Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ **DANGER**
indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ **WARNING**
indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ **CAUTION**
indicates that minor personal injury can result if proper precautions are not taken.

NOTICE
indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ **WARNING**
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

SIMOTION Documentation 1

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Engineering System Handling 3

3.1 CamTool

Preface

Contents of manual

This manual describes the SIMOTION CamTool optional package.

This document is part of the SIMOTION Engineering System documentation package.

Scope

This manual applies to SIMOTION SCOUT in conjunction with the SIMOTION CamTool optional package.

Standards

The SIMOTION system was developed in accordance with ISO 9001 quality guidelines.

Information:

The following is a description of the purpose and use of the manual:

- "Description" section
  This section provides a brief overview of the basic functions of SIMOTION CamTool and its integration into SIMOTION SCOUT.
- "Installation" section
  This section explains how SIMOTION CamTool is installed and the requirements which need to be met before it can be used.
- "Planning/Configuring" section
  This chapter describes the basic functions of SIMOTION CamTool, and contains information on how to use the CamTool when editing cams.
- "Functions" section
  This section explains how to create a cam.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.2:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

3.1.1 Fundamental safety instructions

3.1.1.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life caused by machine malfunctions caused by incorrect or changed parameterization

Incorrect or changed parameterization can cause malfunctions on machines that can result in injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

3.1.1.2 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

3.1.1.3 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

3.1.2 Description

Introduction

The graphical user interface in SIMOTION CamTool allows you to create, edit and optimize cams.

SIMOTION CamTool is fully integrated in SIMOTION SCOUT. This allows you to also use in SIMOTION CamTool information configured in SIMOTION SCOUT (e.g. axis settings).

Basic functions

SIMOTION CamTool provides the following basic functions:

- Insert and edit cams.
  Cams can be added to a SCOUT project using SIMOTION CamTool. In addition, you can edit with CamTool a cam created with CamEdit: Cams can also be imported from a text file or uploaded from a SIMOTION device.
- Modifying the representation of the cam in CamTool
  In SIMOTION CamTool, you can show and hide diagrams, change the representation parameters of the axes and diagrams, and adapt the lines and fonts. You can also represent auxiliary lines in the diagram.
- Converting cams from SIMOTION CamTool to SIMOTION CamEdit.
  To edit with SIMOTION CamEdit a cam edited in SIMOTION CamTool, the cam must be converted.
- Exporting cams into a text file.
- Downloading cams to a SIMOTION device
- Printing a cam.

3.1.3 Installing the Software

3.1.3.1 Installing SIMOTION CamTool

Introduction

SIMOTION CamTool is an optional package for SIMOTION SCOUT.

SIMOTION SCOUT must already be installed on the system on which you want to install SIMOTION CamTool. For further information, refer to the system requirements.

Note

You require administrator rights for the installation.

Following installation, every user (including those without administrator rights) can work with SIMOTION CamTool.

System requirements

The system requirements for SIMOTION CamTool match the system requirements of SIMOTION SCOUT.

Installing SIMOTION CamTool

To install SIMOTION CamTool:

1. Insert the CD with the installation software into the CD-ROM drive.
2. Start Windows Explorer and select the CD-ROM drive.
3. Open the **CamTool\Disk1** directory.
4. Double-click **setup.exe**. The installation program starts.
5. Run through the installation program. SIMOTION CamTool is now installed.

3.1.3.2 Deinstalling SIMOTION CamTool

Uninstalling SIMOTION CamTool

To uninstall SIMOTION CamTool:

1. Click **Start > Settings > Control Panel** in the Windows taskbar. The **Control Panel** window appears.
2. Double-click **Software**. The **Software Properties** window appears.
3. Select **SIMOTION SCOUT CamTool** on the **Install/Uninstall** tab.
4. Click **Add/Remove**. The uninstall program starts.
5. Run through the uninstall program. SIMOTION CamTool is now uninstalled.

Note

You require administrator rights for the uninstall process.

3.1.4 Configuring

3.1.4.1 Content

Overview

This chapter describes how you work with SIMOTION CamTool. You learn how

- to customize the display of the working area
- to edit a cam with CamTool
- to save a cam

- to customize the display of the cam
- to download a cam to a SIMOTION device

Note

The following operating instructions primarily describe the operation of SIMOTION CamTool using the functions in the menu bar.

You can also execute the functions from the context menus. In this case, right-click the element that you want to edit.

You can also execute the most import functions using the icons in the SIMOTION CamTool toolbar. Pay attention to the tooltip which is displayed when you place the mouse pointer on an icon in the toolbar.

3.1.4.2 Customizing the Working Area Display

Changing the representation using the toolbar

Introduction

You can use the icons in the function bar to show or hide the scaled cam profile, the V diagram (velocity diagram), the A diagram (acceleration diagram), and the J diagram (jerk diagram). Use the zoom tool to enlarge/reduce the display or move it around with the hand tool.

Using the function bar to change the display

To change how diagrams are displayed using the function bar:

1. A tool tip appears when you position the cursor over an icon in the function bar.
2. Click the icon for the function you wish to use.

Function bar icons

The following functions can be used to change the screen display:

Table 3-1 Icons in the SIMOTION CamTool function bar

Icon	Meaning/Operation
	Use this icon (selection tool) to select the cam segments for editing.
	Use this icon to activate/deactivate the display for the scaled cam profile. If you have not made any scaling specifications, the icon will be grayed out. **Note:** When the scaled cam profile is displayed, you will not be able to edit the original curves in the diagram displays.
	Use this icon to show or hide the V diagram (velocity diagram).
	Use this icon to show or hide the A diagram (acceleration diagram).

Icon	Meaning/Operation
	Use this icon to show or hide the J diagram (jerk diagram).
	Use this icon to activate/deactivate the zoom tool. You can also use the ESC key to deactivate the zoom tool. When activated, the zoom tool enables you to perform a variety of functions, depending on whether you position the cursor over the diagram area or a coordinate axis, and whether you press the SHIFT key while doing this: **Zoom tool over diagram area (zoom effective in all directions simultaneously)** Left-click to double the size of the entire display. Right-click to halve the size of the entire display. **Zoom tool over coordinate axis (zoom effective in direction of coordinate axis)** Left-click to double the size of the display in the direction of the coordinate axis over which the cursor is positioned. Right-click to halve the size of the display in the direction of the coordinate axis over which the cursor is positioned. **Zoom tool with SHIFT key pressed** The cursor assumes the functions of the hand tool for as long as the SHIFT key is pressed and held down. When the hand tool is activated, you can move the diagram area using drag-and-drop. Any diagrams which are currently visible can be moved in this way.
	Use this icon to activate/deactivate the zoom function. You can also use the ESC key to deactivate the zoom function. **Zoom function on the diagram area** When the zoom function is activated, you can press the mouse button down and outline a section of the diagram area you wish to enlarge. **Zoom function on the coordinate axis** When the zoom function is activated, you can press the mouse button down and outline the section of a coordinate axis you wish to enlarge. The enlargement takes effect in the direction you worked in when outlining the section on the coordinate axis.
	Use this icon to reset the previous zoom setting.
	Use this icon to activate/deactivate the hand tool. You can also use the ESC key to deactivate the hand tool. When the hand tool is activated, you can move the diagram area using drag-and-drop. Any diagrams which are currently visible can be moved in this way.
	Use this icon to restore the entire display to the normal view.

Maximizing working area

Maximizing working area

To set the largest possible working area for SIMOTION CamTool:

1. Click **Maximized working area** in the **View** menu. The detail view and project navigator will close.
2. Maximize the window containing the cam diagrams.

or

1. Select **View > Project navigator** to close the project navigator.
2. Select **View > Detail view** to close the detail view.
3. Maximize the window containing the cam diagrams.

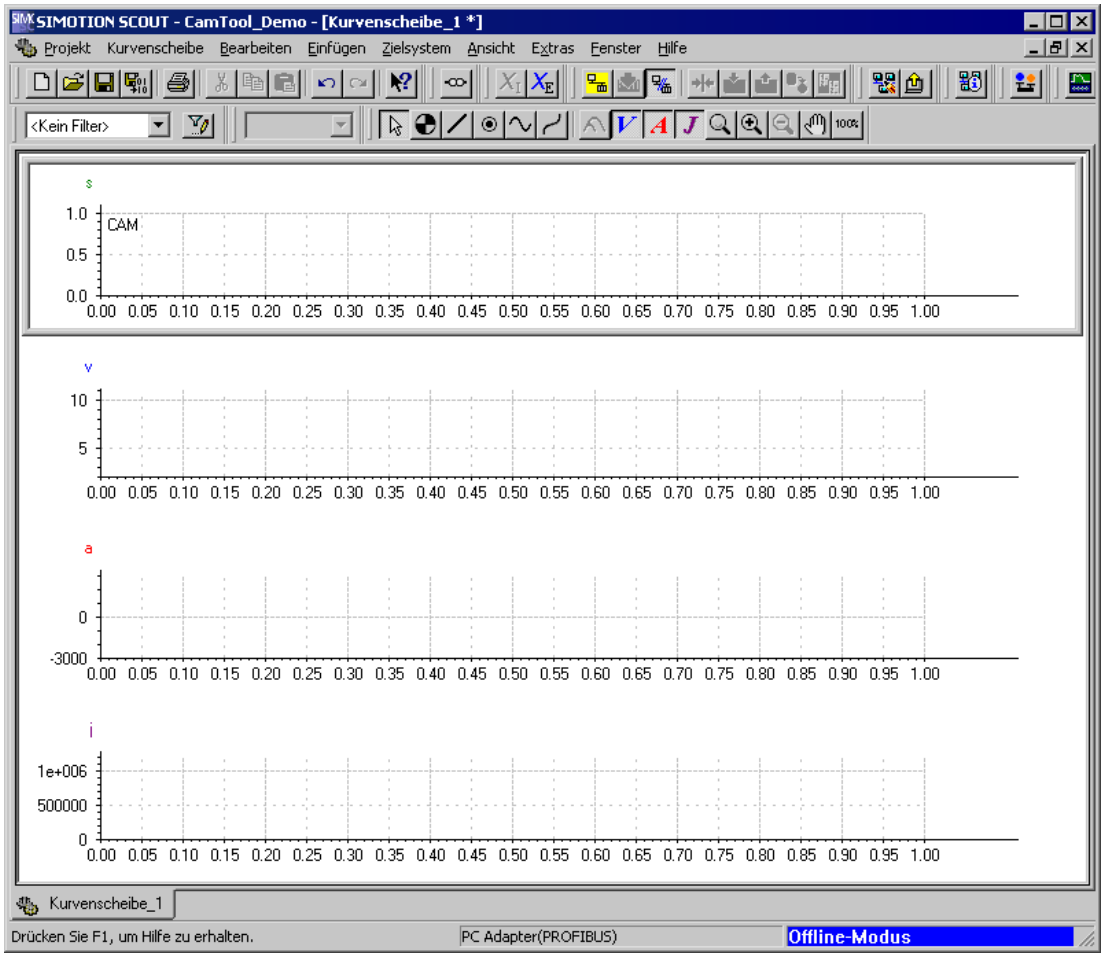

Figure 3-1 Cam diagrams maximized in the SIMOTION SCOUT working area

See also

Changing the representation using the toolbar (Page 59)

3.1.4.3 Editing a Cam with CamTool

Content

Overview

With SIMOTION CamTool, you can edit a cam that is inserted in a SCOUT project.

You can use the following methods to insert and edit a cam. You can

- add a cam to a SCOUT project using SIMOTION CamTool.
- edit with CamTool a cam created with CamEdit.
- import and edit a cam from a text file.
- upload and edit a cam from a SIMOTION device.

Adding a cam to a SCOUT project using CamTool

Requirement

SIMOTION CamTool must be installed as an optional package for SIMOTION SCOUT.

The project in which you wish to insert the cam must be open in SIMOTION SCOUT. There must be at least one SIMOTION device configured in this project.

Inserting a cam in a SCOUT project

To insert a cam in a SCOUT project:

1. In the project navigator, find the SIMOTION device under which you wish to insert a new cam.
2. Open the **Cams** folder and double-click **Insert cam with CamTool.**

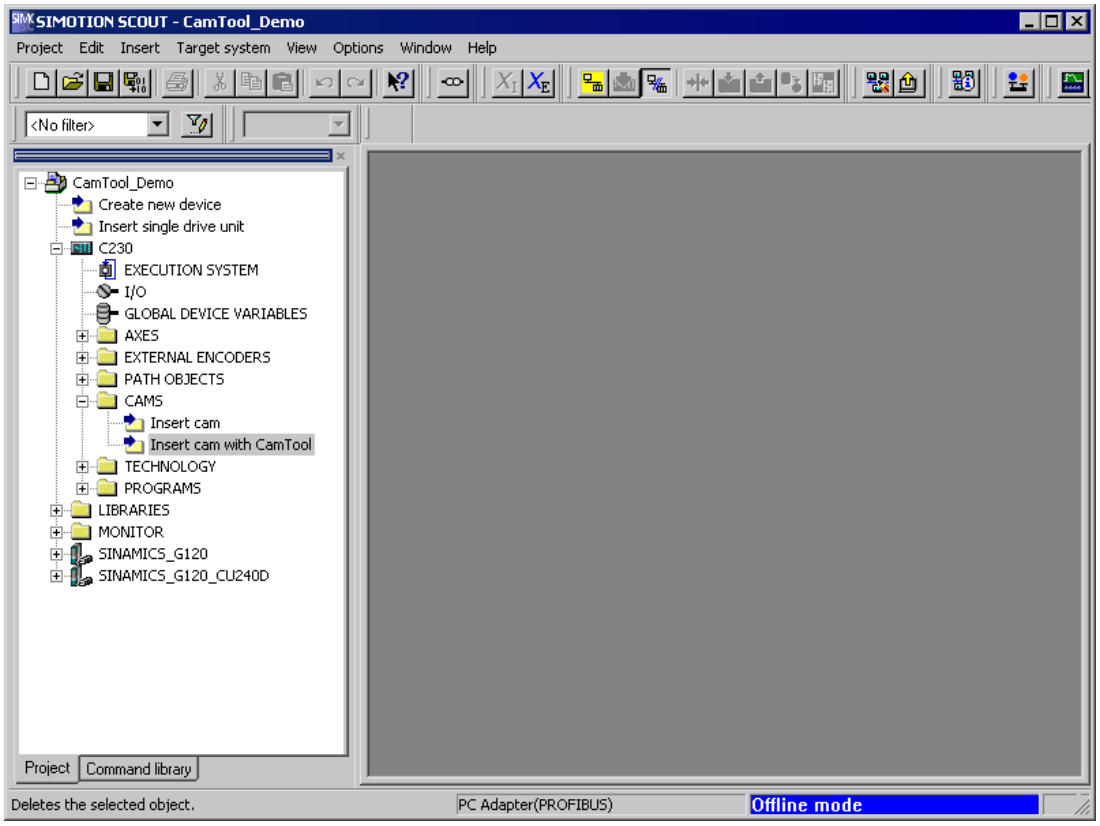

Figure 3-2 Inserting a new cam with CamTool

3. The **Insert cam** window appears. Enter a unique designation for the cam under **Name** (all the cams within the project are listed under **Existing cams**).

