchronous DRAM	-
SELV	Safety Extra Low Voltage	Safety extra low voltage
SRAM	Static Random Access Memory	Static RAM
SVP	Serial No. of the device	-
SW	Software	-
TFT	Thin-Film-Transistor	Type of LCD flat-screen
TxD	Transmit Data	Data transfer signal
UL	Underwriters Laboratories Inc.	US organization for tests and certifications according to own or binational standards (with CSA / Canada) standards
UMA	Unified Memory Architecture	Video memory
USB	Universal Serial Bus	-
UPS	Uninterruptible power supply	-
VCC	-	Positive supply voltage of integrated circuits
VDE	Verein deutscher Elektrotechniker (Union of German Electrical Engineers)	-
VGA	Video Graphics Array	Video adapter which meets industrial standard
WD	Watchdog	Program monitoring with error detection and alarming.

11.2 Equipment Manual

11.2.1 SIMOTION P320-4 E / P320-4 S

Preface

Preface

This document is part of the **SIMOTION P documentation package**.

This documentation describes the SIMOTION P320-4 hardware platform which can be delivered in the SIMOTION P320-4 E and SIMOTION P320-4 S hardware versions:

- SIMOTION P320-4 E with the Windows Embedded Standard 7 32-bit operating system and real-time expansion for SIMOTION.
  Successor to SIMOTION P320-3.
- SIMOTION P320-4 E with the Windows 7 Ultimate 32-bit operating system and real-time expansion for SIMOTION.
  Successor to SIMOTION P350-3.

References

The following documents contain the descriptions for the SIMOTION P hardware platform:

- SIMOTION P320-4 E / P320-4 S, Manual, Edition 09/2016
- SIMOTION P320-4 E / P320-4 S, Commissioning and Hardware Installation Manual, Edition 09/2016

Validity range

This manual applies to the SIMOTION P320-4 E and SIMOTION P320-4 S devices as of product level SIMOTION V4.5.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Chapters in this documentation

The following sections describe the purpose and the use of this documentation:

- Safety instructions
  Contains fundamental safety instructions for SIMOTION and specific safety instructions for SIMOTION P320-4.
- Description
  System overview and product description for SIMOTION P320-4. The communication versions are also described.
- Use planning
  Points to note in advance: upon delivery, the permitted installation positions, environmental and ambient conditions and electromagnetic compatibility.
- Interfaces
  Description of the interfaces and operator control and display elements for SIMOTION P320-4.
- Installation/mounting
  An overview of the installation of the SIMOTION P320-4 taking into account the mounting positions.
- Connecting
  This section provides general information and important notes that you must observe when connecting the SIMOTION P320-4.
- Troubleshooting/FAQs
  List of possible errors and their remedies.
- Technical specifications
  This section contains an overview of the technical data, which is listed in detail for the individual components.
- Dimension drawings
  In this section you can find dimension drawings and dimensions of the SIMOTION P320-4.
- Spare parts
  You can find information about the spare parts for the SIMOTION P320-4 here.
- Appendix
  In addition to the safety information, the annexes also contain information about the standards, approvals and EGB guideline.
- Index
  Alphabetical directory for locating information.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.2:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

Product disposal

SIMOTION P is an environmentally friendly product! It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Marking of the plastic materials as per ISO 11469.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The product is to be disposed of in accordance with national regulations.

The product described in this manual can be recycled owing to its low pollutant content. For environmentally friendly recycling and disposal of your old device, please contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner/index.asp

11.2.1.1 Safety instructions

Fundamental safety instructions

General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Specific safety instructions for the SIMOTION P320-4

General safety instructions for the SIMOTION P320-4

⚠ WARNING

Life-threatening voltages are present with an open control cabinet

When you install the device in a control cabinet, some areas or components in the open control cabinet may be carrying life-threatening voltages.

If you touch these areas or components, you may be killed by electric shock.

Switch off the power supply to the cabinet before opening it.

System expansions

NOTICE

Damage through system expansions

Device and system expansions may be faulty and can affect the entire machine or plant.

The installation of expansions can damage the device, machine or plant.

Device and system expansions may violate safety rules and regulations regarding radio interference suppression.

If you install or exchange system expansions and damage your device, the warranty becomes void.

Note the following for system expansions:

- Only install system expansion devices designed for this device. Contact your technical support team or where you purchased your PC to find out which system expansion devices may safely be installed.
- Observe the information on electromagnetic compatibility (Page 8108).

NOTICE

"Open Type" UL508

Note that the device is classified as "Open Type" for use in the area of Industrial Control Equipment (UL508). Installation of the device in an enclosure according to UL508 is conditional for approval or operation according to UL508.

Battery and rechargeable battery

⚠ WARNING

Risk of explosion and release of harmful substances

Improper handling of lithium batteries can result in an explosion of the batteries.

Explosion of the batteries and the released pollutants can cause severe physical injury. Worn batteries jeopardize the function of the device.

Note the following when handling lithium batteries:

- Replace used batteries in good time, see the section "Replacing the backup battery" in the Commissioning and Hardware Installation Manual.
- Replace the lithium battery only with an identical battery or types recommended by the manufacturer (Article No.: A5E30314053).
- Do not throw lithium batteries into fire, do not solder on the cell body, do not recharge, do not open, do not short-circuit, do not reverse polarity, do not heat above 100°C and protect from direct sunlight, moisture and condensation.

High frequency radiation

NOTICE

Unintentional operating situations

High frequency radiation, e g. from a cellular phone, interferes with device functions and can result in malfunctioning of the device.

Persons are injured and the plant is damaged.

Avoid high-frequency radiation:

- Remove radiation sources from the environment of the device.
- Switch off radiating devices.
- Reduce the radio output of radiating devices.
- Observe the information on electromagnetic compatibility (Page 8108).

ESD Guideline

Electrostatic sensitive devices can be labeled with an appropriate symbol.

NOTICE

Electrostatic sensitive devices (ESD)

When you touch electrostatic sensitive components, you can destroy them through voltages that are far below the human perception threshold.

If you work with components that can be destroyed by electrostatic discharge, observe the ESD Guideline.

Further information

You can find more detailed information about the **EGB Guideline** in Annex B in the section with the same name.

Notes on use

⚠ WARNING

Hazards on an unprotected machine or plant

According to the results of a risk analysis, hazards can occur on an unprotected machine. The hazards can result in personal injury.

According to the risk analysis, the risk of personal injury can be avoided with the following measures:

- Additional protective devices on the machine or plant. With this, especially the programming, configuration and wiring of the inserted I/O modules have to be executed, in accordance with the necessary risk analysis identified safety performance (SIL, PL or Cat.).
- The correct use of the device has to be verified with a function test on the system. This test can detect programming, configuration and wiring errors.
- Documentation of the test results that you can enter in the relevant safety records when required.

NOTICE

Ambient conditions

Ambient conditions for which the device is not suitable can cause faults or damage the device.

Note the following:

- Operate the device only in closed rooms. Failure to comply nullifies the warranty.
- Operate the device only in accordance with the ambient conditions specified in the technical specifications.
- Protect the device against dust, moisture and heat.
- Do not expose the device to direct sunlight or other strong sources of light.
- Without additional measures, such as a supply of clean air, the device may not be used in locations with harsh operating conditions caused by acidic vapors or gases.
- Observe the permissible mounting positions of the device.
- Do not obstruct the venting slots of the device.

Note

Use in an industrial environment without additional protective measures

This device was designed for use in a normal industrial environment according to IEC 60721-3-3.

11.2.1.2 Industrial security

Security concept for SIMOTION P320-4

Security

Note

Observe the general security information in this documentation for Industrial security (Page 957).

Regular change of the Windows password

Note

For security reasons, the Windows password should be changed regularly.

It is essential that the AutoLogin is also adapted for this purpose.

You can find instructions in the following sections:

- Changing the Windows user password (Page 8020)
- AutoLogin for SIMOTION P (Page 8024).

Unlocking Windows

Note

Windows locked

Windows may be accidentally locked, e.g. through shortcut key Windows + L.

If you do not know the password for the SIMOTION P320-4, please contact the Siemens Industry Online Support (https://support.industry.siemens.com/cs/?lc=en-DE).

Windows firewall

Note

Windows firewall

To allows the Windows IP to be accessed externally, this must be set as an exception in the Windows firewall **File and Printer Sharing**. Otherwise, there is only limited access to Windows from outside.

Security and networks

Note

You will find information on the security of networks in Section General security measures (Page 8011).

Remote desktop connection

Note that for the SIMOTION P320-4 with Headless operation, you require a user name and password for a remote desktop connection. Per default, the remote desktop connection is already set up.

Note

Deactivating the remote desktop connection

If you do **not** use the remote desktop connection, it must be deactivated for security reasons.

See Section Deactivating the remote desktop connection (Page 8030)

SIMOTION IT

Note

Security concept

Note the security concept of HTTP/S, FTP and Telnet access on the Web server when working with SIMOTION IT.

You will find information in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual or the SIMOTION online help in Section Security concept.

Note

User administration

Note the information on the user administration when working with SIMOTION IT.

You will find information in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual or the SIMOTION online help in Section User administration.

Information on industrial security

The following sections are taken from the Motion Control Industrial Security Configuration Manual:

- Why is industrial security so important? (Page 8009)
- General security measures (Page 8011)
- Product-specific measures (virus scanners) (Page 8019)

You can view the entire document in the Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/108862708).

Why is industrial security so important?

The topic of data security and access protection (security) is becoming more and more important in industrial environments. The progressive networking of entire industrial plants, the vertical integration and networking of the individual levels of a company, and new technologies, such as remote maintenance and remote access, are leading to increased requirements for protecting industrial plants.

The threats are diverse and the consequences far-reaching.

Possible threats:

- Espionage of data, recipes, etc.
- Sabotage of production plants
- System stoppage, e.g. due to virus infection and malware

- Manipulation of data or application software
- Unauthorized use of system functions

Possible effects of a security incident

- Loss of intellectual property
- Loss of production or reduced product quality
- Company image and economic damage
- Catastrophic environmental influences
- Danger to persons and machines

Trends in the IT sector

Overview

There are many new trends which affect industrial security:

- Cloud computing in general
  The number of network connections across the world is constantly increasing. This enables innovations such as cloud computing and the applications that go hand in hand with it. In conjunction with cloud computing, there has been a massive increase in the number of mobile devices, such as mobile phones and tablet PCs.
- Wireless technology
  On the other hand, the increasing use of mobile devices has only become possible thanks to the ubiquitous availability of mobile networks. Wireless LAN is also becoming increasingly available.
- Smart Grid
  Networking is not only limited to data networks, it also influences our energy infrastructure.
- Worldwide remote access to plants, machines and mobile applications
- The "Internet of things"
  Millions of electronic devices are becoming network-capable and are communicating via the Internet, such as onboard computers in cars, which send warranty information to dealers, or water meter sensors that transmit water consumption data to municipal water suppliers via radio.

However, in order for everything from cloud computing to sensors to work without service disruptions, you need reliable network infrastructures that are well protected against attacks from malware and hackers.

Possible corporate security holes

Possible security holes or weak points

The security chain of a company is only as strong as its weakest link. Security holes can exist at numerous points. The following list gives only a few examples:

- Employees
- Production plants
- Network infrastructure
- Data centers
- PC workstations
- Laptops
- Tablet PCs
- Printers
- Smartphones
- Portable storage media
- Guidelines and regulations

For this reason, a holistic approach is required to deal with the issue of security. Coordinated guidelines and regulations are required that cover all areas: Devices, systems, processes and employees.

General security measures

Overview

In the following section you will learn about the general security measures you can take in order to protect your system from threats. All of the measures are recommended.

Additional specific security measures for SINUMERIK, SIMOTION and SINAMICS products can be found in Section Product-specific security measures (Page 8019).

Basically, the measures should be coordinated with one another and correspond to the ring-shaped principle of the "Defense in Depth" strategy. The measures are structured according to the "onion" principle and each measure forms an additional protective layer around the core: the production plant.

Figure 11-116 Defense in depth strategy

- **Plant security**
  Plant security represents the outermost protective ring. Plant security includes comprehensive physical security measures, e.g. entry checks, which should be closely coordinated with protective measures for IT security.
- **Network security**
  The measures, grouped under the keyword "Network security", form the core of the protective measures. This refers to the segmentation of the plant network with limited and secure communication between subnetworks ("secure islands") and the interface check with the use of firewalls.
- **System integrity**
  "System integrity" represents the combination two major measures. PC-based systems and the control level must be protected against attacks. Steps include the following measures:
  - User authentication for machine or plant operators with individual authorization levels
  - Integrated access protection mechanisms in the automation components to prevent unauthorized changes via the engineering system or during maintenance
  - The use of antivirus and whitelisting software to protect PC systems against malware
  - Maintenance and update processes to keep the automation systems up-to-date (e.g. patch management, firmware updates, etc.)

Plant security

Physical protection of critical production areas

Unauthorized persons may be able to enter the production site/building and damage or alter production equipment as a result of gaps in a company's physical security. Confidential information can also be lost. This can be prevented if both the company's site and the production areas are protected accordingly.

Company security

The company's physical security can be ensured via the following measures:

- Closed off and monitored company premises
- Entry control, keys / card readers and/or security personnel
- Escorting of external personnel by company employees

Physical production security

The physical security of a production location can also be ensured via the following measures:

- Separate access control for production areas.
- Installation of critical components in securely lockable cabinets / switching rooms including monitoring and alarm signaling options
- Prohibited production areas with restricted access rights
- Configuration of the radio field to restrict the WLAN range so that it is not available outside the defined areas (e.g. factory building).
- Guidelines that prevent the use of third-party data storage media (e.g. USB sticks) and IT devices (e.g. notebooks) classified as insecure on the control.

Further information

Further information on integrated security solutions can be found on the Surveillance page (http://www.buildingtechnologies.siemens.com/bt/global/en/security-solution/Pages/security-solution.aspx).

Network security

Network segmentation

Separation between production and office networks

One important protective measure for your control is the strict separation of the production networks and the other company networks. This separation creates protection zones for your production networks.

Note

The products – drives, controllers, commissioning tools (e.g. STARTER or Startdrive) – described in this manual must only be operated in protection zones.

Separation by means of a firewall system

In the simplest scenario, separation is achieved by means of an individual firewall system which controls and regulates communication between networks.

Separation via a DMZ network

In the more secure version, the coupling is established via a separate DMZ network. In this case, direct communication between the production network and the company network is completely prevented by firewalls and only takes place indirectly via servers in the DMZ network.

Note

The production networks should also be divided into separate automation cells in order to protect critical communication mechanisms.

General security measures

Observe the general security measures even within protection zones, for example:

- Virus scanners (Page 8017)
- Reduction of attack points (Page 8017)

Network segmentation with SCALANCE S

Siemens provides SCALANCE S security modules to meet network protection and network segmentation requirements.

SCALANCE S security modules

SCALANCE S security modules with Security Integrated provide:

- Stateful inspection firewall
  In order to implement user-specific control and logging, firewall rules can also be specified that only apply to certain users.
- VPN via IPsec (data encryption and authentication)
  This establishes a secure tunnel between authenticated users whose data cannot be intercepted or manipulated. The most important aspect is the protection against external access via the Internet.
- NAT/NATP (address translation)
- Router functionality (PPPoE, DDNS) for broadband Internet access (DSL, cable)
- S623 with additional VPN port (DMZ) enables the secure connection of an additional network for service and remote maintenance purposes. S623 also permits the secure, redundant connection of subordinate networks by means of routers and firewall redundancy.

Principle

This application example shows cell segmentation by several SCALANCE S modules, each of which is upstream of the automation cell. The data traffic to and from the devices within automation cells can be filtered and controlled with the SCALANCE S firewall. If required, the traffic between the cells can be encrypted and authenticated. Secure channels and client access from the PCs to the cells can be established via SOFTNET Security Client, VPN client software for PCs.

System integrity

System hardening

Reduction of attack points

Network services and ports

Activated services represent a risk. To minimize the risk, only the necessary services for all of the automation components should be activated. Ensure that all activated services are taken into account (especially web servers, FTP, remote maintenance, etc.) in the security concept.

A description of the ports used can be found in the Manuals and Function Manuals of the respective products.

User accounts

Any active user account allows access to the system is thus a potential risk. Therefore, take the following security measures:

- Reduction of configured/activated user accounts to the actually needed minimum
- Use of secure access data for existing accounts
- Regular checks, especially of the locally configured user accounts
- Regular change of passwords

Passwords

NOTICE
Changing default passwords The misuse of passwords can also represent a considerable security risk. We recommend that default passwords be changed during the commissioning and changed at regularly defined intervals as required.

Virus scanner

The use of a virus scanner must not impact the production operations of a plant. As the last consequence, this will lead to even a virus-infected computer not being permitted to immediately shut down if this would cause the control of the production process to be lost.

In order to be used on industrial control components, a virus scanner should therefore meet the following requirements:

Virus scanner requirements

- If a local firewall that has been adapted to the production operations is used, it must be possible to install the virus scanner without its own firewall.
- The virus scan clients can be divided into (product- and task-specific) groups and configured separately.
- It must be possible to deactivate the automatic distribution of the virus signatures and other updates.
- It must be possible to carry out the distribution of the virus signatures and updates manually and in groups.
- It must be possible to conduct a file scan and system scan manually and in groups.
- For the virus detection scenario, a message can be configured without a file action such as "Delete", "Clean", etc. being automatically carried out.
- It must be possible to log all of the messages on the virus scan server.
- On a virus scan client, it must be possible to suppress the local message window because it could obscure important messages from the production process.

Note

Installation of software

The installation of software is often a process which represents a serious and complicated change to the respective system. The storage location of the files to be installed must always be free of viruses (e.g. a file server with its own virus scanner or DVD checked for viruses).

Patch management

Microsoft security updates

The **WSUS** (Windows Server Update Service) system functionality provided by Microsoft is available for current Windows systems. WSUS supports administrators by providing Microsoft updates in large local networks. WSUS automatically downloads update packages from the Internet (Microsoft Update) and offers them to the Windows clients for installation.

The fully automatic update process ensures that Microsoft security updates are always available on Siemens clients.

Product-specific measures

Virus scanners, Windows security patches, SIMOTION P

General information on virus scanners

Once an industrial PC system is connected to the Internet, either directly or via an internal company network, there is a danger that it can become infected with a virus. However, malicious software is not only able to reach the system via the Intranet/Internet, but also, for example, via a removable storage device (such as a USB memory stick) attached to the system for backing up data.

SIMOTION P320-4 virus scanners

A virus scanner that runs on Microsoft Windows, as used in office or home computers, has a deep impact on a system's processes. There are, for example, processes such as real-time scans or regular system scans. Such interventions can cause performance issues for the system, and as a result, for the SIMOTION Runtime software. Although the SIMOTION Runtime software runs in a real-time environment, it still depends on the available system resources.

Note

Because of the resulting performance impairments, the installation and use of a standard virus scanner on a SIMOTION P320-4 during system runtime does not make sense and is not permitted.

Using a virus scanner

As a standard virus scanner cannot be used for SIMOTION P320-4, an alternative procedure is followed. The virus scanner is installed to a separately bootable Windows PE operating system. It is started, for example, from a CD or a USB storage device and then performs a virus scan.

Note

FAQ in Industry Online Support

More information on using a virus scanner on a SIMOTION P320-4 can be found in the FAQ "How can a virus scanner be used on a SIMOTION P320-4?" (https://support.industry.siemens.com/cs/ww/en/view/59381507), which is available as a download from the Industry Online Support portal.

Windows security patches

A brief test is performed when a new SIMOTION version is released. During this brief test, a check is performed to establish whether the installation of the security update has affected any basic functions.

Changing the Windows user password

Permitting the Windows password to be changed

Before the Windows password can be changed, it must be permitted for the user.

If the following procedure is not observed, an error message is issued and the Windows password cannot be changed.

Note the following procedure:

1. Select the entry point **Control Panel** > **All Control Panel Items** > **Administrative Tools** > **Computer Management**.
   Double-click **Computer Management**.

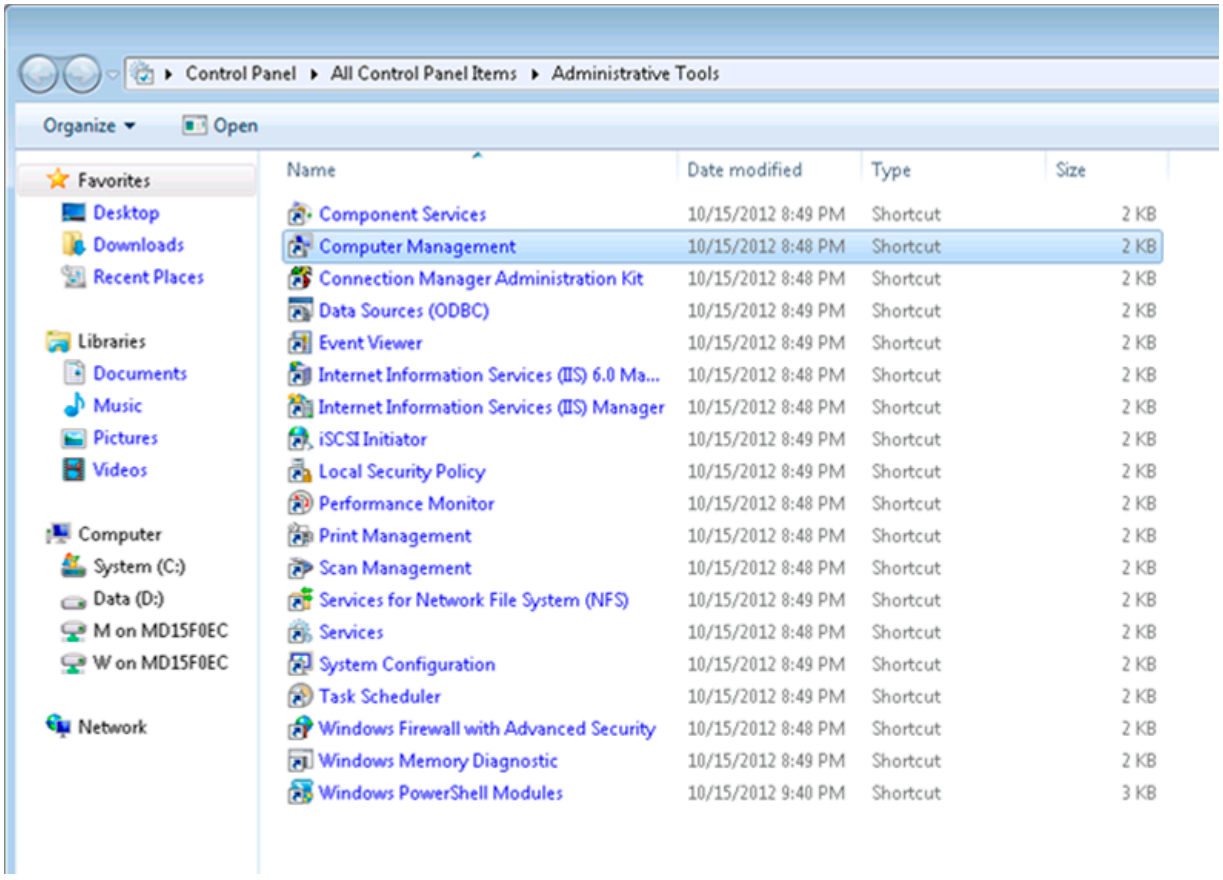

Figure 11-117 Homepage:

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

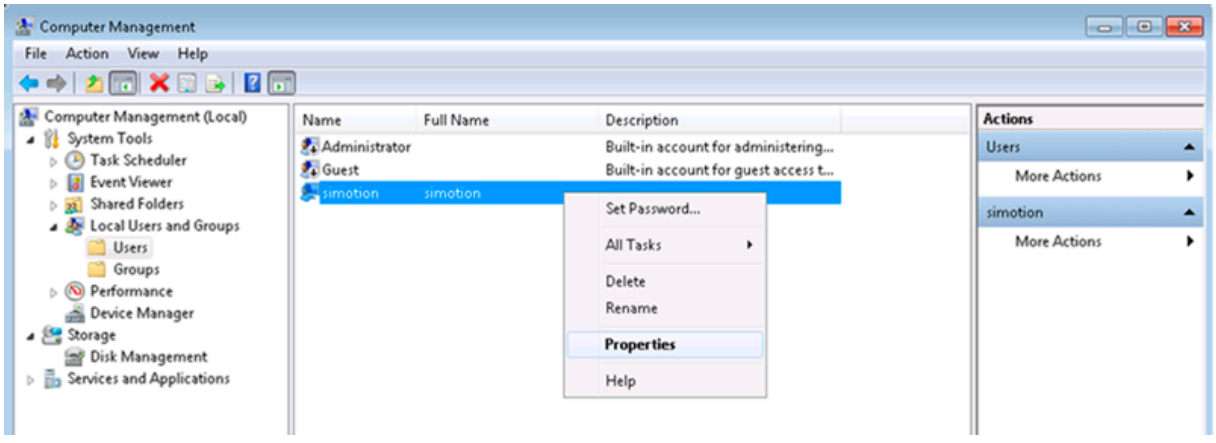

Figure 11-118 Computer management

3. With the selection of **Users simotion**, you can display the properties via **Properties**.
4. Deactivate the "**User cannot change password**" checkbox in the **General** tab on the **simotion Properties** dialog box.
   This checkbox must be deactivated for the user to change the Windows password.

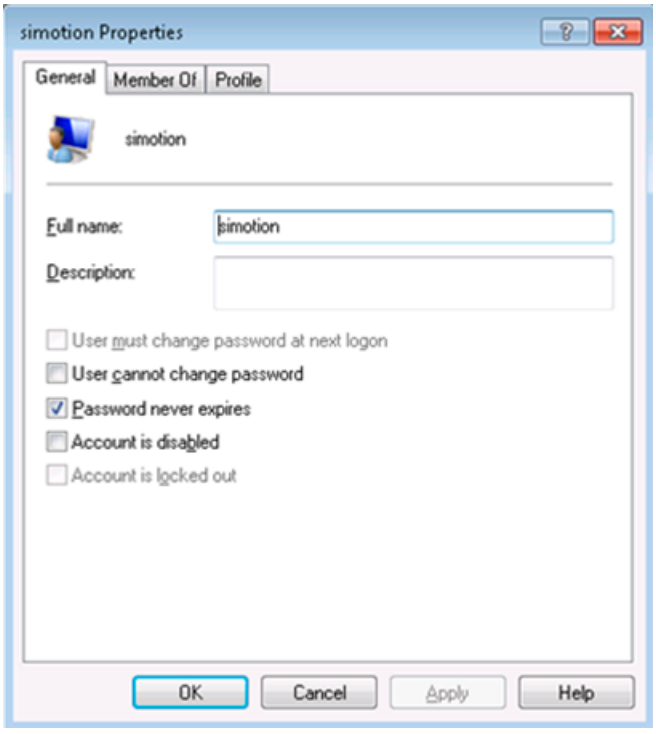

Figure 11-119 SIMOTION properties

Changing the Windows password

You can find general information on the Windows password on the website at Microsoft - Changing des Windows-password (http://windows.microsoft.com/en-us/windows/change-windows-password#change-windows-password=windows-7).

To change the Windows password, proceed as follows:

1. Press Ctrl+Alt+Del. The following Windows window opens.

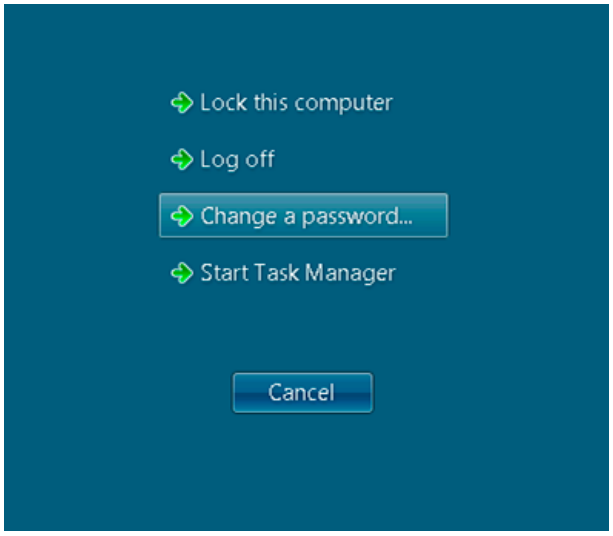

Figure 11-120 Changing the Windows password

2. After you have confirmed **Change a password...** , the Windows window to change the Windows password opens.
   First enter your current password and then the new Windows password. You must enter the new Windows password a second time for confirmation.

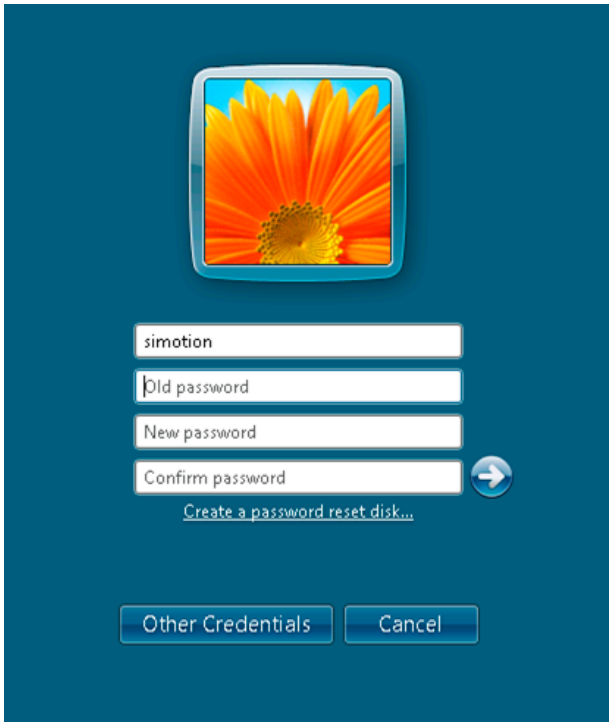

Figure 11-121 Entering the new Windows password

3. The password was changed successfully.

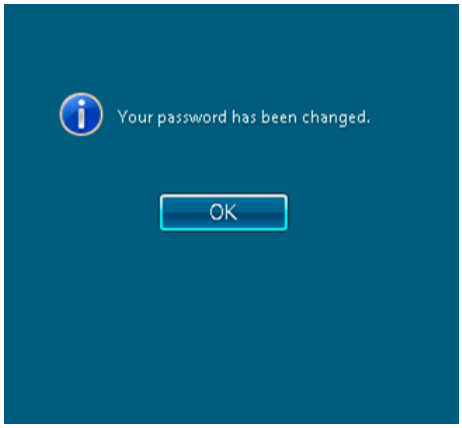

Figure 11-122 Confirmation of change

4. In the event of an error when the "User cannot change password" checkbox is activated, the following error message is displayed.
The Windows password has not been changed.

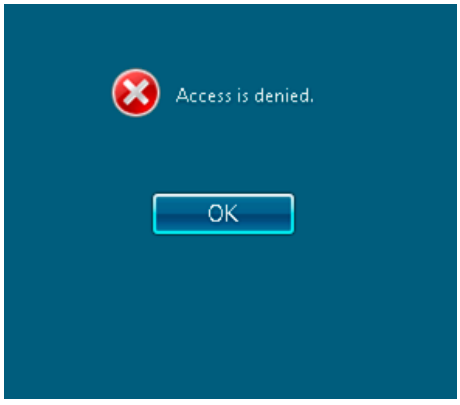

Figure 11-123 Error message when changing the Windows password has not been permitted.

Changing the AutoLogin

The password for the AutoLogin must be changed when the user has changed the Windows password.

The Windows user password is changed in the normal way, e.g. "Change Password" screen. See also Section Changing the Windows user password (Page 8020).

Automatically Log On

SIMOTION P320-4 is preset so that the user does not have to enter the user name and the password to log on.

Preparation for changing the AutoLogin

In order that an AutoLogin still functions after changing the Windows password, the password for the AutoLogin must be changed.

The required procedure is shown in the following so that the change of the AutoLogin for SIMOTION P320-4 can be prepared:

1. Open the **Computer Management** window via **Control Panel** > **All Control Panel Items** > **Administrative Tools** .

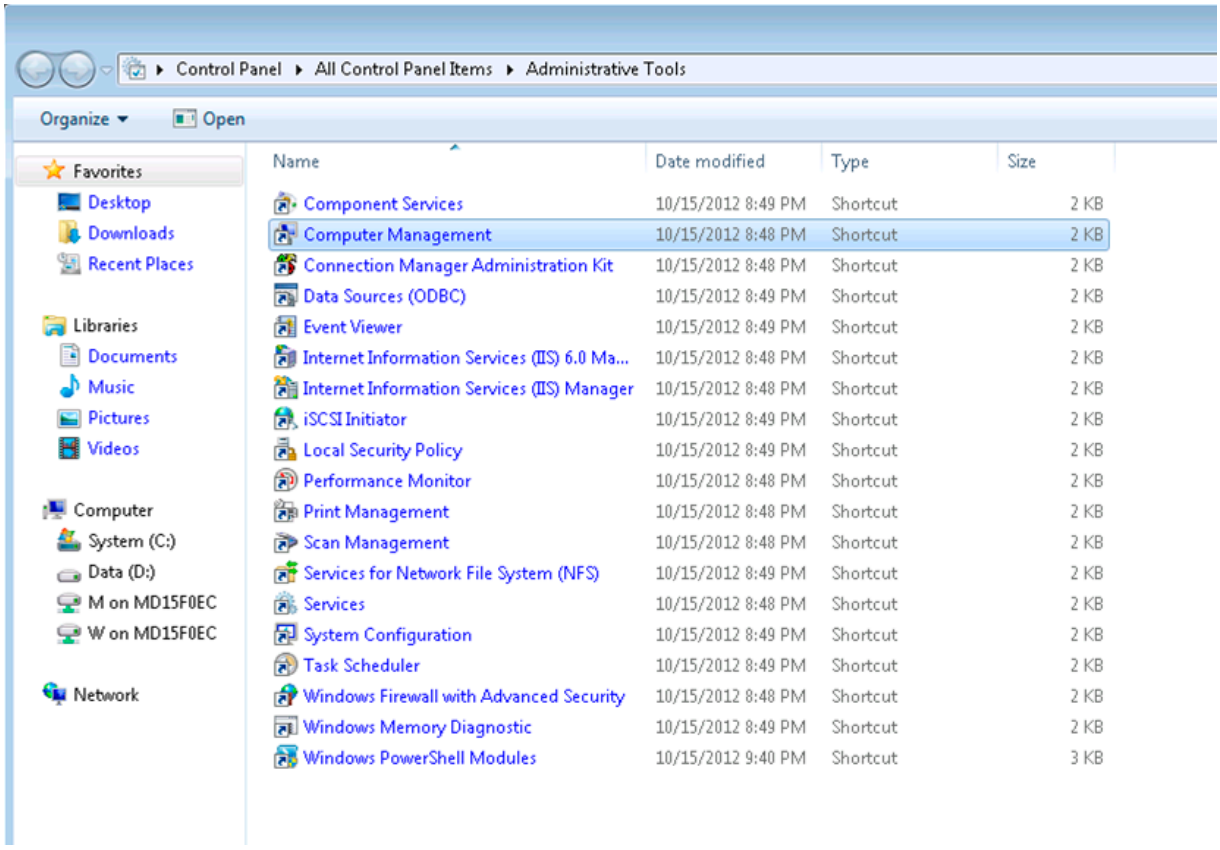

Figure 11-124 Computer Management entry point

2. The **Users** folder is displayed at **Local Users and Groups** in the **Computer Management** window.
   Click the **Users** folder. The available user groups are displayed.

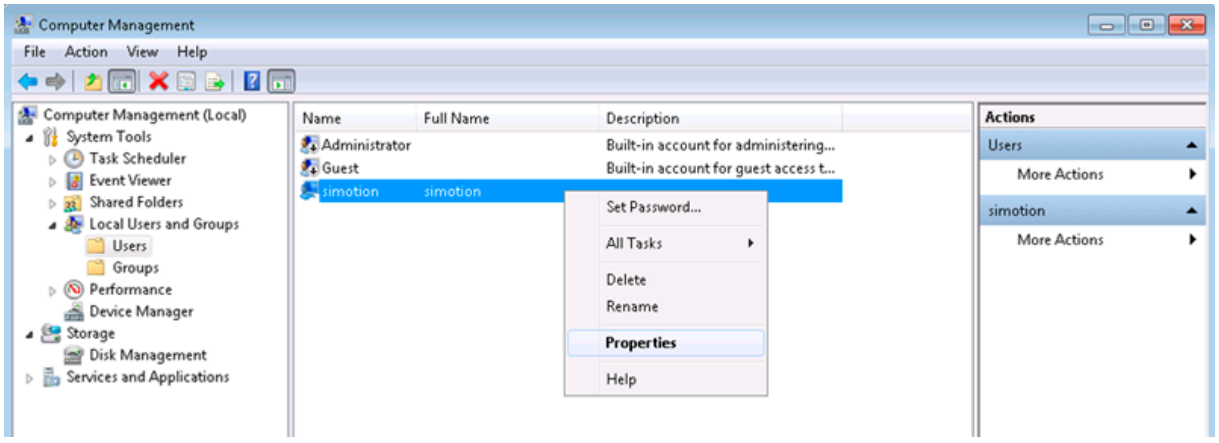

Figure 11-125 Computer Management - Users

3. With the selection of **Users**> **simotion**, you can display the properties via **Properties**.

4. Deactivate the **User cannot change password** checkbox in the **simotion Properties** dialog box.

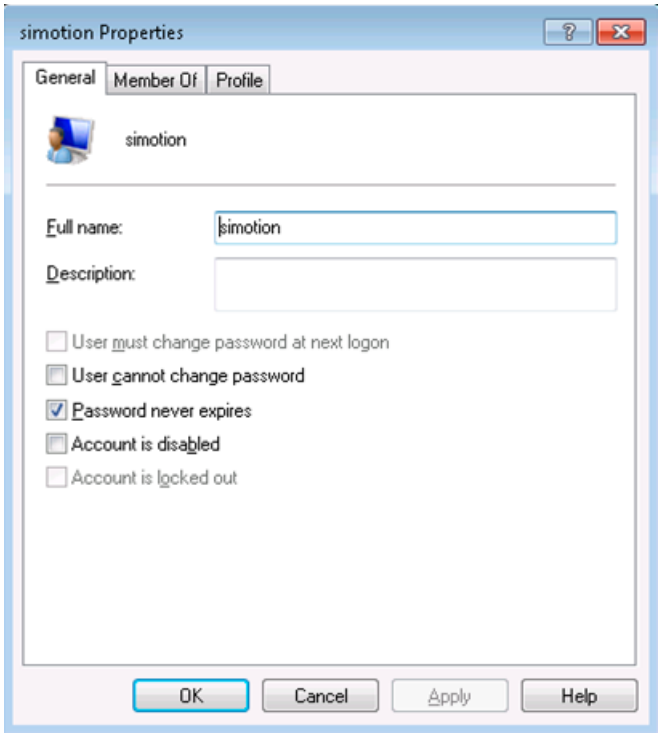

Figure 11-126 simotion Properties - General dialog box

5. Confirm with **OK.**

Changing the password for AutoLogin

To change the password for the AutoLogin, proceed as follows:

1. Open the search via **Windows-Start** and enter: **netplwiz**

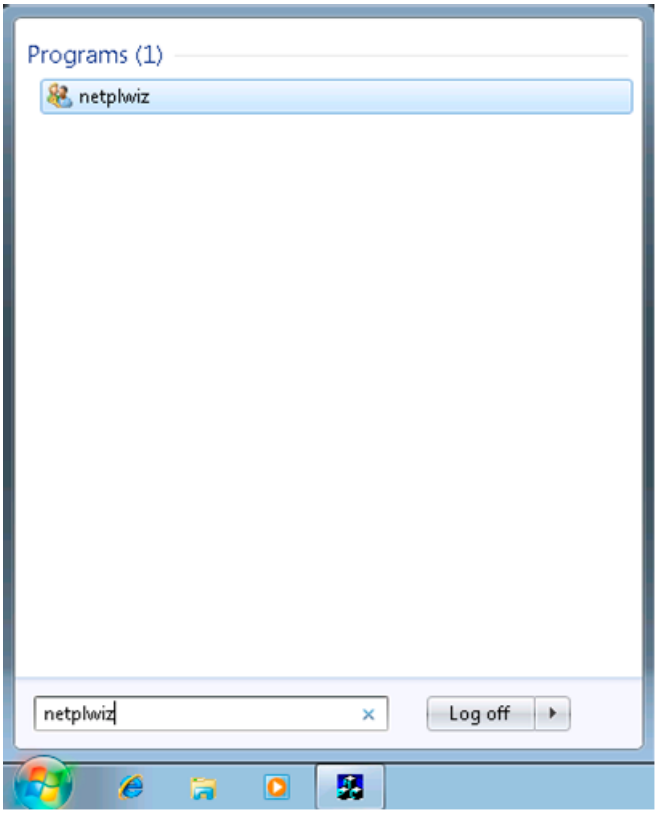

Figure 11-127 Programs netplwiz

2. The following **User Accounts** dialog box opens.

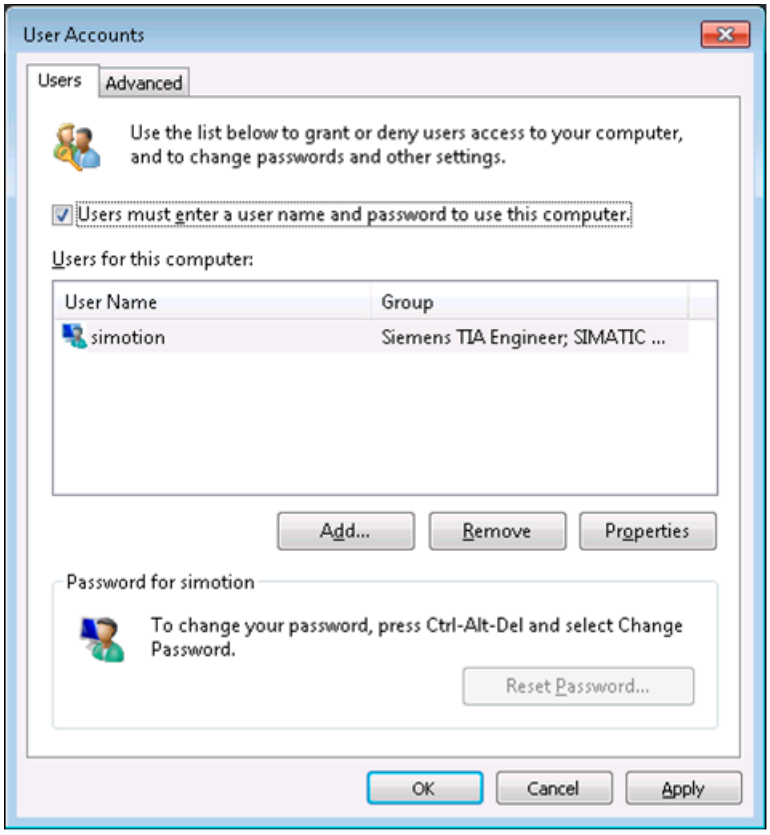

Figure 11-128 User Accounts

3. In the **Users** tab, activate the **Users must enter a user name and password to use this computer** checkbox.
   The **Apply** button is now active. Deactivate the checkbox and accept the changes now with the **OK** or **Apply** button.
   This is necessary so that the **Automatically Log On** dialog box is subsequently displayed.

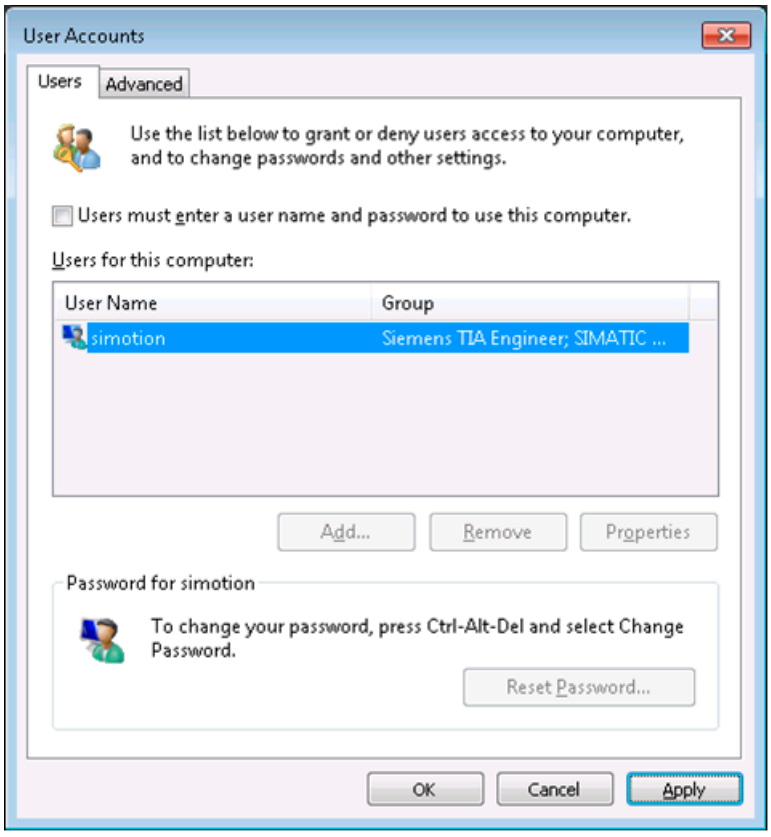

Figure 11-129 User accounts

4. Enter your changed Windows user password in the **Automatically Log On** dialog box and confirm it by entering it a second time.

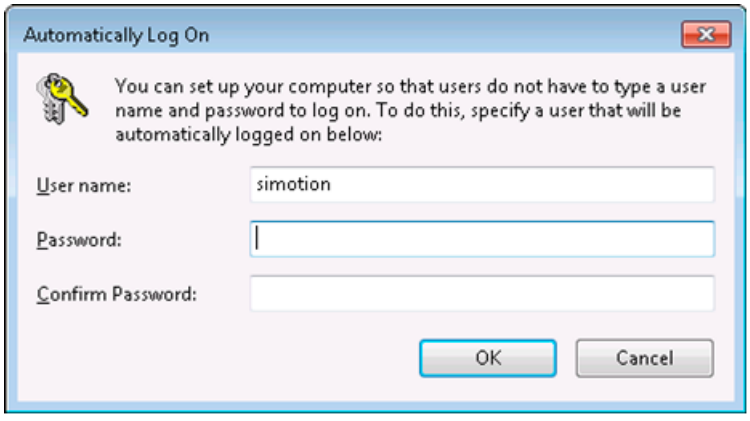

Figure 11-130 Automatically Log On dialog box

5. Confirm the password with **OK**.

Deactivating the remote desktop connection

Deactivating the remote desktop connection

If you do not use the headless mode and do not require a remote desktop connection, we recommend that you explicitly disable the remote desktop connection.

NOTICE
Deactivating the remote desktop connection
To ensure that the remote desktop connection is not used, it must be explicitly deactivated.

Procedure for deactivating the remote desktop connection

1. Using the Control Panel, select **System** > **Remote settings**.

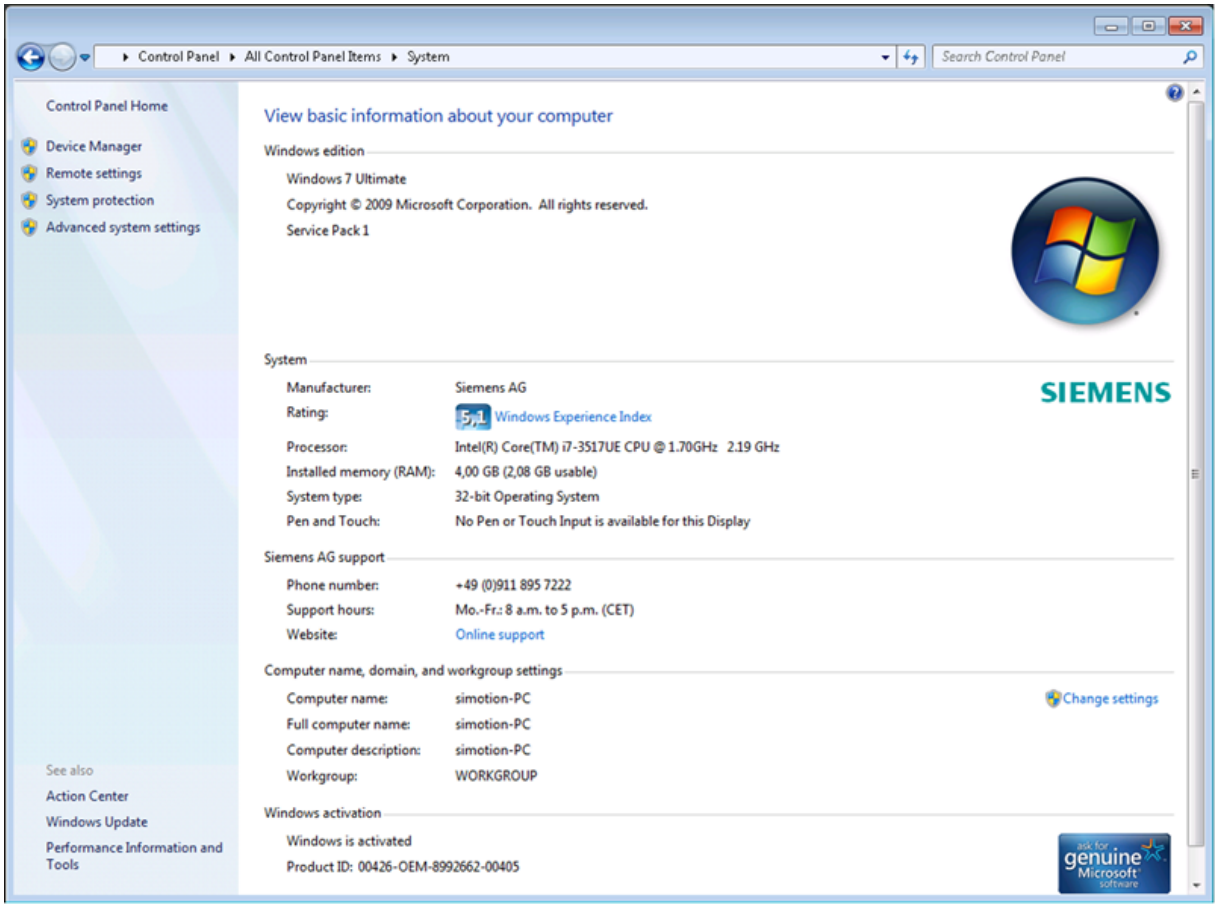

Figure 11-131 Remote settings

2. Select the **Remote** tab in the **System Properties** dialog box.

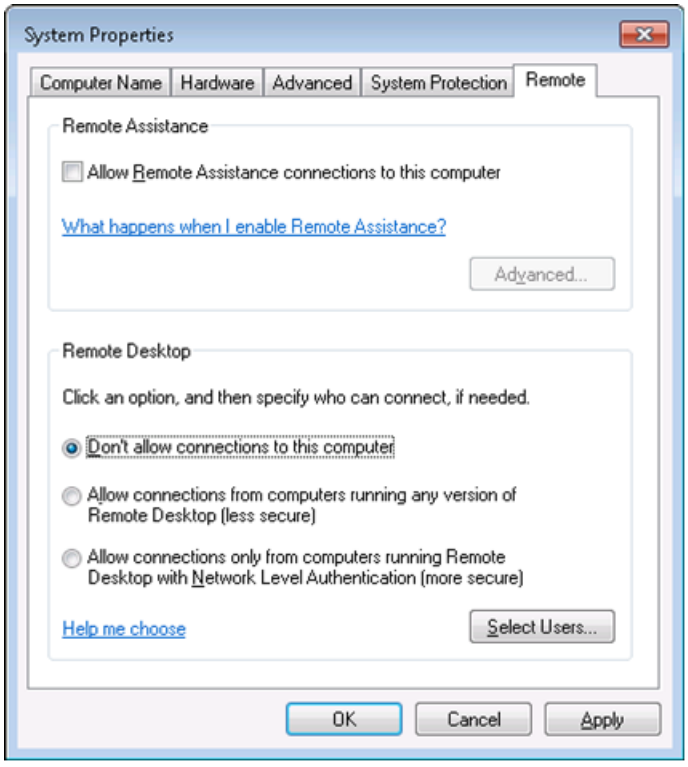

Figure 11-132 System Properties dialog box

3. Select the **Don't allow connections to this computer** option at **Remote Desktop**.
4. Confirm with **OK**.

Any remote desktop access is deactivated with this operation.

11.2.1.3 Description

System overview

Overview

SIMOTION P is a PC-based, open Motion Control System from SIMOTION.
Control, motion control, and HMI functions are executed together with standard PC applications on the SIMOTION P hardware platform. SIMOTION P combines the compatibility of the Windows operating system with real-time capability of SIMOTION P Runtime.

The fully independent SIMOTION P Runtime runs in parallel to Windows on SIMOTION P. This real-time expansion makes it possible to implement demanding motion control applications with high performance requirements on platforms of the SIMOTION P range. The hardware consists of a computing unit with innovative Intel technology, which is ready for operation at the time of delivery.

The drives and I/O devices are connected either via PROFINET onboard or IsoPROFIBUS board (optional).

The SIMATIC Flat Panel IFP1500, IFP1900 and IFP2200 can be used for the operation of the SIMOTION P320-4 hardware platform in a distributed configuration.

SIMOTION P320-4 versions

The SIMOTION P320-4 can control various I/O systems and HMI components via PROFINET onboard or the optional IsoPROFIBUS board.
If required, a USB DVD drive can be connected, for example.

The following versions of the SIMOTION P320-4 are available:

- SIMOTION P320-4 E
  with the Windows Embedded Standard 7 32-bit operating system and real-time expansion for SIMOTION.
- SIMOTION P320-4 S
  with the Windows 7 Ultimate 32-bit operating system and real-time expansion for SIMOTION.

Application

The SIMOTION P320-4 applications are directed at machines that require a high level of integration of PLC, motion control and technology functions on account of the increasing use of servo drives:

- Packaging machines
- Plastic and rubber processing machines
- Presses, wire-drawing machines
- Textile machines
- Printing machines
- Machines for processing wood, glass, ceramics, and stone
- Production lines in the renewable energy sector, e.g. solar technology, wind power installations

SIMOTION P320-4 product description

SIMOTION P320-4 overview

The SIMOTION P320-4 provides high-level industrial performance. It features:

- Compact design
- Maintenance-free operation
- High degree of ruggedness
- Long-term availability

Figure 11-133 SIMOTION P320-4 view

Figure 11-134 SIMOTION P320-4 (open perspective) with plugged-in optional IsoPROFIBUS board

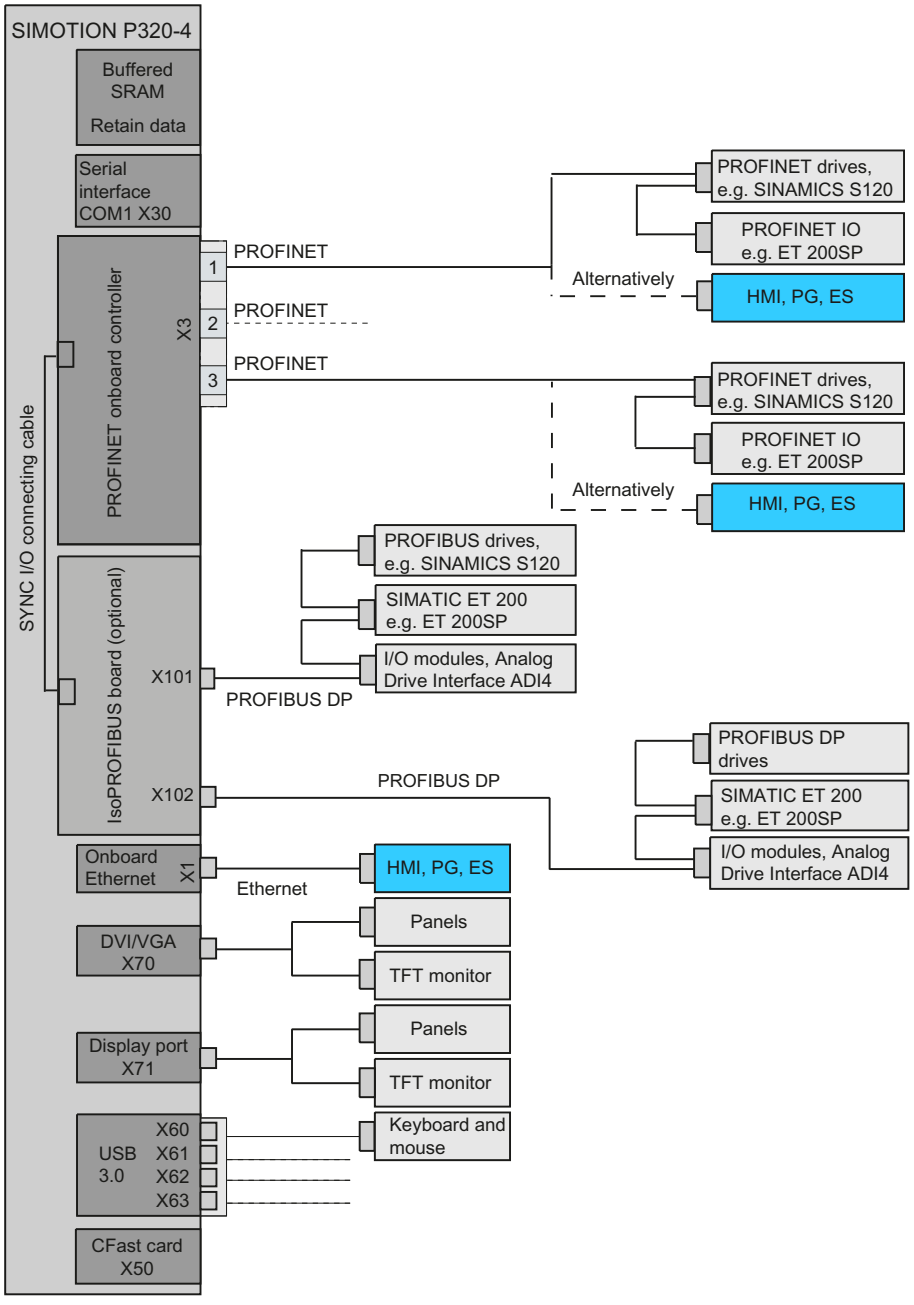
Features

Basic data	
Installation	• Standard rail mounting • Vertical mounting
Processor	
P320-4 E	Intel Core i3-3217UE, 2 x 1.6 GHz, 3 MB cache
P320-4 S	Intel Core i7-3517UE, 2 x 1.7 GHz, 4 MB cache
Main memory	4 GB DDR3 RAM
Optional IsoPROFIBUS board (PROFIBUS DP)	2 x SUB-D socket with configurable baud rates (9.6 Kbit/s - 12 Mbps)
Graphics	• Integrated Intel HD2000 or HD4000 • DVI resolution of 640 × 480 pixels up to 1920 × 1200 pixels • Display port resolution max. 1920 × 1200 pixels • Graphics memory is occupied in the main memory (dynamic UMA)
Power supply	24 VDC (-20%/+20%) max. 4 A
Operating conditions	Operation without fan
Drives and storage media	
CFast card or SSD (Solid State Disk)	Depending on the hardware version of the SIMOTION P320-4
P320-4 E	**2 x CFast card** Internal interface: CFast External interface: CFast
P320-4 S	**SSD (Solid State Disk)** Internal interface: SSD **CFast card** External interface: CFast
USB stick	External, can be connected via USB interface
Interfaces	
Serial	COM (RS 232)
Graphics	DVI-I: Suitable for use as DVI or VGA DPP++: Display port, DVI via DPP-to-DVI adapter
USB	4 × USB 3.0, simultaneous operation of high current, backward compatible with USB 2.0/1.1
Ethernet	1 × RJ45 (10/100/1000 Mbps)
PROFINET I/O	3 × RJ45 (100 Mbps)
Keyboard, mouse	Can be connected via USB interface

Software	
Operating systems	
P320-4 E	Windows Embedded Standard 7 32-bit
P320-4 S	Windows 7 Ultimate 32-bit

SIMOTION P320-4 (hardware) structure

The following figure shows the integration of the SIMOTION P320-4 with integrated PROFINET onboard and optional IsoPROFIBUS board in a target system.



HMI Human Machine Interface

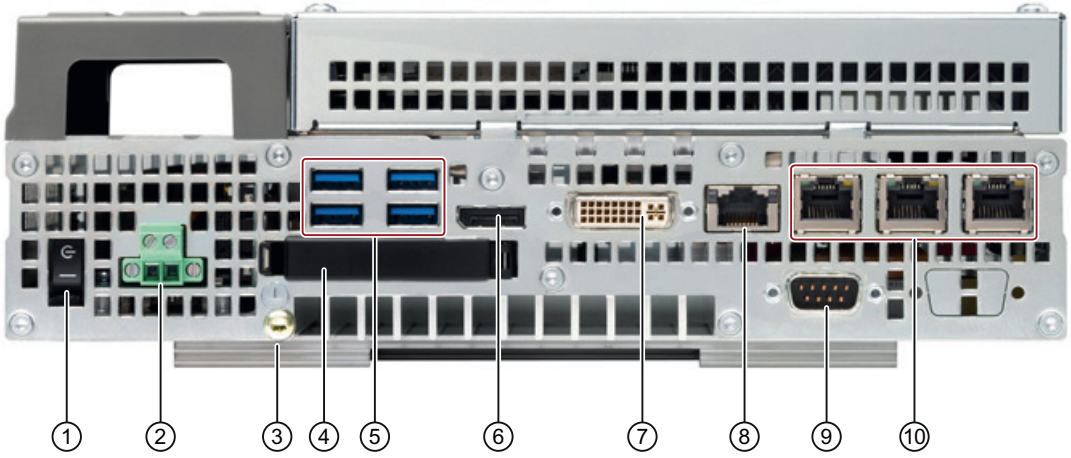
PG Programming device

ES Engineering system

Figure 11-135 SIMOTION P320-4 system overview

Interfaces and operating elements

SIMOTION P320-4



①	On/off switch	Position **OFF** is the delivery state. The on/off switch does not isolate the device from the power supply.
②	24 V DC	Power supply connection
③	Protective conductor	Protective conductor terminal
④	Memory card slot	Cover for the CFast card
⑤	4 × USB 3.0	USB 3.0 high current, backward compatible with USB 2.0/1.1
⑥	Display port	Display port connection for digital monitor
⑦	DVI-I	DVI connector for CRT or LCD monitor with DVI interface
⑧	Ethernet	RJ45 Ethernet connection for 10/100/1000 Mbps
⑨	COM1	Serial interface
⑩	3 × PROFINET	PROFINET ports with three RJ45 sockets

SIMOTION P Runtime (software) structure

SIMOTION P Runtime contains the SIMOTION P Kernel which performs the motion control and interface control.

A SIMOTION project is planned, configured, assigned parameters, commissioned and programmed via the SIMOTION SCOUT engineering system (ES).

The user data can be stored on the data media of the SIMOTION P320-4 .

Siemens WinCC flexible software can be used to visualize operational sequences or to operate the machine. Third-party systems can be linked via the OPC interface.

SIMOTION P Runtime

With the SIMOTION P320-4, the PLC and motion control functionality (starting from position controller upwards) is located centrally in a strictly deterministic task outside the Windows operating system.

Its main field of application is centralized motion control and control tasks requiring close coordination between multiple axes and/or input/output modules.

Functionality ranges from simple positioning to high-performance synchronous operation.

SIMOTION SCOUT

The SIMOTION SCOUT engineering system can be installed on the SIMOTION P320-4 S or connected via the interfaces integrated in SIMOTION P320-4 .

SIMOTION SCOUT TIA

As of version V4.5, the SIMOTION SCOUT TIA engineering system no longer supports the Windows 7 32-bit operating system and therefore cannot be installed.

HMI software

HMI/Runtime software can be operated on the same PC, e.g. the Siemens WinCC flexible software. Other software packages can be linked by means of the OPC interface.

The **HMI software** is used as the general term in the following.

Internal communication

A locally installed HMI can use the local communication to access the following:

- Variables in SIMOTION RT
- Drives on PROFINET IO or PROFIBUS DP
- Other SIMOTION devices on PROFINET IO or PROFIBUS DP

Scope of delivery

The system software supplied with the SIMOTION P320-4 is either already installed on the SIMOTION P320-4 storage medium or is ready to be installed:

- SIMOTION P Kernel
- SIMOTION IT
- SIMOTION IT VM Virtuell Machine (subject to license)

Components

The most important components of the SIMOTION P320-4 and their functions are listed below.

Distributed I/O systems (PROFINET)

Table 11-17 Components for distributed I/O

Component	Function
SIMATIC ET 200M	Modular I/O system for cabinet installation and high channel densities.
SIMATIC ET 200S	Finely modular I/O system for cabinet installation including motor starters, safety technology, and individual grouping of the load groups.
SIMATIC ET 200SP	Finely scalable I/O system for cabinet installation; SIMATIC ET 200SP features a single-cable and multi-cable connection with push-in terminals, compact dimensions, high performance, and low part variety.
SIMATIC ET 200MP	Modular I/O system for cabinet installation and high channel densities in the SIMATIC S7-1500 packaging system. SIMATIC ET 200MP permits the shortest bus cycle times and fastest response time even with large volumes of data.
SIMATIC ET 200eco	I/O system with IP67 degree of protection for machine-related, cabinet-free applications, featuring a flexible and fast connection system in ECOFAST or M12.
SIMATIC ET 200pro	Modular I/O system with IP65/67 degree of protection for machine-related, cabinet-free applications, including motor starters.

Note

Note that not all modules of the above-mentioned I/Os or I/O systems have been released for SIMOTION.

There may also be system-dependent functional differences with regard to the use on SIMOTION and on SIMATIC.
For example, special process-control functions (e.g. HART modules, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

For a detailed and routinely updated list of I/O modules enabled with SIMOTION as well as application information, visit us online at:

SIEMENS Industry Online Support - Product support - Supplementary system components (https://support.industry.siemens.com/cs/de/en)

Further modules are integrated via the GSD file of the device's manufacturer.

Note

Note that in individual cases, additional supplementary conditions must be fulfilled.

Drive systems (via PROFINET IO)

Table 11-18 List of typically connected drive systems

Component	Function
SINAMICS S120	Servo drives, innovative single-axis and multi-axis solution

Optional components

Table 11-19 Optional components

Centralized I/O	Function
IsoPROFIBUS board	PROFIBUS connection
UPS	Uninterruptible Power Supply The drivers for the UPS are not pre-installed on the PC. Install the current drivers that are supplied with the UPS.

Note

An IsoPROFIBUS board may be inserted in addition to the PROFINET onboard.

HMI and SIMOTION SCOUT

HMI and SIMOTION SCOUT Overview

The operational sequences on the SIMOTION P320-4 are either monitored via the HMI system (Human Machine Interface) or the SIMOTION SCOUT engineering system.

The HMI or ES software can be connected using the following variants:

- Local (Page 8040)
- via PROFINET (Page 8053)
- via Ethernet (Page 8054)
- via IsoPROFIBUS (optional) (Page 8055)

Local communication of the HMI/ES

Only one local connection to the local SIMOTION Runtime is possible. If HMI or ES is also installed locally, **PC internal** can access other controllers/devices via PROFINET / PROFIBUS.

See Section Local HMI or ES on SIMOTION P320-4 (Page 8040).

Communication of the HMI / ES via PROFINET / Ethernet / PROFIBUS

By using one of these communication variants, you can control and monitor several SIMOTION devices.

Local HMI or ES on SIMOTION P320-4

The model described below is used for the communication of the SIMOTION P320-4 with a local HMI or ES. The SIMOTION SCOUT engineering system or the HMI system can be installed directly on the **SIMOTION P320-4 S**.

For this model, you must set the communication (access point) to **TCP/IP** .

The SIMOTION P320-4 is already configured for this communication version at the time of delivery.

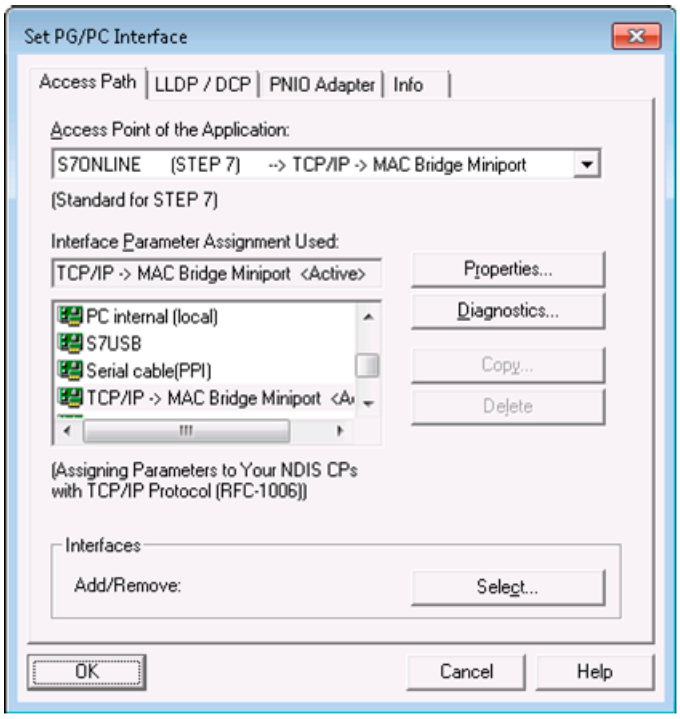


Figure 11-136 Set PG/PC Interface - TCP/IP -> MAC Bridge Miniport dialog box

Note

Local communication via Ethernet (TCP/IP)

For the communication via Ethernet (TCP/IP) to function locally, a link must be available to the Ethernet interface or a LAN cable must be connected **or** the MAC bridge set up.

Note

Setting up the MAC bridge miniport

See also Section Setting up a network bridge - MAC bridge miniport (Page 8042)

Note

Only HMI-Runtime can be installed on the **SIMOTION P320-4 E** version.

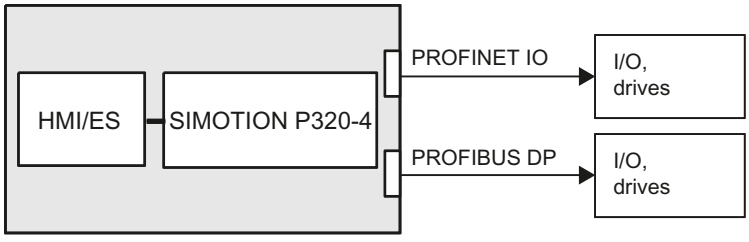

Figure 11-137 Model: Local HMI or ES

Alternatively to TCP/IP , SIMOTION SCOUT can also communicate locally via PC internal (local) .

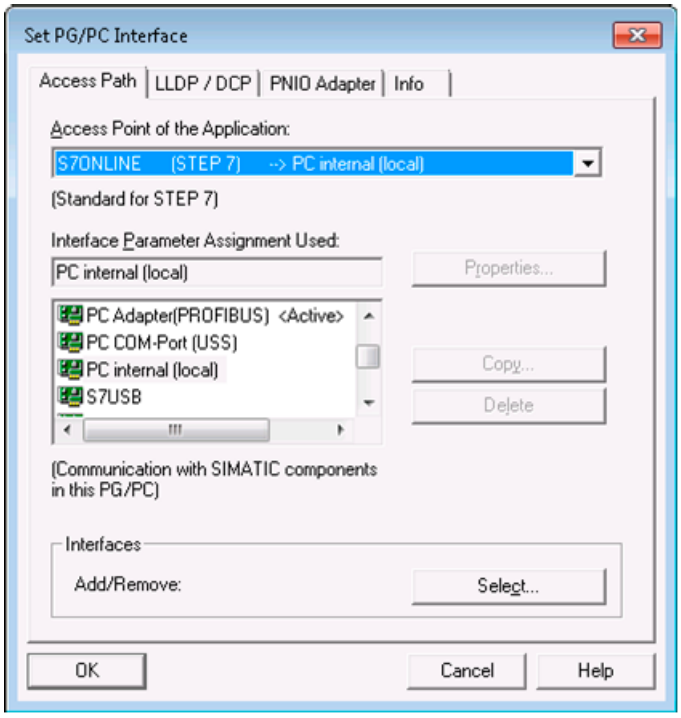

Figure 11-138 Set PG/PC Interface - PC internal (local) dialog box

See also

Local HMI or ES on SIMOTION P320-4 (Page 7858)

Setting up a network bridge - MAC bridge miniport

Note

If you are working with SIMOTION P320-4 version V4.5, the Network Bridge is already preset.

The network bridge must be preset, configured via script and set up as described in the following. Note that the MAC address of the network bridge is different to the MAC address of the Ethernet adapter.

The following is a step-by-step description of how the network bridge **MAC Bridge Miniport** is set up.

Network connections initial situation

Open the **Network and Internet** via the Control Panel.

- Select **Control Panel** > **All Control Panel Items** > **Network and Sharing Center** > **Change adapter settings**.
- Open the **Network and Internet** > **Network Connections** dialog box.
  The network connections of your PC are shown here.

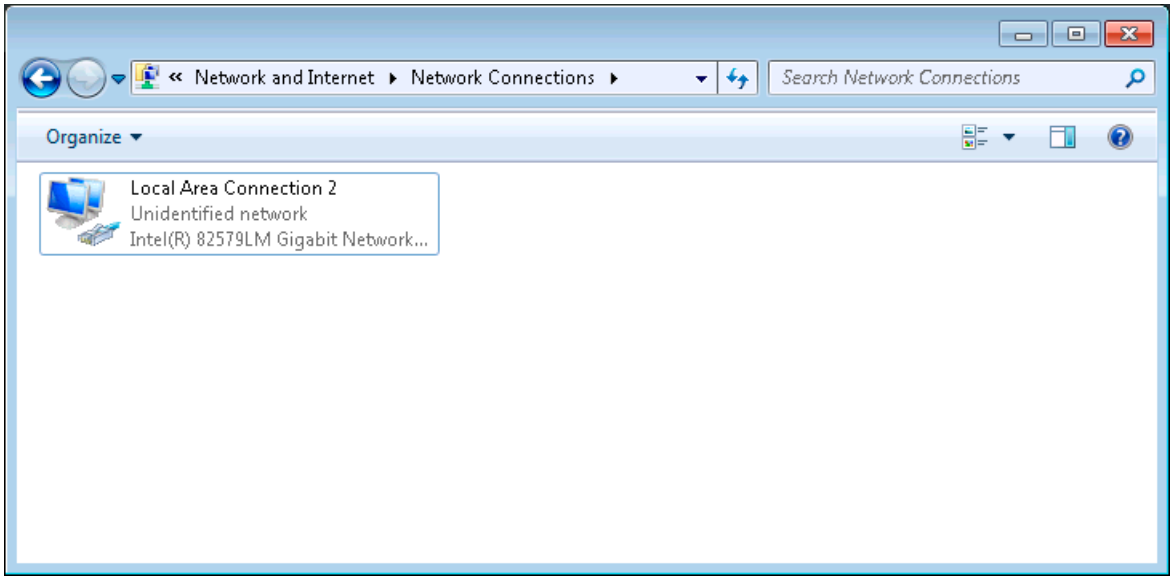

Figure 11-139 Initial situation - Network connections

Device Manager

Open the Device Manager via the Control Panel:

Control Panel > **All Control Panel Items** > **System** > **Device Manager**.

1. Select the **Network adapters** in the dialog box below the "SIMOTION PC". The available network connections are shown here.

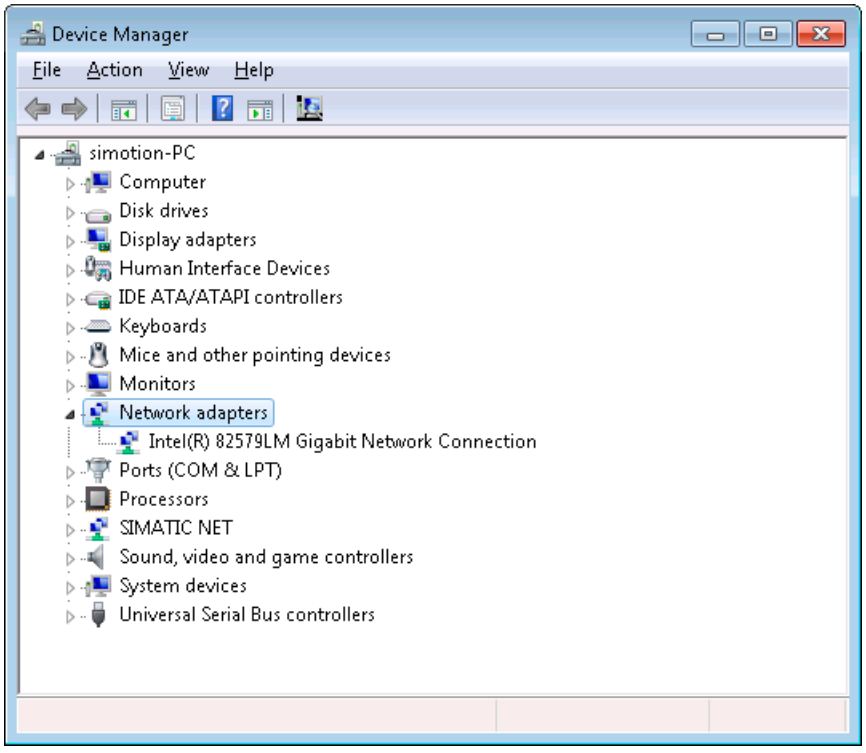

Figure 11-140 Opening the Device Manager

2. Install the **Microsoft Loopback Adapter** via the Device Manager.
3. To do this, select the menu **Action** > **Add legacy hardware**. The **Add Hardware Wizard** then opens.

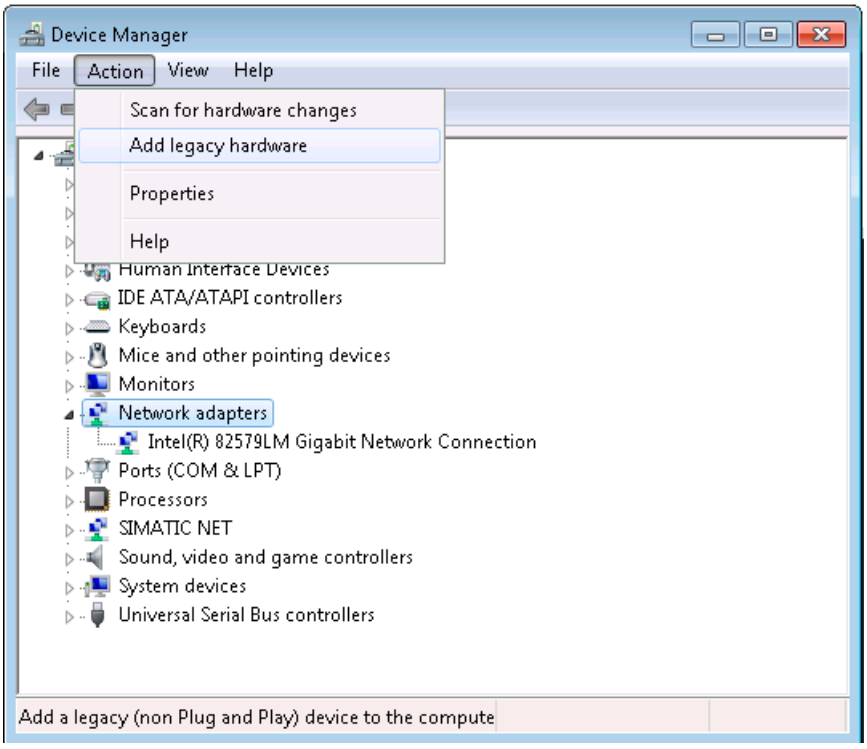

Figure 11-141 Device Manager - Action menu

Add Hardware Wizard

Use the **Add Hardware Wizard** to install the network bridge.

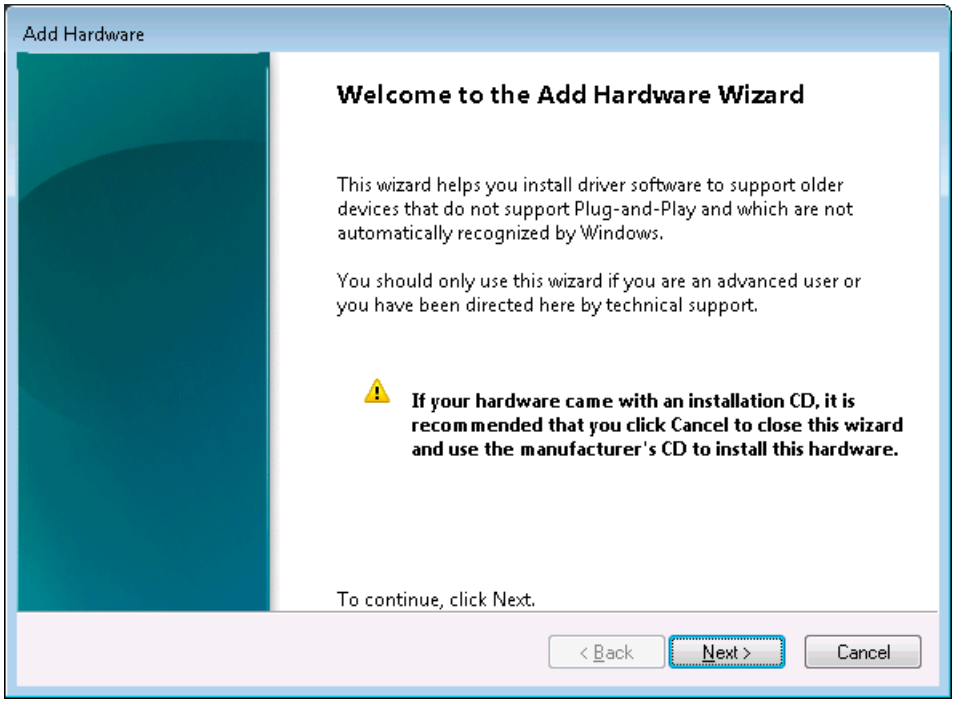

Figure 11-142 Add Hardware - Starting the wizard

1. Click **Next** to start the software wizard.
2. Select the option: **Install the hardware that I manually select from a list (Advanced)** and continue in the wizard with **Next**.

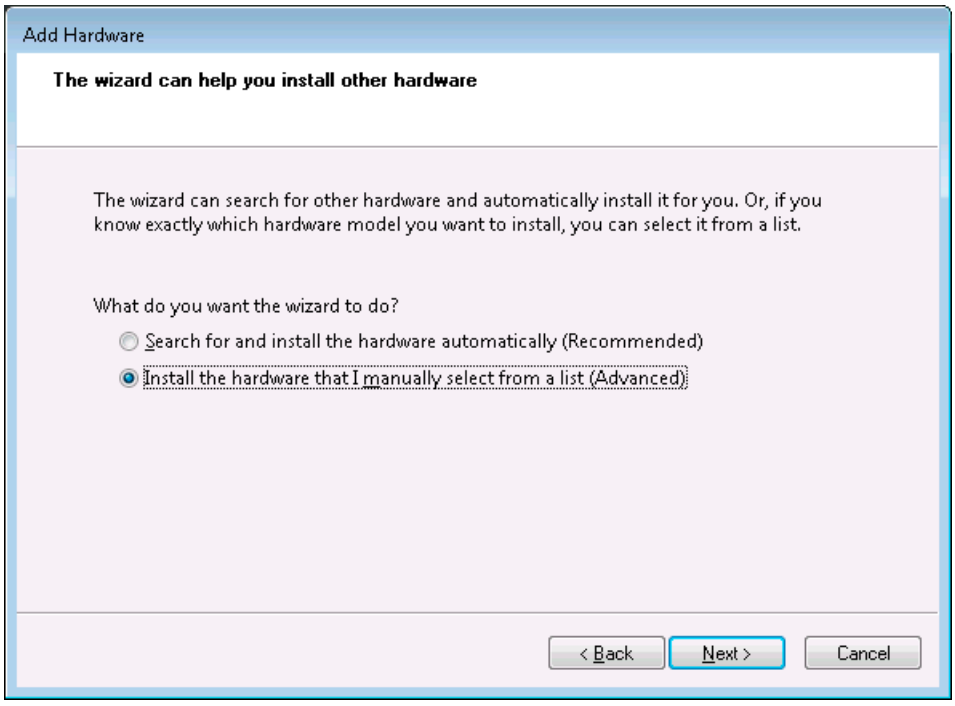

Figure 11-143 Add Hardware - Manual selection from a list

3. Select **Network adapters** in the dialog box now open and continue in the wizard with **Next**.

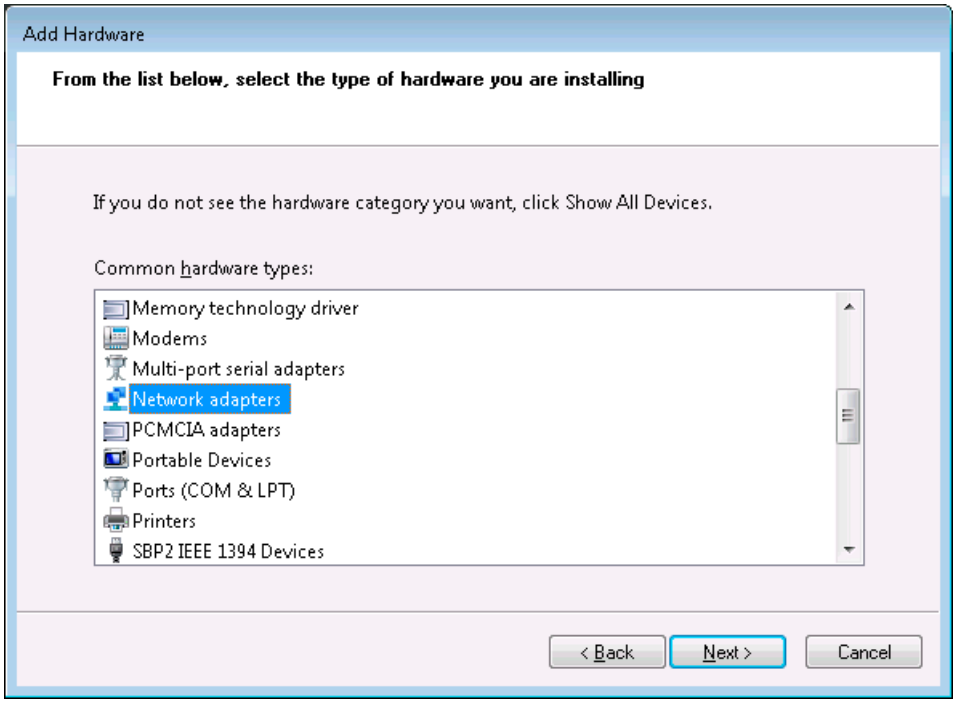

Figure 11-144 Select Add Hardware - Network adapters

4. In the following dialog box, select the **Microsoft Loopback Adapter**.
5. To do this, select Microsoft at **Manufacturer** and the Microsoft Loopback Adapter at **Network Adapter**.

6. Continue in the wizard with **Next**.

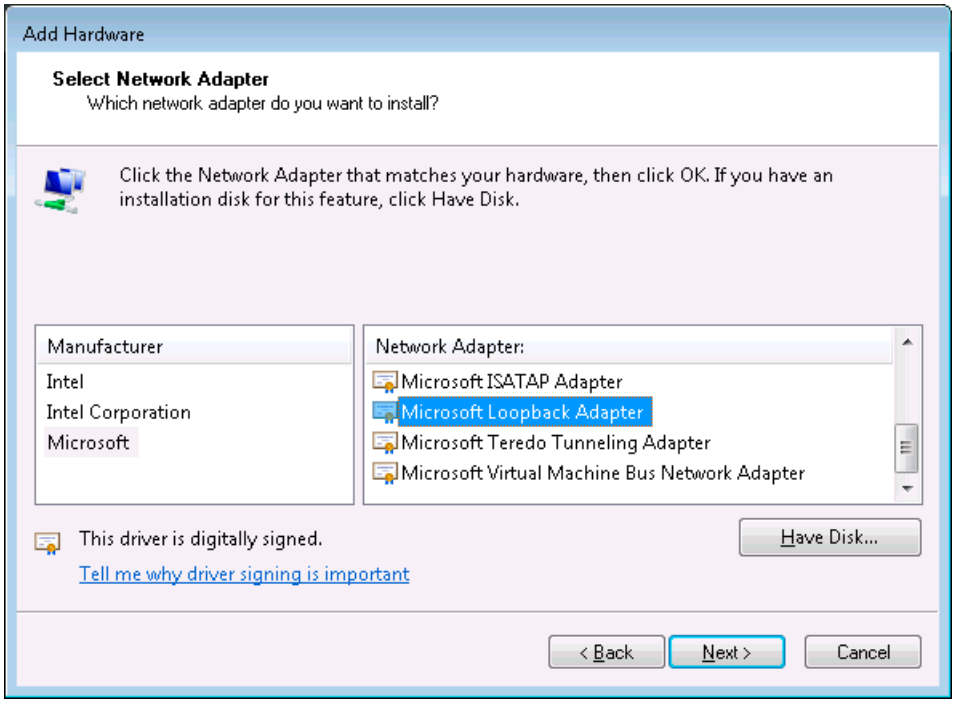

Figure 11-145 Add Hardware - Selecting the desired Network Adapter

7. The selected Network Adapter is shown in the following dialog box.
Click **Next** to confirm and install.

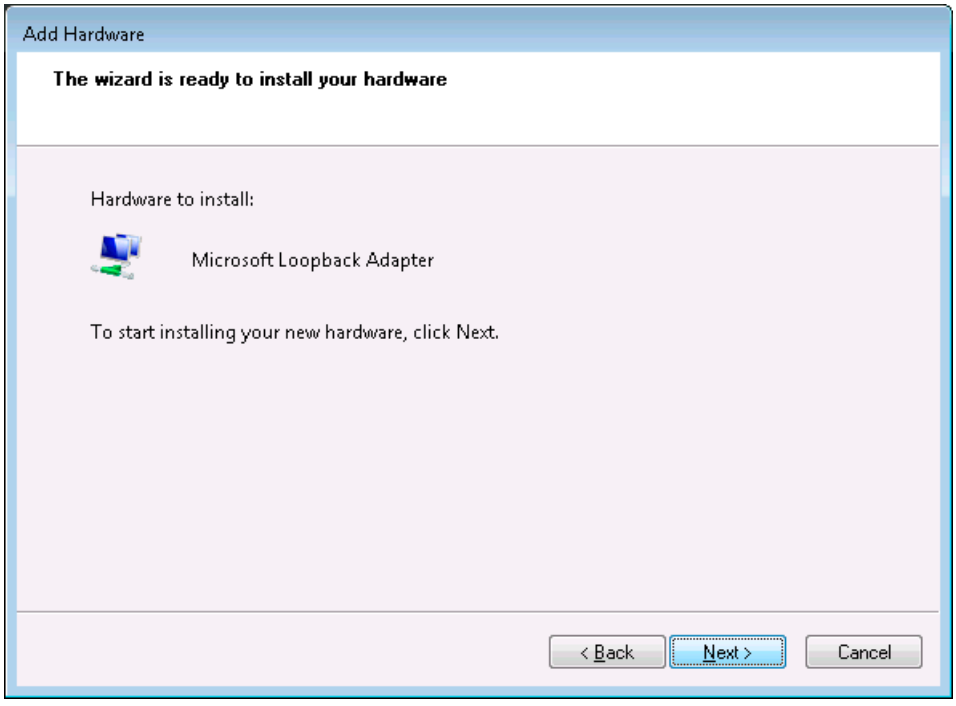

Figure 11-146 Add Hardware - Selected Network Adapter can be installed

8. After finishing the installation, the following dialog box is displayed.
Exit the wizard with **Finish**.

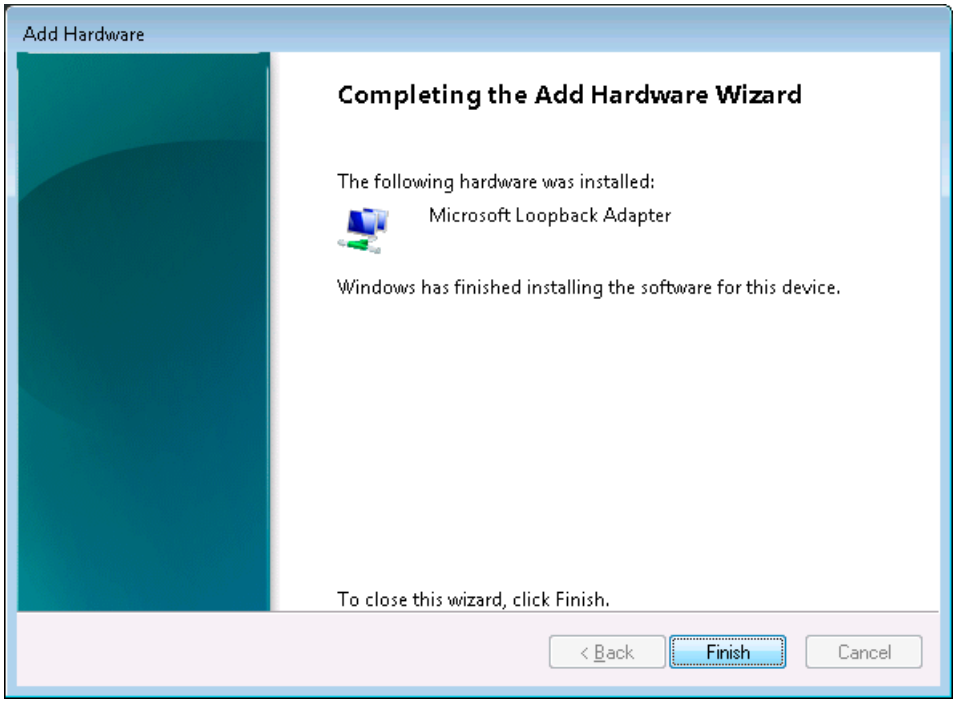

Figure 11-147 Add Hardware - Installation of the Microsoft Loopback Adapter is finished

Checking the installation of the network adapter

You can check the successful installation of the **Microsoft Loopback Adapters** in the

- Device Manager
- Internet connections

Device Manager

The Microsoft Loopback Adapter is displayed at **Network adapters** in the Device Manager.

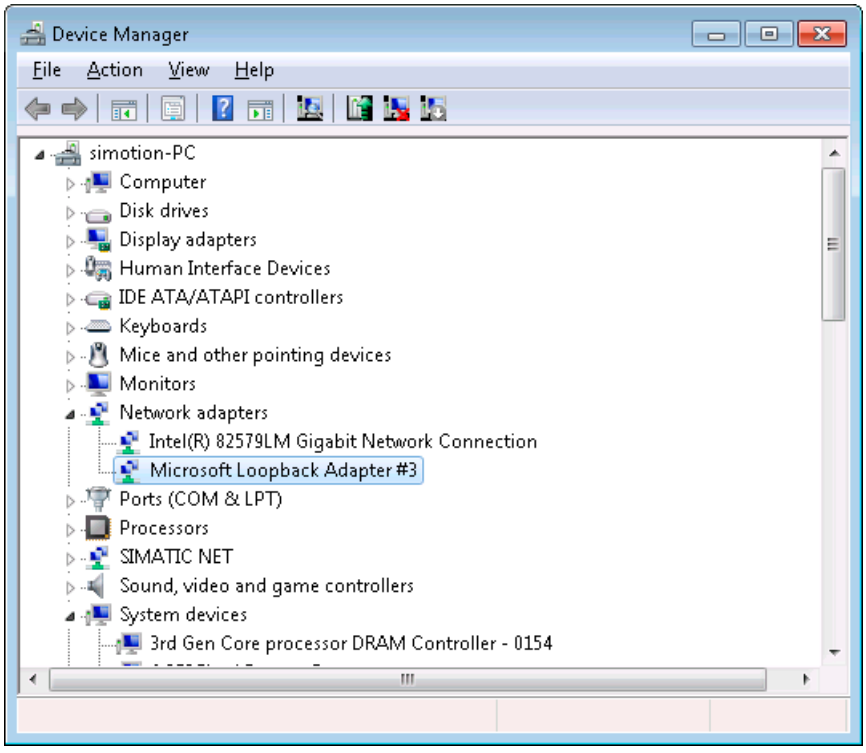

Figure 11-148 Device Manager - Microsoft loopback adapter

Network connections

The newly installed Microsoft Loopback Adapter is also displayed at **Network Connections**.

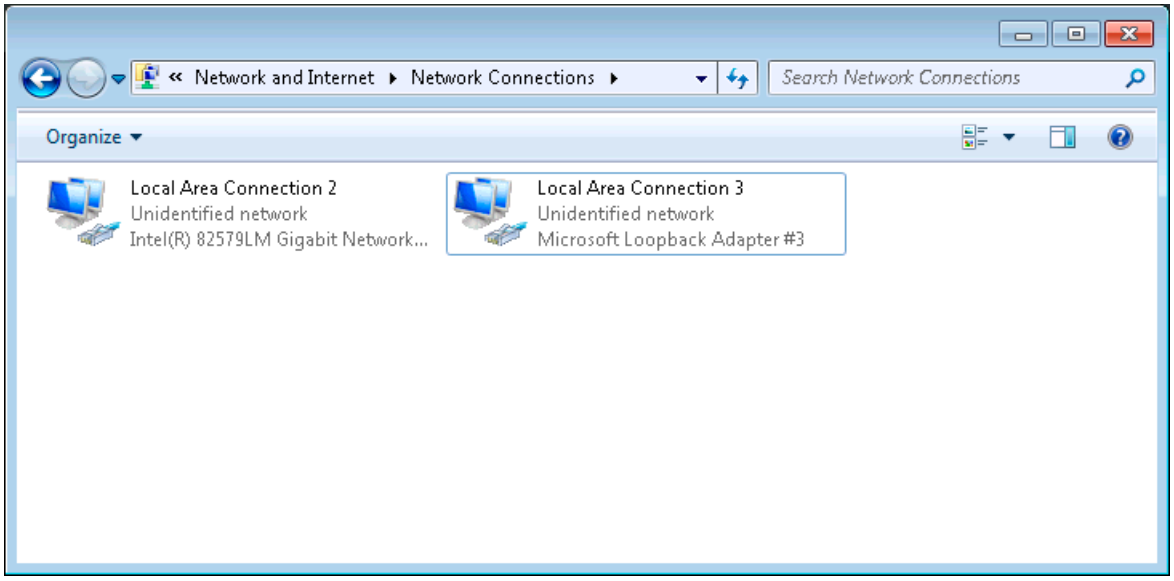

Figure 11-149 Network connections - Display of the newly installed Microsoft loopback adapter

Creating the network bridge

To activate the network bridge, proceed as follows:

1. Select both adapters at Network Connections
2. Select Bridge Connections via the context menu.

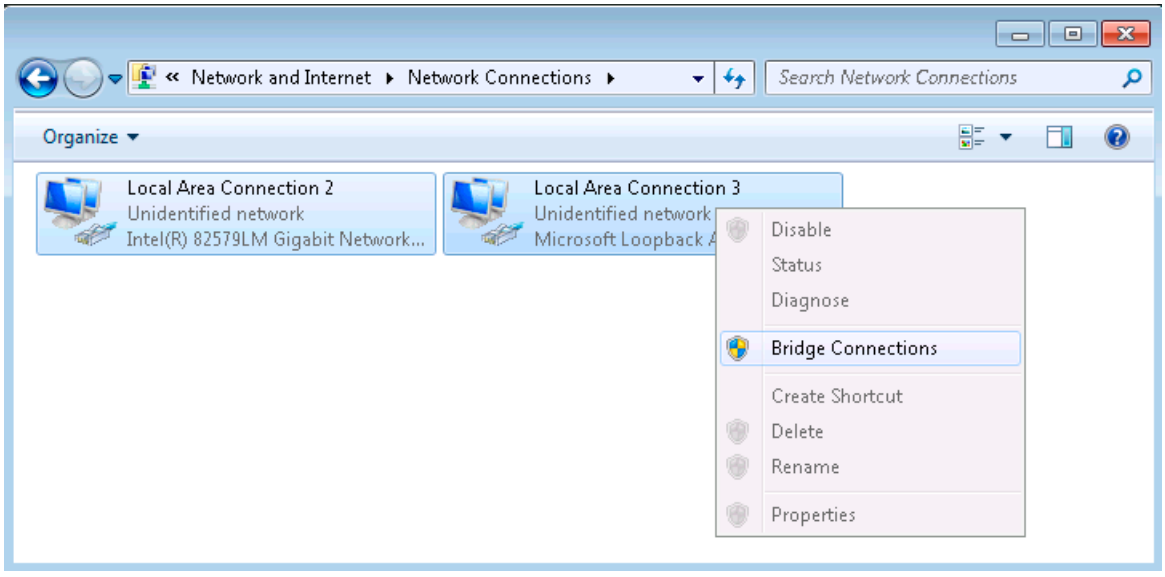

Figure 11-150 Network Connections - Setting the Bridge Connection

3. The Network Bridge MAC Bridge Miniport is displayed.

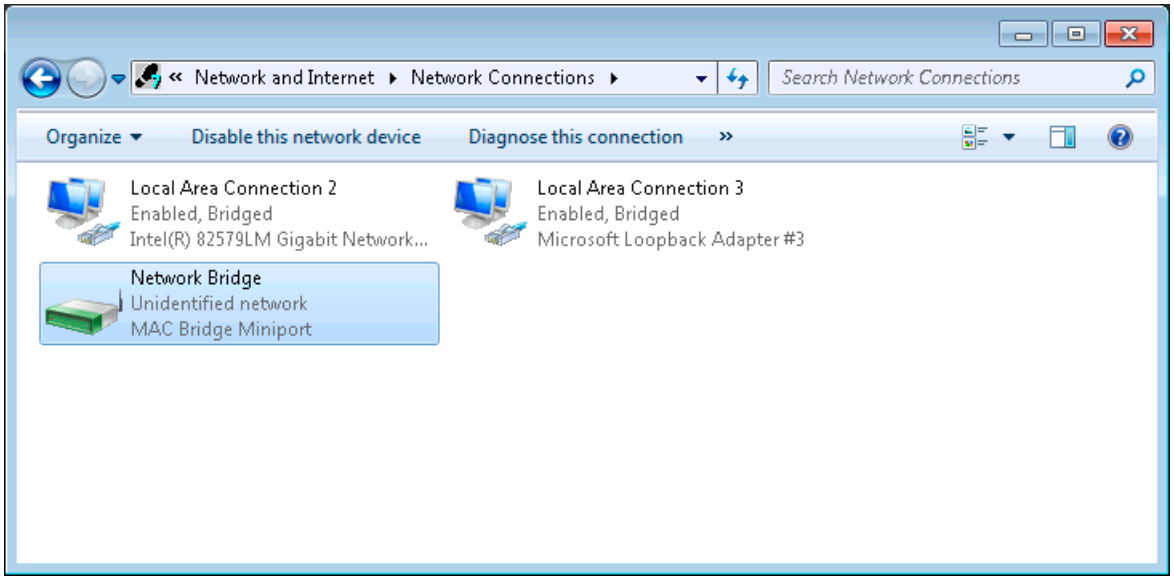

Figure 11-151 Network Connections - Display of the Network Bridge MAC Bridge Miniport

4. To initialize the network bridge, execute the **sp_bridge.cmd** Windows command script.
   The additional script can be found at C:\SiMotion\tools\sp_bridge.cmd
   After executing the batch file, the network bridge has been set up.

Setting "Set PG/PC interface"

Now open the PG/PC interface to complete the setting for the **Network Bridge** .

1. Open the **Set PG/PC Interface** dialog box via the **Control Panel** entry point.
2. Deactivate the **MAC Bridge Miniport DCP** checkbox in the **LLDP / DCP** tab.
   If you do not deactivate the MAC Bridge Miniport DCP, the SIMOTION P320-4 may not be found via Accessible nodes.

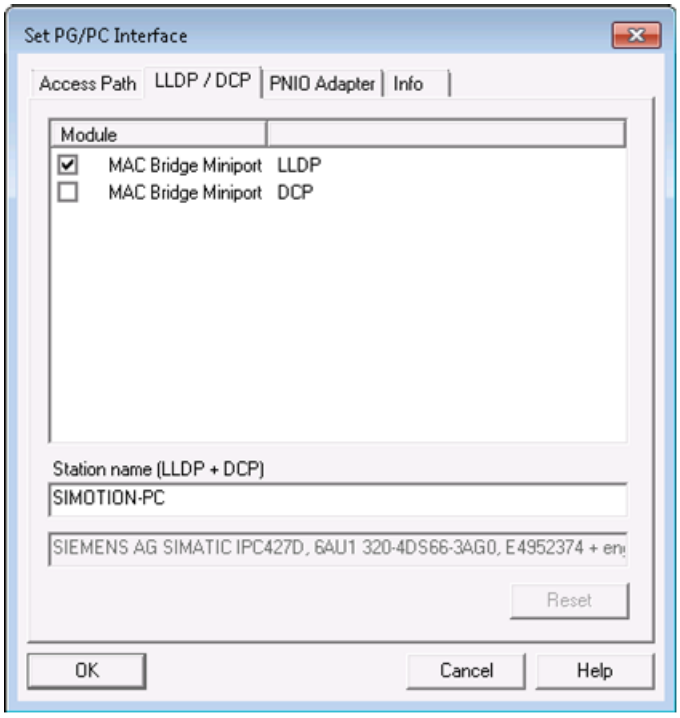

Figure 11-152 Set PG/PC interface

The settings for the network bridge have now been completed.

HMI or ES via PROFINET

Networking via PROFINET

PROFINET is the innovative and open Industrial Ethernet standard (EN 61158) for industrial automation. With PROFINET, devices can be linked up from the field level through to the management level.

With PROFINET, an external HMI or ES can also be integrated into the network and data can be exchanged directly with the SIMOTION P320-4 device.

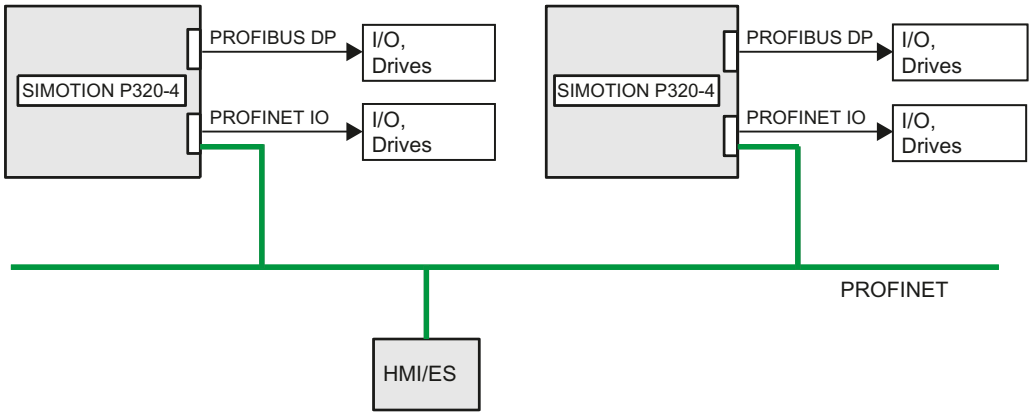

Figure 11-153 Model: Networking via PROFINET

References

You can find further information on the HMI in the documentation:

- SIMOTION Runtime Basic Functions, Section HMI (Human Machine Interface) coupling.
- SIMOTION SCOUT, Configuration Manual
- SIMOTION SCOUT TIA, Configuration Manual
- SIMOTION SCOUT TIA Device Proxy, Configuration Manual

HMI or ES via Ethernet

Networking via Ethernet

A complex interconnection with several HMIs or ESs is only possible using an Ethernet communication. This allows both an external HMI or ES to access several SIMOTION devices or one SIMOTION device to access another one, for example, to display the production data.

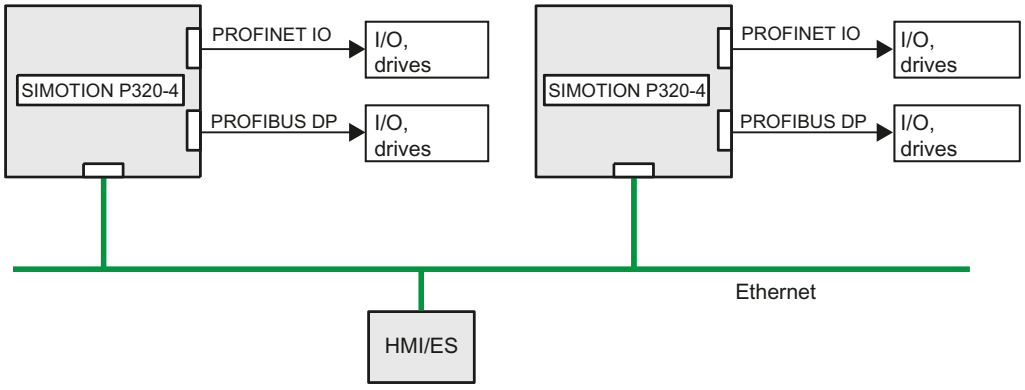

Figure 11-154 Model: Networking via Ethernet

The following services are possible on a SIMOTION device via Ethernet:

- HMI software
  WinCC flexible or the OPC server can use Ethernet to access one or more SIMOTION devices.
- SIMOTION SCOUT Engineering System
  SIMOTION SCOUT can also use Ethernet to access one or more SIMOTION devices.
- SIMOTION IT
  SIMOTION P320-4 offers communication with standard IT protocols (HTTP) over the integrated Ethernet interface.
  This makes it possible to access data or diagnostic information in the SIMOTION P320-4 from any location via intranet or the Internet.
- HTTP (browser, OPC XML)
  Setting in WebCFG.xml - default 80
- HTTPS (browser, OPC XML)
  Setting in WebCfg.xml - default 443
- FTP 21
- Telnet

Note

Information on the SIMOTION IT security concept

More detailed information on the SIMOTION IT security concept of HTTP/S, FTP and Telnet access on the Web server can be found in the following documentation:

- SIMOTION IT Diagnostics and Configuration, Diagnostics Manual, Section security concept

References

You can find further information in the documentation for SIMOTION IT:

- SIMOTION IT Diagnostics and Configuration
- SIMOTION IT Programming and Web Services
- SIMOTION IT Virtual Machine and Servlets

HMI or ES via IsoPROFIBUS (optional)

Networking via PROFIBUS DP

If you connect a central HMI via PROFIBUS DP, the X101 and X102 interfaces of the IsoPROFIBUS board are available.

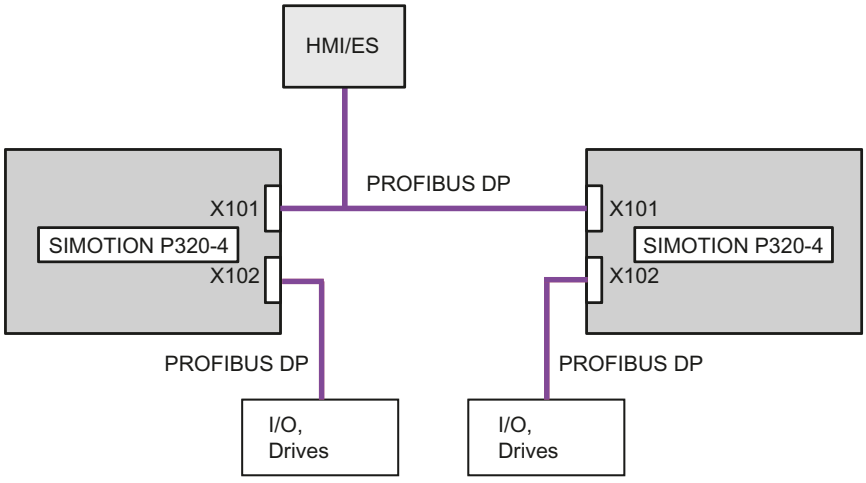

Figure 11-155 Model: Networking via PROFIBUS DP

References

You can find further information on the HMI in the documentation:

- SIMOTION Runtime Basic Functions, section HMI (Human Machine Interface) coupling.

11.2.1.4 Application planning

Unpacking and checking the delivery

Procedure

1. When accepting a delivery, please check the packaging for visible transport damage.
2. If any transport damage is present at the time of delivery, lodge a complaint at the shipping company in charge. Have the shipper confirm the transport damage immediately.
3. Unpack the device at its installation location.
4. Keep the **original packaging** in case you have to transport the device again.

   Note

   Damage to the device during transport and storage

   If a device is transported or stored without packaging, then shocks, vibrations, pressure and moisture may impact the unprotected device.
   A damaged packaging indicates that ambient conditions have already had a massive impact on the device.

   The device may be damaged.

   Do not dispose of the original packaging. Pack the device for transport and storage in the **original packaging**.

5. Check the contents of the packaging and any accessories you may have ordered for completeness and damage.

6. If the contents of the packaging are incomplete, damaged or do not match your order, inform the responsible delivery service **immediately**.

⚠ WARNING

Electric shock and fire hazard due to damaged device

A damaged device can be under hazardous voltage and trigger a fire in the machine or plant. A damaged device has unpredictable properties and states.

Death or serious injury could occur.

Make sure that the damaged device is not inadvertently installed and put into operation. Label the damaged device and keep it locked away. Send off the device for immediate repair.

NOTICE

Damage from condensation

If the device is subjected to low temperatures or extreme fluctuations in temperature during transportation, for example in cold weather, moisture could build up on or inside the HMI device.

Moisture can result in short-circuits in electrical circuits and damage the device.

In order to prevent damage to the device, proceed as follows:

- Store the device in a dry place.
- Bring the device to room temperature before starting it up.
- Do not expose the device to direct heat radiation from a heating device.
- If condensation develops, wait approximately 12 hours or until the device is completely dry before switching it on.

7. Please keep the enclosed documentation, it belongs to the device. You need the documentation when you commission the device for the first time.
8. Write down the identification data of the device.

Identification data of the device

Based on the identification data, the SIMOTION P320-4 device can be identified when service is required or in case of theft.

You also require the identification data in order to view further information on your SIMOTION P320-4 in the **Product Equipment Data** (PED) database.
All the important components of your SIMOTION P320-4 are stored in the PED. The entire history of the device is stored there, including the service reports.
To identify yourself in the PED database, enter the article number and the serial number of your device.

Link to the PED database

The Product Equipment Data database is available on the Internet via the following link (http://www.siemens.com/ped).

Identification data

Enter the identification data in the following table:

Identification data	Source	Value
Serial number	Rating plate	S VP ...
Article number of the device	Rating plate	6AU1320-...
Microsoft Windows Product Key Certificate of Authenticity (COA)	Rear of the device	Only devices with preinstalled Windows operating systems have COA labels
Ethernet address 1	BIOS setup, menu "Advanced", "Peripheral Configuration"	Input by the user.
PROFINET onboard MAC Address Layer 2		
PROFINET onboard MAC Address PROFINET		

SIMOTION P320-4 rating plate

Example of SIMOTION P320-4 S (standard)

You will find the following data on the rating plate of the SIMOTION P320-4:

- Device designation (here): SIMOTION P320-4 S
- Article number of the device (here): 6AU1320-4DS66-3AG0
- Serial number S VP<...>
  The computing unit is uniquely identifiable with the serial number at S VP <...>.
  <...> is an 8-digit character string.
- cULus Approval
- CE marking

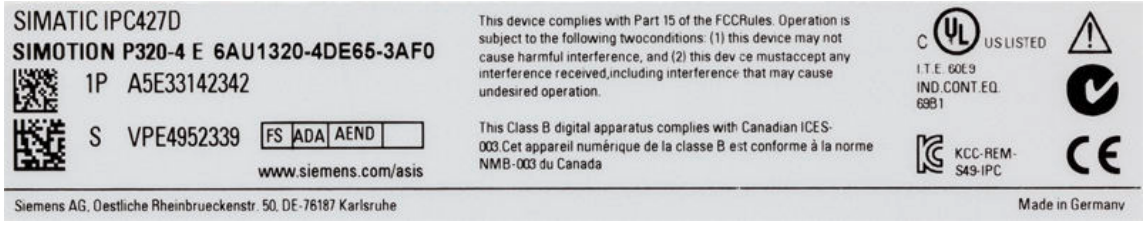

Figure 11-156 SIMOTION P320-4 rating plate

MAC addresses

Example of SIMOTION P320-4 S (standard)

In addition to the data that is found on the SIMOTION P320-4 rating plate, the MAC address plate also contains the **Onboard MAC addresses** for:

- ETHERNET (LAN) X1: VIPCTYSMAC1
- PROFINET (LAN) X3: VIPCTYSPROFINET

The data cited here is not real data.

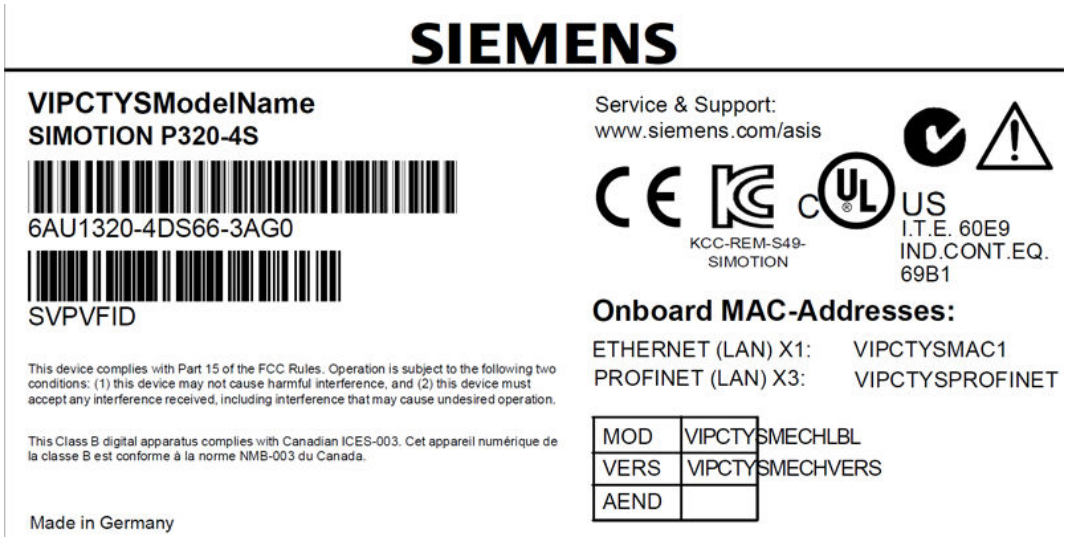

Figure 11-157 SIMOTION P320-4 S rating plate - MAC addresses

Example of a COA label

Microsoft Windows "Product Key" of the "Certificate of Authenticity" (COA):
The COA label is attached to the rear of all devices containing a Windows Embedded Standard 7 or Windows 7 operating system.

- COA label of a device with Windows Embedded Standard 7 32-bit operating system

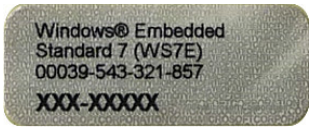

Figure 11-158 ipc477d label coa 01

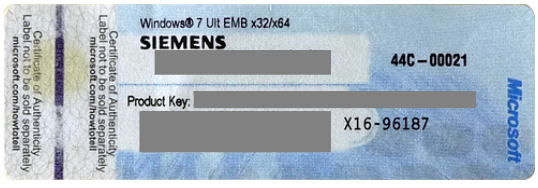
- COA label of a device with Windows 7 operating system



Permissible mounting positions

Information on the permissible mounting positions for the SIMOTION P320-4 can be found in the section Installation/mounting > Permissible mounting positions (Page 8073).

Environmental conditions

Operating conditions

The SIMOTION P320-4 is designed for use in stationary, weather-protected locations.
The operating conditions exceed requirements according to EN 61131-2.

Observe the following points during installation:

- Note the climatic and mechanical environmental conditions specified in Section Technical specifications (Page 8094).
- The device is designed for use in a normal industrial environment. Without additional protective measures (such as the provision of clean air), the SIMOTION P320-4 computing unit cannot be used in places with severe operating environments, for example, locations with corrosive vapors or gases.
- The clearance in the area of the ventilation slots must be at least 100 mm, so that the SIMOTION P320-4 receives sufficient ventilation.
- Do not cover the ventilation slots of the device.
- The DC power supply does not meet requirements according to EN 60950-1 in the area of the power unit connection. As such, SIMOTION P320-4 must be installed so that it is part of an operating area with restricted access (e.g. a locked control cabinet, console or server room).
- Always observe the mounting positions permitted for this device.
- The connected or installed I/O should not generate a reverse voltage greater than 0.5 V in the device.

⚠ WARNING

Invalidation of the approvals

Failure to adhere to these conditions when installing the system will invalidate approvals according to UL 60950-1, UL 508, and EN 60950-1!

Use prohibition

Without additional measures, the SIMOTION P320-4 should not be used in

- Locations with a high percentage of ionizing radiation
- Aggressive environments characterized, for example, by:
  - Dust accumulation
  - Corrosive vapors or gases
- at locations outside of the prescribed ambient conditions
- Installations requiring special monitoring such as:
  - Elevator installations
  - Electrical plants in particularly hazardous areas

An additional measure for using the SIMOTION P320-4 could be its installation in a cabinet.

Ambient conditions

For the mechanical and climatic environmental conditions, refer to the technical specifications in the section Ambient conditions (Page 8097).

Electromagnetic compatibility

Definition

Standards for electromagnetic compatibility (EMC) are fulfilled if the EMC Installation Guideline is complied with.

Further information is provided in the Appendix, Section General regulations (Page 8108).

11.2.1.5 Interfaces

Hardware components of the SIMOTION P320-4

Note

The article numbers of the components listed below can be obtained from the online catalog in the Siemens Industry Mall (http://www.siemens.com/industrymall).

SIMOTION P320-4 complete system

The SIMOTION P320-4 device is supplied with the integrated PROFINET onboard communication module.

An additional IsoPROFIBUS board can be inserted as required.

SIMOTION P320-4 spare parts

The SIMOTION P320-4 consists of the following hardware components:

- **SIMOTION P320-4** computing unit
- **Back-up battery** for the motherboard of the SIMOTION P320-4
- IsoPROFIBUS board (optional communication module for the SIMOTION P320-4)

Operation and display

The following hardware components for operation and display can be used:

- SIMATIC Industrial Flat Panel, in the variants IFP1500, IFP1900 or IFP2200.

Power supply of the SIMOTION P320-4

The power supply must satisfy the requirements as described in section Connecting the power supply (24 VDC) (Page 8085). This can be ensured by using the following devices, for example:

- SITOP smart 24 V / 10 A
- 24 VDC UPS (optional)

Drives and I/O modules

The drives and I/O modules released for use with SIMOTION are specified on the website: www.siemens.com/simotion (www.siemens.com/simotion)

Note

Please note that not all modules of the I/O or I/O systems mentioned are approved for SIMOTION. Moreover, system-related functional differences can occur when these I/O or I/O systems are used on SIMOTION rather than SIMATIC. For example, special process-control functions (hot swapping, etc.) are not supported by SIMOTION for the ET 200M distributed I/O system.

A detailed and routinely updated list of I/O modules released for SIMOTION as well as instructions on their use is provided on the Internet at Siemens Product Support (https://support.industry.siemens.com/cs/ww/en/view/11886029).

In addition to the I/O modules approved for SIMOTION, all certified standard slaves can, in principle, be connected to SIMOTION provided that they support the following data traffic:

- Cyclic data traffic (DP V0)
- Acyclic data traffic (DP V1)
- Isochronous data traffic (DP V2)

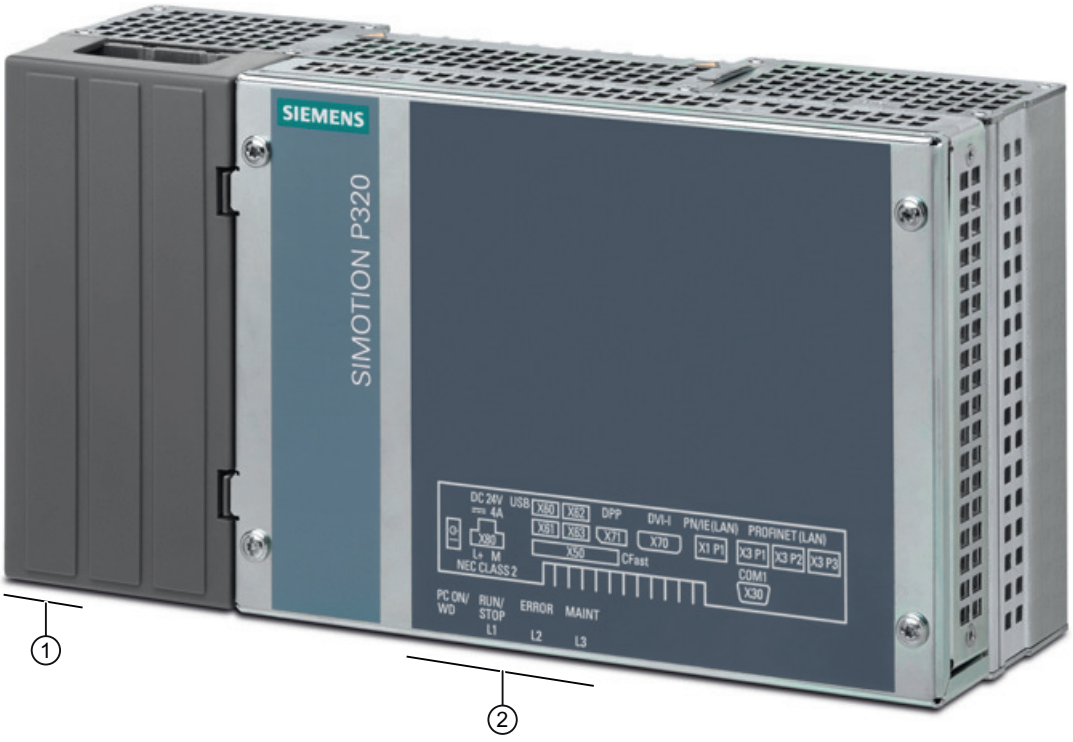
These modules are integrated via the GSD file of the device's manufacturer.

Note

Please note that in individual cases, additional boundary conditions must be fulfilled in order to integrate a standard slave into SIMOTION.

Overview of operator control and display elements

The following figure shows the arrangement of the indication and control elements of the SIMOTION P320-4.



① On/Off switch
② Operating displays (LEDs)

Figure 11-159 SIMOTION P320-4 control and display elements

Control elements

On/Off switch

① **Requirement**:
The BIOS setup entry **After Power Failure** is set to **Power on**.
The On/Off switch is used to switch the SIMOTION P320-4 on.

Figure 11-160 SIMOTION P320-4 - operator controls

⚠ WARNING
De-energize the SIMOTION P320-4! The On/Off switch does not disconnect the device from the power supply system. When the switch is in position **0** (Off), the device is still supplied with mains voltage. To remove power from the device, the power supply plug must be removed.

NOTICE
Close down the operating system first First close down the operating system before switching off the device with the on/off switch, otherwise data may get lost.

Status displays

The status indicators below the interfaces are described in the following table.

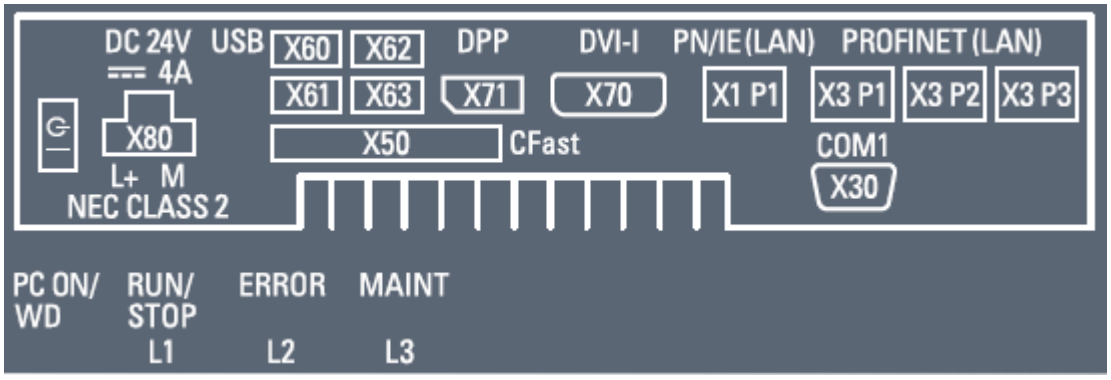


Figure 11-161 SIMOTION P320-4 status indicator

LED	Meaning	State	Description
PC ON/ WD	Power supply	Green	BIOS ready to boot. Indicates the correct supply voltage of 3.3 V, 5 V and 12 V from the integrated power unit.
		Off	Not relevant.
		Green/yellow flashing (1 Hz)	BIOS in POST, power switch on.
		Yellow	Idle state
RUN/STOP or L1	RUN STOP	Off	SIMOTION P Runtime is not running.
		Green	SIMOTION P320-4 in RUN.
		Yellow	SIMOTION P320-4 in STOP.
		Green/yellow: Flashes quickly (2 Hz)	DCP flashing
		Yellow: Flashes quickly (5 Hz)	FAULT state (only in combination with L2 and L3)

LED	Meaning	State	Description
ERROR or L2 (SF PROFINET LED)	-	Off	SIMOTION P320-4 is working error-free.
	Error	Red: Continuous light	Bus error at the PROFINET interface.
		Red: Flashes quickly (2 Hz)	Erroneous configuration.
		Red: Flashes quickly (5 Hz)	FAULT state (only in combination with L1 und L3)
	INIT	Red: Flashes slowly (0.5 Hz)	During the INIT process, the SF PROFINET LED is controlled by the boot loader. The precise flashing behavior therefore cannot be determined and displayed. In the INIT state, 0.5 Hz flashing is displayed in the SIMOTION P State. If no project has yet been loaded, 0.5 Hz flashing is also displayed for the INIT, which, in this case, is also retained in the Running state.
MAINT or L3 (SF LED)	-	Off	SIMOTION P320-4 works error-free.
	Error	Red	An event has occurred which needs to be acknowledged (alarm, message, notification). (See Diagnostics Guide)
		Red: Flashes slowly (0.5 Hz)	License missing for licensed technology objects. Carry out the licensing to correct the error. Further information on the licensing can be found in the SIMOTION P320-4 E / SIMOTION P320-4 S Commissioning and Hardware Installation Manual.
		Red: Flashes quickly (5 Hz)	FAULT state (only in combination with L1 and L2) A fault has occurred to which the user program cannot respond. The following actions may be required to rectify the fault: • Power OFF/ON • Recommissioning

Overview of the SIMOTION P320-4 interfaces

The following table provides an overview of the SIMOTION P320-4 interfaces.

Table 11-20 Overview of the interfaces

Interface	Description	Further information
PROFINET	Three PROFINET ports with RJ45 socket	PROFINET onboard interface (Page 8067)
Ethernet	1 x 8-pole RJ45 interface	Ethernet RJ45 interface (Page 8067)
DVI-I	26-pin socket for connection of a CRT or LCD monitor with DVI interface or VGA with DVI/VGA adapter	DVI-I interface (Page 8068)
Display port	20-pole DPP interface	Display port interface (Page 8069)
USB 3.0	Lower USB channel 0, upper USB channel 1 Lower USB channel 2, upper USB channel 3	USB 3.0 interface (Page 8070)

Interface	Description	Further information
CFast card	Slot for CFast card 50-pin CF socket, types I/II	CFast card (Page 8071)
COM1	Serial interface *V.24*	Serial interface COM1 (Page 8072)
IsoPROFIBUS board (optional)	2 x 9-pin socket	IsoPROFIBUS board (optional) (Page 8072)

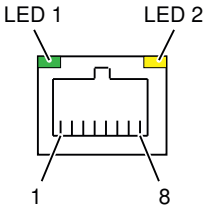
PROFINET onboard

Interface assignment

Designation: PROFINET LAN, X3, 3 ports: P1, P2, P3

Type: 8-pin RJ45 socket

PROFINET onboard LAN (X3) interface



Pin no.	Short description	Meaning	Input/output
1	RD+	Receive data [2]	Input
2	RD-	Receive data [2]	Input
3	TD+	Send data [2]	Output
4, 5 [1]	SYMR	Internal 75 Ohm terminating resistor	-
6	TD-	Receive data [2]	Output
7, 8 [1]	SYMT-	Internal 75 Ohm terminating resistor	-
S	-	Shield	-
-	LED 1	Lights up green: Link	-
-	LED 2	Lights up yellow: Activity	-

[1] Optional product feature

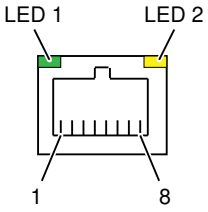
[2] Autonegotiation and autocrossover are supported.

Ethernet

Interface assignment

Designation: PN/IND. Ethernet (LAN), X1

Type: 8-pin RJ45 socket

Ethernet RJ45 interface			
			


Pin no.	**Short description**	**Meaning**	**Input/output**
1	BI_DA+	Bi-directional data A+	Input/output
2	BI_DA-	Bi-directional data A-	Input/output
3	BI_DB+	Bi-directional data B+	Input/output
4	BI_DC+	Bi-directional data C+	Input/output
5	BI_DC-	Bi-directional data C-	Input/output
6	BI_DB-	Bi-directional data B-	Input/output
7	BI_DD+	Bi-directional data D+	Input/output
8	BI_DD-	Bi-directional data D-	Input/output
S	–	Shield	–
	LED 1	Off: 10 Mbps Green light: 100 Mbps Orange light: 1000 Mbps	–
	LED 2	Lit: Active connection, e.g., to a hub Flashing: Activity	–

Note

The interfaces available on the device have been numbered for unique identification.

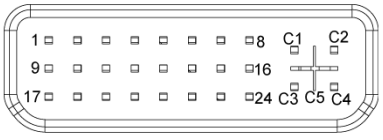
This numbering may deviate, however, from the numbering assigned by the operating system.

DVI-I

Interface assignment

Designation: DVI/VGA, X70

Type: 26-pin socket

DVI-I interface (standard socket)			
			


Pin no.	**Short description**	**Meaning**	**Input/output**
1	TMDS Data2-	DVI data channel	Output

DVI-I interface (standard socket)			
2	TMDS Data2+	DVI data channel	Output
3	TMDS Data2/4 shield	Cable shield	-
4	NC	-	-
5	NC	-	-
6	DDC clock (SCL)	Display Data Channel – Clock	Input/output
7	DDC data (SDA)	Display Data Channel – Data	Input/output
8	Analog vertical sync (VSYNC)	Analog Vertical Sync Signal	Output
9	TMDS Data1-	DVI data channel	Output
10	TMDS Data1+	DVI data channel	Output
11	TMDS Data1/3 shield	Cable shield	-
12	NC	-	-
13	NC	-	-
14	+5 V power (VCC)	+5 V power for DCC	Output
15	Ground (return for +5 V, Hsync and Vsync) (GND)	Analog ground	-
16	Hot Plug Detect	-	-
17	TMDS data 0-	DVI data channel	Output
18	TMDS data 0+	DVI data channel	Output
19	TMDS Data0/5 shield	Cable shield	-
20	NC	-	-
21	NC	-	-
22	TMDS clock shield	Cable shield	-
23	TMDS clock+	DVI clock channel	Output
24	TMDS clock-	DVI clock channel	Output
C1	Analog red (R)	Analog red signal	Output
C2	Analog green (G)	Analog green signal	Output
C3	Analog blue (B)	Analog blue signal	Output
C4	Analog horizontal sync (HSYNC)	Analog horizontal sSync signal	Output
C5	Analog ground (analog R, G, & return) (GND)	Analog ground	-

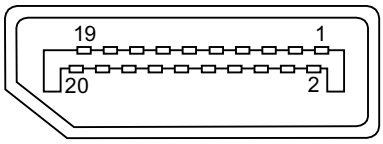
DisplayPort

Interface assignment

Designation: Display port interface, X71

Type: 20-pole DPP interface

Display port interface



Pin no.	Short designation	Meaning	Input/output
1	ML_Lane0+	DP data 0+	Output
2	GND	Ground	-
3	ML_Lane0-	DP data 0-	Output
4	ML_Lane1+	DP data 1+	Output
5	GND	Ground	-
6	ML_Lane1-	DP data 1-	Output
7	ML_Lane2+	DP data 2+	Output
8	GND	Ground	-
9	ML_Lane2-	DP data 2-	Output
10	ML_Lane3+	DP data 3+	Output
11	GND	Ground	-
12	ML_Lane3-	DP data 3-	Output
13	CONFIG1 CAD	Cable Adapter Detect	Input
14	CONFIG2	Ground (PullDown)	-
15	AUX_CH+	Auxiliary channel+	Bidirectional
16	GND	Ground	-
17	AUX_CH-	Auxiliary channel-	Bidirectional
18	HPD	Hot Plug Detect	Input
19	GND	Ground	-
20	DP_PWR	+3.3V (fused)	Output

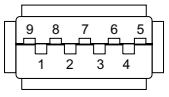
USB 3.0

Interface assignment

Designation: USB X62, X61, X62, X63

Type: 9-channel *high current*

USB 3.0 interface



Pin no.	Short designation	Meaning	Input/output
1	VBUS	+ 5 V (fused)	Output
2	D-	Data line	Input/output
3	D+	Data line	Input/output

USB 3.0 interface			
4	GND	Ground	–
5	RX-	Data line	Input
6	RX+	Data line	Input
7	GND	Ground	–
8	TX-	Data line	Output
9	TX+	Data line	Output

CFast card

Pin assignment of the interface

Designation: CFast X50

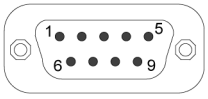
Pin no.	Short designation	Meaning
S1	SGND	Signal GND (ground for signal integrity)
S2	A+	SATA differential
S3	A-	SATA differential
S4	SGND	Signal GND (ground for signal integrity)
S5	B-	SATA differential
S6	B+	SATA differential
S7	SGND	Signal GND (ground for signal integrity)
PC1	CDI	Card Detect Out
PC2	GND	Device GND
PC3	TBD	TBD (not connected)
PC4	TBD	TBD (not connected)
PC5	TBD	TBD (not connected)
PC6	TBD	TBD (not connected)
PC7	GND	Device GND
PC8	LED1	LED Output (not connected)
PC9	LED2	LED Output (not connected)
PC10	IO1	Reserved Input/Output (not connected)
PC11	IO2	Reserved Input/Output (not connected)
PC12	IO3	Reserved Input/Output (not connected)
PC13	PWR	Device Power (3.3V)
PC14	PWR	Device Power (3.3V)
PC15	GND	Device GND
PC16	GND	Device GND
PC17	CDO	Card Detect In

COM1

Interface assignment

Designation: COM1, X30

Type: 9-pin (connector)

Serial interface COM1			
			


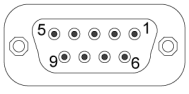
Pin no.	**Short designation**	**Meaning**	**Input/output**
1	DCD	Data carrier detect	Input
2	RxD	Receive data	Input
3	TxD	Transmit data	Output
4	DTR	Data terminal ready	Output
5	GND	Ground	-
6	DSR	Data set ready	Input
7	RTS	Request to send	Output
8	CTS	Clear to send	Input
9	RI	Incoming call	Input

IsoPROFIBUS board (optional)

Interface assignment

Designation: PROFIBUS, X101, X102

Type: 9-pin (socket)

PROFIBUS interface		
		


Pin no.	**Short designation**	**Meaning**
1-2	NC	Not connected
3	LTG_B	Data line (I/O)
4	RTS_AS	AS request to send (O)
5	GND	Ground electrically isolated
6	P5V_dp_fused	+5 V / max. 90 mA (fused) electrically isolated
7	NC	Not connected
8	LTG_A	Data line (I/O)
9	RTS_PG	PG request to send (O)

11.2.1.6 Installation/mounting

Installing the device

SIMOTION P320-4 is particularly suitable for installation in consoles, control cabinets and switchboards.

⚠ WARNING

Perform function test while installing the device in machines or plants

Following the results of a risk analysis, additional protection equipment on the machine or the system is necessary to avoid endangering persons. With this, especially the programming, configuration and wiring of the inserted I/O modules have to be executed, in accordance with the necessary risk analysis identified safety performance (SIL, PL or Cat.). The intended use of the device has to be secured.

The correct use of the device has to be verified with a function test on the system. This test can detect programming, configuration and wiring errors. The test results have to be documented and if necessary inserted into the relevant inputs.

Permissible mounting positions

Note

The SIMOTION P320-4 is approved for operation in closed rooms only.

Ensure the required minimum clearance to other components or enclosure panels:

- Below at least 100 mm
- Above at least 50 mm

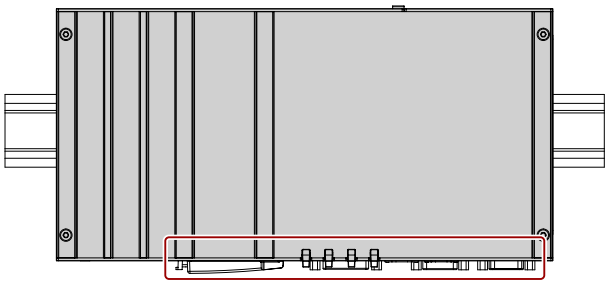
The permissible mounting positions for the SIMOTION P320-4 are standard rail mounting and vertical mounting.

Standard rail mounting

Horizontal mounting is the preferred position.

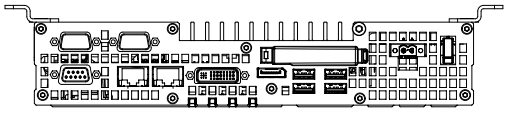
The following horizontal mounting option is permitted:

The interfaces are at the bottom.



The figure shows the interfaces on the front for representation purposes only.

For rail mounting, the interfaces always point downward.

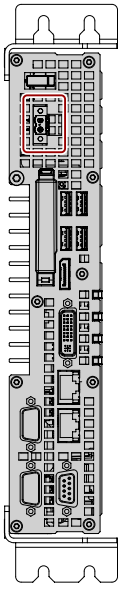


You can find mounting information under Standard rail mounting (Page 8075).

Vertical mounting

The following vertical mounting option is permitted:

The interfaces are at the front. The power supply connection is at the top.



You can find information on mounting under Vertical mounting (Page 8076).

Ambient conditions

Observe the permissible temperature range for operation in the respective mounting position as described in Section "Technical data > Ambient conditions (Page 8097)".

Standard rail mounting and vertical mounting

Standard rail mounting

Requirement

- Standard mounting rail, 35 mm standard profile
  The standard mounting rail is installed at the installation site.
- The standard mounting rail clip is attached to the SIMOTION P320-4.

Note

Ensure that the wall or ceiling can hold four times the total weight of the SIMOTION P320-4 including the standard mounting rail and additional expansion cards. See section Notes on installation (Page 8077).

Mounting the standard mounting rail clip

Before you can install the device on a standard mounting rail, you will need to attach the standard mounting rail clip included in the scope of delivery.

The fasteners and screws required are supplied with the device for mounting depending on the order number.

Requirement

- 1 standard mounting rail clip
- 2 screws
- 1 T20 screwdriver

Use the two screws to mount the standard mounting rail clip on the SIMOTION P320-4 enclosure.

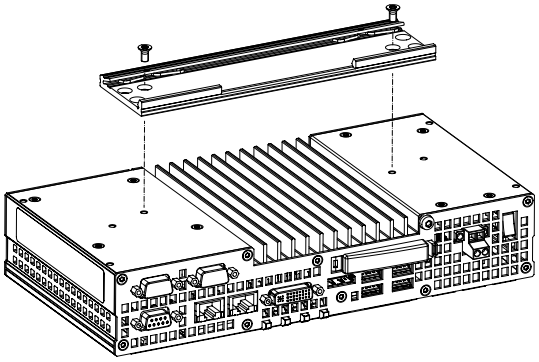


Figure 11-162 Mounting the standard mounting rail clip

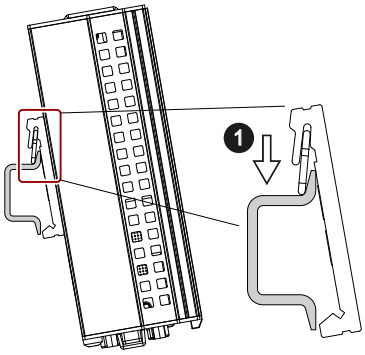
Mounting

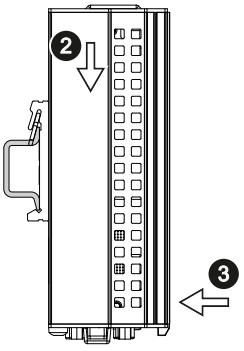
1. Place the SIMOTION P320-4 and rail clip on the upper edge of the standard profile rail at the position shown.



2. Press the SIMOTION P320-4 slightly downward.

3. Once the rail clip slides over the bottom edge of the standard mounting rail, push the device onto the rail.

   Ensure that you hear the SIMOTION P320-4 snapping into place.



Note

To ensure secure vertical mounting on standard mounting rails, install a standard rail ground terminal beneath the device.

Removing

1. Press the SIMOTION P320-4 down until the rail clip releases the device.
2. Swing the SIMOTION P320-4 away from the standard mounting rail.
3. Lift the device up and off.

Vertical mounting

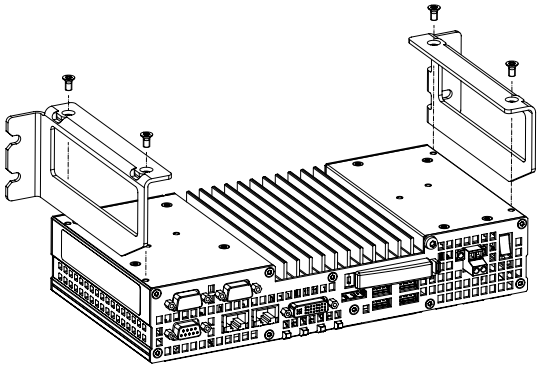
The fasteners and screws required are supplied with the device for the selected mounting option.

Requirement

- 2 mounting brackets
- 4 screws
- 1 T20 screwdriver

Procedure

1. Secure each mounting bracket with two screws.



Installation notes

Note the following:

- The SIMOTION P320-4 is approved for operation in closed rooms only.
- For installation in a control cabinet, observe the SIMATIC installation guidelines and applicable DIN/VDE requirements or other applicable country-specific regulations.
- When the device is used in the area of Industrial Control Equipment according to UL508, note that the device is classified as "Open Type". The installation of the device in a housing according to UL508 is therefore a mandatory requirement for approval or operation in according to UL508.

Securely fastening the SIMOTION P320-4

NOTICE
Insufficient load carrying capacity If the wall it is mounted on does not have a sufficient load-bearing capacity, the device may fall and be damaged. Ensure that the mounting surface on the wall can bear four times the total weight of the device, including fixing elements.

NOTICE
Incorrect fixing elements The device may not be securely fitted if you use dowels and screws other than those specified below for mounting. The device can fall and may be damaged. Use only the dowels and screws specified in the following table.

Connecting elements

The connecting elements for each mounting position are listed in the following:

- Standard rail mounting

Material	Bore diameter	Fastener
Metal, min. 2 mm thickness	5 mm	• 2 x M4 screws • 2 x M4 nuts
Concrete	6 mm, 40 mm depth	• 4 x dowels, ∅ 6 mm, 40 mm length • 4 x screws, ∅ 4 mm, 40 mm length
Plasterboard, min. 13 mm thickness	14 mm	4 x toggle bolts, ∅ 4 mm, 50 mm length

- Vertical mounting

Material	Bore diameter	Fastener
Concrete	6 mm, 40 mm depth 8 mm, 40 mm depth	• 4 x dowels, ∅ 6 mm, 40 mm length • 4 x screws, ∅ 4 mm, 40 mm length • Dowel, ∅ 8 mm, 40 mm length • Screw, ∅ 5 mm, 40 mm length
Plasterboard, min. 13 mm thickness	14 mm	Toggle bolt, ∅ 4 mm, 50 mm length

Mounting positions

The following mounting positions are permitted for the SIMOTION P320-4 and are described in detail in the following sections:

- Standard rail mounting (Page 8075)
- Vertical mounting (Page 8076)

Overview of operating modes for the SIMOTION P320-4

Overview

The following operating modes are available for mounting the SIMOTION P320-4.

The operating modes are:

- Decentralized structure
  The SIMOTION P320-4 is mounted separately from a panel in a decentralized structure.
- Headless operation
  The SIMOTION P320-4 is operated without panel.

Before mounting, the following must be noted:

Before you mount the SIMOTION P320-4 in a control cabinet or a rack, optional components are installed to expand the SIMOTION P320-4.

Example: installation of the optional IsoPROFIBUS board.

To do this, open the device and note the following procedure:

1. Open the cover of the SIMOTION P320-4.
2. Insert the optional IsoPROFIBUS board.
3. Plug in the SYNC I/O cable for synchronizing with PROFINET.
4. Close the cover.
5. Mount the SIMOTION P320-4.

Note

The installation and removal of components as well as the mounting of the SIMOTION P320-4 are described in detail in the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual.

NOTICE
Avoid loss of warranty If you install or exchange system expansions and damage your device, the warranty becomes void.

Decentralized structure

Overview

The decentralized structure provides greater flexibility in terms of location and enables the SIMOTION P320-4 to be positioned in non-critical areas of the plant (e.g. control cabinet).

The decentralized structure of a panel with the SIMOTION P320-4 can be performed via the display port, USB or DVI connection. Please note the cable lengths that are supported for the panel.

For the use of an HMI system, the SIMATIC IFP, for example, can be connected by means of the described interfaces.

11.2.1.7 Connection

Requirements

General information

During the configuration of SIMOTION modules, you must pay attention to the "Electrical configuration design".

The following section provides information on wiring and networking the complete SIMOTION system.

Further information about the connection of the complete system and the individual components can be found in the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual.

Open equipment

These modules are open equipment. This means they may only be installed in housings, cabinets, or in electrical equipment rooms that can only be entered or accessed with a key or tool. Housings, cabinets, or electrical equipment rooms may only be accessed by trained or authorized personnel. An external fire-protection housing is required.

Observe the following points during installation:

- The device should be connected only to **24 VDC** power supply networks that meet the requirements of **safety extra-low voltage** (**SELV**). The cable cross-section must be chosen large enough to ensure that no damage can result from cable overheating in the event of a short-circuit in the SIMOTION P320-4.
- Avoid extreme ambient conditions.
- Protect the device against dust, moisture, heat and severe vibration.
- Do not subject the SIMOTION P320-4 to direct sunlight.
- Install the device in such a way that it poses no danger, for example, by falling over.
- The clearance around the SIMOTION P320-4 must be at least 100 mm to ensure adequate ventilation.
- Do not cover the ventilation slots.

Overview of connections

The connection overview shows the SIMOTION P320-4 interfaces to which the appropriate I/O devices can be connected.

Note

The cabling for all elements and components of the complete system can only be carried out when disconnected from the mains.

It does not matter in which order connection takes place.

The connection of the individual components in the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual.

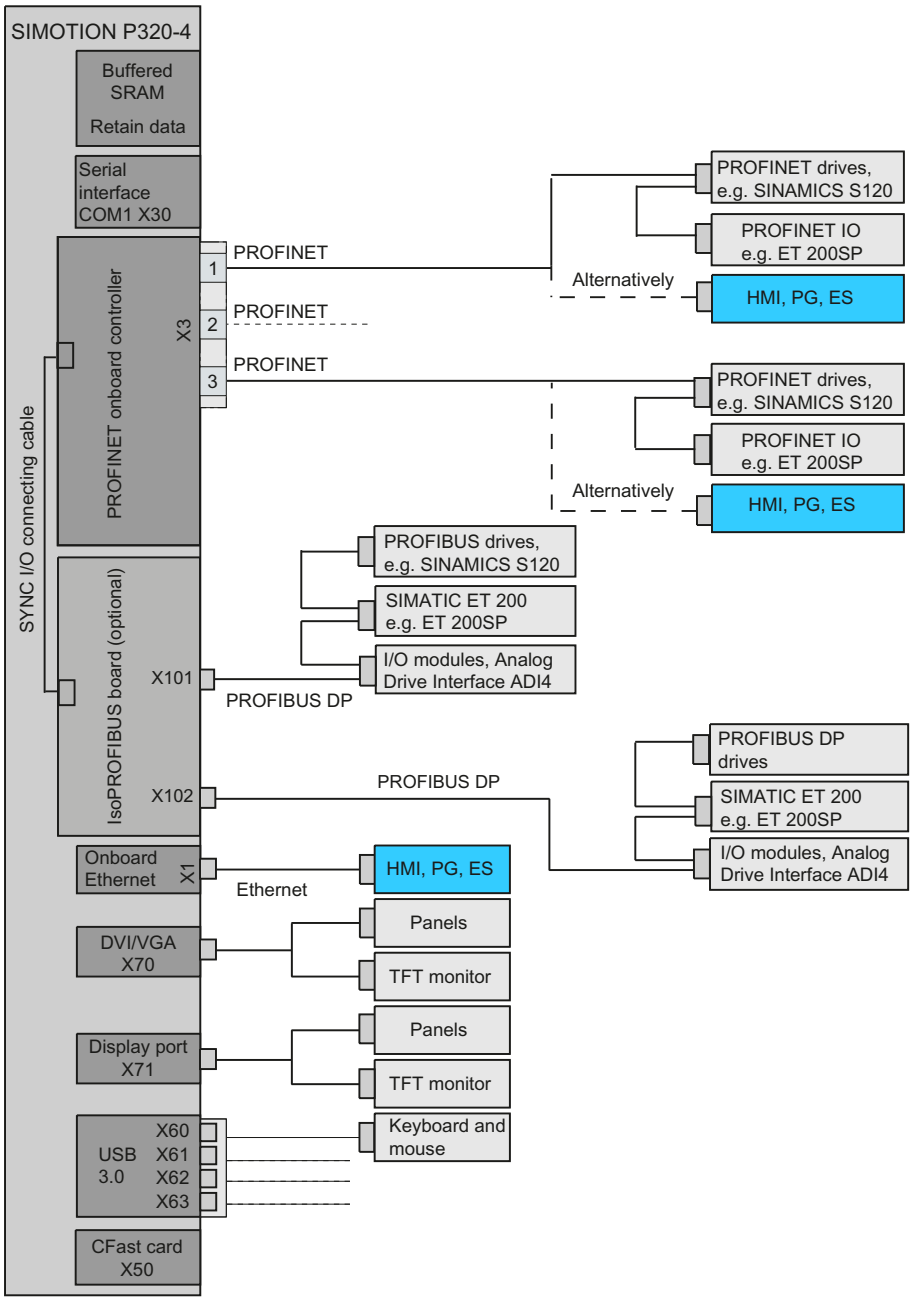


Figure 11-163 Hardware system overview - example with PROFINET onboard and optional IsoPROFIBUS board

Notes on connecting

⚠ WARNING

Risk of fire and electric shock

The On/Off switch does not isolate the device from the power supply. Risk of electric shock if the device is opened incorrectly or defective. There is also a risk of fire if the device or connecting lines are damaged.

You should therefore protect the device as follows:

- Always pull out the power plug when you are not using the device or if the device is defective. The power plug must be freely accessible.
- Connect the device to a protective conductor as instructed, see Section "Connecting the protective conductor".
- Use a central isolating switch in the case of cabinet installation.

⚠ WARNING

Risk of lightning strikes

A lightning strike may enter the mains cables and data transmission cables and reach to a person.

Death, serious injury and burns can be caused by lightning.

Take the following precautions:

- Disconnect the device from the power supply in good time when a thunderstorm is approaching.
- Do not touch mains cables and data transmission cables during a thunderstorm.
- Keep a sufficient distance from electric cables, distributors, systems, etc.

NOTICE

Fault caused by I/O devices

The connection of I/O devices can cause faults in the device.

The result may be personal injury and damage to the machine or plant.

Note the following when connecting I/O devices:

- Read the documentation of the I/O devices. Follow all instructions in the documentation.
- Only connect I/O devices which are approved for industrial applications in accordance with EN 61000-6-2 and IEC 61000-6-2.
- I/O devices that are not hotplug-capable may only be connected after the device has been disconnected from the power supply.

NOTICE

Damage through regenerative feedback

Regenerative feedback of voltage to ground by a connected or installed component can damage the device.

Connected or built-in I/Os, for example, a USB drive, are not permitted to supply any voltage to the device. Regenerative feedback is generally not permitted.

Protective conductor connection and potential equalization

The protective conductor connection is needed to protect the device and helps ensure that interference signals generated by power lines, signal lines or lines to I/O devices are safely discharged to earth.

The protective conductor connection on the device must be connected to the protective conductor of the control cabinet or system in which the device is installed.

⚠ WARNING

Electrical shock hazard and risk of fire

Internal components of a faulty device may carry dangerous voltages that pose the risk of fire or electrical shock. Risk of death and serious injury.

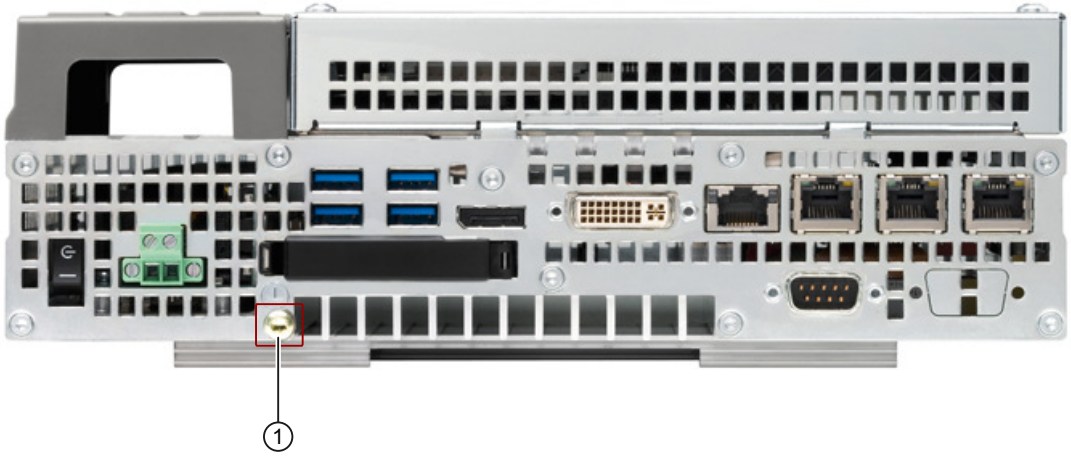
- Always connect the ground conductor before you commission the device.
- Never operate the device without protective conductor.
- Take a faulty device out of service immediately and mark it accordingly.

Requirement

- The device has been installed.
- 1 protective conductor, minimum cross section 2.5 mm^2
- 1 T20 screwdriver
- 1 x M4 cable lug

Procedure

1. Crimp the cable lug onto the protective conductor.
2. Screw the cable lug onto the protective conductor connection as shown.



① Protective conductor connection / potential equalization

3. Wire the protective conductor to the protective conductor connection of the control cabinet in which the device is installed.

Connecting peripheral equipment

Note

Observe suitability for industrial applications

Only connect I/O devices that are suitable for industrial applications in accordance with EN IEC 61000-6-2.

Note

I/O devices capable of hot-plugging (USB)

Hot-plug I/O devices (USB) may be connected while the PC is in operation.

NOTICE
Non-hot-plug I/O devices I/O devices that do not support hot-plugging may not be connected until the device is powered down. Strictly adhere to the specifications for peripheral equipment.

Note

Wait at least ten seconds before you reinsert USB devices.

Note that the EMC immunity of standard USB devices is designed only for office environments. These USB devices are appropriate for handling commissioning and service tasks. You may only use USB devices that are suitable for industrial applications. The USB devices are developed and marketed by the respective supplier. The respective product supplier provides support for the USB devices. The manufacturer's terms of liability shall apply.

Note

The connected or built-in I/Os, such as USB drives, should not introduce a counter EMF into the device.

Reverse voltages exceeding 0.5 V to ground that are generated by connected or installed components may prevent proper operation of the device or lead to its destruction.

Connecting the power supply (24 VDC)

Please note the following to ensure you operate the device safely and in accordance with regulations:

⚠ WARNING

Electrical shock hazard and risk of fire

Voltage exceeding SELV levels may cause fire or electric shock. Death or serious physical injury can result.

- Always wire the device to a 24 VDC power supply that is compliant with SELV requirements.
- You need a corresponding NEC Class 2 power source to comply with requirements to UL 50950-1 and UL 508 when operating the device on a wall, in an open frame, or at any other location.
- In all other cases (IEC / EN / DIN EN 60950-1), either a current source of limited output (LPS = Low Power Source), or a line-side fuse or a line-side circuit breaker is necessary. Current must be limited to 4.16 A. This requires a 4 A fuse max.

The device has reverse polarity protection.

Requirement

- The device has been installed.
- The protective conductor is connected.
- One wired terminal.
  The corresponding 24 VDC power supply is off.
- One 0.5 × 3 Philips screwdriver.

NOTICE
Damage to the device Do not turn the screws of the terminal when the terminal is inserted in the device. The device can be damaged through the pressure of the screwdriver on the terminal and consequently the connection socket. Only connect the wires to the terminal when it is unplugged.

Note

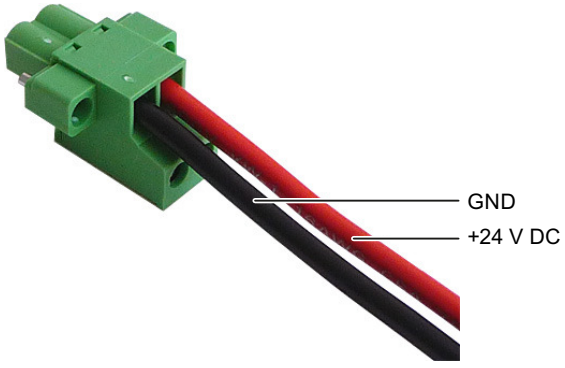
Make sure that the wires are not accidentally swapped over. Note the labeling for the contacts on the front cover of the device.

The terminal to connect the power supply is attached to the device. The terminal is designed for wires with a cross-section of 0.25 mm^2 to 2.5 mm^2. Only connect wires with a cross-section ≥ 0.5 mm^2.

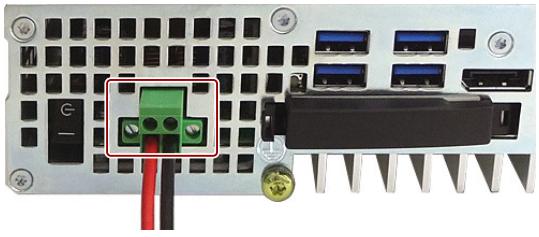
Solid or flexible cables can be used for the connection. Ferrules are not required.

Procedure

1. Connect the cables as shown.
   Note the position of the terminal.



2. Insert the terminal at the marked position.
3. Secure the terminal using the integrated screws.



Connecting the device to networks

Ethernet can be used for integrating the device into existing or planned networks.

Ethernet

The integrated Ethernet interface can be used for communication and for data exchange with automation devices such as SIMOTION SCOUT, SIMATIC S7.

Further information

Further information is available on the Internet at the Siemens Industry Mall (www.siemens.com/industrymall), the catalog and ordering system for automation and drives.

Installing the strain relief

Strain relief for the device is provided in the scope of delivery. The strain relief is designed to prevent the lines connected to the device from being accidentally pulled out.

Attaching PROFINET strain relief

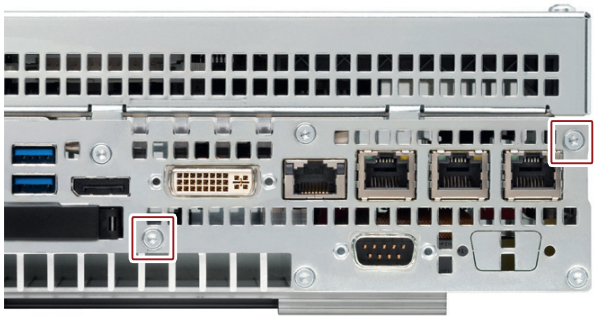
Requirement

- 1 strain relief
- 2 screws
- 1 T10 screwdriver

Mounting

1. Remove the marked countersunk screws.

2. Fasten the strain relief at the PROFINET interface(s).
   Use the oval head screws included with the strain relief.



Removing

Follow the mounting procedure in reverse to remove the strain relief.

Securing cables generally

Secure all cables connected to the device at the cable grip, each with a cable tie. The required cable ties are not part of the scope of delivery.

Requirement

- Maximum of 6 cable ties for USB, Ethernet, PROFIBUS
  Maximum cable tie width 3 mm.
- 1 cutting tool

Procedure

1. Place the cable tie around the attachment plate of the strain-relief assembly and secure the plugged-in cables.
2. Cut off the cable tie overhang.

11.2.1.8 Troubleshooting/FAQs

Error correction

This section provides you with tips on how to locate and troubleshoot common problems.

FAQs / error correction	Possible cause	Possible remedy
The device is not operational.	There is no power supply to the device.	• Check whether the 24 VDC power supply is connected. See Connecting the power supply (24 VDC) (Page 8085). • Check whether the line side switch is activated. See Operator controls (Page 8064).
SIMOTION P does not start after connecting the CFast card.	BIOS settings are not set to Hotplug Enabled.	You can find out how to check and correct the BIOS settings in Section Hotplug Enabled BIOS settings (Page 8090).
SIMOTION P does not start after a reboot.	The user is not logged in automatically.	Set the password for the AutoLogin (Automatically Log On). See Section Changing the AutoLogin > SIMOTION P AutoLogin (Page 8024).
The monitor remains dark.	The monitor is switched off.	Switch on the monitor.
	The monitor is in "power-save" mode.	Press any key on the connected keyboard.
	The brightness button has been set to dark.	Set the monitor brightness button to obtain more light. For detailed information, refer to the monitor operating instructions.
	The power cord or the monitor cable is not connected.	• Check whether the power cord has been properly connected to the monitor and to the system unit or to the grounded shockproof outlet. • Check whether the monitor cable has been properly connected to the system unit and to the monitor.
		If the monitor screen still remains dark after you have performed these checks, please contact your technical support team.
The mouse pointer does not appear on the screen.	The mouse driver is not loaded.	Check whether the mouse driver is properly installed and present when you start the application program. For more detailed information on the mouse driver, refer to the documentation for the mouse or application programs.
	The mouse is not connected.	Check whether the mouse is properly connected to the system unit. If you use an adapter or extension on the mouse cable, also check the connectors.
		If the cursor still does not appear on the screen after you have performed these checks and measures, please contact your technical support team.

FAQs / error correction	Possible cause	Possible remedy
Error message on the screen: Operating system not found	• No operating system present. • Incorrect active boot partition. • Incorrect drive entries in the SETUP.	Check whether one of the specified causes is present:
Wrong time and/or date on the PC.	-	• Press <ESC> during the boot sequence to open BIOS Setup. Detailed information on the BIOS setup can be found in the section Starting Bios settings Hotplug Enabled - BIOS Setup (Page 8090). • Set the time and date in the setup menu.
Although the BIOS setting is OK, the time and date are still wrong.	The backup battery is empty.	Replace the backup battery. See SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual > Service and maintenances > Replacing the backup battery. If the problem cannot be resolved by replacing the battery, then contact your technical support team.
UPS does not function.	The operating system does not have a suitable driver for the UPS.	Install a suitable driver; the correct driver can often be downloaded from the homepage of the device's manufacturer. Note the SIMOTION P320-4 E / P320-4 S Commissioning and Hardware Installation Manual > Power on and software installation > Customer-specific software.
The display in the BIOS for the PROFINET MAC address is incorrect (00:00:00:00:00:00).	-	The correct MAC addresses can be taken from the rating plate on the housing. See also Device identification data (Page 8057), Section MAC addresses.

Hotplug Enabled BIOS settings

Starting the BIOS setup

Proceed as follows:

1. Reset the SIMOTION P320-4 (warm or cold restart).
   Depending on the device version, the default settings may differ from the following figures.
2. After completing the startup test, you can start the program setup with BIOS.
   The following message is shown on the display:

Figure 11-164 SIEMENS Press Esc boot options

Press **Esc**.

3. After booting, the BIOS selection menu is displayed:

Figure 11-165 BIOS selection menu

4. The following buttons are available in the BIOS selection menu:

Button	Function
Continue	Exit BIOS menu, continue with the startup process
Boot Manager	Selection of the boot drive
Boot From File	Starting from a .EFI file
SCU	Device configurator (Setup Configuration Utility)
BIOS Update	BIOS update from USB stick
MEBx	Start the Intel Management Engine BIOS Extension

5. Select the **SCU** device configurator.

6. In the BIOS window, select the **Advanced** tab using the arrow keys and then select **IDE Configuration**.
   Press Enter to confirm the selection.

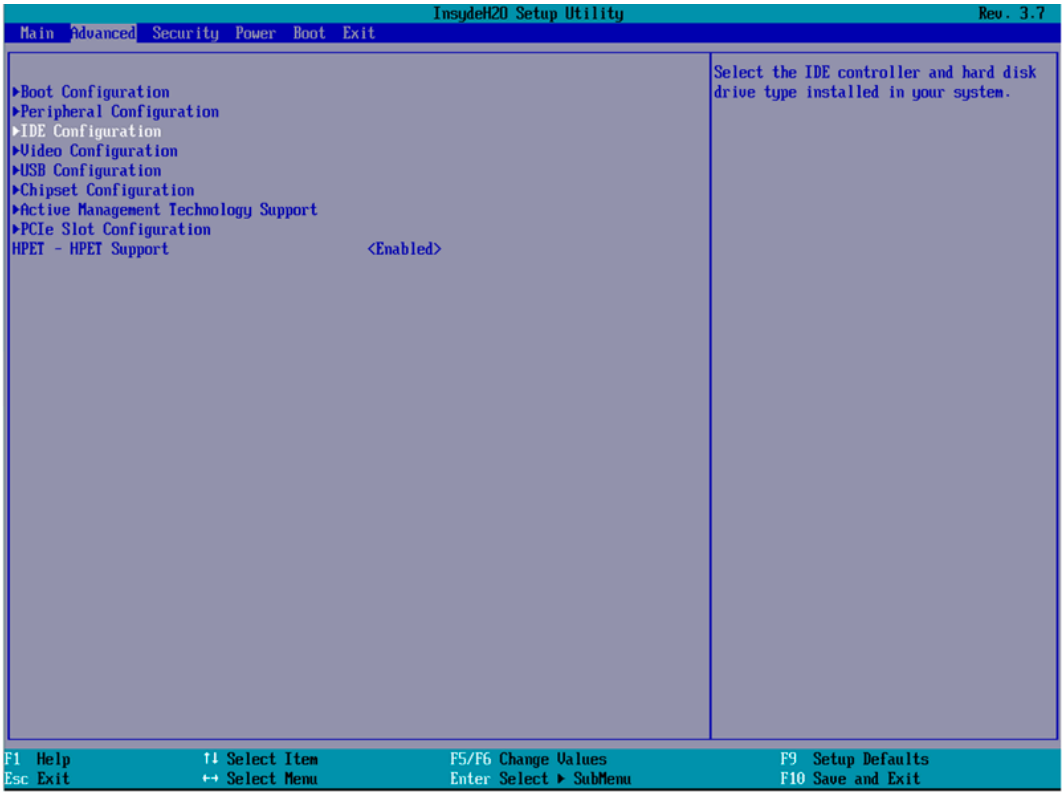


Figure 11-166 Advanced > IDE configuration

7. In the **IDE Configuration** window, select **SATA Port 2 HotPlug**.

8. Change the **Disabled** selection shown here to **Enabled**.

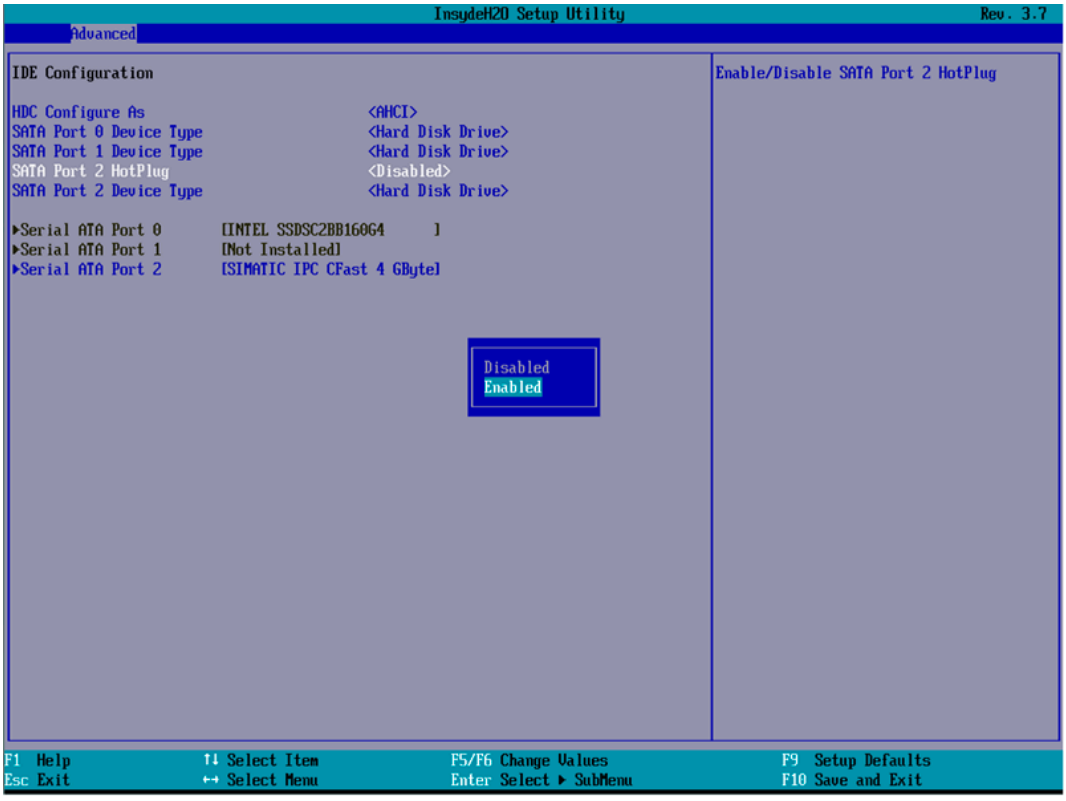

Figure 11-167 IDE Configuration > SATA Port 2 HotPlug

9. Press **F10** Save and Exit. The new entries are accepted.
10. Confirm the subsequent prompt to save the settings and exit the BIOS setup with **Yes**.

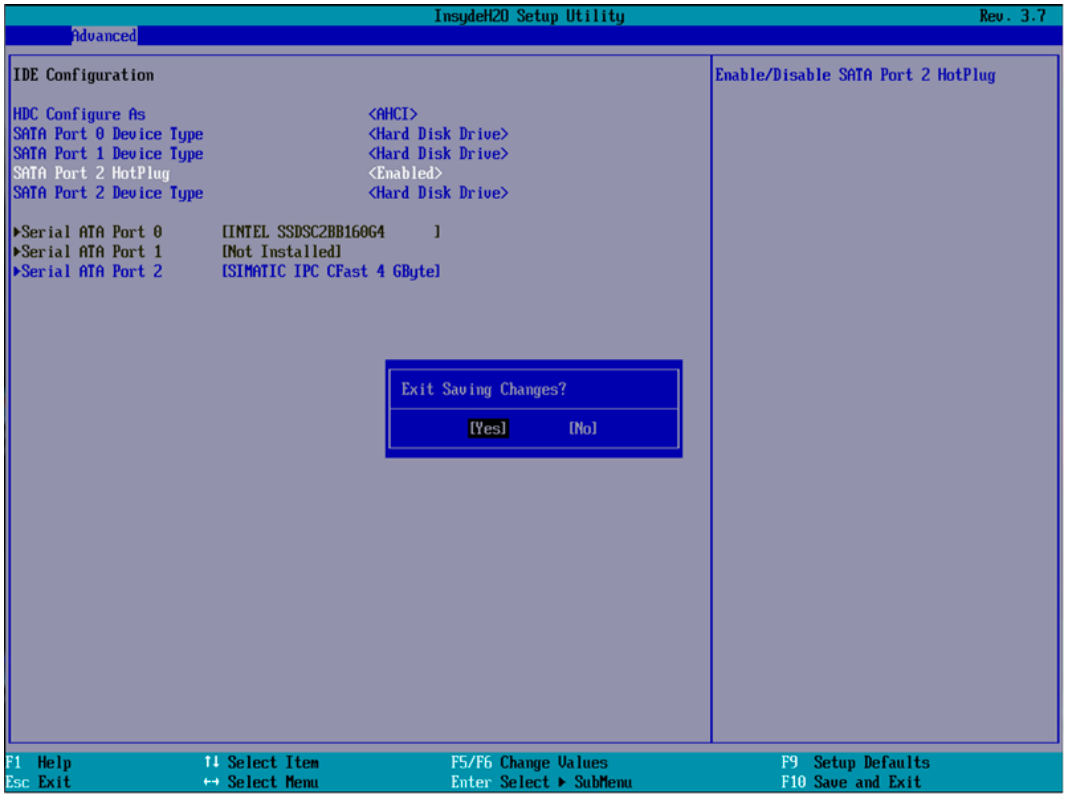

Figure 11-168 Confirming SATA Port 2 HotPlug > Enabled

11.2.1.9 Technical data

Overview of the technical specifications

Overview

The following technical specifications are available for SIMOTION P320-4 and the associated hardware components:

- General SIMOTION P320-4 technical specifications (Page 8095)
- Ambient conditions (Page 8097)
  - Climatic conditions
  - Mechanical conditions
- Technical specifications of the IsoPROFIBUS board (Page 8098)
- Power requirement of the components (Page 8099)
- Integrated DC voltage supply (Page 8100)
- Technical specifications of the SITOP smart 24 V / 10 A (Page 8100)

- Typical power consumption (Page 8102)

General technical specifications

General technical specifications

General technical specifications for SIMOTION P320-4	
Article numbers	**SIMOTION P320-4 E** • 6AU1320-4DE65-3AF0 **SIMOTION P320-4 S** • 6AU1320-4DS66-3AG0
Dimensions	262 × 133 × 50.5 (W × H × D in mm)
Weight	Approximately 2 kg
Supply voltage (DC) [1]	24 VDC [1] (-20%/+20%)
Short-term voltage interruption in accordance with Namur	Min. 15 ms (at 20.4 V) Max. 10 events/h; recovery time min. 1 s
Max. power consumption	64.8 W (at 24 V)
Degree of protection	IP 20 according to IEC 60529
Protection class	Protection class I according to IEC 61140
Safety regulations	EN 60950-1; UL 60950-1; UL 508;
Noise emission	<40dB (A) to DIN 45635-1
Quality assurance	In accordance with ISO 9001

[1] The upstream power supply must generate a safety extra-low voltage with safe electrical isolation according to IEC 60364-4-41 or an NEC Class 2 SELV and LPS according to IEC/UL/ EN/ DIN-EN 60950-1 (see the section "Connecting the power supply (24 V DC) (Page 8085)").

Electromagnetic compatibility

Electromagnetic compatibility	
Interference emission	EN 61000-6-3, EN 61000-6-4, CISPR220 class B; FCC class A
Immunity with regard to conducted interference on the supply lines	± 2 kV according to IEC 61000-4-4; burst ± 1 kV according to IEC 61000-4-5; symmetrical surge ± 2 kV according to IEC 61000-4-5; asymmetrical surge
Noise immunity on signal lines	± 1 kV according to IEC 61000-4-4; burst; length < 3 m ± 2 kV according to IEC 61000-4-4; burst; length > 3 m ± 2 kV according to IEC 61000-4-5; surge; length > 30 m
Immunity to electrostatic discharge	± 6 kV contact discharge according to IEC 61000-4-2 ± 8 kV air discharge according to IEC 61000-4-2

Electromagnetic compatibility	
Immunity to RF interference	10 V/m 80–1000 MHz and 1.4–2 GHz, 80% AM according to IEC 61000-4-3 1 V/m 2–2.7 GHz, 80% AM according to IEC 61000-4-3 10 V 10 kHz to 80 MHz, 80% AM according to IEC 61000-4-6
Immunity to magnetic fields	100 A/m, 50/60 Hz according to IEC 61000-4-8

Motherboard

Motherboard	
Processor	• Intel Core i3-3217UE 1.6 GHz, 3 MB SLC (SIMOTION P320-4 E) • Intel Core i7-3517UE 1.7 GHz, 4 MB SLC (SIMOTION P320-4 S)
Main memory	4 GB
Buffer memory	512 KB MRAM

Drive and memory media

Drive and memory media	
Solid State Disk (SSD)	≥ 80 GB Standard (SIMOTION P320-4 S)
CFast card	≥ 4 GB

Graphics

Graphics	
Graphics controller	Integrated Intel HD2000 or HD4000
Graphics memory	32 - 512 MB Shared Memory
Resolutions, frequencies, color depth	DVI-I: 640 × 480 to 1920 × 1200 / 60 Hz Display port: max. 1920 ×1200 / 60 Hz

Interfaces

Interfaces	
COM1	RS232, 115 kbps max., 9-pin SUB-D, male
DVI-I	Connection of display devices with DVI connector
Display port (DPP)	Connection of display devices with DPP connector
Keyboard	USB support
Mouse	USB support
USB	4 × USB 3.0
PROFINET	3 × RJ45 connector, onboard interface on ERTEC 400 basis, 100 Mbps electrically isolated
Ethernet	1 × Ethernet interface (RJ45) 10/100/1000 Mbps, electrically isolated, with teaming function

Ambient conditions

Climatic conditions

Temperature	Tested according to IEC 60068-2-1, IEC 60068-2-2, IEC 60068-2-14
- During operation	**Standard rail mounting (preferred mounting position)**:
	Operation with CFast card and/or SSD: • With max. 1 expansion card (max. load 10 W): 0 to +40° C • With max. 1 expansion card (max. load 10 W) in RAL [2]: 0 to +50° C [1] Operation with CFast card: • Without expansion cards in RAL [2]: 0 to +55° C [1]
	Vertical mounting:
	Operation with CFast card and/or SSD: • Without expansion cards: 0 to +40° C Operation with SSD: • With max. 1 expansion card (max. load 10 W) in RAL [2]: 0 to +45° C [1] Operation with CFast card: • Without expansion cards in RAL [2]: 0 to +50° C [1] • With max. 1 expansion card (max. load 10 W): 0 to +40° C • With max. 1 expansion card (max. load 10 W) in RAL [2]: 0 to +50° C [1]
- During storage/shipping	-40 °C to +70 °C (for devices with CFast or SSD)
- Gradient	Operating mode: Max. 10° C/h; Storage: 20° C/h; no condensation
Relative humidity	Tested according to IEC 60068-2-78, IEC 60068-2-30
- During operation	5% to 80% at 25° C (no condensation)
- During storage/shipping	5% to 95% at 25° C (no condensation)
Air pressure	
- During operation	1080 to 795 hPa (corresponds to an altitude of -1000 m to 2000 m)
- During storage/shipping	1080 to 660 hPa (corresponds to an altitude of -1000 m to 3500 m)

[1] For P320-4 S you must set "Turbo Mode Level" to "Temperature optimized" in the "Power" menu, selection "Advanced CPU Control", of the BIOS Setup; otherwise you have to reduce the maximum ambient temperature by 5 °C.

[2] RAL = Restricted Access Location
Installation of device in operating facilities with restricted access, for example, a locked control cabinet.

Mechanical conditions

Vibration	Tested according to DIN IEC 60068-2-6
- During operation	With CFast card or SSD: 5 to 9 Hz: 3.5 mm 9 to 500 Hz: 9.8 m/s2
- During storage/shipping	5 to 9 Hz: 3.5 mm 9 to 500 Hz: 9.8 m/s2
Resistance to shock	Tested according to DIN IEC 60068-2-27
- During storage/shipping	250 m/s^2, 6 ms

Technical data of the IsoPROFIBUS board

Technical specifications of the IsoPROFIBUS board (optional)

Table 11-21

IsoPROFIBUS board		
Power consumption for + 5 V PCI voltage		
Standard	2.5 W	
Maximum	3.5 W	
Permissible ambient conditions		
Heat dissipation	Open circuit ventilation	
Temperature	**Operation**	**Storage/transport**
• IsoPROFIBUS board in the SIMOTION P320-4	5° C to 45° C	-20° C to 60° C
Tested according to	EN 60068-2-1, EN 60068-2-2, EN 60068-2-14	
Relative atmospheric humidity	**Operation**	**Storage/transport**
• IsoPROFIBUS board in the SIMOTION P320-4	5 % ... 80 %	5 % ... 95 %
Tested according to	EN 60068-2-30	
Temperature change	Max. 10 K per hour in operation	
Moisture condensation and ice formation	Not permissible	
Design		
Module	Card (3.3 V/5 V, 32 bits)	
Dimensions (H x D) in mm	107 x 170	
Weight	150 g	
Space requirements	Short PCI slot	

Safety

Safety	
Degree of protection	IP20 in mounted state
Protection class	I complies with VDE 0106
Safety regulations	EN 60950
Approvals	CE, UL508, cULus

Quality assurance

Quality assurance complies with ISO 9001.

Note

The safety regulations, approvals, protection type and protection class specified are valid only if the module is inserted in a SIMOTION P320-4.

Power requirements of the components

Maximum power consumption of the auxiliary components

Auxiliary components		Maximum permitted power consumption			Max. total power
		+5 V	+3.3 V	+12 V	
USB device	High current	900 mA	-	-	10 W (for all USB devices)
Display port		-	500 mA	-	
DVI-I		500 mA	-	-	
PROFIBUS		500 mA	-	-	
PCI modules	Per slot	-	1.5 A	0.5 A	10 W (for entire device)
	Total	-	2 A	1 A	

[1] The total power of the PCI and USB cards may not exceed 15 W

Note

Device can overheat!

To avoid overheating, the power loss per PCI slot should not exceed 5 watts.

Integrated DC power supply

Technical specifications

DC power supply	
Input voltage	24 V DC (-20%/+20%)
Power consumption [1]	Max. 90 W
Power failure buffering	hold-up time = 20 ms at 20.4 V (DC_FAIL is active after > 5 ms)
Maximum continuous output power [1]	80 W
Degree of protection	IP 20
Protection class	Protection class I (a protective conductor must be connected to the device)

[1] The power specifications apply to the power supply component not to the device.

Note

Inrush current

The device requires an inrush current of at least 6.5 A for 50 ms.

The peak value of the startup current depends on the input voltage and the impedance of the 24 V power source. Peak currents greater than 6.5 A are possible. This will not have a negative impact on device functionality.

Technical data for the SITOP smart 24 V/10 A

Table 11-22 Technical specifications for the SITOP smart 24 V / 10 A

SITOP smart 24 V/10 A	
Input data	
Input voltage rated value	120/230 VAC
Input voltage range	85 to 132 VAC / 170 to 264 VAC
Power failure bridging	> 20 ms at V_{in} = 93/187 V
Mains frequency rated value	50/60 Hz
Mains frequency range	47 ... 63 Hz
Input current rated value	4.1/2.4 A
Switch-on current (at +25° C)	< 65 A
Recommended miniature circuit breaker	10 A, Characteristic C
Output data	
Output voltage rated value	24 VDC
Output voltage tolerance	± 3 %
Residual ripple/spikes	< 150/240 mV_{pp}
Output voltage adjustment range	22.8 to 28 VDC

SITOP smart 24 V/10 A	
Output current rated value	10 A (12 A up to +45° C)
Efficiency	Typ. 90%
Electronic short-circuit protection	Yes; constant current approx. 1.3 × output current rated value; for 5 seconds extra power at 1.5 × output current rated value
Ambient conditions	
Ambient temperature during storage and transport	-40° ... +85° C
Ambient temperature during operation	0° ... +60° C
Humidity class	Climate class 3K3 according to EN 60721; relative atmospheric humidity 5 to 95%; no condensation
Degree of protection (EN 60529)	IP20
Radio suppression level (EN 55022)	Class B
Line harmonic limitation according to EN 61000-3-2	No
EMC immunity	EN 61000-6-2; EN 61000-4-2/-3/-4/-5/-6/-11
EMC interference emission	EN 61000-6-4
Safety	
Safety class (IEC 536; VDE 1006 T1)	Class I
Primary/secondary galvanic isolation	SELV output voltage according to EN 60950 and EN 50178; transformer according to EN 61558-2-17; overvoltage protection in the event of an internal error $U_a < 60$ V
Dimensions and weight	
Dimensions (W x H x D) in mm	70 x 125 x 125
Weight	Approximately. 0.75 kg
Certifications and approvals	
CE	CE conformity according to 98/336 EEC and 73/23 EEC
UL/CSA	UL 508 (Listed, File E197259); CSA C22.2 No 14, No 60950-1-03
Shipbuilding	Germanischer Lloyd
Directive 94/9/EC	Declaration of conformity according to EN 60079-15: ATEX94/9/EC Cat.3;Eex, nA, II, T4 U
C-Tick	AS/NZS 2064:1997
Article numbers	
	6EP1334-2AA01, 6EP1334-2BA01

Typical power consumption

Technical specifications

Typical current and power consumption of the device at a rated voltage of 24 V

Description	Current consumption	Power consumption
Device with core i3 or core i7 processor	950 mA	23 W
Fieldbus (PROFINET)	120 mA	3 W
USB expansion [1]	Max. 500 mA	Max. 12 W
PCI expansion [1]	Max. 500 mA	Max. 12 W

[1] The total power of the PCI and USB expansion may not exceed 15 W

11.2.1.10 Dimension drawings

Overview of the dimensional drawings

This section contains the dimension drawings for the SIMOTION P320-4:

- Standard rail mounting (Page 8102)
- Vertical mounting (Page 8104)
- SIMOTION P320-4 with an expansion card (Page 8106)

Device dimension drawing for standard rail mounting

Various views of the standard rail mounting with dimensions are shown in the following:

11.2.1.11 Spare parts

Available spare parts for SIMOTION P320-4

You can order the accessories via the Siemens Industry Mall (www.siemens.com/industrymall).

The following spare parts are available for SIMOTION P320-4:

Spare parts for SIMOTION P320-4			
Spare parts	**Article number**	**Scope of delivery**	**Accessories**
Lithium battery	A5E30314053	x	x
External CFast card The external CFast card contains user data. If a CFast card is used as a replacement for the external memory card, **no** Restore DVD or image is necessary.	6ES7648-2BF10-0XG0	x	x
IsoPROFIBUS board	6AU1390-0AA00-0AA1	-	x

Spares On Web

Spares On Web (http://support.automation.siemens.com/WW/view/en/16612315) is an information system that enables you to find out which spare parts are available for your device.

11.2.1.12 Standards and approvals

General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

Korea certification

KC	KC registration number: KCC-REM-S49-SIMOTION Note that this device complies with limit class A with regard to the emission of radio frequency interference. This device can be used in all areas except residential areas. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity (http://support.automation.siemens.com/WW/view/en/10805446/134200).

11.2.1.13 ESD Guideline

ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

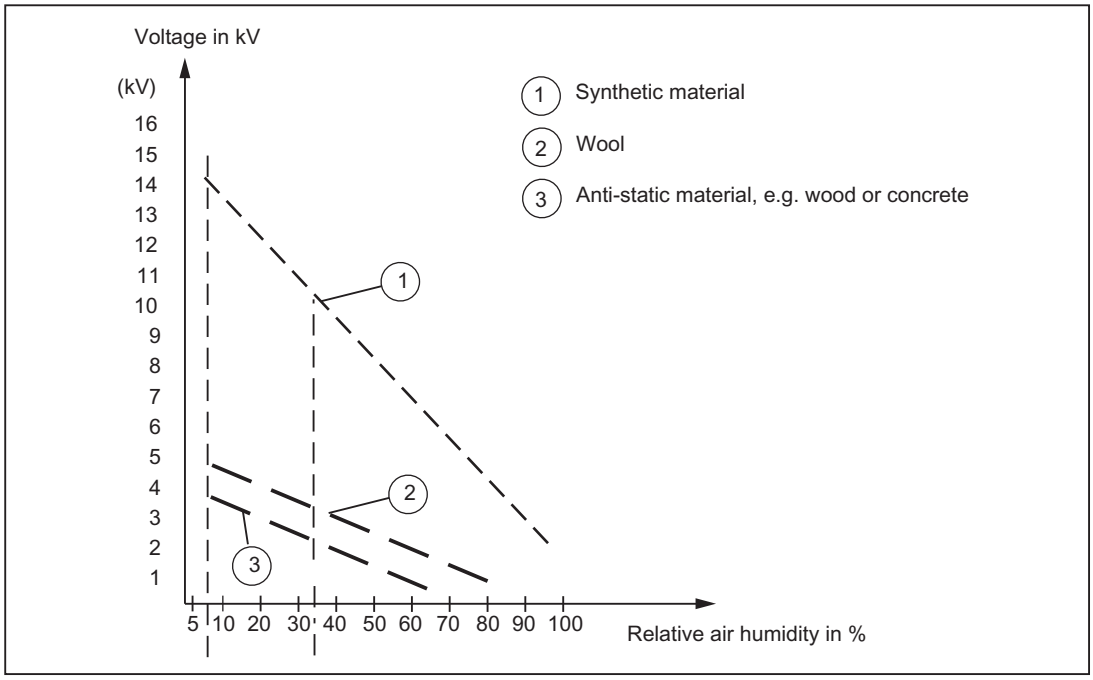

Figure 11-178 Electrostatic voltage that can accumulate on operating personnel

Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

Supplementary Documentation 12

12.1 SIMOTION documentation overview

Preface

Scope of validity

This SIMOTION documentation overview is valid for SIMOTION SCOUT product version V5.4.

SIMOTION overview

An introduction to SIMOTION and navigation to the required detailed information is available at:

www.siemens.com/simotion (www.siemens.com/simotion)

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

12.1.1 SIMOTION Documentation

Overview of the SIMOTION documentation

The complete SIMOTION documentation is divided into various documentation packages and is contained on the SCOUT DVD Documentation, Utilities & Applications.

An initial overview is available as a short system overview for SIMOTION in the Basic Functions Function Manual (see the SIMOTION Description of System and Function Descriptions (Page 8114) documentation package).

Terms and abbreviations from the SIMOTION environment are described in the **SIMOTION Terms and Abbreviations, Glossary** (see SIMOTION Engineering System Handling (Page 8113) documentation package).

The search across all PDF documents of a selected language is possible using **SIMOTION_Index.pdx**. This file is included in the documentation directory of the associated language. To do this, open the file with the Adobe Acrobat Reader, and enter your search term and options in the extended search.

Extensive information especially for the programming and commissioning of a **SIMOTION D** is contained in the commissioning manuals (SIMOTION D (Page 8121) documentation package).

Example for beginners

"Getting Started" in the online help or the Engineering System documentation package is recommended as an introduction to configuring with SIMOTION.

In addition, the **Tutorial SIMOTION SCOUT TIA Getting Started** will give you detailed instructions as to how to, for example, create a project, compile and save it, insert and parameterize a technology object, and create a program. When you have worked through all these steps, you will be able to create more complex projects.

You can find the **Tutorial SIMOTION SCOUT TIA Getting Started** at https://support.industry.siemens.com/cs/ww/de/view/109474299 (https://support.industry.siemens.com/cs/ww/en/view/109474299).

A more detailed overview with appropriate instructions can be found in an example for beginners in the Utilities & Applications. .
The **SIMOTION Utilities & Applications** is contained on the **SCOUT DVD Documentation, Utilities & Applications**.

Start the navigation via "index.html" in the **Utilities_Applications**directory.

The example with a comprehensive documentation can be found at **Examples > Example for beginners**.

12.1.1.1 SIMOTION Engineering System Handling

The documentation package contains documents that describe the handling of the SIMOTION Engineering System and the SIMOTION CamTool option package.

There is also a glossary that contains the SIMOTION terms and abbreviations.

The documents of this documentation package are contained in the 1_Engineering_system_handling directory.

SIMOTION SCOUT, Configuration Manual **Edition 07/2021**
Describes SCOUT, the SIMOTION engineering system.

SIMOTION SCOUT TIA, Configuration Manual **Edition 07/2021**
Describes SCOUT TIA, the SIMOTION engineering system.

SIMOTION SCOUT TIA Device Proxy, Configuration Manual **Edition 11/2016**
Describes SIMOTION SCOUT TIA device proxy.

SIMOTION SCOUT **Edition 11/2016**
Getting Started with SIMOTION SCOUT
SIMOTION D435-2 sample project, Getting Started

SIMOTION SCOUT TIA **Edition 07/2017**
Getting Started with SIMOTION SCOUT TIA,
Getting Started

SIMOTION Terms and Abbreviations, Glossary **Edition 11/2010**
Special SIMOTION terminology, an alphabetically arranged overview.

SIMOTION CamTool, Configuration Manual **Edition 03/2018**
Describes the easy-to-use cam tool.

12.1.1.2 SIMOTION System and Function Descriptions

This documentation package contains descriptions for the basic functions of the SIMOTION system as well as the explanations for the technology objects (TO) and the communications topic.

The documents of this documentation package are contained in the 2_Description_of_system_and_functions directory.

Note

Additional information on system functions, system variables and configuration data is contained in the SIMOTION Programming - References (Page 8118) documentation package.

SIMOTION Runtime Basic Functions, Function Manual **Edition 07/2021**

This documentation provides a brief system overview for SIMOTION and describes the basic structure and the programming of the technology objects.
The runtime system and the memory concept of the SIMOTION controllers are also described.

Motion Control, TO Axis Electric/Hydraulic, External Encoder, Function Manual **Edition 07/2021**

Describes the operating principles of the speed, positioning, and hydraulic axes technology objects and the external encoder.

Motion Control, Synchronous Operation and Cam Technology Objects, Function Manual **Edition 11/2016**

Describes the operating principles of the gearing and camming technology objects.

Motion Control TO Path Object, Function Manual **Edition 04/2019**

Describes the functionality of the technology objects for path interpolation.

Motion Control Output Cam and Measuring Input, Function Manual **Edition 11/2016**

Describes the operating principles of the output cam, cam track, and measuring input technology objects.

Motion Control, Supplementary Technology Objects, Function Manual **Edition 07/2021**

Describes the operating principles of the fixed gear, addition object, formula object, sensor, controller object and temperature controller technology objects.

Motion Control, Basic Functions for Modular Machines, Function Manual **Edition 03/2018**

Describes the modular machines functionality in the SIMOTION and SINAMICS systems.

SIMOTION Communication, System Manual **Edition 07/2021**

Describes the communications capabilities for SIMOTION systems and also to devices outside the SIMOTION family, in particular, SIMATICSIMATIC.

Industrial Security, Configuration Manual **Edition 02/2020**

Describes the necessary measures and information for planning and configuring systems or plants.

12.1.1.3 SIMOTION Service and Diagnostics

This documentation package contains all information about the service and diagnostic functions of the system.

The documents of this documentation package are contained in the 3_Service_and_Diagnosis directory.

Overview of Service and Diagnostics Options, Product Information **Edition 03/2018**

Overview of the options for system diagnostics for SIMOTION devices and references to other manuals and online helps.

Technology Packages Alarms, Diagnostics Manual **Edition 07/2021**

Contains the alarms for the **Cam, Path, Cam_ext** and **TControl** technology packages.

The alarms are organized numerically below the technology packages (TP) according to technology object (TO).

Upgrading SIMOTION Devices, Operating Instructions **Edition 07/2021**

Describes a simple way of exchanging the configuration or firmware of one or more
SIMOTION devices using the Device Update Tool.

Task Trace, Function Manual **Edition 04/2014**

Describes the structure and handling of the SIMOTION Task Trace.

SIMOTION Project Comparison, Function Manual **Edition 07/2021**

Describes the SCOUT Project Comparison function with which you can compare objects within a project or with objects from other projects (offline) or objects of the project with the connected target system (online).

12.1.1.4 SIMOTION IT

This documentation package contains all information about the Web functions for SIMOTION IT with which the machine manufacturer and user can perform commissionings as well as service and diagnostic tasks without engineering tools.

The documents of this documentation package are contained in the 3_SIMOTION_IT directory.

SIMOTION IT Diagnosis and Configuration, Diagnostics Manual **Edition 07/2021**

Describes the diagnosis of the SIMOTION devices via the integrated Web server.
Access is by means of a standard browser (e.g. Firefox) via the IP address of the SIMOTION device. You can use the standard diagnostic pages or your own HTML pages for access.

SIMOTION IT Programming and Web Services, Programming Manual **Edition 07/2021**

Describes the access to the diagnostic functions with Web services.
This function package comprises a Web service that permits the connection of applications to a controller via the Internet and, for example via OPC XML-DA, access to data and operating states in the SIMOTION device.
Commands are transferred via the SOAP (Simple Object Access Protocol) communication protocol.
Additional description of the Trace via SOAP (TVS) function package that permits variables from the environment of the SIMOTION variable provider to be recorded.

SIMOTION IT Virtual Machine and Servlets, Programming Manual **Edition 07/2021**

The Jamaica Virtual Machine (JamaicaVM) provides a runtime system with which Java applications can be executed on the SIMOTION device. It is an implementation of the **Java Virtual Machine Specification**.
The Servlets section of the documentation describes the use of servlets in a Web container of a SIMOTION device.

SIMOTION IT OPC UA **Edition 07/2021**

The SIMOTION IT OPC UA manual describes access to SIMOTION devices via OPC UA.

12.1.1.5 SIMOTION Programming

This documentation package contains documents with the descriptions for the various programming languages and editors.

The documents of this documentation package are contained in the 3_Programming directory.

SIMOTION ST Structured Text, Programming and Operating Manual **Edition 07/2021**

Describes the text-based Structured Text SIMOTION programming language Structured Text.

SIMOTION MCC Motion Control Chart, Programming and Operating Manual **Edition 07/2021**

Describes the graphics-based SIMOTION Motion Control Chart programming language.

SIMOTION LAD/FBD Programming and Operating Manual **Edition 07/2021**

Describes the graphics-based Ladder Diagram (LAD) and Function Block Diagram (FBD) SIMOTION programming languages.

SINAMICS/SIMOTION DCC Editor Description, Programming and Operating Manual **Edition 11/2018**

Describes the graphics-based Drive Control Chart Editor (DCC editor) based on CFC.
Graphics-based configuration of SIMOTION controllers and SINAMICS drives is possible.

12.1.1.6 SIMOTION Programming - References

SIMOTION Lists Manuals

The following documents are reference lists required for the programming of the **Cam**, **Path**, **Cam_ext** and **TControl** technology packages as well as the **SIMOTION devices**.

The documents of this documentation package are contained in the 3_Programming_reference_lists directory.

System Functions/Variables Devices, List Manual **Edition 04/2019**

Describes the system functions/variables for the **SIMOTION C**, **P** and **D** hardware platforms.

Technology Packages System Functions, List Manual **Edition 04/2019**

Describes the system functions for the **Cam_ext** and **TControl technology packages** (TP).
TP **Cam** and TP **Path** are part of TP **Cam_ext**.

The List Manual is organized based on the structure of the SIMOTION SCOUT command library.

The command library is located in the tab of the same name in the project navigator of SIMOTION SCOUT. The system functions are listed in the **PLCopen** and **Technology** folders there.

The list of reserved identifiers can be found in the SIMOTION Basic Functions manual (see SIMOTION System and Function Description (Page 8114) document package).

Technology Packages Configuration Data, List Manual **Edition 07/2021**

Describes the configuration data for the **Cam**, **Path**, **Cam_ext** and **TControl** technology packages.

The configuration data is listed as follows:
Below the technology packages (TP), in alphabetical order according to technology object (TO).

Technology Packages System Variables, List Manual **Edition 07/2020**

Describes the system variables for the **Cam**, **Path**, **Cam_ext** and **TControl** technology packages.

The system variables are listed as follows:

Below the technology packages (TP), in alphabetical order according to technology object (TO).

Other function blocks

The following documents contain descriptions of other **function blocks** from the **SIMOTION SCOUT command library**.

PLCopen Blocks, Function Manual **Edition 01/2015**

Describes the PLCopen blocks for motion control programming from a cyclic PLC viewpoint.

SINAMICS/SIMOTION Description of the standard DCC blocks, Function Manual **Edition 11/2018**

Description of the standard DCC blocks for SIMOTION and SINAMICS.

Drive connection

Standard Function for SINAMICS S120 Line Modules, Function Manual **Edition 01/2015**

Describes the function blocks for the activation and deactivation of the SINAMICS S120 Line Modules with DRIVE-CLiQ connection.

I/O

Supplement to the CP 340 and CP341 Modules, Function Manual **Edition 01/2015**

Describes the function blocks for the data exchange between a SIMOTION device and communication processors.

Supplement to the FM 350-1, FM 350-2 and FM 352 Modules, Function Manual **Edition 01/2015**

Describes the function blocks for the communication between the SIMOTION system and the FM 350-1, FM 350-2 and FM 352 modules.

Supplement to the ET 200S 1SI Serial Interface Module, Function Manual **Edition 04/2019**

Describes the function blocks for the communication between the SIMOTION system and the ET 200S 1SI serial interface.

Supplement to the ET 200S Frequency Converter, Function Manual **Edition 01/2015**

Describes the function block for controlling the ET 200S frequency converter.

Supplement to the Command Interface for AS-Interface Master Modules, Function Manual **Edition 01/2015**

Describes the function block for operation of the command interface of the AS-Interface master modules.

Standard Function for ASIsafe Safety Monitors, Function Manual **Edition 01/2015**
Describes the function blocks for reading out the diagnostic information of the ASIsafe safety monitor.

Standard Functions for RFID Systems, Function Manual **Edition 11/2016**
Describes the function blocks for the data exchange between the SIMOTION system and RFID systems according to the standard profile.

Supplement to the SIWAREX FTA Weighing Module, Function Manual **Edition 01/2015**
Describes the function block for controlling and assigning parameters for the SIWAREX FTA Weighing Module.

Controller

Basic Control, Function Manual **Edition 01/2015**
Describes the function blocks of the BasicControl software.

12.1.1.7 SIMOTION C

The documentation package contains the description for the **SIMOTION C** hardware platform.

The document of this documentation package is contained in the 5_SIMOTION_C directory.

The system functions and variables for the SIMOTION C hardware platform are described in the System Functions/Variables Devices, List Manual.
(See SIMOTION Programming - References (Page 8118) documentation package)

SIMOTION C, Operating Instructions **Edition 03/2018**
Describes the controller versions of the SIMOTION product family.

12.1.1.8 SIMOTION P

The following documents contain the descriptions for the **SIMOTION P** hardware platform.

The documents of this documentation package are contained in the 5_SIMOTION_P directory.

The system functions and variables for the SIMOTION P hardware platform are described in the System Functions/Variables Devices, List Manual.
(See SIMOTION Programming - References (Page 8118) documentation package).

SIMOTION P320-4 E / P320-4 S, Manual **Edition 03/2018**
Describes the PC-based hardware of the SIMOTION product family.

SIMOTION P320-4 E / P320-4 S, Commissioning and Hardware Installation Manual **Edition 03/2018**
Describes the PC-based hardware of the SIMOTION product family.

12.1.1.9 SIMOTION D

Documentation for the SIMOTION D hardware platform

The following documents contain the descriptions for the **SIMOTION D** hardware platform.

The documents of this documentation package are contained in the 5_SIMOTION_D directory.

The system functions and variables for the SIMOTION D hardware platform are described in the System Functions/Variables Devices, List Manual.
(See SIMOTION Programming - References (Page 8118) documentation package)

SIMOTION D4x5-2, Manual **Edition 07/2021**

Describes the drive-based hardware of the SIMOTION product family.

SIMOTION D4x5-2, Commissioning and Hardware Installation Manual **Edition 07/2021**

Describes the drive-based hardware of the SIMOTION product family.

SIMOTION D410-2, Manual **Edition 07/2021**

Describes the hardware for the SIMOTION modular drive system for single axes.

SIMOTION D410-2, Commissioning and Hardware Installation Manual **Edition 07/2021**

Describes the hardware for the SIMOTION modular drive system for single axes.

Documentation for SINAMICS Integrated

The documents for SINAMICS Integrated are contained in the 5_SIMOTION_D directory.

For **SIMOTION D**, the **SIMOTION** PLC and motion control functionality as well as the **SINAMICS S120** drive software run on a shared control hardware.

The integrated **SINAMICS Integrated** drive as well as further drive components are described in the documentation for **SINAMICS S120**.

For **SIMOTION D4xx-2**, the SINAMICS Integrated is based on **SINAMICS firmware version V5.x**

The documents for SINAMICS can also be supplied individually with the appropriate article number as hard copy.

References

Further manuals can be found at Product Support > SINAMICS S High-Performance Converter (https://support.industry.siemens.com/cs/ww/en/ps/13229/man).

12.1.1.10 SIMOTION Supplementary Documentation

This documentation package contains product information as well as the hardware descriptions for components that are operated together with SIMOTION (e.g. ADI4).

The documents of this documentation package are contained in the 4_Additional_documentation directory.

Technology Modules TM Timer DIDQ for SIMOTION SCOUT and SIMOTION SCOUT TIA, Commissioning Manual **Edition 11/2016**

This document describes the functionality and use of the Technology Modules TM Time DIDQ with SIMOTION SCOUT and SIMOTION SCOUT TIA.

TM15/TM17 High Feature SIMOTION Terminal Modules, Commissioning Manual **Edition 01/2015**

This document describes the functionality and use of the TM15 and TM17 High Feature Terminal Modules.

TM15/TM17 High Feature SIMOTION Terminal Modules, Manual **Edition 11/2016**

This document describes the functionality and use of the TM15 and TM17 High Feature Terminal Modules.

ADI4 - Analog Drive Interface for Four Axes, Manual **Edition 04/2014**

This document describes the functionality and use of the ADI4 - Analog Drive Interface with which as many as 4 drives with analog setpoint interface can be operated on the isochronous PROFIBUS DP.

SIMATIC Distributed I/Os IM 174 PROFIBUS Module, Manual **Edition 09/2011**

This document describes the standard functionality of the IM 174 module, an interface module with which as many as four drives can be operated with the analog setpoint interface with one TTL or SSI encoder per axis on the isochronous PROFIBUS DP.

SIMATIC NET (Win7/Win10) for SIMOTION, Product Information **Edition 08/2018**

This document describes the open OPC interface for access to various communication peers via SIMATIC NET.

12.1.2 Standard SIMOTION applications

Numerous standard applications are available for SIMOTION that already provide a solid basic framework or predefined sector-specific configurations. With the help of the provided documentation, the applications can be easily used, adapted and extended for the associated application.

The **SIMOTION Utilities & Applications** are supplied with SIMOTION SCOUT .

They contain standard applications such as, for example:

SIMOTION Flying Saw
Flying saw

SIMOTION Rotary Knife
Cross cutter

SIMOTION Winder
Winder

SIMOTION Traverser
Traverser

SIMOTION Line Tension Control
Tension control

SIMOTION Top Loading
Solution for flexible handling applications

Project generator SIMOTION easyProject
The **SIMOTION Utilities & Applications** also contain the SIMOTION easy-Project project generator.
Basic functions required in practically every application can be integrated quickly and easily in a new or existing project with the aid of **SIMOTION easyProject** .