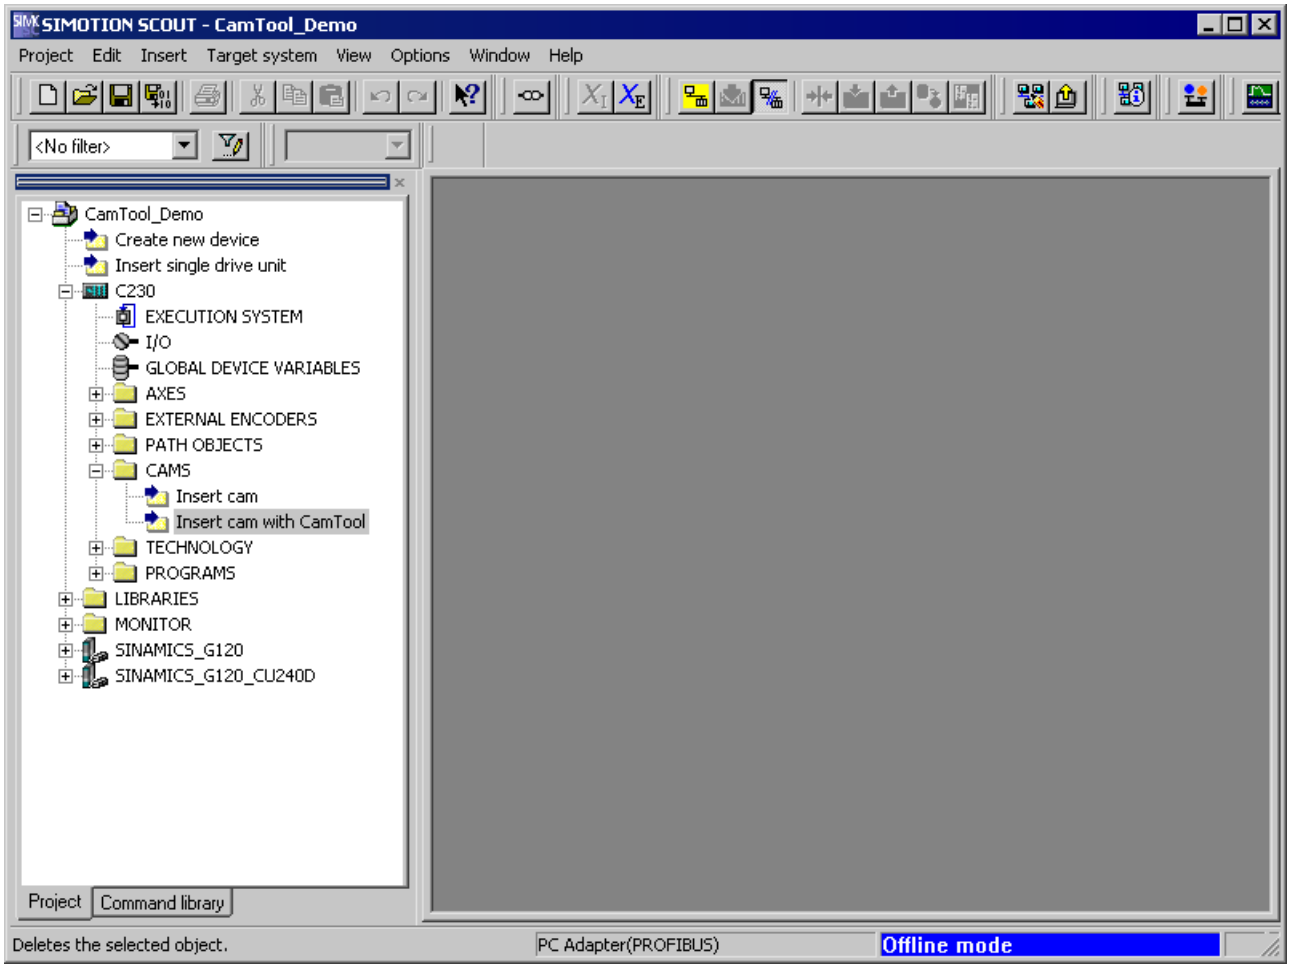

Figure 3-3 Window for inserting cams

4. Click **OK**. A window appears in the SIMOTION SCOUT working area. Depending on the settings in the **Cam > Diagrams** menu item, the cam diagrams will appear in this window.

Note

The cam diagrams show:

- The master axis in the horizontal direction (X-axis) and
- The slave axis in the vertical direction (Y-axis)

See also

Changing the representation using the toolbar (Page 59)

Edit cam created with CamEdit with CamTool

Editing a cam with CamTool

To edit a cam created with CamEdit using CamTool:

1. Close the cam in SIMOTION CamEdit.
2. In the project navigator, find the cam you wish to edit with SIMOTION CamTool.
3. Right-click the cam and select **Convert to CamTool** in the context menu that appears. The cam is opened with SIMOTION CamTool the next time the cam is opened.
4. Double-click the cam. The cam is opened and displayed with SIMOTION CamTool. Segment boundaries between individual cam segments are marked in the S diagram (path diagram).

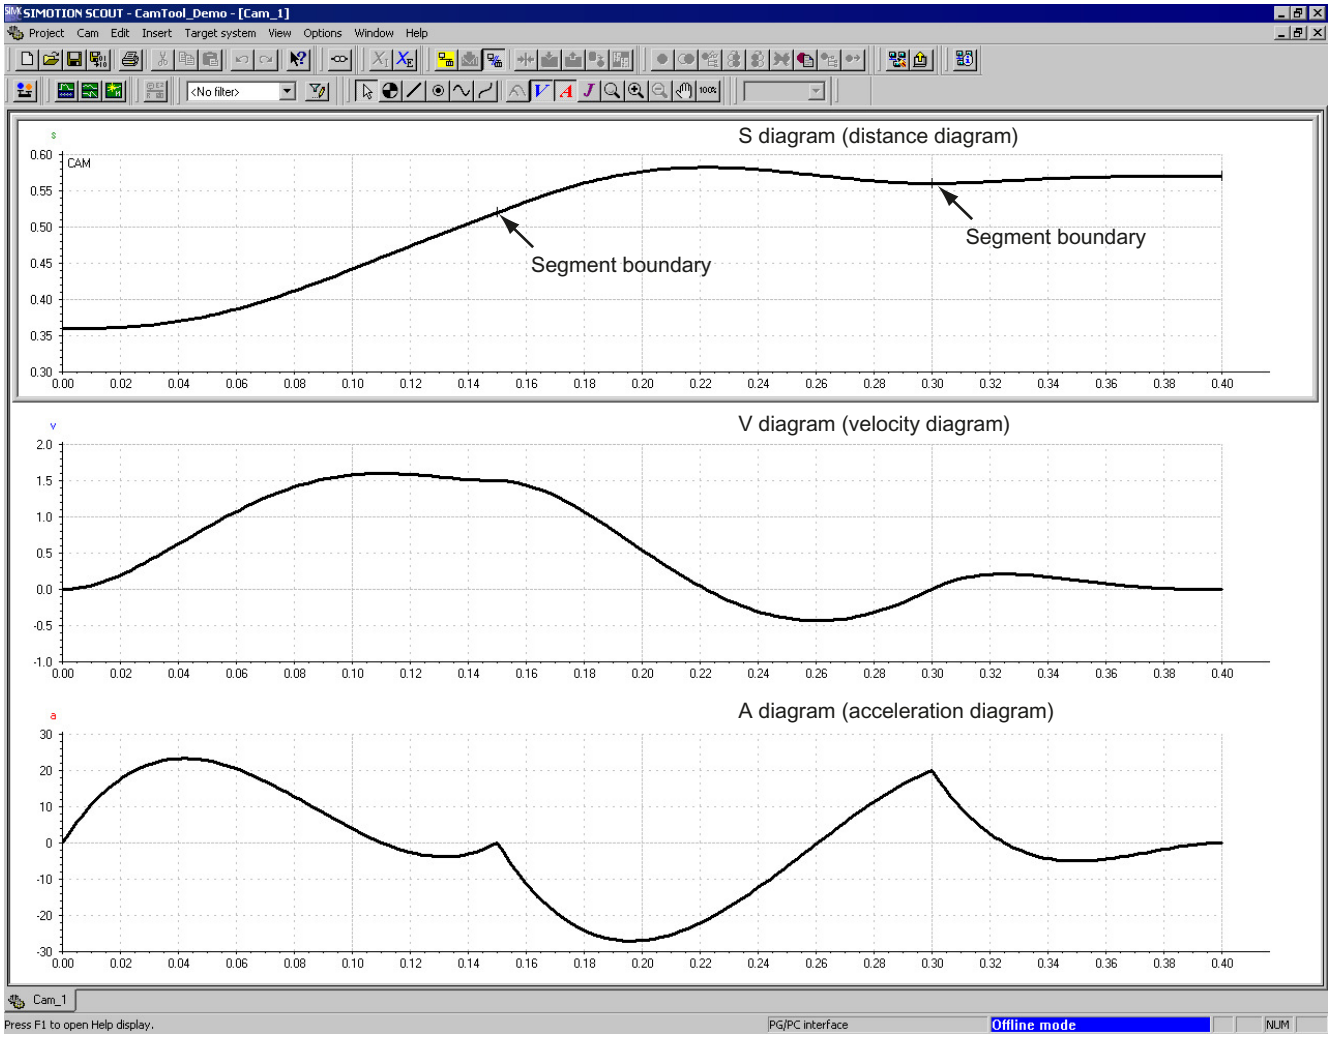

Figure 3-4 Cam created with CamEdit opened with CamTool

5. Select the cam segment you wish to edit. Take the displayed segment boundaries into account.

6. Press the DEL key to delete the cam segment. SIMOTION CamTool replaces the cam segment with an interpolation curve (transition). Fixed points are inserted in the cam profile where necessary to retain the corner points of the original curve.

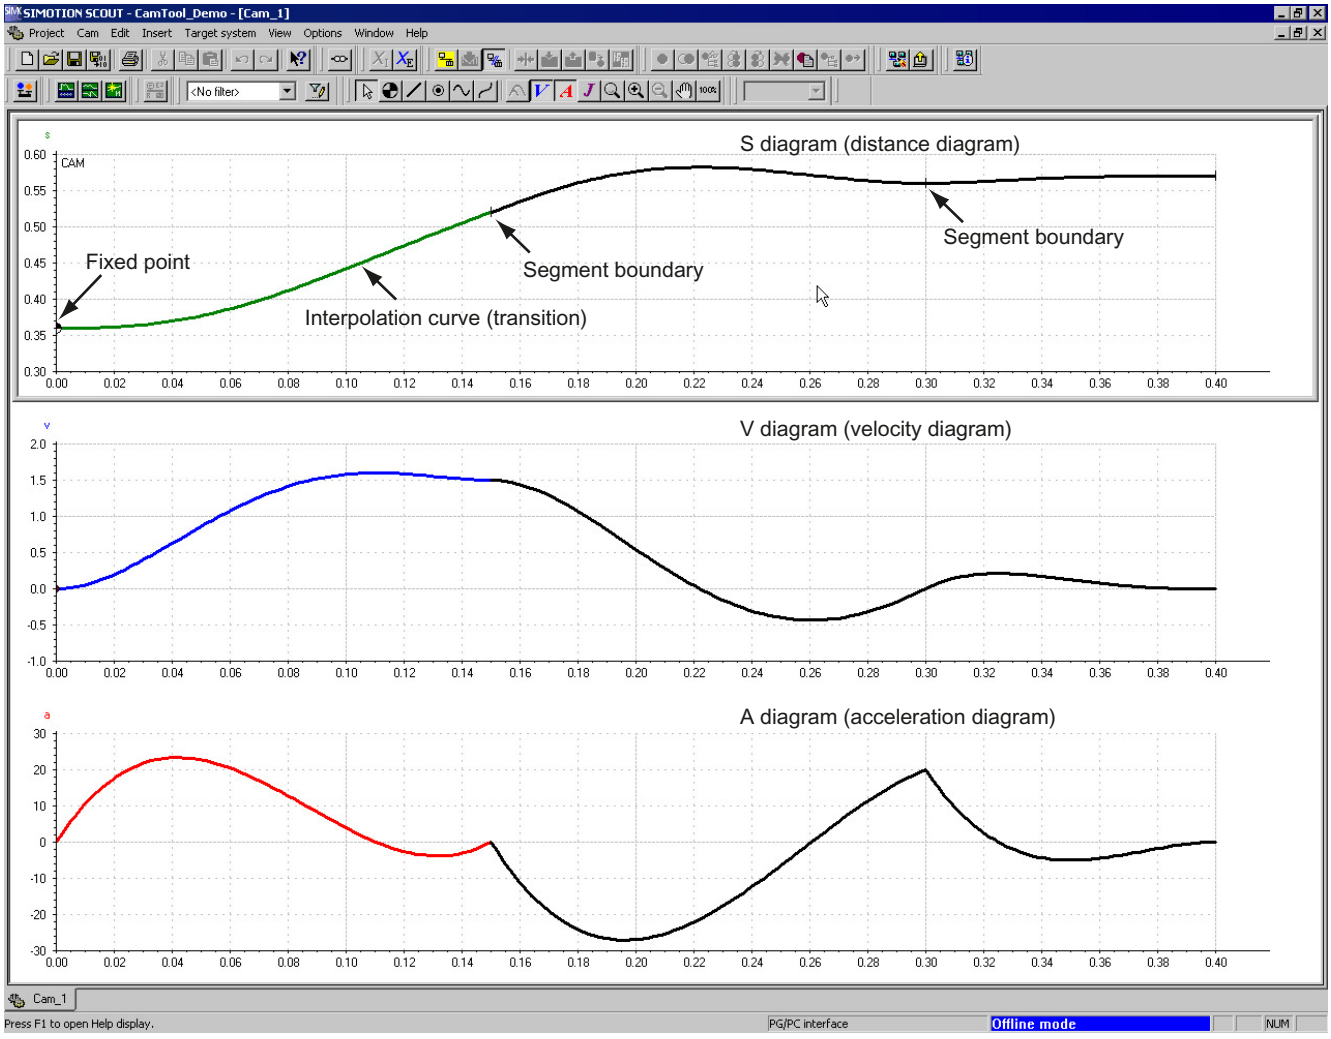

Figure 3-5 Cam segment replaced with fixed point and transition (interpolation polynomial) by SIMOTION CamTool

7. You can edit (e.g. change the position) the cam segment (e.g. fixed point) inserted by SIMOTION CamTool.
8. You can optimize the interpolation curve (transition) inserted by SIMOTION CamTool (e.g. velocity).

See also

Changing the representation using the toolbar (Page 59)

Importing the geometry

Introduction

You can reimport a cam exported from SIMOTION CamTool as a text file into CamTool (e.g. in order to reimport a cam edited in an external program).

Note

The way the cam is represented in the text file must be compatible with the Microsoft Excel CSV format.

Importing a cam

There are two variants for the import of external cams:

- Import with creation of a new cam
- Import with overwriting of an existing cam

Import with creation of a new cam

You can import a new cam via the context menu **Export/import -> Import external cam -> CamTool...**

Import with overwriting of an existing cam

To import a cam from a text file, proceed as follows:

1. Open the cam in which you wish to insert the cam from the text file with SIMOTION CamTool.
   or
   Insert a new cam in which you wish to import the cam from the text file.