Other standard applications

All of the complete SIMOTION standard applications can be found on the Internet at: SIMOTION industry-sector solutions (http://www.Siemens.com/simotion/solutions) and as a download in the Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/14505/ae).

The documents are supplied with the associated application or on request.
Please contact your Siemens contact regarding this.

A selection of standard applications is listed below:

SIMOTION Easy Basics
Collection of standardized SIMOTION basic functionality
(also see Product Support > Motion Control System SIMOTION > SIMOTION Easy Basics (https://support.industry.siemens.com/cs/ww/en/view/43192803))

SIMOTION Modular Machine

Permits topology changes in a SINAMICS drive system during runtime.

SIMOTION Message Handling

The application for quick integration of the message handling in an existing SIMOTION project

SIMOTION Axis Function Block

Solution for controlling motion control basic function.

SIMOTION Startup Check

The application for the startup check of devices and I/O modules in the SIMOTION system

SIMOTION Cartoner

Solution for packaging machines

SIMOTION Intelligent Belt

Solution for the automatic operation of an intelligent belt (dual tension) as well as the provision of functions such as homing, positioning and jogging

SIMOTION/SIMATIC Ethernet Communication TCP/IP LCom

TCP/IP communication for SIMOTION and SIMATIC for data blocks up to 64 KB time synchronization

SIMOTION/SIMATIC OMAC V3

This software library provides a user-friendly basis for the configuration of an OMAC-compliant mode manager and a data interface for SIMOTION or SIMATIC

SIMOTION Hydraulik/Servo/Mechanical Press

The application for automating mechanical universal presses with SIMOTION

SIMOTION Electronic Tranfer

Solution for electronic transfer systems in the metal forming technology

SIMOTION Roll Feed

Solution for electronic roll feed in the metal forming technology

SIMOTION Feeder

Solution for press linking with feeder in the metal forming technology

SIMOTION Print Standard
Application example for various printing machine types

SIMOTION Application Traverser
Traverser

SIMOTION Application Weaving
Solution for weaving machines

SIMOTION Application Ring Spinning
Solution for ring spinning machines

SIMOTION Application Rowing Frame
Solution for flyer control in the spinning process

12.1.3 SIMOTION Ordering Information

Catalogs for SIMOTION and other components

SIMOTION, Catalog PM 21 **Edition 2017**
Equipment for production machines
Ordering information
Article number: E86060-K4921-A101-A4

SINUMERIK 840, Catalog NC 62, **Edition 2018**
Equipment for machine tools
Ordering information
Article number: E86060-K4462-A101-A3

SIMATIC Products for Totally Integrated Automation, Catalog ST 70, **Edition 2017**
Ordering information
Article number: E86060-K4670-A101-B6

SIMATIC Products for Totally Integrated Automation **Edition 2018**
Catalog News ST 70 N
Article number: E86060-K4670-A151-A9

SIMATIC NET, Industrial Communication, Catalog IK PI, Complete Catalog **Edition 2017**
Ordering information

Article number: E86060-K6710-A101-B8

SIMATIC NET, Industrial Communication, Short Catalog **Edition 11/2013**
Article number: E86060-K6710-B111-B3

Interactive catalogs

Products for Automation and Drives **Edition 10/2018**
Annual update in October, can be ordered at:
Product catalog CA 01 (http://w3.siemens.com/mcms/topics/en/ik/Pages/Default.aspx)
Article number: E86060-D4001-A500-D8

Industry Mall, Catalog and Online Ordering System for Automation and Drives
Industry Mall (http://www.siemens.com/industrymall)

Technical online documentation for SINUMERIK, SINAMICS, SIMOTION and SIMOTICS

Information and documentation for SINUMERIK, SINAMICS, SIMOTION and SIMOTICS are available on the Internet under:

Online documentation for SINUMERIK, SINAMICS, SIMOTION and SIMOTICS (https://support.industry.siemens.com/cs/ww/en/view/109476679)

In addition to many other useful documents, you will also find in the Information and Download Center catalogs relating to:

- SINUMERIK: NC 62, NC 81.1, NC 82
- SINAMICS: D 11, D 12, D 21.3, D 21.4, D 23.1, D 23.2, D 31, D 35
- SIMOTION: PM 21
- SIMOTICS: D 41, D 81.1, D 81.8, D 83.1

Information and Download Center (http://www.siemens.com/industry/infocenter)

12.1.4 Additional information for SIMOTION

The following documents contain advanced information about SIMOTION.

Michael Braun / Wolfgang Horn: Object-Oriented Programming with SIMOTION. **Edition 2016**
Basic Principles, Example Programs and Concepts according to IEC 61131-3.
1st Edition October 2016. Publicis Publishing, Erlangen
ISBN 978-3-89578-455-2

12.2 Technology Modules TM Timer DIDQ for SIMOTION SCOUT and SIMOTION SCOUT TIA

Preface

This manual describes TM Timer DIDQ 10x24V and 16x24V technology modules used with SIMOTION controllers with PROFINET connection.

This manual is aimed at machine manufacturers, plant engineers, commissioning personnel, and service personnel who use technology modules with SIMOTION SCOUT or with SIMOTION SCOUT TIA.

The following information blocks describe the purpose and use of the Commissioning Manual:

- Description
  This section describes the general use of the TM Timer DIDQ technology modules 10x24V and 16x24V.
- Configuring
  Provides information about configuring, parameterizing and commissioning the TM Timer DIDQ technology modules with the SIMOTION SCOUT and SIMOTION SCOUT TIA engineering systems.
- Functions
  This chapter provides an overview of the functions of the TM Timer DIDQ technology modules.
- Service and maintenance
  Provides information on maintenance work that must be implemented on the TM Timer DIDQ technology modules.
- Diagnostics
  Provides information about the available diagnostic information, how to interpret it, and its meaning.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.5:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

12.2.1 Safety notes

12.2.1.1 Fundamental safety instructions

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

12.2.2 Description

12.2.2.1 Introduction

The following provides an overview of the technical characteristics of the TM Timer DIDQ 10x24V and 16x24V technology modules. It also provides information on systems integration with SIMOTION and an overview of typical machinery applications.

Detailed information on the technology modules, including installation, can be found in the SIMATIC documentation. An overview of the available manuals can be found in Chapter SIMATIC documentation (Page 8135).

12.2.2.2 SIMATIC documentation

Overview of SIMATIC documentation for Timer DIDQ technology modules

The following table lists the SIMATIC documentation that you require when using the Timer DIDQ technology modules.

Note

This manual is intended solely as a supplement for the configuration of TM Timer DIDQ technology modules under SIMOTION SCOUT or SIMOTION SCOUT TIA. The SIMATIC documentation listed in the following table is therefore required when using the technology modules.

Subject	Documentation	Most important content
Description of the system	• ET 200SP Distributed I/O System System Manual • ET 200MP Distributed I/O System System Manual	• Use planning • Mounting • Connecting • Commissioning
	S7-1500 Automation System System Manual	
	Interface Module Manual	• Connecting • Alarms, diagnostic, error and system alarms • Technical specifications • Dimension drawing
	• Manual ET 200SP Technology Module TM Timer DIDQ 10x24V • Manual ET 200MP/S7-1500 Technology Module TM Timer DIDQ 16x24V	• Properties • Connecting • Configuring • Technical specifications
Configuring control systems so that they are interference-proof	Designing interference-free controllers Function Manual	• Fundamentals • Electromagnetic compatibility • Lightning protection

Subject	Documentation	Most important content
Time-based IO	Highly accurate input/output with time-based I/O Function Manual	• Fundamentals • Configuring • Programming • Diagnostics
Isochronous mode	PROFINET with STEP 7 Function Manual	• Benefit • Application • Parameter settings

SIMATIC Manuals

On the Internet (http://www.siemens.com/automation/service&support (http://www.siemens.com/automation/service&support)), all current manuals for SIMATIC products are available as a free download.

12.2.2.3 Properties

Properties of the TM Timer DIDQ 10x24V and 16x24V technology modules

The TM Timer DIDQ 10x24V and 16x24V technology modules have the following properties:

TM Timer DIDQ 10x24V technology module	TM Timer DIDQ 16x24V technology module
Technical properties	
4 digital inputs 6 digital outputs	16 digital inputs and outputs, electrically isolated in groups of 8 Various combinations of the digital inputs and outputs can be parameterized: • 0 digital inputs and 16 digital outputs (for cam applications with many outputs) • 3 digital inputs and 13 digital outputs (for mixed applications, involving cams, measuring inputs and incremental encoders) • 4 digital inputs and 12 digital outputs (for flexible mixed operation) • 8 digital inputs and 8 digital outputs (for measuring inputs and incremental encoders) **Note**: As of TIA Portal V14 and SIMOTION SCOUT TIA V4.5, depending on the channel configuration (see above), as many as eight additional digital inputs without technology are available. For further information, see sections Setting options for TM Timer DIDQ 16x24V technology module (Page 8166) and Linking symbolic I/O variables with TM Timer DIDQ (Page 8172).
24 VDC rated output voltage	
Rated output current 0.5 A or 0.1 A (high-speed operation) per digital output	
24 V encoder supply output, short-circuit proof	

TM Timer DIDQ 10x24V technology module	TM Timer DIDQ 16x24V technology module
Parameterizable substitute values (per digital output)	
Parameterizable diagnostics	
Two supply voltages L+ (only TM Timer DIDQ 16x24V technology module)	
Supported encoder/signal types for digital inputs	
• 24 V incremental encoder with signal A and B • 24 V pulse encoder with a signal	
Supported functions	
• Time stamp function for inputs and outputs (resolution 1 µs) • Counting (counting range 32 bits) • Oversampling for inputs and outputs • Pulse width modulation	
Supported system functions	
• Isochronous mode • Firmware update • I&M identification data	

12.2.2.4 System integration

System integration

To integrate and operate the TM Timer DIDQ technology modules, an interface module is always required; for interface module ET 200SP, the IM 155-6 PN HF and for interface module ET 200MP, the standard or HF version.

The following options exist to integrate the TM Timer DIDQ technology modules in a SIMOTION automation solution via PROFINET:

- SIMOTION SCOUT
  When configured using SIMOTION SCOUT, only TM Timer DIDQ 10x24V technology modules with interface module ET 200SP IM 155-6 PN HF can be used.

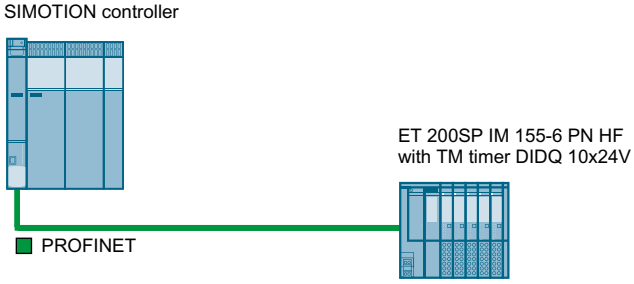

Figure 12-1 Integration in SIMOTION SCOUT

- SIMOTION SCOUT TIA
  During configuration with SIMOTION SCOUT TIA, the technology modules can be integrated as follows:
  - Integration of the TM Timer DIDQ 10x24V technology modules via ET 200SP IM 155-6 PN HF interface module.
  - Integration of the TM Timer DIDQ 16x24V technology modules via ET 200MP standard or HF version.

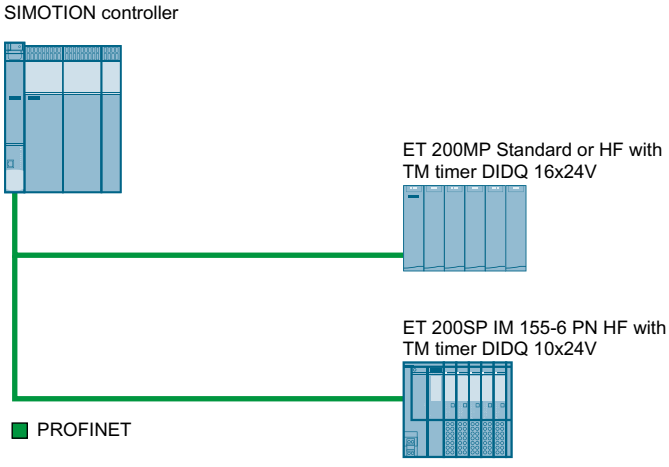

Figure 12-2 Integration SIMOTION SCOUT TIA

Setup

In the *SIMATIC ET 200SP TM Timer DIDQ 10x24V technology module* and *SIMATIC ET 200MP/ S7-1500 TM Timer DIDQ 16x24V technology modules* manuals you can find information about the design of the technology modules and a description of the interfaces.

12.2.2.5 Machine applications

Many production machines require fast, precise detection of signals or precise switching of digital outputs. The TM Timer DIDQ technology modules therefore represent an optimum solution for the requirements of a wide range of industrial applications.

Applications

Many production machines require fast, precise detection of signals or precise switching of digital outputs. Applications include the following:

- Edge detection
- Quality monitoring (e.g. product is good/bad)
- Product tracking (e.g. product is available / not available)
- Print-mark detection
- Tool monitoring (e.g. presses)
- Machine condition monitoring (e.g. plastic injection molding machines)
- Weft break monitoring (e.g. textile machines)

Applications requiring fast, high-precision output of signals include:

- Position-dependent switching of actuators
  - Camera trigger signal (quality assurance)
  - Control of an air nozzle for blowing away cut-offs
  - Control of nozzles for applying glue tracks
- Product extraction from production line
- Implementation of line motion control systems
- Output of pulse patterns

Application example: Application of glue tracks

In the following example, glue tracks are applied to a workpiece. The glue tracks are applied via glue guns. The control of the glue guns is via digital outputs with cam functionality on the TM Timer DIDQ technology module.

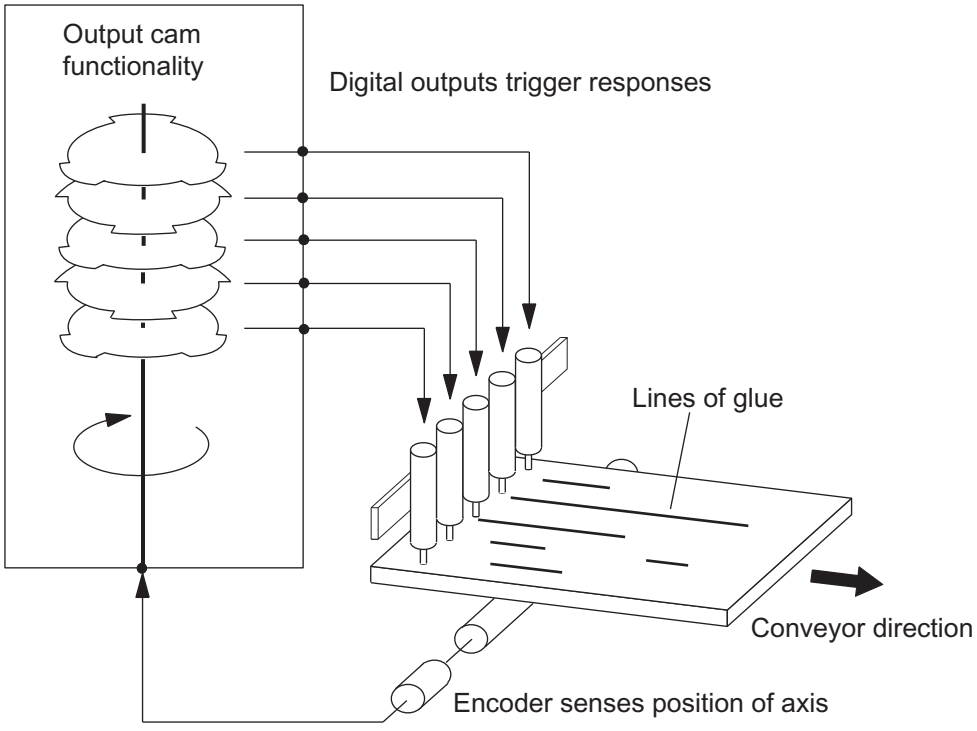

Figure 12-3 Example of an electronic cam control

Depending on the axis position, the SIMOTION "TO outputCam" or "TO camTrack" controls the digital outputs of the technology module.

The output delay times (output delay times of DO / actuators, etc.) are compensated in the technology object. This compensation ensures that the glue placement is always accurate regardless of machine speed.

12.2.3 Configuring

12.2.3.1 Introduction

The chapter describes the parameterization of the TM Timer DIDQ technology modules and the configuration of the communication under the engineering systems SIMOTION SCOUT and SIMOTION SCOUT TIA. The use of the I/O channels is shown using an interconnection with TO outputCam or TO measuring input and addressing using symbolic variables in the user program.

12.2.3.2 SIMOTION SCOUT

Hardware and software requirements

The following requirements must be satisfied in order to be able to work with the TM Timer DIDQ technology modules.

Hardware requirements

- SIMATIC ET 200SP interface module, HF or HS version
- TM Timer DIDQ 10x24V technology module
- SIMOTION controller with PROFINET interface (see section System integration (Page 8137))
- PROFINET cables
- External 24 VDC power supply (note the requirements in the *SIMATIC ET 200SP TM Timer DIDQ 10x24V technology module*)

Software requirements

Please observe the following requirements:

- SIMOTION software as of V4.4 HF6
- SIMATIC ET 200SP interface module in the HF version
- SIMATIC Step7 as of V5.5 SP4 and installation of the HSP file, minimum HSP240.V2.2

Note

Download source for the HSP:

http://support.automation.siemens.com/WW/view/de/23183356 (http://support.automation.siemens.com/WW/view/en/23183356)

Instructions to install the HSP for STEP7 V5.x are provided under the following FAQ:

http://support.automation.siemens.com/WW/view/de/22374877 (http://support.automation.siemens.com/WW/view/en/22374877)

The technology modules are integrated into the hardware configuration (HW Config) of the SIMATIC STEP 7 engineering system and are assigned parameters there.

HW Config is used by SIMOTION SCOUT and SIMATIC STEP 7 to configure the hardware of an automation project.

Irrespective of whether you work with SIMATIC STEP 7 or SIMOTION SCOUT, the parameterization is always performed in HW Config.

Requirements for operation

Preconditions

The following preconditions must be met before operating TM Timer DIDQ technology module.

1. Your system hardware including the technology module is installed and wired.
2. You have physically connected the technology module via an ET 200SP interface module, version HF or HS, with a SIMOTION controller via the PROFINET IO interface (see Chapter System integration (Page 8137)).
3. You have created a project with a SIMOTION controller with PROFINET interface in SIMATIC STEP 7 or in SIMOTION SCOUT and configured PROFINET IRT. For isochronous operation, the following settings must be made at the SIMOTION controller.

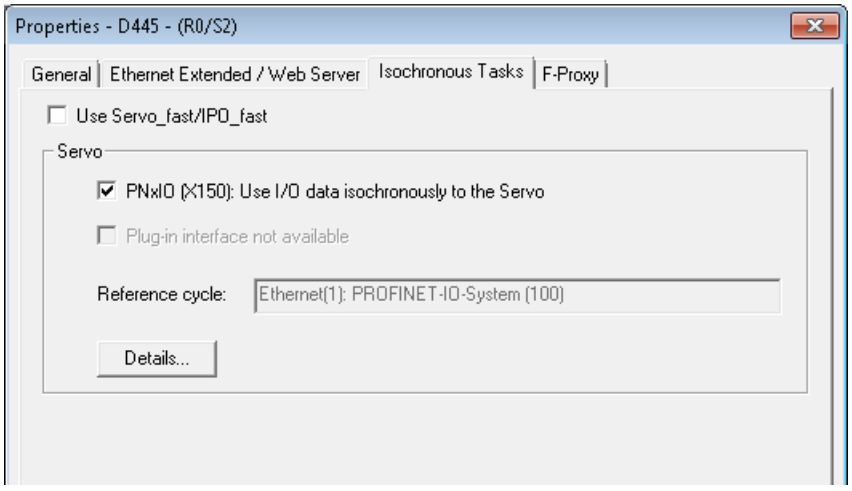

Figure 12-4 Isochronous setting at the SIMOTION controller

Note

For further information on configuration of the PROFINET communication please refer to the *SIMOTION SCOUT Communication* Manual.

Note

The procedures contained in this section assume that the user has a general understanding of SIMATIC STEP 7 and SIMOTION SCOUT.

Note

Please note that interface module ET 200SP – in conjunction with technology module TM Timer DIDQ – is operated with a minimum PROFINET clock cycle of 500 µs depending on the quantity structure.

Creating a technology module and configuring communication

Procedure

1. Open the HW configuration in SIMOTION SCOUT or SIMATIC STEP 7.
2. First, integrate an ET 200 SP interface module, version HF into the project. In the hardware catalog, navigate via PROFINET IO -> I/O -> ET 200SP to the corresponding module.
3. Select the module in the "Hardware Catalog" window.

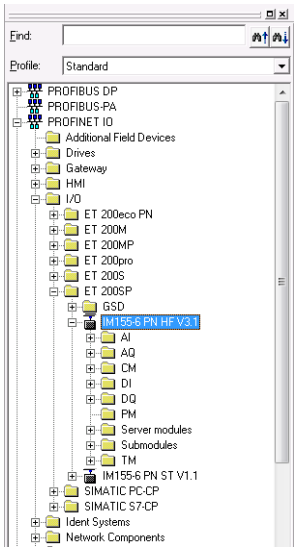

Figure 12-5 Hardware catalog - ET 200SP interface module, version HF

4. Drag and drop the module into the station window on the PROFINET line.

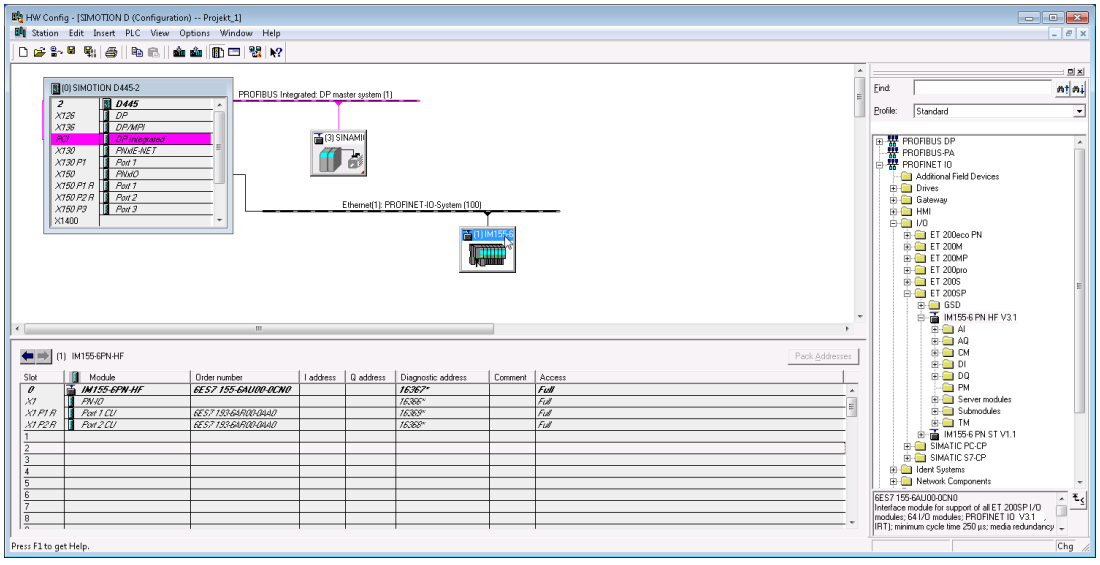

Figure 12-6 ET 200SP interface module inserted in the station window on PROFINET line

5. Now insert the TM Timer DIDQ 10x24V technology module into the project. In the hardware catalog, navigate via PROFINET IO -> I/O -> ET 200SP -> TM -> Time based IO to the module.
6. Select the module in the "Hardware Catalog" window.

7. Drag the module to the detail view under the ET 200SP.

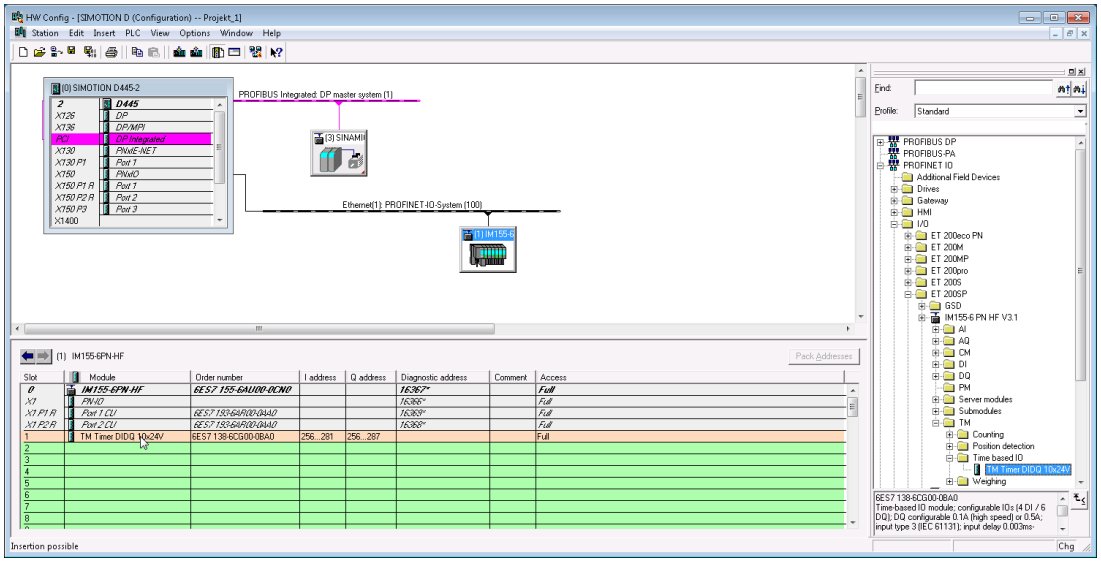

Figure 12-7 TM Timer DIDQ 10x24V technology module in the detail view

8. Then, add another server module to the detail view. With the server module, the ET 200SP distributed I/O system is completed.

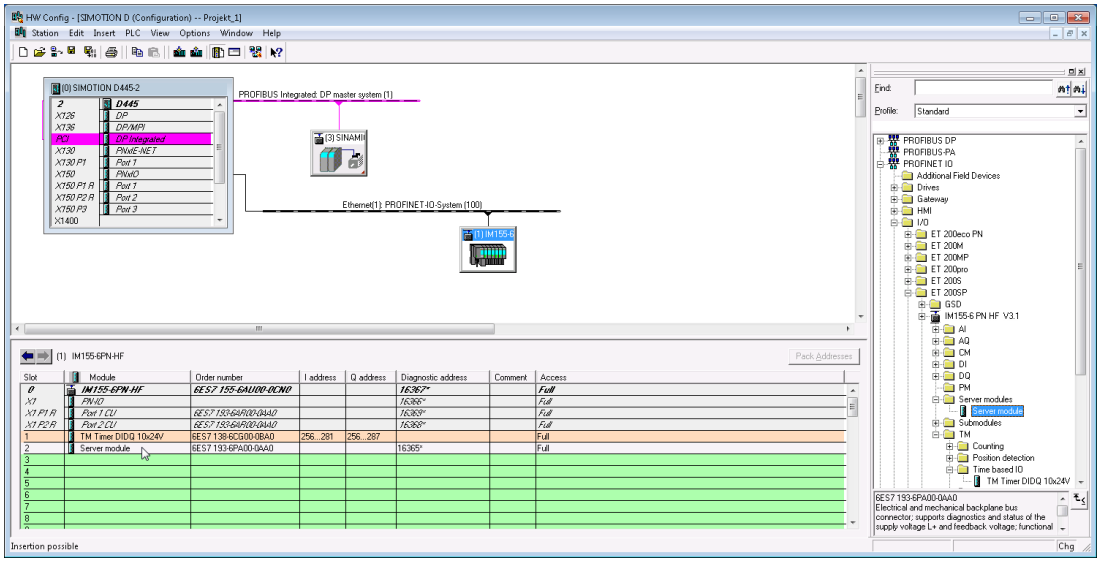

Figure 12-8 Server module in the detail view

Properties of the technology module

The object properties for the TM Timer DIDQ technology modules can be opened in the HW configuration via the context menu or by double-clicking the module in the detail view.

1. To open the context menu, select the TM Timer DIDQ technology module with the right mouse key.
2. Select Object properties. The following dialog box opens.

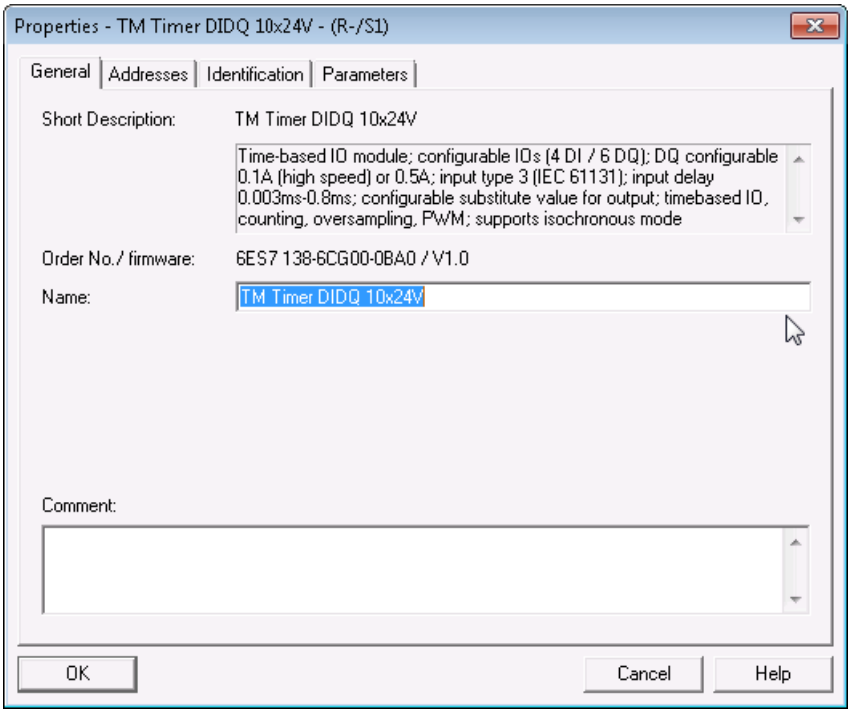

Figure 12-9 Properties of the TM Timer DIDQ 10x24V technology module

You can view or change the following properties in the object properties:

- General tab
  - Short designation, order number, name
    The short designation, the information below it, and the ordering number are identical to the entries in the Hardware Catalog window.
    In the Name field you can find the short description of the module, which can be changed according to your specifications. When you change the description, the new description is displayed in the configuration table.
  - Comments
    You can enter, for example, the application of the module in this field.
- Addresses tab
  Here you can assign the module one start address each for the inputs and outputs. The end addresses are calculated automatically.

- Identification tab
  - Plant ID of the module
  - Location ID of the module
  - Date on which the module was installed.
  - Further information: Free text, which is stored in the module.
- Parameters tab
  In this tab you parameterize the module, for example the configuration of the DQ/DI groups (see Setting options for TM Timer DIDQ 10x24V technology module (Page 8148)).

Configuring PROFINET communication

Preconditions

1. The respective ET 200SP interface module is initialized.
2. The ET 200SP interface module is integrated into the topology (prerequisite for operation in IRT mode).
3. The controller is configured as sync master (prerequisite for operation in IRT mode).

Note

For further information on configuration of the PROFINET communication please refer to the *SIMOTION SCOUT Communication* or *SIMATIC Communication* Manuals.

Operating the ET 200SP interface module and TM Timer DIDQ technology module in IRT mode

For use of the channels as cam output or measuring input input, the module must be synchronized with the controller (IRT mode).

To configure PROFINET communication on the PN interface module ET 200SP and on the TM Timer DIDQ technology module in **IRT mode**, please proceed as follows:

1. Configure the PROFINET IO topology.
2. Select the ET 200SP interface module in HW Config.
3. Select the **PN IO** line in the detail view of HW Config. Double-click to open the "Properties - PN IO" dialog box.

4. Switch to the "Synchronization" tab and select "Sync slave" for the **Synchronization role** and "IRT" for the **RT class**.

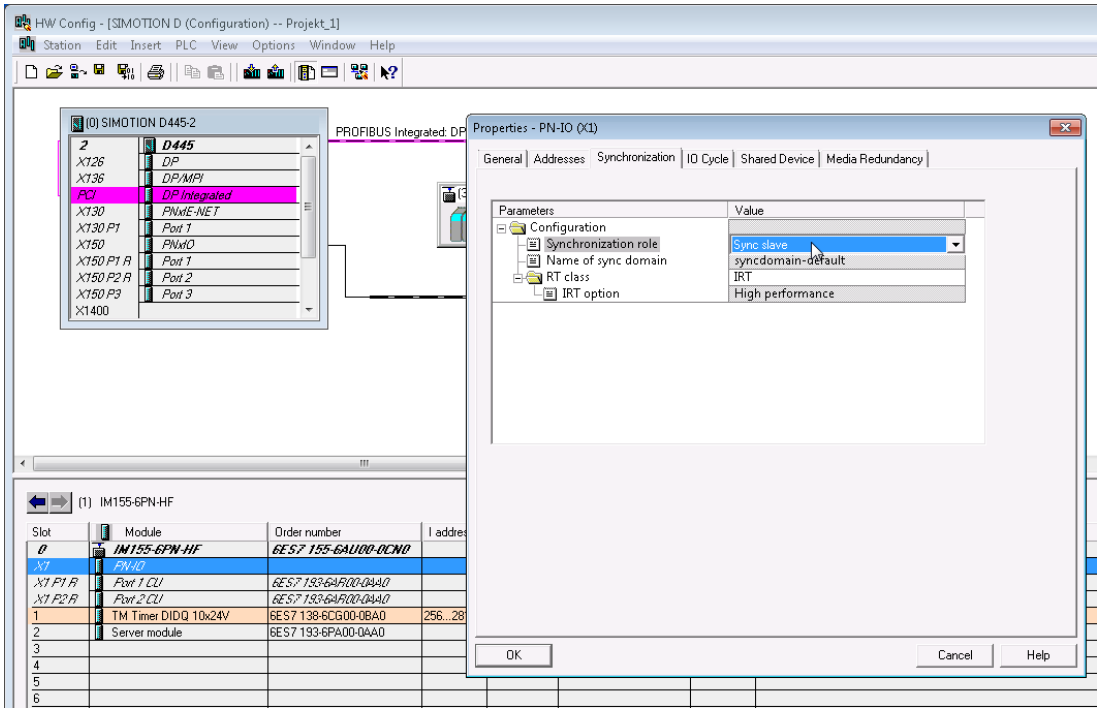

Figure 12-10 Configuring communication (IRT mode) - synchronization

5. Switch to the "IO cycle" tab and select the cycle "Servo" for **Assign IO device isochronously**.

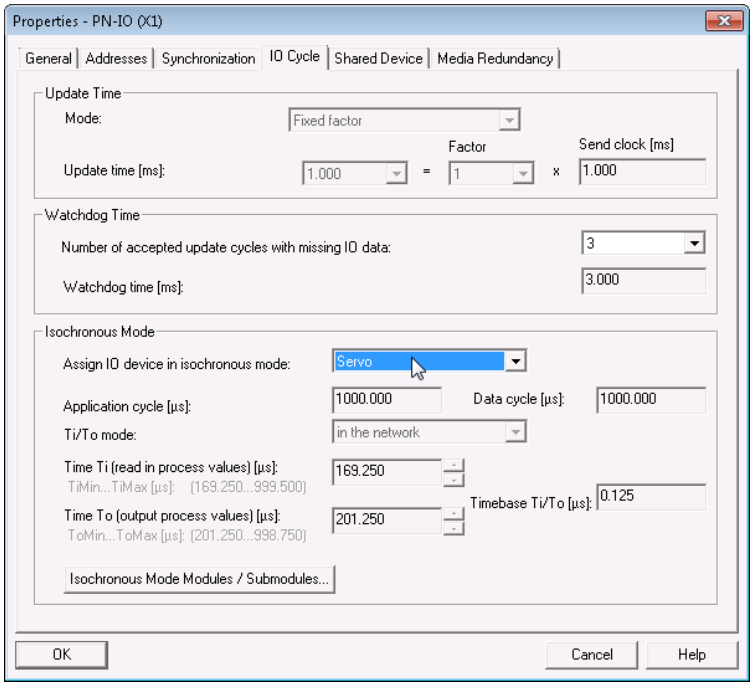

Figure 12-11 Configuring the communication - PROFINET IO cycle

Note

If you operating several ET 200SP interface modules and technology modules TM Timer DIDQ, you must set the isochronous mode at all of the modules.

Configuring I/O channels

Setting options for TM Timer DIDQ 10x24V technology module

Overview

The following pages provide an overview of the properties of the TM Timer DIDQ 10x24V technology module and the properties that you can define for the channels. Not all of the parameters are available depending on the settings.

Parameters	Value range	Default
Basic parameters		
PWM period for the digital outputs	• 10 ms • 5 ms • 2 ms • 1 ms • 0.5 ms • 0.2 ms	10 ms
Response to CPU STOP	• Output substitute value • Keep last value	Output substitute value
Enable diagnostics interrupts	• Deactivated • Activated	Deactivated
Channel parameters		
Configuration DQ/DI group (DQ0/DI0 or DQ1/DI1)	• Timer DQ with enable input • Use input/output individually	Timer DQ with enable input
Operating mode of the digital output	• Timer DQ • Oversampling • Pulse width modulation PWM	Timer DQ
Substitute value for the digital output	• 0 • 1	0
High-speed output (0.1 A)	• Deactivated • Activated	Activated
Inverting of the input or output signal	• Deactivated • Activated	Deactivated
HW enable via the digital input	• Level-controlled • Edge-controlled	Level-controlled

Parameters	Value range	Default
Level selection for HW enable	• Active at high level • Active at low level	Active at high level
Configuration DQ/DI group (DQ2/DI2/DI3)	• Incremental encoder (A, B phase shift) • Timer DI2 with enable input DI3 • Timer DQ2 with enable input DI2 • Use inputs individually	Incremental encoder (A, B phase shift)
Invert counting direction (incremental encoder)	• Deactivated • Activated	Deactivated
Operating mode of the digital output	• Numerator • Timer DI • Oversampling	Timer DI
Input delay for the digital input	• none • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms	0.1 ms
Signal evaluation for the counter	• With rising edge • With falling edge	With rising edge

Further information

See Manual *ET 200SP TM Timer DIDQ 10x24V technology module*.

Configuring I/O channels

Procedure

To configure I/O channels as measuring input input (Timer DI) and output cam (Timer DQ) in the TM Timer DIDQ 10x24V technology module, proceed as follows.

1. Select the ET 200SP interface module in HW Config in the station window. Open the "Properties" dialog by double-clicking on the TM Timer DIDQ 10x24V technology module in the detail view.
2. You can configure the channels in the "Properties" dialog box of the technology module under the "Parameters" tab.
3. In the example, select the value "Use input/output individually" for the DQ0 / DI0 channel group from the "Configuration DQ/DI group" drop-down list. This allows the channels DQ0 and DI0 to be parameterized and used independently of one another.

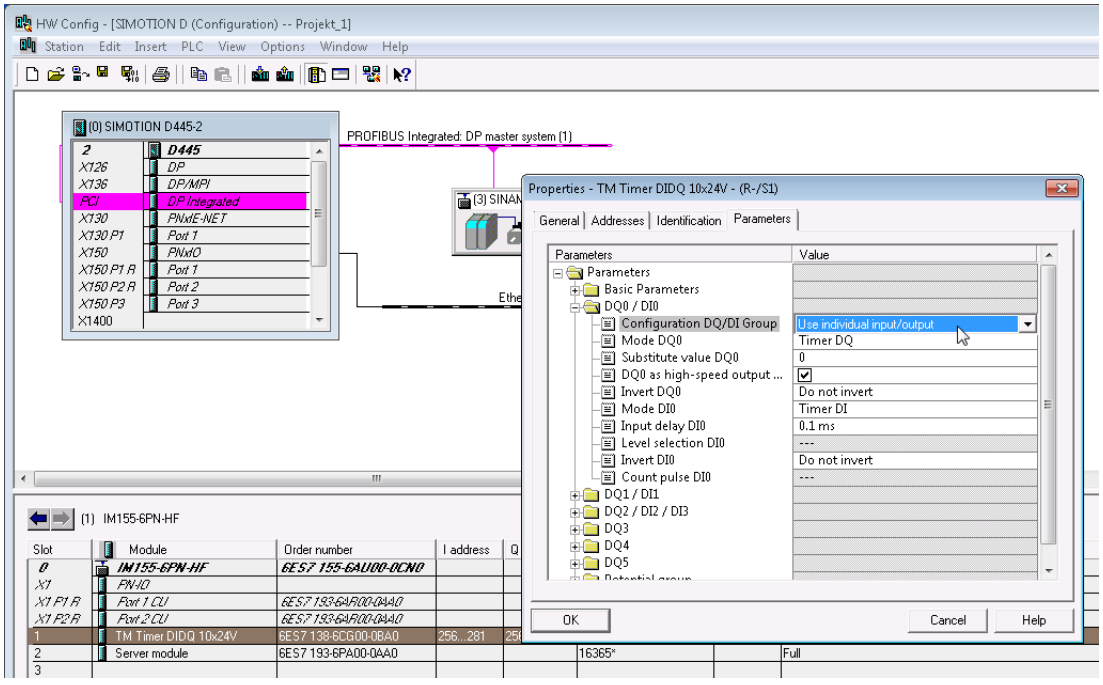

Figure 12-12 Configuring the TM Timer DIDQ 10x24V technology module

Note

This setting allows channel DQ0 to be interconnected as output cam and DI0 as measuring input under SIMOTION SCOUT.

Other information

Note

The technology modules and the individual channels may only be reparameterized in offline state. All changes become effective only after saving, compilation and eventual download of your changed user project to the controller (see Chapter Saving and compiling a user project with SCOUT/SCOUT TIA (Page 8178)).

Use of I/O channels

Introduction

After configuring the technology modules as described in section Configuring I/O channels (Page 8148), the channels can be used in your user project.

In Chapter Linking technology objects with TM Timer DIDQ (Page 8151) using an example, it is shown how channels **DQ0** (Timer DQ) and **DI0** (Timer DI) are interconnected with technology objects **TO cam** or **TO measuring input** .

In Chapter Linking symbolic I/O variables with TM Timer DIDQ (Page 8154), using an example, it is shown in the address list how a variable 'var_QI_MI' can be assigned via symbolic assignment of the quality information **QI** of the measuring input input.

You can find an overview of the I/O points of the channels in Chapter Overview of the I/O points of the channels (Page 8157).

Linking technology objects with TM Timer DIDQ

In the following example, the configured I/O channels (see section Configuring I/O channels (Page 8148)) are linked with one output cam technology object and with one measuring input technology object.

Cam outputs and measuring input inputs are assigned with the assignment partners **CAM_n** or **MI_n**.

Note

This assignment is only possible if Profinet communication was completely configured (see Creating a technology module and configuring communication (Page 8143)).

A general understanding of technology objects is therefore required to perform the required configurations.

Note

Technology objects may only access a TM Timer DIDQ technology module once the technology module has completely powered up (see Chapter Synchronization (Page 8177)). Otherwise, a technology alarm will be triggered.

TO outputCam

Note

Before you insert an output cam, a TO axis (position or synchronous axis) or a TO external encoder, to which the output cam is assigned, has to be created.

To insert a new output cam:

1. In the project navigator, highlight the OUTPUT CAMS folder under the relevant axis or external encoder.
2. Select Insert > Technology object > Output cam or double-click Insert output cam in the project navigator under the axis or external encoder in the OUTPUT CAMS folder. The Insert output cam window appears.
3. Enter a name for the output cam.
4. Confirm with OK. In the working area, the window for the configuration is displayed and the created output cam TO is shown in the project navigator.

In the Configuration window, define the configuration data values for the output cam.

1. Double-clicking in the project navigator below the output cam on the Configuration element displays the window in the working area.
2. Make the following settings:
   - Activate the "Activate output" checkbox.
   - Under the selection "Cam output on:" select entry "Output cam (CAM)".

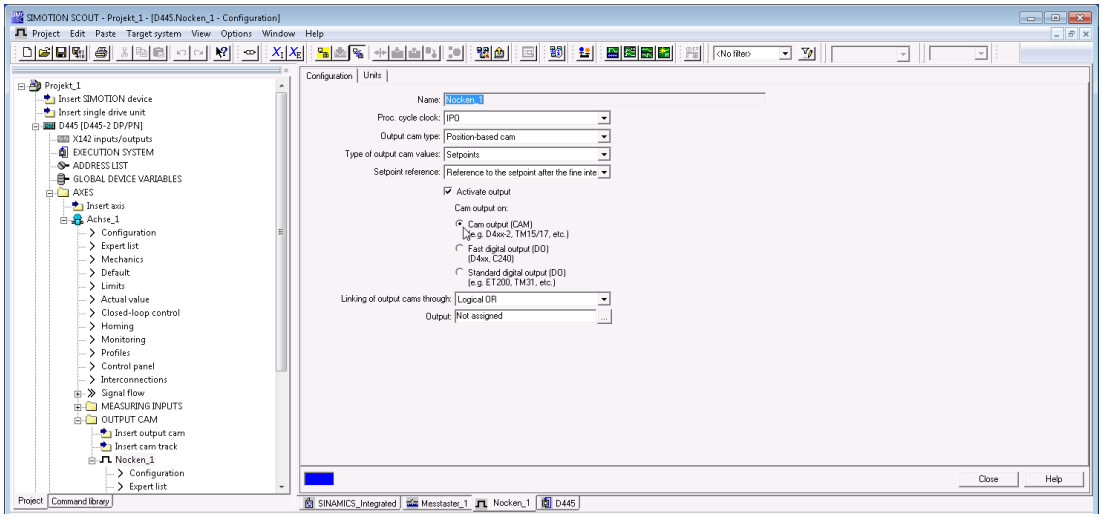

Figure 12-13 Configuring the TO output cam

3. Assign the assignment partner **CAM _0** of the technology module to the output.

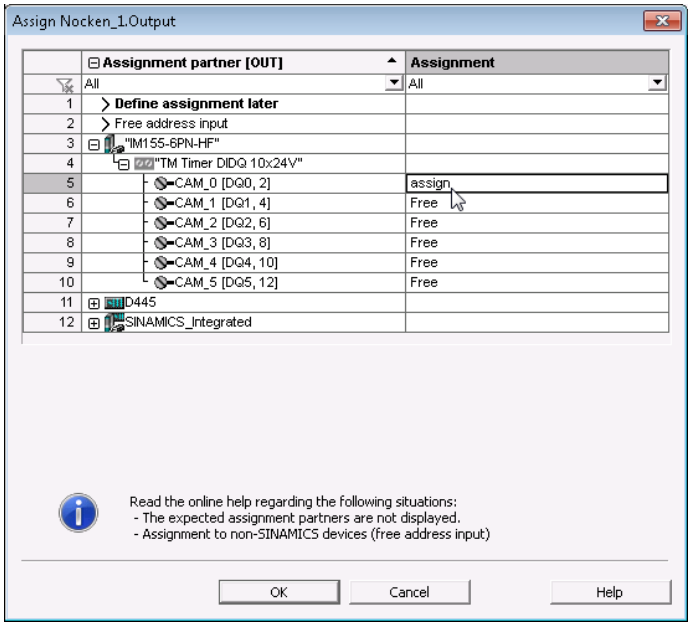

Figure 12-14 Assignment of cam output to TO output cam

4. Confirm with OK.

TO measuringInput

Note

Before you insert a measuring input, the hardware must have been configured – and a TO axis (position or synchronous axis) or a TO external encoder, to which the measuring input is assigned, has to be created.

This is how you enter a measuring input
1. In the project navigator, highlight the folder MEASURING INPUTS under the relevant axis or external encoder.

2. Select Insert > Technology Objects > Measuring Input, or double-click Insert Measuring Input in the project navigator at the axis or external encoder entry in the MEASURING INPUTS folder. The Insert Measuring Input window appears.

3. Enter a name for the measuring input.

4. Confirm with OK. In the working area, the window for the configuration is displayed and the measuring input created is shown in the project navigator.

In the Configuration window, define the configuration data values for the measuring input.

1. Double-clicking in the project navigator below the measuring input on the Configuration element displays the window in the working area.
2. Assign the assignment partner **MI _0** of the technology module to the input.

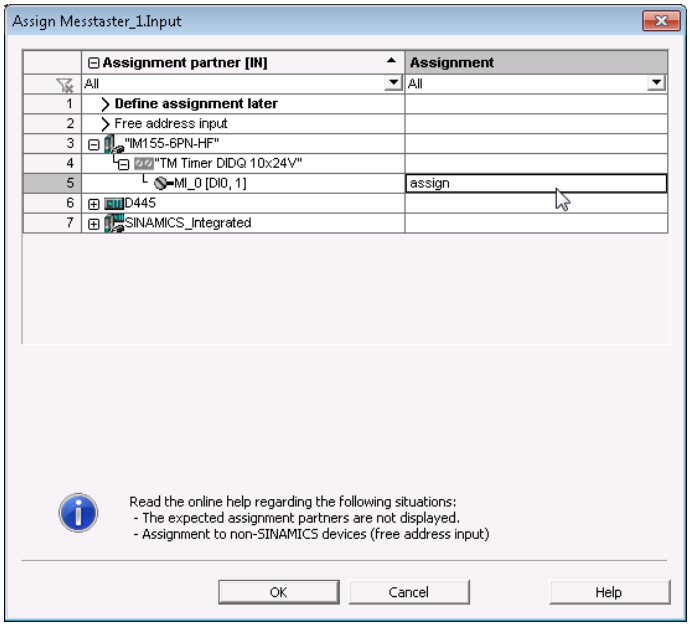

Figure 12-15 Assignment of measuring input input to TO measuringInput

3. Confirm with OK.

Further information

Further information on configuring the output cam and measuring input technology objects can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs Function Manual*.

Linking symbolic I/O variables with TM Timer DIDQ

You can address digital I/O channels using symbolic variables in the user program.

Precondition

The I/O channels are configured as described under Chapter Configuring I/O channels (Page 8148).

Procedure

In the following example, create variable 'var_QI_MI' and link this with quality information **QI** of the measuring input input **MI_0**.

1. Open the **address list** via the project navigator.
2. In the **View** field, select 'I/Os'.
3. Create the variable 'var_QI_MI', type "BOOL", and select 'IN' in the **I/O address** field.

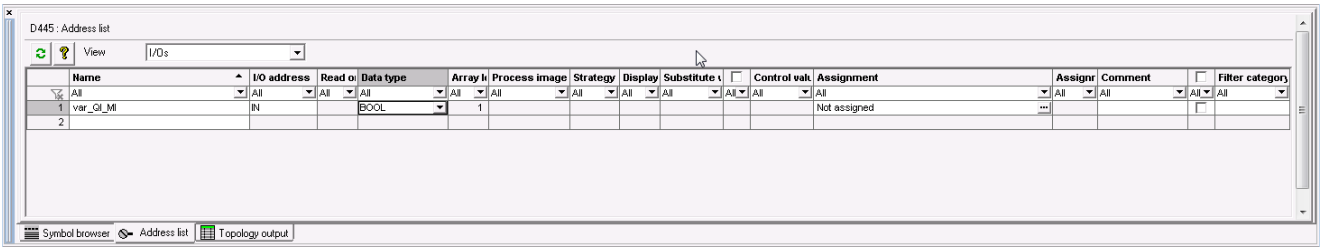

Figure 12-16 Creating variables in the address list

4. In the **Assignment** field, click on ...
5. First select the technology module in the following dialog.

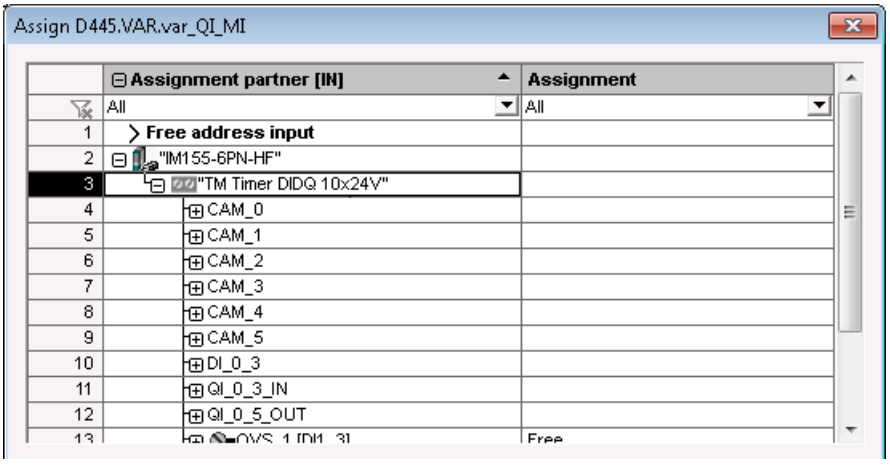

Figure 12-17 Dialog assignment - select module

6. Scroll downwards in the list of assignment partners and from the measuring input input, select the quality information **QI**.

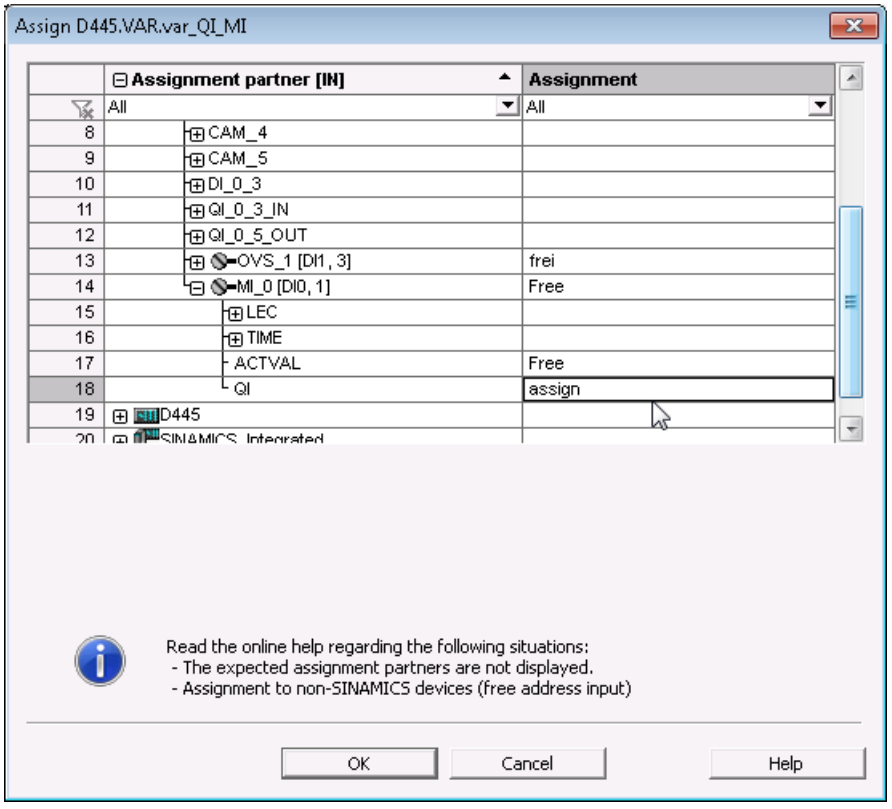

Figure 12-18 Dialog assignment - select QI of the measuring input input

7. Confirm the selection by clicking **OK**.

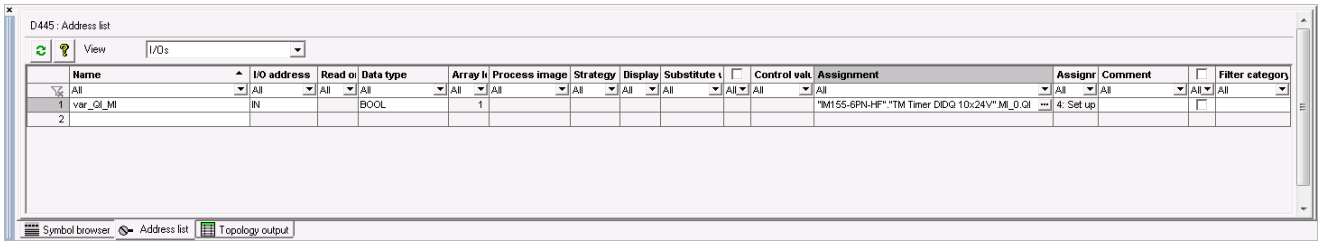

Figure 12-19 Address list following successful assignment

Note

The procedures for generating symbolic variables and for using the process image or direct I/O access are described in detail in the SIMOTION SCOUT Manual.

Overview of the I/O points of the channels

I/O points of the channels Timer DI and Timer DQ

Each I/O channel has different cyclic data in the form of I/O points.

I/O point	Input	Output	Function of the channel [1]	Description
ACTVAL	X		Timer DI, Timer DQ	Actual value of the input / reading back the channel status
QI	X		Timer DI, Timer DQ	Quality information
SETVAL		X	Timer DI, Timer DQ	Setpoint
TIME	X		Timer DI	Time stamp Timer DI
		X	Timer DQ	Time stamp Timer DQ
LEC	X		Timer DI	Counter for lost edges on Timer DI
SEL		X	Timer DI	Edge selection at Timer DI; is used by the TO measuring input
SETEN		X	Timer DI, Timer DQ	Enabling signal
EN	X		Timer DI, Timer DQ	Signal state of the enabling signal

1) Timer DI (measuring input), Timer DQ (output cam)

When using technology objects (interconnection of Timer DQ with TO outputCam/camTrack or Timer DI with TO measuringInput), the following I/O points are not relevant, because they are used or processed by technology objects:

- SEL
- TIME
- ACTVAL
- SETVAL

I/O points of the counter, oversampling, incremental encoder and pulse width modulation channels

Each I/O channel has different cyclic data in the form of I/O points.

I/O point	Input	Output	Channel function	Description
ACTVAL	X		Incremental encoder, oversampling, counter	Actual value of input
QI	X		Incremental encoder, oversampling, counter, pulse width modulation	Quality information
EVENTVAL	X		Incremental encoder, counter	Actual count value
REFVAL	X		Incremental encoder	
ACTSAMPLE	X		Oversampling	32 states of the digital input (oversampling pattern)

SETSAMPLE		X	Oversampling	Specification of the 32 states of the digital output (oversampling pattern)
		X	Pulse width modulation	Specification of pulse-pause ratio as percentage value

Further information

Further information on the I/O points of the channels can be found in the Manual *ET 200SP TM Timer DIDQ 10x24V Technology Module in* Chapter *Control and feedback signal interface*.

12.2.3.3 SIMOTION SCOUT TIA

Hardware and software requirements

The following requirements must be satisfied in order to be able to work with the TM Timer DIDQ technology modules.

Hardware requirements

- SIMATIC ET 200SP interface module, version HF/HS or SIMATIC ET 200MP interface module, version Standard/HF
- TM Timer DIDQ 10x24V or 16x24V technology module
- SIMOTION controller with PROFINET interface (see section System integration (Page 8137))
- PROFINET cables
- External 24 VDC power supply (note the requirements in the *SIMATIC ET 200SP Technology Module TM Timer DIDQ 10x24V* or *SIMATIC ET 200MP/S7-1500 Technology Module TM Timer DIDQ 16x24V" Manual*)

Software requirements

Please observe the following requirements:

- SIMOTION software as of V4.4 HF6
- SIMATIC ET 200SP interface module, version HF or SIMATIC ET 200MP interface module in the Standard/HF version
- TIA Portal as of V13 SP1 as of Update 2

Requirements for operation

Preconditions

The following preconditions must be met before operating TM Timer DIDQ technology module.

1. Your system hardware including the technology module is installed and wired.
2. You have physically connected the technology module via an ET 200SP interface module or an ET 200MP interface module with a SIMOTION controller via the PROFINET IO interface (see Chapter System integration (Page 8137)).
3. You have created a project with a SIMOTION controller with PROFINET interface in the TIA Portal (sync master) and configured PROFINET IRT. The SIMOTION controller is configured for isochronous operation.
4. You have inserted an ET 200MP interface module, e.g. IM155-5 PN HF, assigned it to the SIMOTION controller, and configured it as sync slave with PROFINET IRT. The interface module is configured for isochronous operation.

   Note

   If you operating several ET 200SP/ET 200MP interface modules and technology modules TM Timer DIDQ, you must set the isochronous mode at all of the modules.

5. You have integrated the interface module into the PROFINET topology.

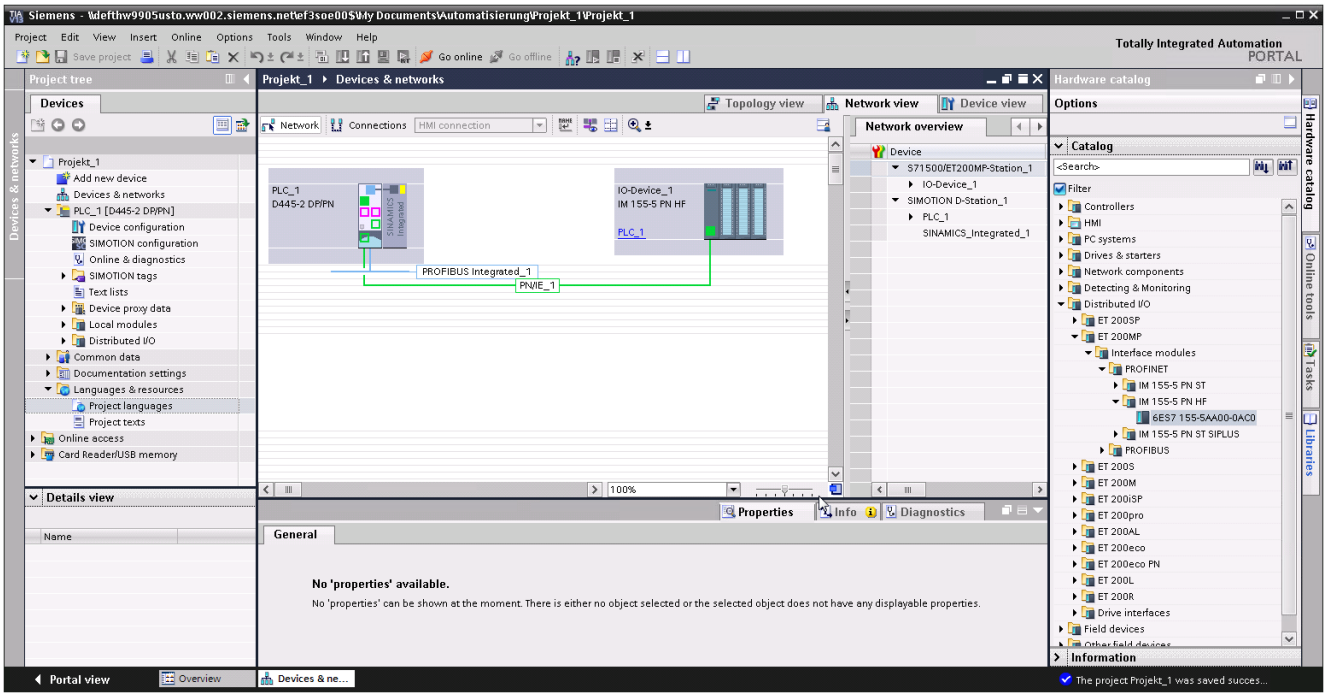

Figure 12-20 Project in the TIA Portal - network view

Note

For further information on configuration of the PROFINET communication please refer to the *SIMOTION SCOUT TIA* Configuration Manual.

Note

The procedures contained in this section assume that the user has a general understanding of TIA Portal or SCOUT TIA.

Note

Please note that interface module ET 200SP – in conjunction with technology module TM Timer DIDQ – can be operated with a minimum PROFINET clock cycle of 500 µs and the ET 200 MP interface module in conjunction with the TM Timer DIDQ technology module, with a minimum PROFINET clock cycle of 250 µs – depending on the quantity structure.

Creating and configuring a technology module

Procedure

1. Switch to the network view in the TIA Portal.
2. The device configuration opens by double-clicking on the ET 200MP interface module.

3. In the "Hardware Catalog" window, navigate to the TM Timer DIDQ 16x24V technology module via Technology modules -> Time-based IO.
4. Drag the technology module to the desired slot in the device view.

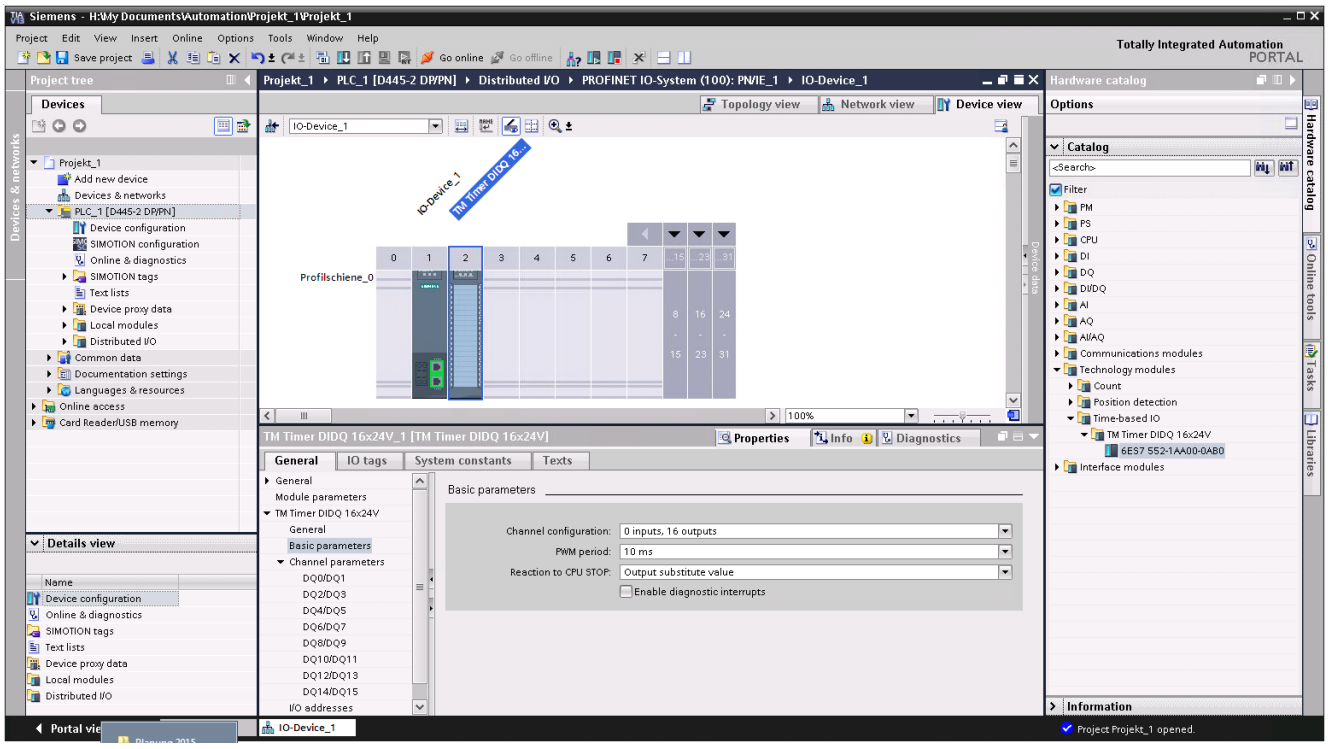

Figure 12-21 TM Timer DIDQ 16x24V technology module inserted in the project

Note

The interface module and the TM Timer DIDQ technology module must be configured for isochronous operation. Check the settings in the inspection window (device configuration of the ET 200MP interface module must be open) under tab PROFINET interface -> Extended options -> Isochronous mode.

Properties of the technology module

The object properties for the TM Timer DIDQ technology modules can be set in the inspection window (the technology module must be selected in the device view) in the "General" tab.

You can view or change the following properties in the object properties:

- General
  - Project information such as name, rack, slot, comment.
    In the Name field you can find the short description of the module, which can be changed according to your specifications. When you change the description, the new description is displayed in the configuration table.
  - Catalog information on the module
  - Identification & Maintenance, e.g. plant ID, date of installation

  Basic parameters
  - Channel configuration
  - PWM
  - Response to CPU STOP
  - Enable diagnostics interrupts
- Channel parameters
  In this tab you parameterize the module, for example the configuration of the DQ/DI groups (see Setting options for TM Timer DIDQ 10x24V technology module (Page 8165) and Setting options for TM Timer DIDQ 16x24V technology module (Page 8166)).
- I/O Addresses
  Here you can assign the module one start address each for the inputs and outputs. The end addresses are calculated automatically. In addition, you must assign the process image, e.g. servo, to the module.

Configuring the technology module

In the following example, a channel configuration with 4 inputs and 12 outputs is used for the TM Timer DIDQ 16x24V technology module.
The input and output addresses are assigned to the process image "Servo".

1. In the "Channel configuration" drop-down list under "Basic parameters", select the setting "4 inputs, 12 outputs".

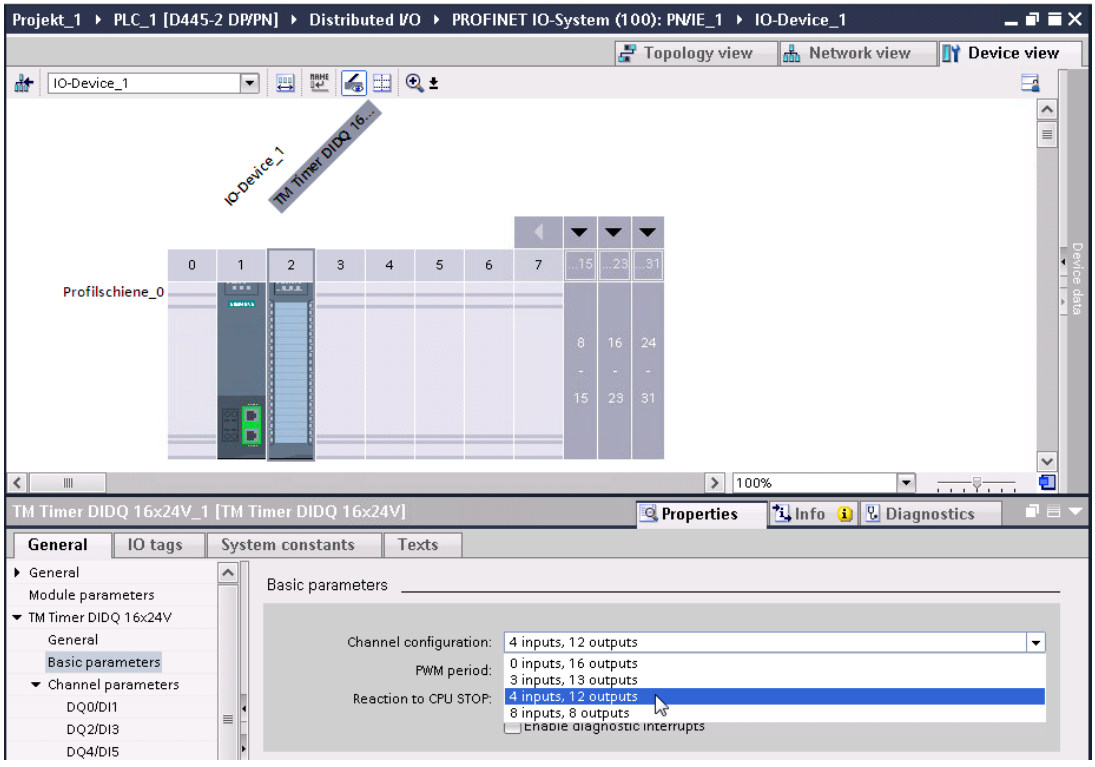

Figure 12-22 Basic parameters - channel configuration

2. In the "Process image" drop-down list under "I/O addresses", uncheck the "Servo" setting for each of the inputs and outputs.
   As start address of the input or output, only use addresses higher than 63; otherwise, when compiling the project, an error message will be output.

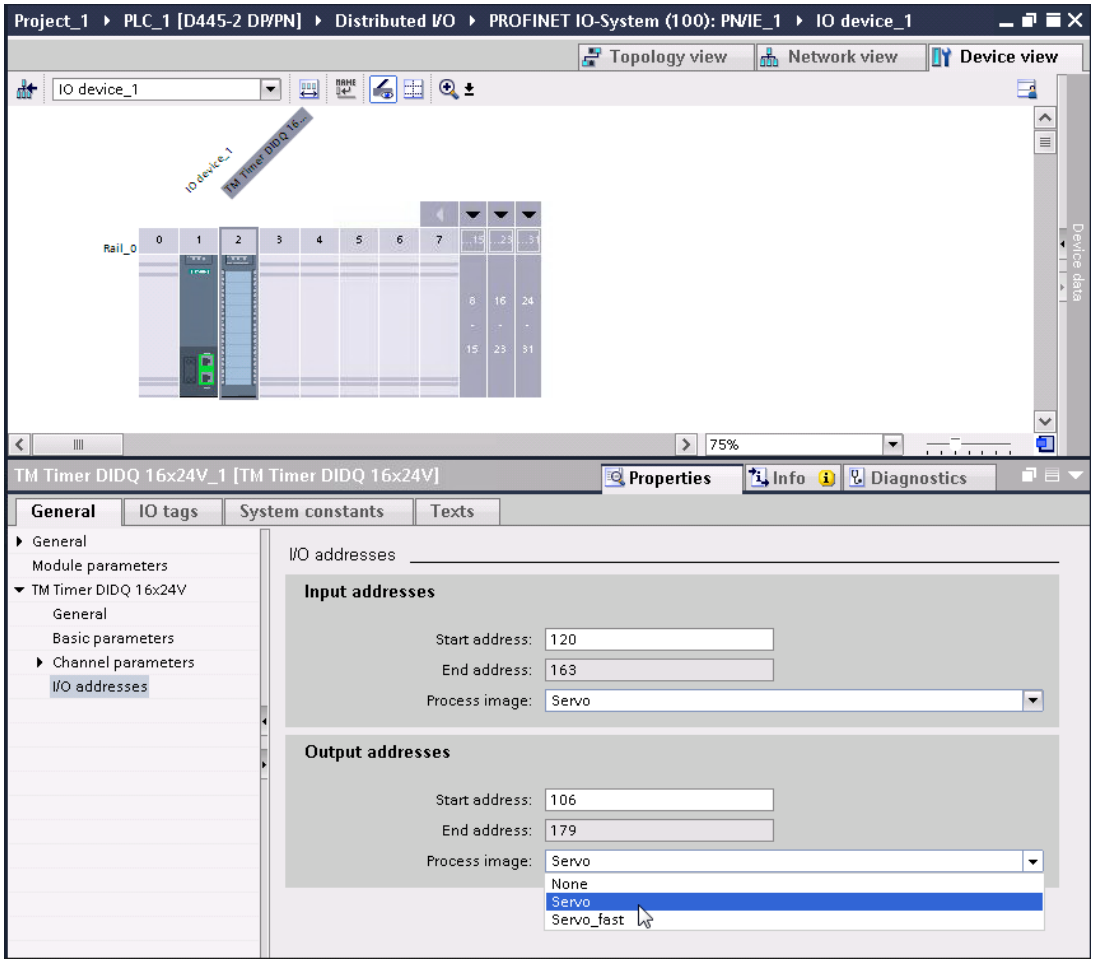

Figure 12-23 I/O addresses - process image

Configuring I/O channels

Setting options for TM Timer DIDQ 10x24V technology module

Overview

The following pages provide an overview of the properties of the TM Timer DIDQ 10x24V technology module and the properties that you can define for the channels. Not all of the parameters are available depending on the settings.

Parameters	Value range	Default
Basic parameters		
PWM period for the digital outputs	• 10 ms • 5 ms • 2 ms • 1 ms • 0.5 ms • 0.2 ms	10 ms
Response to CPU STOP	• Output substitute value • Keep last value	Output substitute value
Enable diagnostics interrupts	• Deactivated • Activated	Deactivated
Channel parameters		
Configuration DQ/DI group (DQ0/DI0 or DQ1/DI1)	• Timer DQ with enable input • Use input/output individually	Timer DQ with enable input
Operating mode of the digital output	• Timer DQ • Oversampling • Pulse width modulation PWM	Timer DQ
Substitute value for the digital output	• 0 • 1	0
High-speed output (0.1 A)	• Deactivated • Activated	Activated
Inverting of the input or output signal	• Deactivated • Activated	Deactivated
HW enable via the digital input	• Level-controlled • Edge-controlled	Level-controlled
Level selection for HW enable	• Active at high level • Active at low level	Active at high level
Configuration DQ/DI group (DQ2/DI2/DI3)	• Incremental encoder (A, B phase shift) • Timer DI2 with enable input DI3 • Timer DQ2 with enable input DI2 • Use inputs individually	Incremental encoder (A, B phase shift)

Parameters	Value range	Default
Invert counting direction (incremental encoder)	• Deactivated • Activated	Deactivated
Operating mode of the digital output	• Numerator • Timer DI • Oversampling	Timer DI
Input delay for the digital input	• none • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms	0.1 ms
Signal evaluation for the counter	• With rising edge • With falling edge	With rising edge

Further information

See Manual *ET 200SP TM Timer DIDQ 10x24V technology module*.

Setting options for TM Timer DIDQ 16x24V technology module

Overview

The following pages provide an overview of the TM Timer DIDQ 16x24V technology module properties and the properties that you can define for the channels. Not all of the parameters are available depending on the settings.

Parameter	Value range	Default
Basic parameters		
Channel configuration of the module	• 0 inputs, 16 outputs • 3 inputs, 13 outputs • 4 inputs, 12 outputs • 8 inputs, 8 outputs See also section "Additional digital inputs without technology function".	0 inputs, 16 outputs
PWM period for the digital outputs	• 10 ms • 5 ms • 2 ms • 1 ms • 0.5 ms • 0.2 ms	10 ms
Response to CPU STOP	• Output substitute value • Keep last value	Output substitute value

Parameter	Value range	Default
Enable diagnostics interrupts	• Deactivated • Activated	Deactivated
Channel parameters		
Operating mode of the digital output	• Timer DQ • Oversampling • Pulse width modulation PWM	Timer DQ
Substitute value for the digital output	• 0 • 1	0
High-speed output (0.1 A)	• Deactivated • Activated	Activated
Inverting of the input or output signal	• Deactivated • Activated	Deactivated
HW enable via the digital input	• Level-controlled • Edge-controlled	Level-controlled
Level selection for HW enable	• Active at high level • Active at low level	Active at high level
Configuration DI group	• Incremental encoder (A, B phase shift) • Timer DI with enable input • Use inputs individually	Incremental encoder (A, B phase shift)
Invert counting direction (incremental encoder)	• Deactivated • Activated	Deactivated
Operating mode of the digital output	• Numerator • Timer DI • Oversampling	Timer DI
Input delay for the digital input	• none • 0.05 ms • 0.1 ms • 0.4 ms • 0.8 ms	0.1 ms
Signal evaluation for the counter	• With rising edge • With falling edge	With rising edge
Configuration DQ/DI group	• Timer DQ with enable input • Use input/output individually	Timer DQ with enable input

Additional digital inputs without technology function

Channel configuration	Number of additional digital inputs without technology function
0 inputs, 16 outputs	8
3 inputs, 13 outputs	5

Channel configuration	Number of additional digital inputs without technology function
4 inputs, 12 outputs	4
8 inputs, 8 outputs	0

Unused inputs are available as digital inputs without technology function. The input delay of an input parameter is parameterized on the associated output channel.

Further information

See *SIMATIC ET 200MP/S7-1500 Technology Module TM Timer DIDQ 16x24V* Manual.

Configuring I/O channels

Procedure

To configure I/O channels as measuring input input (Timer DI) and output cam (Timer DQ) in the TM Timer DIDQ 16x24V technology module,
proceed as follows.

1. The technology module is selected in the device view. To configure the I/O channels, click on channel parameters in the "General" tab in the inspection window.
2. In the example, select the value "Use input/output individually" for the DQ0 / DI1 channel group from the "Configuration DQ/DI group" drop-down list. This allows the channels DQ0 and DI1 to be parameterized and used independently of one another.

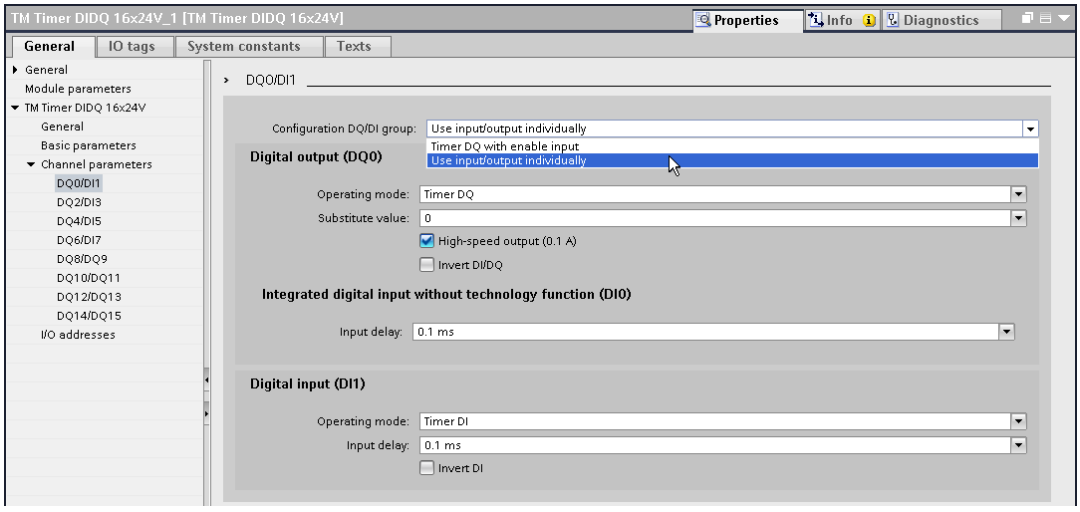

Figure 12-24 Channel parameter - configuration DQ/DI group

In addition to the (DQ0) digital output and the (DI1) digital input, the "Integrated digital input without technology function (DI0)" is also available.

Note

The additional "Integrated digital input without technology function (DI0)" can also be interconnected in SIMOTION SCOUT TIA.

3. Save and compile the project.
4. To interconnect the channels with the technology objects outputCam or measuringInput, open the SIMOTION configuration.

Note

This setting allows channel DQ0 to be interconnected as output cam and DI1 as measuring input input under SIMOTION SCOUT TIA.

Other information

Note

The technology modules and the individual channels may only be reparameterized in offline state. All changes become effective only after saving, compilation and eventual download of your changed user project to the controller (see Chapter Saving and compiling a user project with SCOUT/SCOUT TIA (Page 8178)).

Use of I/O channels

Introduction

After configuring the technology modules as described in section Configuring I/O channels (Page 8165), the channels can be used in your user project.

In section Linking technology objects with TM Timer DIDQ (Page 8169) using an example, it is shown how channels **DQ0** (Timer DQ) and **DI1** (Timer DI) are interconnected with technology objects **TO cam** or **TO measuring input** .

Chapter Linking symbolic I/O variables with TM Timer DIDQ (Page 8172) uses an example to show how in the address list of a 'var_DI' variable the symbolic assignment of the **DI_16** digital input (additional digital input without technology function (DI0)) and a 'var_QI_MI' variable are used to assign the **QI** quality information of the **MI_1** measurement sensing input.

You can find an overview of the I/O points of the channels in section Overview of the I/O points of the channels (Page 8176).

Linking technology objects with TM Timer DIDQ

In the following example, the configured I/O channels (see section Configuring I/O channels (Page 8165)) are linked with one output cam technology object and with one measuring input technology object.

Cam outputs and measuring input inputs are assigned with the assignment partners **CAM_n** or **MI_n**.

Note

This assignment is only possible if Profinet communication was completely configured (see Chapter Requirements for operation (Page 8159) and Creating and configuring a technology module (Page 8160)).

A general understanding of technology objects is therefore required to perform the required configurations.

Note

Technology objects may only access a TM Timer DIDQ technology module once the technology module has completely powered up (see Chapter Synchronization (Page 8177)). Otherwise, a technology alarm will be triggered.

TO outputCam

Note

Before you insert an output cam, a TO axis (position or synchronous axis) or a TO external encoder, to which the output cam is assigned, has to be created.

To insert a new output cam:

1. In the project navigator, highlight the OUTPUT CAMS folder under the relevant axis or external encoder.
2. Select Insert > Technology object > Output cam or double-click Insert output cam in the project navigator under the axis or external encoder in the OUTPUT CAMS folder. The Insert output cam window appears.
3. Enter a name for the output cam.
4. Confirm with OK. In the working area, the window for the configuration is displayed and the created output cam TO is shown in the project navigator.

In the Configuration window, define the configuration data values for the output cam.

1. Double-clicking in the project navigator below the output cam on the Configuration element displays the window in the working area.
2. Make the following settings:
   - Activate the "Activate output" checkbox.
   - Under the selection "Cam output on:" select entry "Output cam (CAM)".

3. Assign the assignment partner **CAM _0** of the technology module to the output.

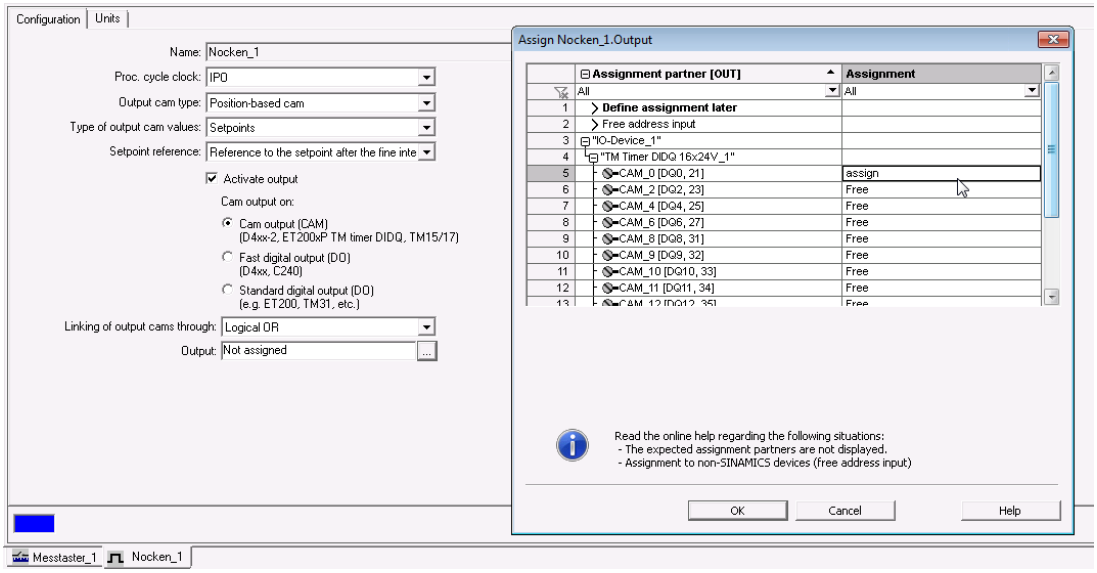

Figure 12-25 Assignment of cam output to TO output cam

4. Confirm with OK.

TO measuringInput

Note

Before you insert a measuring input, the hardware must have been configured – and a TO axis (position or synchronous axis) or a TO external encoder, to which the measuring input is assigned, has to be created.

This is how you enter a measuring input
1. In the project navigator, highlight the folder MEASURING INPUTS under the relevant axis or external encoder.

2. Select Insert > Technology Objects > Measuring Input, or double-click Insert Measuring Input in the project navigator at the axis or external encoder entry in the MEASURING INPUTS folder. The Insert Measuring Input window appears.

3. Enter a name for the measuring input.

4. Confirm with OK. In the working area, the window for the configuration is displayed and the measuring input created is shown in the project navigator.

In the Configuration window, define the configuration data values for the measuring input.

1. Double-clicking in the project navigator below the measuring input on the Configuration element displays the window in the working area.
2. Assign the assignment partner **MI _1** of the technology module to the input.

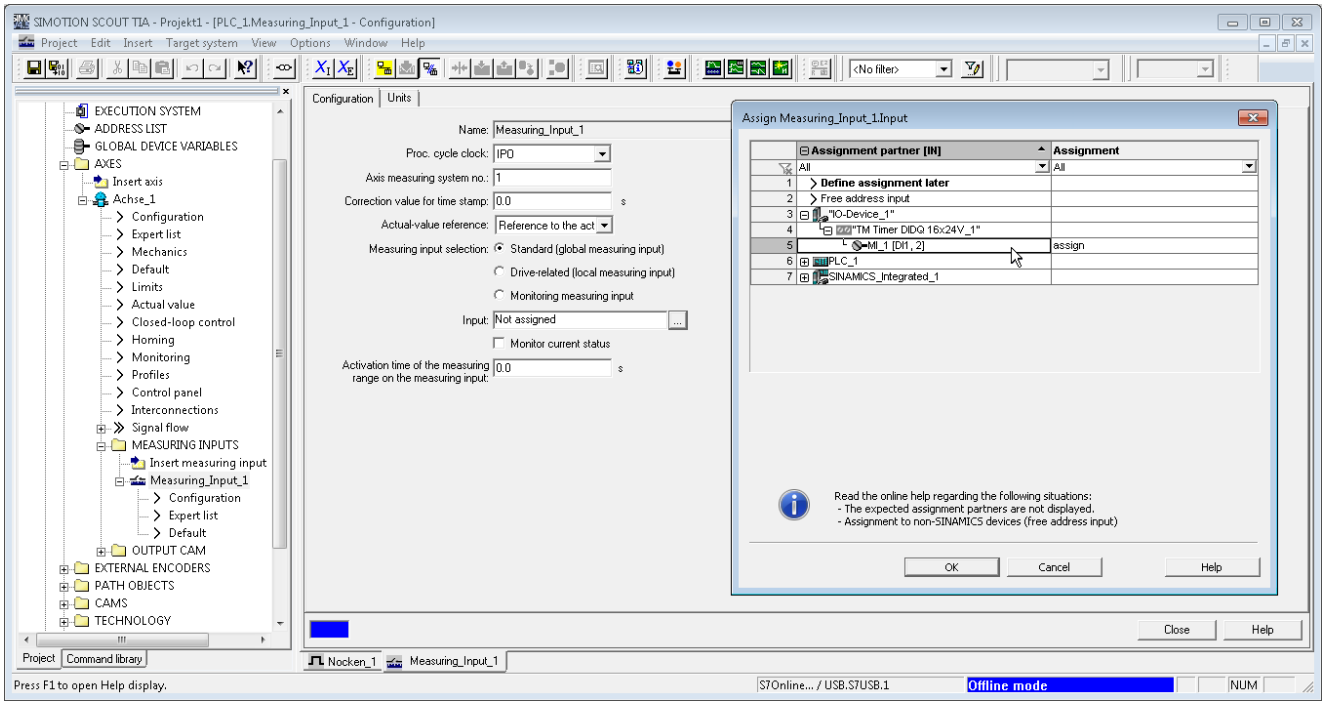

Figure 12-26 Assignment of measuring input input to TO measuringInput

3. Confirm with OK.

Further information

Further information on configuring the output cam and measuring input technology objects can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs Function Manual*.

See also

Service and maintenance (Page 8181)

Linking symbolic I/O variables with TM Timer DIDQ

You can address digital I/O channels using symbolic variables in the user program.

Requirement

The I/O channels are configured as described under section Configuring I/O channels (Page 8165).

Procedure

In the following example, create the 'var_DI' and 'var_QI_MI' variables. Link the 'var_DI' variable with the **DI_16** digital input (additional digital input without technology function (DI0)), and the 'var_QI_MI' variable with the **QI** quality information of the **MI_1** measuring input input.

1. Open the **address list** via the project navigator.
2. In the **View** field, select 'I/Os'.
3. Create the'var_DI' and 'var_QI_MI' variables of BOOL type, and select 'IN' in each **I/O address** field.

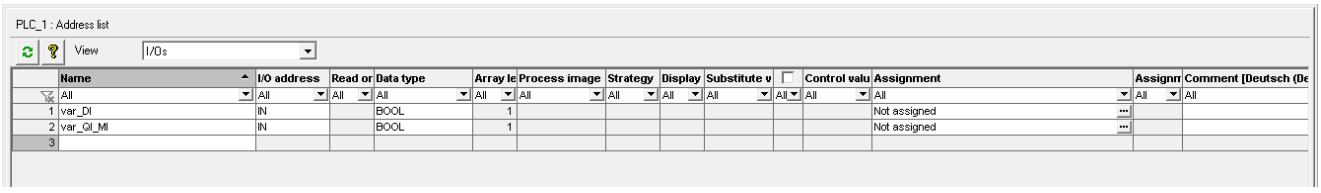

Figure 12-27 Creating variables in the address list

4. Click ... for the 'var_DI' variable in the **Assignment** field
5. First select the technology module in the following dialog.

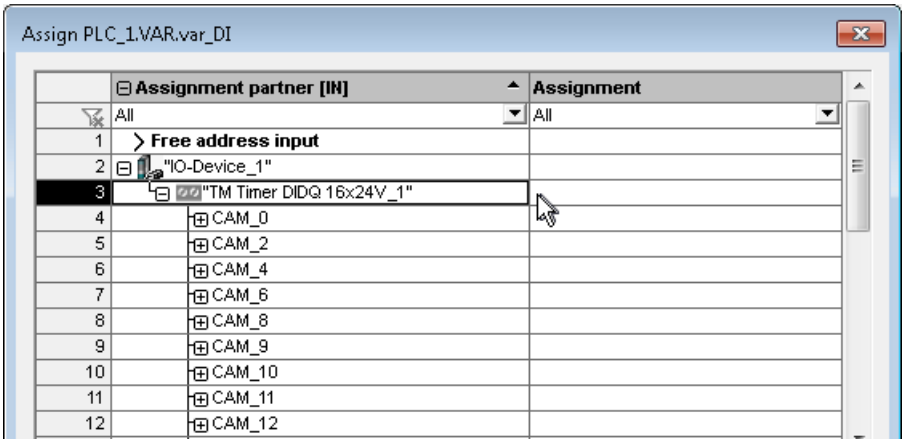

Figure 12-28 Dialog assignment - select module

6. Scroll downwards in the list of assignment partners and select the **DI_16** digital input.

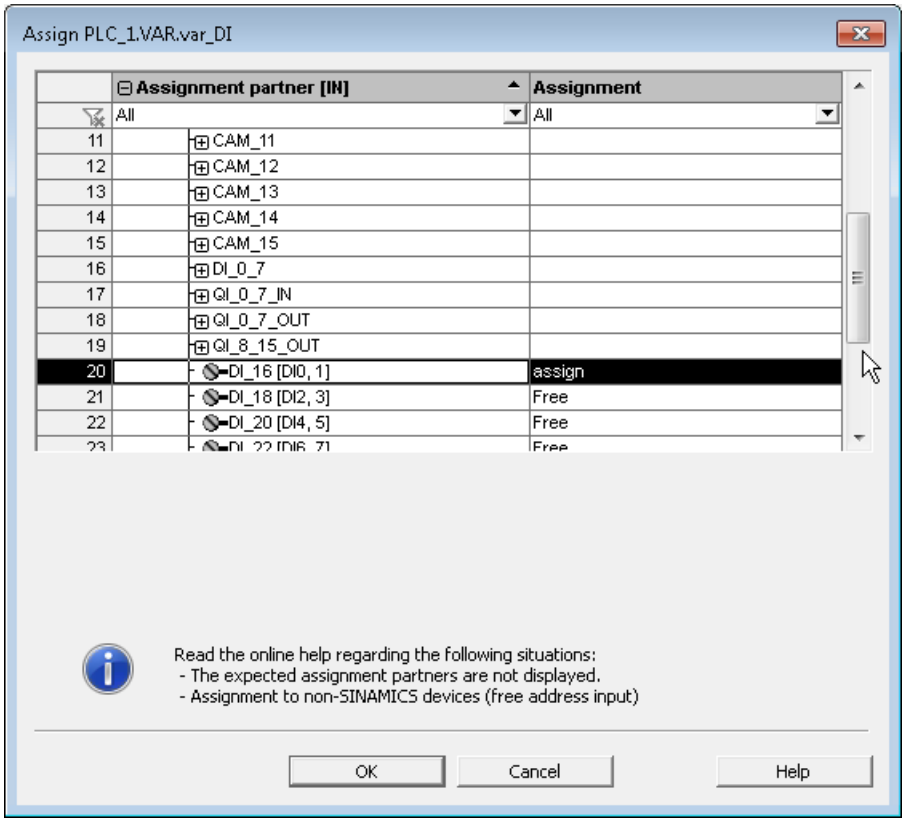

Figure 12-29 Dialog assignment - select DI (without technology function)

7. Confirm the selection by clicking **OK**.
8. Click ... for the 'var_QI_MI'variable in the **Assignment** field

9. Scroll downwards in the list of assignment partners and select the **QI** quality information from the **MI_1** measuring input input.

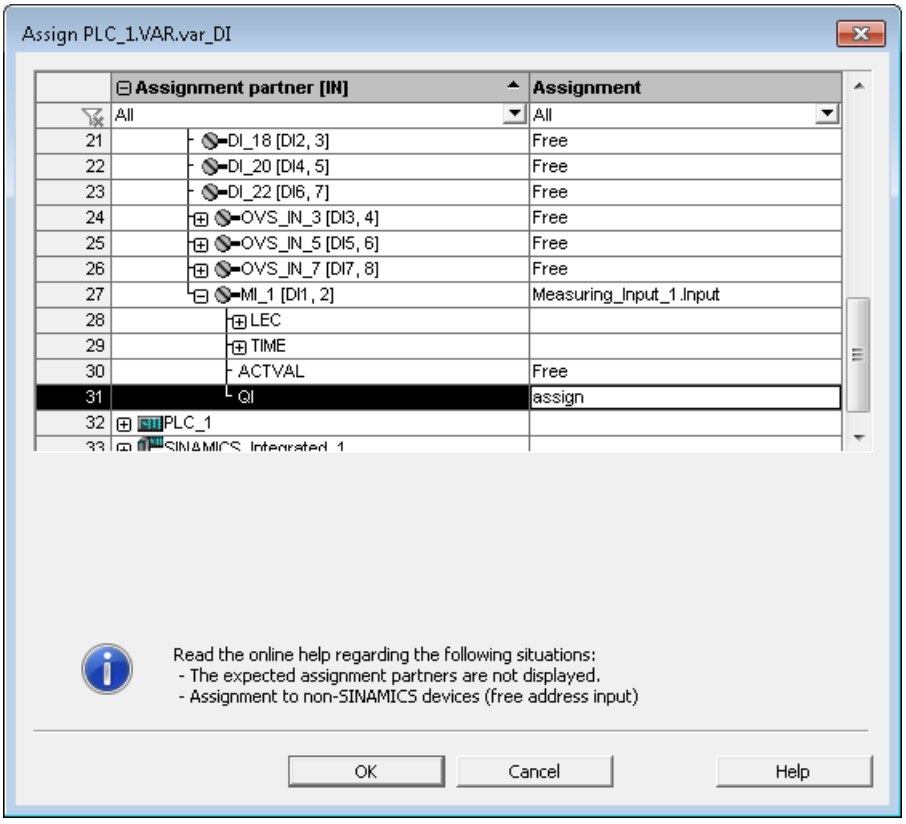

Figure 12-30 Dialog assignment - select QI of the measuring input input

10. Confirm the selection by clicking **OK**.

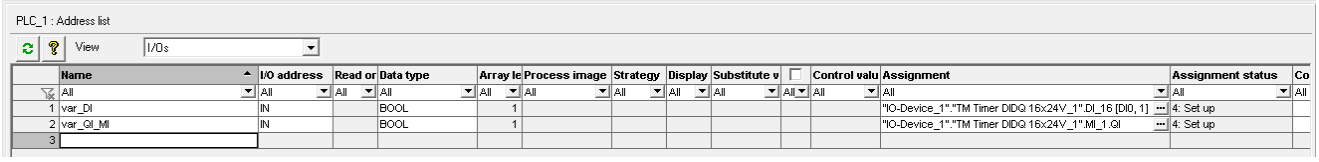

Figure 12-31 Address list following successful assignment

Note

The procedures for generating symbolic variables and for using the process image or direct I/O access are described in detail in the SIMOTION SCOUT TIA Manual.

Overview of the I/O points of the channels

I/O points of the channels Timer DI and Timer DQ

Each I/O channel has different cyclic data in the form of I/O points.

I/O point	Input	Output	Function of the channel [1)]	Description
ACTVAL	X		Timer DI, Timer DQ	Actual value of the input / reading back the channel status
QI	X		Timer DI, Timer DQ	Quality information
SETVAL		X	Timer DI, Timer DQ	Setpoint
TIME	X		Timer DI	Time stamp Timer DI
		X	Timer DQ	Time stamp Timer DQ
LEC	X		Timer DI	Counter for lost edges on Timer DI
SEL		X	Timer DI	Edge selection at Timer DI; is used by the TO measuring input
SETEN		X	Timer DI, Timer DQ	Enabling signal
EN	X		Timer DI, Timer DQ	Signal state of the enabling signal

1) Timer DI (measuring input), Timer DQ (output cam)

When using technology objects (interconnection of Timer DQ with TO outputCam/camTrack or Timer DI with TO measuringInput), the following I/O points are not relevant, because they are used or processed by technology objects:

- SEL
- ACTVAL
- SETVAL
- TIME

I/O points of the counter, oversampling, incremental encoder and pulse width modulation channels

Each I/O channel has different cyclic data in the form of I/O points.

I/O point	Input	Output	Channel function	Description
ACTVAL	X		Incremental encoder, oversampling, counter	Actual value of input
QI	X		Incremental encoder, oversampling, counter, pulse width modulation	Quality information
EVENTVAL	X		Incremental encoder, counter	Actual count value
REFVAL	X		Incremental encoder	
ACTSAMPLE	X		Oversampling	32 states of the digital input (oversampling pattern)

SETSAMPLE		X	Oversampling	Specification of the 32 states of the digital output (oversampling pattern)
		X	Pulse width modulation	Specification of pulse-pause ratio as percentage value

Further information

Further information on the I/O points of the channels can be found in the *SIMATIC ET 200SP Technology Module TM Timer DIDQ 10x24V*and *SIMATIC ET 200MP/S7-1500 Technology Module TM Timer DIDQ 16x24V*Manuals, in Chapter *Control and feedback signal interface*.

12.2.3.4 Synchronization

After recording the connection between the controller and the TM Timer DIDQ technology module (the controller is switched on and powered up, the header module (IM) is switched on and powered up, the TM Timer DIDQ technology module is switched on and powered up, establishing a connection from the controller to the header module (IM) and to the TM Timer DIDQ technology module was successful), the TM Timer DIDQ is parameterized by the controller and the header module (IM) synchronizes to the PN cycle clock.

The cyclic connection is thus established, the cyclic I/O data of the TM Timer DIDQ technology module is now available in the controller (for access by the user program or for technology object access).

Note

The TM Timer DIDQ technology module must only accessed via I/O access if the header module (IM) and the technology module TM Timer DIDQ have been ramped-up. Otherwise, the CPU switches to STOP mode due to an I/O access error during I/O access.

The synchronization can be monitored via the PeripheralFaultTask.

Monitoring of synchronization between a technology module and a SIMOTION controller with PeripheralFaultTask

During the transition from START-UP to RUN, all technology modules with parameterized technology functions are in the "NOT_SYNCHRONIZED" state.

- As soon as the Terminal Modules have been successfully synchronized, the PeripheralFaultTask with interrupt ID "_SC_IO_MODULE_SYNCHRONIZED" (=214) is called.
- If synchronization fails, the PeripheralFaultTask with interrupt ID "_SC_IO_MODULE_NOT_SYNCHRONIZED" (=215) is called.

Example

To synchronize the user task, a user variable **TM_SYNC** is set to **FALSE** in the StartUpTask and set to **TRUE** in the PeripheralFaultTask with interrupt ID = SC_IO_MODULE_SYNCHRONIZED. The

status of **TM_SYNC** is queried in the user task before the (first) direct access to the technology module.

The following TaskStartInfo is supplied in the PeripheralFaultTask every time it is called:

```
UDINT   TSI#interruptID     // scan for triggering event
DINT    TSI#logBaseAdrIn    // valid only when not equal to _SC_INVALID_ADDRESS
DINT    TSI#logBaseAdrOut   // valid only when not equal to _SC_INVALID_ADDRESS
DINT    TSI#logDiagAdr      // valid only when not equal to _SC_INVALID_ADDRESS
DWORD   TSI#details         // set to 0
UINT    TSI#eventClass      // set to 0
UINT    TSI#faultId         // set to 0
```

The TaskStartInfo contains the logical address of the relevant technology module.

TSI#logDiagAdr, TSI#details, TSI#eventClass and TSI#faultId do not have any significance for technology modules.

Further information

Further information on synchronization can be found in the SIMATIC manuals, see SIMATIC documentation (Page 8135).

For further information on the TaskStartInfo, refer to the *SIMOTION ST Structured Text* Manual.

12.2.3.5 Saving and compiling a user project with SCOUT/SCOUT TIA

To save and compile with HW Config or SIMOTION SCOUT, proceed as described below:

Saving and compiling with HW Config

1. Save and compile the project via the menu Station -> Save and compile.
2. Before downloading the hardware configuration, you can select the "Check consistency" option in the Station menu. In this way, you can check whether the hardware configuration has been defined without errors, e.g. with regard to PROFINET settings, etc.
3. Transfer the project to the controller.

Saving and compiling with SIMOTION SCOUT/SCOUT TIA

1. Save and compile the project, e.g. via the Project -> Save and recompile changes menu.
2. You can select the "Check consistency" option in the Project menu of the main SIMOTION SCOUT/SCOUT TIA menu at any time. (For more information, refer to the SCOUT online help.) In this way, you can check whether the configuration, parameterization and programming in SIMOTION SCOUT/SCOUT TIA matches the defined hardware configuration.
3. Transfer the project to the controller.

12.2.3.6 Notes for those changing over

When changing over from the TM15/TM17 High Feature Terminal Modules to the TM Timer DIDQ technology modules, the following points must be worked through:

- Modifications must be made in the control cabinet and interconnections adapted.
- The project must be adapted analogously to the procedure described in Chapter Configuring.
- PROFINET communication with isochronous mode must be configured.

Note

The connection to the SIMOTION hardware cannot be realized using DRIVE-CLiQ as is the case for TM15/TM17 High Feature; PROFINET must always be used.

12.2.4 Functions

12.2.4.1 Overview

For the TM Timer DIDQ technology modules, you can evaluate the signals at the digital inputs and outputs for the following functions:

Function	Designation channel parameterization in HW Config/ HWCN	Access point in SCOUT/SCOUT TIA	Use in SCOUT/SCOUT TIA
Inputs			
Measuring input	Timer DI	MI_n	Interconnectable with SIMOTION TO measuringInput and IO variable
Oversampling	Oversampling	OVS_IN_n	Interconnectable with IO variable
Numerator	Numerator	EPC_n	Interconnectable with IO variable
Incremental encoder	Incremental encoder	EPC_n	Interconnectable with IO variable
Outputs			
Output cam	Timer DQ	CAM_n	Interconnectable with SIMOTION TO outputCam/camTrack and IO variable
Pulse width modulation	Pulse width modulation	PWM_n	Interconnectable with IO variable
Oversampling	Oversampling	OVS_OUT_n	Interconnectable with IO variable

Further information

- Additional information on the functions of the technology modules TM Timer DIDQ is provided in the *SIMATIC ET 200SP technology module TM Timer DIDQ 10x24V* and *SIMATIC ET 200MP/S7-1500 technology module TM Timer DIDQ 16x24V* Manuals.
- Further information on configuring output cams and measuring inputs can be found in the *SIMOTION Motion Control Output Cams and Measuring Inputs Function Manual*.

12.2.4.2 HW enable for the channels Timer DI and Timer DQ

Precondition

You have parameterized a channel at the TM Timer DIDQ as "Timer DQ with enabling input" or "Timer DI with enabling input".

Edge-controlled HW enable

With an edge-controlled enable, output cams are output at the output only if the enable status exists before the output cam start. The enable status is controlled by a configured Measuring Input Technology Object.

For the edge-controlled enable, the technology object measuring input is only measured if enabled. The enable status is controlled by a configured measuring input technology object linked with the enable channel.

For the measuring input TO, only the "one-time measuring" mode is permitted with the following edge detection:

- Rising edge
- Falling edge
- Both edges

Measuring of "Both edges, first rising" and "Both edges, first falling" and the "Cyclic measuring" mode is not supported.

Via the measuring input TO

- the positions of the enable edges can be evaluated (see SIMOTION Motion Control - Output Cams and Measuring Inputs" Function Manual). Please note that the measuring range is monitored in the IPO, IPO2 or position control cycle clock, depending on the configured measuring input cycle clock.
- Set or reset the enable status.
  The enable status is set when the configured edge arrives.
  The enable status is reset
  - At the beginning of the measuring range configured at the Measuring Input TO (with range setting: "Measure in specified range")
  - using the program command _enableMeasuringInput (with range setting: "Measure without a defined range")

The enable status can be monitored via the I/O area of the enable input.

If the enable status is retracted before the output cam ends, the output cam is still output until the end if it has already started. New output cams are no longer output.

Level-controlled HW enable

Note

Information on level-controlled hardware enable is provided in the *SIMATIC ET 200SP technology module TM Timer DIDQ 10x24V* and *SIMATIC ET 200MP/S7-1500 technology module TM Timer DIDQ 16x24V* in Chapter *Functions*.

12.2.5 Service and maintenance

12.2.5.1 Replacing a technology module

Information on replacing a TM Timer DIDQ technology module can be found in the system manuals *SIMATIC ET 200SP distributed I/O system* and *ET 200MP distributed I/O system*, Chapter Maintenance -> Replacing an I/O module.

12.2.5.2 Firmware update

Information on the firmware update can be found in the system manuals *SIMATIC ET 200SP distributed I/O system* and *ET 200MP distributed I/O system,* Chapter Maintenance -> Firmware update.

12.2.6 Diagnostics

12.2.6.1 Overview of the diagnostic possibilities

The following diagnostics options are available to you in the TM Timer DIDQ technology modules:

- LEDs (module)
- Quality information (telegram level)
- HW Config/HWCN (engineering system)

Further information

Further information on the diagnostics options can be found in the *SIMATIC ET 200SP Technology Module TM Timer DIDQ 10x24V*and *S7-1500/ET 200MP Technology Module TM Timer DIDQ 16x24V Manuals*.

12.3 TM15 / TM17 High Feature Operating Manual

Preface

Scope

This manual describes the supplementary TM15 / TM17 High Feature Terminal Modules in operation under SIMOTION D or under SINAMICS S120 in connection with SIMOTION C, P or D.

This manual is aimed at machine manufacturers, plant engineers, commissioning personnel, and service personnel who use SIMOTION in connection with SINAMICS.

Contents of the commissioning manual

The following is a list of chapters included in this manual along with a description of the information presented in each chapter.

- Description
  This section describes the overall use of the TM15 and TM17 High Feature modules.
- Configuration/programming
  This section describes step-by-step instructions for configuration and integration into your user program.
- Commissioning
  This section details what is required at power up and what should be observed during the power up process.
- Error messages
  This section provides diagnostic information regarding possible faults.
- Application tips
  This section contains practical information for interconnection and use of the Terminal Modules.
- Appendix
  This chapter provides factual information (e.g. standards, approvals, and ESD guidelines).
- Index
  The index helps you to locate information in the Manual quickly and easily.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

http://www.siemens.com/mdm

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

Disposal and recycling of the device

TM15 / TM17 High Feature is an environmentally friendly product. It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Identification of plastic materials in accordance with DIN 54840.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The disposal of the products described in this manual should be performed in compliance with the valid national regulations.

The products can be largely recycled owing to their low pollutant content. To recycle and dispose of your old device in an environmentally friendly way, please contact a recycling company certified for electronic waste.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner/index.asp

Further information / FAQs

You can find further information on this manual under the following FAQs:

http://support.automation.siemens.com/WW/view/de/27585482

You can also find additional information under:

- SIMOTION Utilities & Applications: SIMOTION Utilities & Applications will be included in the SIMOTION SCOUT scope of delivery and, along with FAQs, also contain free utilities (e.g. calculation tools, optimization tools, etc.) as well as application examples (ready-to-apply solutions such as winders, cross cutters or handling).
- The latest SIMOTION FAQs at http://support.automation.siemens.com/WW/view/en/10805436/133000
- SIMOTION SCOUT online help
- Refer to the list of references (separate document) for additional documentation

12.3.1 Safety Instructions

12.3.1.1 Fundamental safety instructions

General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

⚠ WARNING

Danger to life or malfunctions of the machine as a result of incorrect or changed parameterization

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

Residual risks of power drive systems

The control and drive components of a drive system are approved for industrial and commercial use in industrial line supplies. Their use in public line supplies requires a different configuration and/or additional measures.

These components may only be operated in closed housings or in higher-level control cabinets with protective covers that are closed, and when all of the protective devices are enabled.

These components may only be handled by qualified and trained technical personnel who are knowledgeable and observe all of the safety instructions on the components and in the associated technical user documentation.

When assessing the machine's risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer must take into account the following residual risks emanating from the controller and drive components of a drive system:

1. Unintentional movements of driven machine components during commissioning, operation, maintenance, and repairs caused by, for example:
   - Hardware defects and/or software errors in the sensors, controllers, actuators, and connection technology
   - Response times of the controller and drive
   - Operating and/or ambient conditions outside of the specification
   - Condensation / conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of radio devices / cellular phones in the immediate vicinity of the controller
   - External influences / damage
2. In the event of a fault, exceptionally high temperatures, including an open fire, as well as emissions of light, noise, particles, gases, etc. can occur inside and outside the inverter, for example:
   - Component malfunctions
   - Software errors
   - Operating and/or ambient conditions outside of the specification
   - External influences / damage

   Inverters of the Open Type / IP20 degree of protection must be installed in a metal control cabinet (or protected by another equivalent measure) such that the contact with fire inside and outside the inverter is not possible.
3. Hazardous touch voltages caused by, for example:
   - Component malfunctions
   - Influence of electrostatic charging
   - Induction of voltages in moving motors
   - Operating and/or ambient conditions outside of the specification
   - Condensation / conductive contamination
   - External influences / damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc. if they are too close.
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly.

Note

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

For more information about residual risks of the components in a drive system, see the relevant sections in the technical user documentation.

12.3.1.2 Specific safety instructions SIMOTION TM15 / TM17 High Feature

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

⚠ WARNING

Danger to life from unexpected movement of machines on (automatic) restart

Dangerous mechanical movements may occur in the system during operation.

Make sure this presents no hazard to personnel or property.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Only safety extra-low voltage in accordance with EN/IEC 60950-1 may be connected to all connections and terminals.

12.3.2 Description

12.3.2.1 TM15 and TM17 High Feature modules - Introduction

Introduction

The TM15 and TM17 High Feature terminal modules can be used to set up inputs of measuring inputs and outputs of output cams for the SIMOTION motion control system. In addition, these terminal modules provide drive-related digital inputs and outputs with short signal delay times.

In particular, wherever standard I/O only permit **one signal change per position control cycle clock**, TM15 and TM17 High Feature can:

- Process up to two edges per position control cycle clock for inputs of measuring inputs or outputs of output cams.
- Process input and output edges even **within** the position control cycle clock.

The use of an internal timer means that the resolution for outputs of output cams and inputs of measuring inputs is in the microsecond range rather than the millisecond range (switching edges are acquired/output under timer control rather than in the IPO or position control cycle clock).

System integration

As a result of the standardized modular design of the SIMOTION system, the terminal modules can be operated very easily by means of the TO outputCam, TO camTrack and TO measuringInput technology objects.

In principle, there are two possibilities for integration of the TM15 and TM17 High Feature modules into a SIMOTION automation solution:

- System configuration with integrated drives
  In this configuration, the TM1x modules are connected directly
  - To the SIMOTION D4x5/D4x5-2
  - To the SIMOTION D410 (not shown in the figure)
  - To the CX32/CX32-2 extension (not shown in the figure)

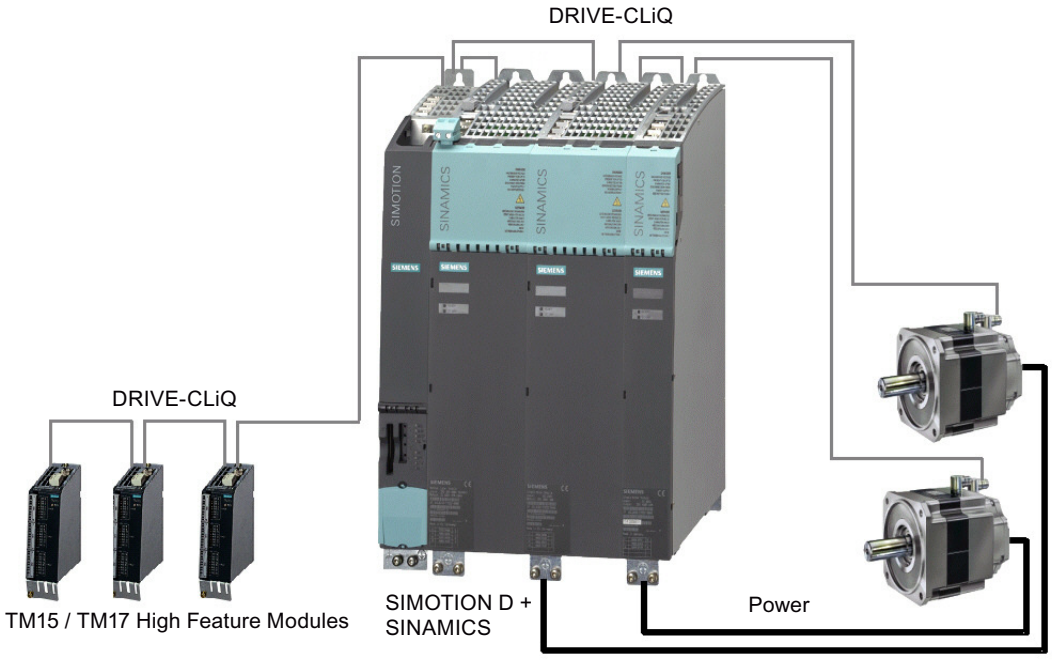

Figure 12-32 Integration of TM15 / TM17 High Feature with SIMOTION D4x5/D4x5-2

- System configuration with external drives
  In this configuration, the TM1x modules are connected to a SINAMICS S120 control unit CU320/CU320-2 or CU310, which is connected
  - To the SIMOTION C, P or D (see figure) via PROFIBUS DP, or

– To the SIMOTION C, P or D via PROFINET IO

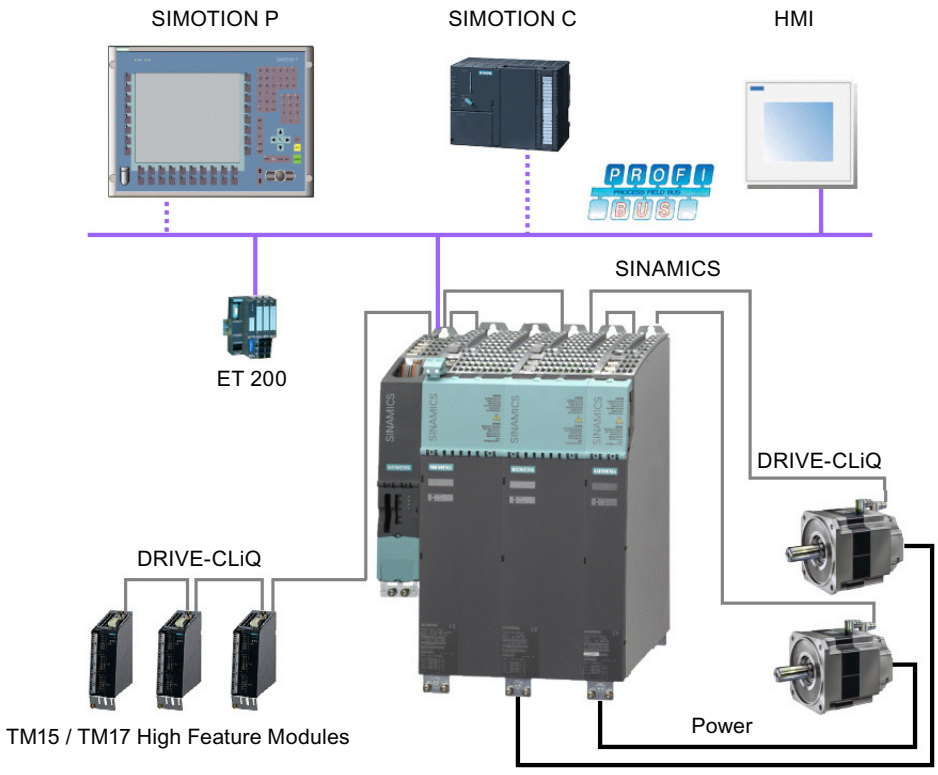

Figure 12-33 Integration of TM15 / TM17 High Feature with SIMOTION C or P

A characteristic of both options is that the DIs, DOs, cam outputs and measuring input inputs can only be accessed from the SIMOTION controller.

Note that the TM15 module can also be used with DI/DO functionality alone (selection: TM15 DI/DO input/output component). In this case, no output cam or measuring input functions are available, but DI and DO terminals can be used by both SIMOTION and SINAMICS (similar to TB30 or TM31).

Note

This Commissioning Manual describes how to integrate the TM15 and TM17 High Feature into SIMOTION. Integration of the TM15 via BICO technology is not covered in this Commissioning Manual. You will find more information on integrating the TM15 via BICO technology in the SINAMICS S120 Commissioning Manual as well as in the SIMOTION D Commissioning and Hardware Installation Manuals.

Project interconnection

As of SIMOTION SCOUT V4.2, in contrast to interconnection via the logical address, there is now an option to symbolically assign drive objects (DOs) to technology objects (TOs).

- Symbolic assignment (fixed assignment)
  The symbolic assignment is set by default and applies to the entire project.
  In the case of the symbolic assignment, the system automatically aligns logical addresses when establishing the DO/TO connection.
  Should any changes be made in the HW Config, you must not manually align the address to ensure that the project is consistent.
- Assignment via the logical address
  Only possible if you deactivate the symbolic assignment in the project or work with a SIMOTION SCOUT version < V4.2.
  As is normally the case, the DO/TOs must be assigned using the logical address. Changes to the logical address space, for example, reconfiguration of HW Config, call for manual re-alignment in order to ensure the consistency of the project.

Structure

The modules are mounted on a DIN rail in accordance with DIN EN 50 022 (35 x 15 / 7.5). They are connected to the SIMOTION/SINAMICS hardware via DRIVE CLiQ.

Several TM1x modules can be installed on one DRIVE CLiQ line.

The SINAMICS S120 Manuals provide more information on the system structure of SINAMICS S and associated hardware.

Note

In the "Supplemental SINAMICS System Components for SIMOTION" Manual, you will find information about the design of Terminal Modules TM15 and TM17 High Feature as well as a description of the interfaces and installation.

See also

Maximum number of terminal modules (Page 8241)

12.3.2.2 Properties: TM15 / TM17 High Feature

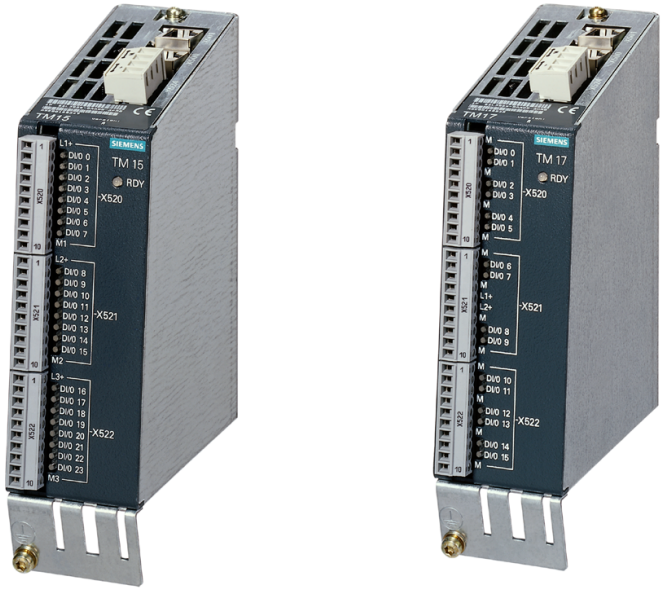

Figure 12-34 TM15 terminal module and TM17 High Feature terminal module

The properties of the terminal modules are presented below. This overview is intended to help you select the appropriate module for your application.

Properties

The TM15 and TM17 High Feature terminal modules are terminal extension modules designed to be mounted on a DIN rail in accordance with DIN EN 50 022.

The terminal modules contain the following:

- Two DRIVE-CLiQ sockets.
- Connection for 24 VDC electronic power supply.
- The logical status of the I/O channel is indicated by the associated green status LED.
- The status of the TM15 / TM17 High Feature is indicated by a multi-colored RDY LED.

Each of the 24 DI/DO (TM15) or 16 DI/DO (TM17 High Feature) can be parameterized on a channel-specific basis as a digital input (DI), digital output (DO), measuring input input or cam output, and can also be inverted. The SCOUT engineering software is used for parameterization.

- Each channel can be parameterized as a digital input (DI) or digital output (DO).
- Each channel can be parameterized as a measuring input input.
- Each measuring input input has a selectable edge detection (falling edge, rising edge, or both edges).
- Each channel can be parameterized as a cam output.

The outputs are equipped with short-circuit protection, shutdown in case of overtemperature, and reverse-polarity protection. The actual signal state of each output channel can be read back on the SIMOTION side.

The differences between the TM15 and TM17 High Feature terminal modules are defined by their range of application. The TM17 High Feature has less I/O channels than TM15, but offers increased functionality.

The TM17 High Feature is distinguished by especially high resolution and accuracy as well as a parameterizable input filter and enable inputs.

The enable inputs can activate measuring input inputs or cam outputs (gate function).

- Level-controlled enable for measuring input inputs
- Level- or edge-controlled enable for cam outputs

In addition, TM17 High Feature supports cyclic measurement of up to two edges per position control cycle clock.

Due to their high accuracy, the DI/DO channels of the TM17 High Feature are non-isolated.

Note

The module hardware of the TM15 and TM15 DI/DO is identical, but there is a difference between the two modules in terms of system integration. For this reason, they must be configured as different input/output components.

This Commissioning Manual describes how to integrate the TM15 and TM17 High Feature into SIMOTION. Integration of the TM15 DI/DO via BICO technology is not covered in this Commissioning Manual. You will find more information on integrating the TM15 DI/DO via BICO technology in the SINAMICS S120 Commissioning Manual as well as in the SIMOTION D Commissioning and Hardware Installation Manuals.

Table 12-1 Comparison table for module selection

Function	**TM15** [1]	**TM15 DI/DO** [1]	**TM17 High Feature** [1]
System integration	Use only in conjunction with SIMOTION (SIMOTION D, CX32/CX32-2 or CU310/ CU320/CU320-2 with SIMOTION as the higher-level controller)	Use also in conjunction with CU310/CU320/CU320-2 without SIMOTION	Use only in conjunction with SIMOTION (SIMOTION D, CX32/CX32-2 or CU310/ CU320/CU320-2 with SIMOTION as the higher-level controller)
Functionality	24 DI/DO can be parameterized on a channel-specific basis as DI, DO, cam output or measuring input input; DI/DO can only be addressed via SIMOTION controller	24 DI/DO-channels can be parameterized as DI or DO; DI/DO can only be interconnected via BICO technology	16 DI/DO can be parameterized on a channel-specific basis as DI, DO, cam output or measuring input input; DI/DO can only be addressed via SIMOTION controller
Short response time	X	X	X
Number of I/O channels	24	24	16
Electrical isolation of inputs and outputs	X	X	-
Grouping of channels	3 groups, each of 8 channels	3 groups, each of 8 channels	2 groups, each of 8 channels

Function	TM15 [1]	TM15 DI/DO [1]	TM17 High Feature [1]
Measuring input inputs (single measurement)	X	-	X
Measuring input inputs (cyclic measurement)	-	-	X
Several measuring inputs per axis	X	-	X
One measuring input for several axes	X	-	X
Measuring on virtual axes	X	-	X
Cam outputs	X	-	X
Resolution - measuring input inputs	Typ. 125 µs [2] (firmware support)	Not applicable	1 µs (hardware support)
Resolution - cam outputs	Typ. 125 µs [2] (firmware support)	Not applicable	1 µs (hardware support)
Accuracy (reproducibility) - measuring input inputs	Typ. ±125 µs [2]	Not applicable	≤ ±1 µs
Accuracy (reproducibility) - cam outputs	Typ. ±125 µs [2]	Not applicable	≤ ±10 µs
Input filtering	50 µs	50 µs	1 µs or 125 µs, user-assignable
Enable via external signal	-	Not applicable	6 channels, max.

[1] "X" = available; "-" = not available.

[2] Corresponds to the DRIVE-CLiQ cycle clock in use (125 µs, typical)

12.3.2.3 Machine applications

Overview

Many production machines require fast, precise detection of signals or exact switching of digital outputs. The measuring input and output cam feature of the TM15 and TM17 High Feature modules represents an optimal solution for a variety of industrial applications.

Applications requiring fast, high-precision detection of signals include:

- Edge detection
- Quality monitoring (e.g. product OK/not OK)
- Product tracking (e.g. product available/not available)
- Print-mark detection
- Tool monitoring (e.g. presses)
- Machine status monitoring (e.g. plastic injection molding machines)
- Weft break monitoring (e.g. textile machines)

Applications requiring fast, high-precision output of signals include:

- Position-dependent switching of actuators
  - Camera trigger signal (quality assurance)
  - Control of an air nozzle for blowing away cut-offs
  - Control of nozzles for applying glue tracks
- Product extraction from production line
- Implementation of line motion control systems
- Output of pulse patterns

Application examples

Edge processing

In this example, the movement of boards through a machine is controlled by fixed guides and clamping brackets. The sides of the boards are machined as they pass by a group of actuated cutters.

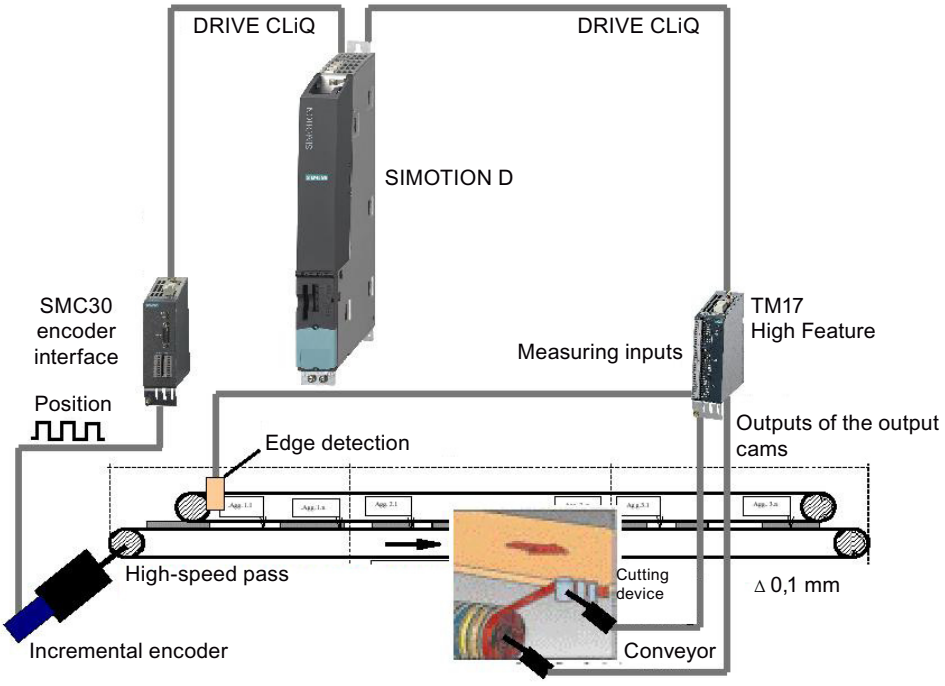

Figure 12-35 Example: Edge detection

The technology of the terminal modules includes:

- Exact encoder value measurements
- Exact edge acquisition
- Exact output of switching signals

As a result, applications with increased line speed are possible.

The switching conditions specific to each type of board are stored in a central controller. Depending on the exact position of the board (relative to its detected rising edge), the individual cutters are engaged and disengaged. The switching signal control relative to the detected edge is critical since cutting accuracy is directly dependent upon precise switching.

Application of glue tracks

In the following example, glue tracks are applied to a workpiece. Each track controls one glue gun via a digital output.

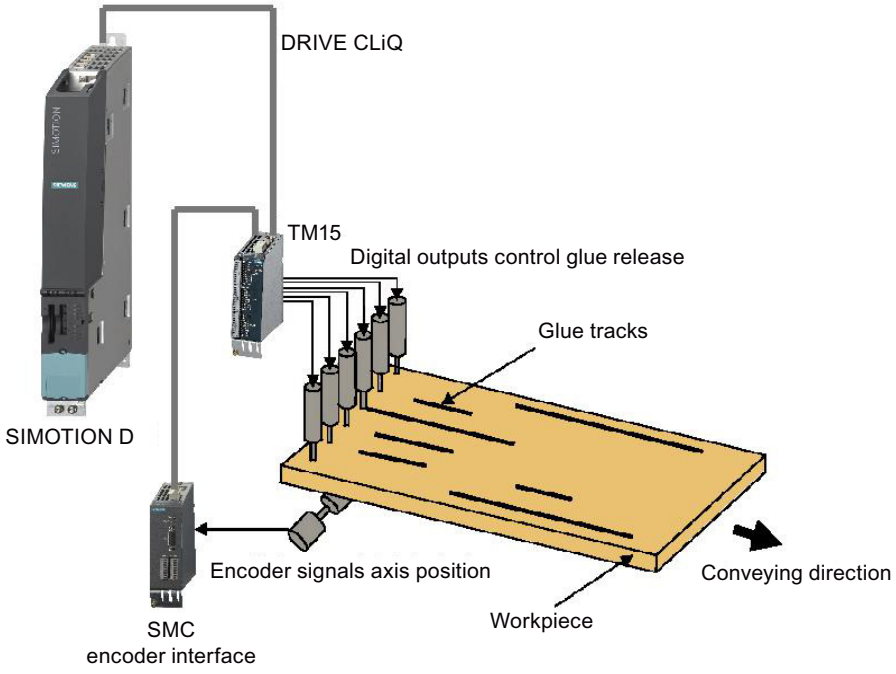

Figure 12-36 Example: Electronic output cam control

The glue guns are activated via outputs of an output cam based on the axis position.

The axis position is measured by an encoder that connects an SMC encoder interface to SIMOTION D via DRIVE-CLiQ.

The SIMOTION Output Cam or Output Cam Track technology object controls the digital outputs of the TM15 based on the axis position.

The output delay times (output delay times of DO / actuators, etc.) are compensated in the technology object. This compensation ensures that the glue placement is always accurate regardless of machine speed.

12.3.3 Configuration/programming

12.3.3.1 Hardware and software requirements

To begin using the terminal modules, you need the following:

Hardware requirements

- TM15 or TM17 High Feature
- One of the following components:
  - SIMOTION D (TM is connected directly to SIMOTION D or CX32/CX32-2)
  - SIMOTION C, P or D (TM is connected to a control unit, which is connected via PROFIBUS/ PROFINET to SIMOTION C, P or D)
  - DIN rail in accordance with DIN EN 50 022 (35 x 15 / 7.5)
  - DRIVE-CLiQ cable
  - PROFIBUS or PROFINET cable
  - External 24 VDC power supply (note the requirements for the TM15 and TM17 High Feature terminal modules)

Software requirements

This documentation describes

- SIMOTION V4.2 and
- SINAMICS V2.x/V4.x

Previous SIMOTION and SINAMICS versions do not include all the functions described in this manual.

See also

Version overview (Page 8275)

12.3.3.2 Requirement for the configuration and programming

Requirement

Once the terminal module hardware is mechanically and electrically installed, it must be integrated in the application project using the SCOUT engineering software.

The procedures contained in this chapter assume that the user has a general understanding of SCOUT.

In addition, a SCOUT project must be generated, for example, with SIMOTION D.

Note

The following description relates to the configuration of TM1x terminal modules, which are connected to the integrated drive of SIMOTION D.

The dialogs encountered during the configuration of terminal modules TM1x may differ slightly if the TM1x are connected to a SINAMICS control unit CU310 or CU320/CU320-2, which is connected to SIMOTION via PROFIBUS or PROFINET.

Project interconnection

Symbolic assignment

As of SIMOTION SCOUT V4.2, in addition to interconnection via the logical address, there is now an option to symbolically assign DO/TOs.

The symbolic assignment is preset for new projects. You can check this via the Project menu.

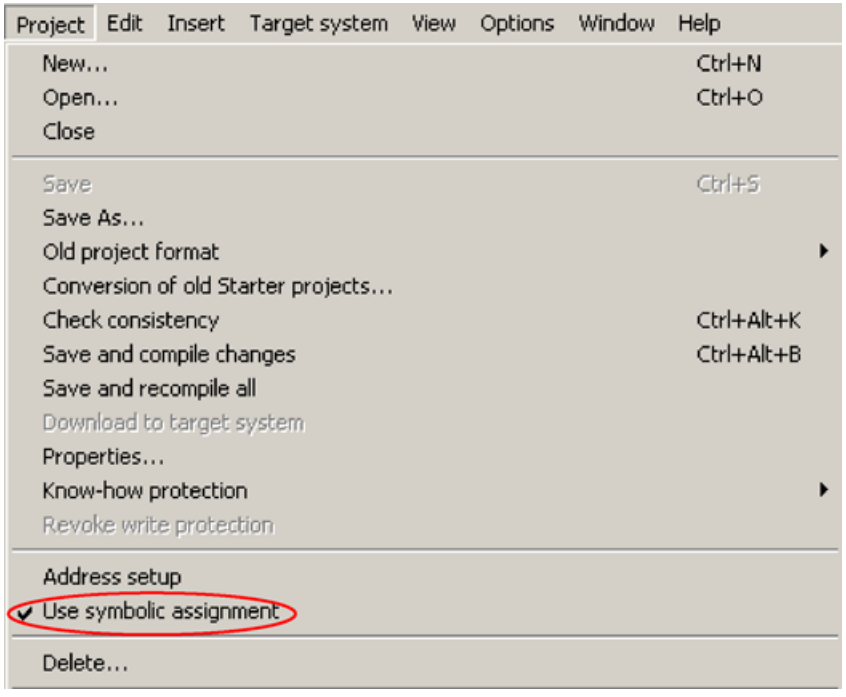

Figure 12-37 Project menu

After creating a terminal module, the automatic addressing in the message frame configuration is activated. The message frame configuration is opened via **SINAMICS_Integrated** -> **Communication** -> **Message frame configuration** in the project navigator.

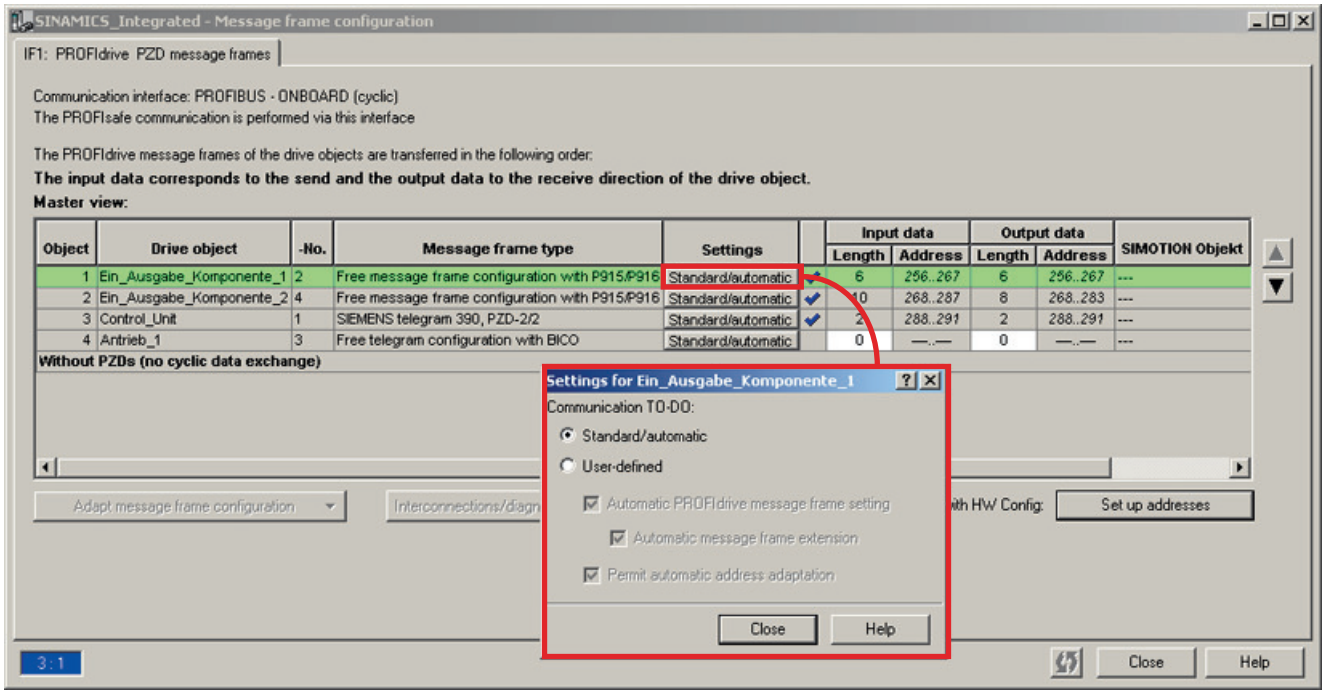

Figure 12-38 Message frame configuration

Note

We recommend that you do not change between symbolic assignment and assignment via the logical address. A change can result in data being lost.

Note

If symbolic assignment is subsequently activated for a project in which message frames have already been configured and interconnected, these can be changed together with the BICO interconnections.

For this reason, make a backup copy of your project before activating the symbolic assignment.

TB30, TM15 DI/DO and TM31 are especially affected.

Note

Further information on symbolic assignment can be found in the Basic Functions Manual, Section Symbolic assignment (as of V4.2).

Assignment via the logical address

If you want to continue using the interconnection of DO/TOs via the logical address, you must deselect the default setting in the Project menu.

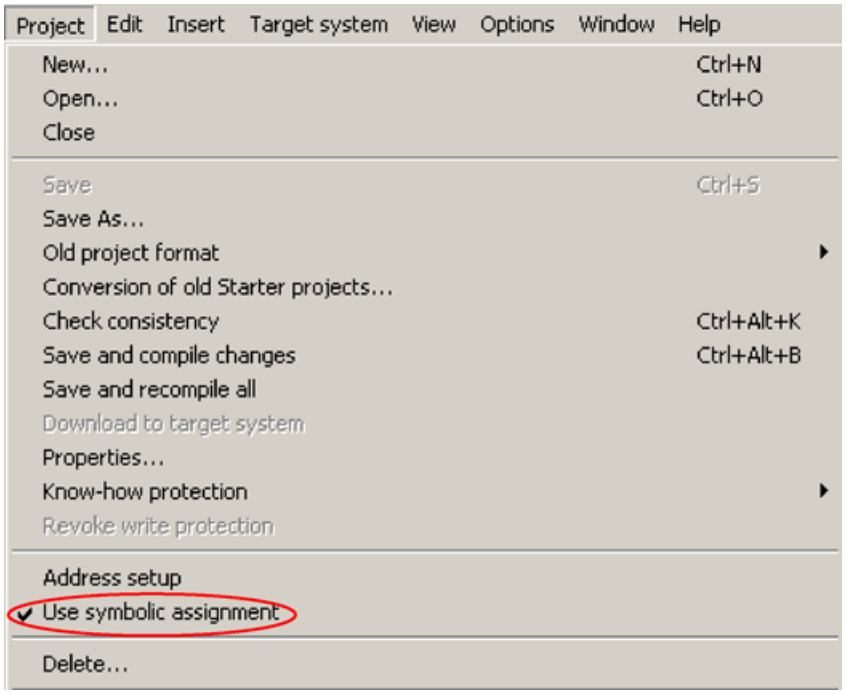

Figure 12-39 Project menu

The message frame configuration is opened via **SINAMICS_Integrated** -> **Communication** -> **Message frame configuration** in the project navigator. The following window with the I/O address assignments of the message frame is displayed.

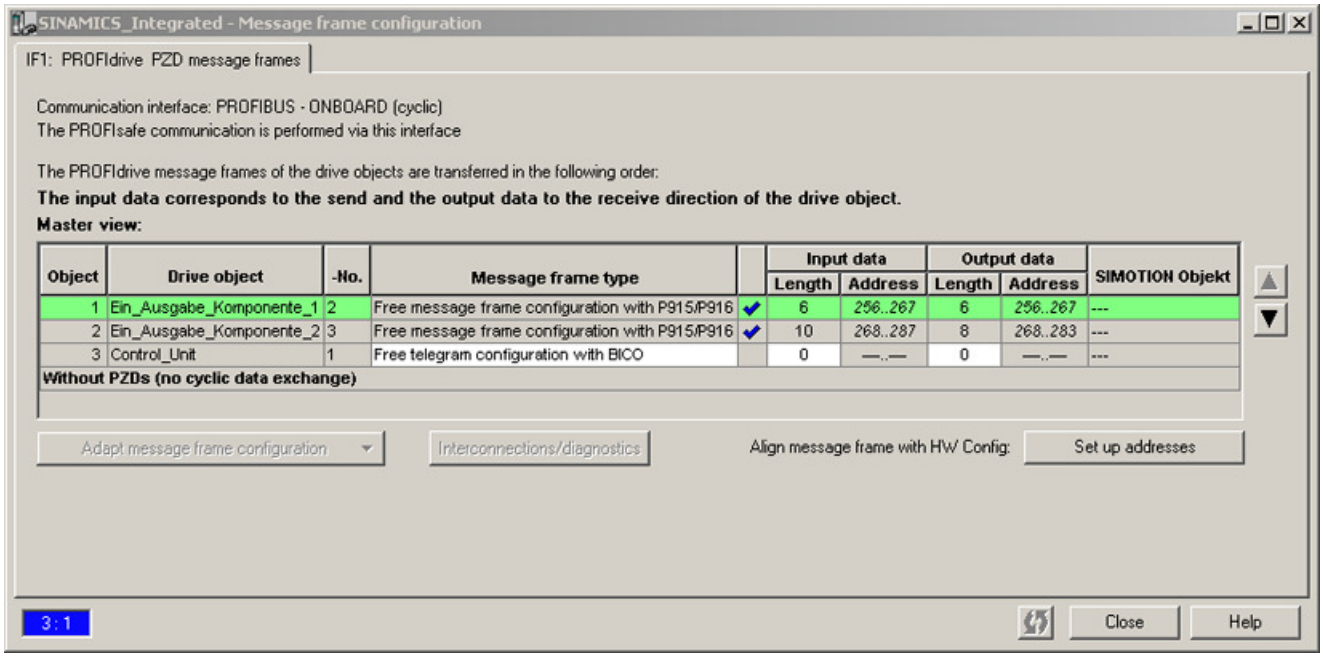

Figure 12-40 Message frame configuration

Note

We recommend that you do not change between symbolic assignment and assignment via the logical address. A change can result in data being lost.

Note

The terminal module must be powered up before it can be accessed via the I/O. Otherwise, an I/O access error will occur and the CPU will go to STOP mode.

12.3.3.3 Inserting new TM1x modules

Procedure

1. Click the **+** next to **Input/output component**. An expanded project tree similar to the one below will be displayed.

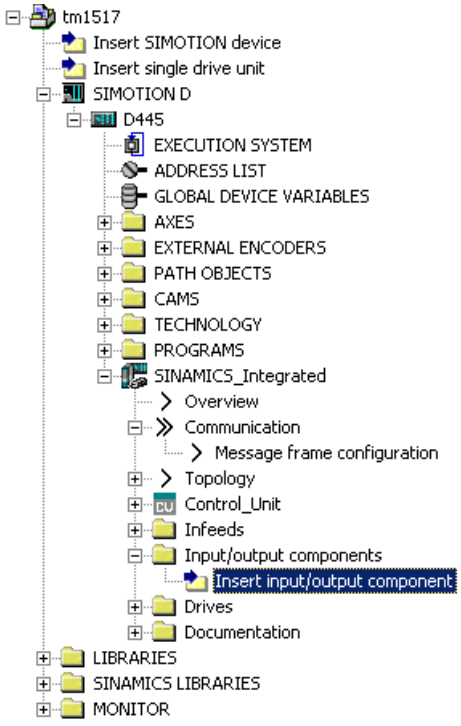

Figure 12-41 "Insert input/output component" window

2. Double-click **Insert input/output component**. A window similar to the one shown below will be displayed.

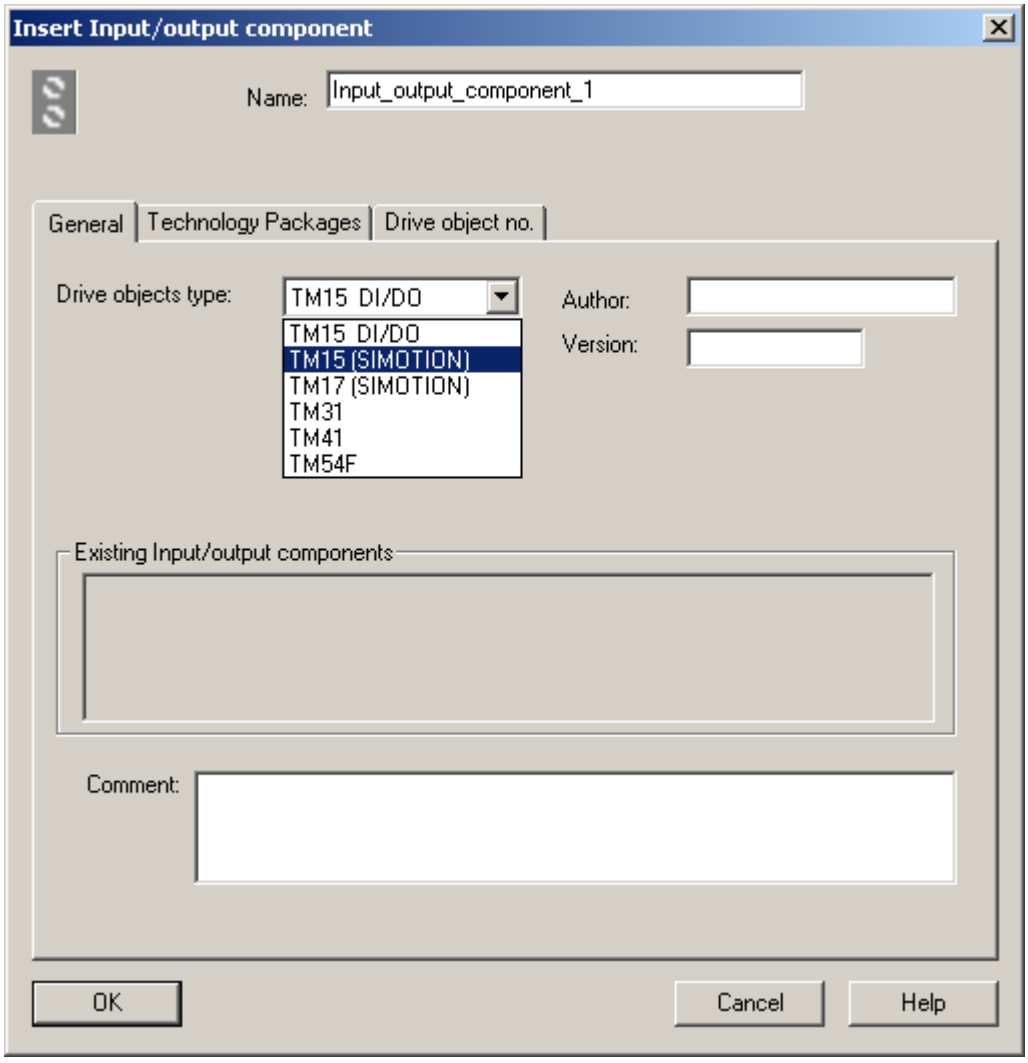

Figure 12-42 "Insert Input/Output Component" window

The **Name** field may be used to give the module a unique name (e.g. TM15_1). A drop-down list box containing the various module types will be displayed under Operating type.

- **TM15 (SIMOTION)** for digital inputs/outputs as well as measuring input inputs and cam outputs (can only be used by SIMOTION)
- **TM15 DI/DO** for digital inputs/outputs (no output cam / measuring input function, but DI/DO can be used by both SIMOTION and SINAMICS)
- **TM17(SIMOTION)** for digital inputs/outputs as well as measuring input inputs and cam outputs for the most stringent accuracy requirements (can only be used by SIMOTION)
- **TM31**, **TB30** can be used, in principle, the same as the TM15 DI/DO
  "TM15 (SIMOTION)" has been selected in the figure. The **Author**, **Version** and **Comments** fields can be used to further describe the module.

3. Click **OK** to insert the new module.

12.3.3.4 Terminal configuration

Configuring I/O channels – TM15

Procedure

1. "TM15_1" will now appear in the project tree. Open the directory tree underneath it and double-click **Configuration**. The window shown below will open.

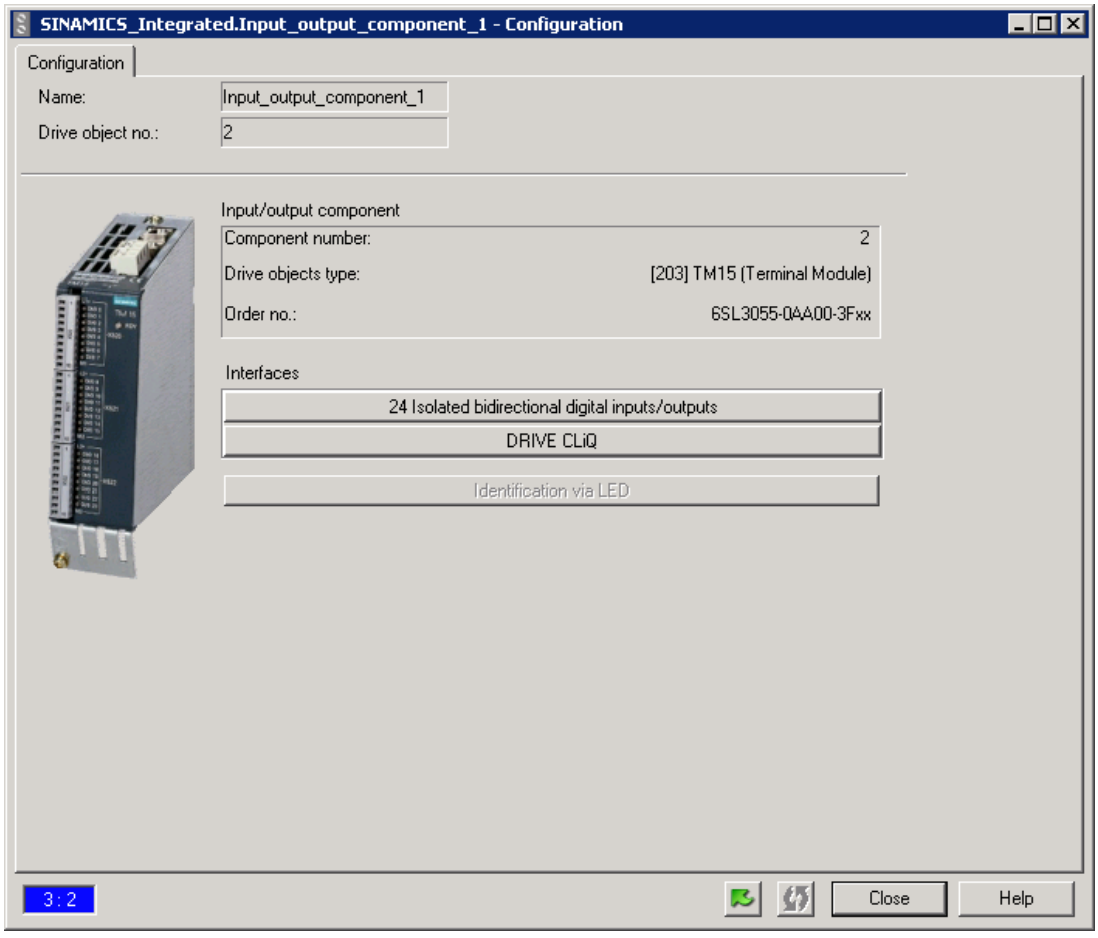

Figure 12-43 SCOUT – "TM15_1 - Configuration" window

Table 12-2 Function of the buttons

Button	Function
24 Isolated bidirectional digital inputs/outputs	Configuration of I/O channels
	Display of component overview

Button	Function
DRIVE-CLiQ	Display of the DRIVE-CLiQ topology
24 Isolated bidirectional digital inputs/outputs	When you click this button (available online only), the selected module can be identified by its RDY LED, which will flash (red-green).

2. Once you are satisfied that the displayed information is correct, you can configure the individual TM15 (SIMOTION) I/O channels. Click the **24 isolated bidirectional digital inputs/ outputs** button. (You can also double-click **Inputs/outputs** in the project tree instead.) The window shown below will open.

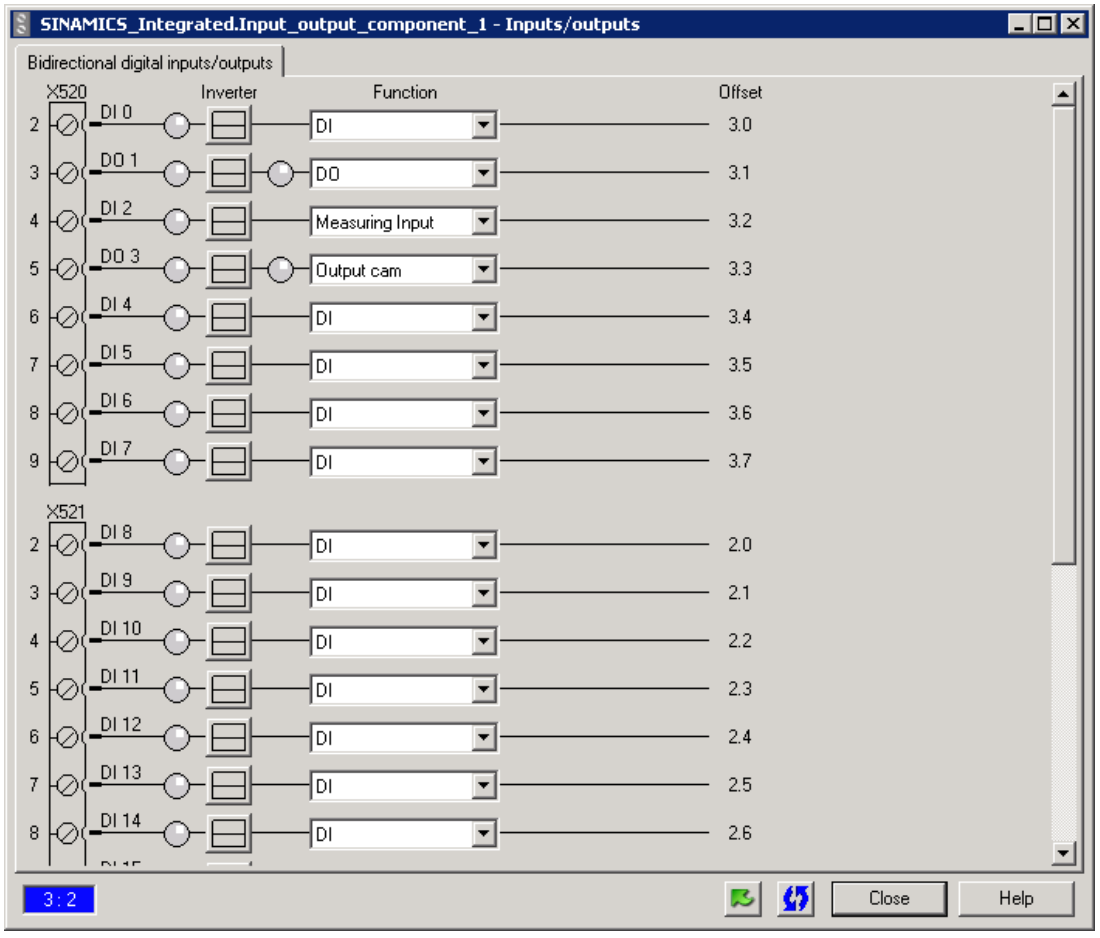

Figure 12-44 SCOUT – graphical configuration screen form for the TM15 (SIMOTION)

You can use the drop-down menus in the **Function** column to select the type of I/O channel to be used (i.e. DI, DO, input of measuring input or output of output cam). One of four possible functions can be assigned to each channel.

Table 12-3 "Function" column: Options in the drop-down menu

Menu option	Description
DI	Channel used as a digital input
DO (standard output[1])	Channel used as: - Digital output, or - Cam output (**without** high switching accuracy)
Measuring input	Channel used as a measuring input input
Output cam (fast output[2])	Channel used as a fast cam output (**with** high switching accuracy)

[1] The cam output is calculated by the SIMOTION technology object in the IPO cycle clock or position control cycle clock. (That is, the resolution is one IPO cycle clock or one position control cycle clock.)

[2] The switching instant of the cam output is calculated by the TM15. For this reason, the resolution is less than the position control cycle clock.

Depending on which function has been selected, you can switch between the input or output using the symbol displayed under "Inverter".

Table 12-4 "Inverter" column: Description of symbols

Symbol	Description
	Signal not inverted
	Inverted input
	Inverted output

Configuring I/O channels – TM17 High Feature

To begin configuring the TM17 High Feature terminal module, you can follow the procedure described in the section on "Configuring I/O Channels – TM15". The window shown below will open.

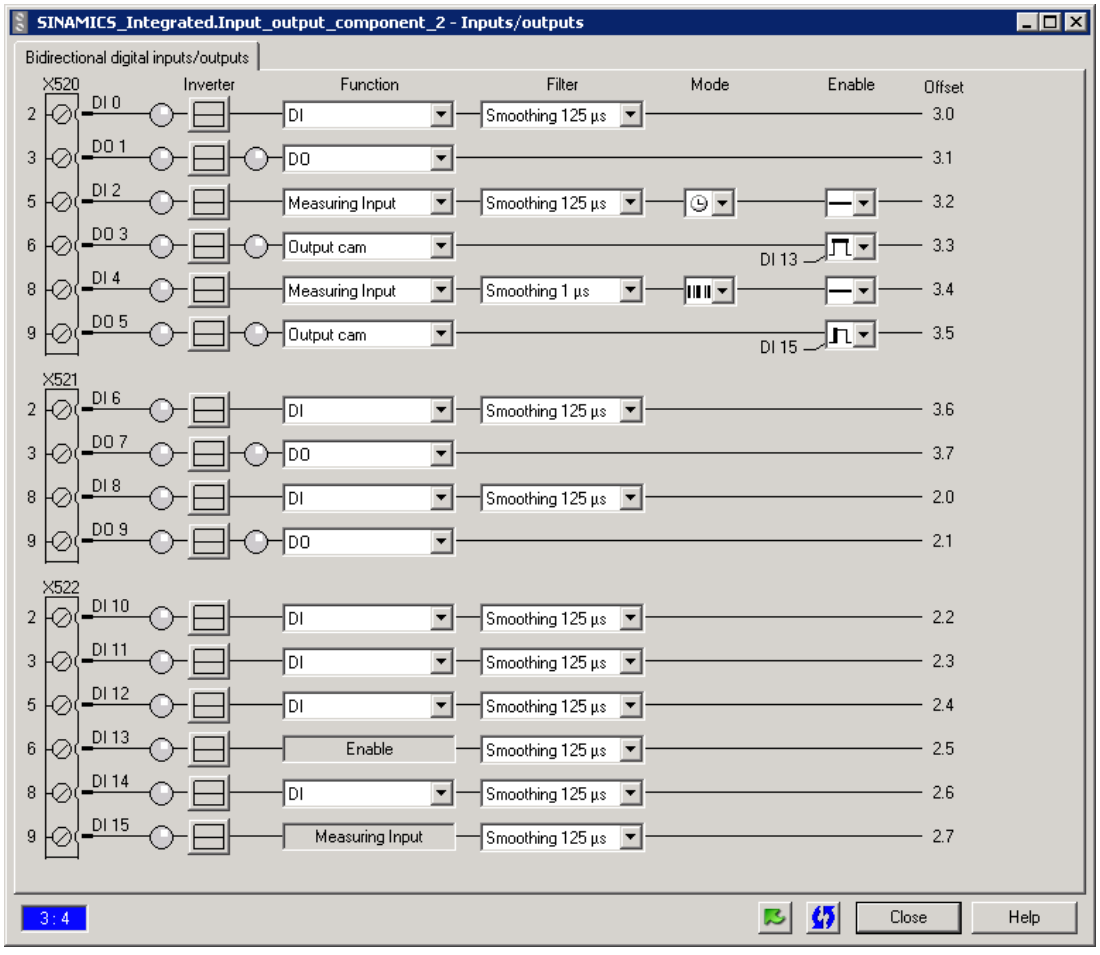

Figure 12-45 SCOUT – graphical configuration screen form for the TM17 (SIMOTION)

The **Inverter**, **Function** and **Offset** columns are identical to those in the TM15 display.

Additional configuration settings for the TM17 High Feature can also be made (see figure below).

Filter

You can select a 1 µs or 125 µs filter for the inputs via the drop-down menus in the **Filter** column. The shortest pulses can be detected using the 1 µs filter; however, the 125 µs filter will provide higher noise immunity.

Measurement modes

You can select the measurement mode from the drop-down menu in the **Mode** column.

Table 12-5 "Mode" column: Description of symbols

Symbol	Measurement mode
	Single measurement
	Cyclic measurement

The main difference between the **Single measurement** and **Cyclic measurement** modes is that with **Single measurement**, a measurement job must be issued by the TO measuringInput for each measurement.

The measurement job remains active until the measurement result has been obtained or until the job is terminated by a command. The measuring process must be reactivated for each new measurement. :

In contrast, the measuring function need only be activated once for **Cyclic measurement** mode. The measuring function remains active until it is deactivated again.

Up to two edges can be measured in each execution cycle of the TO measuringInput (IPO interpolation cycle clock, IPO2 interpolation cycle clock or position control cycle clock).

The measured values must be read out by the user program before new measured values are accepted.

Result:

- A maximum of two edges can be evaluated per IPO cycle clock if the scan routine of the user program is in the IPO synchronous task.
- A maximum of two edges can be evaluated per position control cycle clock if the scan routine of the user program is in the servo-synchronous task.

The servo-synchronous task is the lowest possible time level for a user program.

Table 12-6 Measuring functions in conjunction with TM15 and TM17 High Feature

	Single measurement	Cyclic measurement
Supported terminal modules	TM15 and TM17 High Feature	TM17 High Feature only
Measurement operation	Measurement job must be issued for each measurement	Measuring function need only be activated once. The measuring function remains active until it is deactivated again.
Time between two measurements	Several IPO cycle clocks or several position control cycle clocks[1)]	1 IPO cycle clock or 1 position control cycle clock [1]
Measuring range for measuring input can be defined (as TO function)	possible	possible

[1)] If scan routine is in the servo-synchronous task

See also

System timing for single measurement (Page 8270)

System behavior with cyclic measurement (Page 8271)

Enable function

With the **Enable** drop-down menu, the measuring input inputs or cam outputs of channels 0 to 5 can also be enabled by an enabling signal of channels 10 to 15.

If you select the enable function for channels 0 to 5, the following symbols in the **Function** column will be automatically selected for the assigned enable channels 10 to 15:

- Enable (for level-triggered enable)
- Measuring Input (for edge-triggered enable)

Note

If the enable input is to be used with an "inverted" cam output, the inversion must be parameterized for the TM17 High Feature terminal module and **not** for the TO outputCam or TO camTrack.

An inversion of the output on the "TO outputCam" or "TO camTrack" always causes a low level to be output when the enable is missing (with the desired inversion, however, this would correspond to a driven output cam).

By contrast, when inversion is parameterized for the TM17 High Feature terminal module, it only takes effect once the enabling signal has been sent, thus bringing about the desired result.

Table 12-7 **Enable** and **Function** columns: Description of symbols

Symbol for enabling signal selection (Enable column)	**Symbol for assigned input of enabling signal (Function column)**	**Explanation**
	No enable input	No enabling signal and therefore no enable input selected.
		Level-triggered enabling signal. The channel assigned for the enabling signal is displayed as an enable.
		Edge-triggered enabling signal (setting option only available for cam outputs). The channel assigned for the enabling signal is displayed as a measuring input. A TO measuringInput must be configured in SIMOTION for the measuring input input. The TO measuringInput can be used to evaluate the positions of the enable edges.

The enabling signal polarity depends upon the selection you have made in the "Inverter" column, as follows:

Table 12-8 **Inverter** column: Inverter options for enabling signals

Enabling signal selection (Enable column)	**Inverter options (Inverter column)**	
Not inverted 	Inverted 	
Level-triggered 	Enabling signal is high active	Enabling signal is low active
Edge-triggered 	Enabling signal takes effect on a rising edge	Enabling signal takes effect on a falling edge

Other information

Note

When parameters are reassigned for the I/O channels, the new parameters do not take effect until you restart (power on or hot restart) the SINAMICS or SIMOTION D device.

Note

Additional information and parameter setting options are available in the project tree next to **Configuration** and **Inputs/outputs** (e.g. **Control logic**, **Diagnostics**, etc.). However, this information is most relevant for modules that are configured via BICO technology, e.g. for TM31. These registers are irrelevant to the user in TM15 and TM17 High Feature.

Note

When you click "TM15_1" or "TM17_1" in the project tree, a number of parameters are displayed at the bottom of the symbol browser window. These parameters are irrelevant to the user.

Note

TM15 and TM17 High Feature with vector drives or servo drives

If DRIVE-CLiQ cycle clocks ≠ 125 µs are used with vector drives, inaccuracies will occur when detecting signals via the TO measuringInput or when outputting signals via the TO outputCam / TO camTrack.

The same phenomenon may arise with servo drives if you set sampling times via p112 that result in DRIVE-CLiQ cycle clocks ≠ 125 µs.

In the case of vector drives, the DRIVE-CLiQ cycle clock is calculated by the control unit during ramp-up.
The SCOUT Engineering System must be aware of this DRIVE-CLiQ cycle clock (p4099) that is set automatically by the control unit.

The same phenomenon may arise with servo drives if sampling times are set via p112 that result in DRIVE-CLiQ cycle clocks ≠ 125 µs.

In such cases, you should proceed as follows:

1. Carry out a project download.
2. Establish an online connection.
3. Upload to the SINAMICS drive. The updated p4099 parameter is read in as a result of the upload.
4. Go offline in SCOUT.
5. Only relevant if you have deactivated **Use symbolic assignment**:
   Create the configuration information (FastIO configuration) again. Select the SIMOTION CPU in the project tree and right-click to open the context menu. Recreate the configuration via the menu **FastIO** > **Create new configuration**.

12.3.3.5 Applicative access with symbolic assignment

Introduction

As of SIMOTION SCOUT V4.2, in addition to interconnection via the logical address, there is now an option to symbolically assign DO/TOs.

The procedure for symbolic assignment is described in the following sections. As of SIMOTION SCOUT V4.2, the symbolic assignment is set as default setting (for new projects). You can check this via the Project menu.

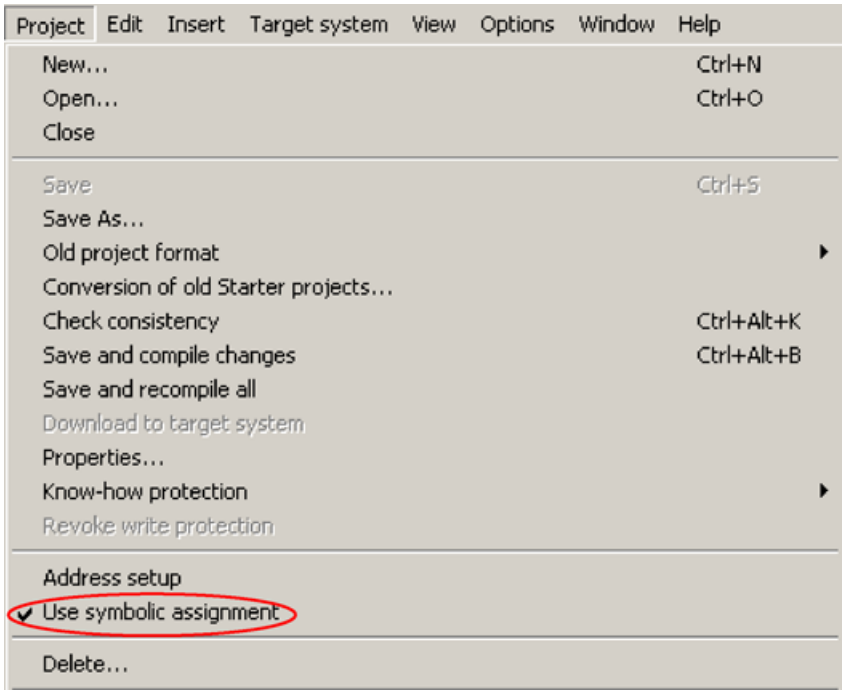

Figure 12-46 Project menu

After creating a terminal module, the automatic addressing in the message frame configuration is activated. The message frame configuration is opened via **SINAMICS_Integrated** -> **Communication** -> **Message frame configuration** in the project navigator.

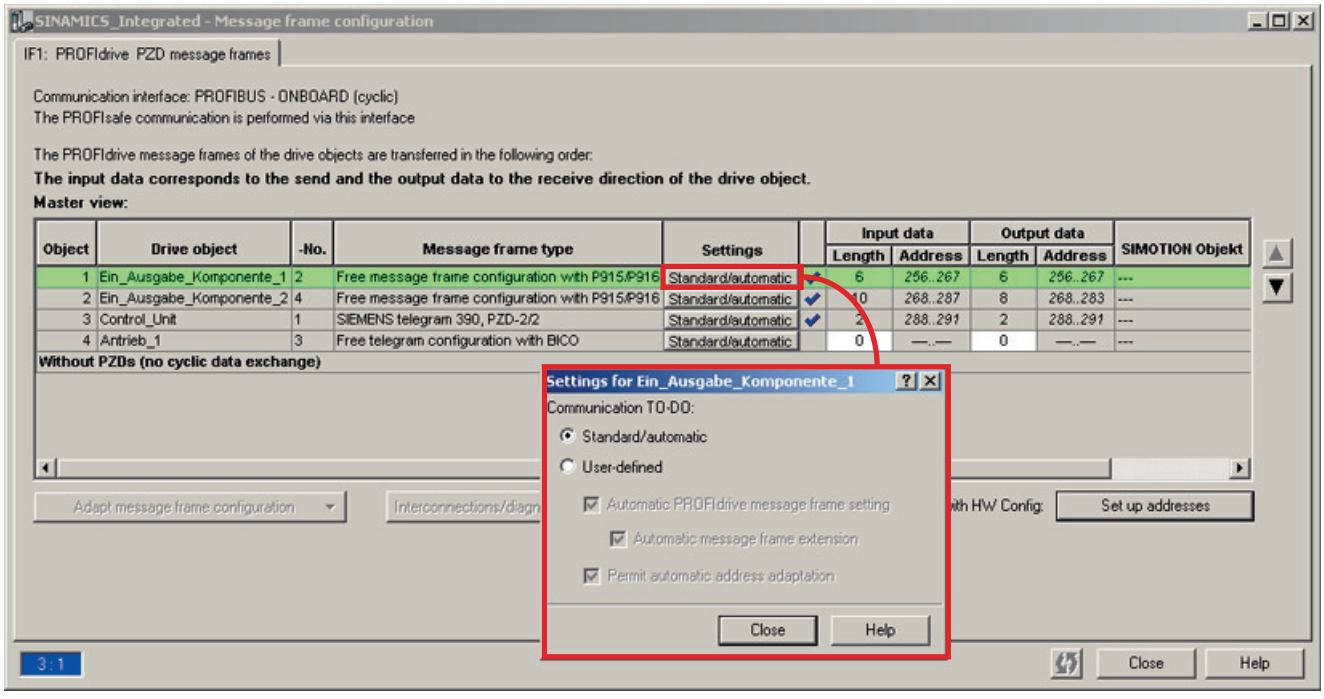

Figure 12-47 Message frame configuration

Note

We recommend that you do not change between symbolic assignment and assignment via the logical address. A change can result in data being lost.

Note

If symbolic assignment is subsequently activated for a project in which message frames have already been configured and interconnected, these can be changed together with the BICO interconnections.

For this reason, make a backup copy of your project before activating the symbolic assignment.

TB30, TM15 DI/DO and TM31 are especially affected.

Note

Further information on symbolic assignment can be found in the Basic Functions Manual, Section Symbolic assignment (as of V4.2).

Note

The terminal module must be powered up before it can be accessed via the I/O. Otherwise, an I/O access error will occur and the CPU will go to STOP mode.

See also

Power Up and Synchronization with the User Program (Page 8227)

Linking symbolic I/O variables with TM1x terminal modules

You can assign addresses to binary I/O channels using symbolic variables in the user program.

Procedure

In the following example, create the variable 'var_IO_DI0' and link this to input DI_0 and variable 'var_IO_DO1' with output DO_1.

The following configuration is the basis for the example.

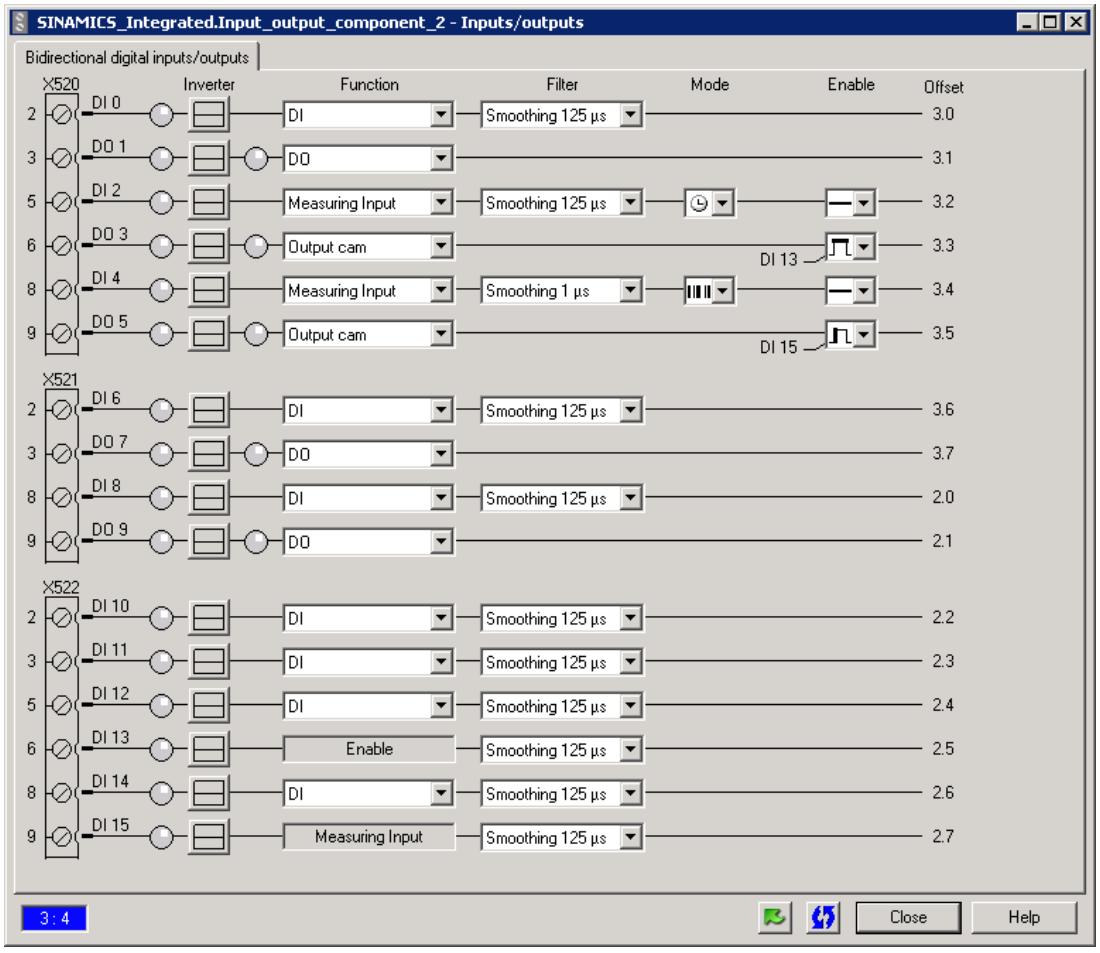

Figure 12-48 SCOUT – graphical configuration screen form for the TM17

Input DI 0

1. Open the **address list** via the project navigator.
2. In the **View** field, select 'I/Os'.
3. Create the variable 'var_IO_DI0' and in the **I/O address** field, select 'IN'.

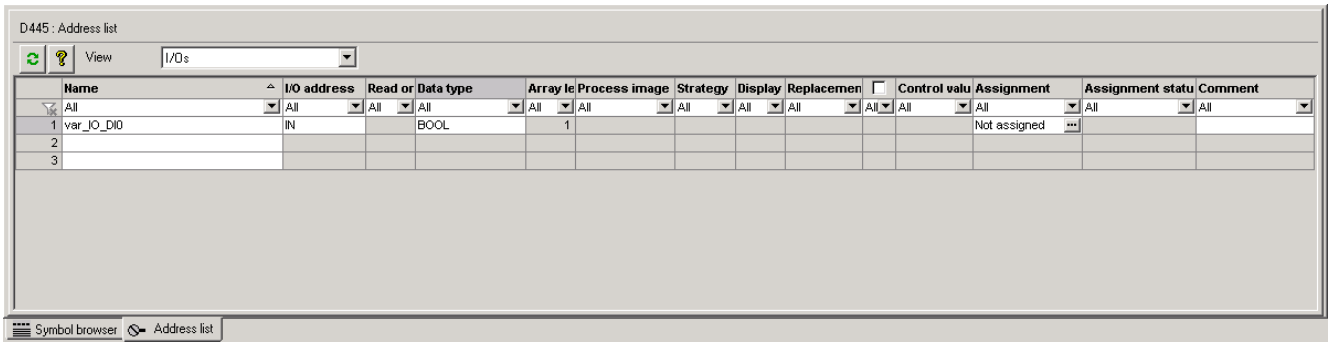

Figure 12-49 Creating variables in the address list

4. Click ... in the **Assignment** field.

5. Select the input DI_0 in the following dialog box (explanations on the identifiers can be found below).

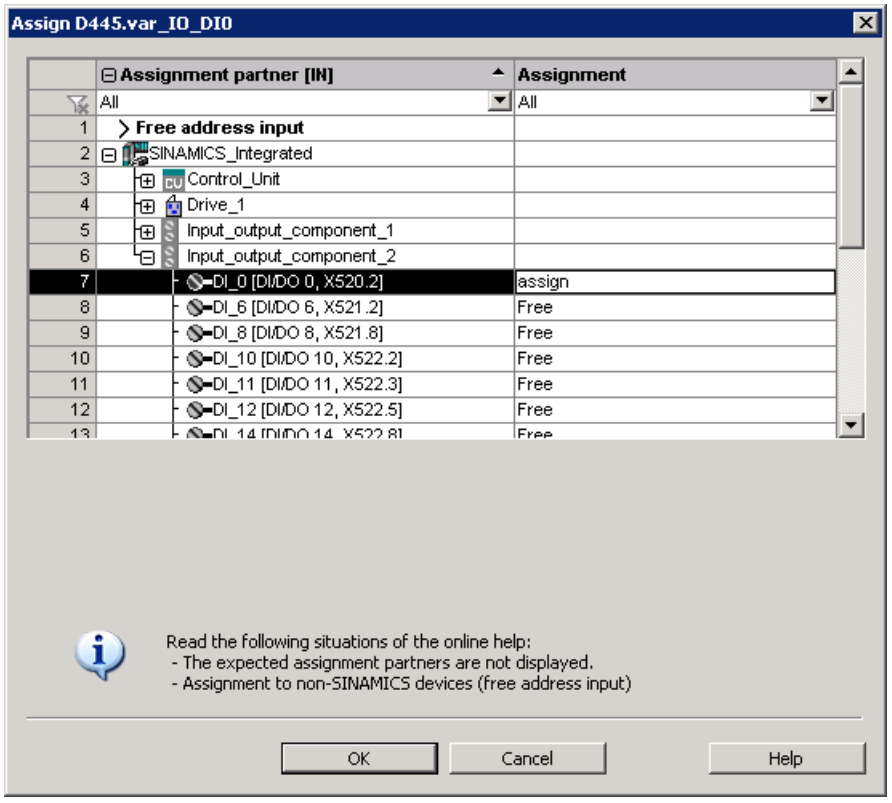

Figure 12-50 Selecting input DI_0

6. Confirm the selection by clicking **OK**.

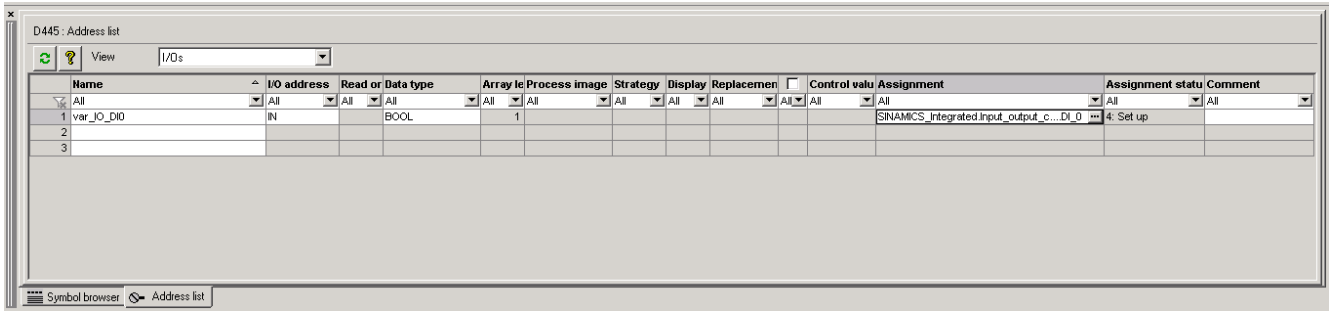

Figure 12-51 Address list following successful assignment

Output DO 1

1. Create the variable 'var_IO_DO1' and in the **I/O address** field, select 'OUT'.

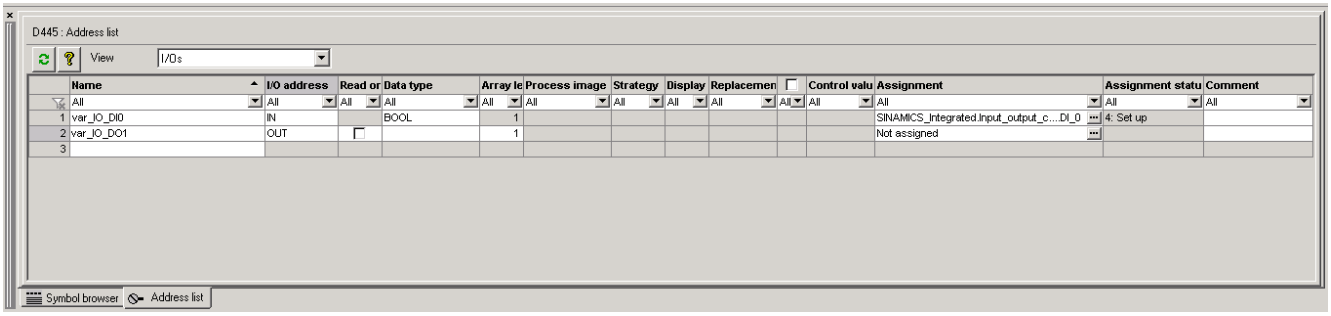

Figure 12-52 Creating variables in the address list

2. Click ... in the **Assignment** field.

3. Select the DO_1 input in the next dialog box.

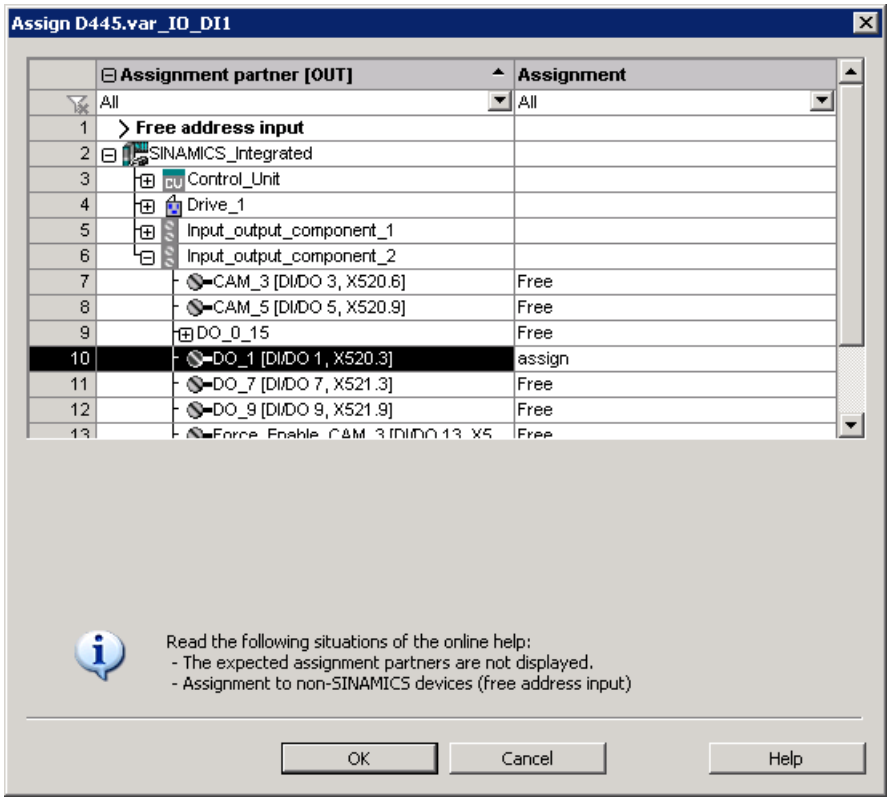

Figure 12-53 Selecting output DO 1

4. Confirm the selection by clicking **OK**.

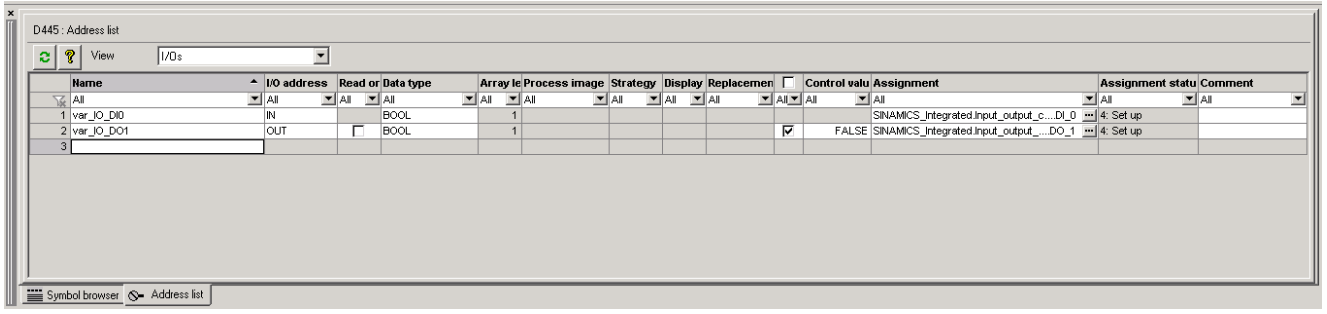

Figure 12-54 Address list following successful assignment

Identifiers

Assignment partner identifier	Description
DO_n	Output
DI_n	Input
MI_n	Measuring input
CAM_n	Output cam
Enable_MI_n	Enable input for measuring input input
Enable_CAM_n	Enable input for cam output

Assignment partner identifier	Description
Force_Enable_MI_n	Forcing enable input for measuring input input
Force_Enable_CAM_n	Forcing enable input for cam output
State_CAM_n	Reading back of the terminal state
State_DO_n	Reading back of the terminal state

Notes

Note

The procedures for generating symbolic variables and for using the process image or direct I/O access are described in detail in the SIMOTION SCOUT Manual.

Note

Please also note that the terminal module must have ramped up before it is accessed via I/Os. You can also configure an error strategy for I/O (CPU stop, substitute value or last value). Note that byte-specific setting is the minimum possible setting.

You cannot assign a substitute value for an output byte if individual bits have been allocated to an TO outputCam or TO camTrack.

See also

Power Up and Synchronization with the User Program (Page 8227)

Controlling the enabling signal

If the enabling signal has been selected for one of the channels on the TM17 High Feature, the user program can control this hardware function.

The control bit of the enabling signal has the following function (= force function):

- "0" → The I/O channel (e.g. channel 0) is controlled by the channel for the enabling signal (e.g. channel 10).
- "1" → The I/O channel (e.g. channel 0) is enabled irrespective of the channel for the enabling signal (e.g. channel 10).

If the I/O channel is activated by a HW enabling signal during forcing, this enable is retained even after the forcing function is terminated (provided that the enable conditions are still fulfilled).

Example

In this example, DO 13 on the TM17 High Feature terminal module is used as the channel for the enabling signal (see the following figure).

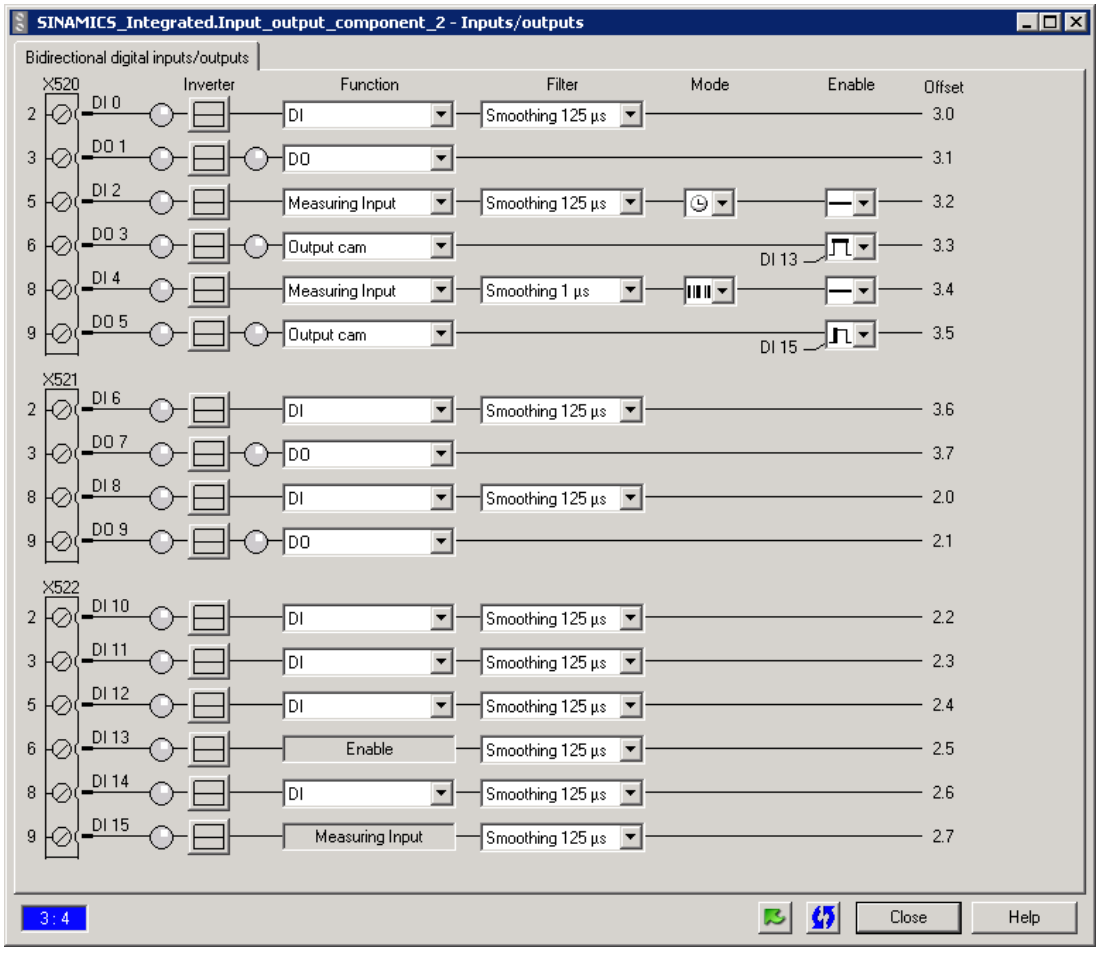

Figure 12-55 SCOUT – graphical configuration screen form for the TM17

Procedure

1. Create a variable in the **address list**, select 'OUT' in the **I/O address** field and 'BOOL' in the **Data type** field.

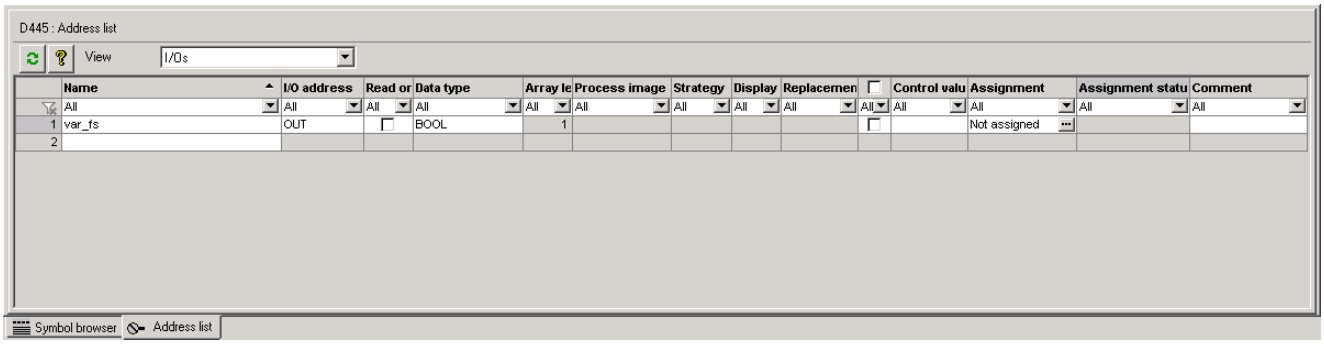

Figure 12-56 Creating a variable

2. Click ... in the **Assignment** field.

3. Select the **Force_Enable_CAM_3** assignment partner in the following dialog box.

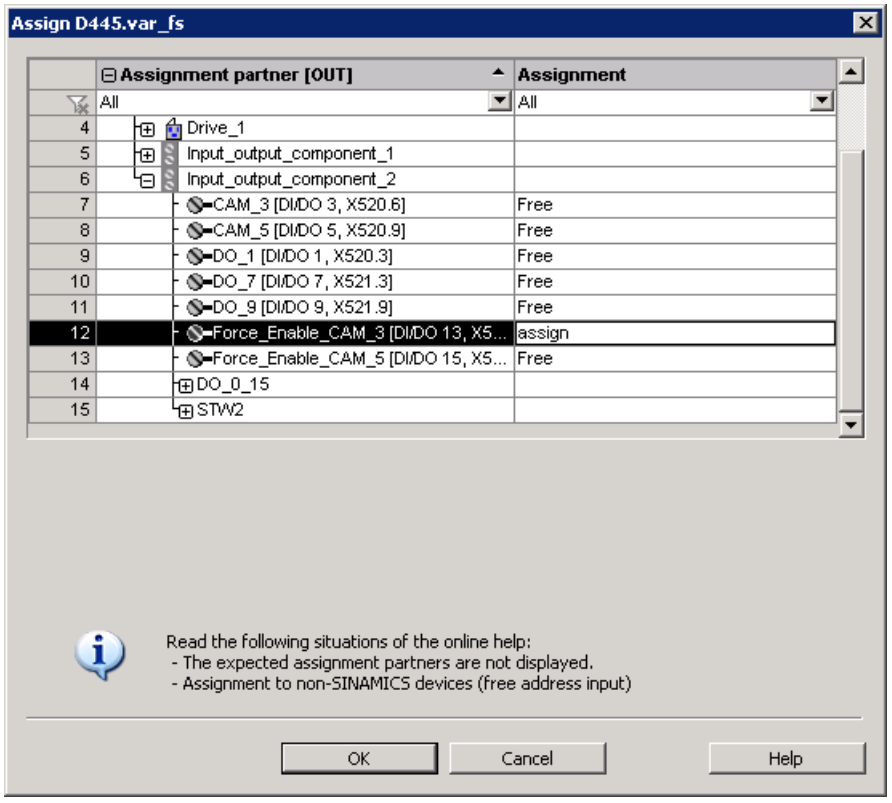

Figure 12-57 Selecting the Force_Enable_CAM_3 output

4. Confirm the selection by clicking **OK**.

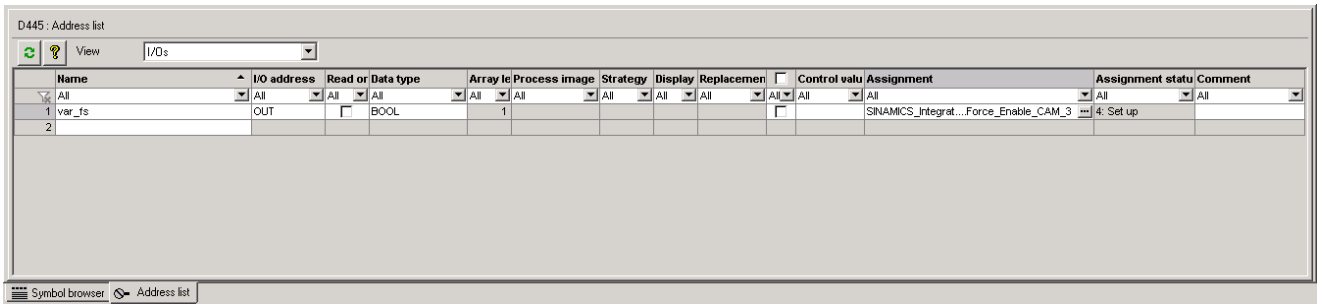

Figure 12-58 Address list following confirmation

Signal status of the enable signal

If required, the user program can read the signal state of the enabling signal via the **Enable_MI_n** or **Enable_CAM_n** assignment partner. The binary value reflects the signal state at time T_{in}.

See also

System behavior with binary inputs and outputs (Page 8268)

Read back function for outputs

The user program can read back the signal state of each output channel on the TM15 or TM17 High Feature via the **State_CAM_n** or **State_DO_n** assignment partner. The binary value reflects the signal state at time T_{in}.

Note

If an inverted output channel is parameterized, the inverted terminal status is read during the read-back.

See also

System behavior with binary inputs and outputs (Page 8268)

I/O assignment to technology objects

Linking technology objects with terminal modules

Measuring input inputs and cam outputs are operated with the associated technology objects (TOs). A general understanding of the use of technology objects is therefore needed to perform the desired configurations.

Note

The terminal module must be powered up before it can be accessed by technology objects. Otherwise, a technology alarm will be triggered.

The assignment of the measuring input inputs is performed as for the inputs (DI) and the assignment of the cam outputs as for the outputs (DO), but with the **CAM_n** or **MI_n** assignment partner.

You will find a detailed description of linking technology objects with terminal modules in the "SIMOTION Motion Control - Technology Objects for Output Cams and Measuring Inputs" Manual.

See also

Power Up and Synchronization with the User Program (Page 8227)

Power Up and Synchronization with the User Program

An isochronous bus is required for operation of the TM1x terminal modules.

The terminal modules must have powered up and reached the synchronized state before they can be read- or write-accessed. The synchronization of the terminal modules requires at least 18 servo cycles.

Until synchronization, the digital outputs are disabled (low level at the terminal).

The TM1x terminal modules are not ready to operate until they are successfully synchronized with the SIMOTION CPU. During this startup phase, the input and output variables must not be accessed directly or else an I/O access error will occur and the CPU will go to STOP mode.

In addition, all access attempts of the TO measuringInput, TO outputCam or TO camTrack in a non-synchronized state will trigger a technological alarm.

The start-up operation can be monitored by directly accessing the TM1x module status word or via the PeripheralFaultTask.

Monitoring synchronization by direct access to the module status word

The synchronization of the TM1x terminal modules is displayed cyclically to the SIMOTION motion control system via the module status word.

The synchronization bit **SYNC** is located in bit 8 of the module status word:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Function	-	-	-	-	-	-	ERR	**SYNC**	-	-	-	-	-	FPGA	PS	MF

"-" means reserved, cannot be used

Synchronization bit (bit 8):

SYNC = 0 → Module is not synchronized
SYNC = 1 → Module is synchronized

Example

You can evaluate the synchronization bit as shown in the following example. Create a variable of the BOOL type and assign it bit 8 from the module status word.

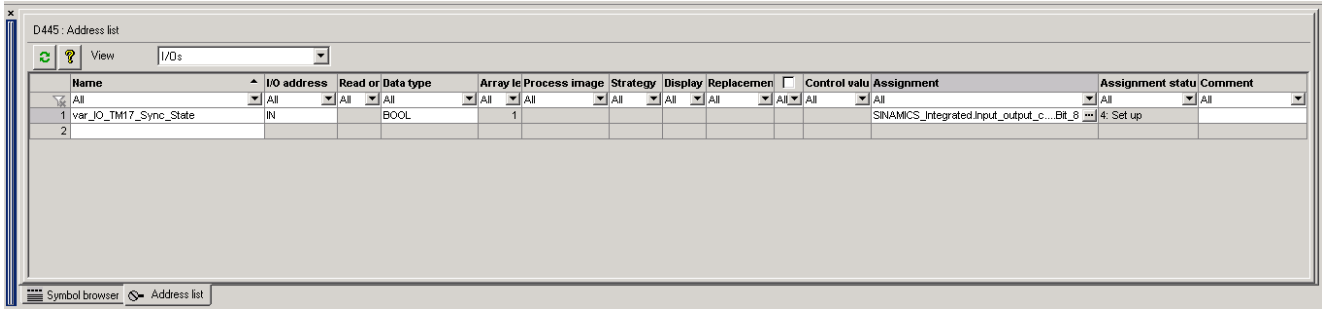

Figure 12-59 Creating variables in the address list

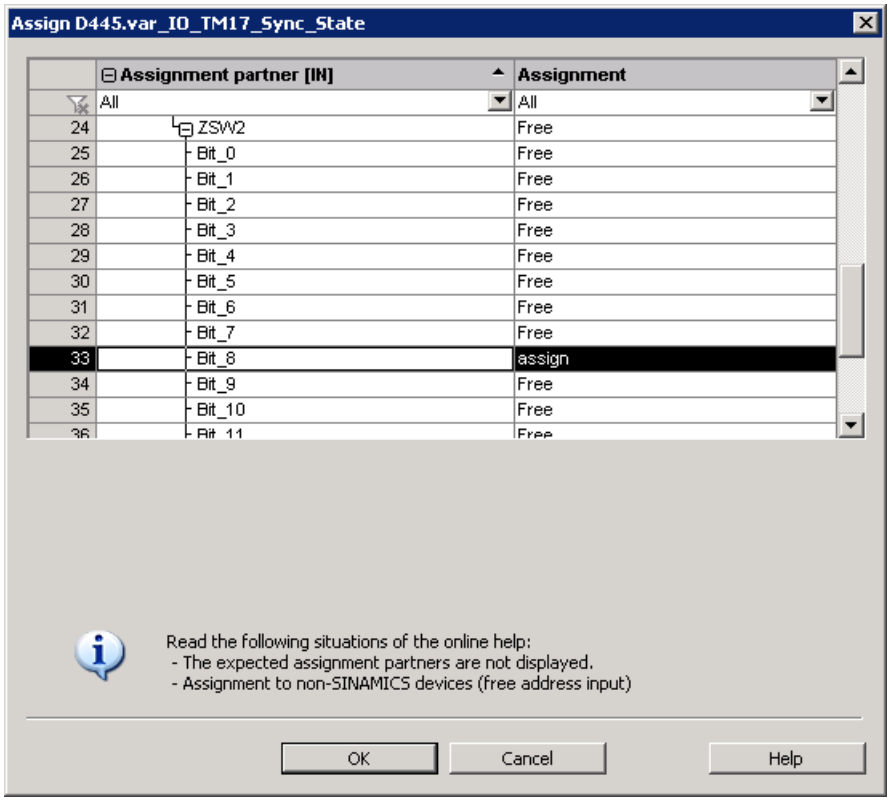

Figure 12-60 Assignment

As soon as SYNC bit = 1, the module is synchronized and may be accessed directly via the I/O or technology objects.

Monitoring the synchronization with PeripheralFaultTask

During the transition from STARTUP to RUN, all TM1x Terminal Modules are in the "NOT_SYNCHRONIZED" state.

- As soon as the Terminal Modules have been successfully synchronized, the PeripheralFaultTask with interrupt ID "_SC_IO_MODULE_SYNCHRONIZED" (=214) is called.
- If synchronization fails, the PeripheralFaultTask with interrupt ID "_SC_IO_MODULE_NOT_SYNCHRONIZED" (=215) is called.

Example

To synchronize the user task, a user variable **TM_SYNC** is set to **FALSE** in the StartUpTask and set to **TRUE** in the PeripheralFaultTask with interrupt ID = SC_IO_MODULE_SYNCHRONIZED. The status of **TM_SYNC** is queried in the user task before the (first) direct access operation.

The following TaskStartInfo is supplied in the PeripheralFaultTask every time it is called:

```
DINT    TSI#logBaseAdrIn    // valid only when not equal to _SC_INVALID_ADDRESS
DINT    TSI#logBaseAdrOut   // valid only when not equal to _SC_INVALID_ADDRESS
```

DINT	TSI#logDiagAdr	// valid only when not equal to _SC_INVALID_ADDRESS
DWORD	TSI#details	// set to 0
UINT	TSI#eventClass	// set to 0
UINT	TSI#faultId	// set to 0

The TaskStartInfo contains the logical address of the relevant module.

TSI#logDiagAdr, TSI#details, TSI#eventClass, and TSI#faultId are irrelevant for TM15/TM17 High Feature Terminal Modules.

For further information on the TaskStartInfo, refer to the "SIMOTION ST Structured Text" Manual.

12.3.3.6 Applicative access via the logical address

Introduction

The following sections describe the procedure for the assignment of DOs/TOs via the logical address.