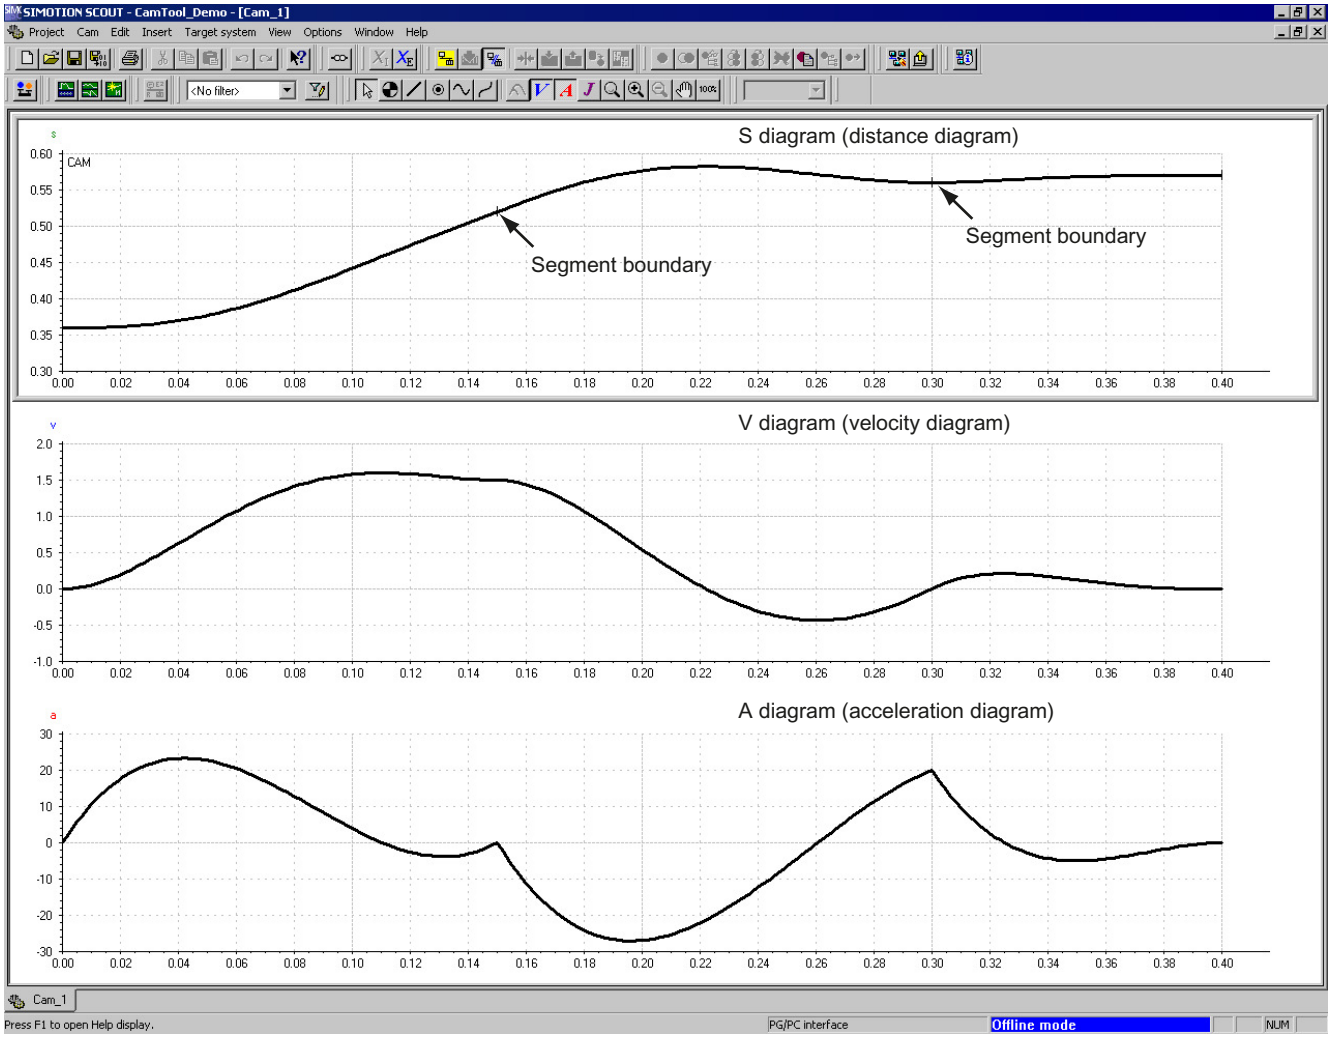

Figure 3-6 Cam imported from a text file

2. Click a diagram to show the **Cam** menu.

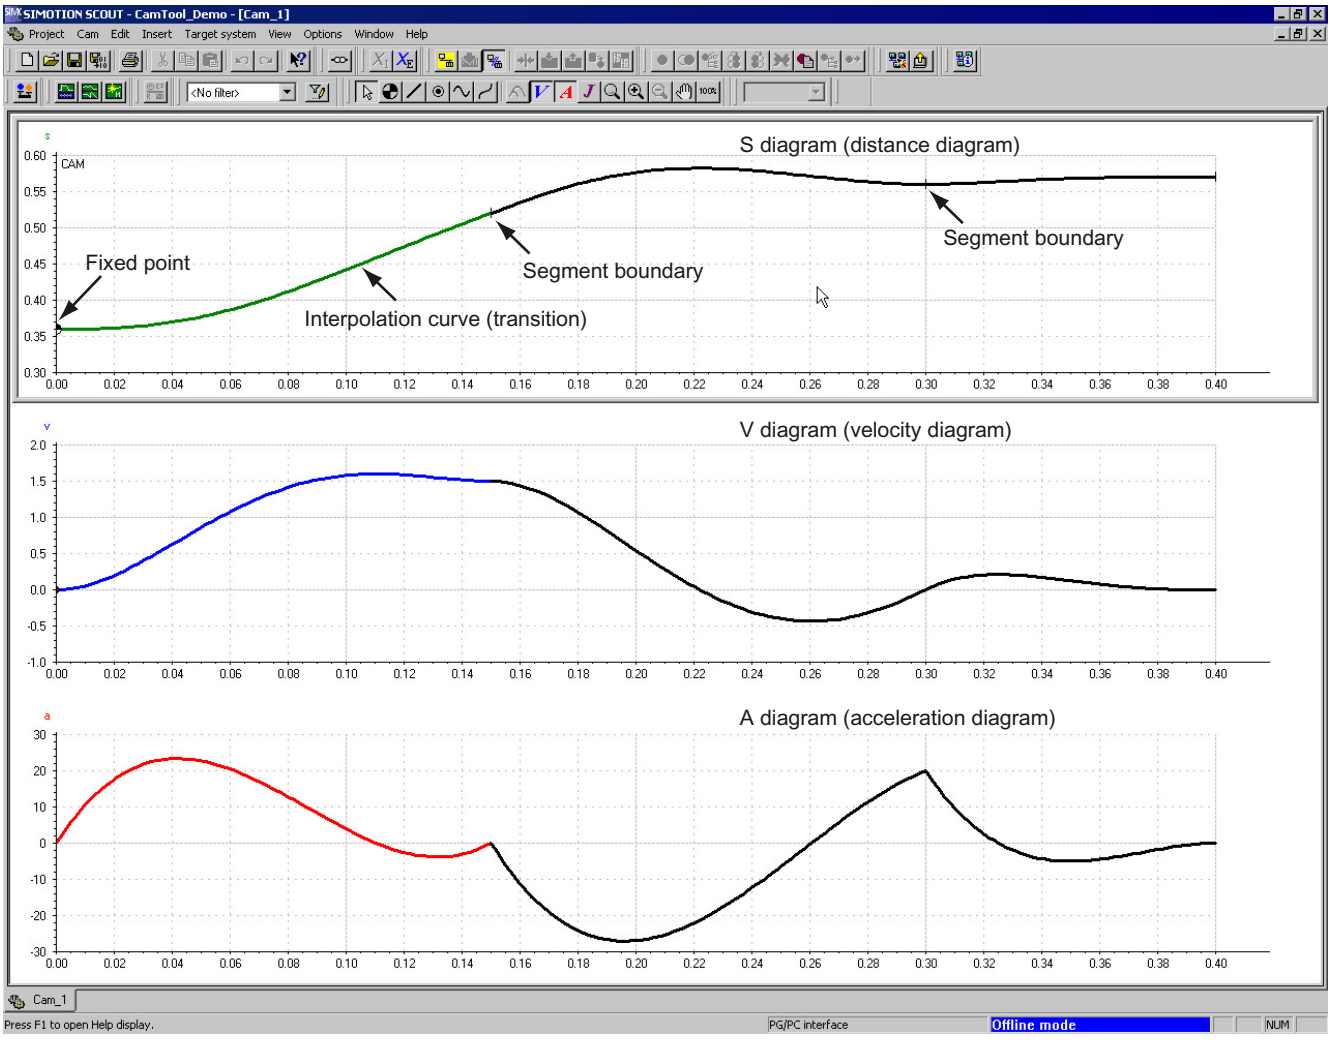

Figure 3-7 Cam segment replaced with fixed point and transition (interpolation polynomial) by SIMOTION CamTool

3. Click the **Cam > Import geometry** menu item. The file selection window appears. At **Search in**, navigate to the text file that contains the cam and select the text file. The designation for the text file is entered at **Name**.
4. Click **OK** in the file selection window. The cam is imported.

Note

If you are importing a cam from a text file and have previously changed the cam displayed, a window appears. This window enables you to accept the changed cam into the project. The cam is then imported from the text file.

Editing an imported cam

To edit a cam imported into SIMOTION CamTool, proceed as follows:

1. The cam imported from a text file is displayed in SIMOTION CamTool. Segment boundaries between individual cam segments are marked in the S diagram (path diagram).
   Select the cam segment you wish to edit. Take account of the displayed segment boundaries.
2. Press the DEL key to delete the cam segment. SIMOTION CamTool replaces the cam segment with an interpolation curve (transition). Fixed points are inserted in the cam profile where necessary to retain the corner points of the original curve.
3. You can edit (e.g. change the position) the cam segment (e.g. fixed point) inserted by SIMOTION CamTool.
4. You can optimize the interpolation curve (transition) inserted by SIMOTION CamTool (e.g. velocity).

See also

Changing the representation using the toolbar (Page 59)

Exporting the geometry

Introduction

You can export a cam created with SIMOTION CamTool as a text file (in order to edit the cam in an external program, for example).

Note

The cam is represented in the text file compatible with the Microsoft Excel CSV format.

The following options are available when exporting:

- As polynomials (polynomial coefficients of the selected cam)
- As raw data (segment properties of the selected cam)

Exporting the cam as polynomials

To export a cam as polynomials, proceed as follows:

1. Open the cam with SIMOTION CamTool.
2. Click a diagram to show the **Cam** menu.
3. Click the **Cam > Export geometry > As polynomials...** menu item. The file selection window appears.
4. At **Save in**, select the target for the text file and enter a designation for the text file at **Name**.
5. Click **OK** in the file selection window. The cam is saved as a text file with the entered designation to the selected target.

Exporting the cam as raw data

To export a cam as raw data, proceed as follows:

1. Open the cam with SIMOTION CamTool.
2. Click a diagram to show the **Cam** menu.
3. Click the **Cam > Export geometry > As raw data...** menu item. The file selection window appears.
4. At **Save in**, select the target for the text file and enter a designation for the text file at **Name**.
5. Click **OK** in the file selection window. The cam is saved as a text file with the entered designation to the selected target.

Note

No export with separated transition segments

Note that the cam cannot be exported with separated transition segments.

Separated transition segments can result, for example, through the deletion of individual segments.

See also

Changing the representation using the toolbar (Page 59)

Upload cam from SIMOTION device

Requirement

The cam must be opened with SIMOTION CamTool.

Note

If you are creating a new cam which has never been downloaded to the SIMOTION device, you first need to download the entire configuration **including** the new cam to the SIMOTION device.

Only then will you be able to upload the cam currently opened with SIMOTION CamTool from the SIMOTION device. Uploading is only possible ONLINE.

Uploading a cam

To upload a cam from a SIMOTION device: :

1. Click the **Project > Connect to target system** menu item. The system switches to ONLINE mode.

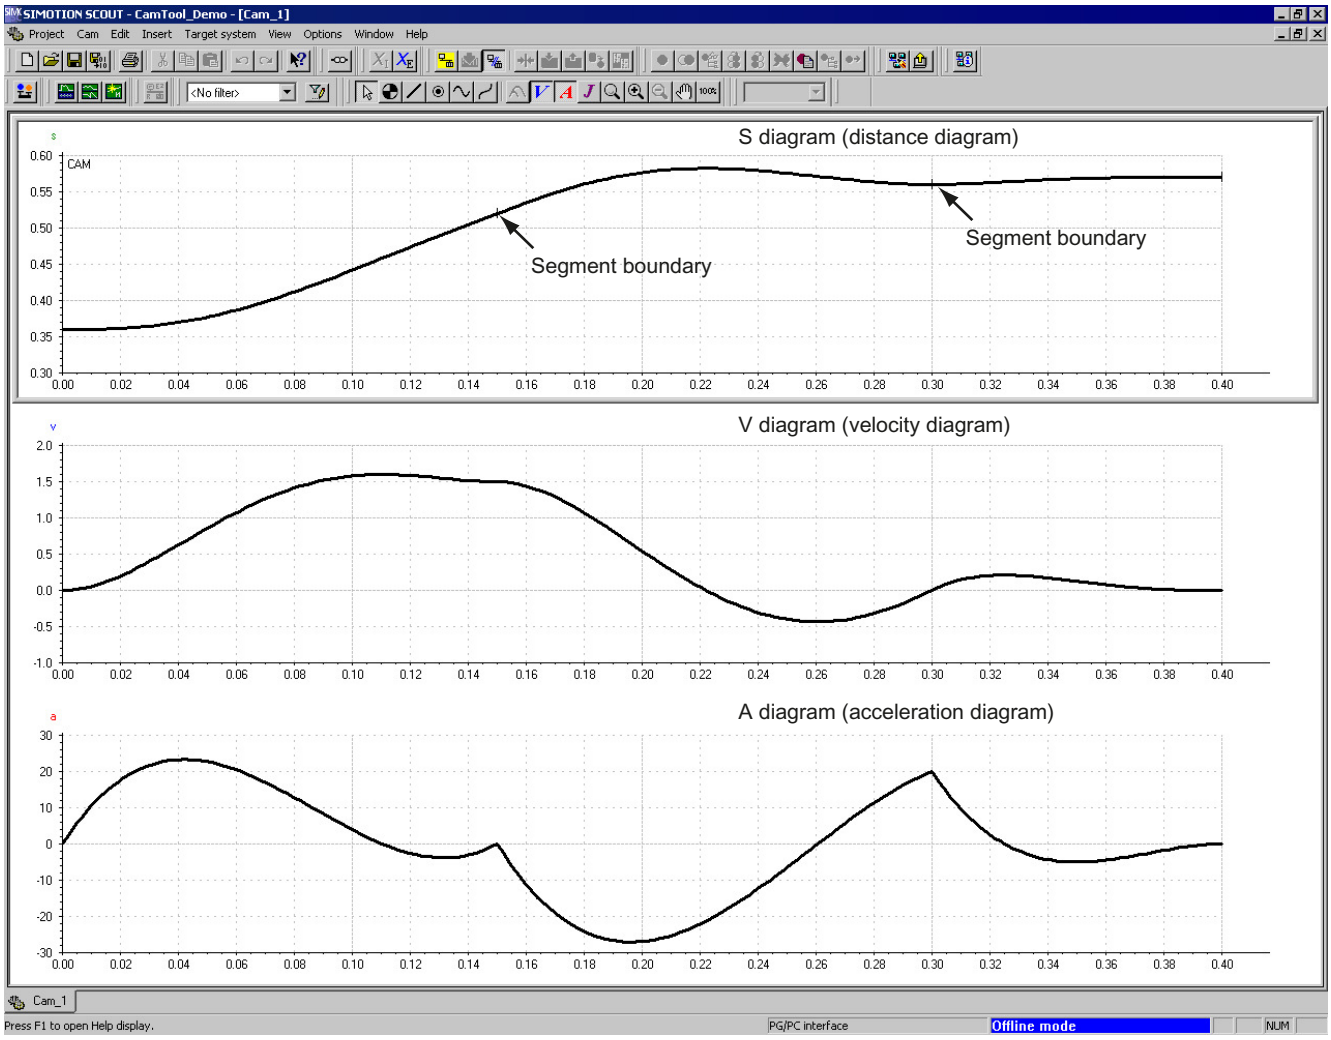

Figure 3-8 Cam uploaded from a SIMOTION device

2. Click a diagram to show the **Cam** menu.

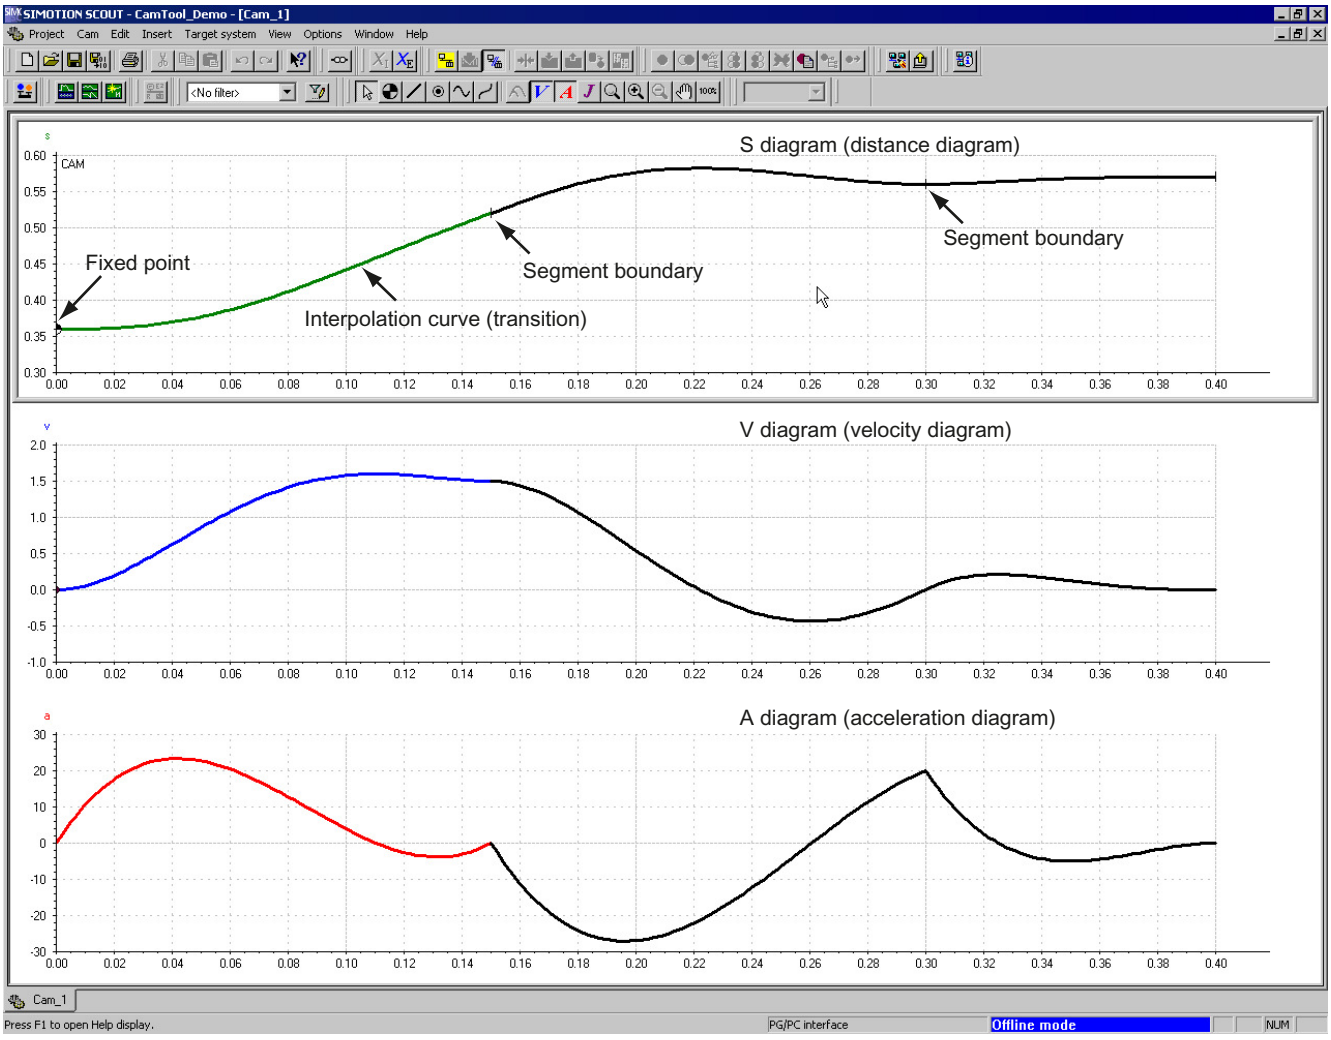

Figure 3-9 Cam segment replaced with fixed point and transition (interpolation polynomial) by SIMOTION CamTool

3. Click the **Cam > Upload cam** menu item. The cam is uploaded from the SIMOTION device.
4. You can switch back to OFFLINE mode once uploading is complete by clicking the **Project > Disconnect from target system** menu item.