As of SIMOTION SCOUT V4.2, the symbolic assignment is set as default setting for new projects. The symbolic assignment is deactivated for old projects. If you want to continue using the interconnection of DO/TOs via the logical address for new projects, you must deselect the default setting in the Project menu.

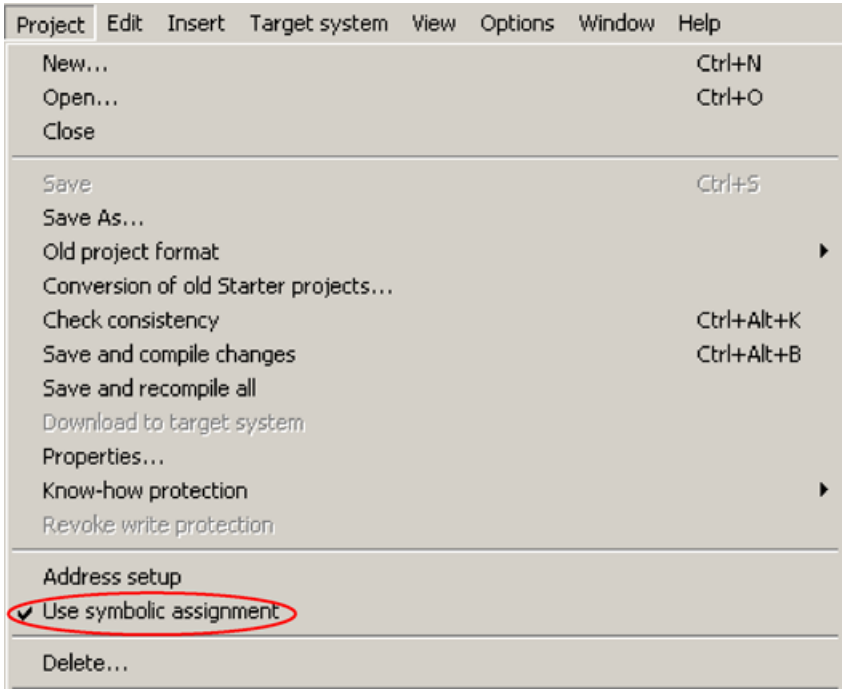

Figure 12-61 Project menu

The message frame configuration is opened via **SINAMICS_Integrated** -> **Communication** -> **Message frame configuration** in the project navigator. The following window with the I/O address assignments of the message frame is displayed.

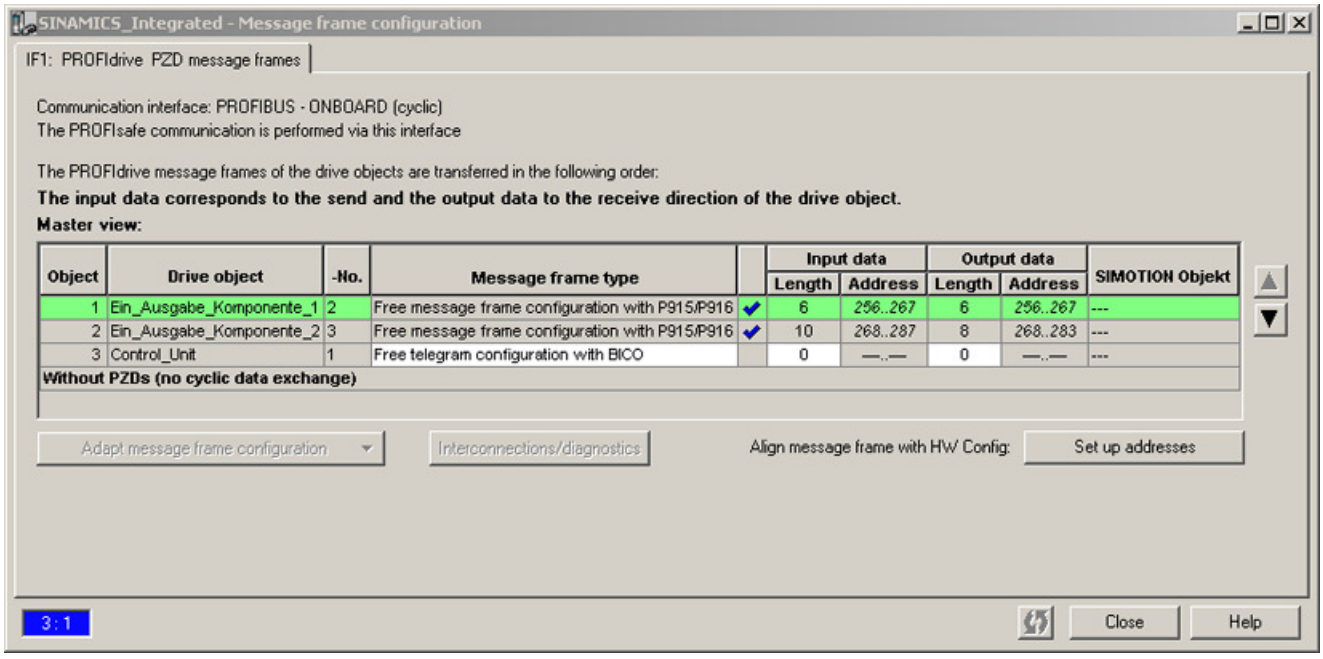

Figure 12-62 Message frame configuration

Note

We recommend that you do not change between symbolic assignment and assignment via the logical address. A change can result in data being lost.

Note

The terminal module must be powered up before it can be accessed via the I/O. Otherwise, an I/O access error will occur and the CPU will go to STOP mode.

See also

Power Up and Synchronization with the User Program (Page 8238)

Generating message frames and TM1x drive objects

The message frames are automatically generated for TM15 and TM17 High Feature (or updated if they previously existed) when you select the "Close" button in the graphical configuration screen form.

When using the TM15 DI/DO, TM31 or TB30 with SIMOTION SCOUT, you must set up the message frames as free message frames and interconnect the terminal functions to the message frame via BICO.

Note

Do not make any changes to the parameters in the Expert list, as these changes will not be automatically updated in the message frame and could therefore lead to errors.

See also

Message frames (Page 8273)

Maximum permissible message frame length (Page 8242)

Aligning the configuration with the hardware

I/O addresses must now be assigned to the message frame so that the runtime system can access it. These addresses are generated/updated by the hardware configuration tool included in SCOUT.

1. To begin assigning addresses in this example, double-click **Message frame configuration** under **SINAMICS_Integrated** -> **Communication** in the project tree. The following window with the I/O address assignments of the message frame appears.

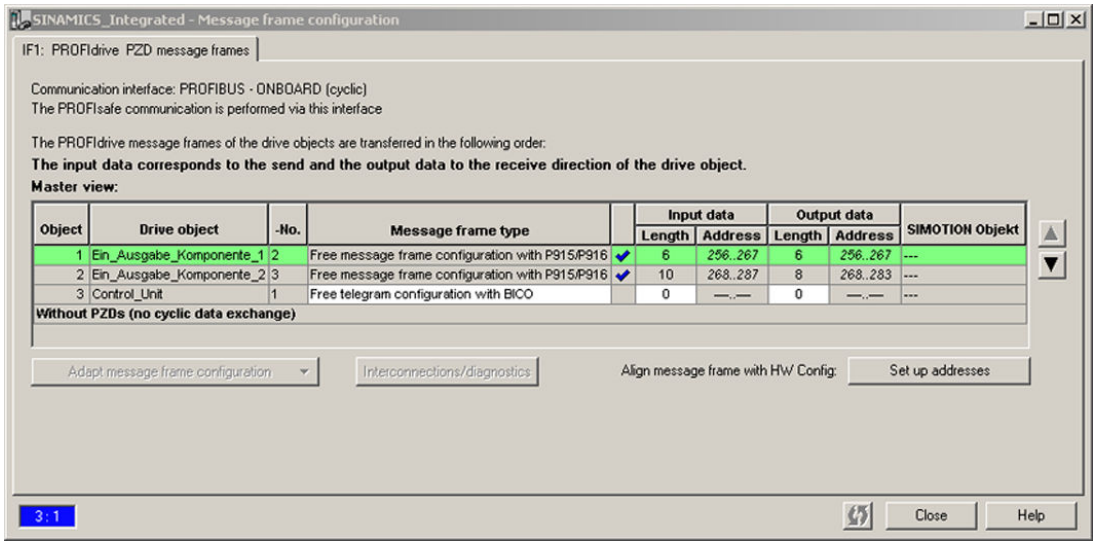

Figure 12-63 Aligning the configuration with the hardware

2. Click **Set up address** and then confirm with **Yes**. The addresses of the inputs and outputs are updated.

Note that the addresses have been assigned automatically. These addresses are the logical start addresses of the module in the message frame.

You must later add the offset values from the graphical configuration screen form to these addresses if you want to determine the addresses for the individual I/O channels.

As an alternative to the above procedure, you can also perform the alignment via the menu **Project** -> **Set up addresses**.

Notes

Note

When a TM1x is reconfigured, the structure of its message frame is changed, thus necessitating a realignment with HW Config. This process will create new (modified) addresses for the inputs and outputs. In addition, the I/O address assignment of the technology object must be updated.

Even if the operating mode of a measuring input is changed (once/cyclically), realignment with HW Config is required, although this does not generate any new (changed) addresses for the inputs and outputs.

Note

Before making changes in the configuration screen forms of the TM15 / TM17 High Feature terminal modules, you must close the screen form for aligning the hardware (see figure above).

Linking symbolic I/O variables with TM1x terminal modules

You can assign addresses to binary I/O channels using symbolic variables in the user program.

Procedure

In the following example, create the variable 'var_IO_DI0' and link this to input DI_0 and variable 'var_IO_DO1' with output DO_1.

For the addressing example, use the input and output addresses from the following figure.

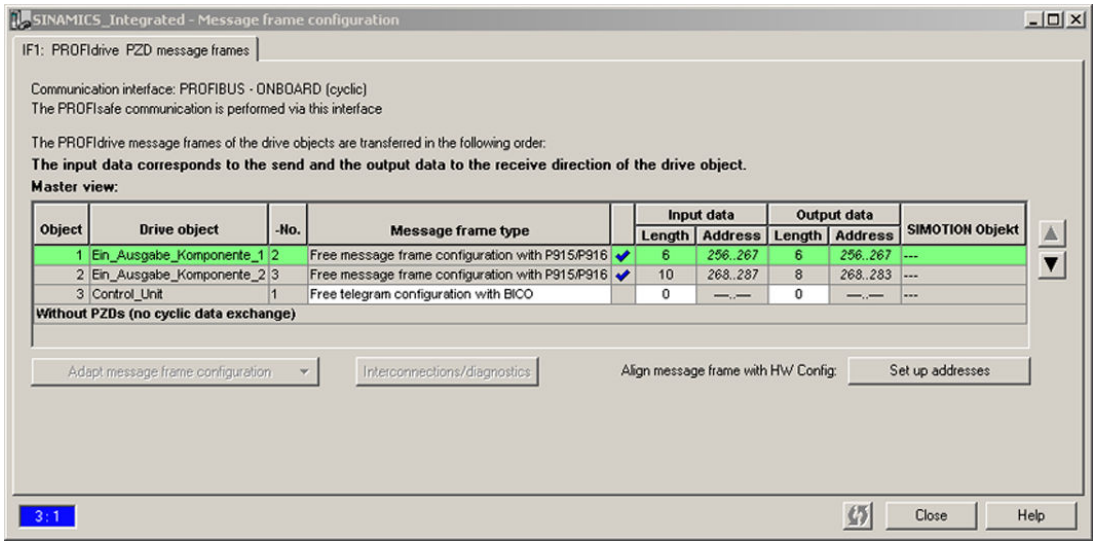

Figure 12-64 Aligning the configuration with the hardware

Refer to the following figure for the offset in the example.

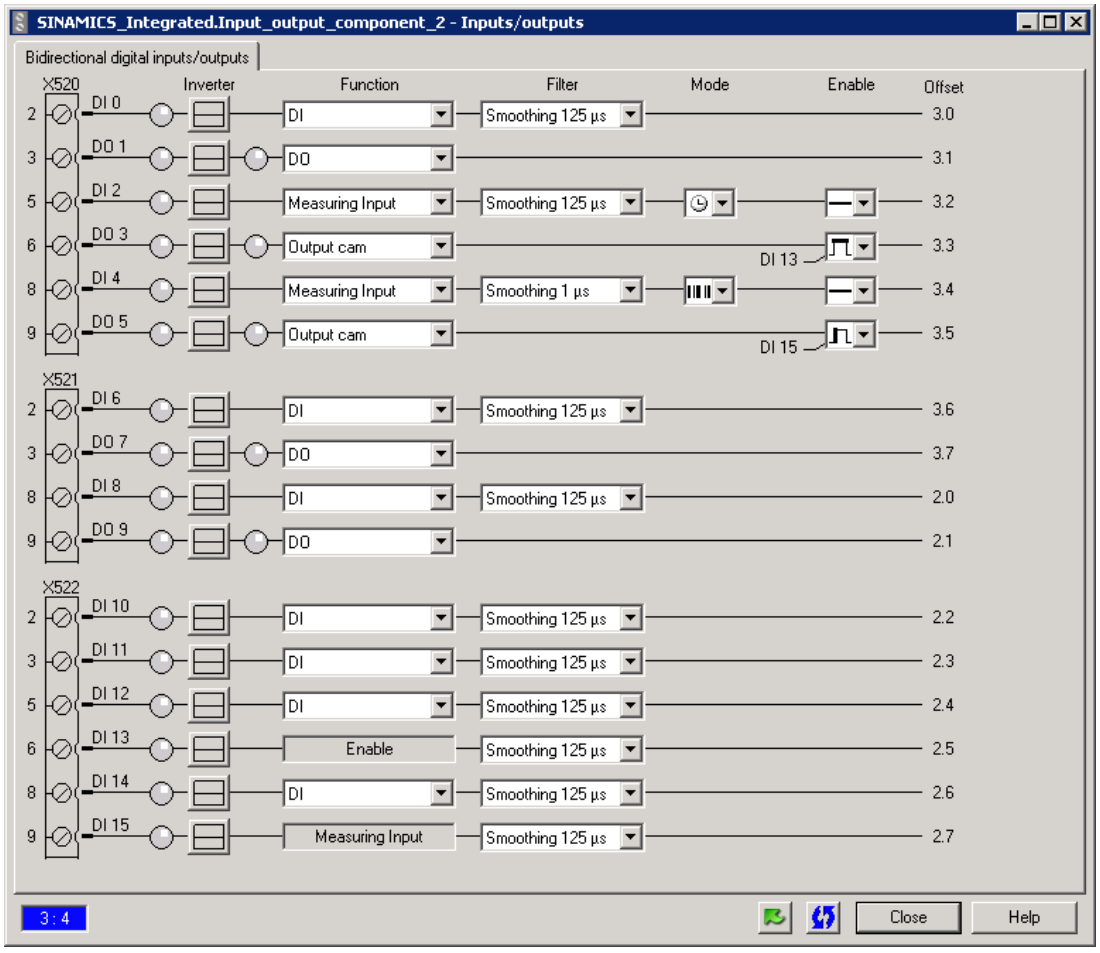

Figure 12-65 SCOUT – graphical configuration screen form for the TM17 (SIMOTION)

Input DI 0

The base "I-address" of the TM17 High Feature is "268". Now add the offset of 3.0. For DI 0, the resulting address is 271.0.

1. Open the **address list** via the project navigator.
2. Create the variable 'var_IO_DI0' and in the **I/O address** field, enter the value 'PI 271.0' (PI stands for input).

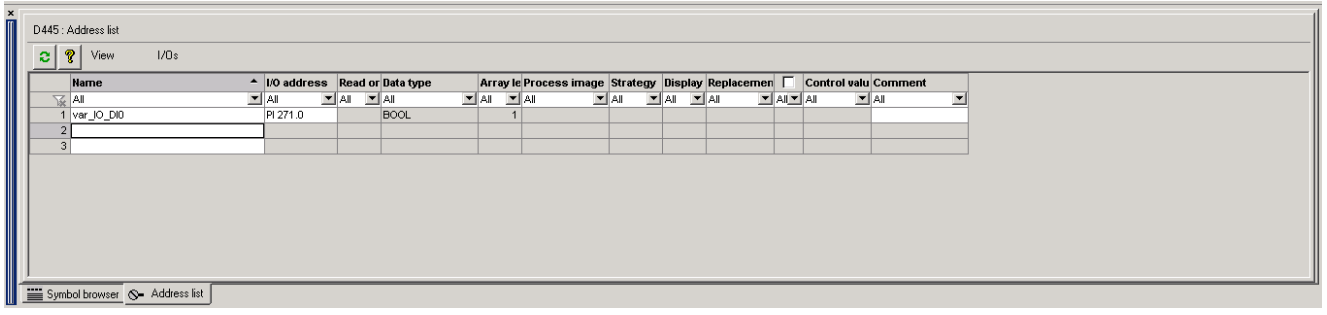

Figure 12-66 Creating variables in the address list

Output DO 1

The base "O-address" of the TM17 High Feature is "268". Now add the offset of 3.1. For DO 1, the resulting address is 271.1.

1. Open the **address list** via the project navigator.
2. Create the variable 'var_IO_DO1' and in the **I/O address** field, enter the value 'PQ 271.1' (PQ stands for output).

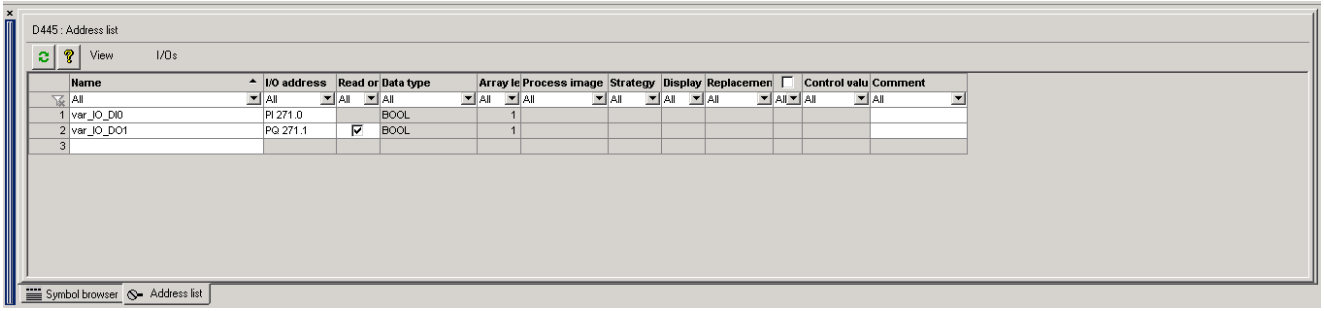

Figure 12-67 Creating variables in the address list

Notes

Note

The procedures for generating symbolic variables and for using the process image or direct I/O access are described in detail in the SIMOTION SCOUT Manual.

Note

You cannot use I/O variables to output to a digital output that is being used simultaneously by a TO outputCam or TO camTrack.

An error message will be output when the project is downloaded to the target system.

Please also note that the terminal module must have ramped up before it is accessed via I/Os. You can also configure an error strategy for I/O (CPU stop, substitute value or last value). Note that byte-specific setting is the minimum possible setting.

You cannot assign a substitute value for an output byte if individual bits have been allocated to an TO outputCam or TO camTrack.

See also

Power Up and Synchronization with the User Program (Page 8238)

Controlling the enable signal

If the enabling signal has been selected for one of the channels on the TM17 High Feature terminal module, the user program can control this hardware function by writing values to the output address assigned to the channel for the enabling signal.

The control bit of the enabling signal has the following function (= force function):

- "0" → The I/O channel (e.g. channel 0) is controlled by the channel for the enabling signal (e.g. channel 10).
- "1" → The I/O channel (e.g. channel 0) is enabled irrespective of the channel for the enabling signal (e.g. channel 10).

If the I/O channel is activated by a HW enabling signal during forcing, this enable is retained even after the forcing function is terminated (provided that the enable conditions are still fulfilled).

Example

In this example, DO 13 on the TM17 High Feature terminal module is used as the channel for the enabling signal (see the following figure).

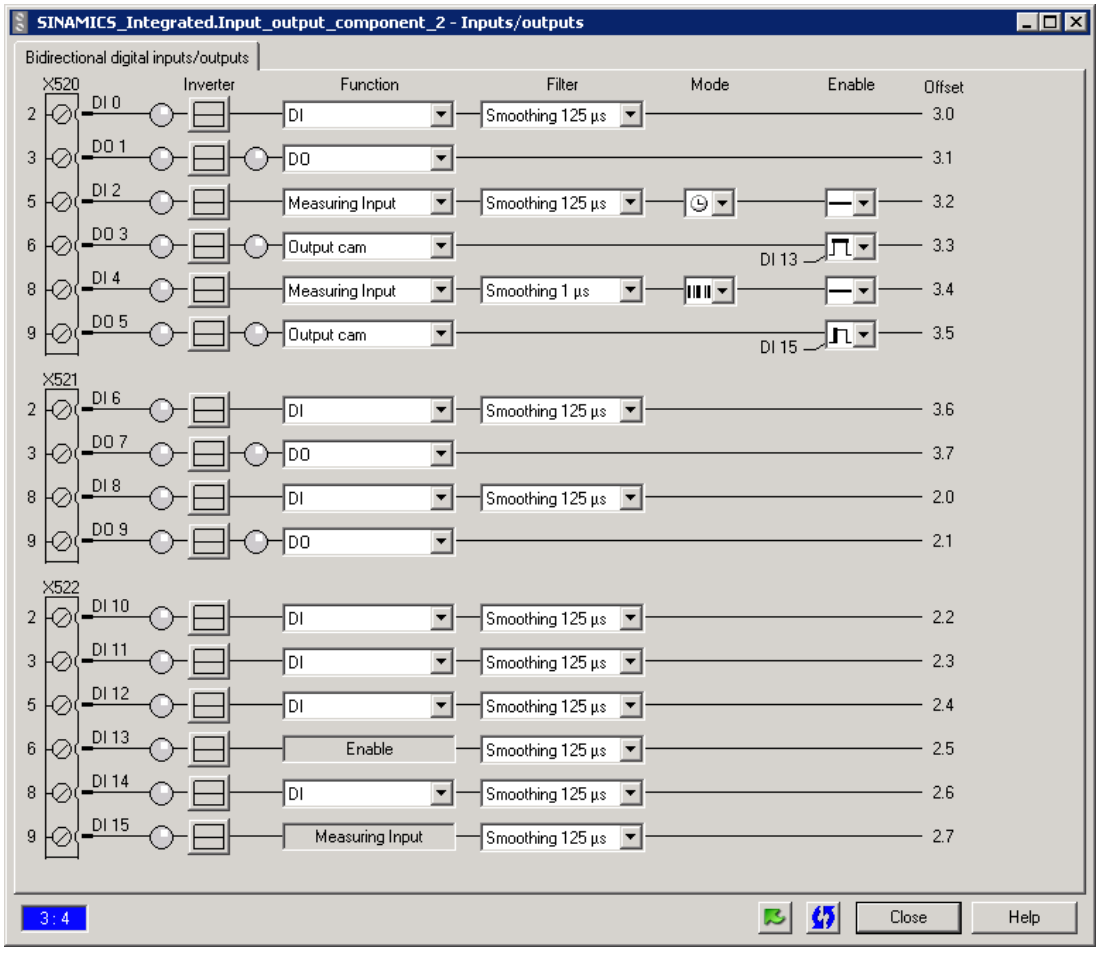

Figure 12-68 SCOUT – graphical configuration screen form for the TM17

Addressing the channel for the enabling signal

Table 12-9 Addressing the channel for the enabling signal

Channel for enabling signal	Assigned to I/O channel	I/O address of enable input (output address)
10	0	(Module address + 2).2
11	1	(Module address + 2).3
12	2	(Module address + 2).4
13	**3**	**(Module address + 2).5**
14	4	(Module address + 2).6
15	5	(Module address + 2).7

The output address for controlling the enabling signal DO 13 is "268" (output address of the TM17 HF in the example) plus an offset of "2.5" (see table). Consequently, the output address to control the enabling signal is 270.5.

Procedure

Create a variable in the **address list** and enter the value 'PQ 270.5' in the **I/O address** field.

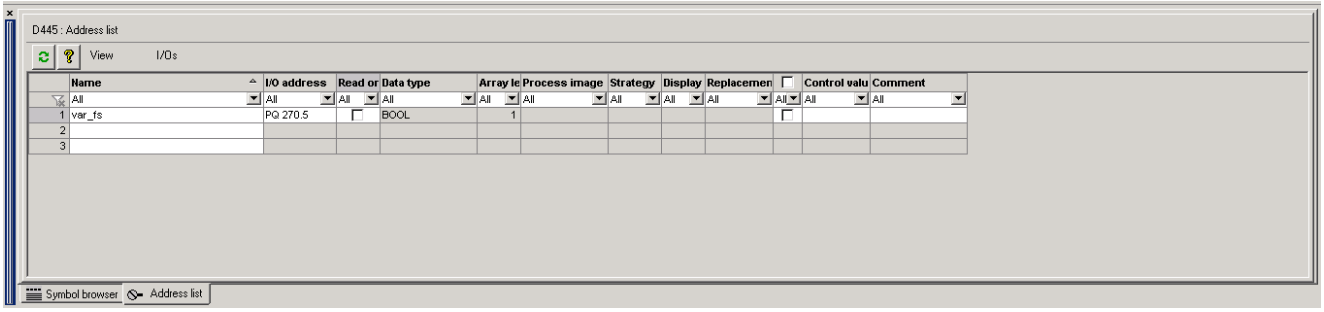

Figure 12-69 Creating a variable in the address list

Signal status of the enable signal

If required, the user program can read the signal state of the enabling signal using the assigned input address (e.g. for CAM 3: 268 + offset 2.5 = 270.5). The binary value reflects the signal state at time T_{in}.

Read back function for outputs

The user program can read back the signal state of each output channel on the TM15 or TM17 High Feature using the assigned input address (e.g. for DO1: 268 + offset 3.1 = 271.1). The binary value reflects the signal state at time T_{in}.

Note

If an inverted output channel is parameterized, the inverted terminal status is read during the read-back.

I/O assignment to technology objects

Linking technology objects with terminal modules

Measuring input inputs and cam outputs are operated with the associated technology objects (TOs). A general understanding of the use of technology objects is therefore needed to perform the desired configurations.

Note

The terminal module must be powered up before it can be accessed by technology objects. Otherwise, a technology alarm will be triggered.

The assignment of the measuring input inputs is performed as for the inputs (DI) and the assignment of the cam outputs as for the outputs (DO), but with the **CAM_n** or **MI_n** assignment partner.

You will find a detailed description of linking technology objects with terminal modules in the "SIMOTION Motion Control - Technology Objects for Output Cams and Measuring Inputs" Manual.

See also

Power Up and Synchronization with the User Program (Page 8238)

Power Up and Synchronization with the User Program

An isochronous bus is required for operation of the TM1x terminal modules.

The terminal modules must have powered up and reached the synchronized state before they can be read- or write-accessed. The synchronization of the terminal modules requires at least 18 servo cycles.

Until synchronization, the digital outputs are disabled (low level at the terminal).

The TM1x terminal modules are not ready to operate until they are successfully synchronized with the SIMOTION CPU. During this startup phase, the input and output variables must not be accessed directly or else an I/O access error will occur and the CPU will go to STOP mode.

In addition, all access attempts of the TO measuringInput, TO outputCam or TO camTrack in a non-synchronized state will trigger a technological alarm.

The start-up operation can be monitored by directly accessing the TM1x module status word or via the PeripheralFaultTask.

Monitoring synchronization by direct access to the module status word

The synchronization of the TM1x terminal modules is displayed cyclically to the SIMOTION motion control system via the module status word.

The synchronization bit **SYNC** is located in bit 8 of the module status word:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Function	-	-	-	-	-	-	ERR	**SYNC**	-	-	-	-	-	FPGA	PS	MF

"-" means reserved, cannot be used

Synchronization bit (bit 8):

SYNC = 0 → Module is not synchronized
SYNC = 1 → Module is synchronized

If you want to monitor the synchronization using I/O accesses, we recommend that you either configure an input WORD variable on the TM1x module status word with "substitute value=0" or perform the access by means of the secured **getSafeValue** system function.

If you are working with a SIMOTION SCOUT version < 4.1 SP2, you can only access the status word via the user program using a WORD variable (the individual bits must then be isolated by masking).

As soon as SYNC bit = 1, the module is synchronized and may be accessed directly via the I/O or technology objects.

Monitoring the synchronization with PeripheralFaultTask

During the transition from STARTUP to RUN, all TM1x Terminal Modules are in the "NOT_SYNCHRONIZED" state.

- As soon as the Terminal Modules have been successfully synchronized, the PeripheralFaultTask with interrupt ID "_SC_IO_MODULE_SYNCHRONIZED" (=214) is called.
- If synchronization fails, the PeripheralFaultTask with interrupt ID "_SC_IO_MODULE_NOT_SYNCHRONIZED" (=215) is called.

Example

To synchronize the user task, a user variable **TM_SYNC** is set to **FALSE** in the StartUpTask and set to **TRUE** in the PeripheralFaultTask with interrupt ID = SC_IO_MODULE_SYNCHRONIZED. The status of **TM_SYNC** is queried in the user task before the (first) direct access operation.

The following TaskStartInfo is supplied in the PeripheralFaultTask every time it is called:

DINT	TSI#logBaseAdrIn	// valid only when not equal to _SC_INVALID_ADDRESS
DINT	TSI#logBaseAdrOut	// valid only when not equal to _SC_INVALID_ADDRESS
DINT	TSI#logDiagAdr	// valid only when not equal to _SC_INVALID_ADDRESS
DWORD	TSI#details	// set to 0
UINT	TSI#eventClass	// set to 0
UINT	TSI#faultId	// set to 0

The TaskStartInfo contains the logical address of the relevant module.

TSI#logDiagAdr, TSI#details, TSI#eventClass, and TSI#faultId are irrelevant for TM15/TM17 High Feature Terminal Modules.

For further information on the TaskStartInfo, refer to the "SIMOTION ST Structured Text" Manual.

12.3.3.7 Export/import project

A consistent project, which uses TM15 or TM17 High Feature modules, can be consistently exported and reimported via **Project Export/Import**.

If only the **SIMOTION CPU** is exported, the message frame configuration for TM1x is not exported with it. Thus, the current message frame configuration is not changed as a result of an import to a CPU.

If only the **SINAMICS drive unit** is exported, the message frame configuration for TM1x is not exported with it. The TM1x configuration must be recreated after an import.

Procedure

1. Select the SIMOTION CPU in the project tree and right-click to open the context menu.
2. Recreate the configuration via the menu **FastIO** > **Create new configuration**.
   The existing configuration is deleted.

12.3.3.8 Limitations of use

Overview

The maximum possible number of terminal modules for each SIMOTION D, SINAMICS control unit or CX32/CX32-2 depends on the following factors:

- Maximum number of terminal modules
- Maximum number of drive objects
- Maximum permissible message frame length
- Other limitations

Maximum number of terminal modules

The following maximum quantity structures apply when using terminal modules:

- The total number of TM15 (without the TM15 DI/DO variant) and TM17 High Feature terminal modules permitted per DRIVE-CLiQ line is three. This also applies when using a DMC20/DME20 DRIVE-CLiQ hub module. If there are more than three TM15 or TM17 High Feature terminal modules connected to a control unit in total, the maximum number of TM15 or TM17 High Feature terminal modules that can be installed on one DRIVE-CLiQ line is two. In addition, exactly one TM54F can be connected for each CU/D4xx/D4x5-2/CX32/CX32-2.
- The total number of all TM15 and TM17 High Feature terminal modules permitted per SIMOTION D4x5/D4x5-2, SINAMICS CU320/CU320-2 or CX32/CX32-2 is eight. TM54F is not included here, i.e. only a maximum of eight terminal modules can be connected, as well as an additional TM54F.
- The total number of all TM15 and TM17 High Feature terminal modules permitted per SIMOTION D410 or SINAMICS CU310 is three.

Note

For details of any other applicable restrictions, refer to the SIMOTION D and SINAMICS Manuals.

The TM15 and TM17 High Feature terminal modules require a DRIVE-CLiQ cycle time of at least 125 µs.

At present, the DRIVE-CLiQ cycle time always corresponds to the currently set current controller cycle clock. If a TM15, for example, is operated in conjunction with vector drives with a DRIVE-CLiQ cycle time > 125 µs, the resolution/accuracy of measuring input inputs or cam outputs deteriorates (resolution/accuracy identical to the DRIVE-CLiQ cycle time). Resolution and accuracy on the TM17 High Feature are not related to the cycle time in use.

The computing load of each TM15 / TM17 High Feature must be considered equivalent to one half of a SINAMICS axis, which can lead to a reduction in the number of axes on the part of drive control (does not apply for **TM15 DI/DO**).

If the TM15 or TM17 High Feature terminal module is operated on a DRIVE-CLiQ line with a cycle time less than 125 µs, communication with these modules is not possible.

Note

Exceeding the allowable number of terminal modules on a given DRIVE-CLiQ line can cause the DRIVE-CLiQ interface to cease communication.

Maximum number of drive objects

The maximum permissible number of drive objects per SIMOTION D, SINAMICS CU or SINAMICS CX32/CX32-2 depends on the controller / control unit used.

- SIMOTION D4x5-2, SINAMICS CU320-2 or SINAMICS CX32-2:
  Max. 24 drive objects
- SIMOTION D4x5, SINAMICS CU320 or SINAMICS CX32:
  Max. 16 drive objects
- SIMOTION D410 or SINAMICS CU310:
  Max. 5 drive objects

Examples of drive objects:

- CU320/CU320-2 control unit
- Regulated infeed
- CX32/CX32-2 extension module
- Motor modules (one double motor module constitutes two drive objects)
- TB30
- TM modules

Maximum permissible message frame length

Each terminal module uses two message frames to communicate with the SIMOTION motion control system:

- Setpoint message frame – contains the programmed setpoints and is sent by the SIMOTION Motion Control System to the TM.
- Actual value message frame – contains the current state of the I/O and is sent by the TM to the SIMOTION Motion Control System.

The maximum length of either the setpoint message frame or the actual value message frame is

- With integrated drives (SIMOTION D / CX32/CX32-2): 512 bytes
- With external drives (CU320/CU320-2/CU310/CU310-2):
  - On PROFIBUS DP: 244 bytes
  - On PROFINET IO: For CU320/CU320-2 with CBE20: 400 bytes
  - On PROFINET IO: For CU310-2 PN / CU320-2 PN (integrated PROFINET interface): 480 bytes

However, because the message frames are user-configured, the length of the message frames is determined by the current configuration, i.e. the actual length can be less.

Message frames contain all data for the drive unit, including:

- Message frame length for all modules of type TM15 / TM17 High Feature
- Message frame length for all axis message frames (e.g. standard message frame 5 has "PZD 9/9" → 9 words [18 bytes] in each direction)

- Message frame length for all line modules (e.g. SIEMENS message frame 370 for infeed with PZD 1/1 → 1 word [2 bytes] in each direction)
- .....

If the message frame contains too much data, the number of TMs must be reduced.

See also

Message frames (Page 8273)

Consistency checks

To ensure that applicable restrictions are not violated, SCOUT has the following built-in consistency checks:

- **At any time**, from the SCOUT main menu, "Check consistency" can be selected from the "Project" drop-down menu. (For more information, refer to the SCOUT online help.) This allows you to verify that the programmed configuration is consistent with the defined hardware configuration.
- **Before downloading the hardware configuration**, "Consistency Check" can be selected from the HW Config "Station" menu. (For more information, refer to the SCOUT online help.) This allows you to verify the integrity of the defined hardware configuration for such things as PROFIBUS settings, timing settings, SINAMICS parameters, etc.
- **Before saving a project in SCOUT**, you can check the consistency of the network by selecting the "Check consistency" option in the "Network" menu of NetPro. (For more information, refer to the SCOUT online help.) This allows you to verify the integrity of the network and ensure that such things as redundant network addresses, unconnected nodes, subnets that have only one node, inconsistent connections, etc., are not present.
- **When the SIMOTION Motion Control System is powering up**, a "topology test" is automatically carried out to ensure that the hardware is consistent with the programmed configuration.

12.3.4 Commissioning

12.3.4.1 Power-up

Once the terminal module is physically installed and connected electrically, power may be applied to the unit.

⚠ DANGER
Danger to life from improper commissioning Non-observance of the standards and safety regulations can result in serious injury or death. • For this reason, you must always observe the applicable standards and safety regulations when configuring a plant / system.

Status LED (RDY) of module

The status of the module and the DRIVE-CLiQ interface are indicated by means of a multicolored LED on the front panel of the TM. The individual colors are explained in the following table. The error display is the same as that used on other SINAMICS components.

Table 12-10 Module status

LEDs	Color	Status	Description
READY	-	Off	Electronics power supply outside the permissible tolerance range.
	Green	Continuous light	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	Continuous light	DRIVE-CLiQ communication is being established.
	Red	Continuous light	This component has at least one fault.
	Green/Red	Flashing 2 Hz	Firmware is being downloaded.
	Green/Orange	Flashing 2 Hz	Component detection: no faults detected.
	Red/Orange	Flashing 2 Hz	Component detection: fault(s) detected.

Note

Interruption of module power supply: If the power supply to the module is interrupted, all outputs will switch to 0 V until synchronous communication resumes.

12.3.4.2 Updating the firmware

The module firmware can be updated using a CompactFlash card, which is inserted in the SIMOTION D or SINAMICS S120 control unit.

Procedure

1. Online connection for SCOUT
   In the project tree, click **SINAMICS_Integrated**.
   Go online by clicking the **Connect to target system** symbol in the main toolbar at the top.
   SCOUT is now connected to the SINAMICS device.

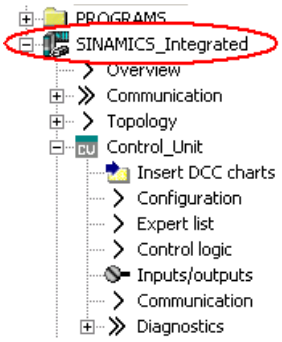

Figure 12-70 SCOUT project tree – Topology

2. Selection of a terminal module
   Double-click **Overview** under **SINAMICS_Integrated**. A window with two tabs **Overview** and **Version overview** appears (similar to figure below).
   The **Version overview** tab contains all the components that are connected to the SINAMICS control unit. The FW version currently installed on the component is displayed in the FW version column. The first two digits stand for the version, i.e. 24.... stands for version V2.4.

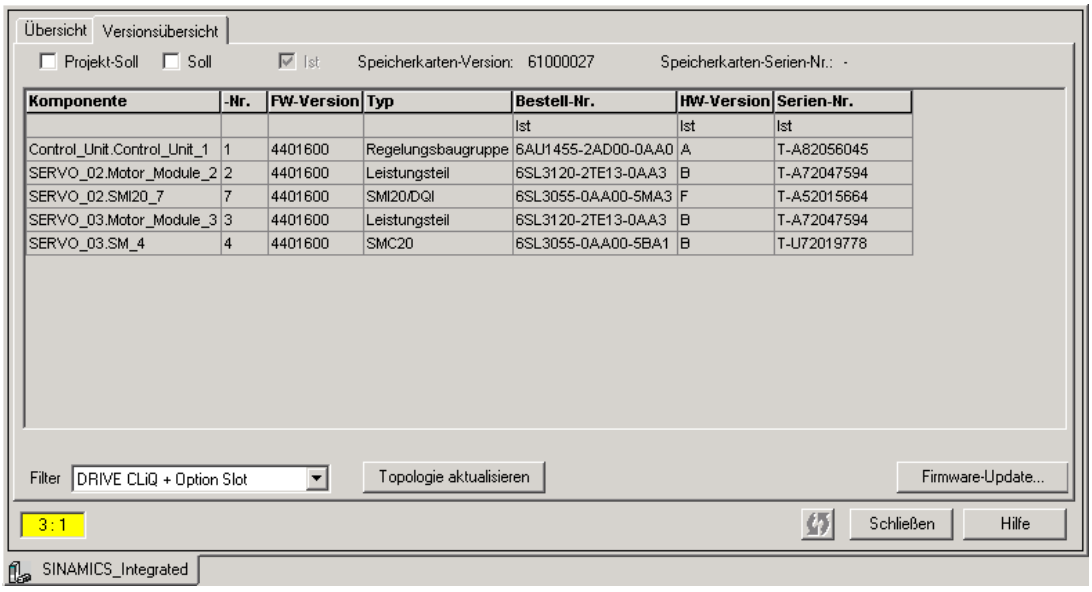

Figure 12-71 Screen displaying components connected to the control unit

3. Updating the firmware
   Right-click the **Firmware update** button. A window will open (similar to screen below).

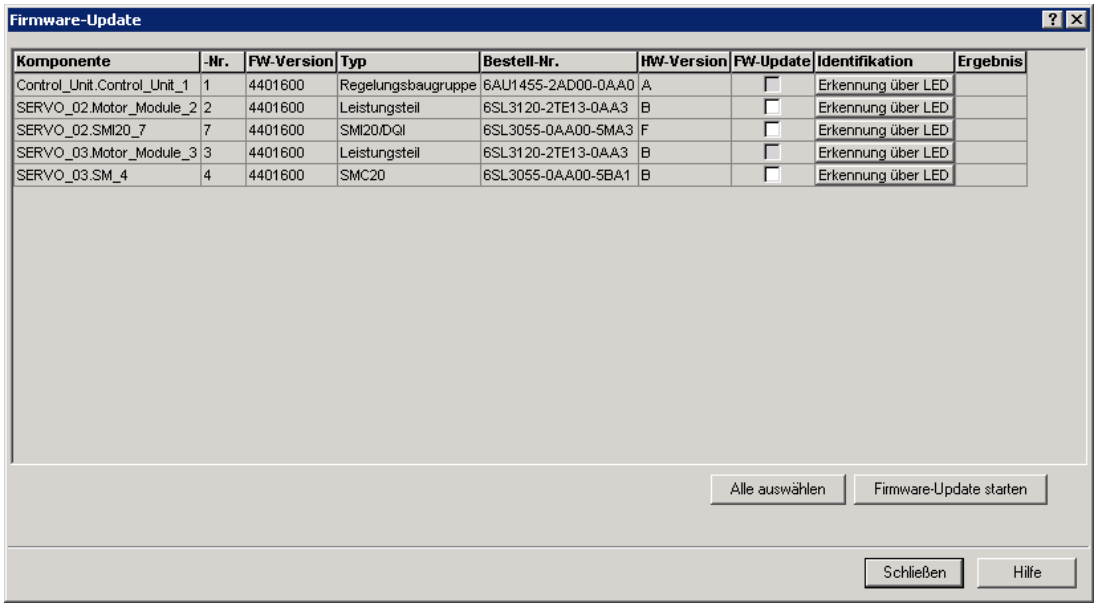

Figure 12-72 Firmware update

You can now select either **Select all** or an individual component in the **FW update** column; in the latter case, click the **Identification via LED** button first to check whether the correct module is selected. The RDY-LED on the selected component flashes green/orange (if no faults are detected) or red/orange (if faults are detected).

Select **Start firmware update** to perform the FW update for the selected components. The firmware update process may take a while - a message is displayed to indicate when it has been completed. During the update, the RDY-LED flashes green/red.

Now switch off the power supply for all drive components (SINAMICS control unit, CX32 extension module, SIMOTION D, terminal module, etc.) and switch it back on to activate the new firmware.

Note

The SIMOTION or SINAMICS CompactFlash card always contains the most recent firmware version for the module.

12.3.4.3 Synchronous mode

Note

This section applies only to systems with external drives since this type of drive must be synchronized during configuration of PROFIBUS/PROFINET. Conversely, systems with integrated drives (i.e. one using SIMOTION D or CX32) use an integrated PROFIBUS that is pre-configured and synchronized.

The TM15 and TM17 High Feature terminal modules must operate isochronously with the SIMOTION Motion Control System. This is achieved by exchanging sign-of-life signals.

Therefore, isochronous operation must be selected

- For PROFIBUS both on the master (SIMOTION) as well as on the slave (SINAMICS)
- For PROFINET both on the master (SIMOTION) as well as on the device (SINAMICS)

PROFIBUS procedure

To make this selection in SINAMICS:

1. Right-click the SINAMICS component in the project tree.
2. In the drop-down menu, select the **Open HW Config** option.
3. Right-click the SINAMICS icon.
4. In the drop-down menu, select the **Object properties** option.

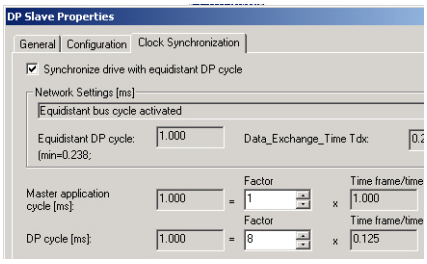

Figure 12-73 SCOUT - "DP Slave Properties" window

5. Select the **Isochronous operation**" tab.
6. Select the **Synchronize drive to equidistant DP cycle** checkbox.

If synchronization is lost (due to multiple consecutive transmission disturbances or interruption of the bus), a flag is set in the module's status word. Also, the module stops operation and all outputs are set to 0 V level. The module automatically attempts to restore the synchronization and to restart. This takes only a few position control cycle clocks if the restart is successful.

Note

To ensure error-free operation, we recommend that you program a synchronous status query in the user program before issuing control commands to technology objects or read/write accessing modules via I/O access.

See also

Error messages (Page 8248)

Power Up and Synchronization with the User Program (Page 8227)

PROFINET procedure

The basic procedure with PROFINET corresponds to PROFIBUS.

However, the synchronization must be activated in the properties of the device PROFINET connection in the **Application** tab.
In addition, a sync domain with the RT class **IRT top** must be selected in the **Synchronization** tab.

12.3.5 Error messages

Introduction

The error messages generated by the TM15 or TM17 High Feature modules are reported cyclically to the SIMOTION Motion Control System via the module status word as well as the diagnostic interrupt.

From SIMOTION V4.1 SP 1 onward, a diagnostic interrupt is also generated. Detailed diagnostic information can be found in the TSI#details of the TaskStartInfo.

The input address of the status word is identical to the start address (I-address) of the module.

Status word structure

The error bit corresponds to bit 9 of the module status word.

ERR = 0:	No error
ERR = 1:	Error. The cause of error is indicated via error bits MF, PS, and FPGA. For hotline purposes, drive parameter P2122 contains a detailed error code. **Error class if ERR = 1 is set:** MF: Internal module error PS: No I/O power supply FPGA: Error in FPGA code

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Function	-	-	-	-	CMP	-	**ERR**	SYNC	-	-	-	-	-	FPGA	PS	MF

-: Reserved, must not be used

ERR	ERR = 1 (error bit); indicates that the module is not ready; more details are specified with bits MF, PS and FPGA
SYNC	SYNC = 1 indicates that the TM1x module is synchronized
CMP	CMP = 1 indicates that the module is not ready and a firmware update is required.

Errors cannot be acknowledged. The error message is automatically deleted as soon as the device has been restarted or the cause of error has been corrected.

Note

The user program must always use a WORD variable to access the status word (individual bits must be isolated by masking).

Diagnostic Interrupt

In the case of an ERR or CMP error message in the status word of the module or errors in the TM1x configuration, diagnostic interrupt _SC_DIAGNOSTIC_INTERRUPT (=201) is triggered with the following TaskStartInfo:

```
DINT    TSI#logBaseAdrIn    // logical I-address of the module
DINT    TSI#logBaseAdrOut   // logical I-address of the module
DINT    TSI#logDiagAdr      // (valid only when not equal to(?)) _SC_INVALID_ADDRESS
DWORD   TSI#details         // Supplementary information
UINT    TSI#eventClass      // 0x39 = fault has occurred
                            // 0x38 = fault has been corrected
UINT    TSI#faultId         // 0x42
```

TSI#details supplies the following supplementary information:

Table 12-11 Supplementary information TSI#details of the diagnostic interrupt (DS0)

<table>
<tr><td rowspan="5">Bit 0 = 1
module fault 1)</td><td rowspan="3">Bit 1 = 1
internal error</td><td>Bit 7 = 1
parameter error 2)</td><td>TM parameters do not correspond to the TM1x configuration in SCOUT. For all SINAMICS devices, re-align them using HWConfig (see Aligning the configuration with the hardware (Page 8232)).</td></tr>
<tr><td>Bit 25 = 1
processor failure</td><td>MF:
Module status word bit 0 = 1

Module status word bit 2 = 1
For notes see Error messages (Page 8248)</td></tr>
<tr><td>Bit 2 = 1
external error</td><td>Bit 4 = 1
load current supply I/O is missing</td><td>PS:
Module status word bit 1 = 1
For notes see Error messages (Page 8248)</td></tr>
<tr><td colspan="2">Bit 16 = 1
incorrect module or incorrect firmware</td><td>CMP:
module status word bit 11 = 1.
Update the firmware for the module.</td></tr>
<tr><td colspan="3">Bit 8 = 1
Bit 9 = 1
Bit 10 = 1
Bit 11 = 1</td><td>SIMATIC module class
Digital I/O module</td></tr>
</table>

1) In addition to the diagnostic interrupt, an entry is made in the diagnostic buffer if at least one of the bits is set to "Module fault".

2) This alarm cause is not signaled in the status word of the module, but is generated by the parameter comparison. In addition to the diagnostic interrupt, the following entry is made in the diagnostic buffer for each individual inconsistency:
Parameters inconsistent for logical address input, reason xxx, note yyy

For further information on the TaskStartInfo, refer to the "SIMOTION ST Structured Text" Manual.

Error codes

Table 12-12 Error codes (for hotline)

ERROR CODE 35...	BITS	DESCRIPTION	REMEDY
...402	-	Inconsistent configuration in terms of sampling time (For detailed expert information, see P4099, note: delay time [µs])	Perform an upload, compile the project and download it to the target system.
...420	-	Inconsistent configuration of the measuring input channels. The TO measuringInput is connected to a TM1x channel that has not been configured as a measuring input input. (For detailed expert information, see P4029, P4049, note: channel number)	Compile the project and download it to the target system.
...430	-	Inconsistent configuration of the output cam channels. The TO outputCam / TO camTrack is connected to a TM1x channel that has not been configured as a cam output (For detailed expert information, see P4029, P4049, note: channel number)	Compile the project and download it to the target system.
...801 to ...905	MF	Internal module error or Communication problem on DRIVE-CLiQ interface	Replace the module and contact your local technical support.
...906	PS	At least one of the terminals for the I/O power supply is not connected or the I/O power supply is outside of the specified range. If the error is no longer present, the error code is retracted automatically.	Check all terminals for the I/O power supply.
...907	FPGA	FPGA programming error (TM17 High Feature only)	Try to update the firmware. If error is still present, replace the module and contact your local technical support.

The error code (see table above) is stored as parameter P2122 in the SINAMICS control unit. This code can be read by the user task with the "readDriveParameter" system function (see SIMOTION documentation "Reference List – System Functions / Variables").

Another option is to use the BICO technology editor to link parameter P2122 with an I/O word that has been added to one of the axis message frames of the SINAMICS control unit. This enables cyclic reading of the error code.

Error correction

If problems arise during commissioning of the TM15 or TM17 High Feature, please verify the following:

- Make sure that the planned application is permitted. Note the information in the SIMOTION general conditions list (see SCOUT CD).
- Check the firmware version of the TM15 / TM17 High Feature and update it if necessary.
- Create the FastIO configuration via SCOUT. Select, for example, the "D435" controller in the project tree. Right-click to open the context menu and select **FastIO** --> **Create new configuration**.
- If necessary, delete the user data on the CF card and completely reload the project. Then execute **Copy RAM to ROM**.
- Restart (power on or hot restart) the SINAMICS or SIMOTION D device. The new I/O channel parameters do not take effect until you execute the restart.

Updating the firmware (Page 8244)

12.3.6 Application tips

12.3.6.1 Current controller cycle clocks <> 125 µs / use of output cams and measuring inputs

If current controller cycle clocks <> 125 µs are used, the parameter calculations of the drive must be transferred to the PG when using cam outputs on the TM15 / TM17 High Feature or for global measuring inputs, and Fast IO configuration generated again.

A change of the current controller cycle clock may have effects on the sampling times of the inputs/outputs on the drive side (e.g. TM15/TM17 High Feature, p4099 Sampling time of the inputs/outputs).

Sampling times <> 125 µs occur in the following cases:

- For servo drives with manual change of the current controller sampling time (drive parameters p0112 and p0115[0])
- For vector drives depending on the number of vector drives and with chassis units depending on the device type used
- If only an infeed and **no drives** are connected to the drive unit, then the sampling time is 250 µs.

For the cam outputs and the measuring input inputs (only for global measuring inputs) to function correctly, the sampling times must be known to the engineering system.

Table 12-13 Influence of the current controller cycle clock on the dead time compensation

	Current controller cycle clock has no effect on the function	**Current controller cycle clock has an effect on the function**
Cam outputs	SIMOTION D	TM15/TM17 High Feature
Measuring input inputs (global measuring inputs)	D4x5-2 (terminal X142)	• TM15/TM17 High Feature • SIMOTION D (except D4x5-2, terminal X142) • Controller extension (CX) • SINAMICS S110/S120 control units
Measuring input inputs (local measuring inputs)	---	---

In order for the changed cycle clock ratios to be taken into account by the engineering system, proceed as follows:

1. Go online and perform a project download. The SINAMICS performs parameter calculations once. These are automatically backed up on the CompactFlash Card
2. Perform an upload to the PG ("Target system" > Load" > "Load CPU / drive unit to PG").
3. This transfers the parameter calculations of the drive to the PG. The cycle clock ratios are then known in the engineering system.
4. Go offline.
5. Generate the configuration information (Fast IO configuration) again. To do this, select the SIMOTION CPU in the project tree and right-click to open the context menu "Fast IO" > "Create new configuration".
6. Click "Save project and compile all".
7. Go online and download the project to the target system.

SCOUT uses the described procedure to calculate internal system data that is required for outputting/detecting signals with a high level of position accuracy.

Note

If the cycle clock ratios are not set correctly, an appropriate message is output in the diagnostic buffer.

12.3.6.2 Tips on proximity switches

Proximity switches can be used in conjunction with the terminal modules to sense the presence or absence of a metallic surface. The advantages of using proximity switches over mechanical switches include the ability to perform non-contact sensing and a longer switch life.

Proximity switches contain electronic circuits in a compact, rugged enclosure. Note the following when using proximity switches:

- Use a **shielded conductor** from the switch to the DC input connection. This conductor should **not** be routed through a multi-signal connector.
- If an in-line connector is needed, use a **shielded connector** for each proximity switch cable. **Do not route any other signals through this connector**. This prevents crosstalk between pins of noisy cables and sensitive receive signals. If enough noise is injected on the 24 V supply (e.g., through testing or as a result of natural machine noise), the proximity switch circuitry will be re-initialized, causing faulty operation.
- The 24 V source (whether supplied from the TM or a separate power source) should originate at the module and should be included within the shield over the entire distance.

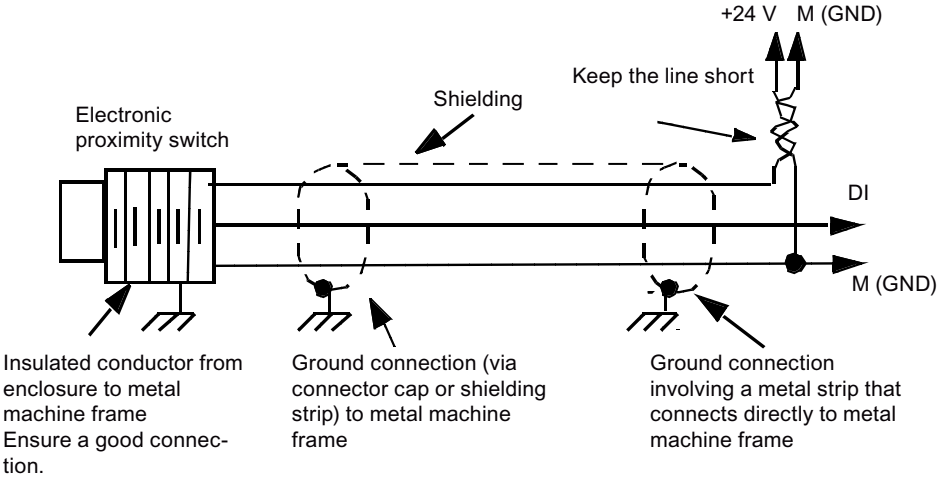

Figure 12-74 Proximity switch

Proximity switch cable shielding

The proximity switch shield should be grounded to the metal case on the switch side and to the shield connection on the terminal module at the other end. This grounding to the machine frame should be made in such a way that it will not corrode.

Machine safety and well-shielded grounding connections require good conductive connection between metal parts of machine components. Coatings and corrosion compromise the electrical continuity of the machine.

12.3.6.3 Information on leakage currents

Input configuration

Terminal module inputs occasionally receive their signal from an electronic device. Such a device can produce leakage current when the device is in de-energized state (OFF). If this current causes the input voltage at the terminal module to exceed 5 Volts, the circuit may not be able to detect whether this device is switched on or off. This may lead to faulty operation. If this occurs, a resistor must be added in parallel with the input circuit to divert a portion of this leakage current so that the input voltage does not exceed 5 VDC. The input resistance of the terminal module must be taken into account when selecting this resistor(2.8 kOhm for TM15 and TM17 High Feature). The wattage of the resistor must be great enough that the current consumption can be adapted to the output voltage of the switched-on source device.

Output configuration

Based on its design, the terminal module produces only 10 µA of leakage current for each output circuit. This is well below the level that would cause an electronic device to erroneously interpret an OFF state as an ON state. Therefore, unlike some output circuits that can have leakage currents as great as 2 mA, the TM requires no external resistor to divert leakage current.

12.3.6.4 Power switches ("SmartFETs")

The power switches used for outputs have built-in protection from excessive load currents and short circuits at the output. The hardware of the module monitors the overcurrent/over temperature signal.

Note

If the power switch is switched OFF due to an over temperature or overcurrent condition but the "ON" command persists, the output will be switched on again once the over temperature or overcurrent condition is eliminated.

The green channel LED illuminates when the power switch of the channel is switched on. A diode at each output protects the power switch from a reverse overvoltage failure when an inductive load is switched off.

You will find further information on handling inductive loads in our FAQs.

12.3.6.5 Input and output circuit

TM15

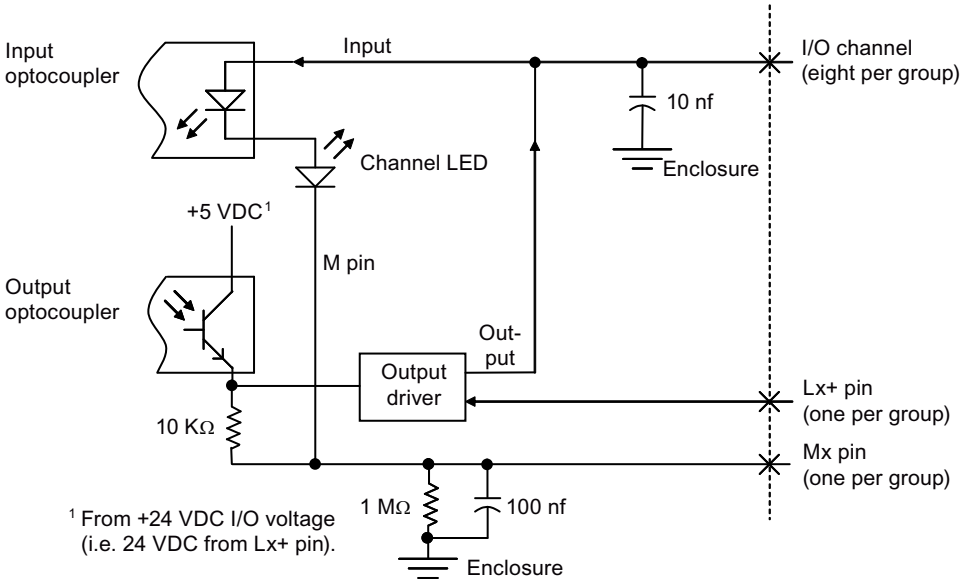

Figure 12-75 Input and output circuit - TM15

Grounding scheme

For TM15, the following are internally connected:

- Module power supply ground
- Logic ground
- TM chassis

The ground for the I/O power supply (terminals M1, M2, and M3) is capacitively coupled to the three grounds indicated above.

If terminal M1, M2 or M3 is connected to one of the three grounds indicated above, isolation for the associated group of I/O channels will be lost.

The I/O power supply ground (terminals M1, M2, and M3) must be connected to the reference ground of the current source in order for their associated I/O channels to function.

TM17 High Feature

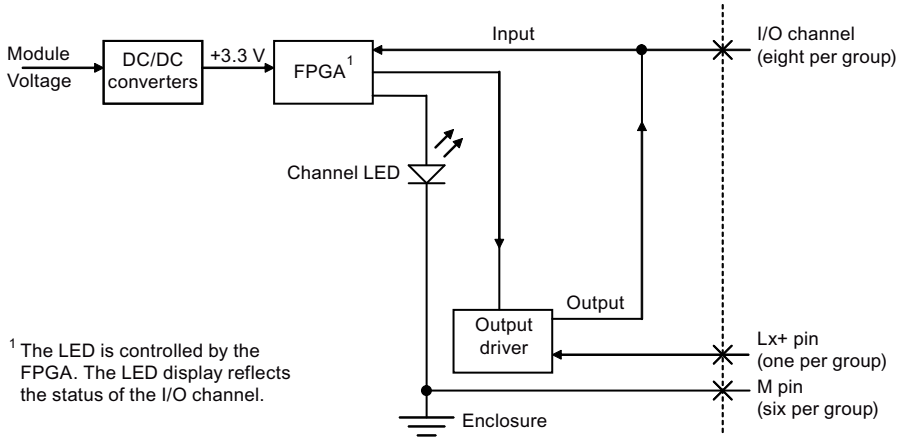

Figure 12-76 Input and output circuit - TM17

Grounding scheme

For TM17 High Feature, the following are internally connected:

- Module power supply ground
- Logic ground
- TM chassis

The ground of the I/O power supply is connected directly to the three grounds indicated above.

The ground connections for the I/O of the TM17 High Feature and not isolated. The ground of the I/O power supply (terminal M) must be connected to the reference ground of the current source in order for their associated I/O channels to function.

12.3.6.6 Other application examples

Use of inputs

The following figure shows an example of an input connection. Although TM15 is shown, the TM17 High Feature is wired in a similar manner. Note that no 24 VDC is required on the "L1+" terminal since it is only needed in an output application for the output driver. (See also "Supplementary SINAMICS System Components for SIMOTION" Manual.)

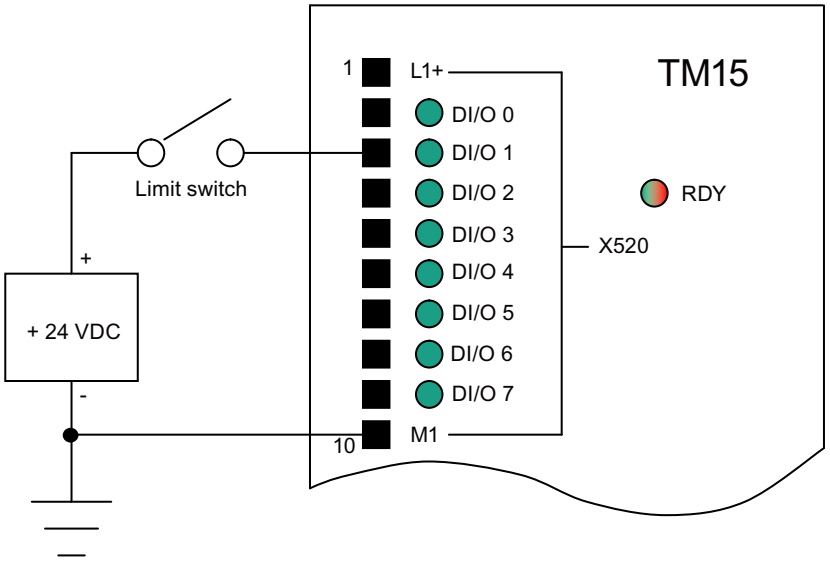

Figure 12-77 Example: Input circuitry on the TM15

Use of outputs

The following figure shows an example of an indicator lamp connection. Although the TM15 is shown, the TM17 High Feature can be wired in a similar manner. Please note that 24 VDC is required on the "L1+" terminal for the output driver to operate. (See also "Supplementary SINAMICS System Components for SIMOTION" Manual.)

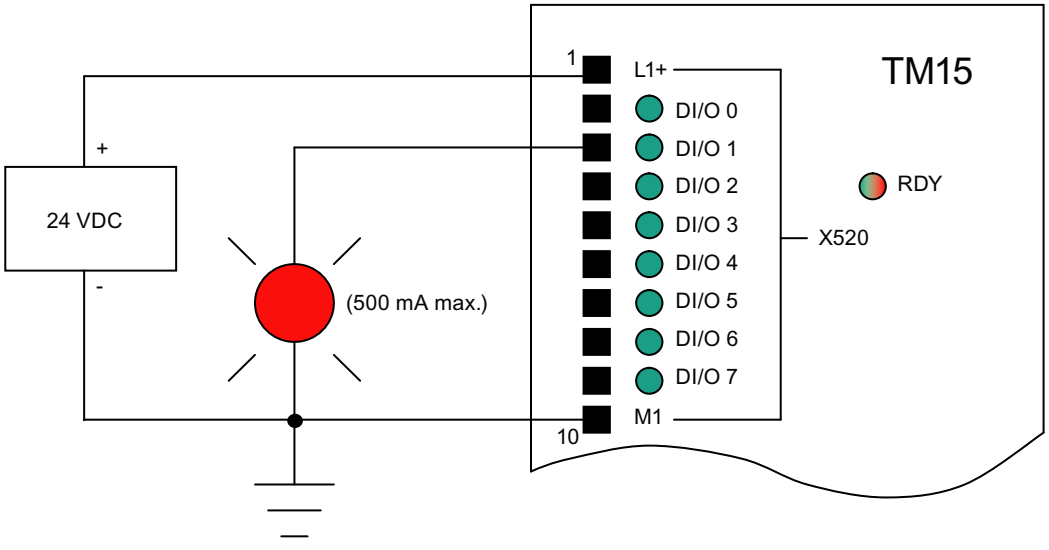

Figure 12-78 Example: Output circuitry on the TM15

Connection of a proximity switch

The following figure shows an example of a proximity switch connection. Several "M" (ground) terminals are available. In this example, the switch is supplied with 24 VDC via a DI/O (DI/O 2 in the example below). This DI/O may also be used to supply multiple switches, up to a current load of 500 mA per channel. (Typically, a 3-wire proximity switch requires about 150 mA.)

If DI/O 2 is configured as an inverted output, a 24 V (high level) supply is applied after system power up without being programmed. DI/O 3 must be configured as an input.

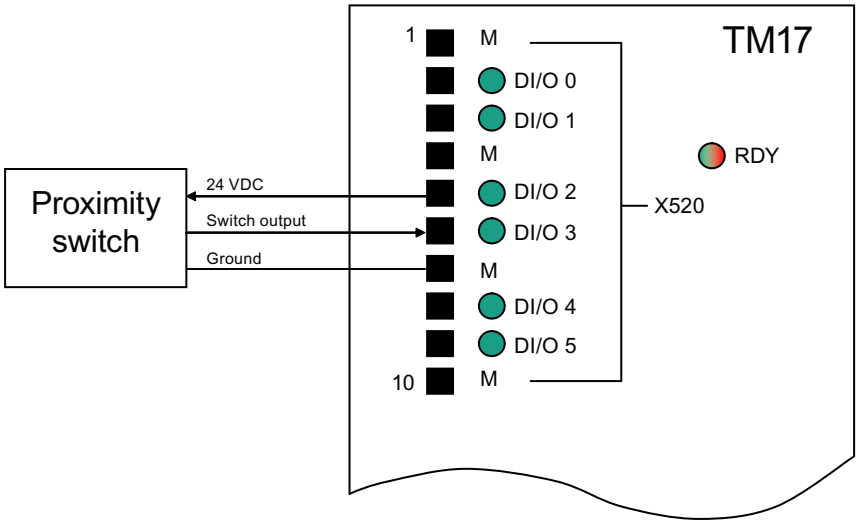

Figure 12-79 Example: Proximity switch connected to TM17 High Feature

Using the enable signal

This example illustrates the use of enable signals with outputs of output cams. When a workpiece is in the proper position, the output of the output cam is activated via the enable input. This ensures that the output cam (and thus the glue) is output only when a workpiece is present.

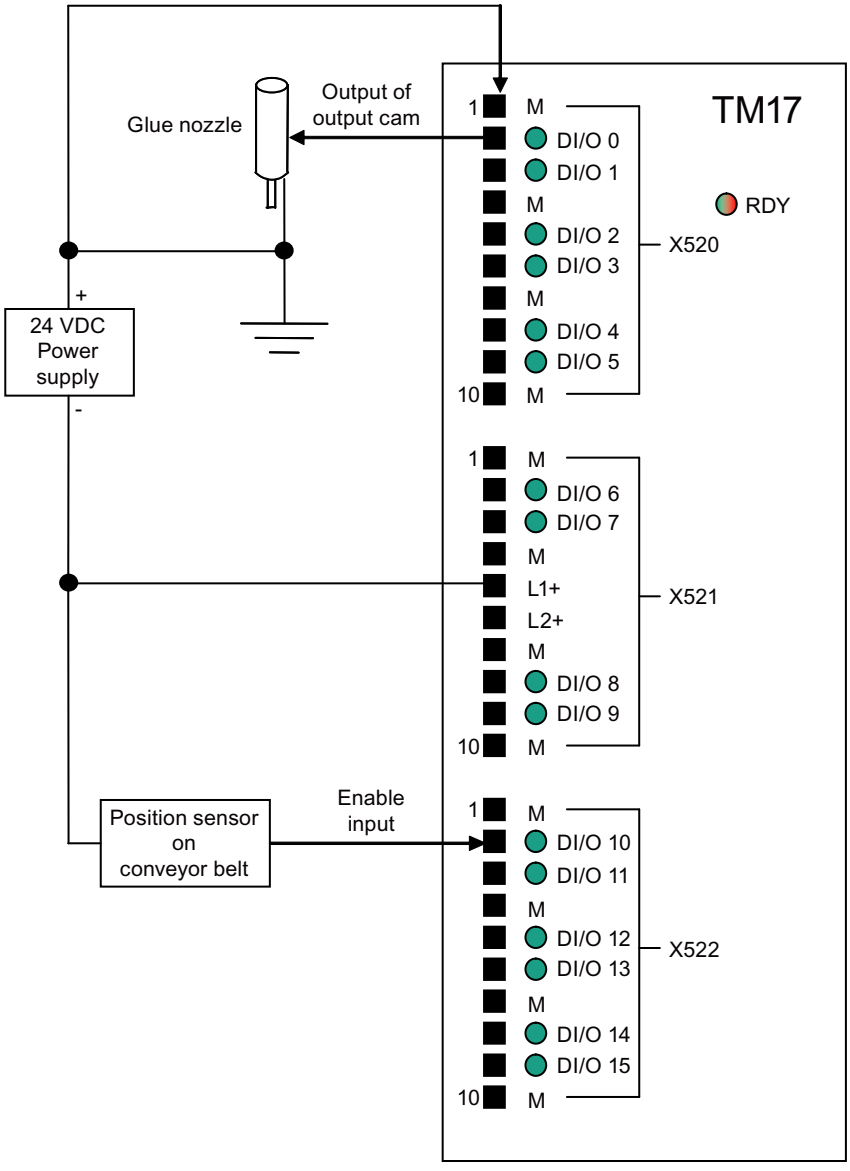

Figure 12-80 Controlling a glue nozzle using the output of an output cam

Output modes (Page 8265)

Multiple µs-granular measuring ranges

A maximum of one measuring range can be specified for the Measuring Input technology object. Only measurements taken within this range are recorded.

The resolution of the measuring range of the Measuring Input technology object conforms to the measuring input processing cycle clock (IPO interpolator cycle clock, IPO2 interpolator cycle clock, or position control cycle clock).

If more than one measuring range is needed or if the measuring range is to be specified more precisely, this can be accomplished in the application as described below:

- Configure a Measuring Input technology object with level-triggered enable on the TM17 High Feature (measuring input e.g., DI/O 0; assigned enable input is therefore DI/O 10)
- Configure an output cam track, and output this to an output of an output cam of TM17 High Feature. (Output of output cam e.g., to DI/O 12)
- Connect the output of the output cam to the enable input of the measuring input

The output cam track is used to define the measuring range for the measuring input in the application (each output cam corresponds to one measuring range and can therefore be specified on a µs-specific basis).

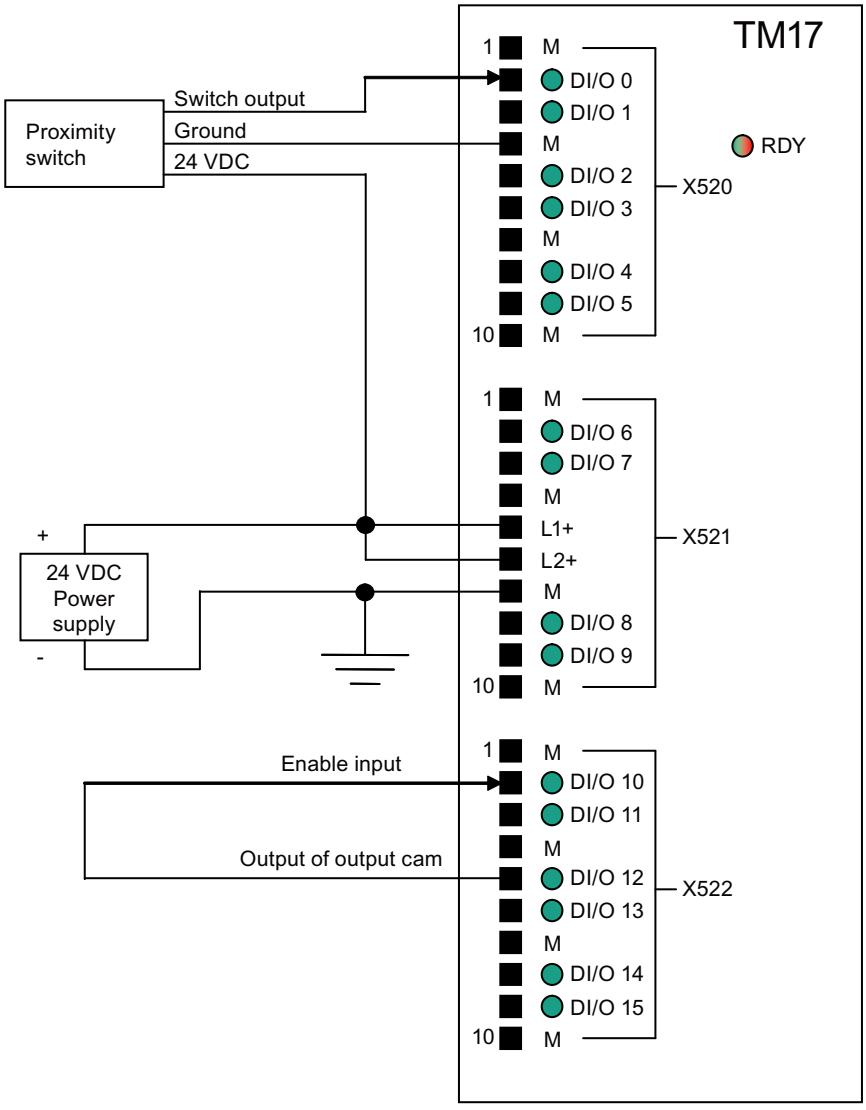

Figure 12-81 Multiple µs-granular measuring ranges

Acquisition of times / time-triggered output

If it is necessary to acquire times (e.g., measure the duration of a pulse) or to output a signal for a specific time period (e.g., output a pulse for a certain duration), a Measuring Input technology object or an Output Cam / Output Cam Track technology object connection to a virtual axis can be used for this purpose.

The virtual axis is moved at constant velocity, e.g., at 1,000 degrees per second.

Accordingly, an angular degree of 0.1 degree would correspond to a time period of 100 µs.

12.3.6.7 Frequently Asked Questions (FAQs)

Current FAQs on the Terminal Modules TM15 and TM17 High Feature are located at the following link:

http://support.automation.siemens.com/WW/view/de/24332926

12.3.7 Technical data

12.3.7.1 Operating modes

Overview of operating modes

Each channel can be individually configured for one of the following modes:

Table 12-14 Operating modes

Mode of operation	TM15	TM17 High Feature
Digital input (DI)	X	X
Input of measuring input (single measurement)	X	X
Input of measuring input (cyclic measurement)	-	X
Input of measuring input with level-triggered enable	-	X (channels 0 to 5)
Enabling signal	-	X (channels 10...15)
Digital output (DO)	X	X
Output of output cam	X	X
Output of output cam with level-triggered enable	-	X (channels 0 to 5)
Output of output cam with edge-triggered enable	-	X (channels 0 to 5)

Input modes

Digital input (TM15/TM17 High Feature)

If an I/O channel has been configured as a DI, it operates as a standard digital input.

Input of measuring input (TM15/TM17 High Feature)

If an I/O channel has been configured as an input of a measuring input, a time value is acquired with the input edge. This value represents the time of the event referenced to the local system time.

Note

The resolution of the measuring time varies according to the type of module:

- In the case of the TM15, the resolution corresponds to the DRIVE CLiQ clock cycle, but is at least 125 µs.
- In the case of the TM17 High Feature, the resolution is 1 µs.

Enabling signals (TM17 High Feature only)

Inputs of measuring inputs can be activated with enabling signals (= gate function). Specifically, channels 10 through 15 – if programmed as enabling signals – enable channels 0 through 5, respectively. Each enabling signal is level-triggered.

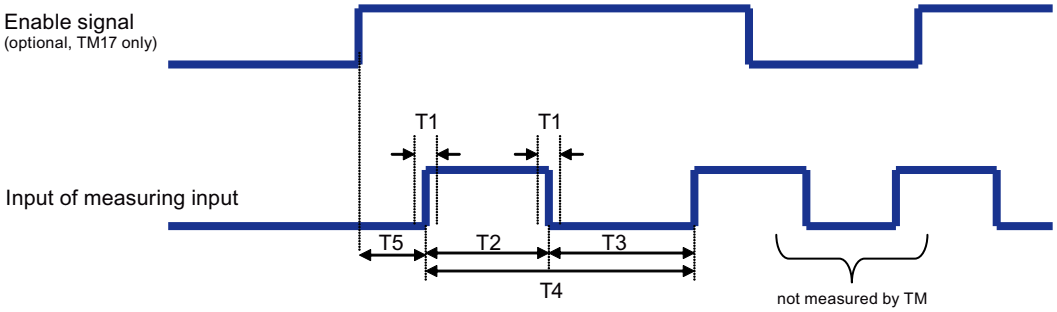

Figure 12-82 Diagram – Control of inputs

Table 12-15 Timing for input of measuring input

Timer	TM15	TM17 High Feature	Comments
T1	125 µs [1]	1 µs	Resolution
T2	≥ 125 µs [1]	≥ 1 µs/125 µs	TM17: Depends on selected filter times
T3	≥ 125 µs [1]	≥ 1 µs/125 µs	TM17: Depends on selected filter times
T4	Depends on ratio of IPO to servo		
T5	Not applicable (TM15 does not have an enable function)	≥ 1 µs/125 µs	TM17: Depends on selected filter times

Times specified for positive logic.

IPO = Interpolator cycle clock

[1] DRIVE CLiQ cycle clock, but at least 125 µs

System timing for single measurement (Page 8270)

System behavior with cyclic measurement (Page 8271)

Configuring I/O channels – TM17 High Feature (Page 8212)

Output modes

Digital output (TM15/TM17 High Feature)

If a channel has been configured as a DO, it operates as a standard digital output. See figure under "System behavior for digital inputs and outputs"

Output of output cam (TM15/TM17 High Feature)

This operating mode treats output channels as outputs of an output cam (see section on "System Behavior"). The outputs are enabled and disabled depending on the time values calculated in the SIMOTION technology object.

Switching times are specified by two time values (ON and OFF values) referenced to the local system time.

Note

The resolution of the switching times varies according to the type of module:

- In the case of the TM15, the resolution corresponds to the DRIVE CLiQ clock cycle, but is at least 125 µs.
- In the case of the TM17 High Feature, the resolution is 1 µs.

See also

System behavior with binary inputs and outputs (Page 8268)

System behavior with outputs of output cam (Page 8272)

Output of output cam with enable signal (TM17 High Feature only)

The "Output of output cam with enable" mode treats output channels as outputs of an output cam, for which an enable signal is required (available on channels 0 through 5 only). This mode is selected on a channel-by-channel basis during I/O configuration.

Provided that an enable signal exists, output cams are output as a function of the time values calculated in the SIMOTION technology object.

Switching times are specified by two time values (ON and OFF values) referenced to the local system time.

Note

Provided that the enable function for outputs of output cams is used and the output cams are to be output "inverted", an inverted output must be assigned for TM17 High Feature (an inversion of the output on the Output Cam or Output Cam Track technology object causes a low level to be output whenever there is no enable, which would correspond in this case to an activated output cam).

Level-triggered enable

With a level-triggered enable, output cams are only output to the output if the enable signal is applied statically before the output cam start.

If the enable signal is retracted before the output cam end, the output cam is still output up to the end. New output cams are no longer output.

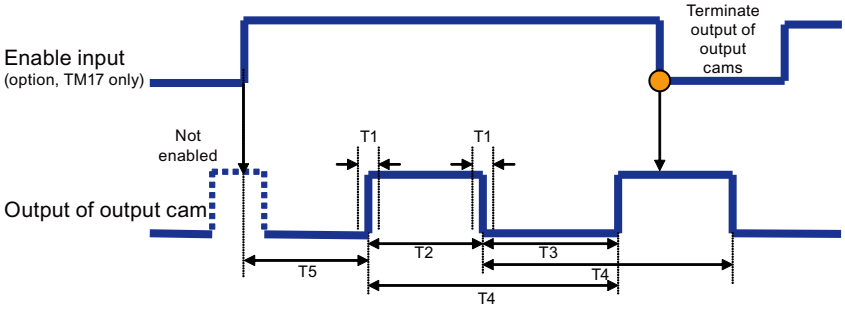

Figure 12-83 Diagram – Output of output cam with level-triggered enable signal

Table 12-16 Timing of output of output cam

Timer	TM15	TM17 High Feature	Comments
T1	125 µs [1]	1 µs	Resolution
T2	≥ 125 µs [1]	≥ 50 µs (typical) ≥ 100 µs (maximum)	Depends on the load conditions of the output. See "Supplementary SINAMICS System Components for SIMOTION" Manual.
T3	≥ 125 µs (typical) [1] ≥ 150 µs (maximum)	≥ 75 µs (typical) ≥ 250 µs (maximum)	Depends on the load conditions of the output. See "Supplementary SINAMICS System Components for SIMOTION" Manual.
T4	IPO or servo		Depends on the technology object cycle time.
T5	Not applicable (TM15 does not have an enable function)	≥ 1 µs/125 µs	Depends on selected filter times. See "Supplementary SINAMICS System Components for SIMOTION" Manual.

Times specified for positive logic.

IPO = Interpolator cycle clock

[1] DRIVE CLiQ cycle clock, but at least 125 µs

Edge-triggered enable

With an edge-triggered enable, output cams are output at the output only if the enable status exists before the output cam start. The enable status is controlled by a configured Measuring Input Technology Object.

For the Measuring Input TO, only the "one-time measuring" mode is permitted with the following edge detection:

- Rising edge
- Falling edge
- Both edges

Measuring of "Both edges, first rising" and "Both edges, first falling" and the "Cyclic measuring" mode is not supported.

Via the Measuring Input TO

- the positions of the enable edges can be evaluated (see "SIMOTION Motion Control - Technology Objects for Output Cams and Measuring Inputs" Manual). Please note that the measuring range is monitored in the IPO, IPO2 or position control cycle clock, depending on the configured measuring input cycle clock.
- Set or reset the enable status.
  The enable status is set when the configured edge arrives.
  The enable status is reset
  - At the beginning of the measuring range configured at the Measuring Input TO (with range setting: "Measure in specified range")
  - By program command _enableMeasuringInput (with range setting: "Measure without a defined range")

The enable status can be monitored via the I/O area of the enable input.

If the enable status is retracted before the output cam ends, the output cam is still output until the end if it has already started. New output cams are no longer output.

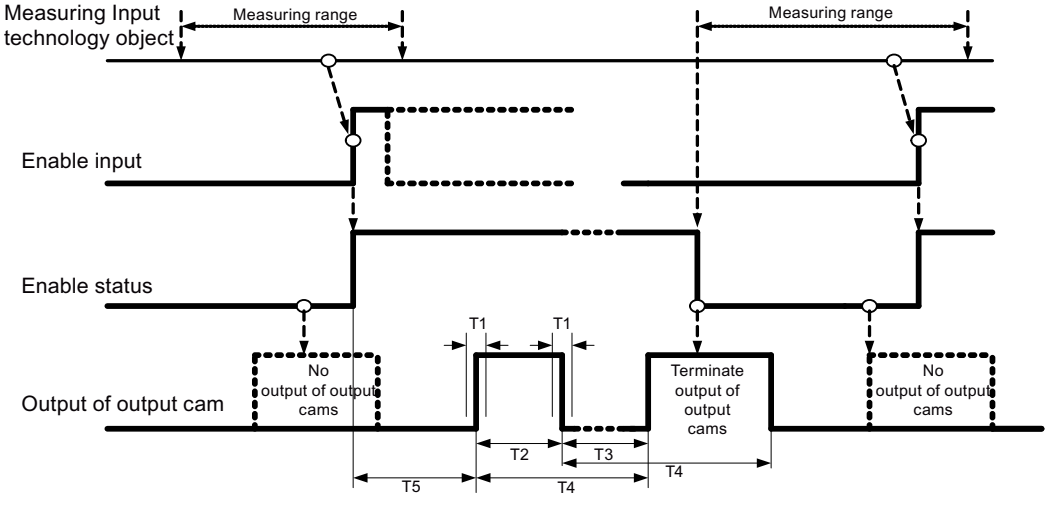

Figure 12-84 Diagram - Output of output cam with edge-triggered enable signal

Note

Times T1 to T5 correspond to the times in the table in section on "Level-Triggered Enabling".

12.3.7.2 System behavior

The following timing data relate to a clock cycle setting of

IPO: Servo: Bus cycle clock = 1 : 1 : 1 and a scan routine in the IPO synchronous task.

Note

The following describes the system behavior for PROFIBUS and can also, in principle, lay the basis for PROFINET configurations.

System behavior with binary inputs and outputs

The system behavior for **digital inputs and outputs** is shown in the figure below:

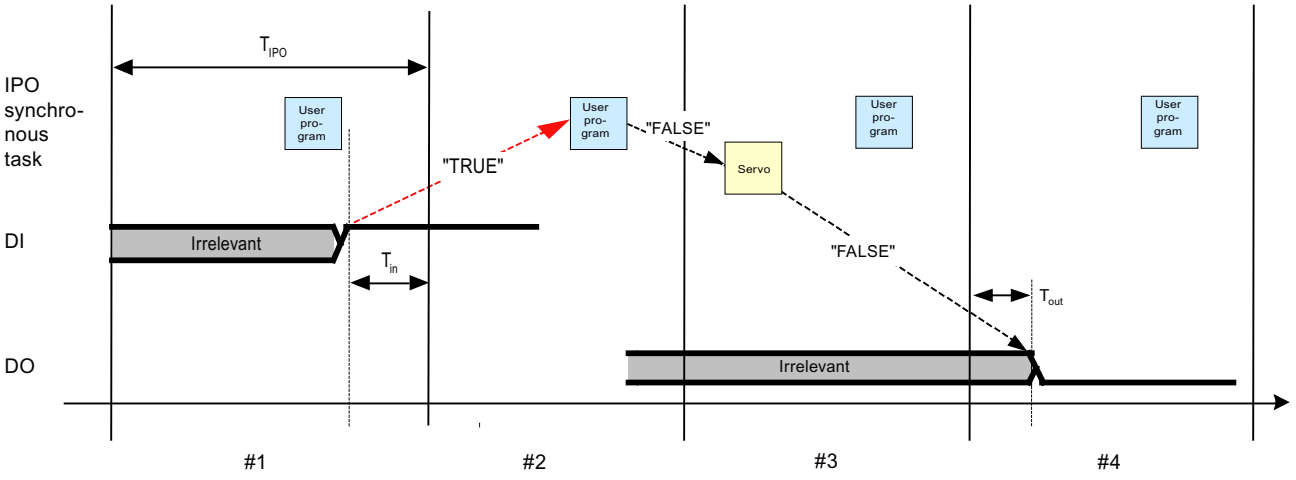

Figure 12-85 System behavior with digital inputs and outputs (TM15 and TM17 High Feature) with user program in the IPO synchronous task level

A digital input channel (DI) is always sampled at time T_{in} at the end of each IPO cycle clock. A digital output channel (DO) is always activated at time T_{out} at the beginning of the IPO cycle clock.

If the user program is executed in the IPO synchronous task, a DI state change (TRUE) in the first IPO cycle clock (#1) is detected in the next IPO cycle (#2). If an output signal (FALSE) is activated in response, it is first processed in position control cycle clock #3 and then transmitted to the module via PROFIBUS at the beginning of the next IPO cycle clock #4 (assuming an IPO: servo ratio of 1:1).

$T_{in} = T_i$ + 1 x DRIVE CLiQ cycle; SINAMICS: $T_i \geq 125$ µs

$T_{out} = T_o$ + 1 x DRIVE CLiQ cycle SINAMICS: $T_o \geq 125$ µs

where T_i and T_o are isochronous PROFIBUS time parameters. The value of T_i and T_o depends on the other PROFIBUS nodes; you can read off the exact value from the "DP Slave Properties" screen form in "HW Config". (In PROFINET screen "Properties - CBE20-PN" of the device.)

Note

If the user program is executed in the servo-synchronous user task rather than the IPO synchronous user task, the output signal is output one IPO cycle clock earlier.

Note

In order to operate the TM1X, the cycle time of the DRIVE CLiQ line must be at least 125 µs.

It is also possible to run a user program in the servo-synchronous task level. In this case, a user-programmed response in position control cycle clock #3 (terminal-terminal response time) is possible when there is a DI state change in position control cycle clock #1.

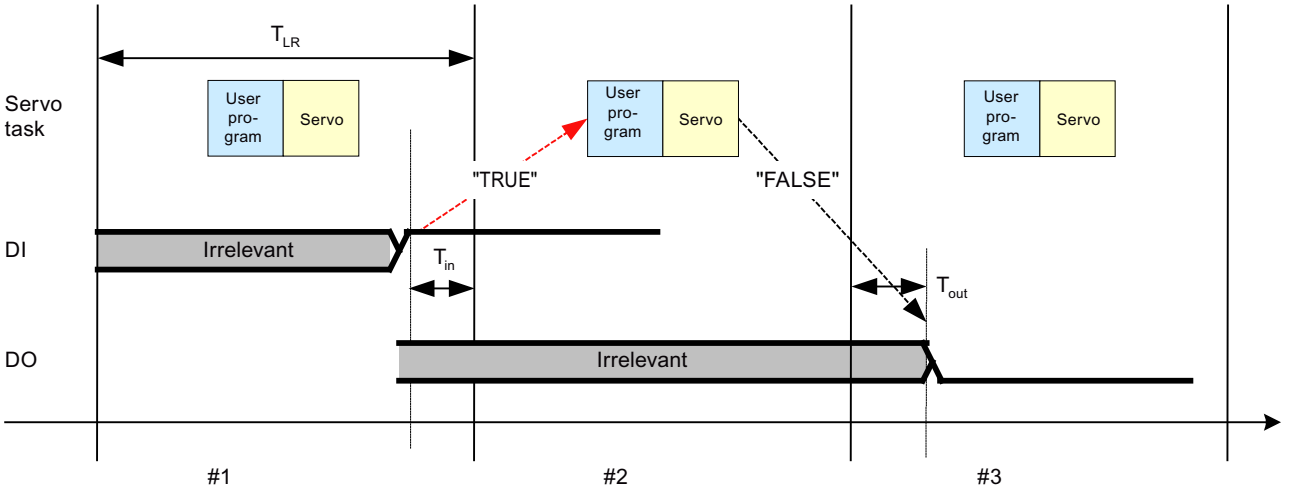

Figure 12-86 System behavior with digital inputs and outputs (TM15 and TM17 High Feature) with user program in the servo-synchronous task level

System timing for single measurement

The system behavior for a single measurement is shown in the figure below:

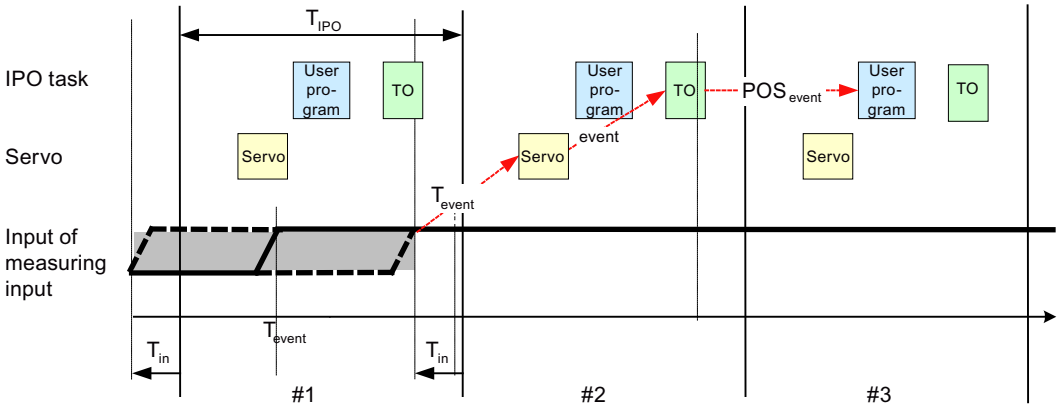

Figure 12-87 System behavior for single measurement (call Measuring Input technology object and user program in the IPO cycle clock)

If a measuring input event occurs in the shaded area in IPO cycle clock #1, then the actual event time T_{event} is transferred at the beginning of the following IPO cycle clock. In the Measuring Input technology object (TO), T_{event} is converted to a position value (POS) that is available to the user program in IPO cycle clock #3.

The time-related behavior for single measurement depends on two parameters:

- The ratio between the IPO cycle time and the cycle time of the position control cycle clock (i.e. ratio of IPO to servo).
- The time level to which the Measuring Input technology object is assigned.

The following table shows the minimum sampling cycle.

The minimum sampling cycle defines the time between two measurements (e.g. the time between detection of two print marks).

Table 12-17 Minimum sampling cycle – Single measurement

TO executed in IPO cycle clock	TO executed in position control cycle clock
5 position control cycle clocks + 2 IPO cycle clocks	6 position control cycle clocks + 1 IPO cycle clock

Each sampling cycle is started by a measurement command from the technology object. The TM15 and TM17 High Feature Terminal Modules are capable of sampling a maximum of two edges within one sampling cycle.

The minimum pulse width depends on the specified edge selection:

Edge selection	Minimum distance	Explanation
Rising edge	Minimum sampling cycle (see "Minimum Sampling Cycle" table).	Each new edge requires a new measurement command.
Falling edge		

Edge selection	Minimum distance	Explanation
Both edges	>1 µs/125 µs[1] (TM17) >125 µs (TM15)	Both edges are sampled within one sampling cycle.
Both edges, rising edge first		Minimum distance between first measurement edge and previous edge = 4 position control clock cycles
Both edges, falling edge first		

[1] Depending on filter selection.

Note

The parameter assignment screen for the Measuring Input technology object contains **two** fields for edge selection:

- Edge selection for (single) measurement
- Edge selection for cyclic measurement

System behavior with cyclic measurement

Up to two edges can be measured in each execution cycle of the Measuring Input TO (IPO interpolation cycle clock, IPO2 interpolation cycle clock or position control cycle clock).

The measured values must be read from the user program before they can be overwritten by a new measurement.

Result:

- A maximum of two edges can be evaluated per IPO cycle clock if the scan routine of the user program is in the IPO synchronous task.
- A maximum of two edges can be evaluated per position control cycle clock if the scan routine of the user program is in the servo-synchronous task

The servo-synchronous task is the lowest possible time level for a user program.

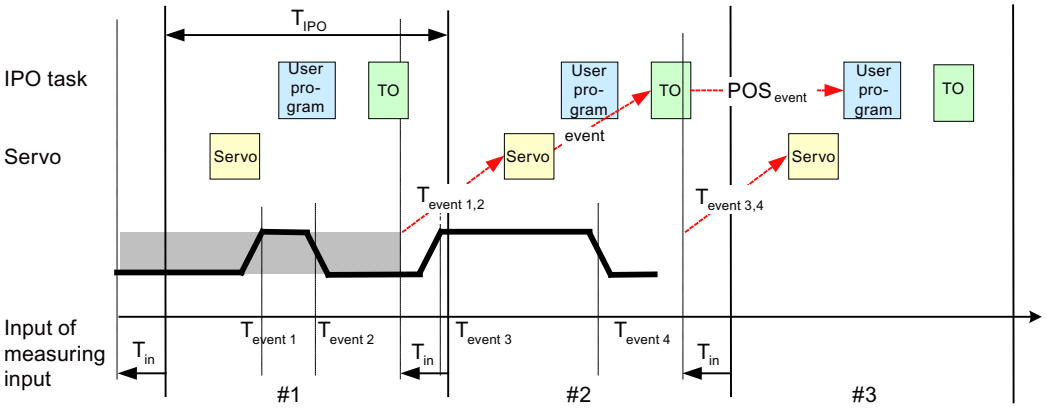

Figure 12-88 System behavior with cyclic measurement (call TO Measuring Input and user program in the IPO cycle clock)

Note

If no edges are measured in a clock cycle, the TM17 High Feature can measure up to 4 edges in the following clock cycle, whereby the 3rd and, if necessary, 4th edges are buffered (buffer of up to 2 edges).

In the following cycle clock, the buffered edges are transferred first even if new edges were recorded; these new edges are buffered again.

Table 12-18 Minimum time between two edges (cyclic measuring)

Edge selection	Minimum distance	Explanation
Rising edge	10 µs with filter setting of 1 µs	however, a maximum of 2 edges per task cycle of the scan routine
Falling edge	500 µs with filter setting of 125 µs	
Both edges	> 1 µs with filter setting of 1 µs > 125 µs with filter setting of 125 µs	however, a maximum of 2 edges per task cycle of the scan routine

Note

The parameter assignment screen for the Measuring Input technology object contains **two** fields for edge selection:

- Edge selection for (single) measurement

- Edge selection for cyclic measurement

System behavior with outputs of output cam

The system behavior for outputs of output cam is shown in the figure below:

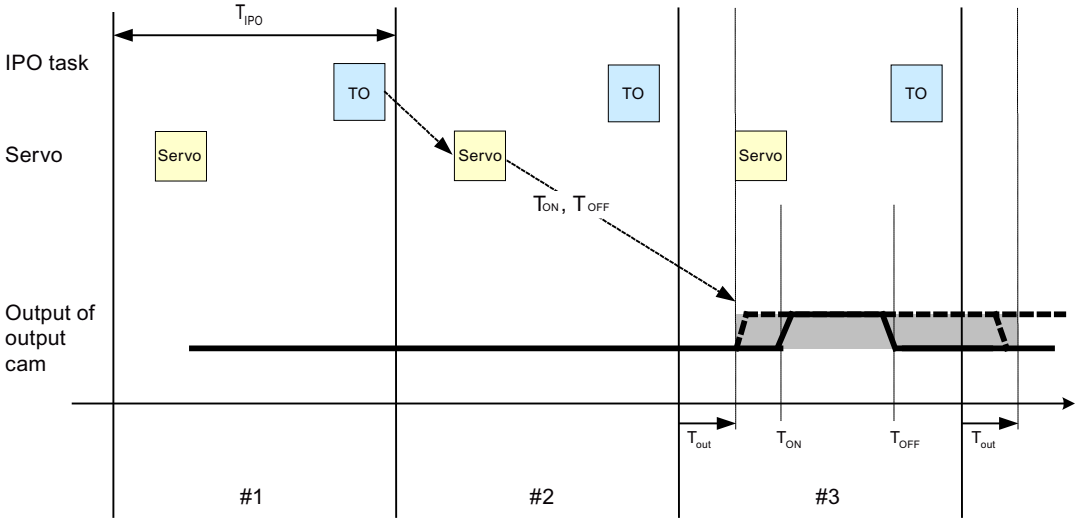

Figure 12-89 System behavior with outputs of output cams (call TO Output Cam and user program in the IPO cycle clock)

In order to switch an output of an output cam in the shaded area of IPO #3, the Output Cam technology object (TO) determines the switching positions in IPO #1. These switching positions are converted in the following position control clock cycle to time stamp T_{on} and T_{off} and then transferred at the beginning of IPO #3.

The same system timing applies to the Output Cam Track technology object.

Interpolation

A linear interpolation is used to calculate the output cam switching points and for the conversion of measuring input edges to axis positions. This can affect the accuracy in the event of strong axis acceleration.

The time that elapses between the "state change on the terminal" and the "calculation in the technology object" can be obtained from the timing diagrams.

System timing for single measurement (Page 8270)

System behavior with cyclic measurement (Page 8271)

System behavior with outputs of output cam (Page 8272)

System Behavior of TM15 DI/DO

The exact timing of TM15 DI/DO is described in the Motion Control Function Manual; basic functions are described in chapter "Integration of drive I/O".

12.3.7.3 Message frames

The maximum length of either the setpoint message frame or the actual value message frame is

- With integrated drives (SIMOTION D / CX32/CX32-2): 512 bytes
- With external drives (CU320/CU320-2/CU310/CU310-2):
  - On PROFIBUS DP: 244 bytes
  - On PROFINET IO: For CU320/CU320-2 with CBE20: 400 bytes
  - On PROFINET IO: For CU310-2 PN / CU320-2 PN (integrated PROFINET interface): 480 bytes

However, because the message frames are user-configured, the length of the message frames is determined by the current configuration, i.e. the actual length can be less.

Note that this maximum length applies to the entire PROFIBUS slave or the entire PROFINET device and therefore contains all data for the SINAMICS drive unit, including the:

- Message frame length for all modules of type TM15 / TM17 High Feature
- Message frame length for all axes
- Message frame length for all line modules

If the message frame contains too much data, the number of permissible TMs may be reduced.

The message frame length of a TM1x module can be calculated using the following formulas:

N = number of time-driven output channels (i.e. cam outputs).

M = number of time-driven input channels (i.e. measuring input inputs or edge-triggered enable inputs).

- **TM15**: (N + M ≤ 24)
  Length of setpoint message frame (output address area)
  = 12 + 2 · N (max. = 60 bytes)
  Length of actual value message frame (input address area)
  = 12 + 2 · M (max. = 60 bytes)

- **TM17 High Feature**: (N + M ≤ 16)
  Length of setpoint message frame (output address area)
  = 8 + 4 · N (max. = 72 bytes)
  Length of actual value message frame (input address area)
  = 8 + 4 · M (max. = 72 bytes)

Example

Assume a TM17 High Feature is configured with:

- 4 measuring input inputs
- 6 cam outputs
- 3 digital inputs
- 3 digital outputs

The following applies:

- Length of setpoint message frame (output address area)
  = 8 + 4 · 6 = 32 bytes
- Length of actual value message frame (input address area)
  = 8 + 4 · 4 = 24 bytes

Note

Cam outputs **without high switching accuracy** (i.e. no time-driven output channels are used) count as a digital output.

Maximum permissible message frame length (Page 8242)

12.3.8 Version overview

Function	Available as of
Use of TM15 / TM17 High Feature	
Use of TM15 and TM17 High Feature with SIMOTION D4x5 or on a SINAMICS S120 control unit CU320, which is connected via PROFIBUS DP to SIMOTION C, P or D	As of delivery release (SIMOTION V3.1.1, SINAMICS V2.1)
Use of TM15 and TM17 High Feature with SIMOTION D4x5-2 or on a SINAMICS S120 control unit CU320-2, which is connected via PROFIBUS DP to SIMOTION C, P or D	SIMOTION V4.2 SINAMICS V4.x
TM15 and TM17 High Feature with CX32	SIMOTION V3.2, SP1 SINAMICS V2.3
Use of TM15 and TM17 High Feature with CX32-2	SIMOTION V4.2 SINAMICS V4.x
Use of TM15 or TM17 High Feature on a SINAMICS S120 control unit CU320, which is connected to SIMOTION P or D via PROFINET IO.	SIMOTION V4.1 SINAMICS V2.5
Use of TM15 or TM17 High Feature on a SINAMICS S120 control unit CU320, which is connected to SIMOTION C via PROFINET IO.	SIMOTION V4.1 SP2 HF 3/4 SINAMICS V2.5
Use of TM15 or TM17 High Feature on a SINAMICS S120 control unit CU320-2, which is connected to SIMOTION C, P or D via PROFINET IO.	SIMOTION V4.2 SINAMICS V4.x
Use of TM15 or TM17 High Feature on a SINAMICS S120 control unit CU310, which is connected to SIMOTION via PROFIBUS DP or PROFINET IO.	SIMOTION V4.1, SP1 SINAMICS V2.5
Use of TM15 and TM17 High Feature with SIMOTION D410	SIMOTION V4.1, SP1 SINAMICS V2.5, SP1
Use of TM15, TM17 High Feature with DMC20/ DME20 DRIVE-CLiQ hub module	SIMOTION V4.1 SINAMICS V2.5
TM15 DI/DO	
The module hardware of the TM15 and TM15 DI/DO is identical, but there is a difference between the two modules in terms of system integration. For this reason, they must be configured as different input/ output components. The I/O of the TM15 DI/DO can be assigned drive functions or interconnected to a drive message frame via BICO interconnection technology, which transfers the I/O states between SINAMICS and SIMOTION via PROFIBUS DP or PROFINET IO. You will find more information about integrating the TM15 DI/DO using BICO interconnection in the SINAMICS S120 Commissioning Manual.	
Use of TM15 DI/DO on a SINAMICS S120 control unit CU320/CU320-2	SIMOTION V3.2, SP1 SINAMICS V2.3
Use of TM15 DI/DO on a SINAMICS S120 control unit CU310	SIMOTION V4.0 SINAMICS V2.4
Use of TM15 DI/DO on SIMOTION D4x5 or CX32	SIMOTION V4.0 SINAMICS V2.4
Use of TM15 DI/DO on SIMOTION D4x5-2 or CX32-2	SIMOTION V4.2 SINAMICS V4.x

Function	Available as of
Use of TM15 DI/DO on SIMOTION D410	SIMOTION V4.1, SP1 SINAMICS V2.5, SP1
Use of TM15 DI/DO with DMC20/DME20 DRIVE CLiQ hub module	SIMOTION V4.0 SINAMICS V2.4
Axis types (servo/vector)	
Use of TM15 and TM17 High Feature in conjunction with servo axes	As of delivery release (SIMOTION V3.1.1, SINAMICS V2.1)
Use of TM15 and TM17 High Feature in conjunction with vector axes	SIMOTION V4.1, SP1 SINAMICS V2.5
Use of TM15 DI/DO in conjunction with servo and vector axes	SIMOTION V3.2, SP1 SINAMICS V2.3
Measuring input/output cam functions	
Edge-triggered enable of cam outputs	SIMOTION V3.2 SINAMICS V2.2
Cyclic measurement in conjunction with TM17 High Feature (max. two edges per IPO)	SIMOTION V3.2 SINAMICS V2.2
Cyclic measurement in conjunction with TM17 High Feature (max. two edges per servo)	SIMOTION V4.0
Measuring on virtual axes with TM17 High Feature	SIMOTION V3.2
Measuring on virtual axes with TM15	SIMOTION V3.2, SP1
Several measuring inputs per axis	SIMOTION V3.2
One measuring input for several axes (monitoring measuring input)	SIMOTION V4.0
Measuring range for measuring input with cyclic measurement can be defined (as TO function)	SIMOTION V4.0
Quantity structures	
Total number of all TM15 and TM17 High Feature per SIMOTION D4x5/D4x5-2, CU320/CU320-2 or CX32/CX32-2	Up to SINAMICS V2.2: 2 max.; (0 CX32) up to SINAMICS V2.3: 3 max. SINAMICS V2.4, or later: 8 max. (of which max. 3 per DRIVE-CLiQ line)
Total number of all TM15 DI/DO per SIMOTION D4x5/D4x5-2, CU320/CU320-2 or CX32/CX32-2	8 max.
Total number of all TM15 DI/DO per D410/CU310	3 max.
Total number of all TM15, TM17 High Feature per D410/CU310	3 max.
Maximum permissible number of drive objects per SIMOTION D4x5, SINAMICS CU320, or CX32	Max. 10 drive objects SIMOTION V3.2 and SINAMICS V2.2, or later: Max. 16 drive objects
Maximum permissible number of drive objects per SIMOTION D4x5-2, SINAMICS CU320-2 or CX32-2	SIMOTION V4.2 and SINAMICS V4.x: Max. 24 drive objects
Maximum permissible number of drive objects per D410/CU310	5 max.

Function	Available as of
Maximum permissible message frame length per slave (PROFIBUS)	244 bytes SIMOTION V4.0 and SINAMICS V2.4, or later: 512 bytes with integrated drives of SIMOTION D4x5/D4x5-2, D410 or CX32/CX32-2
Maximum permissible message frame length per DEVICE (PROFINET)	1,380 bytes max.
Miscellaneous	
Servo-synchronous user task (SIMOTION Task System)	SIMOTION V4.0

Note

The SIMOTION version information always refers to the use of the respective SIMOTION SCOUT version, the SIMOTION runtime version as well as the corresponding version of the "CAM" or "CAM_EXT" technology package (including TO measuringInput, TO outputCam and TO camTrack).

The SINAMICS version information always refers to the SINAMICS runtime version including the respective firmware status of the terminal modules as well as the corresponding version of the STARTER.

Older TM15 and TM17 High Feature modules must be upgraded to the new firmware version before the new functions can be used.

12.3.9 Standards and approvals

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus Approval

	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find more information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm. Enter the first 7 characters of the article number under **Keyword**. Then click **Search**.

EMC

KOREA	
이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.	
For sellers or other users, please keep in mind that this device is an A-grade electromagnetic wave device. This device is intended to be used in areas other than home.	
The EMC limit values to be observed for Korea correspond to the limit values of the EMC product standard for variable-speed electric drives EN 61800-3 of Category C2 or the limit value class A, Group 1 to CISPR11. By implementing appropriate additional measures, the limit values according to category C2 or limit value class A, Group 1, are observed. For this purpose, additional measures, such as e.g., the use of an additional RFI suppression filter (EMC filter) may be necessary. In addition, measures for EMC-compliant configuration of the plant are described in this Manual and/or the "EMC Installation Guideline" Configuration Manual. Please note that ultimately it is always the label on the device that provides the decisive information on the compliance with standards.	

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity.

12.3.10 ESD guidelines

12.3.10.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

12.3.10.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

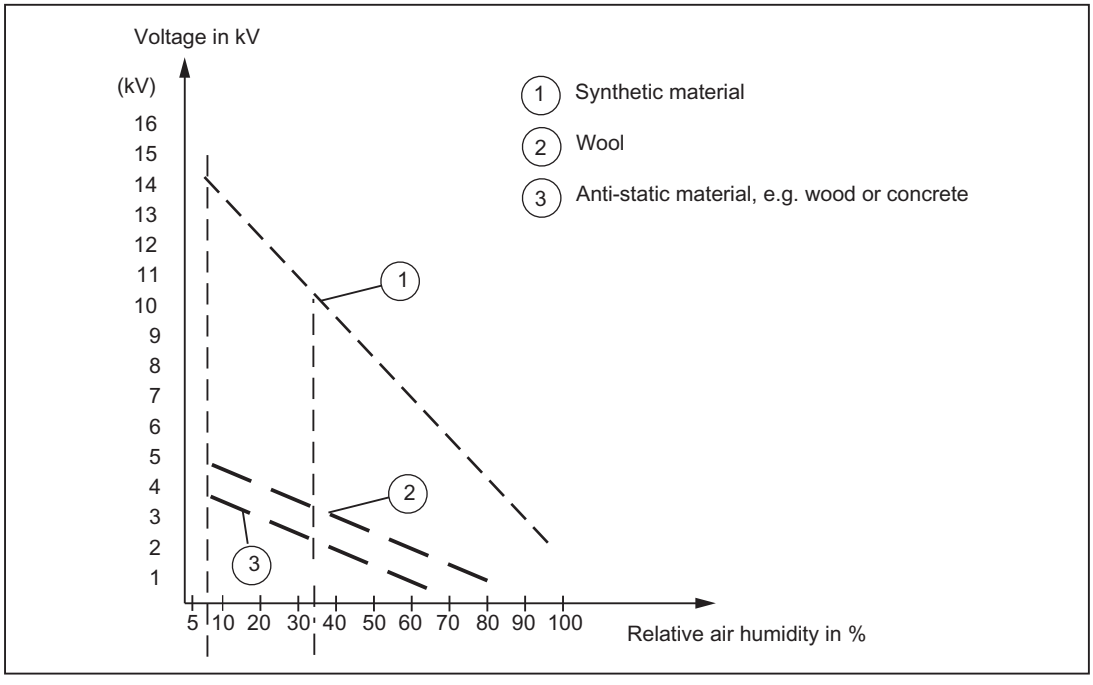

Figure 12-90 Electrostatic voltage that can accumulate on operating personnel

12.3.10.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

12.3.11 List of abbreviations

Refer to this list for an understanding of the abbreviations and acronyms that are used in this Manual:

BiCo	Binector/Connector
CU	Control unit
DI	Digital input
DI/O	Digital input/output
DO	Digital output
I/O	Input/output

12.4 TM15 / TM17 High Feature Terminal Modules

Preface

Scope

This manual describes the supplementary TM15 / TM17 High Feature Terminal Modules in operation under SIMOTION D or under SINAMICS S120 in connection with SIMOTION C, P or D.

This manual is aimed at machine manufacturers, plant engineers, commissioning personnel, and service personnel who use SIMOTION in connection with SINAMICS.

Contents of the manual

The following is a list of chapters included in this manual along with a description of the information presented in each chapter.

- System overview
  Provides information about the applications, versions, and integration of the hardware components of the SINAMICS S system in connection with operation under SIMOTION.
- Components
  - Description
    Provides a brief description of each system component and its interfaces.
  - Interfaces
    Provides information about the different interfaces of the devices, their pin assignment, and possible applications.
  - Installation/Mounting
    Provides information about installation and uninstallation of the devices.
  - Electrical connection
    Provides information about the electrical connection of system components.
  - Technical data
    Provides information about the relevant technical data for the device.
- Appendix
  This chapter provides factual information (e.g. standards, approvals, and ESD guidelines).

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.5:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

Disposal and recycling of the device

TM15 / TM17 High Feature is an environmentally friendly product. It includes the following features:

- In spite of its excellent resistance to fire, the flame-resistant agent in the plastic used for the housing does not contain halogens.
- Identification of plastic materials in accordance with DIN 54840.
- Less material used because the unit is smaller and with fewer components thanks to integration in ASICs.

The disposal of the products described in this manual should be performed in compliance with the valid national regulations.

The products can be largely recycled owing to their low pollutant content. To recycle and dispose of your old device in an environmentally friendly way, please contact a recycling company certified for electronic waste.

If you have any further questions about disposal and recycling, please contact your local Siemens representative. Contact details can be found in our contacts database on the Internet at:

http://www.automation.siemens.com/partner/index.asp

Further information / FAQs

You can find further information on this manual under the following FAQs:

http://support.automation.siemens.com/WW/view/de/27585482

You can also find additional information under:

- SIMOTION Utilities & Applications: SIMOTION Utilities & Applications will be included in the SIMOTION SCOUT scope of delivery and, along with FAQs, also contain free utilities (e.g. calculation tools, optimization tools, etc.) as well as application examples (ready-to-apply solutions such as winders, cross cutters or handling).
- The latest SIMOTION FAQs at http://support.automation.siemens.com/WW/view/en/10805436/133000
- SIMOTION SCOUT online help
- Refer to the list of references (separate document) for additional documentation

12.4.1 Safety instructions

12.4.1.1 Fundamental safety instructions

General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

⚠ WARNING

Danger to life caused by machine malfunctions caused by incorrect or changed parameterization

Incorrect or changed parameterization can cause malfunctions on machines that can result in injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit http://www.siemens.com/industrialsecurity.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under http://www.siemens.com/industrialsecurity..

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

Residual risks of power drive systems

The control and drive components of a drive system are approved for industrial and commercial use in industrial line supplies. Their use in public line supplies requires a different configuration and/or additional measures.

These components may only be operated in closed housings or in higher-level control cabinets with protective covers that are closed, and when all of the protective devices are enabled.

These components may only be handled by qualified and trained technical personnel who are knowledgeable and observe all of the safety instructions on the components and in the associated technical user documentation.

When assessing the machine's risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer must take into account the following residual risks emanating from the controller and drive components of a drive system:

1. Unintentional movements of driven machine components during commissioning, operation, maintenance, and repairs caused by, for example:
   - Hardware defects and/or software errors in the sensors, controllers, actuators, and connection technology
   - Response times of the controller and drive
   - Operating and/or ambient conditions outside of the specification
   - Condensation / conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of radio devices / cellular phones in the immediate vicinity of the controller
   - External influences / damage
2. In the event of a fault, exceptionally high temperatures, including an open fire, as well as emissions of light, noise, particles, gases, etc. can occur inside and outside the inverter, for example:
   - Component malfunctions
   - Software errors
   - Operating and/or ambient conditions outside of the specification
   - External influences / damage

   Inverters of the Open Type / IP20 degree of protection must be installed in a metal control cabinet (or protected by another equivalent measure) such that the contact with fire inside and outside the inverter is not possible.
3. Hazardous touch voltages caused by, for example:
   - Component malfunctions
   - Influence of electrostatic charging
   - Induction of voltages in moving motors
   - Operating and/or ambient conditions outside of the specification
   - Condensation / conductive contamination
   - External influences / damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc. if they are too close.
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly.

Note

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

For more information about residual risks of the components in a drive system, see the relevant sections in the technical user documentation.

12.4.1.2 Specific safety instructions SIMOTION TM15 / TM17 High Feature

⚠ DANGER

Danger to life from energized parts

Death or serious injury will result if energized parts are touched.

Turn off and lock out all power supplying this device before working on this device.

⚠ WARNING

Danger to life from unexpected movement of machines on (automatic) restart

Dangerous mechanical movements may occur in the system during operation.

Make sure this presents no hazard to personnel or property.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Only safety extra-low voltage in accordance with EN/IEC 60950-1 may be connected to all connections and terminals.

12.4.2 Terminal Module TM15

12.4.2.1 Description

The Terminal Module TM15 is a terminal expansion module for snapping on to a DIN EN 60715 mounting rail. The TM15 can be used to increase the number of available digital inputs/outputs within a drive system.

Table 12-19 Interface overview of the TM15

Type	Quantity
Digital inputs/outputs	24 (isolation in 3 groups each with 8 DI/O)

12.4.2.2 Safety Information

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- It is essential that you maintain 50 mm ventilation clearances above and below the component.

12.4.2.3 Description of Ports

Overview

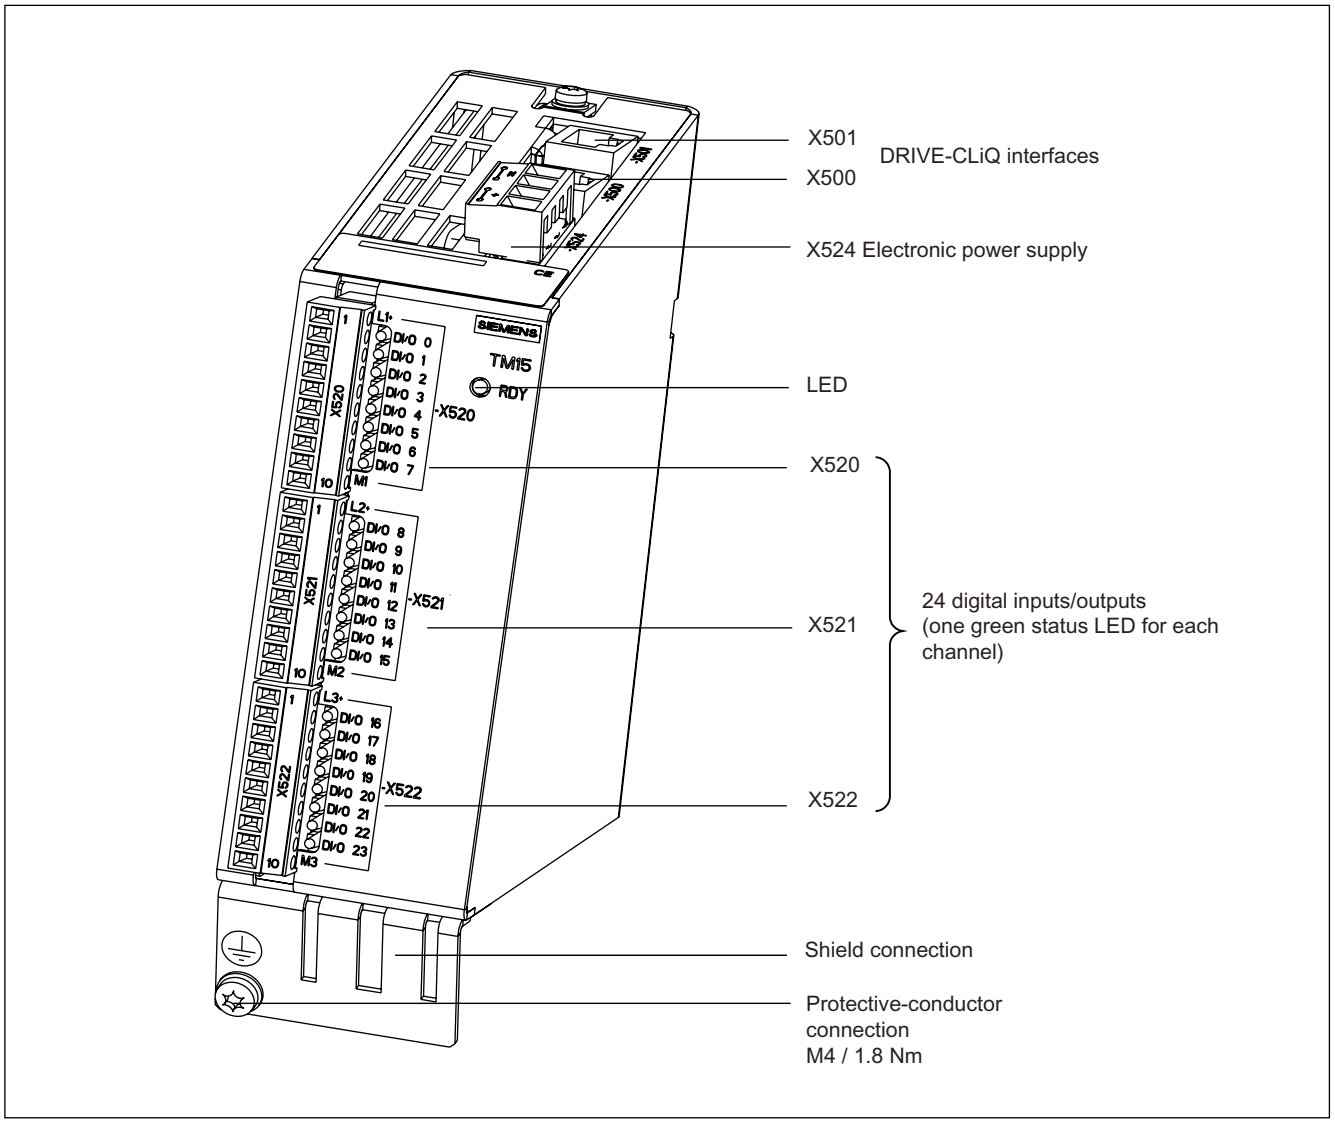

Figure 12-91 Interface description TM15

Connection example

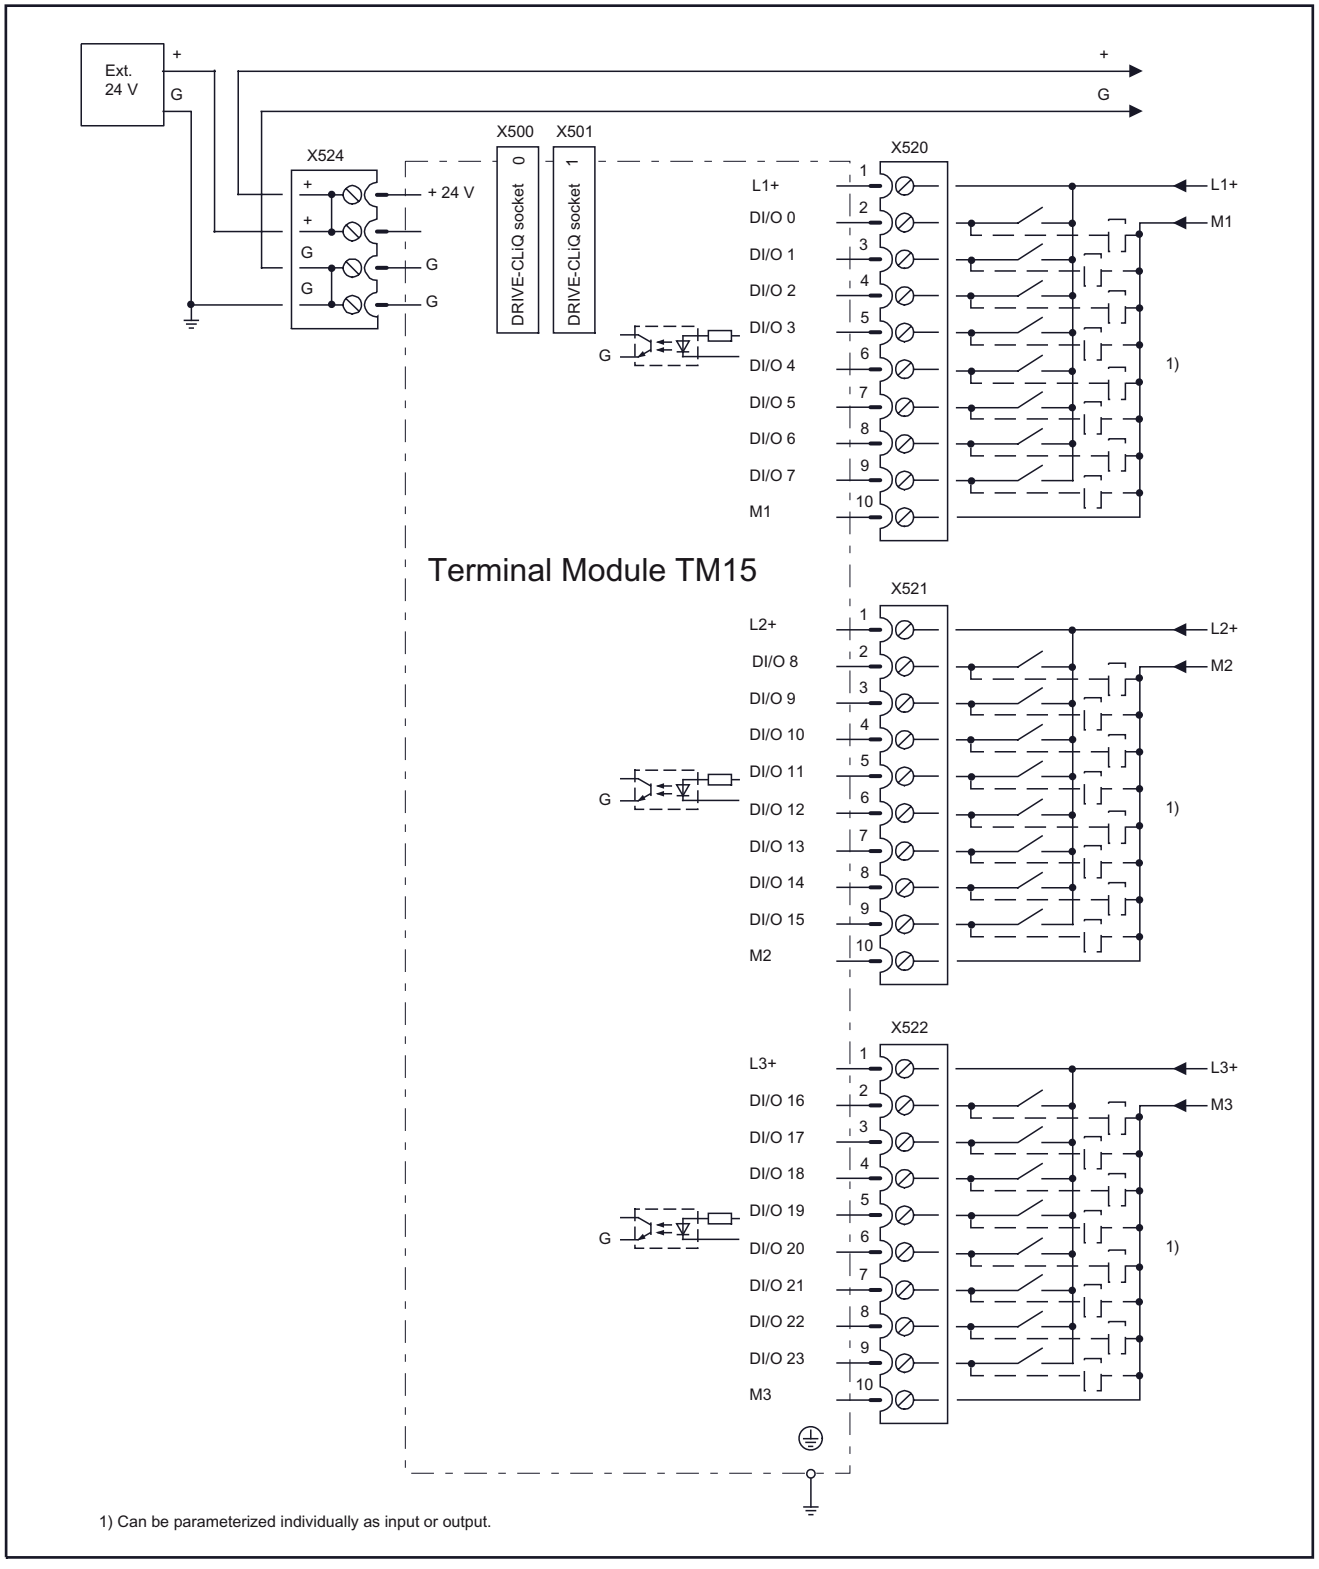

Figure 12-92 Example connection of TM15

X500 and X501 DRIVE-CLiQ interface

Table 12-20 DRIVE-CLiQ interface X500 and X501

	Pin	Signal name	Technical specifications
	1	TXP	Transmit data +
	2	TXN	Transmit data -
	3	RXP	Receive data +
	4	Reserved, do not use	
	5	Reserved, do not use	
	6	RXN	Receive data -
	7	Reserved, do not use	
	8	Reserved, do not use	
	A	+ (24 V)	Power supply
	B	GND (0 V)	Electronic ground
Blanking plate for DRIVE-CLiQ interface: Yamaichi, Article No.: Y-ConAS-13			

X524 Electronic power supply

NOTICE

The Terminal Modules are reset upon interruption of the supply voltage.

It is essential to ensure that the external 24 VDC power supply to the terminal module is not interrupted for longer than 3 ms. After an interruption of 3 ms, the command to reset the component is issued, causing all outputs to be reset.

Table 12-21 Terminals for the electronic power supply

	Terminal	Designation	Technical specifications
	+	Electronic power supply	Voltage: 24 V DC (20.4 V – 28.8 V) Current consumption: max. 0.15 A Max. current via jumper in connector: 20 A at 60 °C (15 A according to UL/CSA)
	+	Electronic power supply	
	M	Electronic ground	
	M	Electronic ground	
Max. connectable cross-section: 2.5 mm²			

Note

The two "+" and "M" terminals are jumpered in the connector. This ensures that the supply voltage is looped through.

The current consumption increases by the value for the DRIVE-CLiQ node. The digital outputs are supplied via terminals X520, X521, and X522.

Requirements for the power supply

Requirements for the power supply are as follows:

Table 12-22 Requirements for the electronic power supply

Parameter	Requirement
Current	150 mA[1] per module (TM15)

[1] Does not include the current provided for the DI/O or for the DRIVE-CLiQ Interface.

The maximum supply current for TM15 is calculated from the sum of the 3 currents below:

- 150 mA, maximum, via X524 connection
  (module logic must always be taken into account)
- 450 mA, maximum, via X524
  (24 V supply via DRIVE-CLiQ; relevant only if a module connected downcircuit of the TM15 is supplied via DRIVE-CLiQ, e.g. encoder without a separate 24 V connection)
- 24 x 0.5 A, maximum, via X520/X521/X522
  (all channels are parameterized as DO and loaded with 0.5 A)

The terminal module monitors the electronic power supply for both overvoltage and undervoltage conditions.

Note

Avoid long cables. The 24 VDC power supply should be located as close as possible to the terminal modules. The total length of all power cables, when added together, must not exceed 10 meters.

X520 digital inputs/outputs

Table 12-23 Screw terminal X520

	Terminal	Designation[1]	Technical specifications
	1	L1+	See chapter "Technical specifications"
	2	DI/O 0	
	3	DI/O 1	
	4	DI/O 2	
	5	DI/O 3	
	6	DI/O 4	
	7	DI/O 5	
	8	DI/O 6	
	9	DI/O 7	
	10	M1 (GND)	
Max. connectable cross-section: 1.5 mm^2			

1) L1+: A 24 V DC power supply for DI/O 0 to 7 (first potential group) must always be connected if at least one DI/O of the potential group is used as output.
M1: A reference ground for DI/O 0 to 7 (first potential group) must always be connected if at least one DI/O of the potential group is used as either input or output.
DI/O: Digital input/output

X521 digital inputs/outputs

	10	M3 (GND)	
Max. connectable cross-section: 1.5 mm^2			

[1] L3+: A 24 V DC power supply for DI/O 16 to 23 (third potential group) must always be connected if at least one DI/O of the potential group is used as output.
M3: A reference ground for DI/O 16 to 23 (third potential group) must always be connected if at least one DI/O of the potential group is used as either input or output.
DI/O: Digital input/output

Description of the LEDs on the Terminal Module TM15

Table 12-26 Description of the LED

LED	Color	State	Description
READY	-	OFF	Electronics power supply outside permissible tolerance range.
	Green	Continuous	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	Continuous	DRIVE-CLiQ communication is being established.
	Red	Continuous	At least one fault is present in this component.
	Green/red	Flashing 2 Hz	Firmware is being downloaded.
	Green/Orange	Flashing 2 Hz	Component detected: no fault present
	Red/Orange	Flashing 2 Hz	Component detected: Fault(s) present

Cause and rectification of faults

The following reference contains information about the cause of faults and how they can be rectified:

- SINAMICS S Commissioning Manual
- SIMOTION D4x5 Commissioning and Hardware Installation Manual
- TM15 / TM17 High Feature Commissioning Manual

12.4.2.4 Dimension Drawing

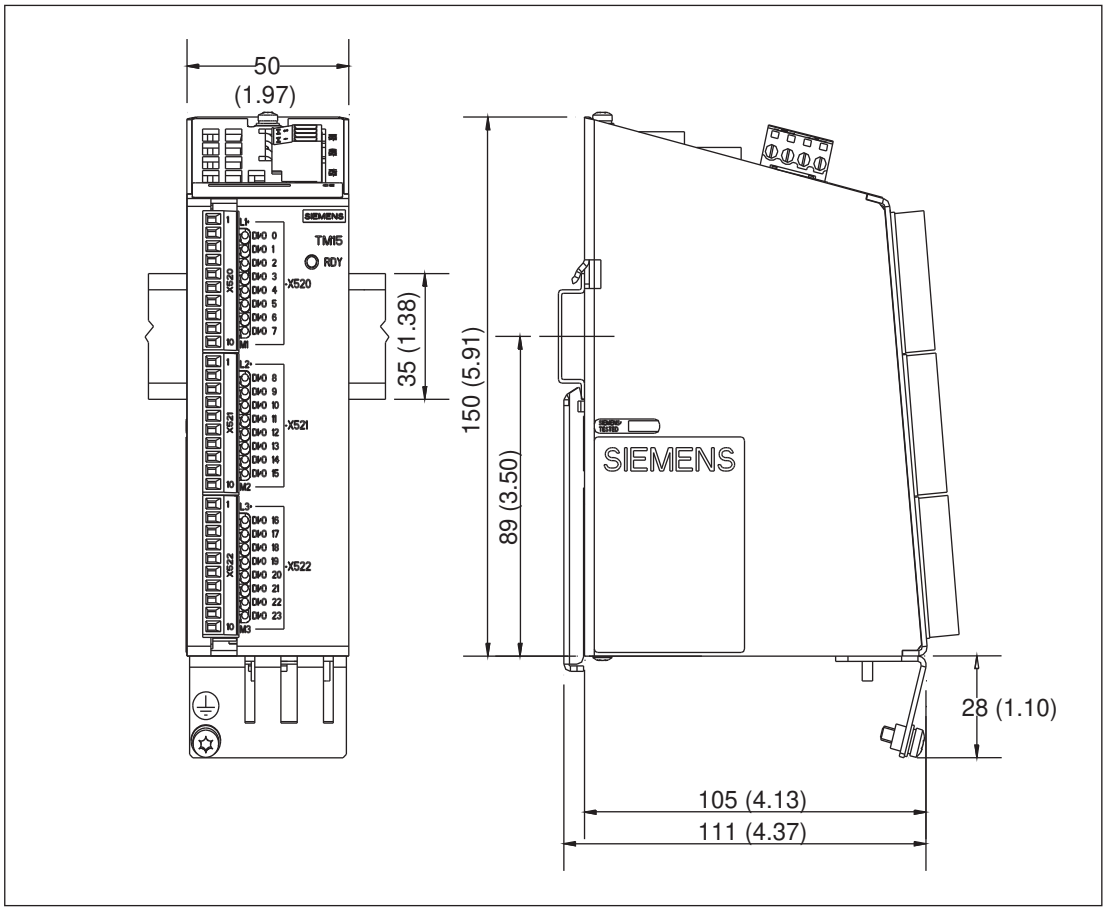

Figure 12-93 Dimension drawing of the TM15

12.4.2.5 Installation

Installation

1. Place the component on the DIN rail.
2. Snap the component on to the DIN rail. Make sure that the mounting slides at the rear latch into place.
3. You can now move the component on the DIN rail to the left or to the right to its final position.

Disassembly

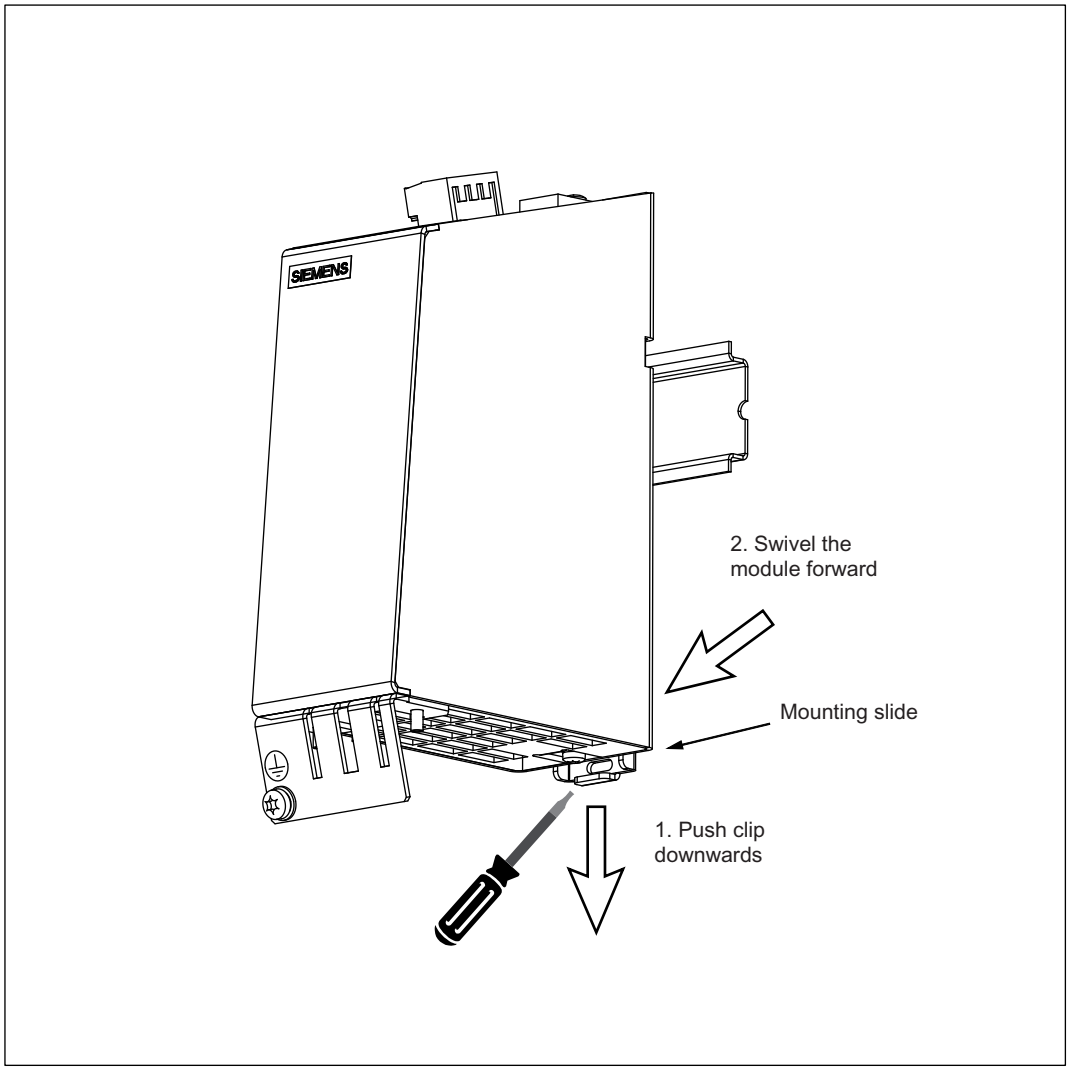

Figure 12-94 Releasing the component from a DIN rail

12.4.2.6 Electrical Connection

It is always advisable to shield the digital input/output wiring.

The following pictures show two typical shield connections from Weidmüller.

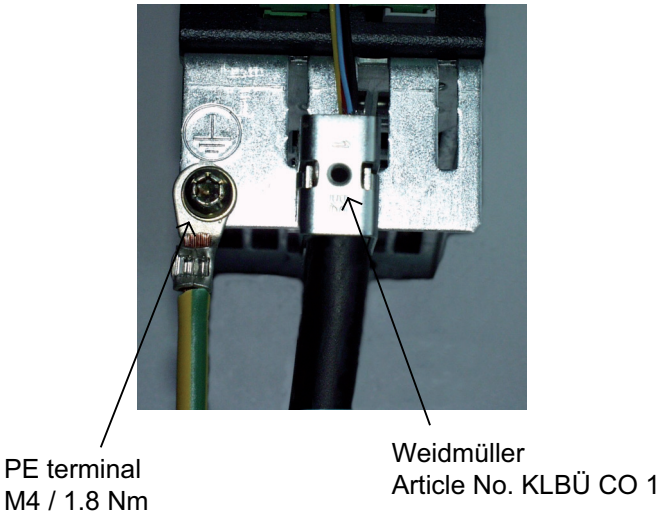

Figure 12-95 Shield connections

Internet address of the company:

Weidmüller: http://www.weidmueller.com

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

The TM15 housing is connected to the ground terminal of the module supply (terminal X524). As long as the chassis is grounded, the housing is also grounded. An additional ground connection using the M4 screw is especially necessary if high potential bonding currents can flow (e.g. through the cable shield).

Connector coding

Siemens supplies a series of coding keys (coding sliders) with each Terminal Module TM15. To code a connector, you must insert at least one coding slider and cut off at least one coding projection on the connector:

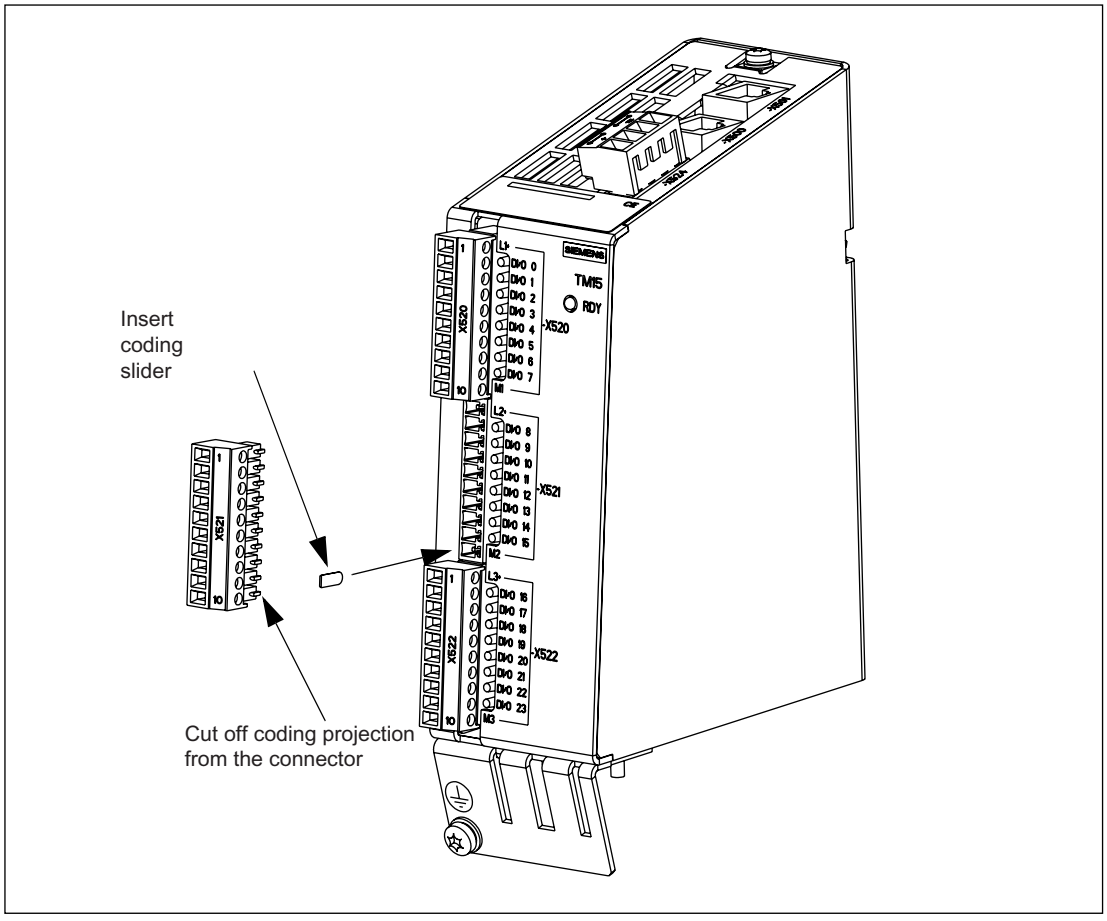

Figure 12-96 Procedure for encoding a connector

To avoid incorrect wiring, unique connector coding schemes for the I/O connectors X520, X521, and X522 may be defined. Examples of possible patterns:

- Different coding between the 3 plugs of a component (i.e., X520, X521, and X522).
- Different component types are encoded differently.
- Identical components on the same machine are encoded differently (e.g. several TM15-type components).

12.4.2.7 Commissioning

Note

For information about commissioning , see the *SIMOTION Terminal Modules TM15 / TM17 High Feature* Commissioning Manual.

12.4.2.8 Technical data

Table 12-27 Technical data

Terminal Module TM15 **6SL3055-0AA00-3FAx**	**Unit**	**Value**
Electronic power supply Voltage Current (without DRIVE-CLiQ or digital outputs) Power loss	 V_{DC} A_{DC} W	 24 DC (20.4 – 28.8) 0.15 <3
Ambient temperature up to an altitude of 2000 m	°C	0 - 60
Storage temperature	°C	-40 to +85
Relative humidity	5% to 95%, no condensation	
I/O		
• Digital inputs/outputs	Each can be parameterized separately as DI or DO	
• Number of digital inputs/outputs	24	
• Isolation	Yes, in groups of 8	
• Max. cable length	m	30
Digital inputs		
• Voltage	V_{DC}	-30 to +30
• Low-level (an open digital input is interpreted as "low")	V_{DC}	-30 to +5
• High level	V_{DC}	15 to 30
• Input impedance	kΩ	2.8
• Current consumption (at 24 V DC), typical	mA	9
• Max. voltage in OFF state	V_{DC}	5
• Current in OFF state	mA	0.0 to 1.0 (per channel)
• Input delay of digital inputs, typical [1)]	µs	For "0" to "1" 50 For "1" to "0" 100
Digital outputs (sustained short-circuit-proof)		
• Voltage	V_{DC}	24
• Max. load current per digital output	A_{DC}	0.5
• Output delay (ohmic load)		
• typical	µs	For "0" to "1" 50 For "1" to "0" 150
• maximum	µs	For "0" to "1" 100 For "1" to "0" 225

Terminal Module TM15 **6SL3055-0AA00-3FAx**	**Unit**	**Value**
• Min. output pulse (100% amplitude, 0.5 A with resistive load)	µs	125 (typ.) 350 (max.)
• Max. switching frequency (100% amplitude, 50%/50% duty cycle, with 0.5 A and a resistive load)	kHz	1 (typ.)
• Voltage drop in ON state	V_{DC}	0.75 (max.) with all circuits fully loaded
• Leakage current in OFF state	µA	max. 10 per channel
• Output voltage drop (I/O power supply to the output)	V_{DC}	0.5
• Max. total current of the outputs (per group) to 60 °C to 50 °C to 40 °C	 A_{DC} A_{DC} A_{DC}	 2 3 4
IEC enclosure specification	IP20 degree of protection	
Protective-conductor connection	On the housing with M4/1.8 Nm screw	
Response time	The response time for the digital inputs/outputs (TM15 DI/DO) consists of the following elements: • Response time on the component itself (approx. 1/2 DRIVE-CLiQ cycle). • Transmission time via the DRIVE-CLiQ connection (approx. 1 DRIVE-CLiQ cycle). • Evaluation on the control unit (see function diagram) **References:** SINAMICS S List Manual, chapter "Function diagrams".

Approval	UL and cULus http://www.ul.com File: E164110, Vol. 2, Sec. 9	

1) Pure hardware delay

12.4.3 Terminal Module TM17 High Feature

12.4.3.1 Description

The Terminal Module TM17 High Feature is a terminal expansion module for snapping on to a DIN EN 60715 mounting rail. The TM17 High Feature can be used to increase the number of available digital inputs/outputs within a drive system.

Table 12-28 Interface overview of the TM17 High Feature

Type	**Quantity**
Digital inputs/outputs	16 (non-isolated, 2 voltage groups, each with 8 DI/O)

12.4.3.2 Safety Information

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- It is essential that you maintain 50 mm ventilation clearances above and below the component.

12.4.3.3 Description of Ports

Overview

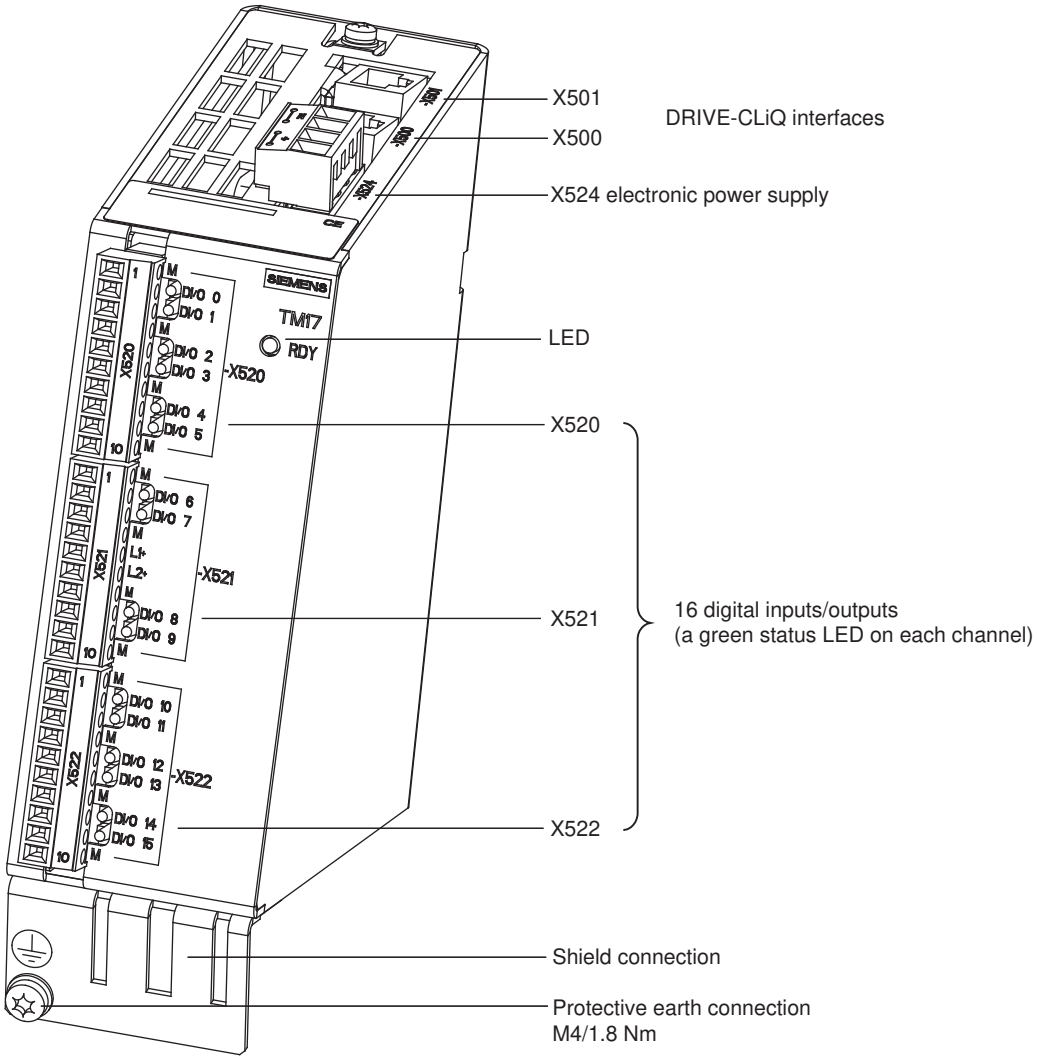

Figure 12-97 TM17 High Feature interface description

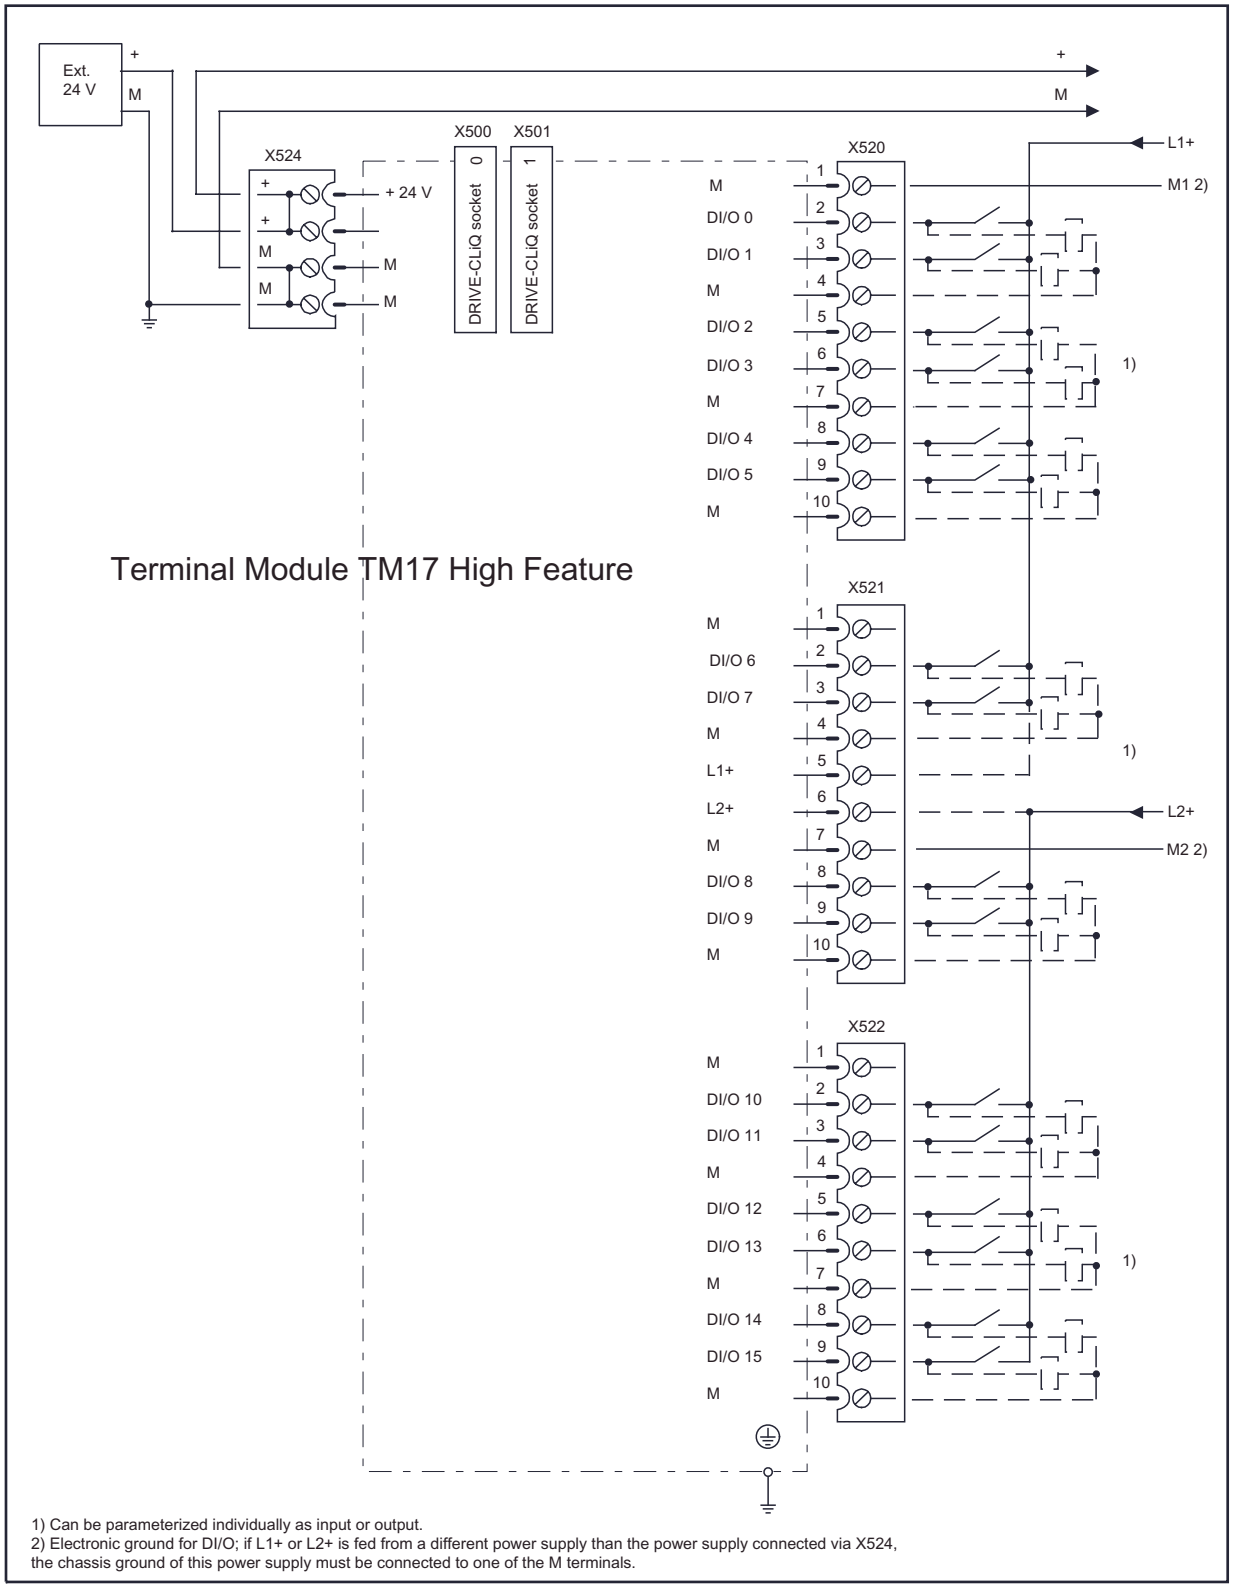
Sample connection



1) Can be parameterized individually as input or output.
2) Electronic ground for DI/O; if L1+ or L2+ is fed from a different power supply than the power supply connected via X524, the chassis ground of this power supply must be connected to one of the M terminals.

	A	+ (24 V)	Power supply
	B	GND (0 V)	Electronic ground
Blanking plate for DRIVE-CLiQ interface: Yamaichi, Article No.: Y-ConAS-13			

X524 Electronic power supply

NOTICE

The Terminal Modules are reset upon interruption of the supply voltage.

It is essential to ensure that the external 24 VDC power supply to the terminal module is not interrupted for longer than 3 ms. After an interruption of 3 ms, the command to reset the component is issued, causing all outputs to be reset.

Table 12-30 Terminals for the electronic power supply

	Terminal	Designation	Technical specifications
	+	Electronic power supply	Voltage: 24 VDC (20.4 V - 28.8 V) Current consumption: max. 0.2 A Max. current via jumper in connector: 20 A at 60 °C (15 A according to UL/CSA)
	+	Electronic power supply	
	M	Electronic ground	
	M	Electronic ground	
Max. connectable cross-section: 2.5 mm²			

Note

The two "+" and "M" terminals are jumpered in the connector and not in the device. This ensures that the supply voltage is looped through.

The current consumption increases by the value for the DRIVE-CLiQ node. The digital outputs are supplied via terminals X520, X521, and X522.

Requirements for the power supply

Requirements for the power supply are as follows:

Table 12-31 Requirements for the electronic power supply

Parameter	Requirement
Current	200 mA[1] per module (TM17 High Feature)

[1] Does not include the current provided for the DI/O or for the DRIVE-CLiQ Interface.

The maximum supply current for TM17 High Feature is calculated from the sum of the 3 currents below:

- 200 mA, maximum, via X524 connection
  (module logic must always be taken into account)
- 450 mA, maximum, via X524
  (24 V supply via DRIVE-CLiQ; relevant only if a module connected downcircuit of the TM17 High Feature is supplied via DRIVE-CLiQ, e.g. encoder without a separate 24 V connection)
- 16 x 0.5 A, maximum, via X520/X521/X522
  (all channels are parameterized as DO and charged with 0.5 A)

The terminal module monitors the electronic power supply for both overvoltage and undervoltage conditions.

Note

Avoid long cables. The 24 VDC power supply should be located as close as possible to the terminal modules. The total length of all power cables, when added together, must not exceed 10 meters.

X520 digital inputs/outputs

Table 12-32 Screw terminal X520

	Terminal	Designation[1]	Technical specifications
	1	M (GND)	See chapter "Technical specifications"
	2	DI/O 0	
	3	DI/O 1	
	4	M (GND)	
	5	DI/O 2	
	6	DI/O 3	
	7	M (GND)	
	8	DI/O 4	
	9	DI/O 5	
	10	M (GND)	
Max. connectable cross-section: 1.5 mm^2			

[1] M: Electronic ground for DI/O 0 to 15; if L1+ or L2+ is fed from a power supply other than the power supply connected via X524, the chassis ground of this power supply (L1+ or L2+) must be connected to one of the M-terminals.

DI/O: Digital input/output

X521 digital inputs/outputs

	Terminal	Designation[1]	Technical specifications
	1	M (GND)	See chapter "Technical specifications"
	2	DI/O 6	
	3	DI/O 7	
	4	M (GND)	
	5	L1+	
	6	L2+	
	7	M (GND)	
	8	DI/O 8	
	9	DI/O 9	
	10	M (GND)	
Max. connectable cross-section: 1.5 mm^2			

[1] L1+: A 24 VDC infeed for DI/O 0 to 7 (first voltage group) must always be connected when at least one DI/O of the voltage group is used as an output.
L2+: A 24 VDC infeed for DI/O 8 to 15 (second potential group) must always be connected when at least one DI/O of the potential group is used as an output.
M: Electronic ground for DI/O 0 to 15; if L1+ or L2+ is fed from a power supply other than the power supply connected via X524, the chassis ground of this power supply (L1+ or L2+) must be connected to one of the M-terminals.
DI/O: Digital input/output

X522 digital inputs/outputs

Table 12-34 Screw terminal X522

	Terminal	Designation[1]	Technical specifications
	1	M (GND)	See chapter "Technical specifications"
	2	DI/O 10	
	3	DI/O 11	
	4	M (GND)	
	5	DI/O 12	
	6	DI/O 13	
	7	M (GND)	
	8	DI/O 14	
	9	DI/O 15	
	10	M (GND)	
Max. connectable cross-section: 1.5 mm^2			

[1] M: Electronic ground for DI/O 0 to 15; if L1+ or L2+ is fed from a power supply other than the power supply connected via X524, the chassis ground of this power supply (L1+ or L2+) must be connected to one of the M-terminals.

DI/O: Digital input/output

Description of the LEDs on Terminal Module TM17 High Feature

Table 12-35 Description of the LED

LED	Color	State	Description
READY	-	OFF	Electronics power supply outside permissible tolerance range.
	Green	Continuous	The component is ready for operation and cyclic DRIVE-CLiQ communication is taking place.
	Orange	Continuous	DRIVE-CLiQ communication is being established.
	Red	Continuous	At least one fault is present in this component.
	Green/red	Flashing 2 Hz	Firmware is being downloaded.
	Green/Orange	Flashing 2 Hz	Component detected: no fault present
	Red/Orange	Flashing 2 Hz	Component detected: Fault(s) present

Cause and rectification of faults

The following reference contains information about the cause of faults and how they can be rectified:

- SIMOTION D4x5 Commissioning and Hardware Installation Manual
- TM15 / TM17 High Feature Commissioning Manual

12.4.3.4 Dimension drawing

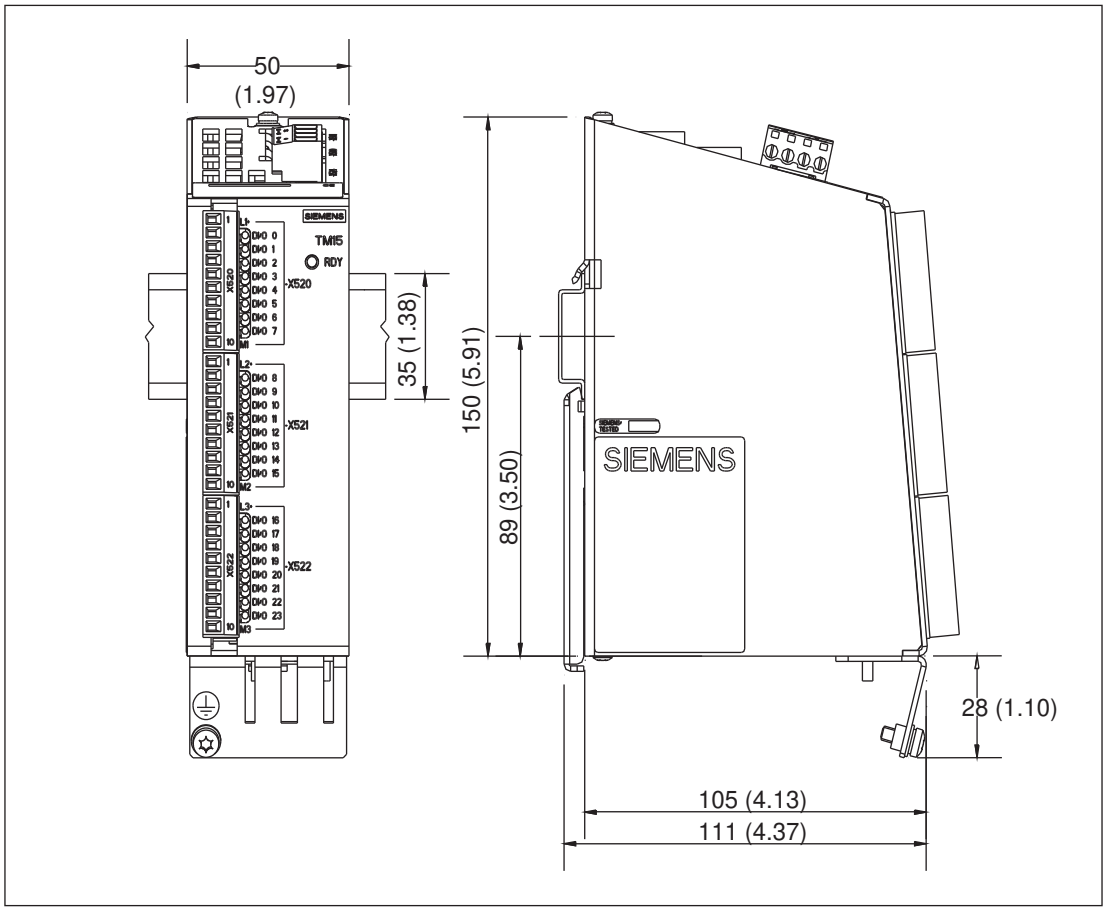

Figure 12-99 Dimension drawing of TM17 High Feature (like TM15)

12.4.3.5 Installation

Installation

1. Place the component on the DIN rail.
2. Snap the component on to the DIN rail. Make sure that the mounting slides at the rear latch into place.
3. You can now move the component on the DIN rail to the left or to the right to its final position.

Disassembly

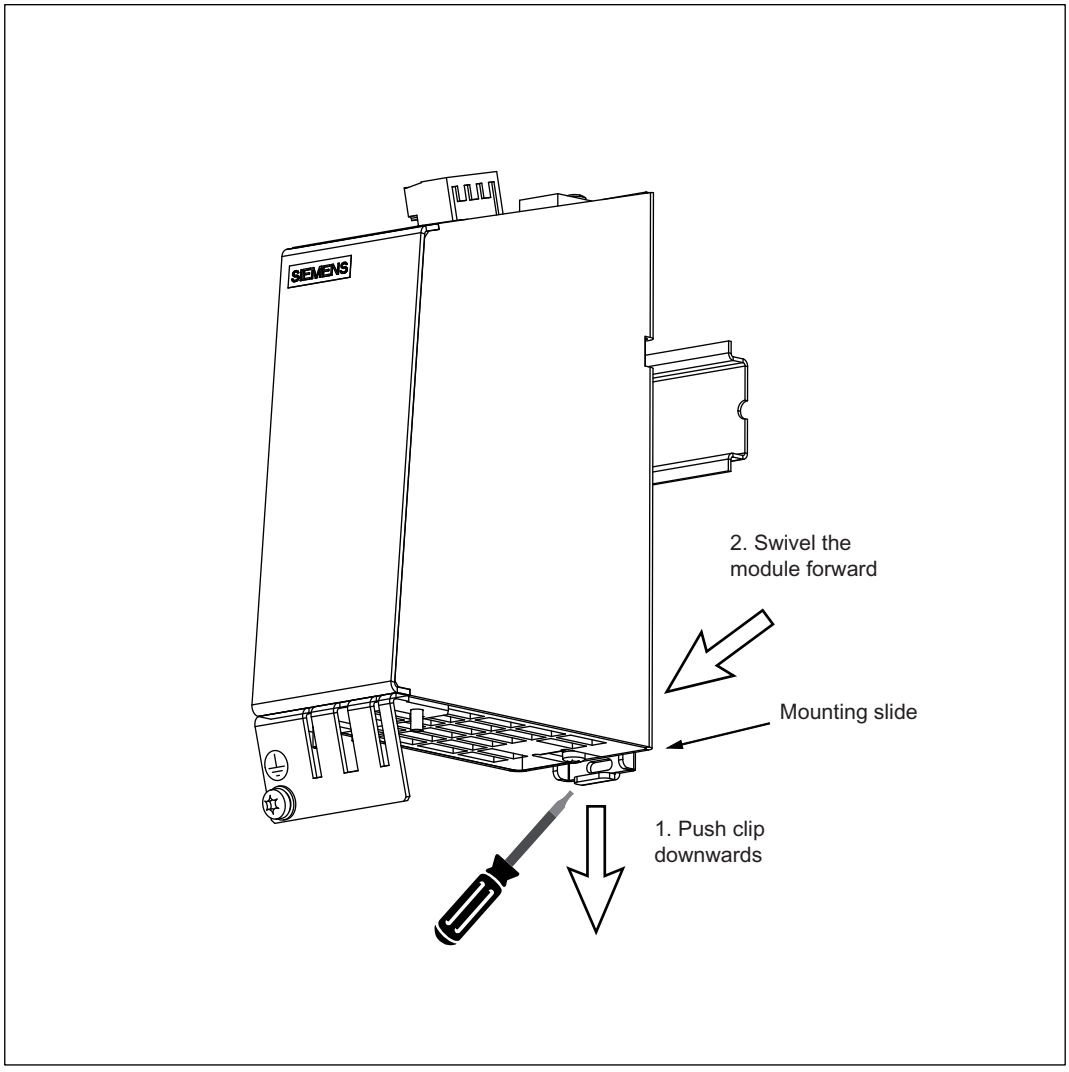

Figure 12-100 Releasing the component from a DIN rail

12.4.3.6 Electrical Connection

It is always advisable to shield the digital input/output wiring.

The following pictures show two typical shield connections from Weidmüller.

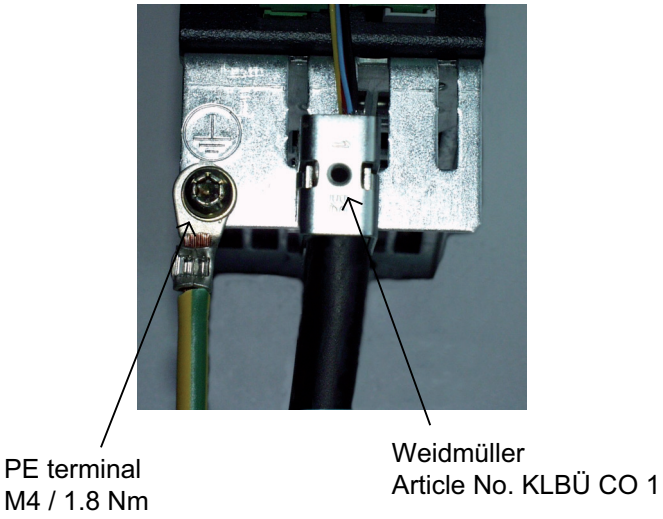

Figure 12-101 Shield connections

Company Internet addresses:

Weidmüller: http://www.weidmueller.com

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

The casing of the TM17 High Feature is connected to the chassis terminal of the module power supply (terminal X524). As long as the chassis is grounded, the housing is also grounded. Additional grounding via the M4 screw is required, in particular, when large equipotential bonding currents can flow (e.g. via the cable shield or the non-isolated I/O of the TM17 High Feature).

Connector coding

Siemens supplies a series of coding elements (coding sliders) with each Terminal Module TM17 High Feature. To code a connector, you must insert at least one coding slider and cut off at least one coding projection on the connector:

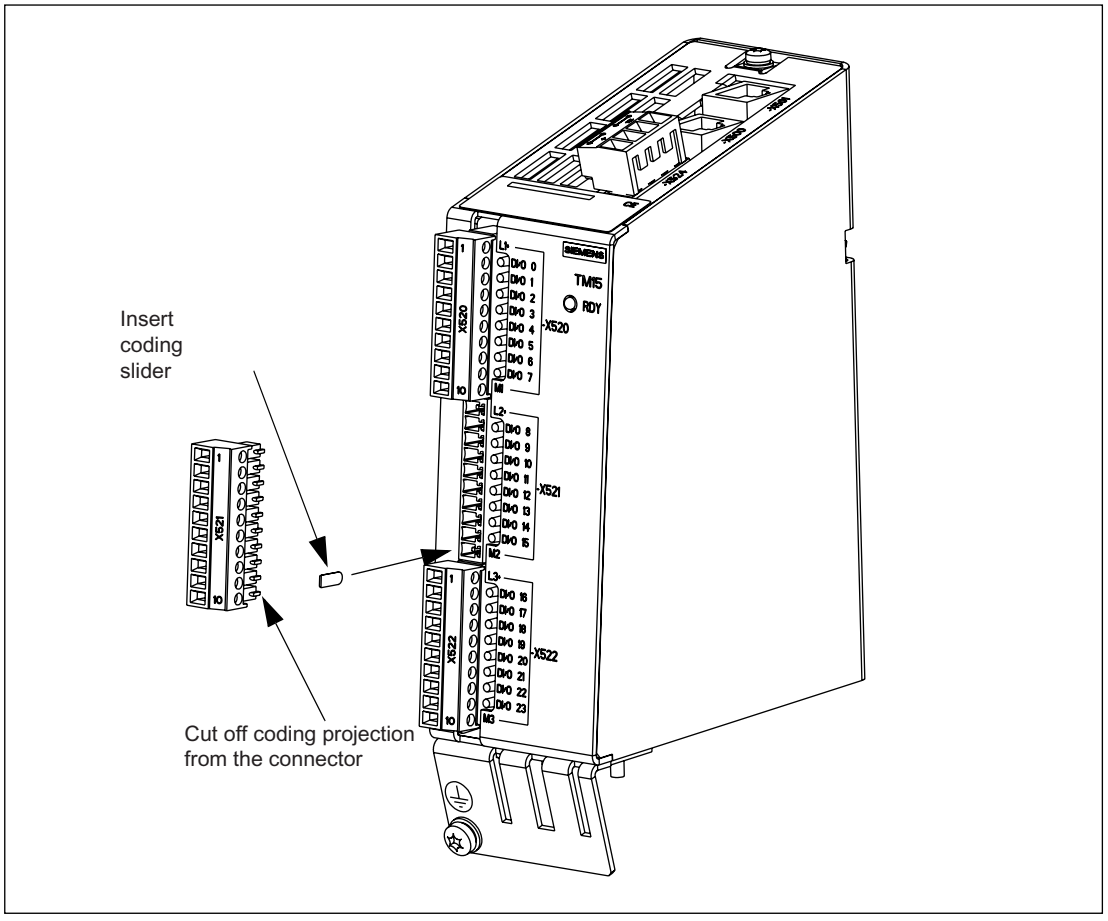

Figure 12-102 Connector coding - procedure (same as for TM 15)

To avoid incorrect wiring, unique connector coding schemes for the I/O connectors X520, X521, and X522 may be defined. Examples of possible patterns:

- Different coding between the 3 plugs of a component (i.e., X520, X521, and X522).
- Different components are coded differently.
- Identical components on the same machine are coded differently (e.g. several TM17 High Feature components).

12.4.3.7 Commissioning

Note

For information about commissioning , see the *SIMOTION Terminal Modules TM15 / TM17 High Feature* Commissioning Manual.

12.4.3.8 Technical data

Table 12-36 Technical data

Terminal Module TM17 High Feature	Unit	Value
Electronic power supply Voltage Current (without DRIVE-CLiQ or digital outputs) Power loss	 V_{DC} A_{DC} W	 24 VDC (20.4 – 28.8) 0.2 <4
Ambient temperature up to an altitude of 2000 m	°C	0 - 60
Storage temperature	°C	-40 to +85
Relative humidity	5% to 95%, no condensation	
I/O		
• Digital inputs/outputs	Each can be parameterized separately as DI or DO	
• Number of digital inputs/outputs	16	
• Isolation	No, 2 voltage groups	
• Max. cable length	m	30
Digital inputs		
• Voltage	V_{DC}	-30 to +30
• Low-level (an open digital input is interpreted as "low")	V_{DC}	-30 to +5
• High level	V_{DC}	15 to 30
• Input impedance	kΩ	2.8
• Current consumption (at 24 V DC), typical	mA	9
• Max. voltage in OFF state	V_{DC}	5
• Current in OFF state	mA	-11.0 to 2.0 (per channel)
• Input delay of digital inputs, typical	µs	(hardware filter that can be selected via the software) For "0" to "1" 1 or 125 ±15% [1] For "1" to "0" 1 or 125 ±15% [1]
• LEDs (per channel)	1 green at logic side	
Digital outputs (sustained short-circuit-proof)		
• Voltage	V_{DC}	24
• Max. load current per digital output	A_{DC}	0.5
• Output delay (ohmic load)		
typical	µs	For "0" to "1" 50 For "1" to "0" 75

Terminal Module TM17 High Feature	Unit	Value
maximum	µs	For "0" to "1" 100 For "1" to "0" 150
• Min. output pulse (100% amplitude, 0.5 A with resistive load)	µs	75 (typ.) 150 (max.)
• Max. switching frequency (100% amplitude, 50%/50% duty cycle, with 0.5 A and a resistive load)	kHz	1 (typ.)
• Voltage drop in ON state	V_{DC}	0.75 (max.) with all circuits fully loaded
• Leakage current in OFF state	µA	max. 10 per channel
• Output voltage drop (I/O power supply to the output)	V_{DC}	0.5
• Max. total current of the outputs (per group) to 60 °C to 50 °C to 40 °C	 A_{DC} A_{DC} A_{DC}	 2 3 4
IEC enclosure specification	IP20 degree of protection	
Protective-conductor connection	On the housing with M4/1.8 Nm screw	
Weight	kg	0.86
Approval	UL and cULus http://www.ul.com File: E164110, Vol. 2, Sec. 9	

[1] The shortest pulses can be detected using the 1 µs filter; however, the 125 µs filter will provide higher noise immunity.

12.4.4 Standards, Certificates and Approvals

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus approval

	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find further information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm Enter the first seven characters of the article number at **Keyword**. Then click **Search**.

Korea certification

	KC registration number: KCC-REM-S49-SIMOTION Note that this device complies with limit class A with regard to the emission of radio frequency interference. This device can be used in all areas except residential areas. 이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity.

See also

Declaration of conformity (http://support.automation.siemens.com/WW/view/en/10805446/134200)

12.4.5 ESD guidelines

12.4.5.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

12.4.5.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

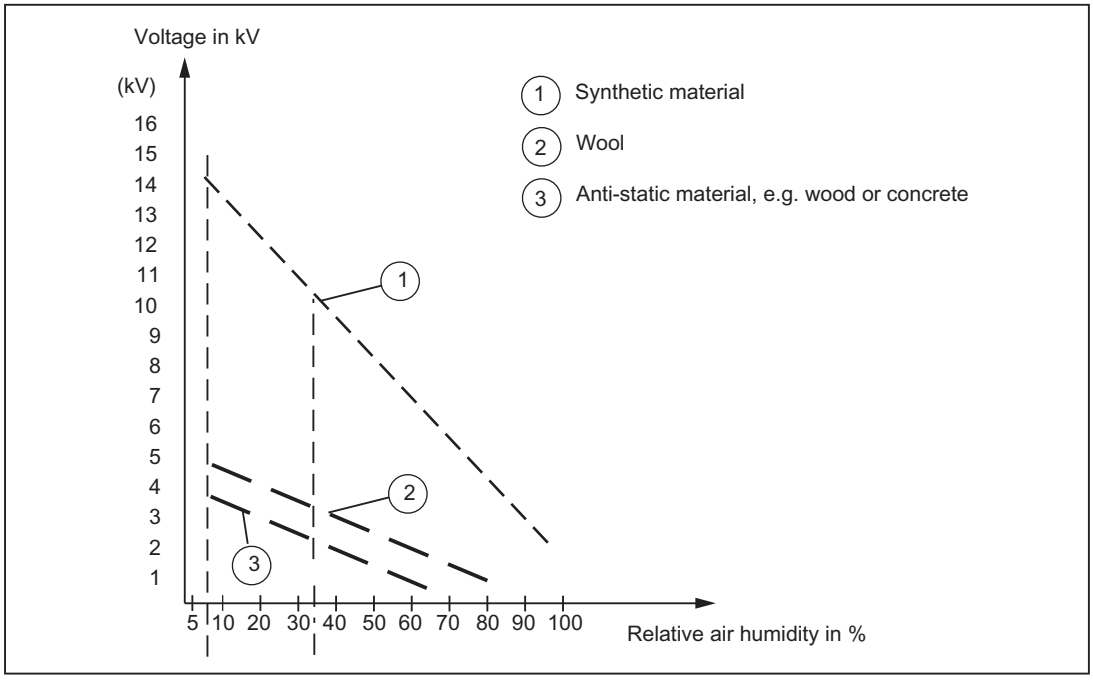

Figure 12-103 Electrostatic voltage that can accumulate on operating personnel

12.4.5.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

12.5 SIMOTION ADI4 - Analog Drive Interface for 4 Axes

Preface

Purpose of the manual

This manual describes the functionality and use of the ADI4 - Analog Drive Interface for 4 Axes.

Note

This manual provides information about the hardware and applications of the ADI4. In the SIMOTION manuals, you will find general information about working with the SIMOTION SCOUT engineering software, technology objects, etc.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics

- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

http://www.siemens.com/mdm

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

Scope

ADI4 is supported by the following Siemens products:

- SCOUT Engineering System, Version 3.1.1 or later
- SIMOTION Runtime, Version 3.1.1 or later
- SINAMICS V2.1 or later

Organization of information

The information about ADI4 in this manual is organized as follows:

- General
  This chapter describes the properties and essential features as well as the higher-level boundary conditions of the ADI4.
- Hardware description
  This chapter describes the interfaces of the ADI4, the control cabinet installation, and the power supply of the module.
- Parameter assignment
  This chapter describes the assignment of ADI4 parameters for PROFIBUS DP and for functions.
- Commissioning
  This chapter presents a commissioning example using absolute and incremental encoders in conjunction with ADI4.
- Index
  The index helps you to locate information in the manual quickly and easily.

12.5.1 Fundamental safety instructions

12.5.1.1 General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

12.5.1.2 Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

12.5.1.3 Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

12.5.1.4 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
  For more detailed information, go to:
  http://www.siemens.com/industrialsecurity
- Make sure that you include all installed products into the integrated industrial security concept.

12.5.1.5 Residual risks of power drive systems

The control and drive components of a drive system are approved for industrial and commercial use in industrial line supplies. Their use in public line supplies requires a different configuration and/or additional measures.

These components may only be operated in closed housings or in higher-level control cabinets with protective covers that are closed, and when all of the protective devices are enabled.

These components may only be handled by qualified and trained technical personnel who are knowledgeable and observe all of the safety instructions on the components and in the associated technical user documentation.

When assessing the machine's risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer must take into account the following residual risks emanating from the controller and drive components of a drive system:

1. Unintentional movements of driven machine components during commissioning, operation, maintenance, and repairs caused by, for example:
   - Hardware defects and/or software errors in the sensors, controllers, actuators, and connection technology
   - Response times of the controller and drive
   - Operating and/or ambient conditions outside of the specification
   - Condensation / conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of radio devices / cellular phones in the immediate vicinity of the controller
   - External influences / damage
2. In the event of a fault, exceptionally high temperatures, including an open fire, as well as emissions of light, noise, particles, gases, etc. can occur inside and outside the inverter, for example:
   - Component malfunctions
   - Software errors
   - Operating and/or ambient conditions outside of the specification
   - External influences / damage

   Inverters of the Open Type / IP20 degree of protection must be installed in a metal control cabinet (or protected by another equivalent measure) such that the contact with fire inside and outside the inverter is not possible.
3. Hazardous touch voltages caused by, for example:
   - Component malfunctions
   - Influence of electrostatic charging
   - Induction of voltages in moving motors
   - Operating and/or ambient conditions outside of the specification
   - Condensation / conductive contamination
   - External influences / damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc. if they are too close.
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly.

Note

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

For more information about residual risks of the components in a drive system, see the relevant sections in the technical user documentation.

12.5.2 General

12.5.2.1 Overview

Properties

Properties of ADI4 module

An ADI4 module (Analog Drive Interface for 4 axes) is an interface module suitable for operating up to four drives with an analog setpoint interface and TTL/SSI encoders on an equidistant PROFIBUS-DP.

Communication between the controller and the ADI4 is performed via an ADI4-specific message frame type which, in addition to digital input/output data, also contains a message frame type for each drive specified according to a PROFIDrive profile (standard message frame 3, see Chapter "AUTOHOTSPOT"). As part of cyclic DP communication, the actual drive values (encoder values) are transferred from the ADI4 module to the controller via PROFIBUS DP, and the speed setpoints calculated by the controller are transferred to the ADI4 module.

The transferred speed setpoints are then output from the ADI4 module to the drives as analog values.

Essential features

Features of the ADI4 module

The module has the following essential features:

- PROFIBUS DP connection (maximum of 12 Mbits/s)
- 4 servo interfaces
  - Inputs: TTL/SSI encoder for incremental and absolute measuring systems
  - Bidirectional analog outputs: ±10 V

- General and drive-specific digital input/output signals
- On-board status display via four diagnostic LEDs

To supply the module and digital outputs with power, an external voltage source (+24 VDC) is needed.

Article No. and firmware version

Article number

Article number: 6FC5 211-0BA01-0AA4

Firmware version

The firmware version is not displayed directly on the module. The article number and firmware version correlate as follows:

Article number	Firmware version
6FC5 211-0BA01-0AA2	1.3.3
6FC5 211-0BA01-0AA4	1.4.8

Boundary conditions

The following supplementary conditions must be taken into account for the operation of an ADI4 on the PROFIBUS DP:

- An ADI4 can only be operated on an **equidistant** PROFIBUS DP.
- An ADI4 is **not** a certified DP standard slave as defined by the PROFIDrive profile. For example, an ADI4 does not permit acyclic communication.

Interface (X1): External power supply

Connection

3-pin connector MSTB 2.5/3-ST-5.08 by Phoenix

Pin assignment

Table 12-38 Pin assignment: External power supply (X1)

Pin	Designation	Type[1)]	Function
1	P24EXT1	VI	External supply for module (+24 V)
2	M24EXT1	VI	Reference for external supply
3	PE	VI	Protective conductor of the external supply
[1)] VI: Voltage input			

Connection cables

The required connecting cables must be provided by the user:

Wire, conductor cross section: 1.0 - 1.5 mm^2 (AWG17 - AWG16)

Supply voltage

The specifications of the supply voltage can be found in the chapter "Power supply (Page 8348)".

Interface (X2): PROFIBUS DP

Connection

9-pin sub D socket

Pin assignment

Table 12-39 Pin assignment: PROFIBUS DP (X2)

Pin	Designation	Type[1)]	Function
1	-	-	-
2	-	-	-
3	RxD/TxD-P	B	Receive/transmit data P (B line)
4	RTS	O	Request to Send
5	DGND	VO	Data reference potential (M5V)
6	VP	VO	Supply voltage plus (P5V)
7	-	-	-
8	RxD/TxD-N	B	Receive/transmit data N (A line)
9	-	-	-

[1)] VO: Voltage output
O: Output
B: Bidirectional

Connectors

- 6ES7 972-0BA41-0XA0; cable outlet 35°, without PG connection socket
- 6ES7 972-0BB41-0XA0; cable outlet 35°, with PG connection socket

Cables

- 6XV1 830-0EH10; by the meter; without trailing capability
- 6XV1 830-3EH10; by the meter; with trailing capability

Other technical data

Maximum possible data rate: 12 Mbits/s

Interface (S2): PROFIBUS address

Setting

The PROFIBUS address of the ADI 4 DP slave can only be 15 or 16 for the 802D sl and is set using the S2 switch.

- PROFIBUS address 15: S2 switch, 1 to 4 set to ON
- PROFIBUS address 16: S2, only switch 5 set to ON

Table 12-40 Meaning of switch S2

Switches	Meaning
1	PROFIBUS address: $2^0 = 1$
2	PROFIBUS address: $2^1 = 2$
3	PROFIBUS address: $2^2 = 4$
4	PROFIBUS address: $2^3 = 8$
5	PROFIBUS address: $2^4 = 16$
6	PROFIBUS address: $2^5 = 32$
7	PROFIBUS address: $2^6 = 64$
8	Not used

Note

A newly set PROFIBUS address will only come into effect after power OFF/ON.

Interface (X3): Analog setpoint interface

Connection

50-pin sub D connector

O: Signal output

Prefabricated cables

The following prefabricated cables can be used, depending on the encoder type:

- **Incremental encoder (TTL) with RS 422 and operating voltage 5 V or 24 V**
  Article number: 6FX8 002-2CD01-1□□0 (5 V)
  Article number: 6FX5 002-2CD24-1□□0 (24 V)
  Information on the cable lengths can be found in the "Maximum cable lengths" section.
- **Absolute encoder with SSI**
  Article number: 6FX8 002-2CC11-□□□0
  Information on the cable lengths can be found in the "Maximum cable lengths" section.
- **1FT5 motor with integrated ROD320 encoder**
  Article number: 6FX8 002-2CE02-1□□0
  Cable length: Can be found in the "Maximum cable lengths" section.
  Information regarding the length codes is provided in:
  References: /Z/ Catalog NC Z

Maximum cable lengths

The maximum cable length depends on the following two parameters:

- **Encoder supply voltage**

Table 12-43 Encoder supply voltage

Supply voltage: 5 V DC		
Tolerance	**Current consumption**	**Max. cable length**
4.75 V to 5.25 V	≤ 300 mA	25 m
4.75 V to 5.25 V	≤ 220 mA	35 m

Supply voltage: 24 VDC		
Tolerance	**Current consumption**	**Max. cable length**
20.4 V to 28.8 V	≤ 300 mA	100 m
11 V to 30 V	≤ 300 mA	300 m

- **Transmission frequency**

Table 12-44 Transmission frequency

Encoder type	**Power supply**	**Frequency**	**Max. cable length**
Incremental (TTL)	5 V	1 MHz	10 m
		500 kHz	35 m
	24 V	500 kHz	150 m
Absolute (SSI)	24 V	750 kbit/s	10 m
		187.5 Kbit/s	250 m

Note

If cable lengths longer than 25 m or 35 m are needed for incremental encoders, encoder types with a 24 VDC supply voltage can be used instead.

NOTICE
Maximum cable lengths To ensure error-free transmission of encoder data, do not exceed the maximum cable lengths shown in these tables.

Encoder supply voltages

The encoder supply voltages must comply with the following specification:

Table 12-45 Specification of encoder supply voltages

	Supply voltage[1)]	
	P5MS	P24SSI
Voltage		
• Minimum	4.75 V	20.4 V
• Nominal	5 V	24 V
• Maximum	5.25 V	28.8 V
Ripple		
• Maximum	50 mV_{pp}	3.6 V_{pp}
Current load		
• Per encoder connection	0.3 A	
• Maximum	1.35 A	1 A
[1)] P5MS: Supply voltage for encoder (+5 VDC) P24SSI: Supply voltage for encoder (+24 VDC)		

Connectable measuring systems

Incremental encoder (TTL)

- Differential transmission with RS 422 and operating voltage 5 V or 24 V:
  - Track A as true and inverted signal (U_{a1}, $/U_{a1}$)
  - Track B as true and inverted signal (U_{a2}, $/U_{a2}$)
  - Zero signal N as true and inverted signal (U_{a0}, $/U_{a0}$)
- Maximum output frequency: 1.5 MHz
- Phase shift of Track A to Track B: 90° ± 30°

- Current consumption: Max. 300 mA
- Encoders with distance-coded zero marks/reference marks are not generally enabled.

Absolute encoder (SSI)

- Transmission method: Synchronous serial interface (SSI) according to RS 485 with 5 V differential signal transmission (RS 422 standard)
  - Output signal: Data as true and inverted signal
  - Input signal: Shift clock as true and inverted signal
- Data transmission format: "Pine tree"
- Resolution: Max. 25 bits
- Maximum transmission rate: 1 Mbit/s
- Current consumption: Max. 300 mA

The following SSI encoders are supported:

- All SSI encoders in the pine tree format whose MsgLength is equal to the number of "significant data bits":
  - 25-bit with 12-bit multiturn and 13-bit singleturn information (setting of the MsgLength 25)
  - 21-bit with 8-bit multiturn and 13-bit singleturn information (setting of the MsgLength 21)
  - 21-bit with 9-bit multiturn and 12-bit singleturn information (setting of the MsgLength 21)
  - 13-bit with 13-bit singleturn information (setting of the MsgLength 13)
- SSI encoder in the pine tree format with the following data:
  - 25-bit with 12-bit multiturn and 12-bit singleturn (setting of the MsgLength 24)
  - 21-bit with 8-bit multiturn and 12-bit singleturn information (setting of the MsgLength 20)
  - 13-bit with 12-bit singleturn information (setting of the MsgLength 12)
  - This applies as long as the encoder permits that not all available data is read!
- All right-justified encoders that satisfy the first condition indicated above.

Interface (X6-1): Digital outputs

Connection

Two 12-pin connectors FK-MCP 1.5/15-ST-3.81 made by Phoenix

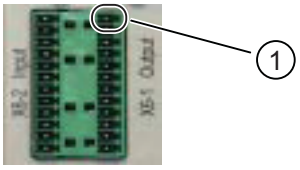
Pin assignment

Table 12-46 Pin assignment: Digital output interface (X6-1)

Pin	Designation	Type[1)]	Function
1	P24EXT2	VI	External 24 VDC supply voltage
2	Q0	DO	Digital output signal 1
3	Q1	DO	Digital output signal 2
4	Q2	DO	Digital output signal 3
5	Q3	DO	Digital output signal 4
6	DIR1	DO	Digital output signal 5 or directional signal of axis 1[3)]
7	DIR2	DO	Digital output signal 6 or directional signal of axis 2[3)]
8	DIR3	DO	Digital output signal 7 or directional signal of axis 3[3)]
9	DIR4	DO	Digital output signal 8 or directional signal of axis 4[3)]
10	RDY1	K [2)]	"Ready" signal of relay contact 1
11	RDY2	K [2)]	"Ready" signal of relay contact 2
12	MEXT2	VI	Reference of the external supply voltage

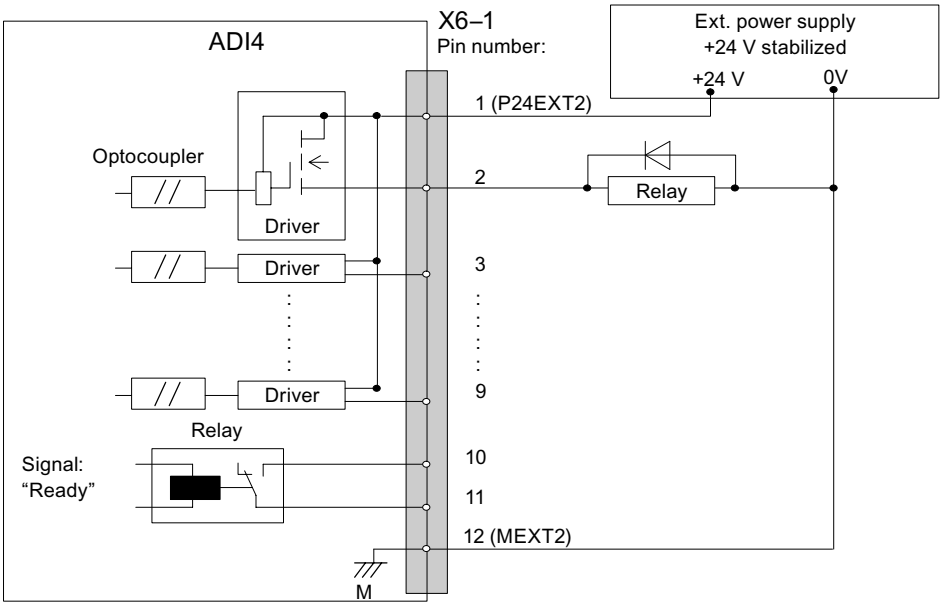
[1)] VI: Voltage input
DO: Digital output (24 V)
K: Relay contact
[2)] Max. current carrying capacity: 2 A for 150 VDC or 125 VAC;
Max. number of switching cycles:
- 24 VDC, 1 A: 10^7
- 24 VDC, 2 A: 10^5

[3)] For "unipolar spindle" function (or unipolar motor)



Pin 1a

① PIN 1



PIN assignment 2

Supply voltage

To supply the digital outputs with power, an external 24 VDC voltage source must be connected to X6-1, Pin 1 (P24EXT2).

The reference ground of the external voltage source must be connected to X6-1, Pin 15 (MEXT2).

You will find additional information in Section "Technical data (Page 8352)".

Electrical specification

Table 12-47 Electrical specification of the digital outputs

Digital outputs	Min.	Typical	Max.	Nominal
High-level voltage (U_H)	V_{CC} - 3 V	1)	V_{CC}	24 V
Output current I_{OUT}	-	-	500 mA	-
Voltage with low level (U_L)	-	-	-	0 V
Leakage current at low level	-	50 µA	400 µA	-
Signal delay T_{PHL}, T_{PLH} 2)	-	0.5 ms	-	-
Supply voltage of the digital outputs 1) Typical output voltage: V_{CC} - I_{OUT} * R_{ON} - 0.65 V V_{CC}: Actual operating voltage P24EXT2 Max. output current I_{OUT}: 500 mA Max. short-circuit current: 4 A (max. 100 µs, V_{CC} = 24 V) Internal resistance R_{ON}: 0.4 Ω 2) The PROFIBUS communication time as well as the application cycle time must also be taken into account. Incorrect connection (polarity reversal) causes neither high level nor destruction of the outputs.				

General electrical properties

- Galvanic isolation using optocouplers
- Current limitation to maximum 500 mA
- Protection against: short-circuit, overtemperature, and loss of ground
- Automatic disconnection in case of undervoltage

Relay contact: "Ready" signal

The relay contact remains open or is **opened** if the module is in one of the following states:

- Initialization of the module after Power ON
- Power failure or hardware interrupt (NMI)
- No cyclic communication to the DP master
- PLL error
- Synchronization error
- Overtemperature

The relay contact is **closed** if both conditions are present:

- Module status "Ready"
- Cyclic communication with the DP master

Connection cables

The required connection cables must be provided by the user:

- Supply voltage X6-1, Pin 1 and 12 (P24EXT2):
  Wire, conductor cross-section of 1.5 mm^2 (AWG16)
- Digital outputs X6-1, Pins 2 to 9:
  Wire, conductor cross-section 0.5 to 1.5 mm^2 (AWG20 - AWG16)
- Ready X6-1, Pin 10 and 11:
  Wire, conductor cross-section of 1.5 mm^2 (AWG16)

Note

The maximum permissible length of the digital signal cable is 30 m.

Interface (X6-2): Digital inputs

Connection

Two 12-pin connectors FK-MCP 1.5/15-ST-3.81 made by Phoenix

Note

Enable signals for analog axes

The Drive Ready signals are used as enable signals for the analog axes. If there is NO 24 V at these inputs, the POWER enable of the axis is NOT set. The axis therefore cannot be enabled/traversed.

Pin assignment

Table 12-48 Pin assignment: Digital input interface (X6-2)

Pin	Designation	Type [1)]	Function
1	P24OUT	VI	24 VDC supply voltage
2	BERO1	DI	Input signal of BERO / external zero mark 1
3	BERO2	DI	Input signal of BERO / external zero mark 2
4	BERO3	DI	Input signal of BERO / external zero mark 3
5	BERO4	DI	Input signal of BERO / external zero mark 4
6	MEPU1	DI	Measuring signal, measuring input 1 (see "Measuring input" below)
7	MEPU2	DI	Measuring signal, measuring input 2 (see "Measuring input" below)

Pin	Designation	Type [1]	Function
8	DRV1_RDY	DI	"Drive Ready" signal of axis 1
9	DRV2_RDY	DI	"Drive Ready" signal of axis 2
10	DRV3_RDY	DI	"Drive Ready" signal of axis 3
11	DRV4_RDY	DI	"Drive Ready" signal of axis 4
12	MOUT	VI	Reference of the supply voltage

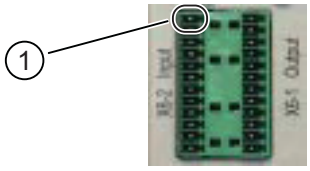
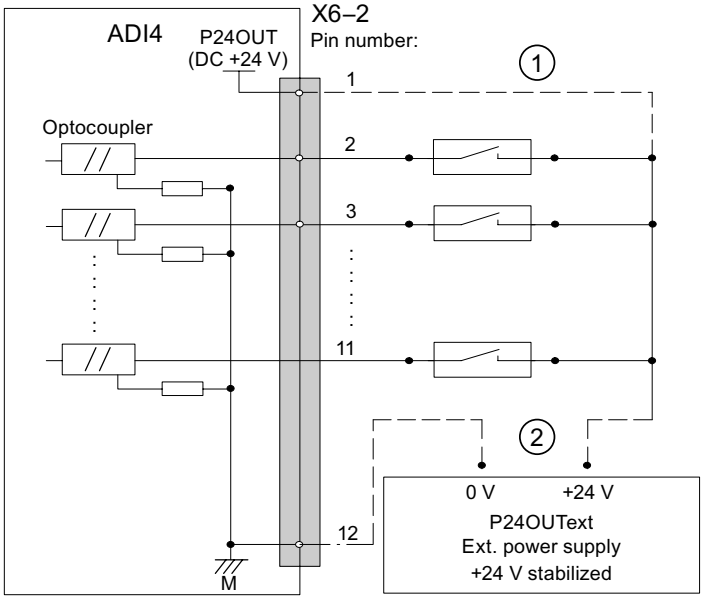
DI: Digital input (24 V)



Pin 1b

① PIN 1



PIN assignment 3

① Connection if the internal supply voltage P24OUT is used;
the connection in accordance with ② is no longer required.

② Connection if an external supply voltage P24OUText is used;
the connection in accordance with ① is no longer required.

Internal supply voltage P24OUT

Specification of the internal supply voltage P24OUT available at X6-2, Pin 1 for the digital inputs:

Table 12-49 Specification of the supply voltage P24OUT

Voltage	
• Minimum	20.4 V
• Nominal	24 V

Voltage	
• Maximum	28.8 V
Ripple	
• Maximum	3.6 V_{pp}
Current load	
• Typical	0.1 A
• Maximum	1 A
Power consumption	
• Typical	3.02 W
• Maximum	30.2 W
Insulation Class	A, in accordance with DIN 57110b
Typical output voltage: V_{CC} - I_{OUT} * RON - 0.65 V V_{CC}: Actual P24OUT operating voltage Max. output current I_{OUT}: 1 A Internal resistance R_{ON}: 0.4 Ω The supply voltage P24OUT is short-circuit proof.	

External supply voltage P24OUText

If an external supply voltage is used, its reference ground must be connected to X6-2, Pin 12 (M).

X6-2, Pin 1 (P24OUT) then remains open.

Electrical specification

Digital inputs	**Min.**	**Typical**	**Max.**	**Nominal**
High-level voltage (U_H)	15 V	1)	30 V	24 V
Input current I_{IN} at U_H	3.7 mA	-	7.5 mA	-
Voltage with low level (U_L)	-30 V	-	+5 V	0 V
Signal delay T_{PHL}, T_{PLH} 2)	-	3 µs	-	-

1) See table "Specification of the supply voltage P24OUT"

2) The PROFIBUS communication time as well as the application cycle time must also be taken into account.

Incorrect connection (polarity reversal) causes neither high level nor destruction of the inputs.

Connection cables

The required connection cables must be provided by the user.

- Supply voltage X6-2, Pin 1 (P24OUT), external supply voltage P24OUText:
  Wire, conductor cross-section of 1.5 mm^2 (AWG16)
- Digital inputs X6-2, Pins 2 to 11:
  Wire, conductor cross-section 0.5 to 1.5 mm^2 (AWG20 - AWG16)

General electrical properties

- Galvanic isolation using optocouplers
- Active current limiting of the inputs
- Protection from negative input voltage

Measuring input

ADI4 supports only measurement of a rising **or** falling edge of the measuring input. A simultaneous request for measurement on a rising edge and a falling edge of the measuring input cannot be parameterized.

Interface (H1/H2): Module status

The module status is displayed on the front of the module with four diagnostic LEDs.

Table 12-50 Diagnostic LEDs (H1/H2)

Designation		Color	Description
H1	POWER	Green	Supply voltage LED = Off: Supply voltage not applied LED = On: Supply voltage is applied
	OVTEMP	Red	Overtemperature display LED = Off: Device temperature < overtemperature limit LED = On: Device temperature ≥ Overtemperature limit
H2	EXCHANGE	Green	Status: Message frame exchange with DP master LED = Off: No message frame exchange with DP master LED = On: Cyclic message frame exchange with DP master
	READY	Red	Ready status: Message frame exchange with DP master LED = Off: Not yet ready LED = On: Ready LED = Off and EXCHANGE = On: Message frame exchange active LED = flashing: Error occurred during message frame exchange

12.5.3.3 Control cabinet installation

Installation

For high frequency interference currents, the housing of the ADI4 module must be connected with low-resistance to the back wall of the control cabinet, and this wall in turn must be connected with low-resistance to the motors/machines. The module should be installed on a bare mounting wall. The connection between the mounting wall and the motors/machines must be electrically conductive and have a large surface area. Coated cabinet walls and DIN rails, or similar mounting means with a small contact area, do not meet this requirement.

Cable routing

Power and signal cables must always be routed separately. All I/O interface (X6-1/X6-2) signal lines should exit jointly. Single strands that are related from the signal point of view must be twisted together. Signal cables and encoder cables should be installed separately.

All cables and lines within the control cabinet should always be placed as close as possible to the control cabinet walls. Extended installation through open space can cause interference injections (antenna effect). The proximity to sources of interference (contactors, transformers, etc.) must be avoided by placing a shield plate between the cable and the source of interference, if necessary. Cables and conductors should not be extended using terminals or similar devices. To protect against interference injections from external sources, signal cables must be shielded.

⚠ **WARNING**
The module has been designed for operation in an enclosed control cabinet. Operation outside an enclosed control cabinet is not permissible.

12.5.3.4 Power supply

ADI4 module

To supply the ADI4 module (+24 VDC), an external power source is needed. The power supply is connected through terminal X1 (P24EXT1) on the front panel of the ADI4 module. For more detailed information, refer to the chapter "Interface (X1): External power supply (Page 8334)".

Digital outputs

To supply (+24 VDC) the digital outputs, an external power source is needed. The power supply is connected through Terminal X6-1, Pin 1 (P24EXT2). For more detailed information, refer to the chapter "Interface (X6-1): Digital outputs (Page 8341)".

Digital inputs

If the digital inputs are not supplied with the internal supply voltage of X6-2, Pin 1 (P24OUT), this supply voltage can optionally be replaced with an external power source (+24 VDC, 1 A maximum).