Note

If you are uploading a cam from the SIMOTION device and have already changed the cam displayed, a window will appear. This window enables you to accept the changed cam into the project. The cam is then uploaded from the SIMOTION device.

Editing an uploaded cam

To edit a cam that has been uploaded from a SIMOTION device:

1. The uploaded cam is displayed in SIMOTION CamTool. Segment boundaries between individual cam segments are marked in the S diagram (path diagram).
   Select the cam segment you wish to edit. Please take account of the segment boundaries displayed.
2. Press the DEL key to delete the cam segment. SIMOTION CamTool replaces the cam segment with an interpolation curve (transition). Fixed points are inserted in the cam profile where necessary to retain the vertices from the original curve.
3. You can edit (e.g. change the position of) the cam segment (e.g. fixed point) inserted by SIMOTION CamTool.
4. You can optimize the interpolation curve (transition) inserted by SIMOTION CamTool (e.g. its velocity).

See also

Changing the representation using the toolbar (Page 59)

3.1.4.4 Save cam

Requirement

The cam must be opened with SIMOTION CamTool.

Note

If you are exiting SIMOTION CamTool and have already changed the cam, a window will appear. This window enables you to accept the changed cam into the project. SIMOTION CamTool then closes.

If you are uploading a cam from a SIMOTION device and have already changed the cam displayed, a window will appear. This window enables you to accept the changed cam into the project. The cam is then uploaded from the SIMOTION device.

If you are importing a cam from a text file and have already changed the cam displayed, a window will appear. This window enables you to accept the changed cam into the project. The cam is then imported from the text file.

Saving a cam

To save a cam:

1. Click the **Project > Save** menu item. The cam is accepted into the SCOUT project.

See also

Changing the representation using the toolbar (Page 59)

3.1.4.5 Customize the display of the cam

Display the cam

Diagram display

The S diagram (distance diagram) of the cam is always displayed in the SIMOTION SCOUT working area. You can show or hide the V diagram (velocity diagram), the A diagram (acceleration diagram) and the J diagram (jerk diagram) via icons in the toolbar.

Representation parameters

You can customize the display parameters (e.g. representation range) for the master axis, the slave axis and the individual diagrams. This also includes the fonts and lines used for the display.

Show/hide diagram

Requirement

The cam must be opened with SIMOTION CamTool.

Showing/Hiding a diagram

To show/hide a diagram:

1. Click a diagram to show the **Cam** menu.
2. In the **Cam > Diagrams** menu item, click the diagram you wish to show/hide. The diagram is shown/hidden.

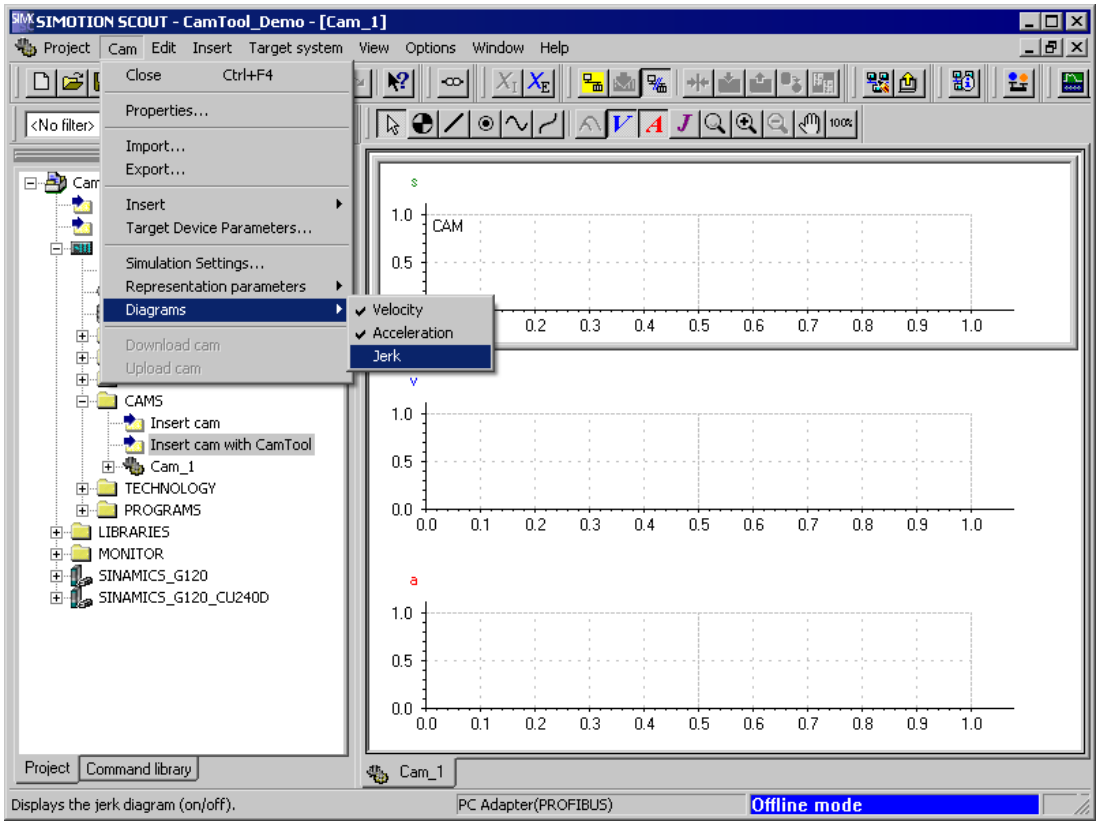

Figure 3-10 Showing/hiding diagrams

See also

Changing the representation using the toolbar (Page 59)

Change axis representation parameters

Requirement

The cam must be opened with SIMOTION CamTool.

Changing representation parameters for axes

To change the representation parameters for the master axis or slave axis:

1. Click a diagram to show the **Cam** menu.
2. In the **Cam > Representation parameters** menu item, click the axis whose representation parameters you wish to change.
3. The **Master properties** window (for the master axis) or the **S diagram (slave) properties** window (for the slave axis) appears.

Change the representation parameters for the master axis in **Master properties.**

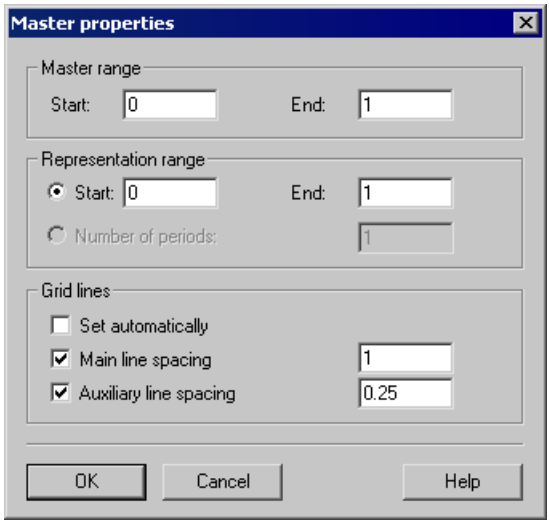

Figure 3-11 Master properties window

Change the representation parameters for the slave axis in **S diagram (slave) properties.**

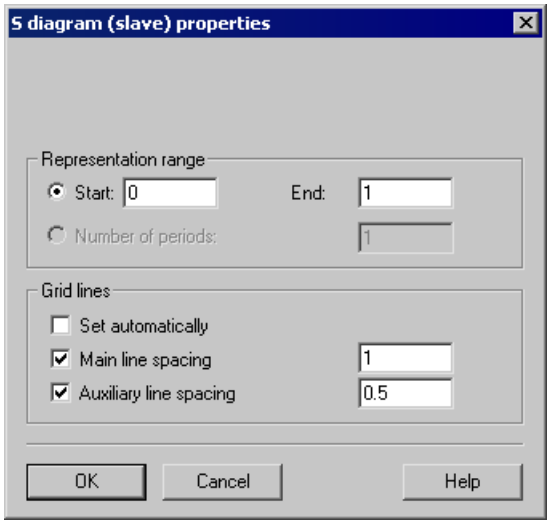

Figure 3-12 Slave properties window

Table 3-2 Parameters in the window for the master or S diagram (slave) properties

Field/Button		Meaning/Operation
Master range (Master properties)		Specify the **master range** (definition range) for the curve by setting its start and end points. Cam segments must be contained within the master range (see also **Master range** under **Target device properties** on the **Coordinates** tab).
	Start	Here, you enter the **start** point of the curve or the start of the curve's master range.
	End	Here, you enter the **end** point of the curve or the end of the curve's master range.
Representation range		
	Start (Number of periods deactivated)	Here, you specify the **start** of the representation range. If the **Number of periods** option is activated, the system will specify the start.
	End (Number of periods deactivated)	Here, you enter the **end** of the representation range. If the **Number of periods** option is activated, the system will specify the end.
	Number of periods (Cyclic absolute, Cyclic relative)	If you have specified the **Cyclic absolute** or **Cyclic relative execution type** under **Target device parameters** on the **Coordinates** tab, you will be able to select the **Number of periods** option. Enter the number of periods you want to display here.
Grid lines		
	Set automatically	If you activate **Set automatically**, the optimum distance between the grid lines will be set automatically. If you deactivate **Set automatically**, you will be able to specify the distance between the grid lines under **Main line spacing** or **Auxiliary line spacing**.
	Main line spacing	This is where you activate **Main line spacing** for the grid lines. If you deactivate the **Set automatically** option, you will be able to set the distance between the grid lines for main line spacing. **Note**: The distance between the grid lines defined in main line spacing must be a multiple of the distance between the specifications for grid lines with auxiliary line spacing.
	Auxiliary line spacing (Main line spacing activated)	If the **Main line spacing** option is activated, you will also be able to activate the grid line display for **Auxiliary line spacing**. If you deactivate the **Set automatically** option, you will be able to set the distance between the grid lines for auxiliary line spacing. **Note**: The distance between the grid lines defined in main line spacing must be a multiple of the distance between the specifications for grid lines with auxiliary line spacing.

Changing the representation using the toolbar (Page 59)

Change diagram representation parameters

Requirement

The cam must be opened with SIMOTION CamTool.

Changing representation parameters for a diagram

To change the representation parameters for the V diagram (velocity diagram), A diagram (acceleration diagram), or the J diagram (jerk diagram):

1. Click a diagram to show the **Cam** menu.
2. In the **Cam > Representation parameters** menu item, click the diagram whose representation parameters you wish to change.
3. The **V diagram properties** window (for the velocity diagram), the **A diagram properties** window (for the acceleration diagram), or the **J diagram properties** window (for the jerk diagram) appears.

For the V diagram (velocity diagram), change the representation parameters in **V diagram properties.**

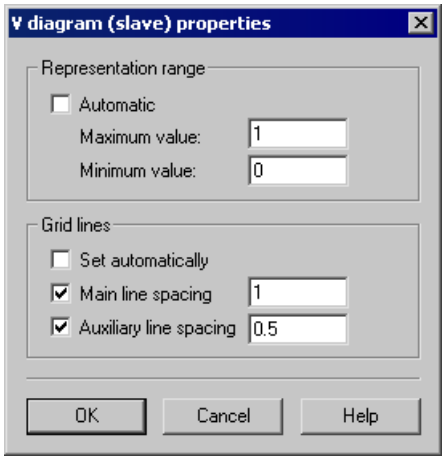

Figure 3-13 V diagram properties window

For the A diagram (acceleration diagram), change the representation parameters in **A diagram properties.**

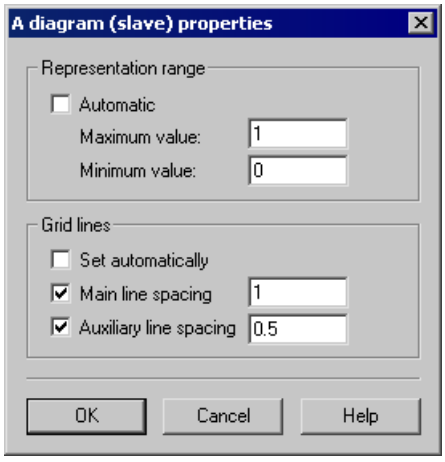

Figure 3-14 A diagram properties window

For the J diagram (jerk diagram), change the representation parameters in **J diagram properties.**

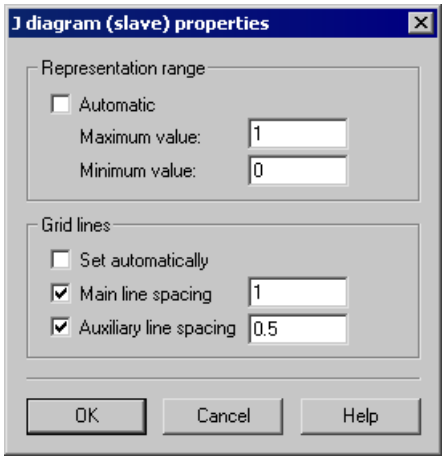

Figure 3-15 J diagram properties window

Table 3-3 Parameters in the V/A/J diagram properties window

Field/Button		Meaning/Operation
Representation range		
	Automatic	If you activate **Automatic**, the representation range will be automatically adapted in the Y direction to fit the value range for the curve shown. If you deactivate **Automatic**, you will be able to specify the representation range in the Y-direction using **Maximum value** and **Minimum value**.
	Maximum value (Automatic deactivated)	Here, you enter the **maximum value** of the representation range. If the **Automatic** option is activated, the system will specify the maximum value.

Field/Button		Meaning/Operation
	Minimum value (Automatic deactivated)	Here, you enter the **minimum value** of the representation range. If the **Automatic** option is activated, the system will specify the minimum value.
Grid lines		
	Set automatically	If you activate **Set automatically**, the optimum distance between the grid lines will be set automatically. If you deactivate Set automatically, you will be able to specify the distance between the grid lines under **Main line spacing** or **Auxiliary line spacing**.
	Main line spacing	This is where you activate **Main line spacing** for the grid lines. If you deactivate the **Set automatically** option, you will be able to set the distance between the grid lines for main line spacing. **Note:** The distance between the grid lines defined in main line spacing must be a multiple of the distance between the specifications for grid lines with auxiliary line spacing.
	Auxiliary line spacing (Main line spacing activated)	If the **Main line spacing** option is activated, you will also be able to activate the grid line display for **Auxiliary line spacing**. If you deactivate the **Set automatically** option, you will be able to set the distance between the grid lines for auxiliary line spacing. **Note:** The distance between the grid lines defined in main line spacing must be a multiple of the distance between the specifications for grid lines with auxiliary line spacing.

Change lines and fonts representation parameters

Default parameters for lines and fonts are used when displaying diagrams. You can change these default settings.