The reference ground (GND) of the external power supply source must be connected with X6-2, Pin 12. X6-2, Pin 1 (P24OUT) remains open.

Specification of the supply voltages (+24 VDC)

The external supply voltages for the ADI4 module, the digital outputs, and optionally the digital inputs must comply with the specifications provided in the "Encoder supply voltages" table.

Table 12-51 Specification of the external supply voltages

	Supply voltage[1]		
	P24EXT1	**P24EXT2**	**P24OUText**
Voltage			
• Minimum		18.5 V	
• Nominal		24 V	
• Maximum		30.2 V	
Ripple			
• Maximum		3.6 V_{pp}	
Current load			
• Typical	0.5 A	-	0.1 A
• Maximum	1 A	8 A	1 A
Power consumption			
• Typical	12 W	-	3.02 W
• Maximum	30.2 W	241.6 W	30.2 W

[1] P24EXT1: Supply voltage of the ADI4 module
P24EXT2: Supply voltage for the digital outputs
P24OUText: Optional supply voltage for the digital inputs

NOTICE
The external supply voltages must each be generated as functional extra-low voltage with safe electrical isolation (DIN EN 60204-1, PELV).

Fuse

On the module side, supply voltages P24EXT1 and P24EXT2 must be protected against the following:

- Overvoltage
- Short-circuit (electrical current limiting of outputs)
- Polarity reversal
- Overload
  - P24EXT1: Fuse 2.5 A / 250 V
  - P24EXT2: Fuse 8 A / 125 V

12.5.3.5 Grounding

Grounding

The module must be installed according to EN 60204.

The user must ground each of the supply voltages. To do this, a connection must be established from Terminal X1, Pin 2 (MEXT1) or X6-1, Pin 15 (MEXT2) to a central grounding point of the system.

If a large-area, permanent metallic connection with the central grounding point is not possible using the rear panel, the module must be connected to the grounding rail by means of a wire (cross-section > 10 mm^2).

⚠ CAUTION
A protective conductor must be connected. An M6 screw is provided on the lower right of the front of the housing to connect the protective conductor. See Chapter "AUTOHOTSPOT".

Transportation altitude	-	-1000 to 3000 m
Shock stress during transportation		
Free fall in transport packaging	≤ 1000 mm	

12.5.4 Parameter assignment

12.5.4.1 Boundary conditions of ADI4 DP slave

Note

The following boundary conditions must be taken into account for the operation of an ADI4 DP slave on the PROFIBUS DP:

- An ADI4 DP slave is not a certified DP standard slave as defined by the PROFIDrive profile. For example, an ADI4 DP slave does not enable acyclic communication. Therefore, an ADI4 DP slave can only be operated on a DP master specially released for this purpose.
- An ADI4 DP slave can only be operated on an equidistant PROFIBUS DP. The minimum DP cycle is 1 ms.

12.5.4.2 Requirements

Components for parameter assignment

The following components are required for assigning parameters for an ADI4 DP slave:

- ADI4:
  as from article number: 6FC5 211-0BA01-0AA1
  Firmware Version 01.02.02 and higher
- SIMATIC STEP 7 Version 5.1 and higher
- SIMOTION
  - SIMOTION P or C: SIMOTION V2.1 and higher (SCOUT and Runtime)
  - SIMOTION D: SIMOTION V3.1 and higher (SCOUT and Runtime)

12.5.4.3 PROFIBUS DP parameter assignment

Parameter assignment sequence

Parameter assignment sequence

The PROFIBUS DP parameter assignment for the ADI4 DP slave can be generally divided into the following steps:

1. Step
   After inserting the ADI4 DP slave in the configuration, the following parameters are assigned on a slave-specific basis:
   - PROFIBUS parameters (see Section "PROFIBUS parameters (Page 8354)")
   - Function parameters (see Section "Function parameters (Page 8361)")

   Step 1 should be carried out first for **all** ADI4 DP slaves needed in the configuration.
2. Step
   Parameter assignment of the equidistant cyclic DP communication (see Section "Parameter assignment of the DP communication (Page 8370)")
   Step 2 can be performed **last** on **any** ADI4 DP slave. These settings can be transferred to all other ADI4 DP slaves by means of the adjustment function of the SlaveOM.

Inserting an ADI4 DP slave in the configuration

Procedure

1. To insert an ADI4 DP slave in the configuration, open the hardware catalog using the **View > Catalog** menu command.
   The ADI4 DP slave can be found at:
   – Profile: **Standard**
   PROFIBUS DP > SINUMERIK > ADI4

   SIMATIC Technology CPU
   If S7-Technology was installed for the Technology CPU, the ADI4 DP slave is located under:
   – Profile: **SIMATIC Technology CPU**
   PROFIBUS DP (DRIVE) > Other FIELD DEVICES > SINUMERIK > ADI4
2. Using a drag-and-drop operation, select the ADI4 DP slave and move it onto to the DP master system in the station window.
   The DP master system is displayed in the station window with the following symbol:

   

When you release the left mouse button, the DP slave ADI4 is inserted into the configuration.

Note

As you drag the DP slave, the cursor appears as a circle with a slash through it. When the cursor is positioned exactly over the DP master system, it changes to a plus sign, and the DP slave can be added to the configuration.

12.5.4.4 PROFIBUS parameters

Parameter components

Configuring the PROFIBUS parameters

The PROFIBUS parameters are a result of the following:

- PROFIBUS address
- Number of axes and encoders (message frame type)
- I/O addresses

PROFIBUS address

Procedure

Inserting an ADI4 DP slave into the configuration will open the "Properties - PROFIBUS Interface ADI4" dialog, "Parameters" tab:

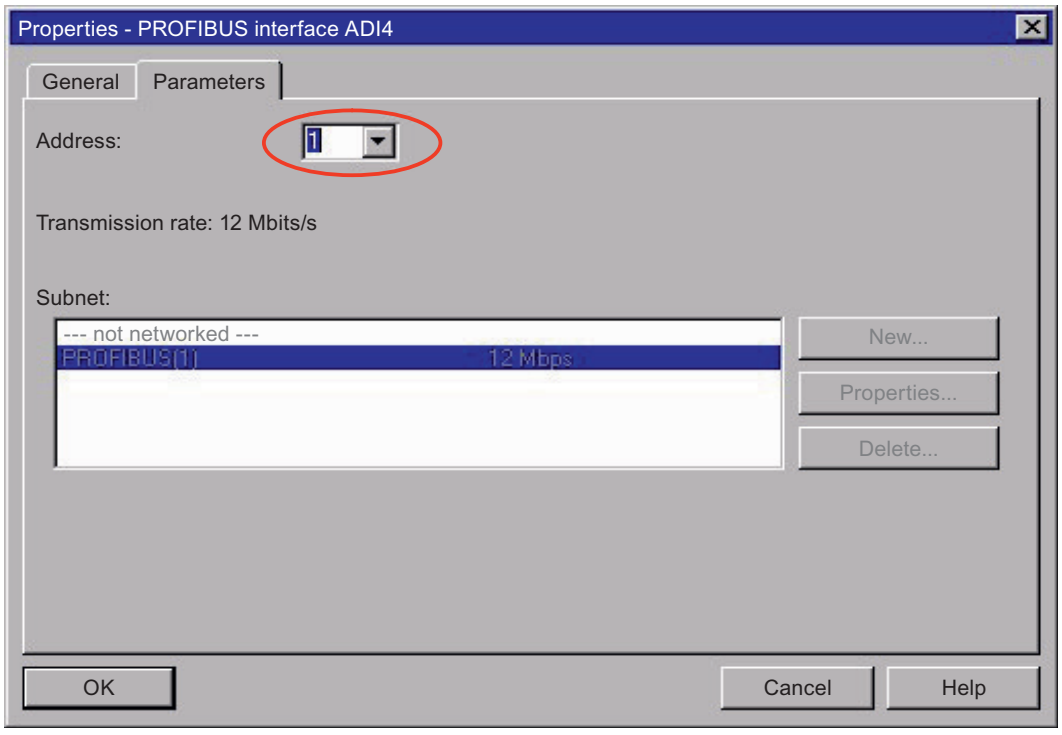

Figure 12-106 PROFIBUS address

The displayed address value was automatically set by HW Config to the next available PROFIBUS address within the configuration.

Note

The PROFIBUS address of the ADI4 DP slave can be set to any value, in principle. However, it must be ensured that the PROFIBUS address setting in HW Config matches the DIP switch setting on the ADI4 DP slave:

There is **no automatic adjustment**!

The following data must agree:

- SIMATIC S7 configuration ADI4 DP slave
  PROFIBUS address
- ADI4 module DIP switch S2
  PROFIBUS address

Note

PROFIBUS address 127

If PROFIBUS address is set to 127, when the module powers up, the firmware release is displayed on the internal module LEDs using a flashing code. It is not recommended to use PROFIBUS address 127 as this lengthens the time that the module requires to power up.

After the dialog is confirmed with "OK", the "DP Slave Properties" dialog box is opened. Continue with the parameter assignment for the message frame type.

Message frame type

Telegram type

The ADI4 DP slave is operated with a specific telegram type:

4 axes, each with one encoder (standard telegram 3) and I/O data

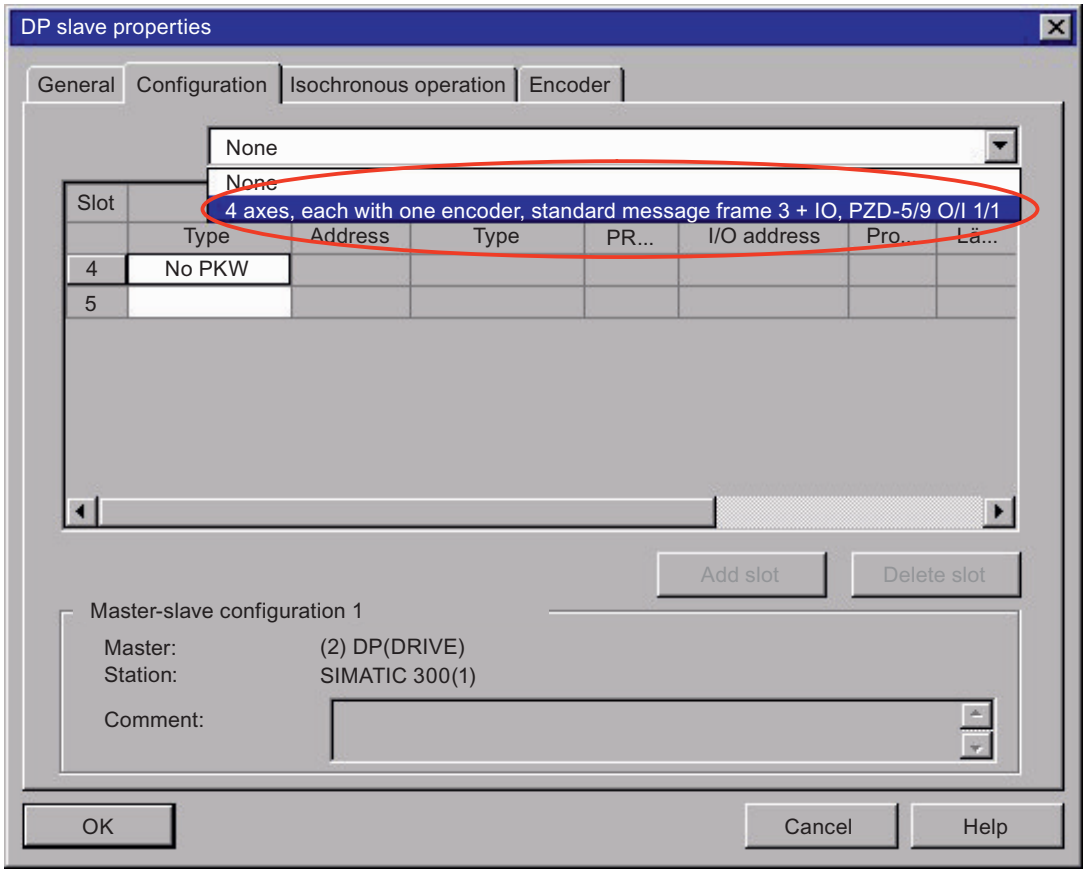

Figure 12-107 Telegram type

Setting the telegram type

By default, no telegram type is selected. The ADI4-specific telegram type must be explicitly selected in the "Configuration" tab.

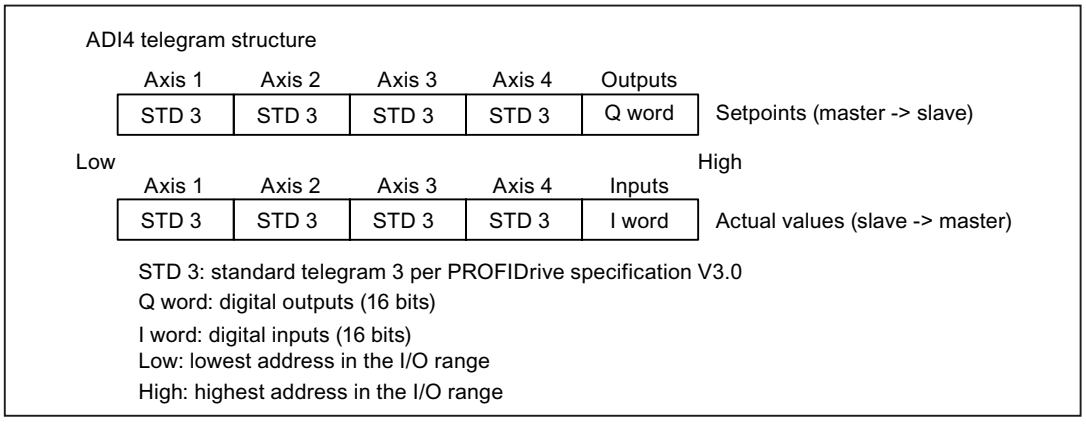
1. In the "DP Slave Properties" dialog box, select the "Configuration" tab.
2. In the "Default" list, select the entry "4 axes, each with one encoder, Standard telegram 3 + IO, PZD-5/9 O/I 1/1".
3. Click "OK".

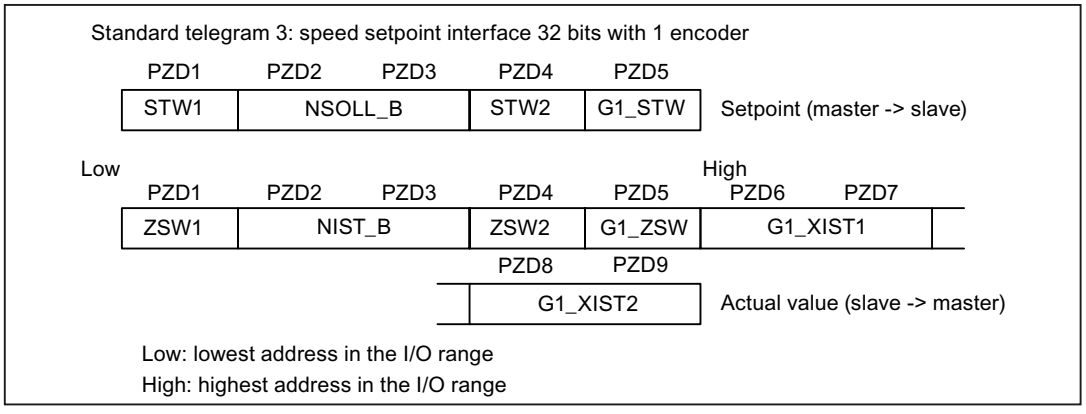
Telegram structure

The telegram is structured as follows:

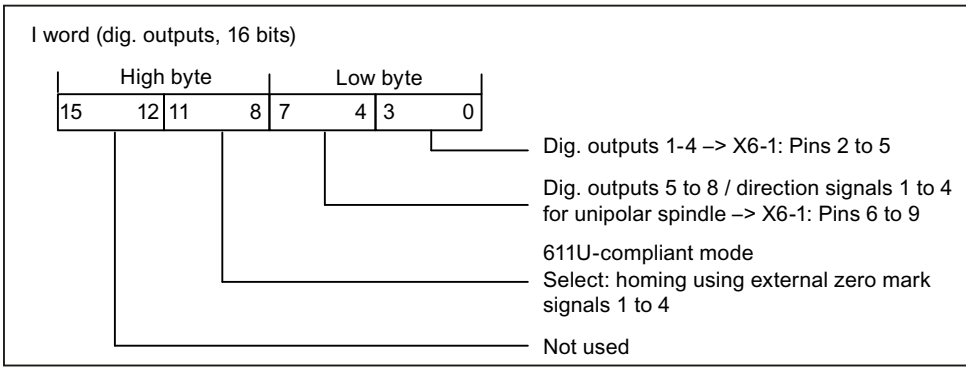
Table 12-53 Telegram structure

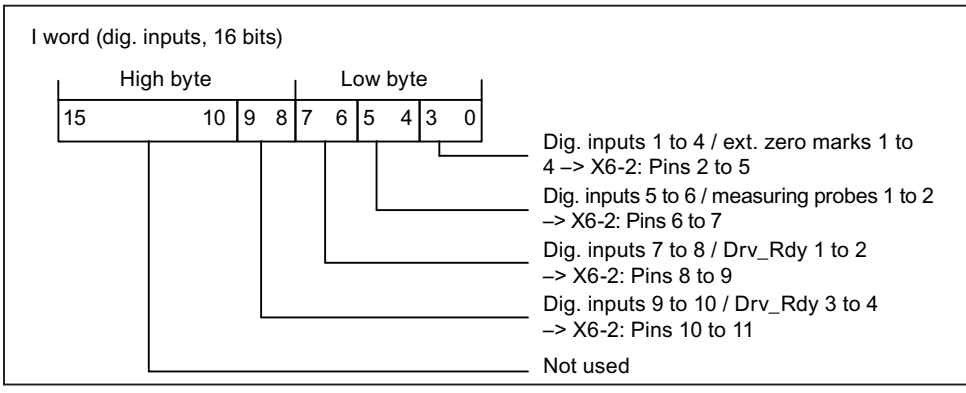
Telegram type	Description
4 axes, each with one encoder, Standard telegram 3 + IO, PZD-5/9 O/I 1/1	4 x Standard telegram 3 and 1 PZD word each for digital I/O data
PZD x/y Number of process data words, x: Setpoint, y: Actual value, e.g. PZD-5/9: 5 process data words for setpoints 9 process data words for actual values	
	
	





Telegram type	Description
	
	





Note

The telegram type setting for the ADI4 DP slave in HW Config must agree with the telegram type setting in the controller.

There is **no automatic adjustment**.

Encoder control word Gx_STW

Description of the encoder control word (extract) for:

- Find reference mark
- On-the-fly measurement
- Encoder error

Table 12-54 Encoder control word Gx_STW (extract)

Bit	Name		Signal status, description		
0	Find reference mark or On-the-fly measurement	**Functions**	**Find reference mark**: Bit 7 = 0		
			Bit	**Meaning**	
			0	Function 1: Homing using the encoder zero mark (except in "611U-compliant mode")	
			1	Function 2: Homing using rising edge of external zero mark	
			2	Function 3: Homing using falling edge of external zero mark	
			3	Function 4: Not used	
1			**On-the-fly measurement**: Bit 7 = 1		
2			**Bit**	**Meaning**	
3			0	Function 1: Measuring using measuring probe 1 rising edge	
			1	Function 2: Measuring using measuring probe 1 falling edge	
			2	Function 3: Measuring using measuring probe 2 rising edge	
			3	Function 4: Measuring using measuring probe 2 falling edge	
			Note • Bit 0 ... 3 Bit x = 1 Function requested Bit x = 0 Function not requested • If more than one function is enabled, the values for all functions cannot be read until all functions have ended and this has been signaled via the relevant status bit (G1_ZSW, Bit 0 - Bit 3 = 0). • Find reference mark A **falling** edge when homing using the external zero mark is **not** evaluated by SINUMERIK. • Meas. on-the-fly The rising and falling edges of the measuring input can be enabled simultaneously. The measuring input signal is detected according to the direction of the signal change. The measured values are read out consecutively. Notice ADI4 only supports measurement on a rising **or** falling edge. • Find reference mark and on-the-fly measurement Only one of the two functions can be active at a time.		
4		**Command**	**Bit 6, 5, 4**	**Meaning**	
			000	- -	
5			001	Activate function x	
6			010	Read value x	
			011	Cancel function x	
7		**Mode**	0	Find reference mark	
			1	On-the-fly measurement	
:			:		
15	Encoder error		0	No error	
			1	Encoder error pending; error code in Gx_XIST2	

Additional encoder actual value Gx_XIST2

Error codes in Gx_XIST2 where G1_ZSW, Bit 15 = 1

Table 12-55 Error codes in Gx_XIST2

G1_XIST2	Meaning	Possible causes/description
1_{Hex}	Encoder sum error	The encoder signal levels are too low, faulty (inadequate shielding) or cable breakage monitoring has been tripped.
2_{Hex}	Zero mark monitoring	A fluctuation in the measured rotor position has arisen between two encoder zero marks (encoder pulses may be lost).

I/O addresses

Requirements

For communication between the controller and the individual axes of an ADI4 DP slave, it is necessary that the setpoint and the actual value of an axis have the same I/O address.

HW Config takes this requirement into account automatically when an ADI4 DP slave is inserted in the configuration.

Inserting I/O addresses

1. In the "DP Slave Properties" dialog box, select the "Configuration" tab.
2. Under PROFIBUS partner, I/O addr., enter: <**I/O address**>.
3. Click "OK".

Note

The setpoint and actual value of an axis must have the same I/O address.

I address (actual value) = O address (setpoint)

If an ADI4 DP slave is inserted into an S7 project through a copy operation, e.g., from another S7 project, the I/O addresses are assigned directly by HW Config. This may have the consequence that an axis is assigned different I/O addresses for setpoint and actual values. The I/O addresses must be manually corrected in this case.

To avoid access conflicts between the PROFIBUS DP drives and the I/O modules, values **≥ 272** must be used for I/O addresses for the ADI4 DP slave.

Consistency

Consistency setting

The default setting for I/O data consistency is "Total length".

The "Total length" consistency setting means that direct access from the PLC user program (e.g. byte, word, or double word) to this address area of the PLC operating system is not permitted.

12.5.4.5 Function parameters

Parameters

The function-specific parameters of the ADI4 DP slave are entered under the "Encoder" tab:

- Encoder type
- Unipolar spindle (or unipolar motor)
- Shutdown ramp
- Shutdown delay
- Tolerable sign-of-life failures
- Reserved bits for fine resolution
- 611U conformant mode

The figure below shows the corresponding dialog box with sample values for the various encoder types and parameters.

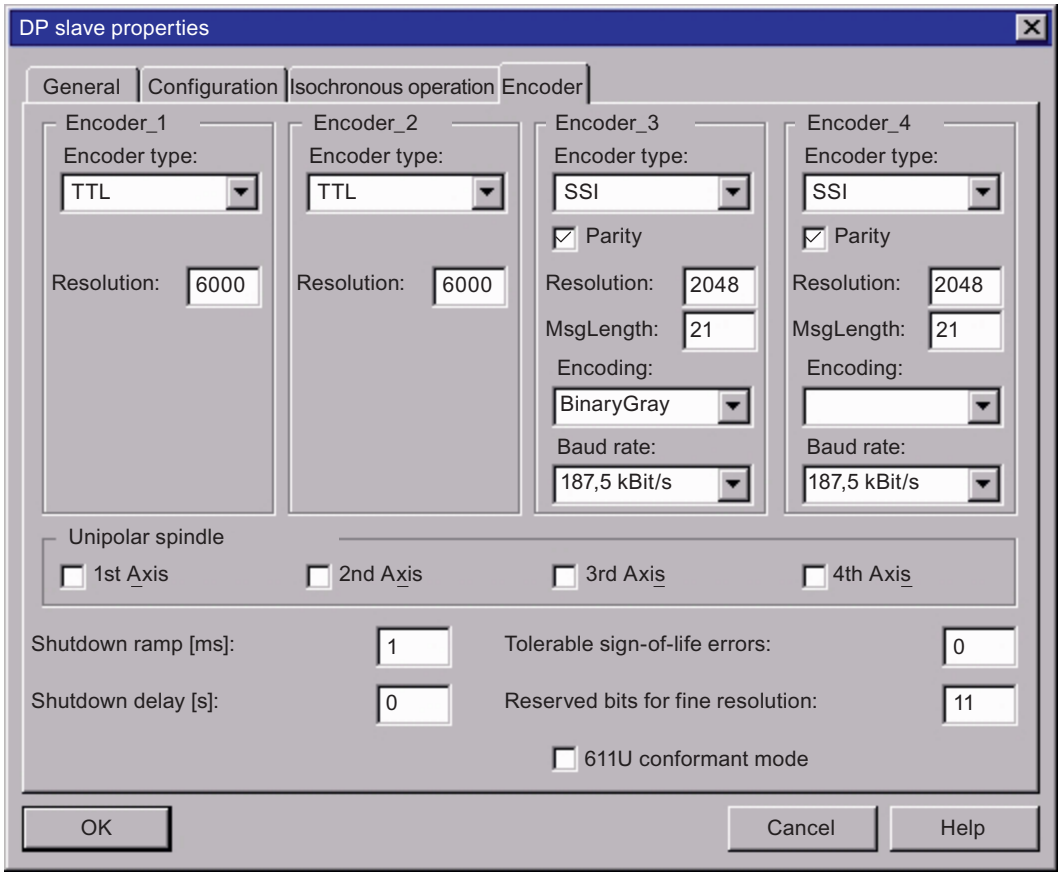


Figure 12-108 "DP Slave Properties" dialog box, "Encoder" tab

Encoder type

Encoder type "not available"

An encoder type setting of "not available" for Encoder x means that Axis x does not exist, or that it is not to be operated. User data transmitted for this axis in the PROFIBUS message frame are empty.

Encoder type TTL

Encoder parameters:

- Resolution
  Encoder resolution in encoder pulses per encoder revolution

---

Note

In the case of spindles with a low-resolution encoder, the actual-value characteristic (incrementing) may be displayed in a non-linear fashion. The incrementing that is visible on the actual-value display is the result of the speed resolution (RR), where:

- RR: 60000 / (T_{DP} * ER * PM)
- RR (speed resolution): [(revolutions/min) / encoder pulse]
- T_{DP} (position control cycle clock = PROFIBUS cycle clock): [ms]
- ER (encoder resolution): [Encoder pulse / revolution]
- PM (pulse multiplication)

Example:

T_{DP} (position control cycle clock = PROFIBUS cycle clock): 2 ms

ER (encoder resolution): 2500 pulses/revolution

PM (pulse multiplication): 4

RR = 60000 (2*2500*4) = 3 (revolutions/min) / encoder pulse

Encoder type SSI

Encoder parameters:

- Parity
  Select this check box if the encoder data are to be transmitted from the encoder to the ADI4 with a parity bit.
- Resolution
  Encoder resolution in encoder pulses per encoder revolution
- MsgLength
  Number of user data bits transmitted by the encoder

- Encoding
  The following encoder codes are supported:
  - Binary
  - Gray
- Baud rate
  The following baud rates are supported:
  - 187.5 Kbits/s
  - 375 Kbits/s
  - 750 Kbits/s

Note

The following boundary conditions must be taken into account for SSI encoders:

- The baud rate setting must be identical for all SSI encoders. If baud rate settings are different, the baud rate of the SSI encoder with the highest encoder number is used.
- In conjunction with ADI4, only absolute encoders (SSI) with "Pine tree" data output format (TSSI) can be operated.

Unipolar spindle or unipolar motor

Introduction

The drive can be moved in two directions. Selecting the "Unipolar spindle" option switches the voltage range of the analog output voltage.

Unipolar spindle not selected

If the "Unipolar spindle" option is **not** selected, an analog voltage in the range of **-10 V** to **+10 V** is output as the setpoint.

Unipolar spindle selected

If the "Unipolar spindle" check box **is selected**, an analog voltage in the range of **0 V** to **+10 V** is output as the setpoint. The direction of rotation is then output from the ADI4, depending on the current speed setpoint, via a digital output of the ADI4:

- Direction of rotation signal for Axis 1 → Digital output X6-1, Pin 6
- Direction of rotation signal for Axis 2 → Digital output X6-1, Pin 7
- Direction of rotation signal for Axis 3 → Digital output X6-1, Pin 8
- Direction of rotation signal for Axis 4 → Digital output X6-1, Pin 9

Note

"Unipolar spindle" (or "Unipolar motor") function is not available.

Shutdown ramp

The "Shutdown ramp" parameter specifies a function that is linear with respect to time. If an error is detected in the ADI4, all ADI4 drives are slowed down to Setpoint "0" in accordance with this function.

A parameter value of "0" brings the drives to an immediate stop (braking at the current limit).

- Unit: [ms]

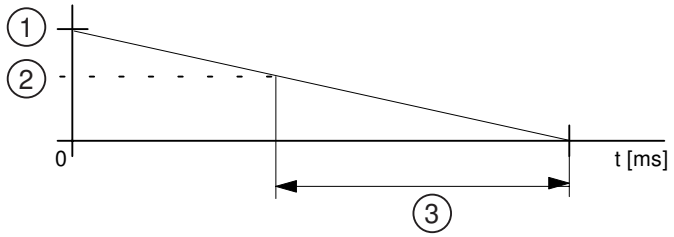

Figure 12-109 Parameter: Shutdown ramp

① Maximum setpoint
② Current setpoint
③ Parameter value: Shutdown ramp

Shutdown delay

The "Shutdown delay" parameter can be used to specify a time after which all ADI4 drives are slowed down to the setpoint "0" following a temperature alarm in the ADI4.

After the "Shutdown delay" has elapsed, the "Shutdown ramp" is taken into account.

- Unit: [s]

Tolerable sign-of-life failures

The "Tolerable sign-of-life failures" parameter specifies the number of sign-of-life failures tolerated for the DP master. If the assigned number is exceeded, the setpoint interfaces of the drives are ramped down to the value "0" using the "Shutdown ramp".

Note

Presently, the "Tolerable sign-of-life failures" parameter may only be used on values in the range of 0 to 13.

Reserved bits for fine resolution

"Additional substitute bits for fine resolution" parameter

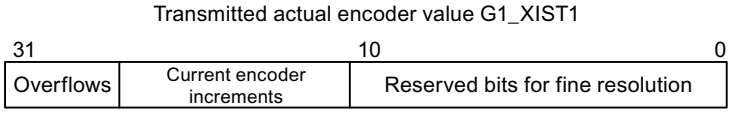
The "Additional substitute bits for fine resolution" parameter specifies the desired pulse multiplication of the encoder increments transmitted in actual encoder values G1_XIST1 and G1_XIST2.

G1_XIST1

Presently, the number of additional substitute bits for fine resolution must be set permanently to "11". This corresponds to a pulse multiplication of: $2^{11} = 2048$.

Note

Presently, the "Reserved bits for fine resolution" parameter setting must always be set to "11".



G1_XIST2

The number of additional substitute bits for fine resolution is set permanently to "1" and cannot be changed.

Absolute position values supplied in G1_XIST2 are never provided with a number of reserved bits for fine resolution. They are always supplied as they were read from the SSI encoder.

611U conformant mode

Possible settings

In 611U conformant mode, the signal source for homing of axes is no longer specified using the PROFIDrive standard message frame (STD3, encoder control word G1_STW), but rather using the additional digital output word in the PROFIBUS message frame of the ADI4 (see table "Message frame structure" in Section "Message frame type (Page 8356)").

611U conformant mode:

- Not selected
  The signal source for homing is specified via the encoder control word Gx_STW in the PROFIDrive standard message frame.
- Selected
  The signal source for homing is specified via the additional digital output word in the PROFIBUS message frame.

Digital output word

The signal sources for the homing are selected on an axis-specific basis via the following bits of the output word (see also output word in the table "Message frame structure" in Section "Message frame type"):

Table 12-56 Output word: signal sources for homing

Bit	Value	Signal source for homing
8	0	Axis 1: Zero mark of Encoder 1 (X4-1)
	1	Axis 1: **Rising** edge of External zero mark 1 (X6-2, Pin 2)
9	0	Axis 2: Zero mark of Encoder 2 (X4-2)
	1	Axis 2: **Rising** edge of External zero mark 2 (X6-2, Pin 3)

Bit	Value	Signal source for homing
10	0	Axis 3: Zero mark of Encoder 3 (X4-3)
	1	Axis 3: **Rising** edge of External zero mark 3 (X6-2, Pin 4)
11	0	Axis 4: Zero mark of Encoder 4 (X4-4)
	1	Axis 4: **Rising** edge of External zero mark 4 (X6-2, Pin 5)

If the 611U conformant mode has been assigned for an axis to be homed, the axis-specific signal for selection of the signal source must be set in the digital output word of the ADI4 from the PLC user program. This must take place prior to the request of the "Find reference mark" function in the control word.

Note

With 611U conformant mode

- For homing of an axis using an encoder zero mark and an external zero mark, the appropriate axis-specific bit must be set to 0 (encoder zero mark) in the digital output word by the PLC user program.
- The signal source for homing can be switched during operation.

Without 611U conformant mode

- Homing is always performed in relation to the zero mark of the axis.

The following sections show the basic system structure and the respective boundary conditions of the individual homing methods.

Exiting the dialog box

If the "DP Slave Properties" dialog box is exited with "OK", the data are accepted and the dialog box is closed.

Step 1: End

Step 1 of the ADI4 DP slave parameter assignment is now complete.

Homing using encoder zero mark

System structure

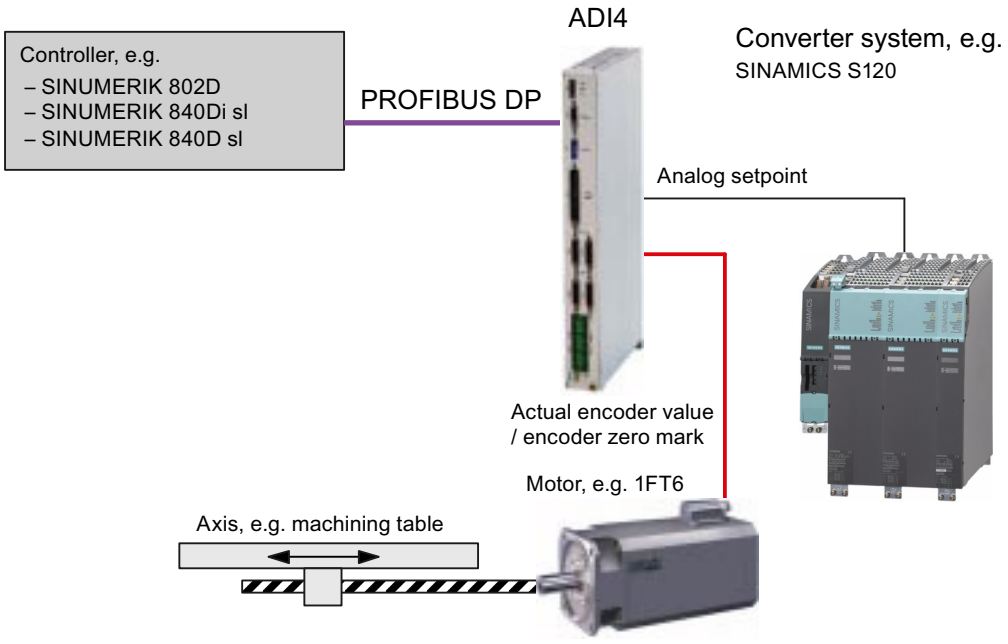


Figure 12-110 Basic system structure: Homing using encoder zero mark

Function

Once the controller requests homing, the ADI4 transmits the actual encoder value to the controller as the home position the next time it detects an encoder zero mark.

Without 611U conformant mode

No further measures are required.

With 611U conformant mode

The relevant signal for the axis to be homed (e.g. Axis 1) must be set in the digital output word:

- Digital output word:
  Bit 0: = 0 ⇒ "Axis 1: Zero mark of Encoder 1 (X4-1)"

Homing using external zero mark

System structure

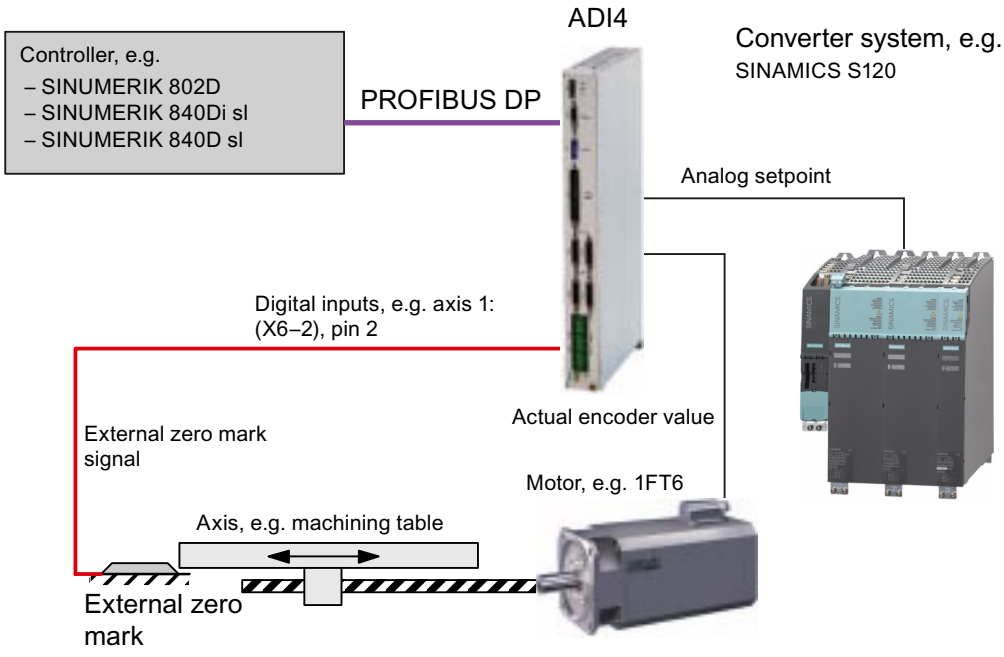

Figure 12-111 Basic system structure: Homing using external zero mark

Function

Once the controller requests homing, the ADI4 transmits the actual encoder value to the controller as the home position the next time it detects an external zero mark signal.

Without 611U conformant mode

The controller must define the relevant function via encoder control word G1_STW:

- Function 2 (Homing via rising edge of external zero mark)
- Function 3 (Homing via falling edge of external zero mark)

With 611U conformant mode

The relevant signal for the axis to be homed (e.g. Axis 1) must be set in the digital output word:

- Digital output word:
  Bit 0: = 1 ⇒ "Axis 1: Rising edge of external zero mark 1 (X6-2, Pin 2)"

Note

Homing using an external zero mark requires 611U conformant mode to be selected.

Homing using encoder zero mark and homing output cam

System structure

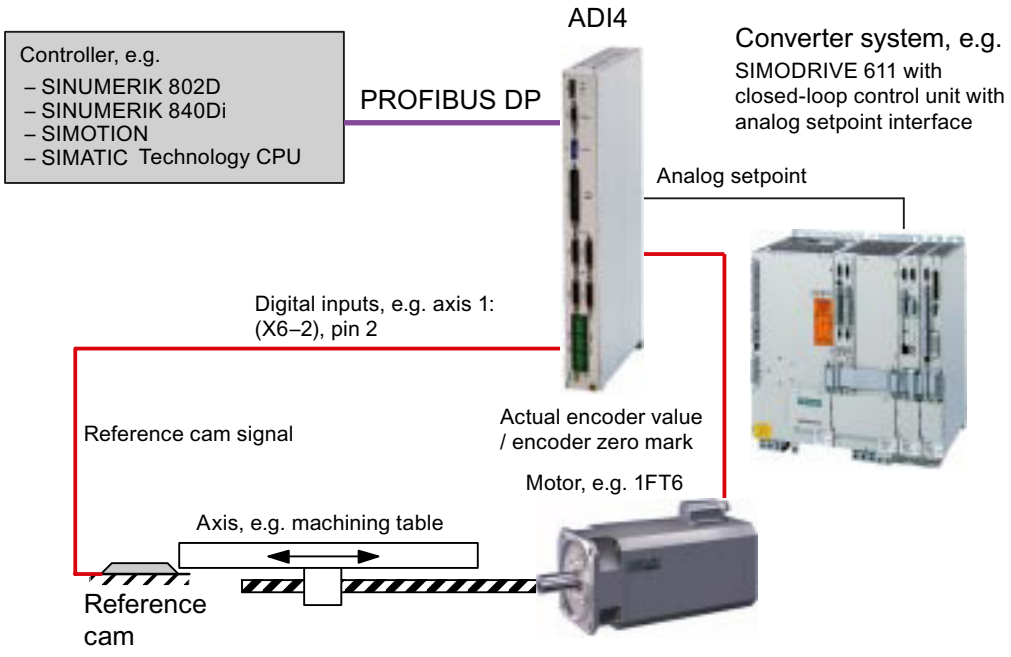

Figure 12-112 Basic system structure: Homing using encoder zero mark and external zero mark

Function

The homing output cam signal must be connected to a digital input on the ADI4 (X6-2, Pins 2 to 5). The homing output cam signal is processed in the controller as part of the homing operation.

Once the homing output cam signal is detected, the controller reduces the axis velocity to the homing approach velocity and requests the ADI4 to home to the next encoder zero mark. Once the request is detected, the ADI4 transmits the actual encoder value to the controller as the home position the next time it detects an encoder zero mark.

Without 611U conformant mode

No further measures are required.

With 611U conformant mode

The relevant signal for the axis to be homed (e.g. Axis 1) must be set in the digital output word:

- Digital output word:
  Bit 0: = 0 ⇒ "Axis 1: Zero mark of Encoder 1 (X4-1)"

Boundary conditions

Measuring input or on-the-fly measurement

ADI4 supports only measurement using a rising **or** falling edge of the measuring input. It is not possible to parameterize simultaneous measurement on a rising edge and a negative edge.

Actual speed

The actual speed value (PZD2/3: NIST_B) contained in Standard message frame 3 (see table "Message frame structure" in Section "Message frame type (Page 8356)") is not supported by the ADI4. The ADI4 always sends the value "0" as the actual speed value.

External encoder interface (encoders without an axis)

If encoders are connected to the ADI4 without at least one axis being assigned, i.e. ADI4 is used exclusively as an external encoder interface, a "Ready" signal (interface X6-1, Pin 10/11) will not be output. For information on the "Ready" signal, refer to Section "Interface (X6-1): Digital outputs (Page 8341)".

Error 20005

In conjunction with an ADI4 DP slave, the following message is displayed when the SIMOTION CPU switches from RUN to STOP mode:

- Error 20005: Device type: 1/2, log. address: x faulted. (Bit: 0, reason: 0x...)

The message can be ignored.

This message is automatically deleted by the system the next time there is a transition from STOP to RUN mode.

Homing using external zero mark

Homing always occurs at a rising edge, irrespective of which external zero mark edge (rising or falling) was selected for homing in SIMOTION.

12.5.4.6 Parameter assignment of the DP communication

Parameter assignment of the equidistant cyclic DP communication

Action steps

Once all the DP slaves have been inserted in the configuration and their function parameters have been assigned as described (Step 1), the parameters for the equidistant cyclic DP communication must then be assigned (Step 2).

Parameters are assigned to the equidistant cyclic DP communication in two steps, as well:

Step 1

- Activation of the equidistant DP cycle
- Equidistant master cyclic component T_{DX}

Step 2

- Equidistant DP cycle T_{DP}
- Master application cycle T_{MAPC}
- Actual value acquisition T_i
- Setpoint acceptance T_o

Note

When assigning parameters for DP communication, you must observe the boundary conditions applicable to the individual parameters (see the chapter "Boundary conditions (Page 8384)").

Activation of the equidistant DP cycle

Procedure

Double-click an ADI4 DP slave. In the station window of HW Config, the dialog box: "DP Slave Properties" opens.

Note

It is recommended that the equidistant DP cycle be enabled for all ADI4 DP slaves by enabling the equidistant DP cycle within the selected ADI4 DP slave, and then performing an alignment:

During an alignment, all values displayed in the "DP Slave Properties" dialog box, "Isochronous mode" tab are transferred to all DP slaves of the same type, ADI4 DP slave here, of the configuration.

Dialog: Start

Dialog: DP slave properties
Tab: Isochronous operation
Radio button: Synchronize drive to equidistant DP cycle ☑
Button: Alignment

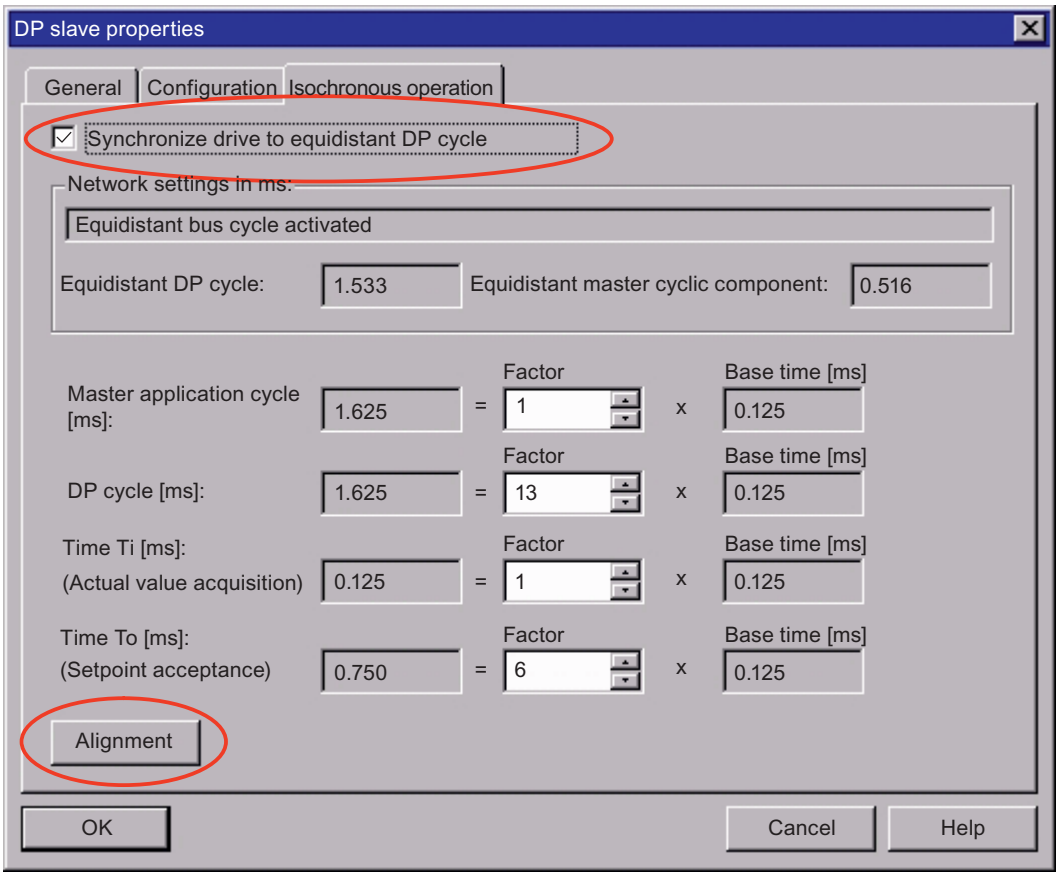

Figure 12-113 "DP Slave Properties" dialog box

Equidistant master cyclic component TDX

Procedure

Once synchronization to the equidistant DP cycle has been enabled for all DP slaves, the time required for the cyclic component of the DP communication must be recalculated.

The calculation is performed automatically by the DP master each time the equidistant bus cycle is enabled. This is performed in the following dialog box by selecting/clearing the "Activate equidistant bus cycle" check box.

Dialog: Continuation

Dialog box: DP slave properties
Tab: General
Group:: Node/Master System

Tab: Parameters

Button: Properties...
Dialog box: PROFIBUS properties
Tab: Network settings
Button: Options...
Dialog box: Options
Tab: Equidistance
1. Radio button: Activate equidistant bus cycle ☐ (deselect)
2. Radio button: Activate equidistant bus cycle ☑ (select)

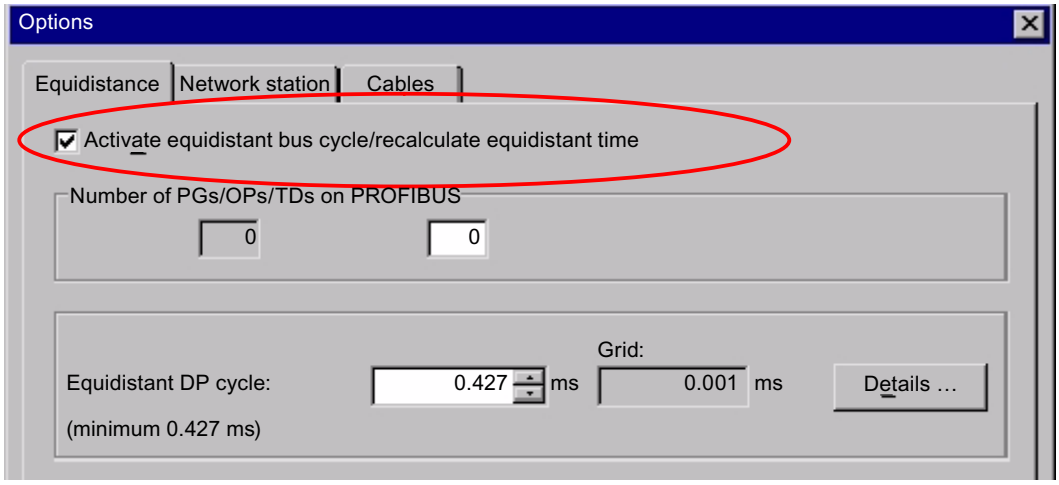

Figure 12-114 "Options" dialog box (excerpt)

Note

If there are different equidistant DP slave types (for example, SINAMICS drives, ADI4, SINAMICS I/O modules) in an S7 project, you must first perform the following two steps for each DP slave type:

1. Synchronize drive to equidistant DP cycle
2. Perform alignment

You can then continue to set the other parameters.

See also

Function parameters (Page 8361)

Equidistant DP cycle TDP

Procedure

When the cyclic component of the DP communication is calculated, the DP master automatically changes the value for the equidistant DP cycle to the minimum required time. This change must be undone by re-entering the intended value for the equidistant DP cycle.

(SINUMERIK 840D sl)

Equidistant DP cycle

For SINUMERIK 840D sl, an ADI4 module is connected via an external PROFIBUS (connection: DP1 (X126) or DP2/MPI (X136)). The DP cycle - with constant bus cycle time - of the external PROFIBUS must then be set the same as the position controller clock cycle parameterized in the NC or the equidistant DP cycle of the internal PROFIBUS.

Note

The DP cycle of the external PROFIBUS must be the same as that of the internal PROFIBUS:

Equidistant DP cycle (external PROFIBUS) = position controller cycle = equidistant DP cycle (internal PROFIBUS)

Connection to "NCU7x0.2 PN"

If an ADI4 module is connected to NCU module "NCU7x0.2 PN" then a module with the following version and higher must be used: **Article No. ...-0AA2**

Dialog: Continuation

Dialog box: Options

OK (close dialog box: Options)
OK (close dialog box: PROFIBUS properties)
OK (close dialog box: Properties - PROFIBUS interface ADI4 ...)

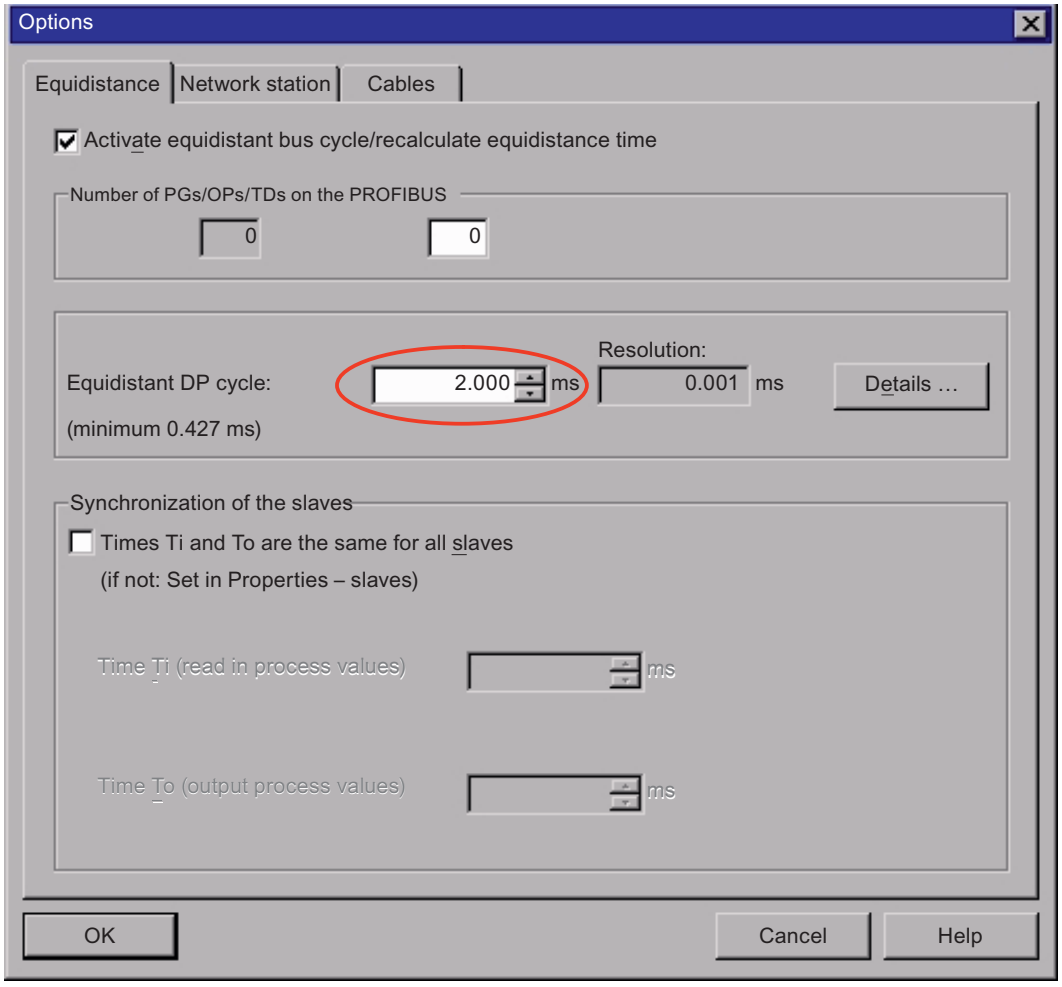

Figure 12-115 "Options" dialog box

DP cycle TDP

Procedure

In the "Factor" entry field of the "DP cycle (ms)", enter a value such that the resulting DP cycle is equal to the equidistant DP cycle.

Dialog: Start

Dialog: DP slave properties
Tab: Isochronous operation
Entry field: Factor = 16 (example value)

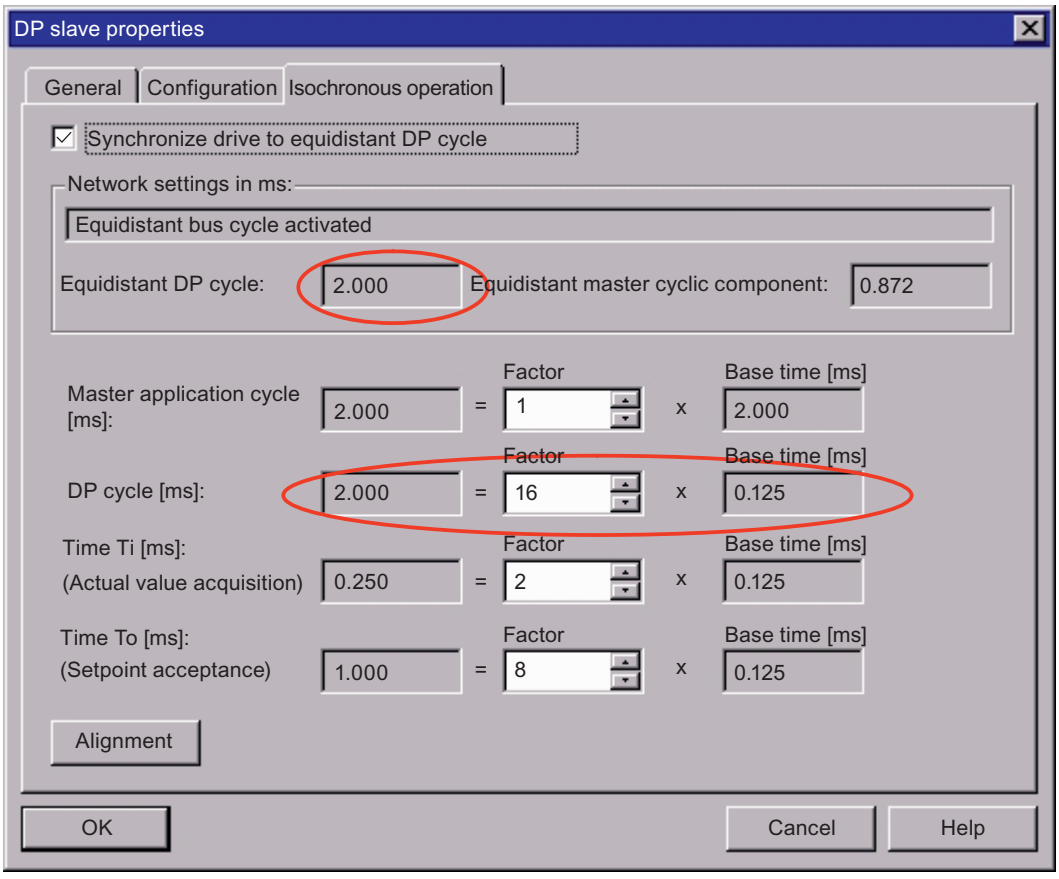

Figure 12-116 "DP Slave Properties" dialog box

Note

The DP cycle time ("DP cycle" parameter) of the ADI4 DP slave must be set to the same value as the DP cycle time setting for the DP master ("Equidistant DP cycle" parameter):

DP cycle = equidistant DP cycle

Master application cycle TMAPC

Introduction

The "Master application cycle T_{MAPC}" parameter specifies the integer ratio between the cycle time of the master application (position controller) and the equidistant DP cycle.

Note

The ratio between master application cycle T_{MAPC} and DP cycle time T_{DP} **must** be 1:1.

Procedure

In the entry field for the factor of the "Master application cycle [ms], enter a value such that the required time ratio is achieved.

Dialog: Continuation

Dialog: DP slave properties
Tab: Isochronous operation
Entry field: Factor = 1

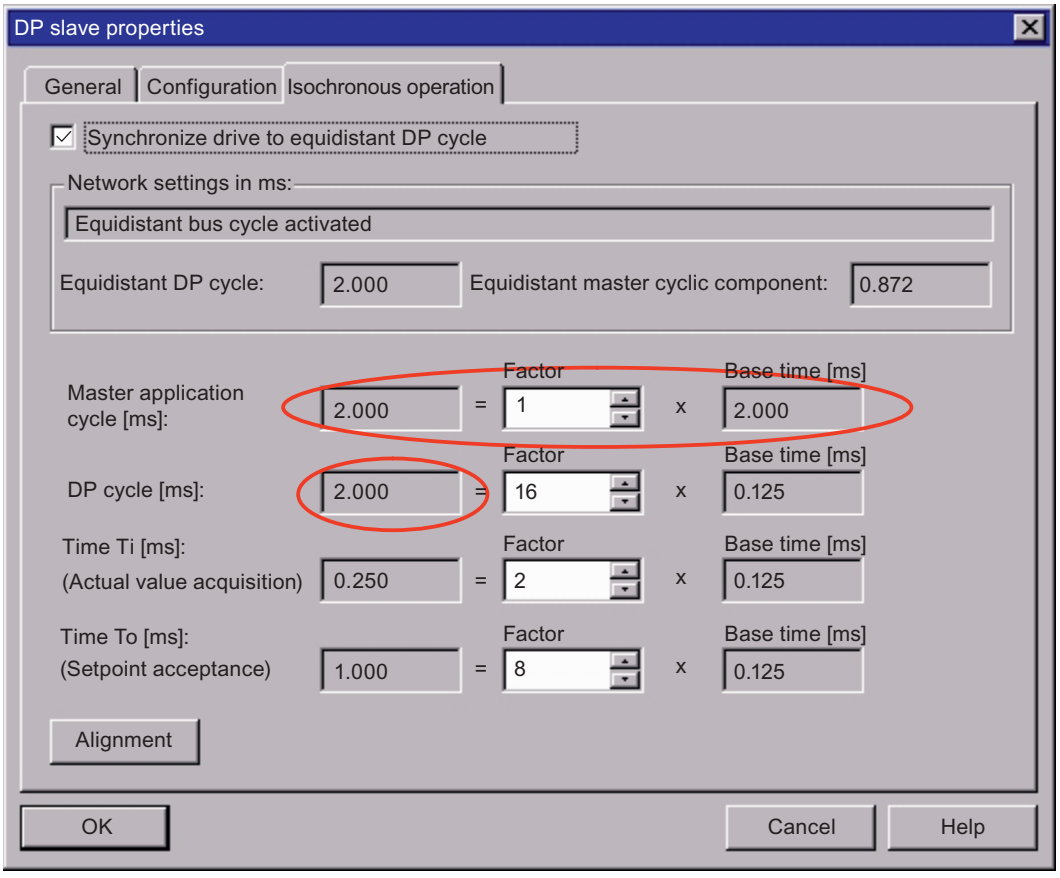

Figure 12-117 "DP Slave Properties" dialog box

Execution scheme T_{MAPC} : T_{DP} = 1 : 1

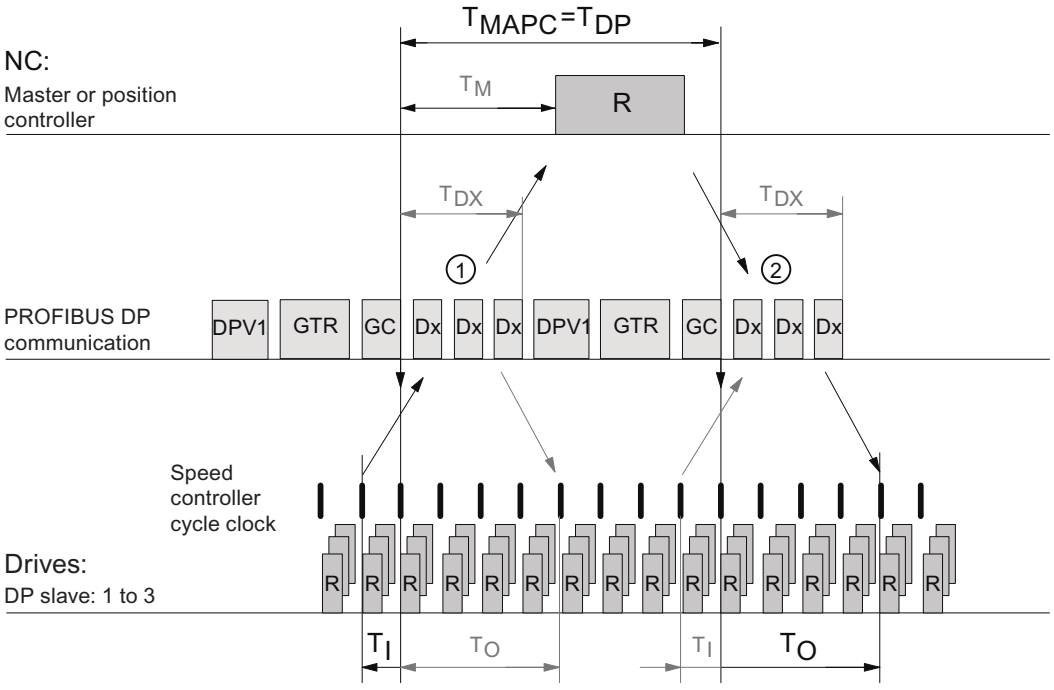

Figure 12-118 Example: Optimized DP cycle with T_{MAPC} : T_{DP} = 1 : 1

T_{MAPC}	Master application cycle: Position control cycle clock
T_{DP}	DP cycle time: DP cycle time
T_{DX}	Data exchange time: Total transfer time for all DP slaves
T_M	Master time: Offset of the start time for NC position control
T_I	Input time: Time of the actual value acquisition. The actual values are transferred to the DP master in the **next** DP cycle.
T_O	Output time: Time of the setpoint acceptance. The setpoints were generated by the DP master application in the **previous** DP cycle.
GC	Global control message frame (broadcast message frame) for cyclic synchronization of the equidistance between the DP master and DP slaves
R	Processing time for speed or position controller
Dx	User data exchange between the DP master and DP slaves
DPV1	After cyclic communication, an acyclic service is sent, if the token holding time T_{TH} has not yet been exceeded. T_{TH} is calculated by the engineering system.
GTR	GAP, TOKEN, RESERVE: GAP: An attempt is made during GAP to accept new active stations. TOKEN: The token passing is either to itself or other masters. RESERVE: The reserve is used as an "Active break" for the station to send the token to itself until the equidistant cycle expires.

① The actual values for the current DP-Cycle/position control cycle clock are transferred from the DP slave drives to the NC position controller.

② The setpoints computed by the NC position controller are transferred to the DP slave drives.

Actual value acquisition Ti

Introduction

The "Actual value acquisition T_i" parameter specifies the time when an ADI4 DP slave reads in the actual values (actual position value).

It is recommended to specify the same time for the actual value acquisition T_i for all ADI4 DP slaves. Special attention must be paid to this if axes of different ADI4 DP slaves move according to interpolation on a common path.

Procedure

Enter the required value in the entry field for the factor of the actual value acquisition.

Dialog box: Start

Dialog box: DP slave properties
Tab: Isochronous mode
Entry field: Factor = 2 (example value)

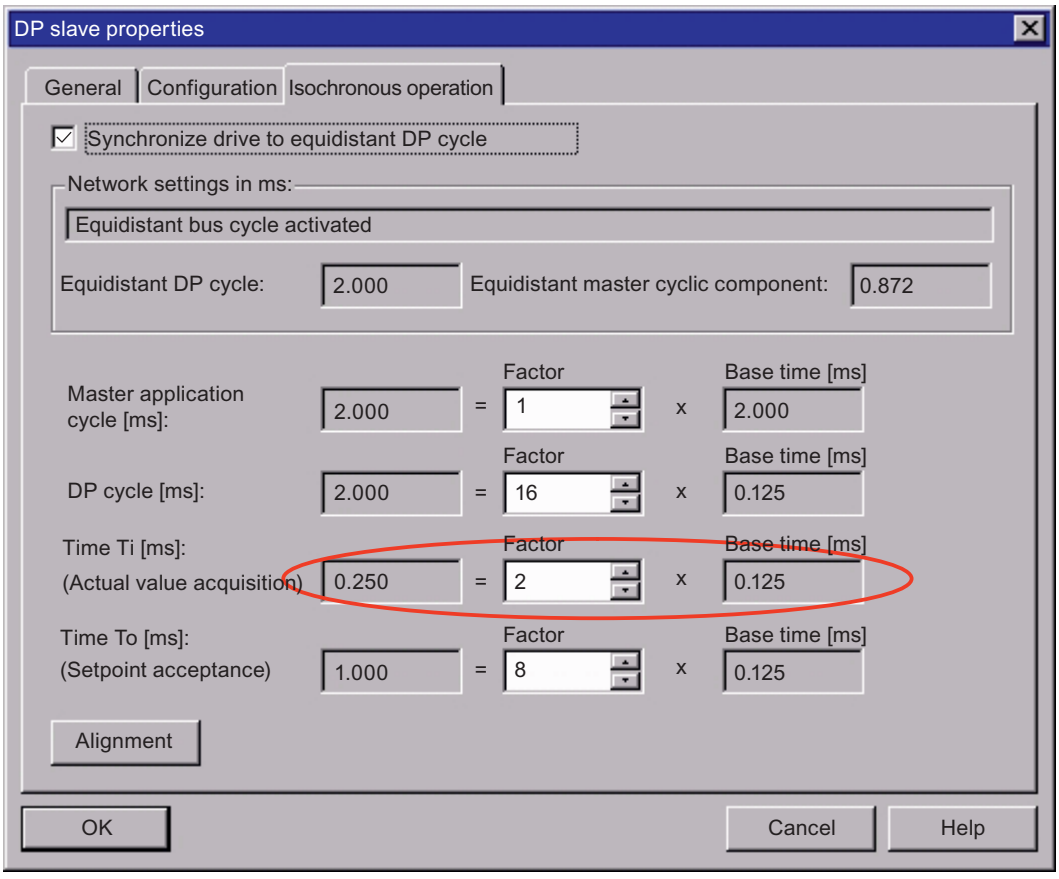

Figure 12-119 "DP Slave Properties" dialog box

Note

The following condition must be observed for the time of actual value acquisition T_i:

Base time ≤ actual value acquisition ≤ DP cycle

Possible times for Ti are: 250 µs ≤ Ti ≤ 625 µs

Setpoint acceptance To

Introduction

The "Setpoint acceptance T_o" parameter specifies the time when the ADI4 DP slave receives the speed setpoint from the position controller.

It is recommended that setpoint acceptance time T_o be the same for all ADI4 DP slaves, particularly if axes are interpolated together.

Procedure

Enter the required value in the entry field for the factor of the setpoint acceptance.

Dialog: Start

Dialog: DP slave properties
Tab: Isochronous operation
Entry field: Factor = 8 (example value)

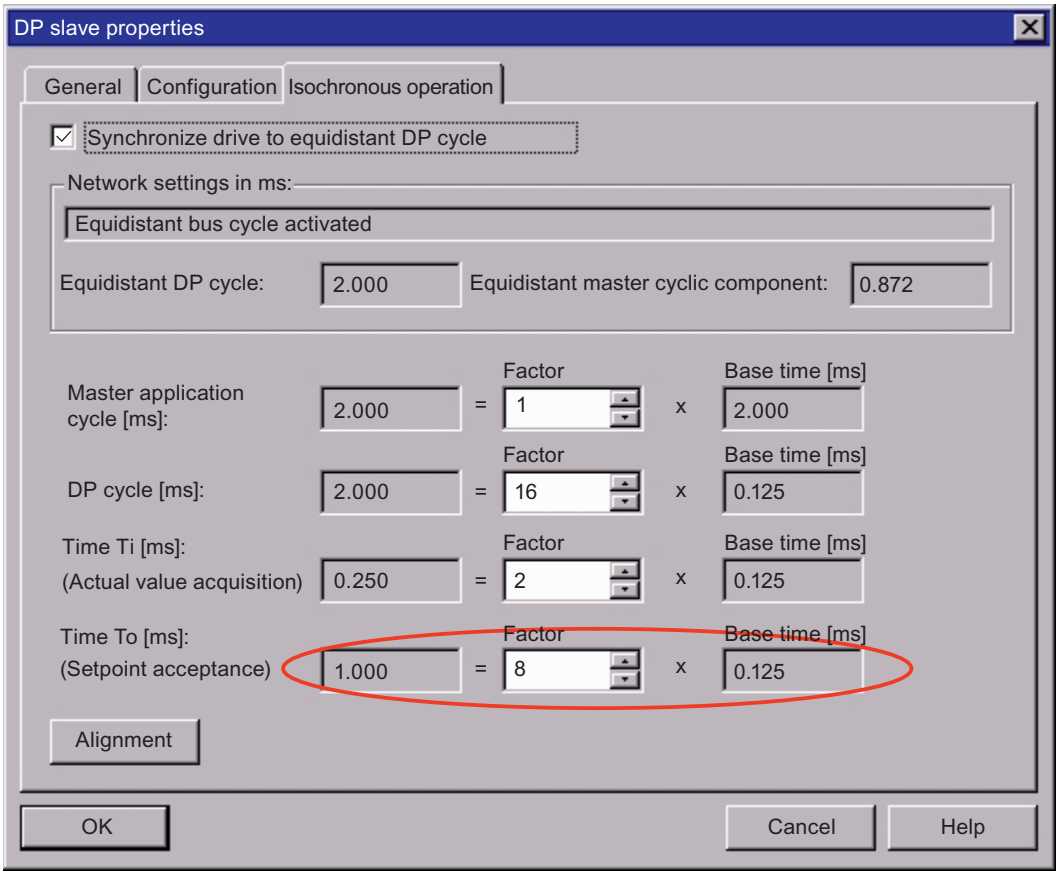

Figure 12-120 "DP Slave Properties" dialog box

Note

The following condition must be observed for the time of setpoint acceptance T_o:

Equidistant master cyclic component + base time ≤ setpoint acceptance ≤ DP cycle

Alignment

Procedure

The alignment is used to transfer the values of the current ADI4 DP slave displayed in the "Isochronous operation" tab to all the other ADI4 DP slaves of the configuration.

Dialog: End

Dialog: DP slave properties
Tab: Isochronous operation
Button: Alignment
OK

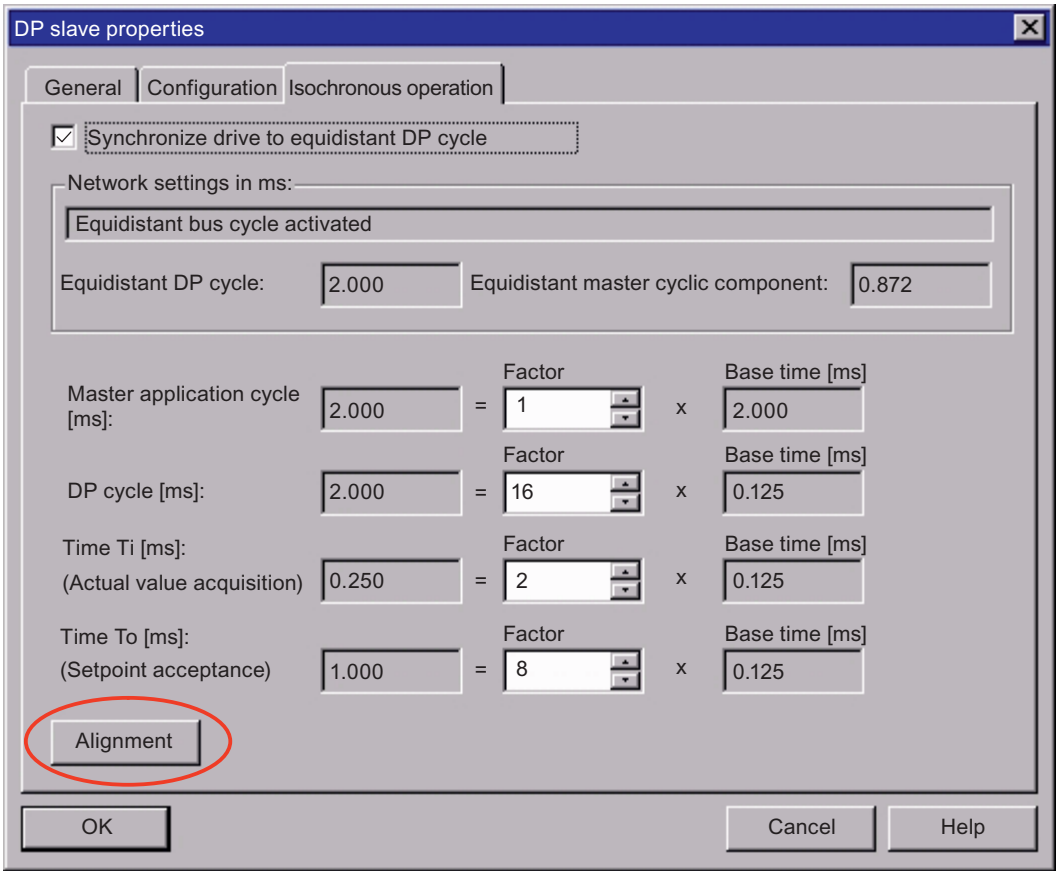

Figure 12-121 "DP Slave Properties" dialog box

Note

If an S7 project includes different equidistant DP slave types (for example, SINAMICS drives, ADI4, SINAMICS I/O modules), the following parameter settings must be made for each DP slave type as described above and an alignment must be performed:

- Equidistant DP cycle T_{DP}
- Master application cycle T_{MAPC}
- Actual value acquisition T_i
- Setpoint acceptance T_o

The alignment only transfers the values displayed in the "Isochronous operation" tab to the DP slaves **of the same** type.

The alignment concludes the parameter assignment of all ADI4 DP slaves with respect to the DP communication.

Boundary conditions

ADI4 with Article No. 6FC5 211-0BA01-0AA1 or higher

The following boundary conditions must be observed during the final parameter assignment of the isochronous DP cycle in conjunction with ADI4 with Article No. 6FC5 211-0BA01-0AA1 and higher:

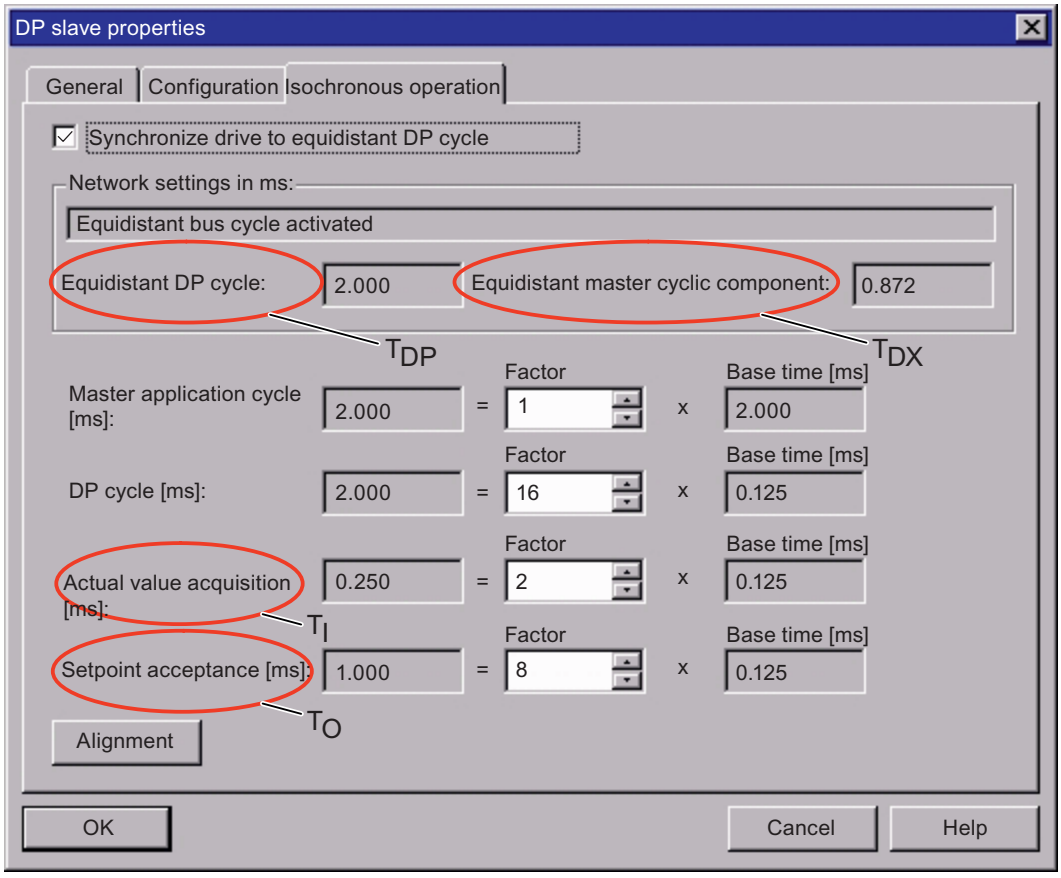

Figure 12-122 Excerpt of "DP Slave Properties" dialog box

1. Equidistant DP cycle (T_{DP})
   $\mathbf{T}_{DP} = 2 * n * 125\ \mu s$;
   with $n \geq 4$ (⇒ Minimum $T_{DP} = 1$ ms)
2. Setpoint acceptance (T_o)
   $(TDX + 125\ \mu s) \leq \mathbf{T}_o < T_{DP}$;
   with rounded variable $TDX = T_{DX}$, rounded to an integer multiple of 125 µs
3. Actual value acquisition (T_i)
   $(250\ \mu s \leq \mathbf{T}_i \leq 625\ \mu s)$ and $(\mathbf{T}_i \neq 500\ \mu s)$
4. T_i and T_o cannot be in the same 125 µs cycle clock
   $\Delta T \neq 0$; with $\Delta T = T_{DP} - \mathbf{T}_i - \mathbf{T}_o$

5. If $\mathbf{T}_o = (T_{DP} - 125\ \mu s)$
   Then for T_i, the following must apply: $\mathbf{T}_i > 3 * 125\ \mu s$
6. If $\mathbf{T}_o = (TDX + 125\ \mu s)$
   Then for $(T_i + T_o)$, the following must apply: $(\mathbf{T}_i + \mathbf{T}_o) \neq (T_{DP} + 125\ \mu s)$

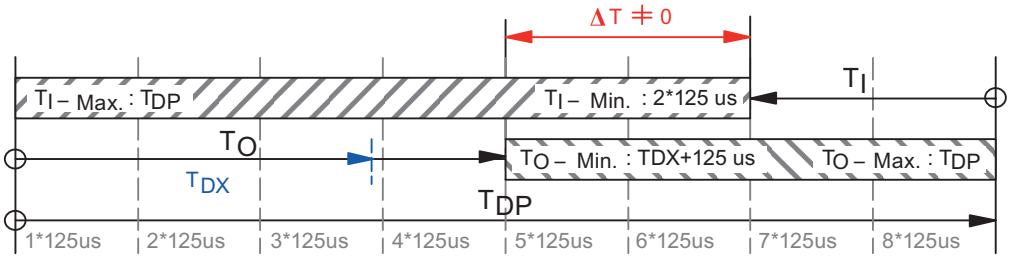

Figure 12-123 Graphic illustration of the boundary conditions

Typical parameter values

Equidistant DP cycle (T_{DP})	2.000 ms	3.000 ms
Actual value acquisition (T_i)	0.250 ms	0.250 ms
Setpoint acceptance (T_o)	1.250 ms	1.000 ms

Note

ADI4 DP slaves

- Article number: 6FC5 211-0BA01-0AA**0**
- Article number: 6FC5 211-0BA01-0AA**1** or ...-0AA**2**

exhibit a different behavior for a parameter assignment for actual value acquisition (T_i) and setpoint acceptance (T_o) deviating from the boundary conditions indicated above.

- ADI4 DP slave with Article No. ...-0AA**0**
  If parameters are assigned that deviate from the boundary conditions stated above, they are ignored by this ADI4 DP slave as the parameters have fixed internal values. The ADI4 DP slave establishes cyclic communication with the DP master using the preset values (and not the assigned parameters) without an error message.
- ADI4 DP slave with Article No. ...-0AA**1** or ...-0AA**2**
  If a parameter assignment that deviates from the boundary conditions stated above is downloaded to this ADI4 DP slave, the ADI4 DP slave does **not** establish cyclic communication with the DP master.

12.5.5 Commissioning

12.5.5.1 Wiring of drive ready signals

In order to use the S7 function block FB 401 (MC_POWER) to switch on a drive connected to the ADI4, the drive must signal its readiness. For this purpose, the ready signal of the drive must be wired with one of the ready signal inputs "Drive Ready" Axis x (DRVx_RDY), Interface (X6-2) of the ADI4.

The ready signal must continue to exist at the ADI4 input even after the drive is switched on. If the signal is cleared, the drive will stop.

Note

Drives without ready signal

If a ready signal is not available for a drive, the corresponding digital ready signal input "Drive Ready" Axis x (DRVx_RDY) of the ADI4 can be assigned statically with 24 V. The disadvantage of this is that the S7 function block FB 401 (MC_POWER) can no longer detect a drive failure. FB 401 returns the status "TRUE" at its output even after a drive failure.

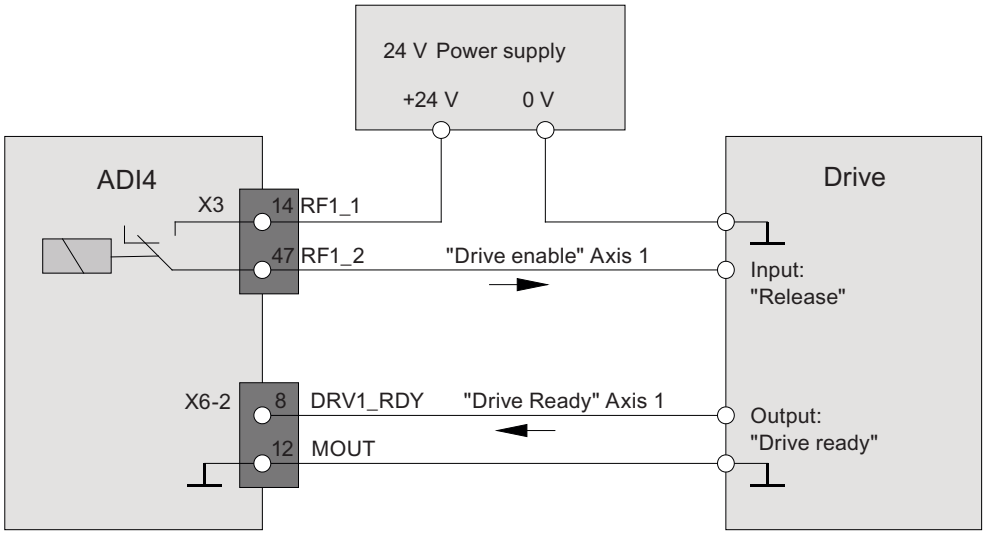

Figure 12-124 Drive enable for Axis 1 (principle)

12.5.5.2 Absolute encoder (SSI), single-turn

General

The parameter assignment of a single-turn absolute encoder (SSI) illustrated in the following example is performed using the "External encoder" technology object.

If the encoder belongs permanently to an axis, the "Axis" technology object is used to assign parameters.

Note

In conjunction with ADI4, SIMOTION only supports encoders with 13-bit and 25-bit message frames.

Encoder data

The encoder used in this example is a Siemens encoder, Article No. 6FX2 001-5HS12 with the following data:

Parameters	Value
Encoder type	Rotary
Encoder type	Cyclic absolute encoder (SSI)
Increments/revolution	4096
User data length	12
Message length	13
Message frame format	PINETREE
Actual value protocol format	GRAY

Settings in STEP 7, HW Config

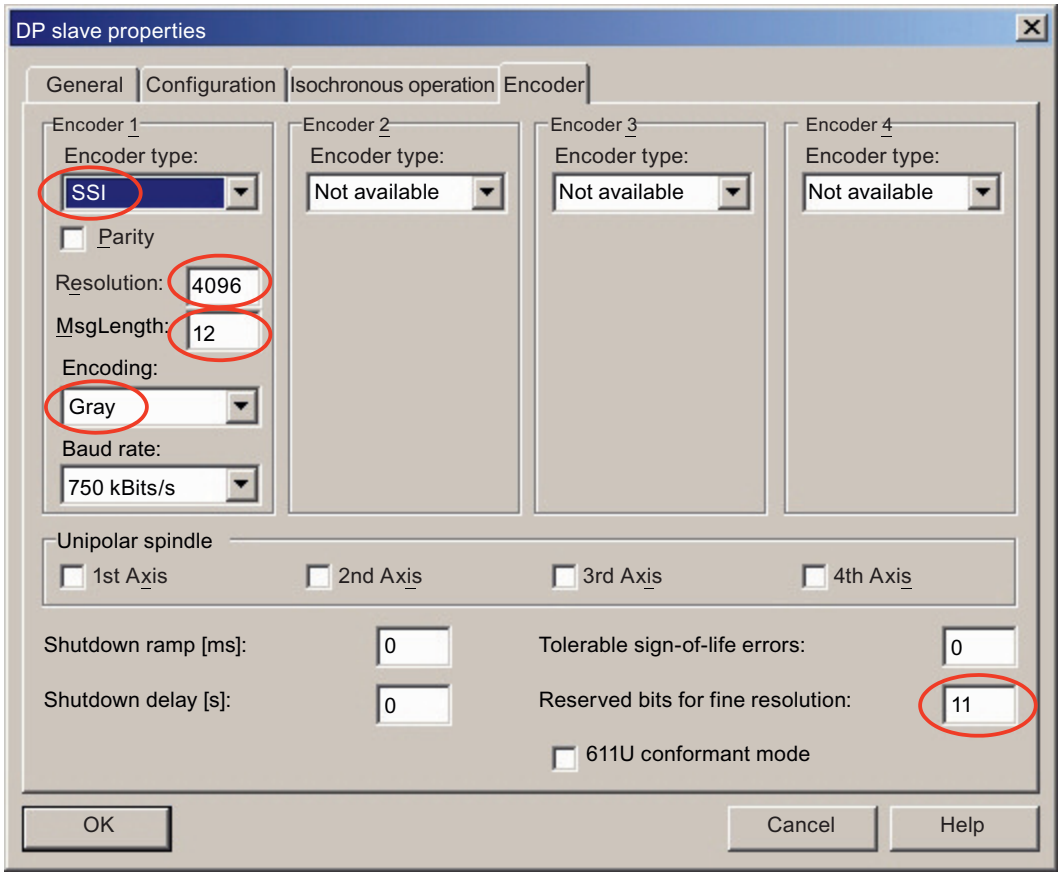

Figure 12-125 Encoder settings in STEP 7, HW Config

Settings	Value
Resolution	Encoder parameters: "Increments/revolution (resolution)"
MsgLength	Encoder parameters: "User data length"
Encoding	Encoder parameters: "Actual value protocol format"
Reserved bits for fine resolution	**Note**: The value is permanently set by ADI4.

SIMOTION/TCPU settings

After you have created a new encoder in the project navigator of SIMOTION SCOUT under "EXTERNAL ENCODERS" and have assigned the technology object parameters in the displayed dialog boxes, e.g. "Axis Type" and "Units", the encoder data must be entered in the "Encoder Assignment" and "Encoder - Data" dialog boxes.

1. Settings in the "Encoder Assignment" dialog box

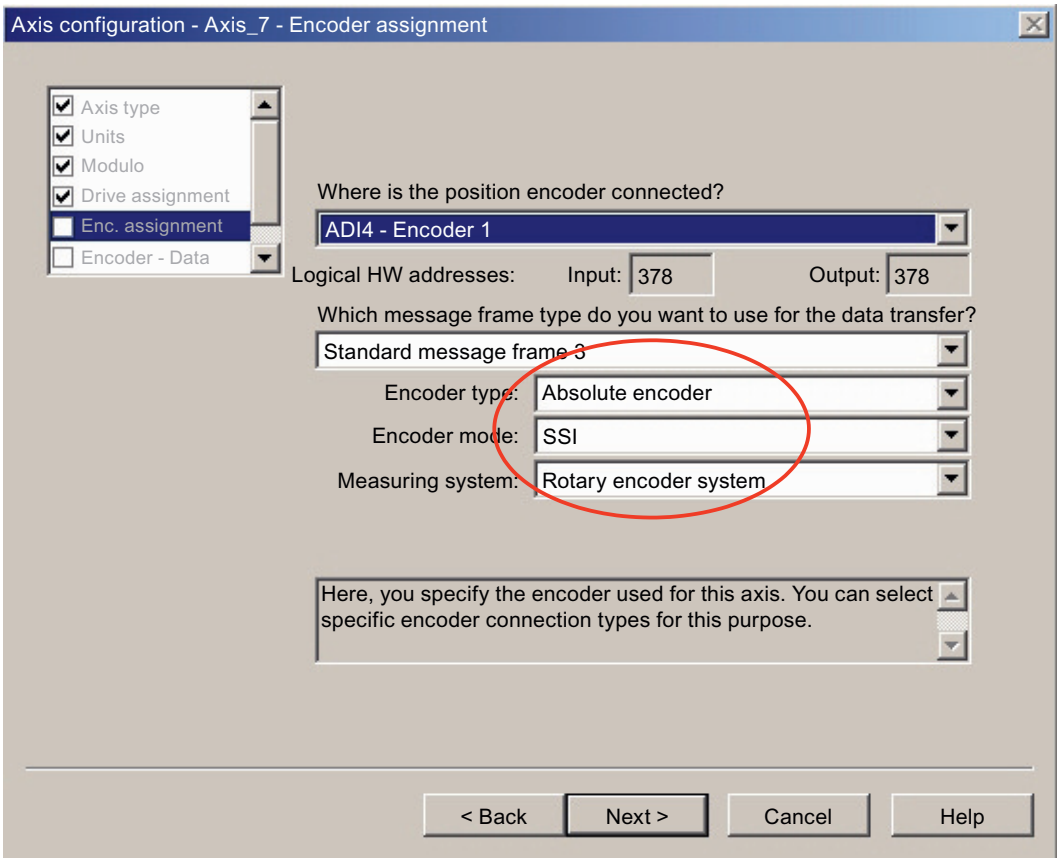

Figure 12-126 Encoder assignment settings

2. Settings in the "Encoder - Data" dialog box

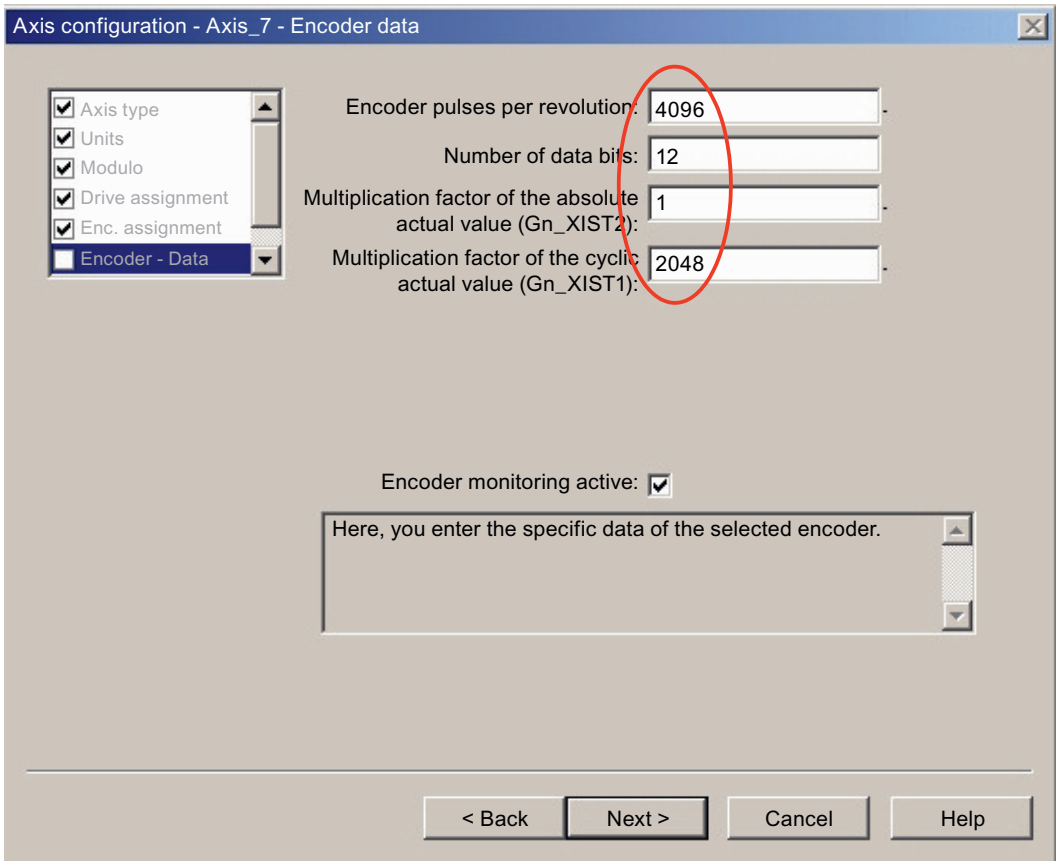

Figure 12-127 Encoder data settings

Settings:

Encoder data settings	Value
Encoder pulses per revolution	Encoder parameters: "Increments/revolution (resolution)"
Number of data bits	Encoder parameters: "User data length of the encoder"
Multiplication factor of the absolute actual value (Gn_XIST2)	1 (The absolute actual value (Gn_XIST2) is taken over directly)
Multiplication factor of the cyclic actual value (Gn_XIST1)	2^(STEP 7, HW Config: "Reserved bits for fine resolution") = 2^{11} = 2048

Overview: SIMOTION encoder parameters

Parameters: TypeOfAxis > Encoder_1 >	Value
encoderTyp	SENSOR_CYCLIC_ABSOLUT
encoderMode	SSI_MODE
encoderSystem	ROTATORY_SYSTEM
AbsEncoder > absResolution	4096
AbsEncoder > absDataLength	12
AbsEncoder > absResolutionMutiplierAbsolute	1 [1)]

Parameters: TypeOfAxis > Encoder_1 >	Value
AbsEncoder > absResolutionMutiplierCyclic	2048 [2]
[1] After the ramp-up of the controller, the absolute actual value of the encoder is read out once.	
[2] 2048 = 2^{11}; corresponds to STEP 7, HW Config: "Reserved bits for fine resolution" = 11	

12.5.5.3 Absolute encoder (SSI), multiturn

General

The parameter assignment of a multiturn absolute encoder (SSI) illustrated in the following example is performed using the "External encoder" technology object.

If the encoder belongs permanently to an axis, the "Axis" technology object is used to assign parameters.

Note

In conjunction with ADI4, SIMOTION only supports encoders with 13-bit and 25-bit message frames.

Encoder data

The encoder used in this example is a Siemens encoder, Article No. 6FX2 001-5HS24 with the following data:

Encoder parameters	Value
Encoder type	Rotary
Encoder type	Cyclic absolute encoder (SSI)
Increments/revolution	8192
User data length	25
Message length	25
Message frame format	PINETREE
Actual value protocol format	GRAY

Settings in STEP 7, HW Config

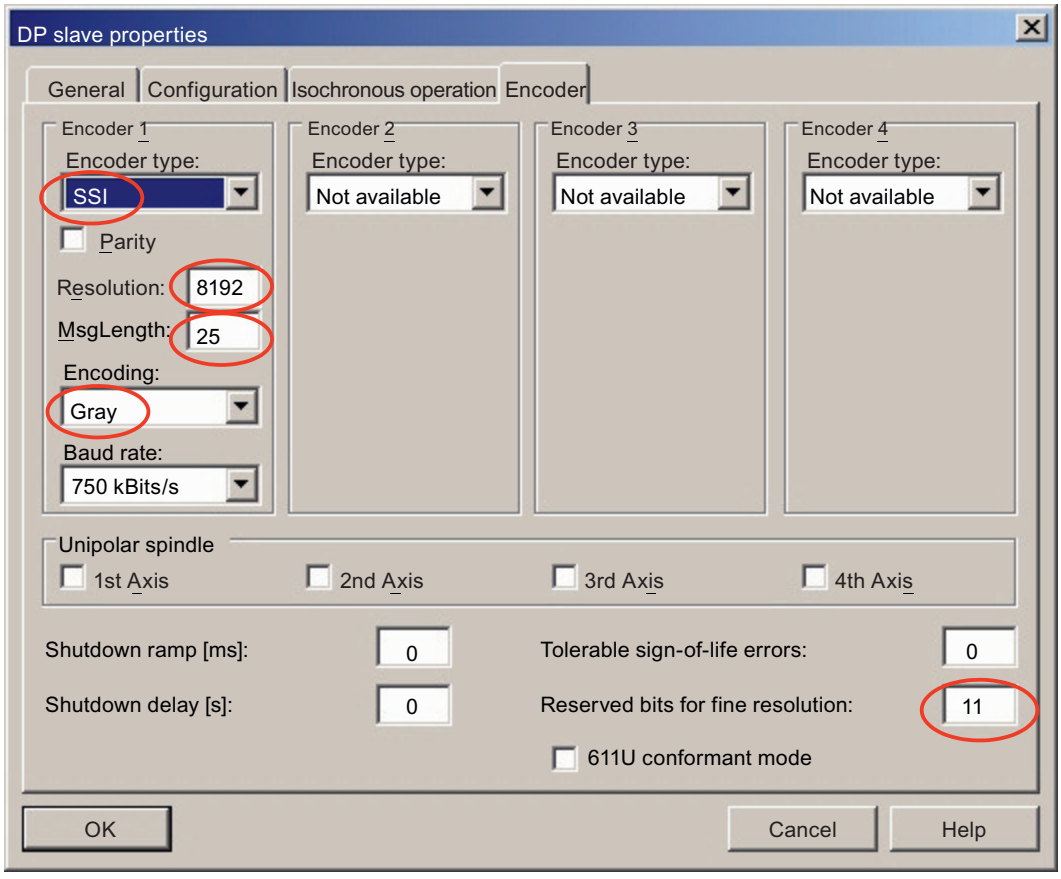

Figure 12-128 Encoder settings in STEP 7, HW Config

STEP 7 settings, HW Config	Corresponding encoder parameters
Encoder type	Encoder parameters: "Encoder type"
Resolution	Encoder parameters: "Increments/revolution (resolution)"
MsgLength	Encoder parameters: "User data length"
Encoding	Encoder parameters: "Actual value protocol format"
Reserved bits for fine resolution	**Note**: The value is permanently set by ADI4.

SIMOTION/TCPU settings

After you have created a new encoder in the project navigator of SIMOTION SCOUT under "EXTERNAL ENCODERS" and have assigned the technology object parameters in the displayed dialog boxes, e.g. "Axis Type" and "Units", the encoder data must be entered in the "Encoder Assignment" and "Encoder - Data" dialog boxes.

1. Settings in the "Encoder Assignment" dialog box

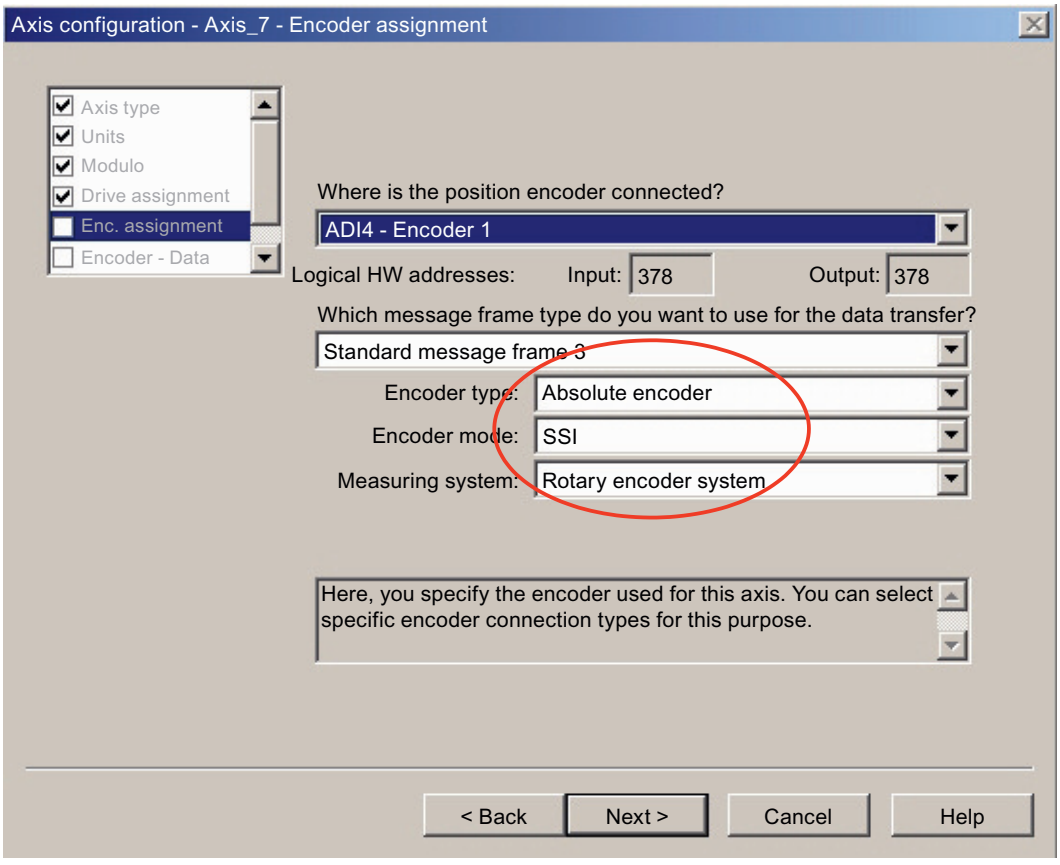

Figure 12-129 Encoder assignment settings

2. Settings in the "Encoder - Data" dialog box

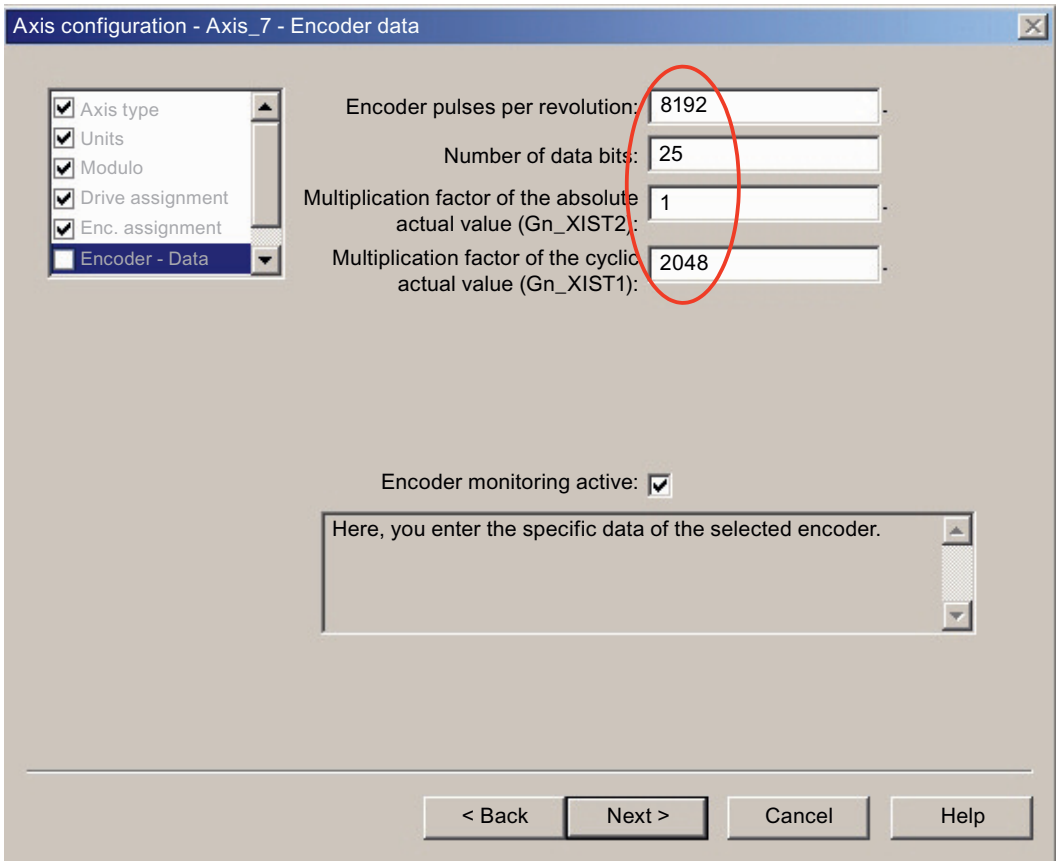

Figure 12-130 Encoder data settings

Settings:

Encoder data settings	Value
Encoder pulses per revolution	Encoder parameters: "Increments/revolution (resolution)"
Number of data bits	Encoder parameters: "User data length of the encoder"
Multiplication factor of the absolute actual value (Gn_XIST2)	1 (The absolute actual value (Gn_XIST2) is taken over directly)
Multiplication factor of the cyclic actual value (Gn_XIST1)	2^(STEP 7, HW Config: "Reserved bits for fine resolution") = 2^{11} = 2048

Overview: SIMOTION encoder parameters

Parameters: TypeOfAxis > Encoder_1 >	Value
encoderTyp	SENSOR_CYCLIC_ABSOLUT
encoderMode	SSI_MODE
encoderSystem	ROTATORY_SYSTEM
AbsEncoder > absResolution	8192
AbsEncoder > absDataLength	25
AbsEncoder > absResolutionMutiplierAbsolute	1 [1)]

Parameters: TypeOfAxis > Encoder_1 >	Value
AbsEncoder > absResolutionMutiplierCyclic	2048 [2]
[1] After the ramp-up of the controller, the absolute actual value of the encoder is read out once.	
[2] 2048 = 2^{11}; corresponds to STEP 7, HW Config: "Reserved bits for fine resolution" = 11	

12.5.5.4 Incremental encoder (TTL)

General

The parameter assignment of an incremental encoder (TTL) illustrated in the following example is performed using the "External Encoder" technology object.