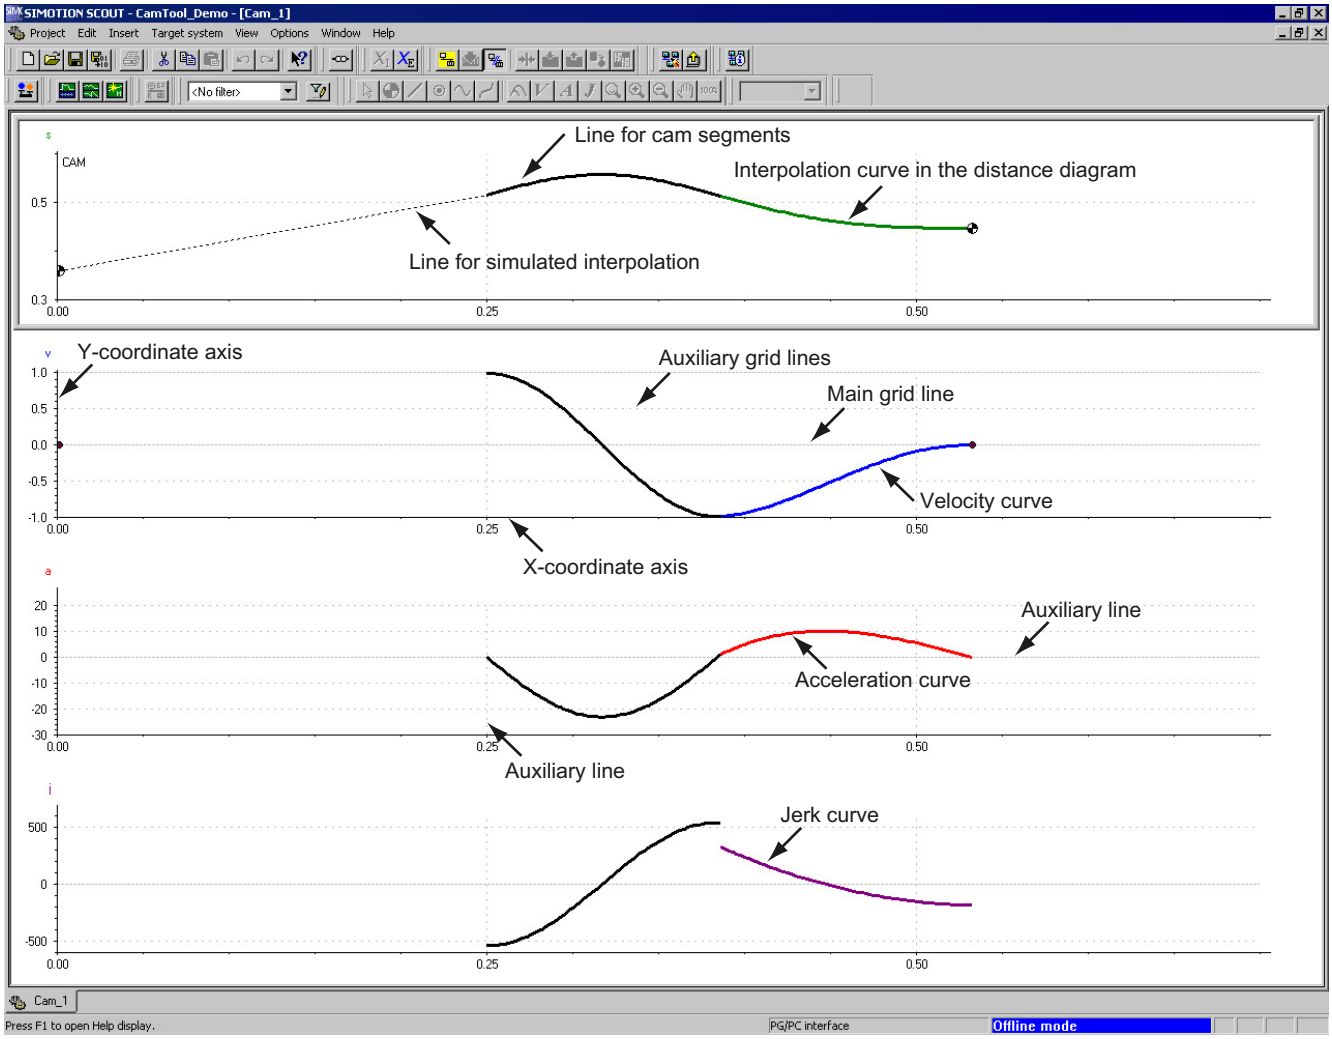

Figure 3-16 Representation parameters in diagrams (lines for scaling and physical limit value are not shown)

Table 3-4 Representation parameters in diagrams

Representation parameters	Note
Main grid lines	You can change the type and color of the line.
Auxiliary grid lines	You can change the type and color of the line.
Auxiliary line	You can change the type, color, and width of the line.
Line at physical limit	You can change the type, color, and width of the line.
X-axis	You can change the color and width of the line.

Representation parameters	Note
Y-axis	You can change the color and width of the line.
Line for simulated interpolation	You can change the color and width of the line. **Line for simulated interpolation** is used to display a transition interpolated by the target device.
Interpolation curve in the path diagram	You can change the color and width of the line.
Velocity curve	You can change the color and width of the line.
Acceleration curve	You can change the color and width of the line.
Jerk curve	You can change the color and width of the line.
Line for cam segments	You can change the color and width of the line.
Line for scaling	You can change the color and width of the line. The **line for scaling** is used to display a cam profile which has been scaled and moved.

Requirement

The cam must be opened with SIMOTION CamTool.

Changing representation parameters for lines and fonts

To change representation parameters for lines and fonts: :

1. Click a diagram to show the **Cam** menu.
2. Click **Lines and fonts** in the **Cam > Representation parameters** menu item.
3. The **Lines and fonts** window appears.

You can change the representation parameters for the lines on the **Line** tab.

Table 3-5 Parameters on the Line tab

Field/Button		Meaning/Operation
Type of line		Here, you select the **type of line** you wish to specify. The associated parameters and the type of line are displayed under **Settings**.
Settings		**Note:** Grayed-out parameters cannot be changed.
	Type	Here, you select the **type** of line. You can use **Preview** to display the type of line.
	Color	Here, you select the **color** of the line. You can use **Preview** to display the line.
	Width	Here, you select the **width** of the line. You can use **Preview** to display the type of line.
	Preview	Select **Preview** to display the **type**, **color**, and **width** specified for the line.

You can change the representation parameters for fonts on the **Fonts** tab.

Table 3-6 Parameters on the Fonts tab

Field/Button		Meaning/Operation
Settings		
	Font	Here, you select the **font**. You can use **Preview** to display the font.
	Font scheme	Here, you select the **font scheme**. You can use **Preview** to display the font.
	Font size	Here, you select the **font size**. You can use **Preview** to display the font.
	Preview	Select **Preview** to display the font specifications made in **font**, **font scheme**, and **font size**.

Changing the representation using the toolbar (Page 59)

Displaying auxiliary lines in the diagram

You can display horizontal and vertical auxiliary lines in individual diagrams. Auxiliary lines can be used, for example, to determine the position of individual points on the cam profile.

Requirement

The cam must be opened with SIMOTION CamTool.

Displaying a horizontal auxiliary line in a diagram

To display a horizontal auxiliary line (in the direction of the X-axis) in a diagram:

1. In the diagram where you want to display a horizontal auxiliary line, click the X-axis and hold the mouse button down. The current position of the auxiliary line is displayed in the positioning window.
2. Drag the auxiliary line to the position where you wish to display it and release the mouse button. The auxiliary line and the positioning window showing its current position appear in the diagram.

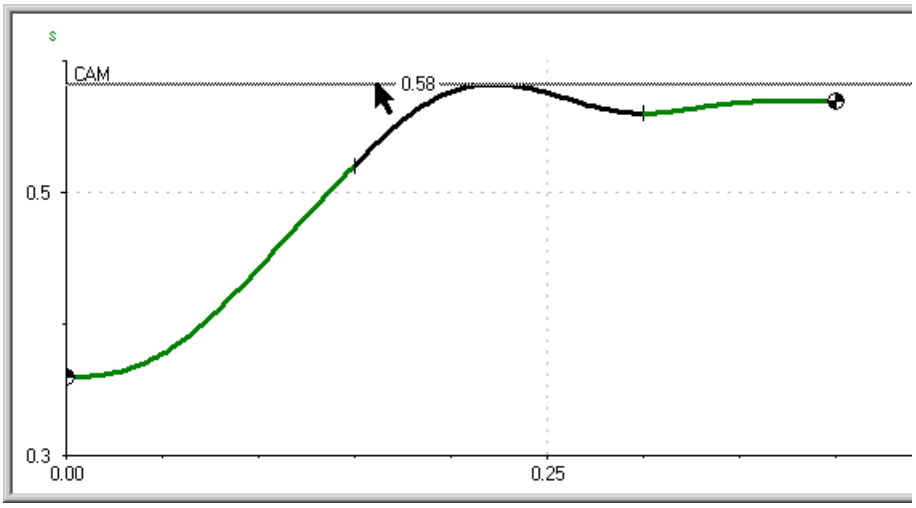

Figure 3-17 Displaying a horizontal auxiliary line

Displaying a vertical auxiliary line in all diagrams on show

To display a vertical auxiliary line (in the direction of the Y-axis) in all diagrams on show:

1. Click the Y-axis in a diagram and hold the mouse button down. The current position of the auxiliary line is displayed in the positioning window.
2. Drag the auxiliary line to the position where you wish to display it and release the mouse button. The auxiliary line and the positioning window showing its current position appear in all the diagrams that are on show.

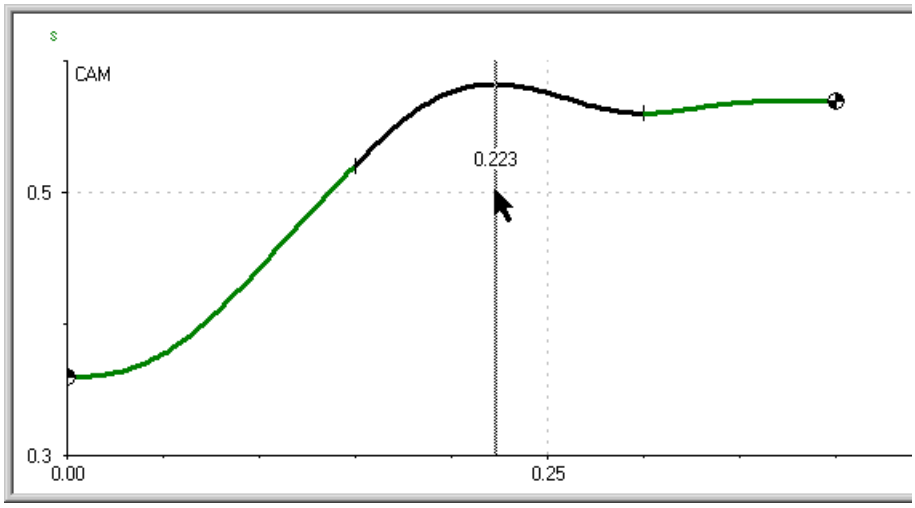

Figure 3-18 Displaying a vertical auxiliary line

Moving a positioning window along an auxiliary line

To move a positioning window showing the current position of the auxiliary line along the horizontal or vertical auxiliary line:

1. Place the cursor on the positioning window. The cursor indicates the direction in which you can move the window. Drag and drop the window showing the current position to the new position.

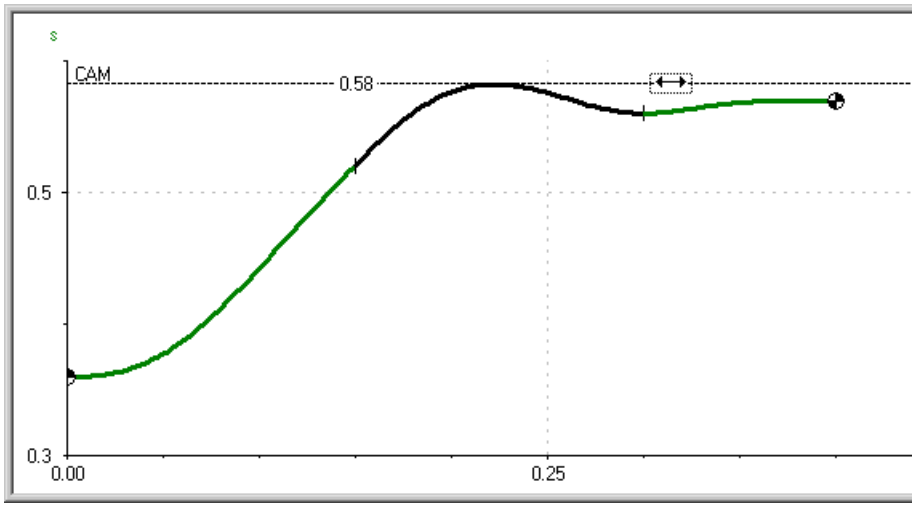

Figure 3-19 Moving a positioning window horizontally

Deleting an auxiliary line in a diagram

To delete a horizontal or vertical auxiliary line in a diagram:

1. Select the auxiliary line you wish to delete.
2. Press the DEL key. The auxiliary line is deleted.

3.1.4.6 Download cam to SIMOTION device

Requirements

The cam is opened with SIMOTION CamTool.

Note

If you create a cam and the cam has never been previously downloaded to the SIMOTION device, you must first download the entire configuration **with** the new cam to the SIMOTION device.

Only then can you download the cam independent of the other technology objects in the SIMOTION device. The download is only possible in ONLINE status.

Download cam to SIMOTION device

To download a cam to a SIMOTION device:

1. Click the menu Project > Connect to target system. The system changes to ONLINE status.
2. Click a diagram to show the Cam menu.
3. Click the menu Cam > Download cam. The cam is downloaded to the SIMOTION device.
4. After the download, you can change back to OFFLINE status. Click the menu Project > Disconnect from target system.

3.1.5 Functions

3.1.5.1 Content

Overview

In this chapter you learn how you can use SIMOTION CamTool to create and optimize a cam, and to make the simulation settings. In addition, you learn how you can use CamTool to edit a cam created with CamEdit and how you can export a cam as a text file.

Note

The following operating instructions primarily describe the operation of SIMOTION CamTool using the functions in the menu bar.

You can also execute the functions from the context menus. In this case, right-click the element that you want to edit.

You can also execute the most import functions using the icons in the SIMOTION CamTool toolbar. Pay attention to the Tooltip which is displayed when you place the mouse pointer on an icon in the toolbar.

3.1.5.2 Structure of a cam

Introduction

Create the cam in the S diagram (path diagram). The cam profile reflects the path-related interdependence between the master axis (X-axis in the diagram) and the slave axis (Y-axis in the diagram).

Cam structure

The cam consists of individual cam segments.

With SIMOTION CamTool, you can use fixed points, straight lines, sine curves, arc sine curves, and interpolation points as cam segments.

SIMOTION CamTool calculates interpolation curves between individual cam segments and displays the V diagram (velocity diagram), A diagram (acceleration diagram), and J diagram (jerk diagram).