If the encoder belongs permanently to an axis, the "Axis" technology object is used to assign parameters.

Note

In conjunction with ADI4, SIMOTION only supports encoders with 13-bit and 25-bit message frames.

Encoder data

The encoder used in this example is a Siemens encoder, Article No. 6FX2 001-2GB02 with the following data:

Parameters	Value
Encoder type	Rotary
Encoder type	Incremental encoder
Increments/revolution (resolution)	1024
Encoder mode	RECTANGLE_TTL

Settings in STEP 7, HW Config

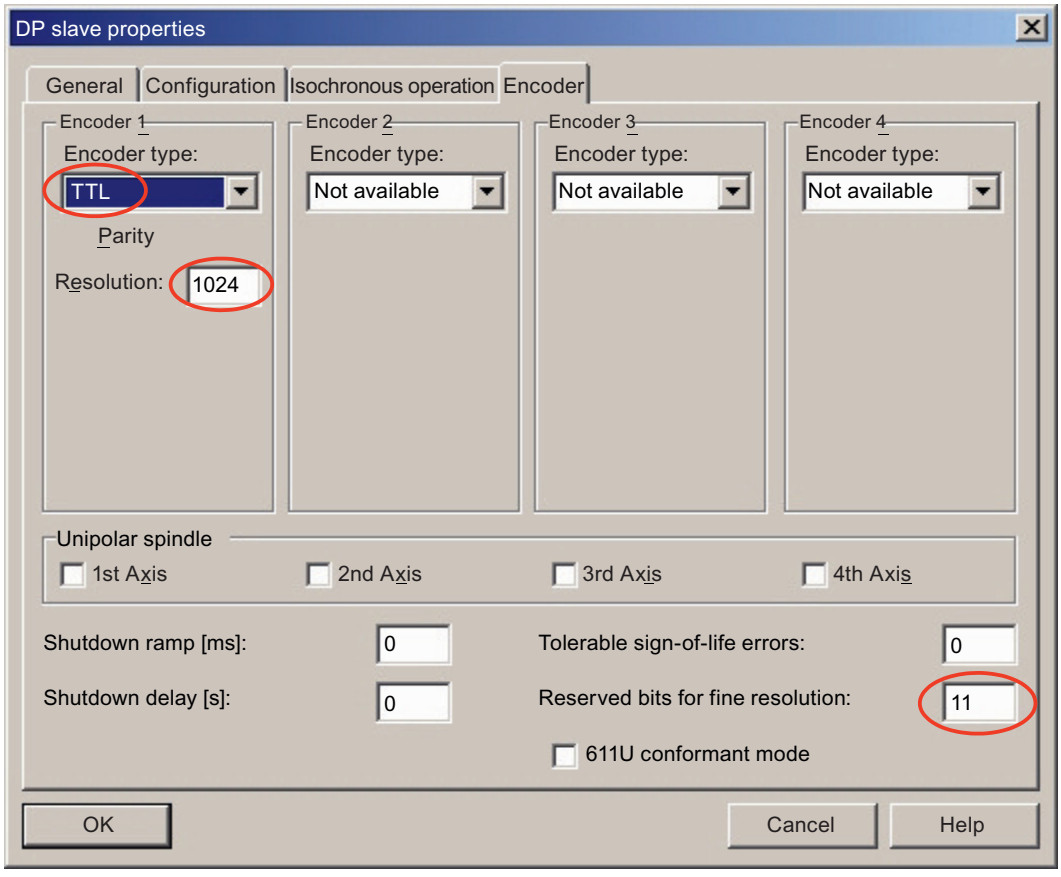

Figure 12-131 Encoder settings in STEP 7, HW Config

Settings:

Settings	
Resolution	Encoder parameters: "Increments/revolution (resolution)"
Reserved bits for fine resolution	The value is permanently set by ADI4.

Settings: SIMOTION/TCPU

After you have created a new encoder in the project navigator of SIMOTION SCOUT under "EXTERNAL ENCODERS" and have assigned the technology object parameters in the displayed dialog boxes, e.g. "Axis Type" and "Units", the encoder data must be entered in the "Encoder Assignment" and "Encoder - Data" dialog boxes:

1. Settings in the "Encoder Assignment" dialog box

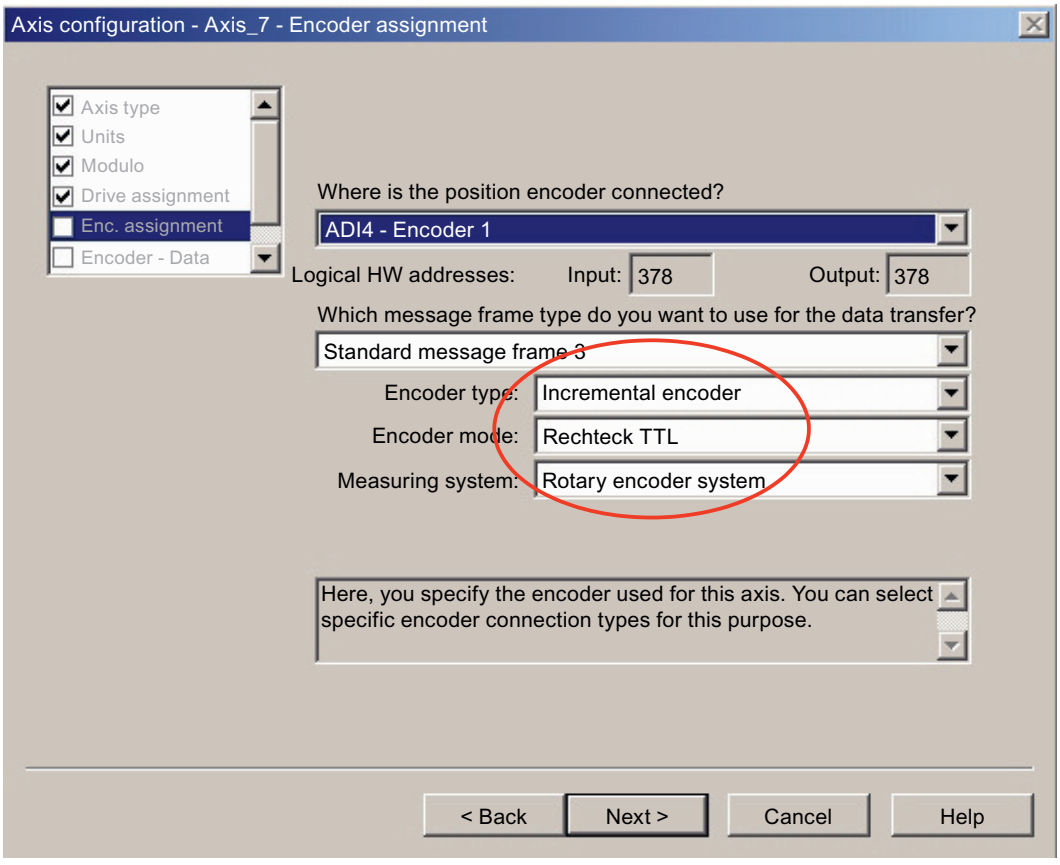

Figure 12-132 Encoder assignment settings

2. Settings in the "Encoder - Data" dialog box

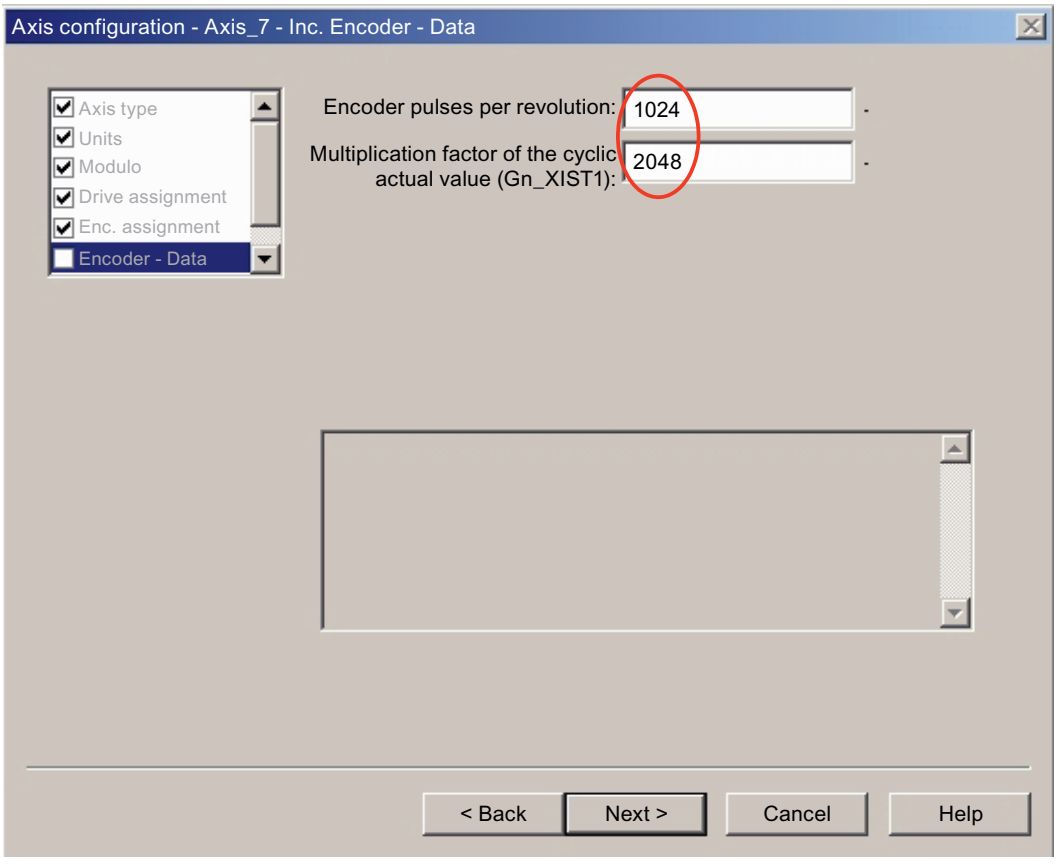

Figure 12-133 Encoder data settings

Settings:

Settings	
Encoder pulses per revolution	Encoder parameters: "Increments/revolution (resolution)"
Multiplication factor of the cyclic actual value (Gn_XIST1)	2^(STEP 7, HW Config: "Reserved bits for fine resolution") = 2^{11} = 2048

Overview: SIMOTION encoder parameters

Parameters: TypeOfAxis > Encoder_1	Value
encoderTyp	SENSOR_INCREMENTAL
encoderMode	RECTANGLE_TTL
encoderSystem	ROTATORY_SYSTEM
IncEncoder > incResolution	1024
IncEncoder > incResolutionMutiplierCyclic	2048 [1]
[1] 2048 = 2^{11}; corresponds to STEP 7, HW Config: "Reserved bits for fine resolution" = 11	

12.5.6 Standards and approvals

12.5.6.1 General rules

CE marking

CE	Our products satisfy the requirements and protection objectives of the EC Directives and comply with the harmonized European standards (EN).

Electromagnetic compatibility

Standards for EMC are satisfied if the EMC Installation Guideline is observed.

SIMOTION products are designed for industrial use in accordance with product standard DIN EN 61800-3, Category C2.

cULus Approval

c UL us	Listed component mark for United States and the Canada Underwriters Laboratories (UL) according to Standard UL 508, File E164110, File E115352, File E85972.

You can find more information on the respective device on the Internet at http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/index.htm. Enter the first 7 characters of the article number under **Keyword**. Then click **Search**.

EMC

KOREA	
이 기기는 업무용(A급) 전자파적합기기로서 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.	
For sellers or other users, please keep in mind that this device is an A-grade electromagnetic wave device. This device is intended to be used in areas other than home.	
The EMC limit values to be observed for Korea correspond to the limit values of the EMC product standard for variable-speed electric drives EN 61800-3 of Category C2 or the limit value class A, Group 1 to CISPR11. By implementing appropriate additional measures, the limit values according to category C2 or limit value class A, Group 1, are observed. For this purpose, additional measures, such as e.g., the use of an additional RFI suppression filter (EMC filter) may be necessary. In addition, measures for EMC-compliant configuration of the plant are described in this Manual and/or the "EMC Installation Guideline" Configuration Manual. Please note that ultimately it is always the label on the device that provides the decisive information on the compliance with standards.	

Declaration of conformity

The current Declaration of conformity is available on the Internet at Declaration of conformity.

12.5.6.2 Residual risks of power drive systems

Residual risks of power drive systems

The control and drive components of a drive system are approved for industrial and commercial use in industrial line supplies. Their use in public grids requires a different configuration and/or additional measures.

These components may only be operated in closed housings or in higher-level control cabinets with protective covers that are closed, and when all of the protective devices are used.

These components may only be handled by qualified and trained technical personnel who are knowledgeable and observe all of the safety instructions on the components and in the associated technical user documentation.

When assessing the machine's risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer must take into account the following residual risks emanating from the controller and drive components of a drive system:

1. Unintentional movements of driven machine components during commissioning, operation, maintenance, and repairs caused by, for example:
   - Hardware faults and/or software errors in sensors, controllers, actuators, and connection systems
   - Response times of the controller and drive
   - Operating and/or ambient conditions not within the scope of the specification
   - Condensation / conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of radio devices / cellular phones in the immediate vicinity of the controller
   - External influences/damage
2. In the event of a fault, exceptionally high temperatures, including open fire, as well as emissions of light, noise, particles, gases, etc. can occur inside and outside the converter, e.g.:
   - Component malfunctions
   - Software errors
   - Operating and/or ambient conditions not within the scope of the specification
   - External influences/damage

   Inverters of the Open Type/IP20 degree of protection must be installed in a metal control cabinet (or protected by another equivalent measure) such that the contact with fire inside and outside the inverter is not possible.

3. Hazardous shock voltages caused by, for example:
   - Component malfunctions
   - Influence of electrostatic charging
   - Induction of voltages in moving motors
   - Operating and/or ambient conditions not within the scope of the specification
   - Condensation / conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc. if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

Note

The components must be protected against conductive contamination (e.g. by installing them in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12).

Assuming that conductive contamination at the installation site can definitely be excluded, a lower degree of cabinet protection may be permitted.

For more information about residual risks of the components in a drive system, see the relevant chapters in the technical user documentation.

12.5.7 ESD guidelines

12.5.7.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

12.5.7.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

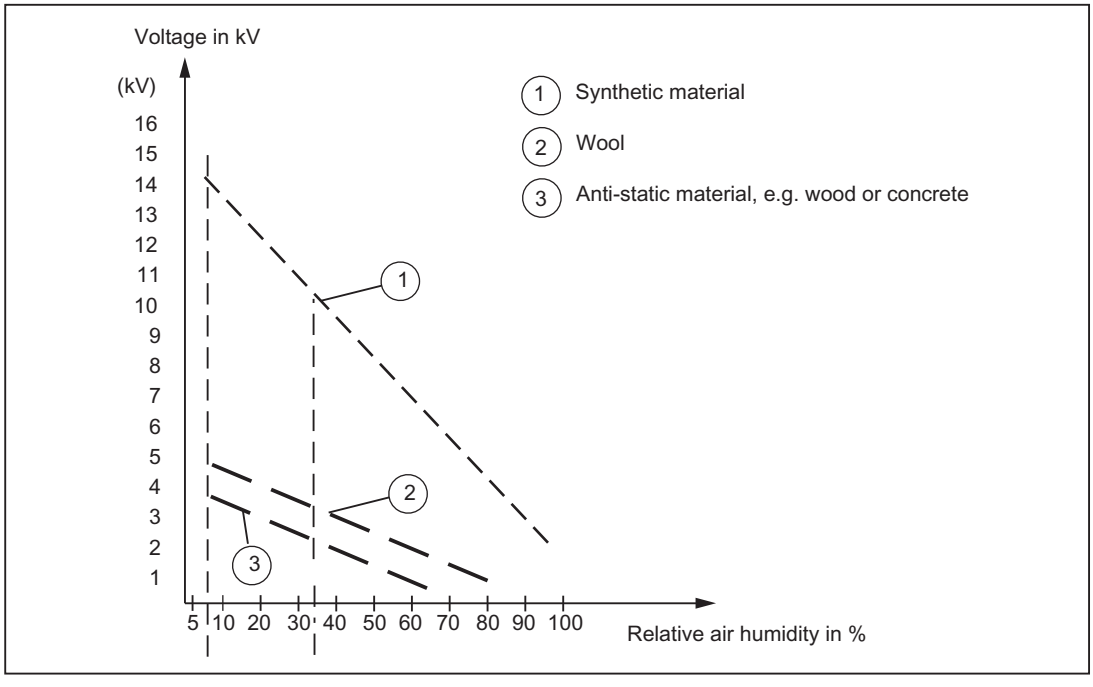

Figure 12-134 Electrostatic voltage that can accumulate on operating personnel

12.5.7.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

12.6 SIMATIC NET (Win7/Win10) for SIMOTION

12.6.1 Introduction

12.6.1.1 Overview

What is SIMOTION?

SIMOTION is an extensive system for the automation of production machines focusing on motion control.

SIMOTION comprises:

- SIMOTION SCOUT,
  An engineering system for creating a project by:
  - Configuring, programming, parameter assignment
  - Graphical or text-based programming
  - Project download to SIMOTION P, C, D

  The project also contains the hardware configuration and user data.
- SIMOTION Kernel
  A kernel for various HW platforms.

What is SIMATIC NET?

SIMATIC NET provides an OPC server as a standard component that enables access to the most diverse communication partners via the open OPC interface.

For a detailed description of SIMATIC NET, please refer to the current documentation CD "SIMATIC NET Manual Collection".

Which functionality is provided by SIMATIC NET for SIMOTION?

SIMATIC NET for SIMOTION provides:

- Access via OPC Data Access, enabling the user to read and write variables of a SIMOTION device.
- OPC Alarms and Events which can be used to receive alarms and events of a SIMOTION device.
- Gateway configuration.
- A SIMOTION OPC File Manager for the conditioning of network information relating to several SIMOTION SCOUT projects so that they can be simultaneously processed by the SIMATIC NET OPC server.

12.6.1.2 Schematic diagram at the design stage

Overview of design stage

The figure below exemplifies an arrangement of the relevant software for the creation of an OPC Client application on an engineering PC/PG.

During the design stage, there is no communication between the PG/PC and the SIMOTION device (OFFLINE mode). A connection is not required.

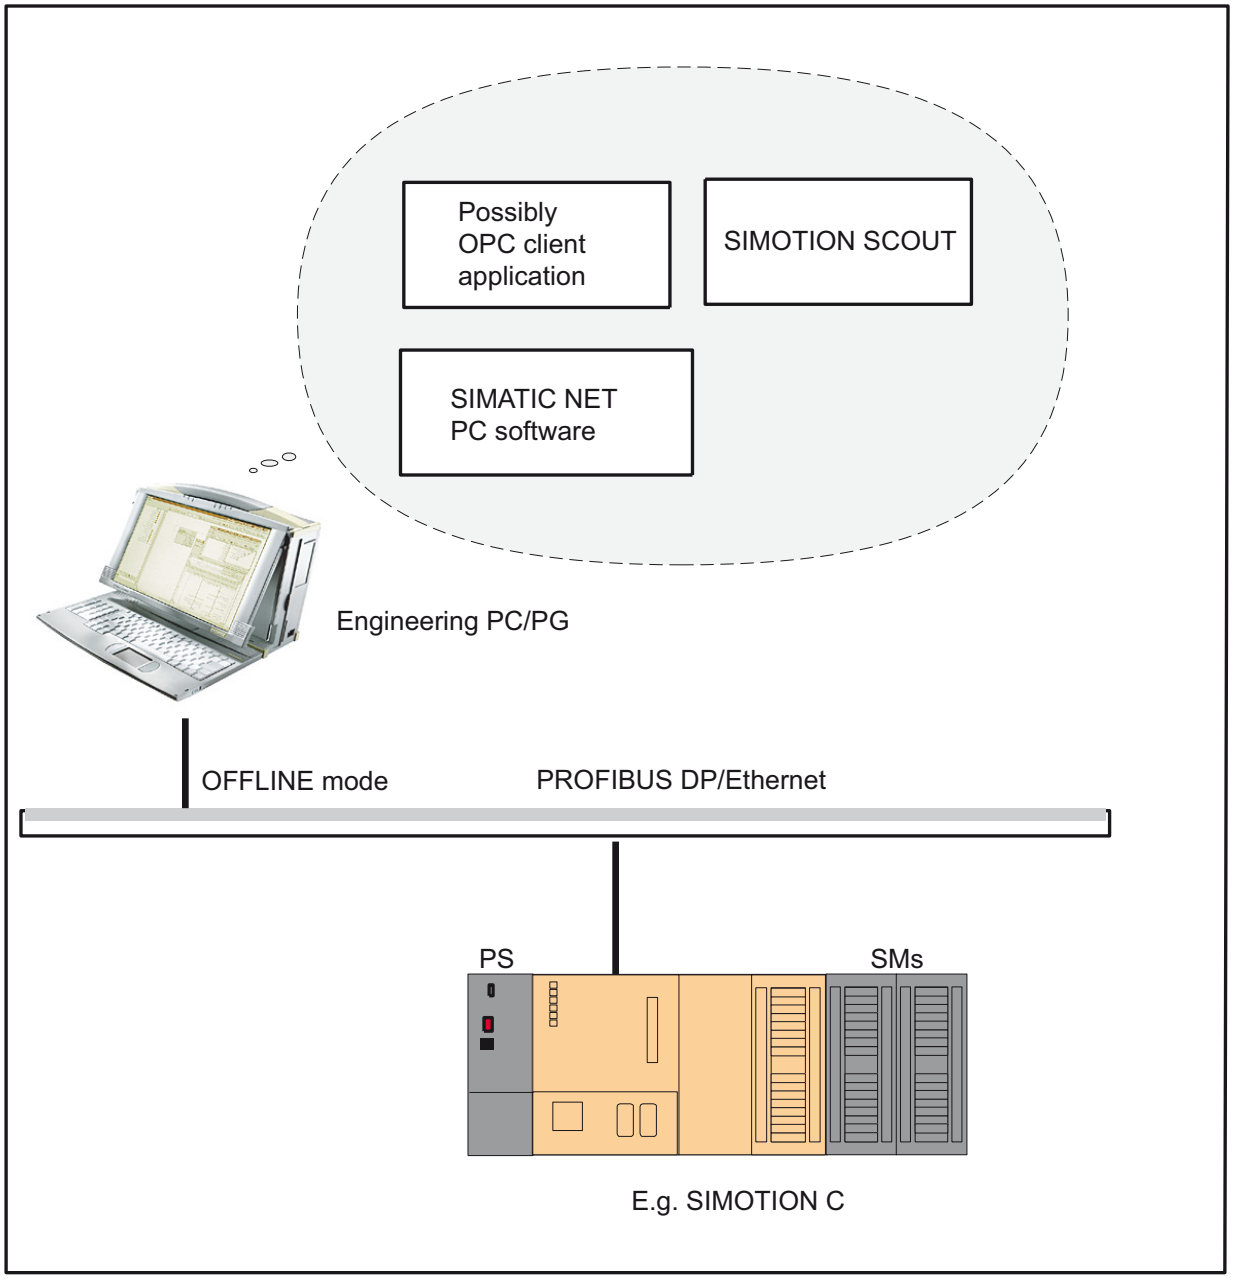

Figure 12-135 Design stage overview (example)

12.6.1.3 Schematic diagram at runtime

Runtime overview

The following figure illustrates the arrangement of an OPC Client with the relevant software on an HMI PC, the kernel and the user data on the SIMOTION device during runtime.

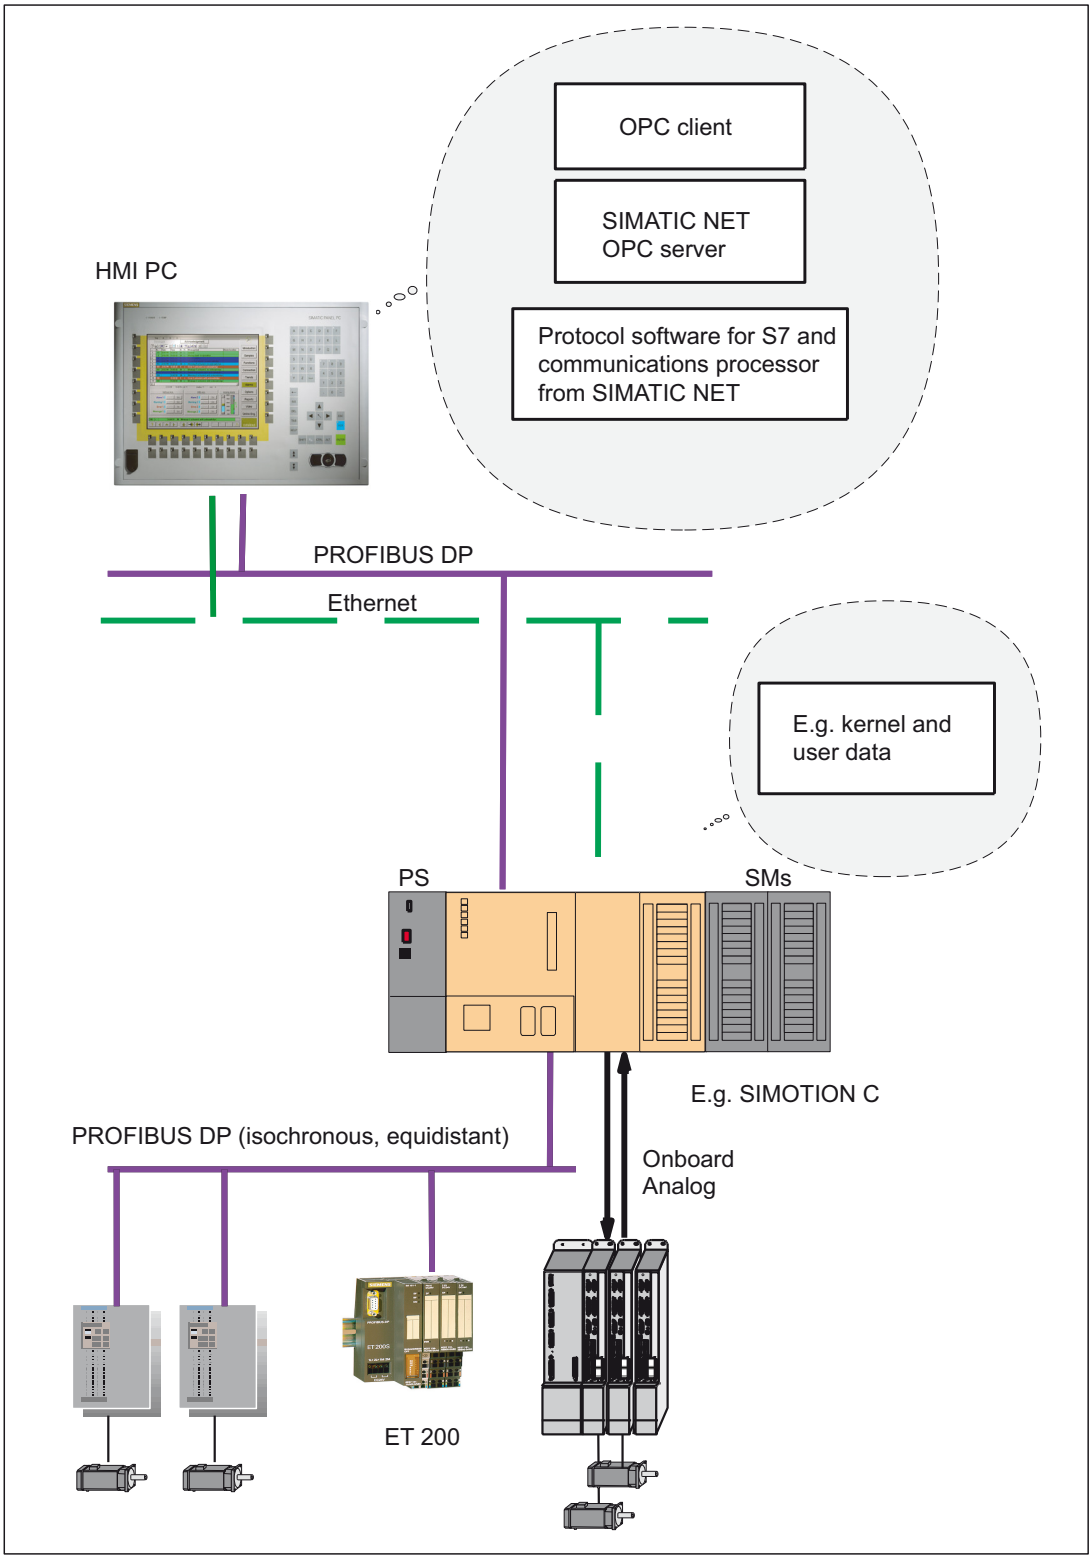

Figure 12-136 Overview at runtime (example)

12.6.2 Installation Guide

Note

This "SIMATIC NET (Win7/Win10) for SIMOTION" Product Information, Edition 08/2018, is valid for Windows® 7 64-bit and Windows® 10 64-bit operating systems.

The "SIMATIC NET (Win7/Win8.1) for SIMOTION" Edition 12/2014 is valid for Windows® 7 32-bit and 64-bit and Windows® 8.1 32-bit and 64-bit operating systems.

The "SIMATIC NET (XP/Win7) for SIMOTION" Edition 05/2013 is valid for Windows® XP and Windows® 7 32-bit and 64-bit operating systems.

The "SIMATIC NET for SIMOTION" Product Information, Edition 05/2009, is valid for Windows® 2000 and Windows® XP operating systems.

12.6.2.1 Hardware and software requirements at the design stage

Hardware requirements at the design stage

Configuration	Minimum requirement
Processor	Intel Pentium III or compatible, 1 GHz
Main memory	512 MB RAM
Screen resolution	1024 x 768 pixels

Software requirements at the design stage

- as of SIMOTION SCOUT V4.2, Windows® 7 32-bit
- as of SIMOTION SCOUT V4.3, Windows® 7 64-bit
- as of SIMOTION SCOUT V5.2, Windows® 10 64-bit

The installation requirements for the product are described in the SIMOTION and SIMATIC NET documentation (SIMATIC NET Manual Collection).

12.6.2.2 Hardware and software requirements at runtime

Hardware requirements at runtime

The hardware requirements of SIMATIC NET as of Version 13 apply.

Software requirements at runtime

- Client/Server
  - as of Windows® 7 64-bit or Windows® 10 64-bit according to the compatibility list **http://support.automation.siemens.com/WW/view/de/18857317**
  - SIMATIC NET PC software as of Version 12 and higher

  SIMOTION C
  - SIMOTION Kernel (kernel included with product shipment)
- SIMOTION P
  - SIMOTION Kernel (kernel included with product shipment)
- SIMOTION D4xx
  - SIMOTION Kernel (kernel included with product shipment)

12.6.2.3 Required licenses

Licenses dependent on communications path

Depending on the communication path used for OPC communication with SIMOTION RT, you will require one of the following SIMATIC NET licenses:

For communication with SIMOTION RT via Ethernet:

- SOFTNET-IE S7 V15 software for S7-, S5-comp. communication, OPC, PG/OP communication (DVD): 6GK1704-1CW15-0AA0
- SOFTNET-IE S7 V15 software for S7-, S5-comp. communication, OPC, PG/OP communication (download): 6GK1704-1CW15-0AK0
- SIMATIC NET SOFTNET-IE S7 LEAN V15; SW for S7-, S5-comp. communication, OPC, PG/OP communication (DVD): 6GK1704-1LW15-0AA0
- SIMATIC NET SOFTNET-IE S7 LEAN V15; SW for S7-, S5-comp. communication, OPC, PG/OP communication (download): 6GK1704-1LW15-0AK0

For communication with SIMOTION RT via PROFIBUS:

- SOFTNET-PB S7 V15 software for S7 communication incl. FDL with OPC server: 6GK1704-5CW15-0AA0
- CP 5711 communications processor USB adapter (USB V2.0): 6GK1571-1AA00

12.6.3 Communication and Handling

12.6.3.1 Fundamental procedures

Overview

Some preparation is necessary for establishing a communication between the OPC Server for SIMATIC NET and a SIMOTION device.

Basically, you must:

Table 12-57 Fundamental procedures

When?	Step	Procedure	Comment
Design stage/ runtime	1	Configure the SIMATIC NET PC software and communications processor.	See the section titled "Configuring the OPC Server/SIMOTION device interface at runtime" (Page 8411)
Design stage	2	Create a project with SIMOTION SCOUT for the SIMOTION device.	See SIMOTION SCOUT operating guide

When?	Step	Procedure	Comment
Design stage	3	Export OPC data.	See the sections titled "Exporting OPC data during the design stage" (Page 8415) and "How is a new OPC configuration enabled when an OPC client is operating?" (Page 8432)
Design stage	4	If you have configured more than one network, you have to configure routing between these networks after file export in SIMOTION SCOUT.	See the section titled "Configuring routing with SIMOTION SCOUT" (Page 8418)
Design stage	5	If there are several projects, you must configure and integrate them with the SIMOTION OPC File Manager.	See the section titled "SIMOTION OPC File Manager" (Page 8422)
Design stage	6	Transfer/copy the exported data to the HMI PC.	See the section titled "Data transfer to the OPC client" (Page 8422)
Design stage	7	Create a Client application based on OLE/COM-DCOM.	For example in Visual Basic
Design stage	8	Download the project to the SIMOTION device.	See SIMOTION SCOUT operating guide

12.6.3.2 Configure the OPC Server/SIMOTION device interface at runtime

Storage paths for export files

Introduction

The runtime behavior of SIMATIC NET is controlled with two parameter files (see "OPC data export during the design stage" (Page 8415)).

Storage paths

The runtime environment looks for the parameter files on the following paths:

- OPC_AE.xml:
  Prior to SIMATIC NET 2007 the file could be found in the following directory:
  "<SIMATIC NET installation directory>\SIMATIC.net\opc2\bins7\simotion\xml\".
  As of SIMATIC NET 2007, SIMATIC NET makes a distinction between the following two installation directories:
  - Installation directory for programs
  - Installation directory for data
    The installation directory for data is identified from the registry using the key "HKEY_LOCAL_MACHINE\SOFTWARE\SIEMENS\SIMATIC_NET\General\Paths", value "SINEC_DataPath".
    OPC_AE.xml must be stored in this installation directory inside the subdirectory \opc2\bins7\simotion\XML\.
    Accordingly, the full path looks like this:
    "<Installation directory for data>\opc2\bins7\simotion\XML\OPC_AE.xml"
- Symbol file OPC_DATA
  We recommend storing OPC_DATA in the same directory.

File name extension

Note

File name extension

The file name extension of the "OPC_DATA" file (SSD, STI, ATI) depends on the version of SIMOTION SCOUT.

Additional note

Note

The "User Data" folder has the "System Folder" property and may be hidden.

The folder can be shown by selecting the menu command "Tools > Folder Options..." in the Windows Explorer.

Configuring the interface for SIMOTION C/SIMOTION D4xx

Procedure

In order to establish a connection between an HMI PC and SIMOTION C/SIMOTION D4xx, you must carry out the following steps to configure the interface:

Table 12-58 Configuring the interface

Step	Procedure
1	Install a PROFIBUS or Ethernet communication module (e.g. CP5611) in the PC. Install the SIMATIC NET PC software.
2	Call the configuration tool for the PC station by clicking the menu item *Start->Siemens Automation->SIMATIC->SIMATIC NET->Communication settings*. Set the PC properties as indicated on the following pages. 1. Navigate to *SIMATIC NET configuration->OPC settings->Symbols*. 2. In the "Active symbol files" section, click the down arrow. – If you want to use "OPC Data" and "OPC Alarms and Events" or just "OPC Data," enter the file name of the "OPC_DATA" symbol file (see the note at "File name extension" (Page 8411)) in the "File name" field and click the "Browse" button to select the directory *"<Installation directory for data>\opc2\bins7\simotion\xml\"*. (The directory that you used last is always offered for selection by default.) Select the following file: – OPC_DATA (see the note at "File name extension" (Page 8411)) The folder has the "System Folder" property and may be hidden. The OPC server must be exited during the selection of the file. 3. In the "Additional settings for SIMOTION" section, select the communication module (e.g. "CP5611 (PROFIBUS)"). 4. Click the "Apply" button to close the dialog box. 5. In the "OPC protocol selection" dialog box, select the "S7" and "OPC UA" protocols and deselect all protocols that are not required. 6. Complete the settings for the SIMATIC NET OPC server with "Apply".

Note

If project data is changed in SIMOTION SCOUT after the export of the symbol file, you must re-export the data (consistency).

See also

OPC alarms and events for SIMOTION (Page 8430)

Configuring an interface on SIMOTION P

Procedure

In order to establish a connection between an HMI PC and SIMOTION P, you must carry out the following steps to configure the interface:

Table 12-59 Configuring the interface

Step	Procedure
1	The PROFIBUS card and the SIMATIC NET PC software are included in the product shipment.
2	Call the configuration tool for the PC station by clicking the menu item *Start->SIMATIC->SIMATIC NET->Settings->Configuration console*. Set the PC properties as indicated on the following pages. 1. Navigate to *Applications->OPC Settings->Symbols*. 2. Click the "Edit List" button in the "Symbols" dialog. The dialog window "Manage Symbol Files" is displayed. If you want to use "OPC Data" and "OPC Alarms and Events" or just "OPC Data", enter the file name of the symbol file "OPC_DATA" (see the note under "File name extension" (Page 8411)) in the field "File name" and click "Browse" to select the directory *"<Installation directory for data> \opc2\bins7\simotion\xml"* (The directory that you used last is always offered for selection by default.) Select the following files: – OPC_AE.XML – OPC_Data.idl – OPC_DATA (see the note under "File name extension" (Page 8411)) The folder has the "System Folder" property and may be hidden. 3. Exit the dialog "Manage Symbol Files" by clicking "OK" and save the files with "Apply". 4. In the "Select OPC Protocol" dialog select the S7 protocol and deselect all of the other protocols which you don't need. 5. Click "Finish" to exit the installation setup for the SIMATIC NET OPC Server.

Note

During the installation on the SIMOTION P, the access point **CP_SM_1**: must be connected to the **PC internal (local)** at "Configuration Console" after the configuration of the interface!

This access point can be set in the menu item

Start->SIMATIC->SIMATIC NET->Settings->Configuration Console.

Note

With SIMOTION V3.1 and higher, communication via **PC internal (local)** is set as default.

OPC alarms and events for SIMOTION (Page 8430)

12.6.3.3 OPC data export during the design stage

OPC data export at the design stage

Exporting configured data

To declare the data configured in SIMOTION SCOUT to SIMATIC NET, you have to export all usable data by selecting the menu command *Options->OPC Data Export...* (i.e. during the design stage).

Parameters are queried during the data export (see "Parameterizing the data export" (Page 8416)).

Directory for files to be exported

The following directory is set by default as the export directory in SIMOTION SCOUT:
"<LW>:\Siemens\Step7\S7proj\<project name>\U7\Tagfiles\"

If you are using the HMI PC both during the design stage and at runtime, select the following directory:
"<Installation directory for data>\opc2\bins7\simotion\xml"

Which files are exported?

You can export the following files:

- Symbol file "OPC_DATA" (see the note under "File name extension" (Page 8411)), i.e.:
  - System variables of the device and the technology objects
  - Global device user variables
  - Symbolic I/O variables
  - Interface variables from user programs
    (for data types see "System variables")
- "OPC alarm/event" (OPC_AE.xml), i.e.:
  - Technology object alarms
  - Diagnostics buffer alarms
  - Alarm_S/Q
  - Connection information

Note

The online help in SIMOTION SCOUT describes the operator sequences required for the OPC data export in detail.

Router configuration

Once the data export is complete, you will be asked if you wish to configure gateways (for routing). "Configuring gateways with SIMOTION SCOUT" describes how to do this.

The export process

The export process is logged in SIMOTION SCOUT in the detail view on the *Symbol File Export Status Display* tab.

Notes

Note

If project data are changed in SIMOTION SCOUT after export of the symbol file, you must re-export the data (consistency).

Note

During commissioning, you must make sure that OPC data transmission is disabled on the active OPC client.

Note

After the export, the files have to be transferred/copied to the OPC client (see "Data transfer to the OPC client" (Page 8422)).

Note

If you are working with multiple projects, please see the information under "SIMOTION OPC File Manager" (Page 8422).

See also

OPC alarms and events for SIMOTION (Page 8430)

Parameterizing the data export

Overview

If the device has several interfaces, the data export requires the following parameters:

- Device
- Protocol
- Interface

Device

The device for which you must select the bus interface is displayed in the "Device" selection field. You must specify the interface settings for each device in the project. You must specify these settings in this window for each device to be connected.

Protocol

In the "Protocol" selection field, you can select between:

- PROFIBUS
- TCP/IP
- PC-INTERNAL (SIMOTION P)

Interface

Note

The selection "Interface" appears if there are several interfaces on the SIMOTION device and they have been configured using different bus addresses.

In the "Interface" selection field, you must specify the interface of the OPC server on the HMI PC which will be used to connect to the respective SIMOTION device during operation.

Each symbol name must be uniquely assignable to a hardware address (bus address).

This assignment is established via the "Interface" selection. SIMOTION SCOUT detects the communication interface and provides the following selection (e.g. for SIMOTION C):

- Select X8, for example, if the interface X8 is used on the device.
- Select X9, for example, if the interface X9 is used on the device.

⚠ WARNING

Cyclic data transfer not guaranteed

If the interface is parameterized for an **equidistant bus cycle**, this interface **may not** be used for an **OPC client**! Cyclic data transfer is not guaranteed when it is used.

Exporting "OPC_DATA" (symbol file)

Notes

The export of "OPC Data" may take some time.

By deselecting the field "Arrays with single elements" it is possible to shorten the data export. When exporting in .ATI format, deselecting always results in only the first address of the array being exported. The server implements the resolution of the single elements during runtime.

Note

OPC data export will only be possible if

- SIMATIC NET software has been installed for the engineering PC/PG (only applicable to versions prior to SIMOTION SCOUT Version V3.2)
- A project is open

Note

With an array of data type "String", the array is always exported with single elements.

Deselection of the "Arrays with individual elements" field is only possible for this data type.

As a string variable is itself already an array, only the individual elements can be exported for addressing reasons.

Note

Warning in the Symbol Editor

The following warning is displayed when you open a SIMOTION .ATI file in the Symbol Editor: "Symboleditor Warning: The following incompatible symbol names were found in the file"

You can ignore this warning: The SIMOTION .ATI file can be used without restrictions.

Exporting "OPC Alarm/Event"

Notes

Note

No user-defined diagnostics buffer contents are exported with "OPC Alarm/Event", but only the specific SIMOTION diagnostics buffer contents. OPC can access these exported text items.

OPC alarms and events for SIMOTION (Page 8430)

Routing configuration with SIMOTION SCOUT

Introduction

If you have configured several networks with NetPro and wish to access a SIMOTION device via a router to a SIMATIC OPC Server, you have to reconfigure this router **once more** in a dialog after file export in SIMOTION SCOUT.

Configuring a router

The "Configure Router" dialog displays the following:

- All configured networks
- All SIMOTION devices contained in the project

First select a location of the OPC Server and then the first router for each node to be addressed via the OPC Server.

The following diagram illustrates a routing configuration.

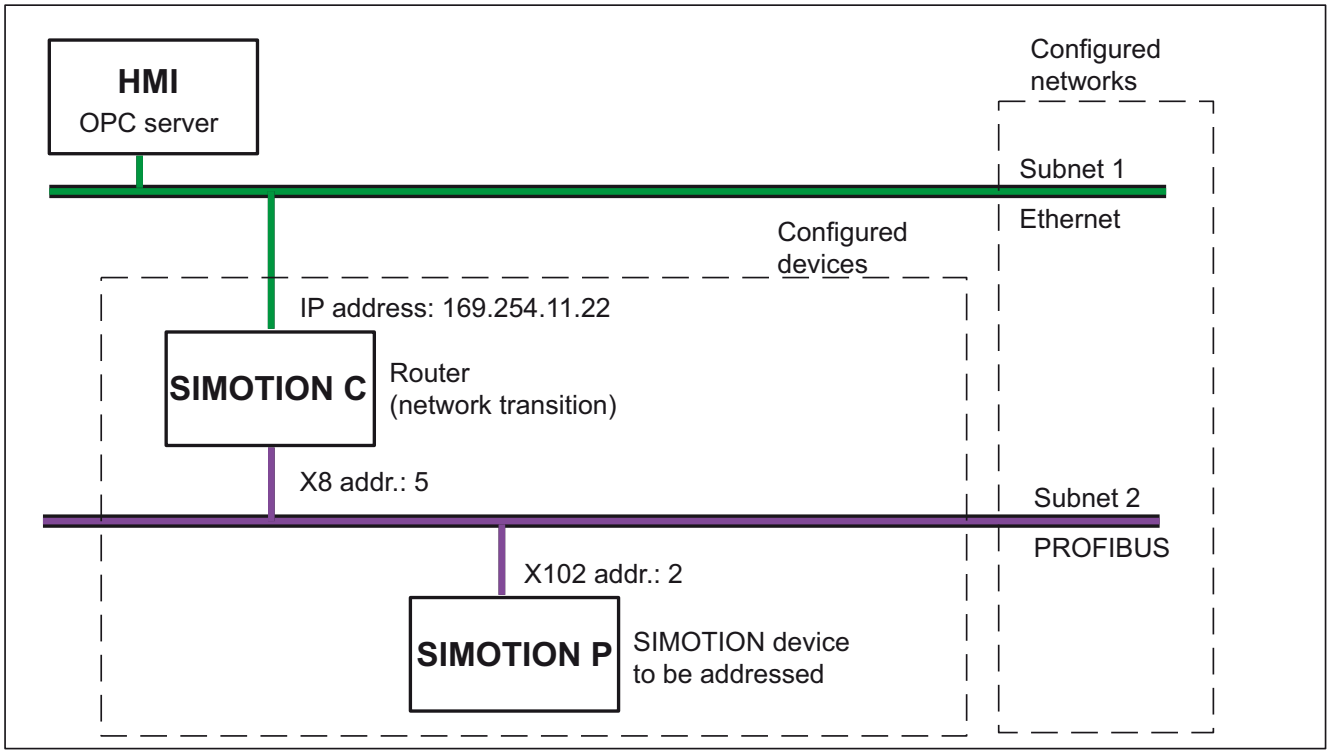

Figure 12-137 Sample configuration for routing

Network configuration for SIMOTION P

With SIMOTION P, you already require the network configuration if you want the OPC Server on the P device to access both the runtime in the SIMOTION P device itself and another SIMOTION device which has been networked via PROFIBUS.

(The reason is that there is an internal "router" between the OPC Server under Windows and the SIMOTION P Runtime. Runtime SIMOTION P has access to the PROFIBUS interface.)

In this case, you need the SIMOTION P device as a router; see the figure below.

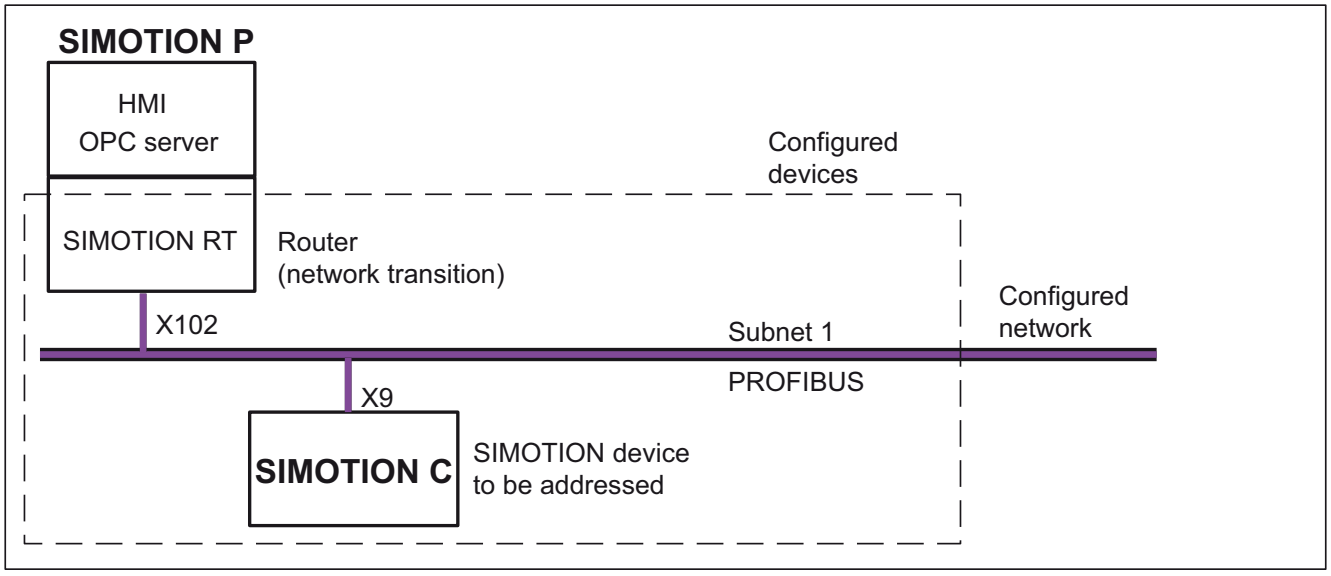

Figure 12-138 Example: SIMOTION P

Network configuration for SIMOTION D4xx

With SIMOTION D4xx the integrated drive is defined as a separate device.

Create a routed connection for this integrated drive as part of the network configuration.

Several projects internetworked

Note

If there are several internetworked projects, please note the following description.

To communicate with the SIMOTION devices in a network interconnection through several projects, the SIMATIC NET OPC Server must be forwarded the following files and items of information:

- "OPC Alarm/Event" files, which may originate from several SIMOTION SCOUT projects
- Time zones
- Router

An auxiliary program, "SIMOTION OPC File Manager", enables you to configure these data for the SIMATIC NET OPC Server. This user program is described under "SIMOTION OPC file manager."

Variables for consistency check

Introduction

When exporting the OPC data from SIMOTION SCOUT, a consistency value is also transferred.

Using this value, the OPC client can check whether this value agrees with the consistency value saved in the SIMOTION device.

Variables for determining the consistency status

To determine the consistency status in relation to a SIMOTION device, the server provides the following variables:

- &stateconsistence()
- &stateconsistenceval()

Table 12-60 Variables for checking the consistency

&stateconsistence()	&stateconsistenceval()	Meaning
"NOTCONFIGURED"	0	No consistency value was saved in the XML file.
"NOTAVAILABLE"	1	Consistency check (still) pending, because the connection was interrupted, for example.
"CONSISTENCE"	2	After the check: The configuration is consistent.
"INCONSISTENT"	3	After the check: The configuration is inconsistent.
"IGNORE"	4	After the check: The controller does not have a consistency value. In SIMOTION SCOUT, the "Activate HMI consistency check" checkbox was deselected during the transfer of the XML project data in the menu *Tools ->Settings->Download*.

Note

The OPC server can only access the consistency status if a connection is established to the respective device. A connection is established if at least one variable is read from the device.

If no connection is established, the status will be "NOTAVAILABLE".

Example for programming the variables in Visual Basic

The syntaxes for variable names for an OPC client with Visual Basic are:

- S7:[<devicename>]&stateconsistence()
- S7:[<devicename>]&stateconsistenceval()

Device name (<device_name>) corresponds to the name for the SIMOTION device as defined in the SIMOTION SCOUT configuration:

For example: "S7:[C230_2]&stateconsistence()"

The syntax for the variable names for the test software OPC SCOUT (included in the SIMATIC NET delivery kit; detailed information can be found in the SIMATIC NET documentation) is described in the following (as example).

In OPC SCOUT, both variables must be entered in one group via *Add Item* (e.g.: "S7: [C230_2]&stateconsistence()).

Then they can be monitored.

You can find OPC SCOUT (SIMATIC NET) in the SIMATIC NET start menu.

12.6.3.4 Data transfer to the OPC Server

Notes

Once you have exported the data, you must transfer/copy it to the HMI PC (OPC client).

The file in the HMI PC has to be located in the following directory:

"<Installation directory for data>\opc2\bins7\simotion\xml"

Note

During commissioning, you must make sure that OPC data transmission is disabled on the active OPC client.

12.6.3.5 SIMOTION OPC File Manager

Introduction

The SIMATIC NET OPC server can be used to monitor SIMOTION devices from multiple SIMOTION projects.

During an export, a symbol file and a file named OPC_AE.xml is generated for each SIMOTION project.

The OPC server can handle several symbol files generated for the files exported from SIMOTION projects, but only one OPC_AE.xml file.

The SIMOTION OPC File Manager closes this gap by combining the exported OPC_AE.xml files from multiple SIMOTION projects in a single file.

SIMOTION OPC File Manager

The SIMOTION OPC File Manager is an auxiliary program which offers the following functionality:

- File selection (selection of the *.xml files to be merged)
- Time zone definition
- Routing definition

The SIMOTION OPC File Manager prepares the network information related to multiple SIMOTION projects in a way that they can be processed together by the SIMATIC NET OPC server.

Delivery and program call

SIMOTION OPC File Manager is delivered as a component of SIMATIC NET.

This is called up in the SIMATIC NET start menu via *Simotion OPC File Manager*.

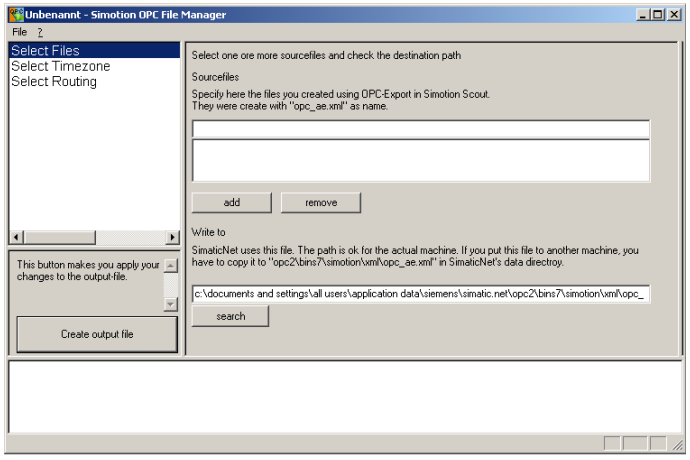

Figure 12-139 SIMOTION OPC File Manager

Note

The software contains open source code with the following copyright "Portions copyright (c) Chris Maunder, 1998".

File selection

SIMOTION OPC File Manager generates from n number of OPC_AE*.xml source files (created during OPC export in SIMOTION SCOUT from several SIMOTION SCOUT projects) a common parameter file and supplements it in places where ambiguities might occur (the respective projects contain the same alarm numbers which wouldn't be doubled in the database) with the information from which project the data originates.

If the project contains data which exclude each other, an error message is displayed in the errors area. Switchover to different screens and a generation of the target file will then be inhibited.

The following screen form represents the file selection in the SIMOTION OPC File Manager:

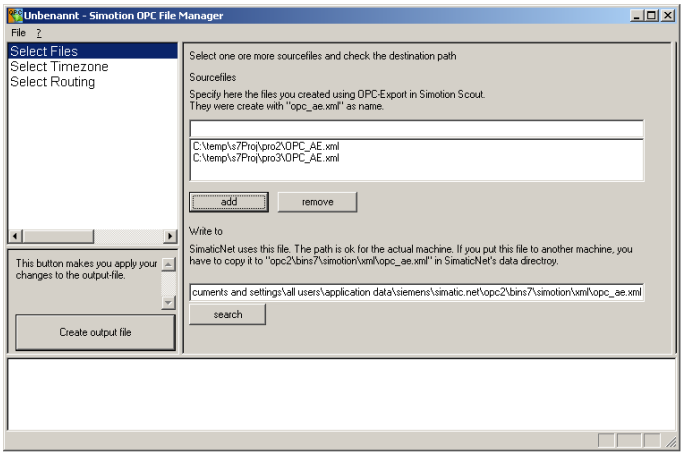

Figure 12-140 File selection

See also

Storage paths for export files (Page 8411)

Fundamental description of an application

Example

Multiple SIMOTION projects have been created for one modular machine. A single PC is to be used for monitoring purposes.

Procedure

Carry out the following steps:

1. Run an OPC export for each SIMOTION project involved and export the data to various directories.
2. Start the SIMOTION OPC File Manager.
3. On the "Select Files" screen, mark all generated OPC_AE*.xml files as source files ("add" button).
4. If necessary, enter time zones and routing information.
5. Select "Create output file" to generate the combined OPC_AE.xml.

Step 1 is completed on the engineering PC/PG. Steps 2 to 5 can be completed either on the engineering PC/PG or on the HMI PC.

Note

If you are working solely on the engineering PC/PG, the XML file generated for the OPC client must be copied to the correct directory, i.e.:

"<Installation directory for data>\opc2\bins7\simotion\xml".

Time zone definition

The time when an alarm is issued will be transmitted without a reference system in SIMOTION RT. The OPC Standard however defines that times will always be transmitted as UTC times. Besides the time, they also contain a time zone indication. The OPC server sets GMT as standard.

Time zone definition

In the "Time zone definition" dialog, a deviation from GMT can be defined for each CPU.

Figure 12-141 Time zones

Routing definition

An OPC client can communicate with several SIMOTION devices over different networks via the SIMATIC NET OPC server. The routers of the respective projects are configured accordingly with the SIMOTION OPC File Manager.

Prerequisite

Prerequisite for introducing the respective projects is:

- Communication of the SIMOTION devices with each other must be configured with *NetPro* in SIMOTION SCOUT.

Note

The router can also be configured within SIMOTION SCOUT. This process is described in "Configuring Routing with SIMOTION SCOUT".

Note

For every additional project, the router must be reconfigured with the SIMOTION OPC File Manager.

Optimum access times

In order to ensure optimum access times, data of the SIMOTION device can only pass every bus segment once. The routing strategy of SIMATIC NET (one standard router per HMI PC), on the other hand, can lead to this standard router referring back to the same segment from which the request comes.

In order to define the access to all devices even in unfavorable configurations, you can, after defining which bus segment you are operating the OPC server on, set any other SIMOTION device of this segment as the first router per SIMOTION device.

Networking example

The following example shows a networking of SIMOTION devices which communicate by an OPC server:

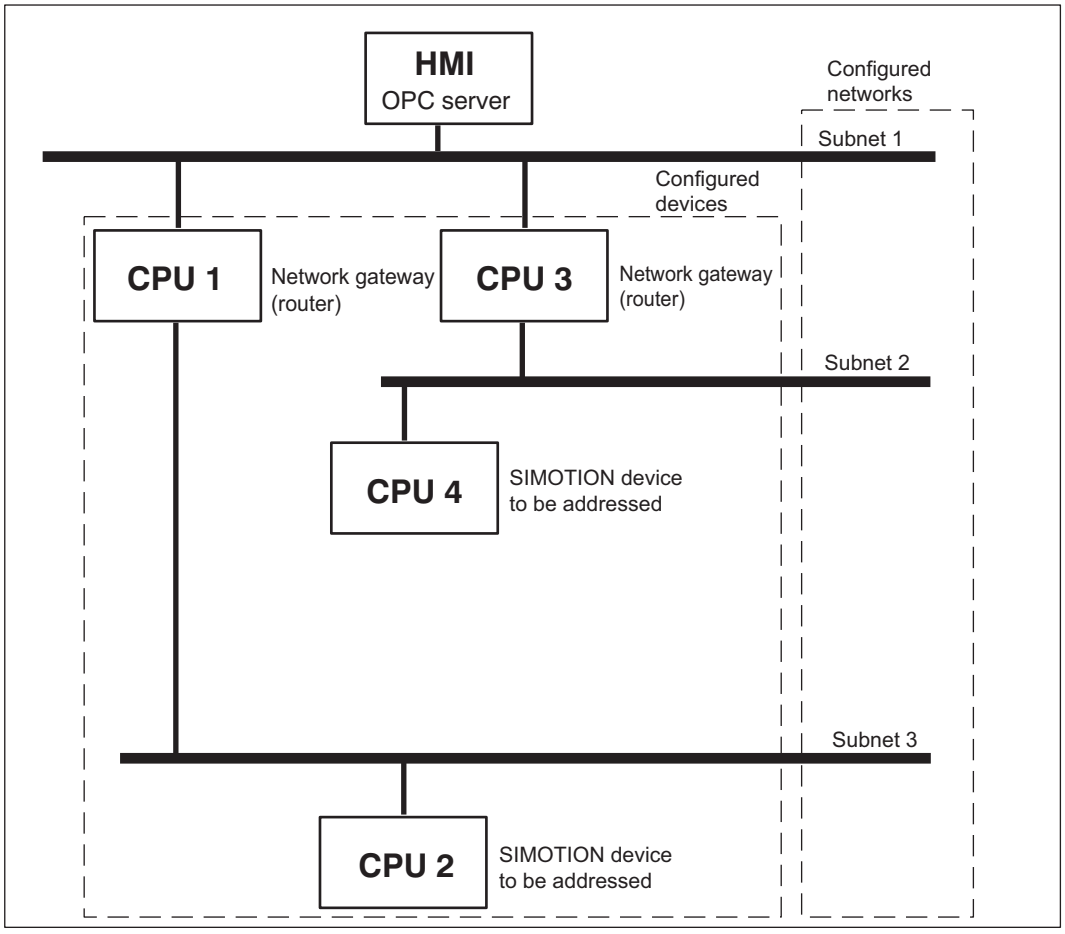

Figure 12-142 Example configuration

The OPC server requires routers for communication. The table below shows the routers of the example configuration:

Table 12-61 Routers of the example configuration

Subnet OPC server	Network node/target device	Router
Subnet 1	CPU 1	is in the same subnet
	CPU 2	CPU 1
	CPU 3	is in the same subnet
	CPU 4	CPU 3

"Routing definition" dialog

In the "Routing definition" dialog you determine:

- the subnet in which the OPC server is,
- the target devices to be addressed,
- the respective routers via which the target device can be addressed by the OPC server.

Figure 12-143 Routing definition

Note

Please observe the following general conditions:

- If you use the "Open" function in the OPC File Manager to read in an existing configuration, you must recheck the router to every target device and re-enter it if necessary under "Routing definition". With the "Open" function, you open a parameter file in which the OPC File Manager notes which exports it is processing and what appropriate information has already been entered. This parameter file is not identical with the "project export" and the merged "group export".
- When you enter **routed connections** with the "routing definition" function, you must select the **subnet** explicitly in the "Subnets" dropdown list **before** you process the routers.

12.6.4 System Features

12.6.4.1 System variables

Introduction

To obtain more precise information on the exported data, an XML export may be initiated in SIMOTION SCOUT using the menu item *Project->Save and Export*.

This XML file can then be viewed using an XML capable Web browser (e.g. MS Internet Explorer 5 or Netscape 6.1).

The variables contained in this file are, amongst others, limit values and file types, and for enums (enumerator data types) the defined values.

Note

To use these enums within an OPC Client environment, a descriptive file (idl file) is generated during OPC data export via the menu item *Options->OPC Data Export...* in addition to the symbols file.

A description of the limit values for SIMOTION system variables can be found in the reference lists, named "SIMOTION Technology Package CAM System Variables".

Data types

The following data types are available in SIMOTION:

Table 12-62 Data types

SIMOTION	Bit width	Sign
BOOL	1 bit	-
BYTE/USINT	8 bits	-
SINT	8 bits	Yes
WORD/UINT	16 bits	-
INT	16 bits	Yes
DWORD/UDINT	32 bits	-
DINT	32 bits	Yes
REAL	32 bits	Yes
LREAL	64 bits	Yes
DATE	64 bits	-
TOD (Time of Day)	32 bits	no
DT (Date and Time)	64 bits	-
TIME	32 bits	Yes
STRING	1 byte/character, max. length -> 254 characters	
Array	Note: Only the data types listed here are valid for an "array".	

Notes

Note

If ProTool/Pro CS is used as an OPC Client, this application will only accept variables in INTEGER format as range pointers.

Note

To determine the consistency status in relation to a SIMOTION device, the server provides the following variables:

- &stateconsistence()
- &stateconsistenceval()

OPC data for SIMOTION

Note

Please note the following general conditions and function restrictions:

- When asynchronously writing a ReadOnly variable, no error message is returned although the value cannot be and is not written. (When synchronously writing a ReadOnly variable, on the other hand, an error message is returned.)
- The valid value range for variables of the type "Date" and "DT" is not maintained via OPC. Values can be written to the variables that are outside of the valid value range. The valid value range for Simotion and OPC is from 1992-01-01 to 2089-12-31.

See also

Variables for consistency check (Page 8421)

12.6.4.2 OPC alarms and events for SIMOTION

Notes

Note

Please note the following general conditions and function restrictions:

- User-defined diagnostic buffers are not exported with "Export OPC data". Therefore no message text is supplied for these events.
- The OPC client that starts the OPC server also receives diagnostic buffer entries that were entered before this time.
- Only **one** language setting for **all** clients:
  Alarm texts are sent to all clients in the same language, namely the language that was set last. The process is independent of the previously set different "LocalIDs".
- A maximum of 40 "Alarm_S" are permitted for OPC alarms and events for SIMOTION:
  If more than 40 different alarms of the "Alarm_S" category are triggered in rapid succession, only the first 40 alarms are transmitted.
- Restriction when using the Automation Wrapper, e.g. with VB OPC clients:
  If a client instances several subscriptions by the Automation Wrapper "sopcdaauto.dll", the subscription activated **first** always gets the events for both subscriptions, i.e. the subscriptions activated later receive no alarms.
- When you disconnect the OPC client from the OPC server, you must wait at least 15 seconds before you re-establish the connection.

Note

Alarm status at "Alarm_SQ"

If an "Alarm_SQ" comes and goes in rapid succession and this alarm is then acknowledged, the status of this alarm may be at "Acknowledged incoming" instead of "Acknowledged outgoing" (only relevant if the time between "Incoming" and "Outgoing" is less than 10 ms).

Note

"ALARM_SQ" alarms with "Outgoing" status show sporadically false time stamp

When connecting an OPC_AE client ("OPC Alarm/Event" client) to an operating SIMOTION controller, the existing alarms are queried (refresh functionality). With "ALARM_SQ" alarms with "Outgoing" status (only acknowledgement required) a false time stamp (date and time) may be displayed sporadically.

12.6.4.3 Consistent data access

General

Access to a data item of a simple SIMOTION device data type is always consistent.

If you want to access several individual data items or arrays in the SIMOTION device (e.g. positions of several axes), user support is required to ensure consistency.

The SIMOTION ST Programming Guide describes in a programming example, how the client application (e.g. an HMI terminal) ensures consistent data access with the SIMOTION device by means of mutual queries.

12.6.5 Tips

12.6.5.1 Programming tips

If you are using an OPC client for creating, then consider the following:

Arrays

If arrays are greater than a PDU (Protocol Data Unit) (currently always 480 bytes on all SIMOTION HW platforms, of which 22 bytes are assigned to the header), we recommend the following:

- Message frames with a user data length greater than 458 bytes need to be split into two or more message frames (e.g. in the case of 540 bytes, into 240 bytes and 300 bytes).
- Use "group.syncRead()" once instead of "item.Read()" several times.

If the data changes within the space of two read access attempts to the PDUs in the array, the array will be inconsistent.

Application solution:

See the SIMOTION ST Programming Manual, "Consistent data access with HMI devices".

Time for data transmission

If you are running a SIMOTION device with multiple OPC clients (user interfaces) on one HMI PC, the data flow will be faster than with a single OPC client.

If, having completed one job, you are waiting for the next job to start based on a timer, you will need to take account of a Windows-related delay of at least 10 to 15 ms.

Recommendation:

You should use "group.syncRead()" to read several arrays rather than sending multiple individual read calls with "item.Read()".

Consistent data access

Access to a data item of an elementary data type in the SIMOTION device is always consistent.

However, if you wish to access several single data items or arrays in the SIMOTION device (e.g. positions of multiple axes), you will need user support to ensure consistency.

The SIMOTION ST Programming Manual uses a programming example to describe how the client application (e.g. HMI device) ensures consistent data access by means of mutual data querying with the SIMOTION device.

Protocol

Activate only the "S7 protocol" on the OPC server and deactivate all other protocols (see also "Configuring the OPC server/SIMOTION device interface at runtime" (Page 8411)). In other words, deactivate protocol multiplexers.

12.6.5.2 How can a new OPC configuration (OPC Data, OPC Alarm/Event) be initialized when an OPC Client is running?

Requirement

No fundamental changes must have been made to the configuration.

Example

An example application for **no** fundamental changes would be:

Within the SIMOTION SCOUT project you delete a variable which has not been declared to the OPC client. Deleting the variable causes the address range to shift in the project.

Procedure

To activate the new OPC configuration by transferring/copying the new project data to the OPC client (see also "Data transfer to the OPC client" (Page 8422)), proceed as follows:

1. Start the file export (see also "Exporting OPC data during the design stage" (Page 8411)).

   Note

   For this export, the target directory must not be the SIMATIC NET installation directory on the HMI PC. (This is because these files are opened exclusively by the OPC server when it is running.)

   Note

   If you have a number of SIMOTION SCOUT configurations for various machines/installations, and these function independently with the task of accessing all devices from a single user interface (their remit might also include routing), you should combine these exported files subsequently with the OPC File Manager (see "SIMOTION OPC File Manager" (Page 8422)).

2. Make the following entry in the "Registry" section of the "sopcsrvr.ini" file (<Installation directory for SIMATIC NET>\SIMATIC.net\opc2\bin):

   ```
   [Registry]
   AllowServerStart=0
   ```

3. Stop the OPC server. You can do this in several ways:

   – You can quit all clients so that the OPC server stops and you copy the new project data to the OPC client.
   Comment: The in-process DP OPC server cannot be stopped in the "Configuration Console" under "Applications->OPC Settings->Quit OPC Server->Stop".
   (This server is activated the first time an OPC client accesses data.)

   To stop the OPC server even if the OPC client is running, proceed as follows:

   – Set the "ForceShutdown" entry in the Windows registry on the HMI PC to the value "1". The entry is located in the following directory:
   MyComputer\HKEY_LOCAL_Machine\SOFTWARE\Siemens\SIMATIC\OPC \SimaticNET.
   The OPC client is informed of the quitting of the OPC server via the shutdown mechanism and will have to subsequently (see Step 6) reconnect and reinitialize.

   Note

   See the "Application example" in the Visual Basic program.

4. Transfer/copy the files exported under Step 1 to the OPC client (target hardware), to the following directory:
   "<Installation folder for SIMATIC NET>\SIMATIC.net\opc2\bins7\simotion\xml".

5. Reset the "AllowServerStart" entry in the "sopcsrvr.ini" file (<Installation directory for data> \opc2\bin) to "1" or delete the line with "AllowServerStart".

```
[Registry]
AllowServerStart=1
```

6. The OPC server will restart with the updated symbols as soon as the OPC client reconnects to the OPC server.

Note

It will not be possible to start the OPC server if the "AllowServerStart" entry is set to "0". This value could be set, for example, due to a process for activating a new OPC configuration failing or the Windows operating system being shut down in the meantime. Therefore, we recommend setting this value to "1" when Windows ramps up (see Step 2) or deleting the line in the "sopcsrvr.ini" file on ramp-up.

12.6.5.3 OPC communication to SIMOTION and SIMATIC S7 controller via PROFIBUS

Requirements

If OPC communication to SIMOTION and SIMATIC S7 controllers via PROFIBUS is to be performed, the following are required:

- Requirements and settings for the OPC communication with SIMOTION:
  - The controllers are on the same PROFIBUS line.
  - The configuration in SIMOTION SCOUT has been loaded to the controller via PROFIBUS.
  - An OPC export has been performed for the configuration.
  - The symbol file OPC_DATA (see the note under "File name extension" (Page 8411) has been entered in SIMATIC NET "Set PC station" and the access point CP_SM_1 has been set to PROFIBUS/CP5611.
- Additional requirements and settings for the OPC communication with S7:
  - The S7 configuration has been loaded to the controller via PROFIBUS.
  - In SIMATIC NET "Set PC Station", the module operating mode must be set to "Configured mode" under Modules – CP5611 - General (see following figure).

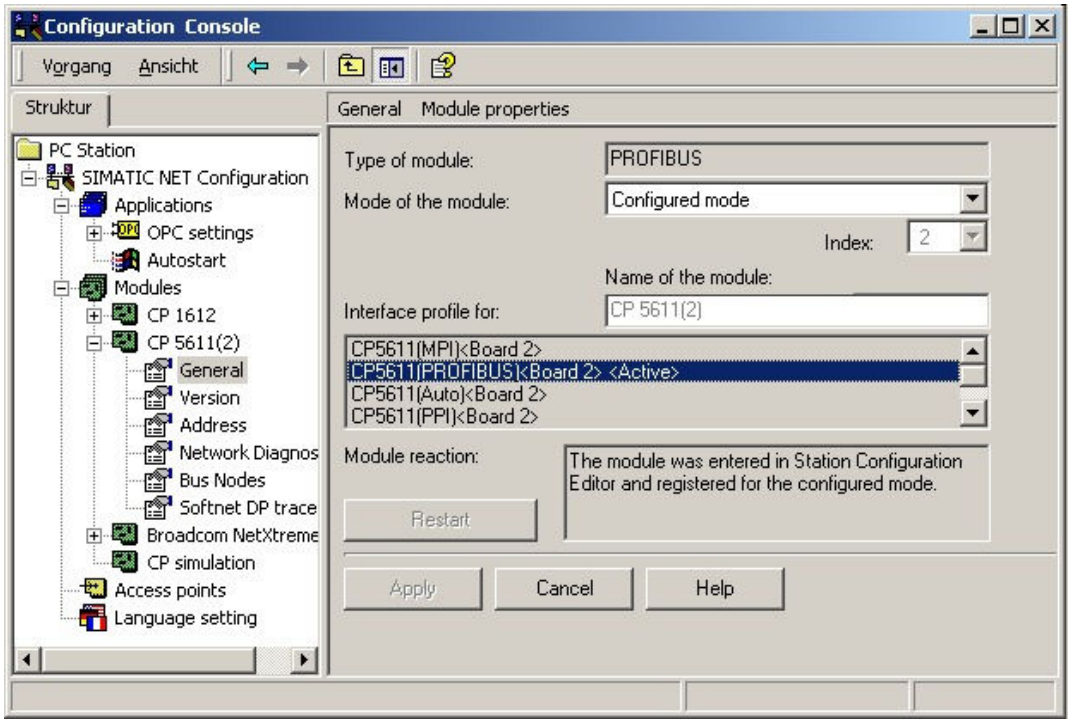

Figure 12-144 Configured mode

  - A PC station from the HW catalog must be inserted in NetPro.

– In the HW Config, an OPC server must be inserted in the PC station at Index 1 and a CP5611 PROFIBUS card must be inserted at Index 2 from the HW catalog (see following figure).

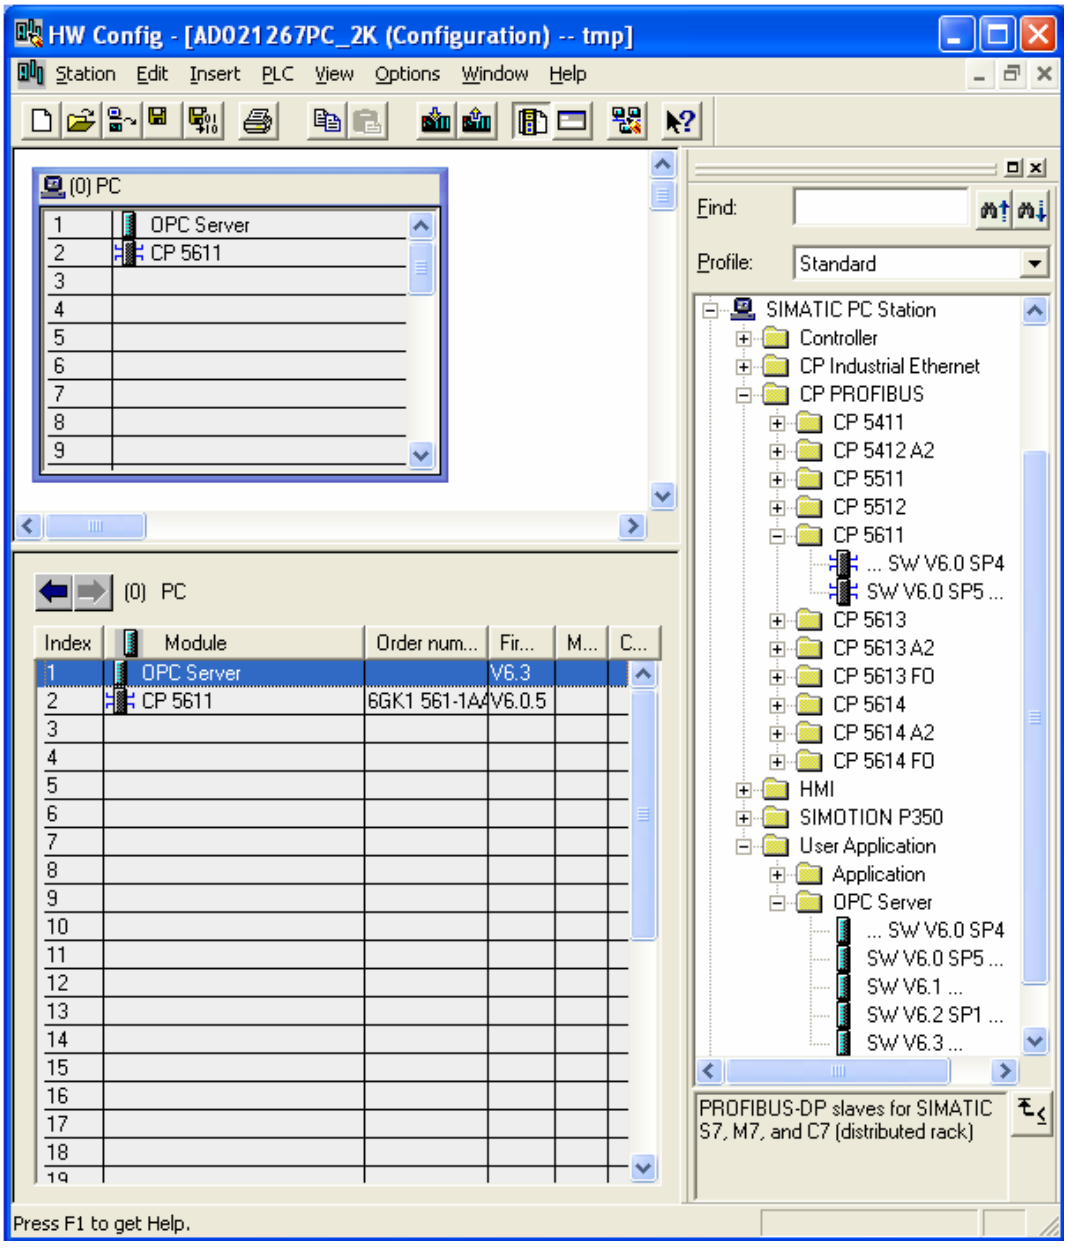

Figure 12-145 HW catalog

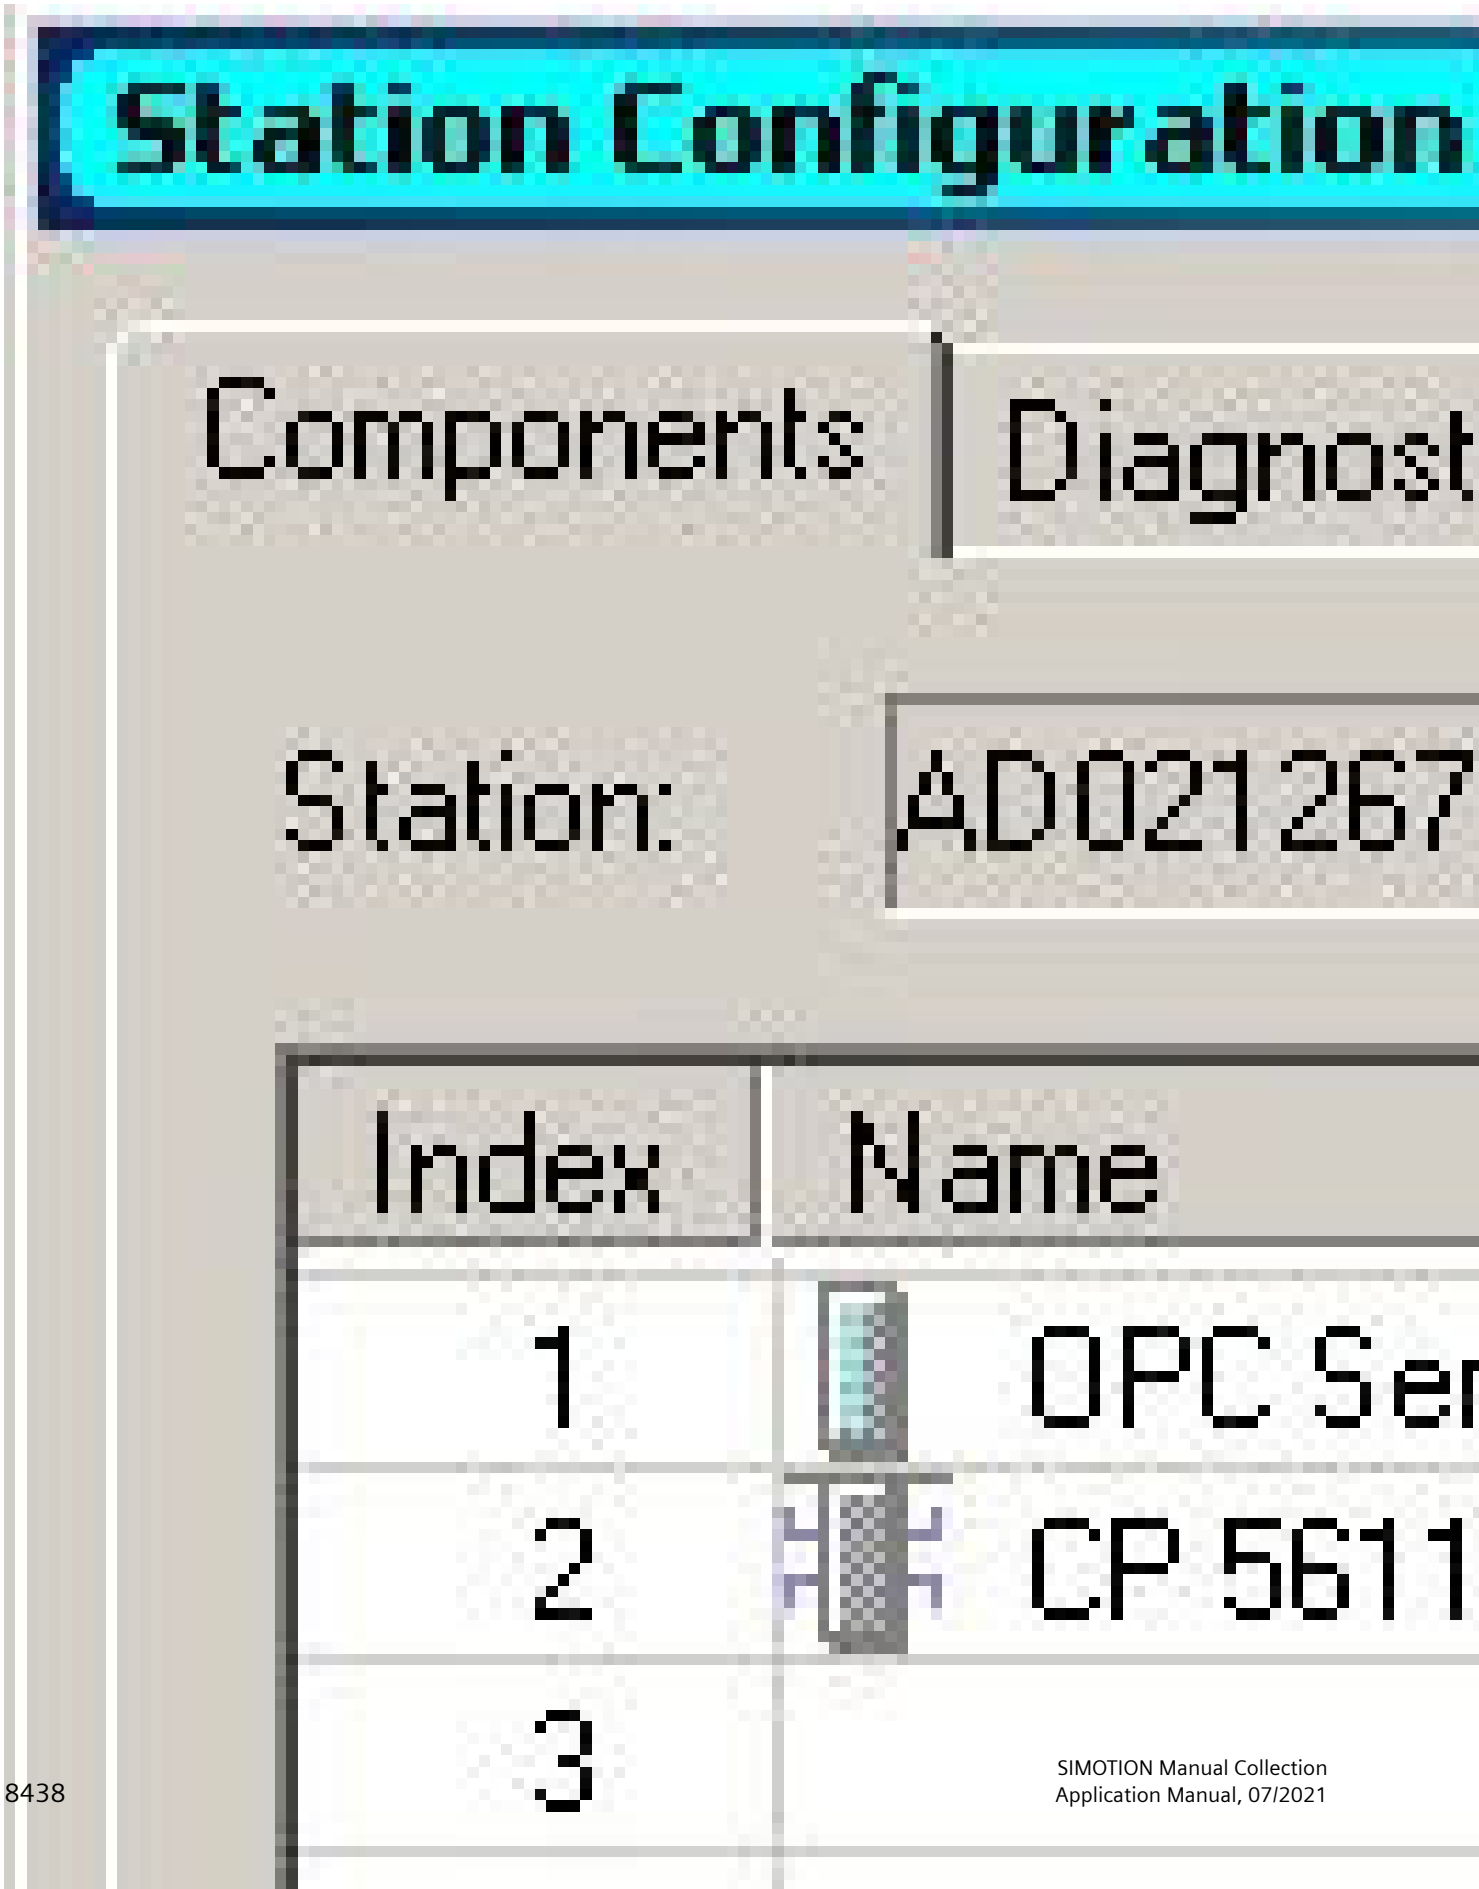
– After Save and compile, the PC station must be loaded to the Station Configuration Editor via the PG/PC interface "PC internal" (see following figure).



Station Configuration
Components

Figure 12-146 Station Configuration Editor

- In SIMATIC NET "Set PC Station", the access point CP_L2_1 must be set to "PC internal".
- In NetPro, an S7 connection must be created for the OPC server in the PC station (see following figure).

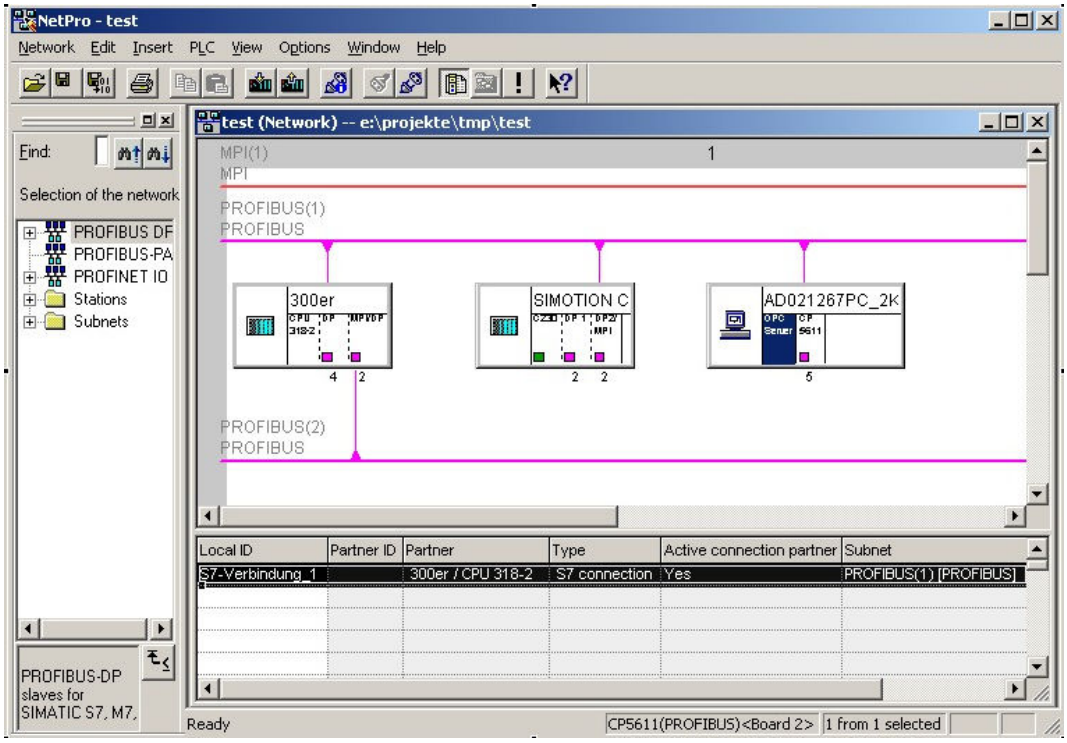

Figure 12-147 NetPro

Note

Further information on the configuration of an OPC S7 connection, can be found under SIMATIC NET "Set PC Station" - SIMATIC NET Configuration: Example: "OPC S7 PROFIBUS"

12.6.5.4 OPC via PROFINET

Introduction

This section describes the fundamentals for OPC communication via PROFINET. The corresponding SIMOTION C/SIMOTION D/SIMOTION P manuals describe what must be observed during a PROFINET configuration.

Fundamentals

This connection is used for the OPC communication via PROFINET in order to establish an OPC connection via TCP/IP. The same protocols are used as for OPC via Ethernet.

This does not effect the other communication via PROFINET between SIMOTION controllers and drives.

The OPC export with the routing and the access points is equivalent to Ethernet / TCP/IP.

It is possible to directly access a SIMOTION P with MCI-PN board or a D4x with CBE30 card from a PG/PC with Ethernet connection via a PROFINET cable.

The OPC routing between PROFIBUS and PROFINET functions from one network to the other.

The following figure represents a possible connection of the HMI PC via PROFINET.

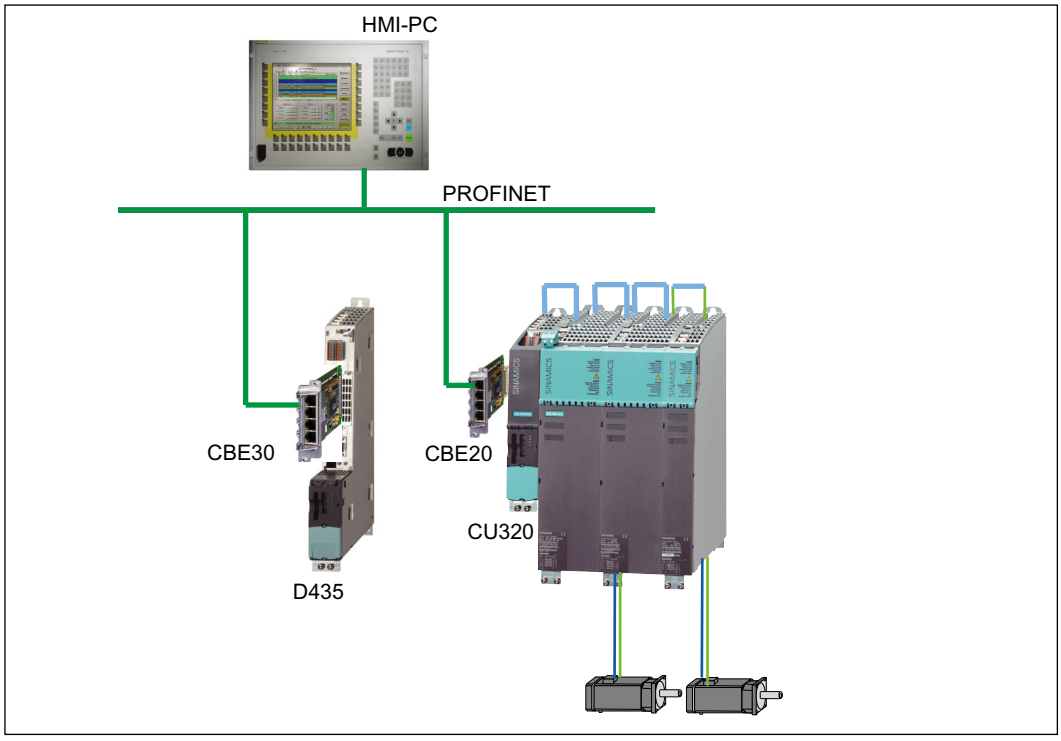

Figure 12-148 PROFINET

12.6.5.5 More tips

How do I create an OPC server in HW Config?

How to create an OPC Server in HW Config is described in the SIMATIC NET documentation on the "SIMATIC NET PC / Software CD, Electronic documentation".

If you use an OPC Server for SIMOTION P, please follow the descriptions in the SIMOTION P manual.

How do I operate the OPC SCOUT?

Among other things, the OPC SCOUT supports connection tests for the OPC client->OPC server->SIMOTION RT connection and programming of an OPC client.

You can create one or more groups from the OPC client via the OPC server among other things. You may choose any name.

In these groups, you can create one or more items. These items directly correspond to the variable names in the SIMOTION SCOUT project.

A group can be switched active or inactive.

- "Active" means that the OPC server scans the variables in the SIMOTION SCOUT in a time base and places them in the cache.
- "Inactive" means that the OPC client reads the variables directly from the SIMOTION device.

Note

The reason for bad quality in an item can be:

- HMI consistency flag set in SIMOTION RT
- Wrong project / wrong OPC configuration loaded
- Item name misspelling
- No connection to SIMOTION RT available

OPC communication with SIMOTION modules

Note

A SIMATIC PC station must not be used for OPC communication with SIMOTION modules only. The reason is that the configuration for OPC communication with SIMOTION is significantly different than that with SIMATIC modules. The procedure for mixed operation is described in "OPC communication with SIMOTION and SIMATIC S7 controller via PROFIBUS" (Page 8435).

Download in running OPC SCOUT

Note

A project download or a download in HW Config can be performed with the OPC SCOUT running. If an OPC server is configured in the component configurator in this case, the connection to the controller is broken and the OPC SCOUT must be restarted. Before restarting the OPC SCOUT it must be ensured that the configured OPC server is in the "RUN" operating state.

Going online with SIMOTION SCOUT with running Alarm client

Note

You may sometimes not be able to go online with SIMOTION SCOUT when an Alarm client is running.

In this case you must first end the alarm client or interrupt the connection to the "OPC Alarms and Events" server.

Maximum permissible number of PG/PC connections via Ethernet/PROFINET

It is possible to go ONLINE to 10 PROFINET nodes simultaneously with SIMOTION SCOUT.

The STEP 7 standard package supports a maximum of 10 simultaneous ONLINE connections via Ethernet.

As SIMOTION SCOUT uses the STEP 7 standard package drivers to go ONLINE, this number also applies here.

If SIMATIC NET is installed in addition to SCOUT, it is possible to establish connections to more than 10 nodes, as SIMATIC NET uses its own drivers that do not have this restriction.

12.6.5.6 Comparison of SIMOTION IT OPC XML-DA/SIMATIC NET for SIMOTION

Overview

In addition to SIMATIC NET for SIMOTION, there is another product,

SIMOTION IT OPC XML-DA. This package also enables you to access data and monitor operating states of the SIMOTION device via Ethernet.

The following table compares the two packages and describes the basic procedures:

Table 12-63 Basic procedure for accessing data

SIMOTION IT OPC XML–DA	SIMATIC NET for SIMOTION
No configuration (OPC export) with SCOUT required. Program variable can be activated via a switch.	OPC export with SIMOTION SCOUT required, which has to be repeated for every project change.
Symbols are interpreted in the SIMOTION device; communication in text format (XML).	Symbols are interpreted during OPC export and stored in the OPC server on the Windows system in a binary form; binary communication -> higher data throughput.
At present only SIMOTION with OPC XML DA. Access to S7 devices not possible at present.	Simultaneous access to SIMOTION and S7 devices.
Client can run on any operating system.	Based on Windows COM/DCOM technology; client and server can only run on Windows operating systems.
Communication with standard protocols (TCP/IP, XML, SOAP), no manufacturer-specific (SIEMENS) tools, drivers required on the client system.	S7 protocol used for communication, appropriate manufacturer-specific drivers required on the client.
Communication only possible via Ethernet.	Communication via PROFIBUS/MPI and Ethernet is possible.
Direct addressing via firewalls is possible.	Generally, DCOM communication not released for firewalls.

12.6.5.7 Example of an application

Example

Note

This section describes a short example of an OPC client application.

The examples for SIMATIC NET can be found in the "SIMATIC.net\opc2\samples" directory.

An OPC client connected to an OPC server is to execute the following tasks:

1. Respond to a OPC server quitting
2. Instantiate the OPC server
3. Restore the connection to the OPC server (see "How is a new OPC configuration enabled when an OPC client is operating?" (Page 8432))

Visual Basic program

The following Visual Basic program contains these steps:

```
Option Expicit
Option Base 0

Const NUM_OF_ITEMS As Long = 3

Dim WithEvents myOPCserver As OPCServer
Attribute myOPCserver.VB_VarHelpID = -1
Dim WithEvents myOPCgroup As OPCGroup
Attribute myOPCgroup.VB_VarHelpID = -1
Dim myOPCitem1 As OPCItem
Dim myOPCitem2 As OPCItem
Dim myOPCitem3 As OPCItem

Dim readData As Variant
Dim writeData(0 To 255) As Integer
Dim writeDataDINT As Long

Dim ItemIDs(NUM_OF_ITEMS) As String
Dim ClientHandles(NUM_OF_ITEMS) As Long
Dim ServerHandles(NUM_OF_ITEMS) As Long
Dim Values() As Variant
Dim Errors() As Long
Dim ErrorString As String
```

```
'called at program start
Private Sub Form_Load()
    Call Init
End Sub

'called at program end
Private Sub Form_Unload(Cancel As Integer)
    Call Destroy
End Sub

'called after connection loss or access fault
Private Sub TimerInit_Timer()
    TimerInit.Enabled = False 'disable timer
    Call Destroy
    Call Init
End Sub

'called at OPC server shutdown
Private Sub myOPCserver_ServerShutDown(ByVal Reason As String)
    Debug.Print Now & " server shutdown"
    TimerInit.Interval = 10000 'try to reconnect after 10 seconds
    TimerInit.Enabled = True
End Sub

'initialize OPC connection
Private Sub Init()

    On Error GoTo InitError

    Set myOPCserver = New OPCServer ' server
    myOPCserver.Connect ("OPC.SimaticNET")
    Set myOPCgroup = myOPCserver.OPCGroups.Add("Test") 'group
    With myOPCgroup
        .IsActive = False 'read synchronous from device
        .IsSubscribed = False 'read synchronous from
        device 'synchronous
        With myOPCgroup.OPCItems
            Set myOPCitem1 = .AddItem("P350.VARIABLE.db1", 1)
            Set myOPCitem2 = .AddItem("P350.ST_1.array1", 1)
            Set myOPCitem3 = .AddItem("P350.ST_1.dint1", 1)
        End With
```

```
    End With
    ServerHandles(0) = myOPCitem1.ServerHandle
    ServerHandles(1) = myOPCitem2.ServerHandle
    ServerHandles(2) = myOPCitem3.ServerHandle
    Debug.Print Now & " server connected"
    Timer1.Interval = 500 'poll data every 500ms
    Timer1.Enabled = True 'poll data

    Exit Sub
InitError:
    MsgBox "Error connecting OPC server: " & Err.Number & " " &
    Err.Description

End Sub
```

12.6.6 Notes on the Online Help and Documentation

Overview

Table 12-64 Online help and documentation

What to do?	Names	Content
SIMOTION SCOUT Online Help	Is part of the SIMOTION SCOUT software	Provides help for the user interface
Entire documentation on the SIMOTION software installation DVD	SIMOTION System Overview	Overview of the product family
	SIMOTION SCOUT, Operator's Guide	Describes the SIMOTION SCOUT engineering system, i.e. details on the installation and Workbench
	SIMOTION MCC, Programming Guide	Describes the graphics-based SIMOTION programming language Motion Control Chart
	SIMOTION ST, Programming Guide	Describes the text-based SIMOTION programming language Structured Text
	SIMOTION LAD/FBD, Programming Manual	Describes the programming language LAD/FBD
	SIMOTION C, Manual	Describes the hardware and commissioning
	SIMOTION Technology Functions of Motion Control (divided in several manuals and lists of references)	Describes the effects of technology objects for Motion Control and contains reference lists for system variables and functions
	SIMOTION Function Blocks, Manual	Supplement for the CP and FM modules
	SIMOTION P, Manual	Describes hardware, software and installation
	SIMOTION D4xx, Manual	Describes hardware, software and installation
All documents on documentation CD "SIMATIC NET Manual Collection"	"SIMATIC NET Manual Collection"	Amongst other subject items, details of the installation, OPC interface, OPC Server

Note

A detailed breakdown of the documentation for SIMOTION can be found in the "SIMOTION documentation overview".