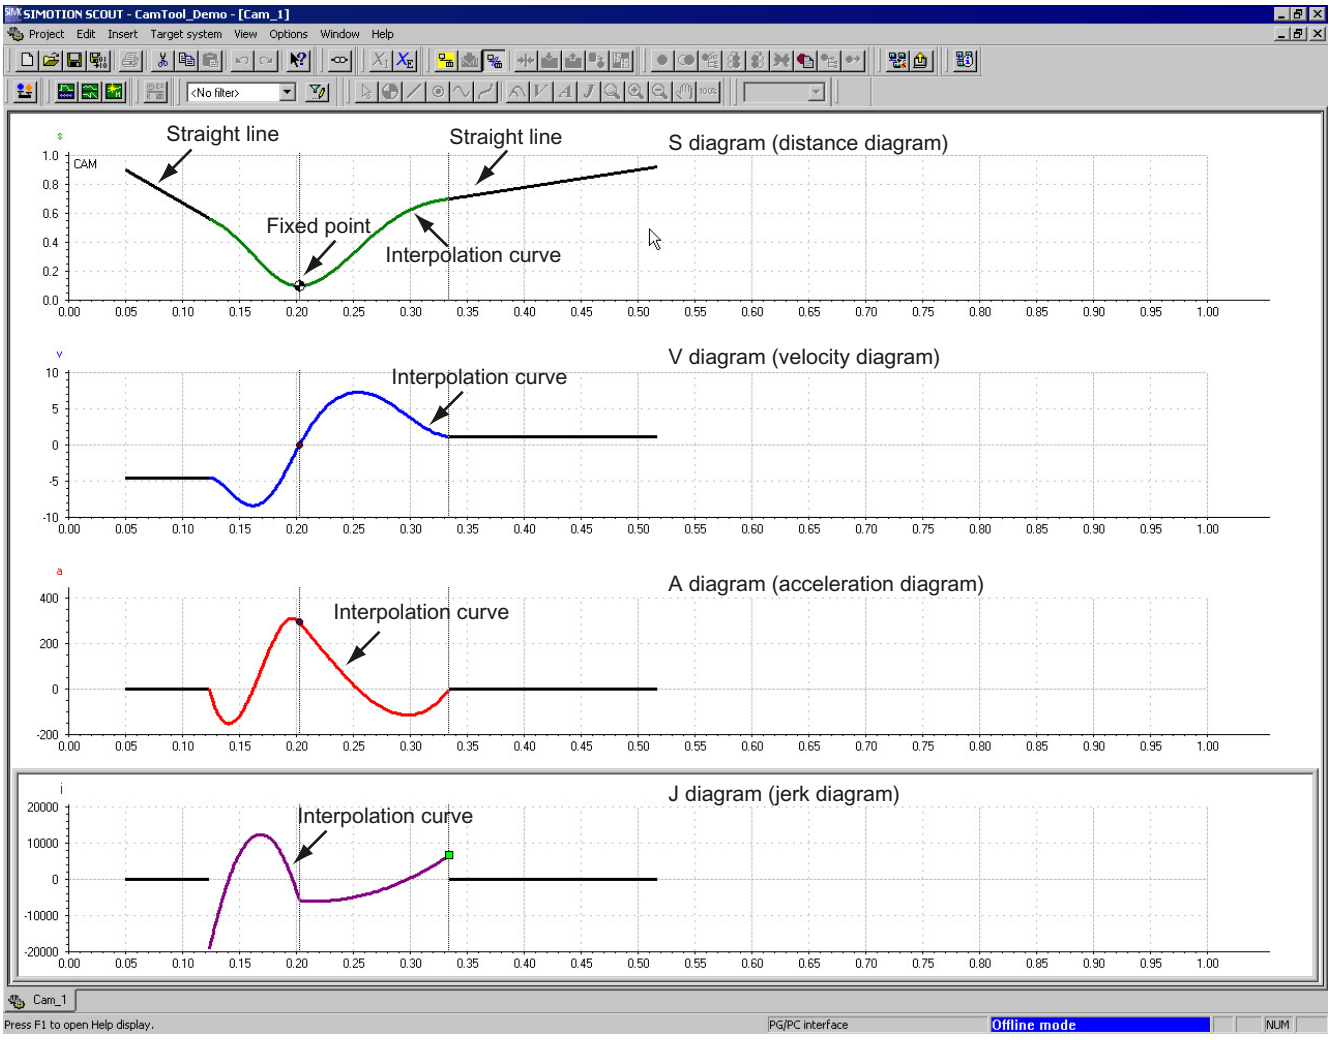

Figure 3-20 Example of a cam with interpolation curves

3.1.5.3 Fixed point

Fixed Point Definition

Definition

The cam consists of individual cam segments. With SIMOTION CamTool, you can use fixed points, lines, sine curves, arc sine curves, and interpolation points as cam segments.

A fixed point is a predefined slave axis position for a given master axis position. You can specify the velocity and acceleration at the position of the fixed point.

Note

Use a fixed point to specify a single, fixed position. CamTool calculates optimum transitions between adjacent cam segments.

Interpolation points (Page 111) must be used for any profile you wish to define. CamTool links the individual interpolation points with a cubic spline in order to create the profile specified by the interpolation points as accurately as possible.

Insert fixed point

Requirement

The cam must be opened with SIMOTION CamTool.

Inserting a fixed point

To insert a fixed point:

1. Click the S diagram (path diagram) to activate it.
2. Click Cam > Insert at fixed point. The cursor changes appearance.
3. Place the modified cursor at the position in the S diagram (path diagram) where you wish to insert the fixed point and click.
   The fixed point appears in the diagram. The position of the fixed point is shown in the tool tip.

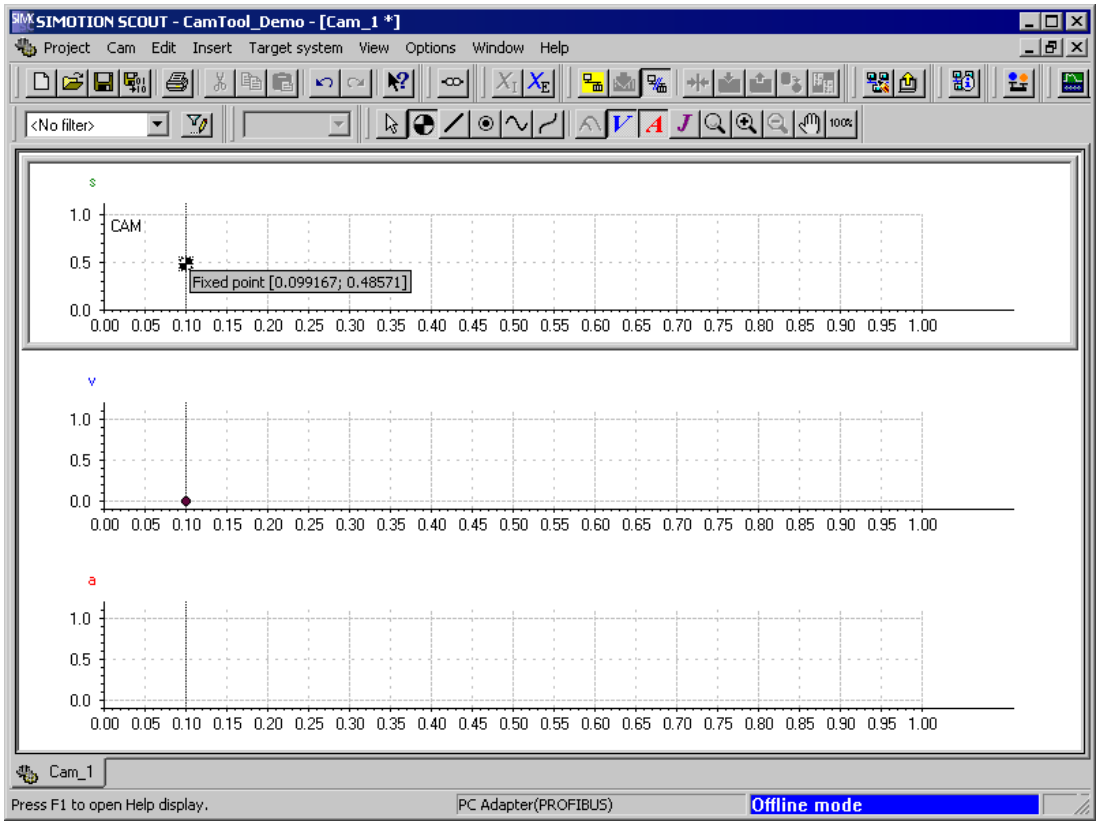

Figure 3-21 Inserting a fixed point

Note

Once you have activated the **Cam > Insert > Fixed point** function, you can continue inserting fixed points in the S diagram (path diagram) until:

- You press the ESC key
- You right-click (to activate the selection tool in the toolbar), or
- You activate another cam segment (straight line, sine curve, arc sine curve, interpolation point) for insertion.

See also

Changing the representation using the toolbar (Page 59)

Change fixed point position

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the position of a fixed point

To change the position of a fixed point:

1. Select the fixed point in the S diagram (path diagram). The position of the fixed point is shown in the tool tip.
2. Drag and drop the fixed point to the new position.

or

1. Double-click the fixed point. The **Fixed point properties** window appears.
2. Enter the fixed point's new x- or y position on the Position tab (Page 94) and click **OK**. The diagram is updated to show the fixed point's new position.

See also

Changing the representation using the toolbar (Page 59)

Changing the velocity at the position of a fixed point:

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the velocity of a fixed point

To change the velocity at the position of a fixed point:

1. The velocity at the position of a fixed point is shown in the form of a handle in the V diagram (velocity diagram).
   Select the handle. The cursor indicates the direction in which you can move the handle.
2. Drag and drop the handle to the new position.

or

1. Double-click the fixed point. The **Fixed point properties** window appears.
2. Enter the new velocity on the Dynamics tab (Page 95) in accordance with the table below and click **OK**. The handle in the V diagram (velocity diagram) appears at the new position.

Field/Button	Meaning/Operation
v =	**v** = indicates the current velocity at the position of the fixed point (see note below).
a = (manual input activated)	**a** = indicates the current acceleration at the position of the fixed point. If **Manual input** is deactivated, the system will calculate the acceleration value. The jerk diagram (J diagram) will then be constant at the fixed point. If **Manual input** is activated, you will be able to enter an acceleration value. To change the acceleration, enter the new acceleration value under **a** = and click **Accept** or **OK**. The diagrams update their display of the fixed point.
Manual input	If you activate **Manual input**, you will be able to enter an acceleration value under **a** =. If you deactivate **Manual input**, the system will calculate the acceleration value. The jerk diagram (J diagram) will then be constant at the fixed point.

Note

If you want to specify an absolute slave velocity, you must select an absolute **master velocity for calculations** in the **Simulation settings** window.

See also

Changing the representation using the toolbar (Page 59)

Changing the acceleration at a fixed point position:

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the acceleration of a fixed point

To change the acceleration at the position of a fixed point:

1. Right-click the fixed point and select **Direct Entry for Acceleration** in the context menu which appears.
2. The acceleration at the position of a fixed point is shown in the form of a handle in the A diagram (acceleration diagram).
   Select the handle. The cursor indicates the direction in which you can move the handle.
3. Drag and drop the handle to the new position.

or

1. Double-click the fixed point. The **Fixed point properties** window appears.
2. Activate the **Manual input** option on the Dynamics tab (Page 95) and enter the new acceleration value.
3. Click **OK**. The handle in the A diagram (acceleration diagram) appears at the new position.

Note

If you want to specify an absolute slave acceleration, you must select an **absolute master velocity for calculations** in the **Simulation settings** window.

Changing the representation using the toolbar (Page 59)

Position, fixed point properties

Position tab

Here, you specify the **position** of the fixed point in the path diagram.

You can set the following parameters:

Table 3-7 Parameters on the Position tab (Fixed point properties window)

Field/Button		Meaning/Operation
Position		
	x =	**x** = indicates the current x position of the fixed point. To change the position, enter the new position under **x** = and click **Accept** or **OK**. The diagram updates its display of the fixed point.
	y =	**y** = indicates the current y position of the fixed point. To change the position, enter the new position under **y** = and click **Accept** or **OK**. The diagram updates its display of the fixed point.

Dynamic response, fixed point properties

Dynamics tab

Here, you specify the **dynamic response** of the fixed point.

You can set the following parameters:

Table 3-8 Parameters on the Dynamics tab (Fixed point properties window)

Field/Button		Meaning/Operation
Dynamics		
	v =	**v** = indicates the current velocity at the position of the fixed point To change the velocity, enter the new velocity value under **v** = and click **Accept** or **OK**. The diagrams update their display of the fixed point. **Note:** If you want to specify an absolute slave velocity, you must select an absolute **master velocity for calculations** in the **Simulation settings** window.
	a = (manual input activated)	**a** = indicates the current acceleration at the position of the fixed point. If **Manual input** is deactivated, the system will calculate the acceleration value. The jerk diagram (J diagram) will then be constant at the fixed point. If **Manual input** is activated, you will be able to enter an acceleration value. To change the acceleration, enter the new acceleration value under **a** = and click **Accept** or **OK**. The diagrams update their display of the fixed point.
	Manual input	If you activate **Manual input**, you will be able to enter an acceleration value under **a** =. If you deactivate **Manual input**, the system will calculate the acceleration value. The jerk diagram (J diagram) will then be constant at the fixed point.

3.1.5.4 Straight line

Definition straight line

Definition

The cam consists of individual cam segments. With SIMOTION CamTool, you can use fixed points, lines, sine curves, arc sine curves, and interpolation points as cam segments.

A straight line defines a synchronous section in the cam. You can specify the velocity along the straight line.

Insert straight line

Requirement

The cam must be opened with SIMOTION CamTool.

Inserting a straight line

To insert a straight line:

1. Click the S diagram (path diagram) to activate it.
2. Click **Straight line** in the **Cam > Insert** menu item. The cursor changes appearance. Place the modified cursor at the position in the S diagram (path diagram) where you wish to insert the straight line and click. The straight line (whose size is predetermined) is inserted. The current position of the straight line is displayed in the tool tip.

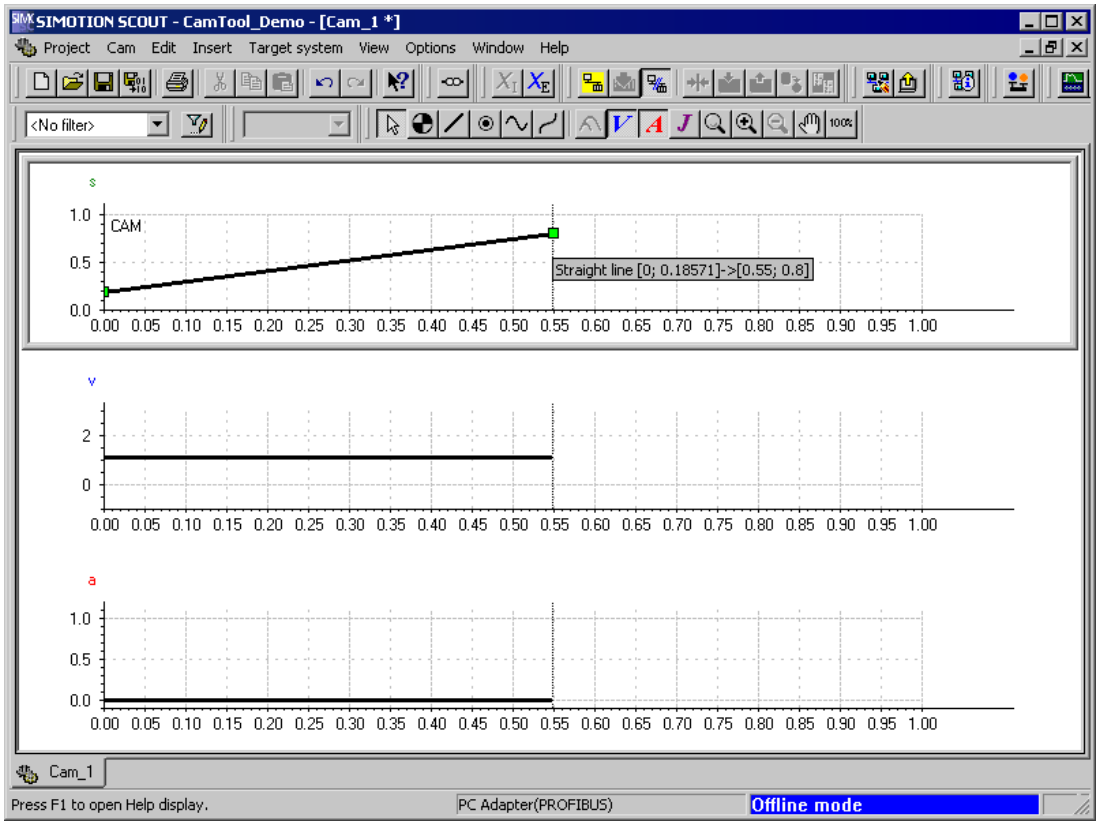

Figure 3-22 Inserting a straight line

Note

Once you have activated the **Cam > Insert > Straight line** function, you can continue inserting straight lines in the S diagram (path diagram) until:

- You press the ESC key
- You right-click (to activate the selection tool in the toolbar), or
- You activate another cam segment (fixed point, sine curve, arc sine curve, interpolation point) for insertion.

See also

Changing the representation using the toolbar (Page 59)

Change straight line position

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the position of a straight line

To change the position of a straight line:

1. Select the straight line in the S diagram (path diagram). The position of the straight line is displayed in the tool tip.
2. The straight line is displayed with handles. Drag and drop the handles for the straight line to the new positions.

or

1. Select the straight line in the S diagram (path diagram). The position of the straight line is displayed in the tool tip.
2. Drag and drop the entire straight line to the new position.

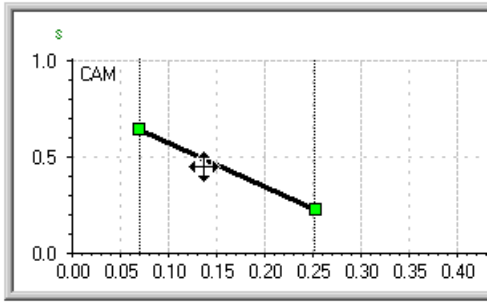

Figure 3-23 Changing the position of an entire straight line

or

1. Double-click the straight line. The **Straight line properties** window appears.
2. Enter the new positions on the Position tab (Page 100) (left: x1 and y1, right: x2 and y2) and click **OK**. The diagram is updated to show the new positions of the straight lines.

See also

Changing the representation using the toolbar (Page 59)

Changing the velocity along a straight line

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the velocity for a straight line

To change the velocity along a straight line:

1. The velocity along a straight line is represented by a line in the V diagram (velocity diagram). Select the line. The cursor indicates the direction in which you can move the line.
2. Drag and drop the entire line to the new position. The S diagram (path diagram) is adapted automatically.

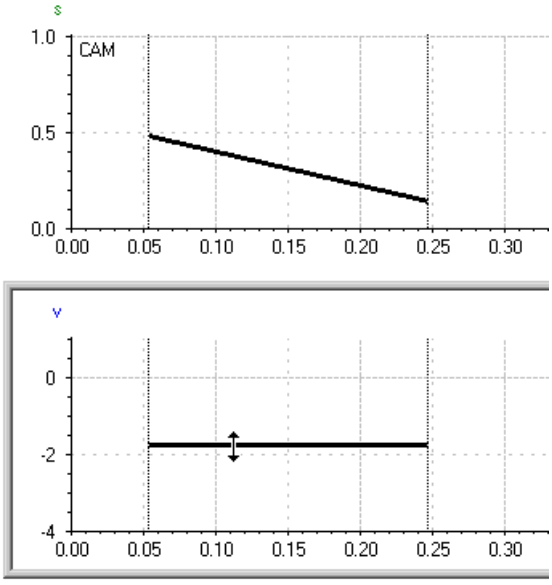

Figure 3-24 Changing the velocity along a straight line

or

1. Double-click the straight line. The **Straight line properties** window appears.
2. Enter the new velocity on the Dynamics tab (Page 100) and click **OK**. The line in the V diagram (velocity diagram) appears at the new position. The S diagram (path diagram) is adapted automatically.

Note

If you want to specify an absolute slave velocity, you must select an **absolute master velocity for calculations** in the **Simulation settings** window.

See also

Changing the representation using the toolbar (Page 59)

Delete straight line

Requirement

The cam must be opened with SIMOTION CamTool.

Deleting a straight line

To delete a straight line:

1. Select the straight line you wish to delete.
2. Press the DEL key. The straight line is deleted and all the diagrams amend their cam displays.

See also

Changing the representation using the toolbar (Page 59)

Position, straight line properties

Position tab

Here, you specify the **position** of the straight line in the path diagram.

You can set the following parameters:

Table 3-9 Parameters on the Position tab (Straight line properties window)

Field/Button			Meaning/Operation
Position			
	Left		
		x1 =	**x1** = indicates the current x1 position of the straight line. To change the position, enter the new position under **x1** = and click **Accept** or **OK**. The diagram updates its display of the straight line.
		y1 =	**y1** = indicates the current y1 position of the straight line. To change the position of the straight line, enter the new position under **y1** = and click **Accept** or **OK**. The diagram updates its display of the straight line.
	Right		
		x2 =	**x2** = indicates the current x2 position of the straight line. To change the position, enter the new position under **x2** = and click **Accept** or **OK**. The diagram updates its display of the straight line.
		y2 =	**y2** = indicates the current y2 position of the straight line. To change the position of the straight line, enter the new position under **y2** = and click **Accept** or **OK**. The diagram updates its display of the straight line.

Dynamic response, straight line properties

Dynamics tab

Here, you specify the **dynamic response** of the straight line.

You can set the following parameters:

Table 3-10 Parameters on the Dynamics tab (Straight line properties window)

Field/Button		Meaning/Operation
Dynamics		
	v =	**v** = indicates the current velocity for the straight line. To change the velocity, enter the new velocity value under **v** = and click **Accept** or **OK**. The diagrams update their display of the straight line. **Note:** If you want to specify an absolute slave velocity, you must select an absolute **master velocity for calculations** in the **Simulation settings** window.

3.1.5.5 Sine curve

Insert sine curve

Requirement

The cam must be opened with SIMOTION CamTool.

Inserting a sine curve

To insert a sine curve:

1. Click the S diagram (path diagram) to activate it.
2. Click **Sin** in the **Cam > Insert > Functions** menu item. The cursor changes appearance.
3. Place the modified cursor at the position in the S diagram (path diagram) where you wish to insert the sine curve and click. The sine curve (whose size is predetermined) is inserted. The current position of the sine curve is displayed in the tool tip.

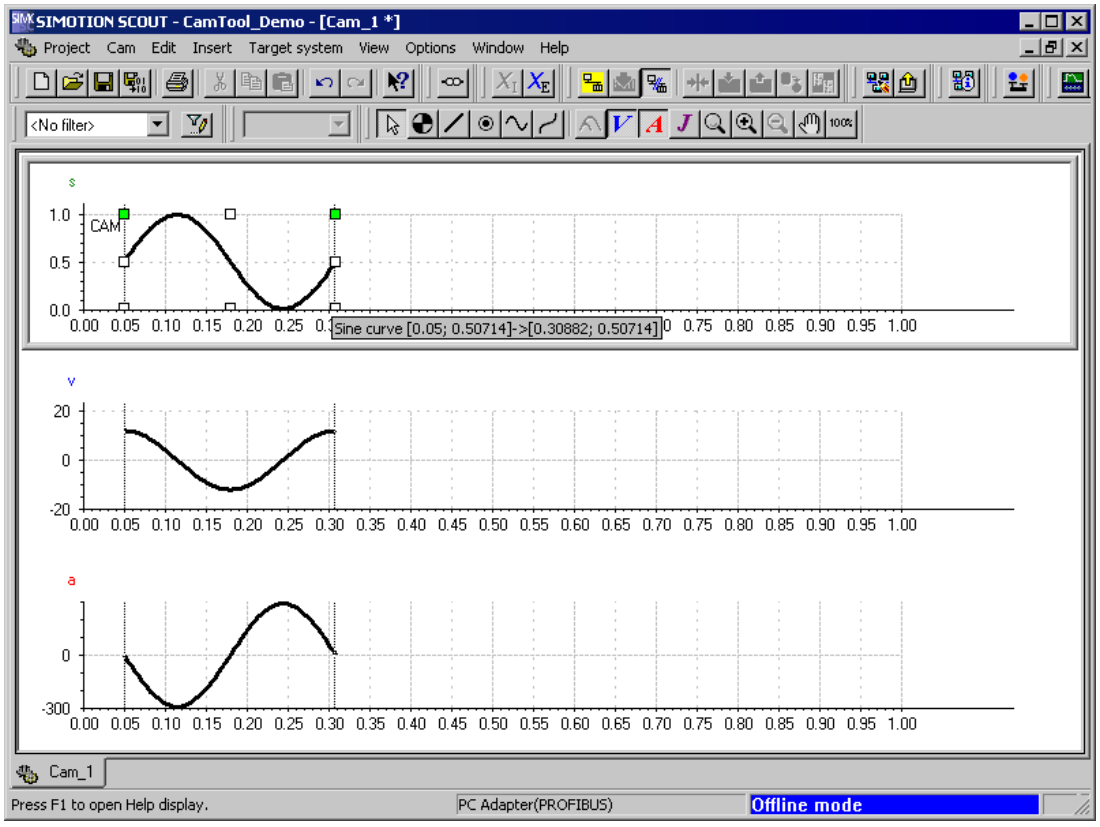

Figure 3-25 Inserting a sine curve

Note

Once you have activated the **Cam > Insert > Sin** function, you can continue inserting sine curves in the S diagram (path diagram) until:

- You press the ESC key
- You right-click (to activate the selection tool in the toolbar), or
- You activate another cam segment (fixed point, straight line, arc sine curve, interpolation point) for insertion.

Changing the representation using the toolbar (Page 59)

Change sine curve definition range

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the definition range of a sine curve

To change the definition range of a sine curve:

1. Select the sine curve in the S diagram (path diagram).
   The current position of the sine curve is displayed in the tool tip.
2. The sine curve is displayed with handles. The handles for the definition range are marked in green. Place the cursor over a handle marked in green. The cursor indicates the direction in which you can move the handle.
3. Drag and drop the green handles to the new positions. While the handles are being moved, the current value for the relevant definition range limit is displayed in the tool tip.

Position, Fx sine properties

Position tab

Here, you specify the **position** of the sine curve in the path diagram.

You can set the following parameters:

Table 3-11 Parameters on the Position tab (Fx sine properties window)

Field/Button	Meaning/Operation
Parameters	The current parameters for the sine curve are shown in the input fields. To change the position, enter the new position in the input fields and click **Accept** or **OK**. The diagram updates its display of the sine curve.

3.1.5.6 Arc Sine Curve

Insert arc sine curve

Requirement

The cam must be opened with SIMOTION CamTool.

Note

The arc sine curve is calculated as an interpolation point table. You can specify the number of interpolation points in the **Fx arc sine properties** window. Double-click the arc sine curve to show the window.

Inserting an arc sine curve

To insert an arc sine curve:

1. Click the S diagram (path diagram) to activate it.
2. Click **Arcsin** in the **Cam > Insert > Functions** menu item. The cursor changes appearance.
3. Place the modified cursor at the position in the S diagram (path diagram) where you wish to insert the arc sine curve and click. The arc sine curve (whose size is predetermined) is inserted.
   The current position of the arc sine curve is displayed in the tool tip.

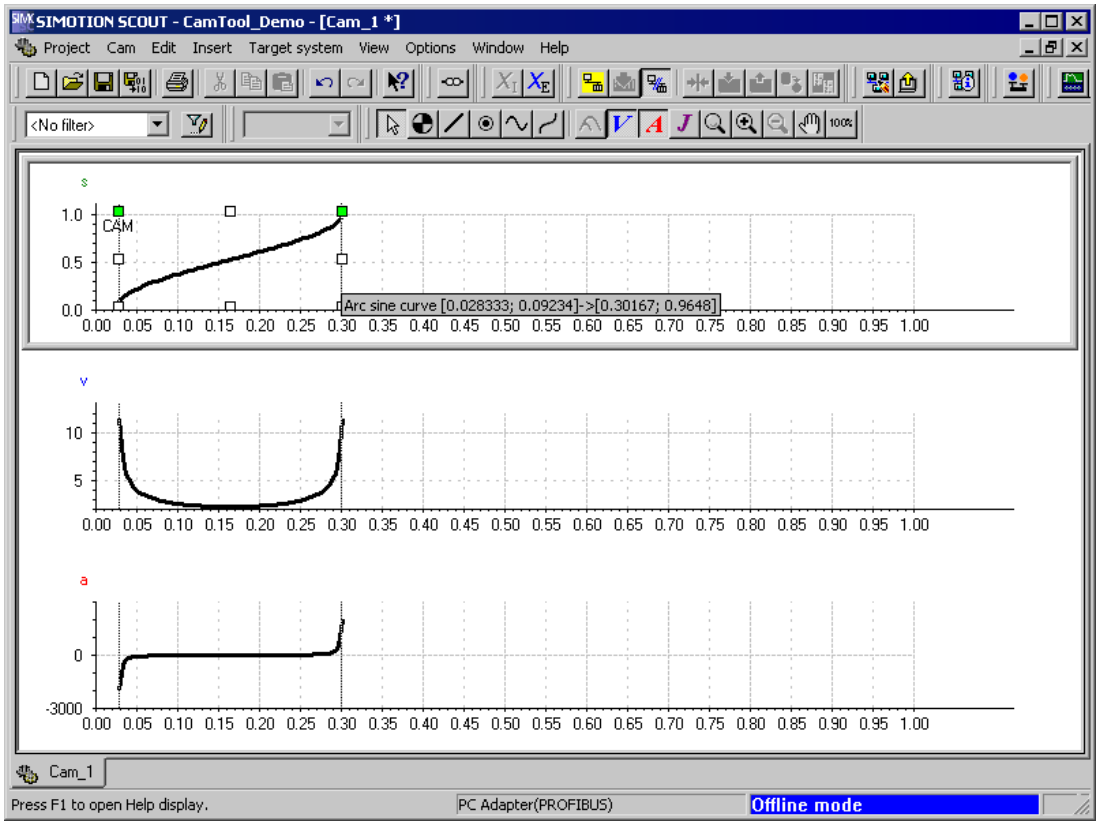

Figure 3-30 Inserting an arc sine curve

Note

Once you have activated the **Cam > Insert > Arcsin** function, you can continue inserting arc sine curves in the S diagram (path diagram) until:

- You press the ESC key
- You right-click (to activate the selection tool in the toolbar), or
- You activate another cam segment (fixed point, straight line, sine curve, interpolation point) for insertion.

Position, Fx arc sine properties

Position tab

Here, you specify the **position** of the arc sine curve in the path diagram.

You can set the following parameters:

Table 3-12 Parameters on the Position tab (Fx arc sine properties window)

Field/Button		Meaning/Operation
Parameters		The current parameters for the arc sine curve are shown in the input fields. To change the position, enter the new position in the input fields and click **Accept** or **OK**. The diagram updates its display of the arc sine curve.
Interpolation points		
	No. of interpolation points	The system saves the arc sine curve as an interpolation point table. Here, you enter the **no. of interpolation points** for the arc sine curve.

3.1.5.7 Interpolation point

Interpolation Point Definition

Definition

The cam consists of individual cam segments. Under SIMOTION CamTool, you can use fixed points, straight lines, sine curves, arc sine curves and interpolation points as cam segments.

An interpolation point is a specified position in the S diagram (distance diagram).

Insert interpolation point

Requirement

The cam must be opened with SIMOTION CamTool.

Note

Use a fixed point (Page 90) to specify a single, fixed position. CamTool calculates optimum transitions between adjacent cam segments.

Interpolation points must be used for any profile you wish to define. CamTool links the interpolation points with a cubic spline in order to create the profile specified by the interpolation points as accurately as possible.

Inserting an interpolation point

To insert an interpolation point:

1. Click the S diagram (path diagram) to activate it.
2. Click **Interpolation point** in the **Cam > Insert** menu item. The cursor changes appearance.
3. Place the modified cursor at the position in the S diagram (path diagram) where you wish to insert the interpolation point and click.
   The interpolation point appears in the diagram. The position of the interpolation point is shown in the tool tip.

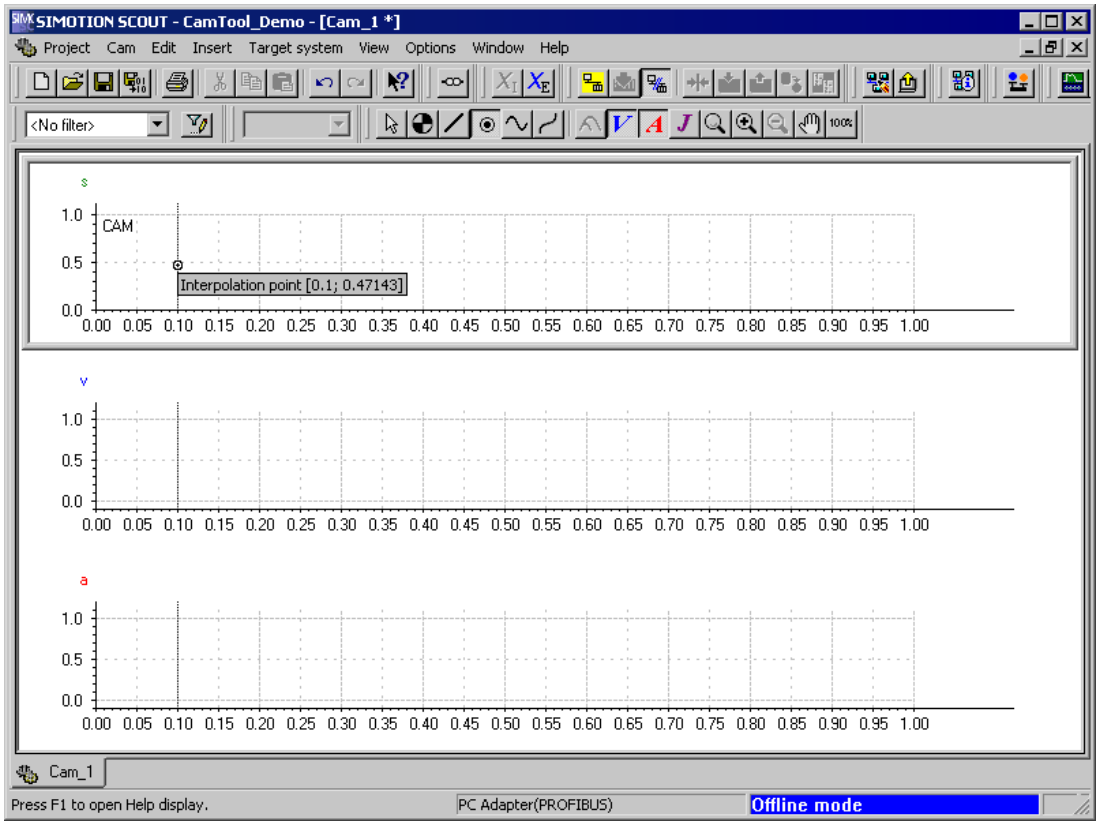

Figure 3-35 Inserting an interpolation point

Note

Once you have activated the **Cam > Insert > Interpolation point** function, you can continue inserting interpolation points in the S diagram (path diagram) until:

- You press the ESC key
- You right-click (to activate the selection tool in the toolbar), or
- You activate another cam segment (fixed point, straight line, sine curve, arc sine curve) for insertion.

Changing the representation using the toolbar (Page 59)

Changing the interpolation point position

Requirement

The cam must be opened with SIMOTION CamTool.

Changing the position of an interpolation point

To change the position of an interpolation point:

1. Select the interpolation point in the S diagram (path diagram). The position of the interpolation point is shown in the tool tip.
2. Drag and drop the interpolation point to the new position.

or

1. Double-click the interpolation point. The Interpolation point properties window appears.
2. Enter the new position on the Position tab (Page 114) and click **OK**. The interpolation point appears at the new position.

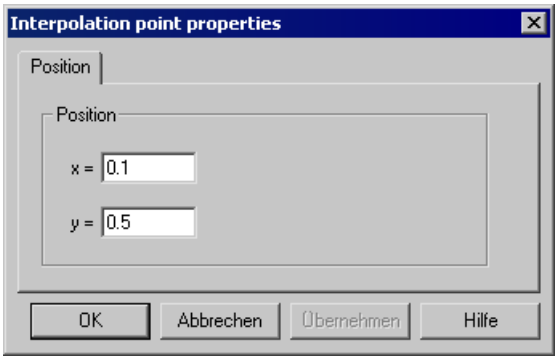

Figure 3-36 Position tab

See also

Changing the representation using the toolbar (Page 59)

Delete interpolation point

Requirement

The cam must be opened with SIMOTION CamTool.

Deleting an interpolation point

To delete an interpolation point:

1. Select the interpolation point you wish to delete.
2. Press the DEL key. The interpolation point is deleted and all the diagrams amend their cam displays.

See also

Changing the representation using the toolbar (Page 59)

Position, interpolation point properties

Position tab

Here, you specify the **position** of the interpolation point in the path diagram.

You can set the following parameters:

Table 3-13 Parameters on the Position tab (Interpolation point properties window)

Field/Button		Meaning/Operation
Position		
	x =	**x** = indicates the current x position of the interpolation point. To change the position, enter the new position under **x** = and click **Accept** or **OK**. The diagram updates its display of the interpolation point.
	y =	**y** = indicates the current y position of the interpolation point. To change the position, enter the new position under **y** = and click **Accept** or **OK**. The diagram updates its display of the interpolation point.

3.1.5.8 Optimizing a Cam

Optimizing a Cam

Introduction

Create the cam in the S diagram (path diagram). The cam profile reflects the path-related interdependence between the master axis (X-axis in the diagram) and the slave axis (Y-axis in the diagram).

Cam structure

The cam consists of individual cam segments.

In SIMOTION CamTool, you can use fixed points, straight lines, sine curves, arc sine curves and interpolation points as cam segments.

SIMOTION CamTool calculates interpolation curves between individual cam segments and displays the V diagram (velocity diagram), A diagram (acceleration diagram), and J diagram (jerk diagram).

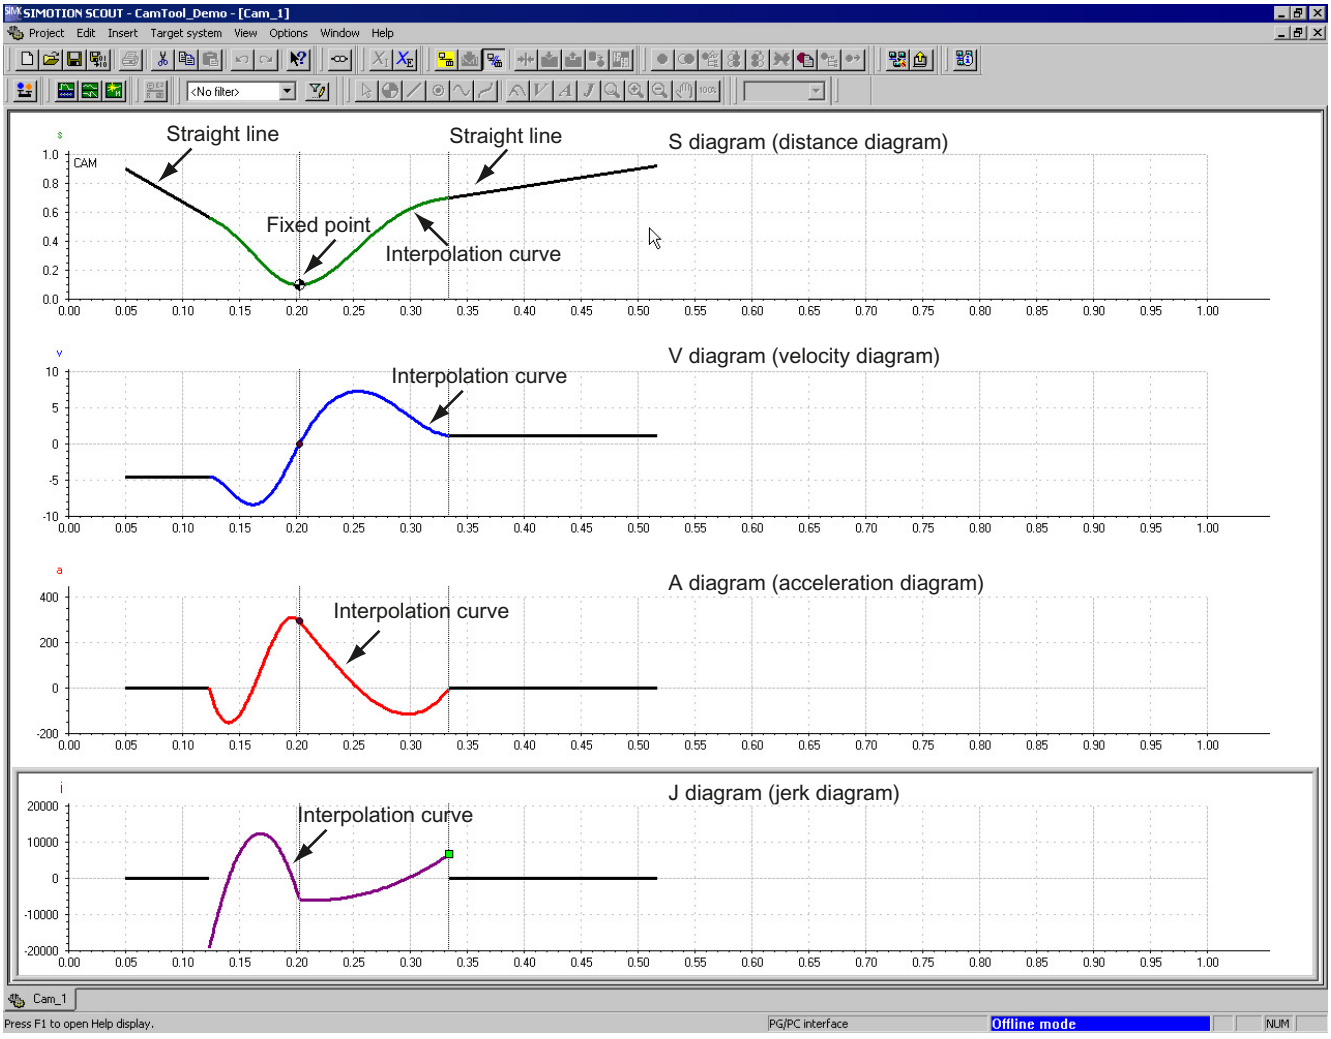

Figure 3-37 Example of a cam with interpolation curves

Interpolating several cam sections

You can interpolate all interpolation curves either with CamTool or by the target device. The default setting is CamTool.

Example:

You can convert a cam that was created with CamEdit as an interpolation point table to a CamTool cam. In this case, all cam segments are interpolated by the target device.

See also

Cam menu - CamTool (Page 134)

Optimize transition

Requirement

The cam must be opened with SIMOTION CamTool.

Optimizing a transition

To optimize a transition:

1. Right-click the transition you wish to optimize and select **Properties** in the context menu which appears.

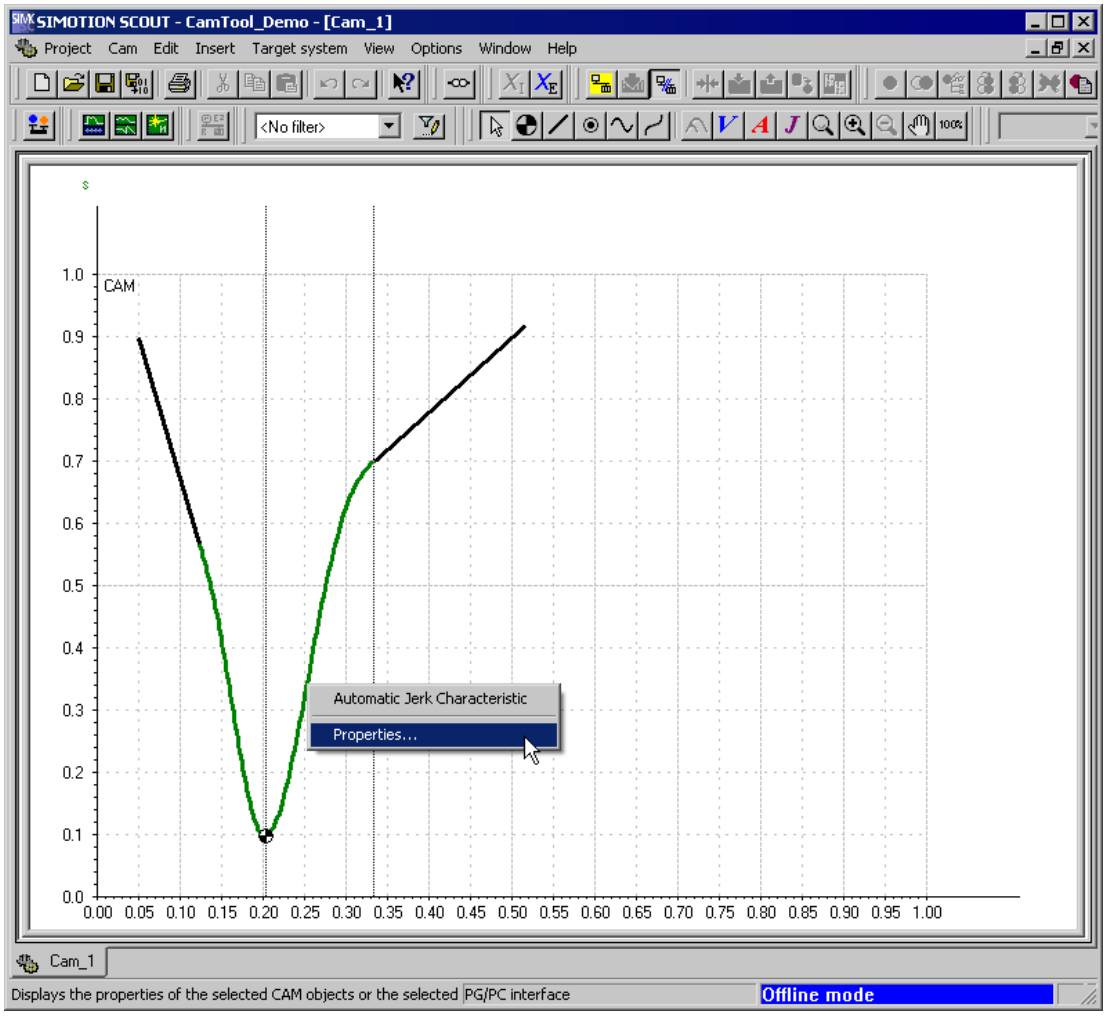

Figure 3-38 Selecting a transition for optimization

2. The **Interpolation curve properties** window appears. Specify the parameters on the Type tab (Page 118).

3. Click the Parameters tab (Page 118) and specify the parameters.
4. Click the Limit values tab (Page 119) to display the minimum and maximum values for the interpolation curve.

Note

Where the slave axis is concerned, you can accept the settings of an existing axis in the project via **Cam > Simulation Settings** and specify the axis limits. These simulation settings for the slave axis are used to calculate the percentage values displayed on the **Limit values** tab.

or

1. For the purpose of optimizing the cam, use the handles which, depending on the settings in the **Interpolation curve properties** window, are shown in the individual diagrams.
2. When positioned over a handle, the cursor indicates the direction in which you can move the handle.
3. Drag and drop the handle to the new position. All the diagrams amend their cam displays.

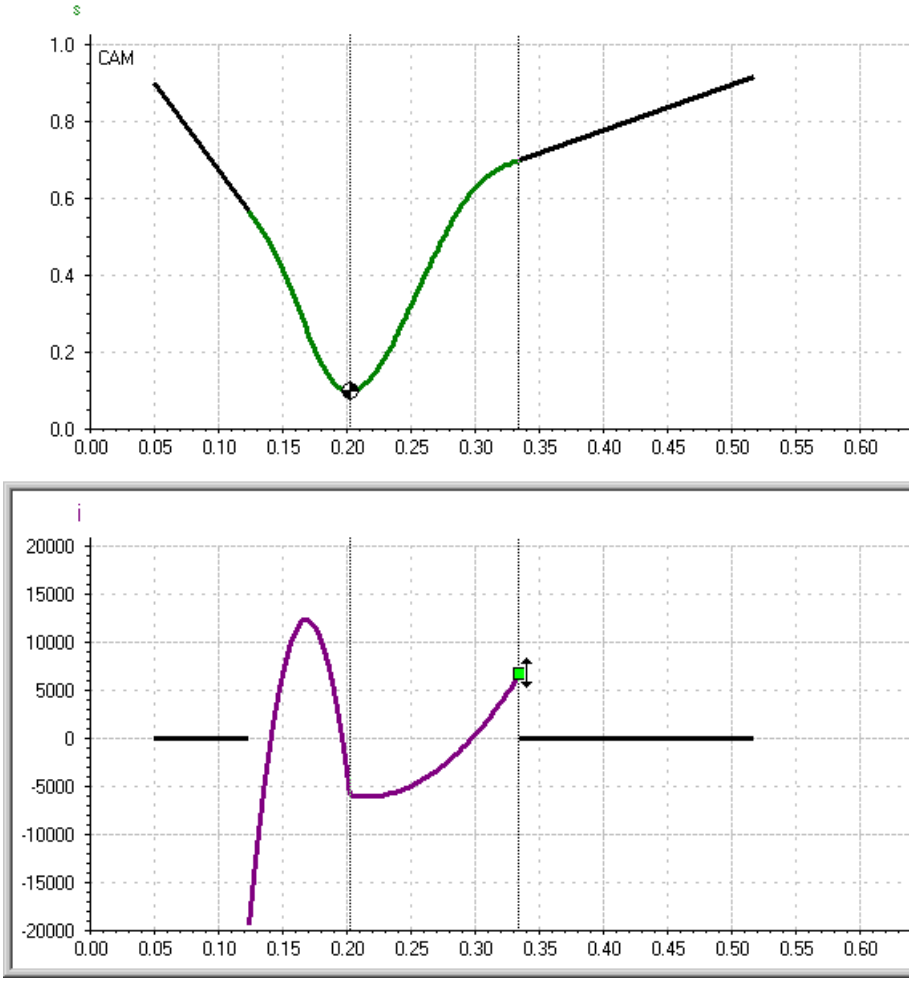

Figure 3-39 Optimizing a cam by dragging and dropping a handle

See also

Changing the representation using the toolbar (Page 59)

Cam menu - CamTool (Page 134)

Interpolation Curve properties

Here, you specify the parameters for the interpolation curve transition.

Type - Interpolation curve properties

Type

Here, you specify the **type** of interpolation curve for the transition.

You can set the following parameters:

Table 3-14 Parameters on the Type tab (Interpolation curve properties window)

Field/Button		Meaning/Operation
Transition		The type of transition is displayed here.
Allow interpolation by target device		If you activate this option, the system does not generate any interpolation curves. The transition is interpolated by the target device. If you click Accept or OK, the diagrams will update their display of the transition.
Optimize for (Allow interpolation by target device deactivated)		
	Do not optimize	If you select this option, all interpolation curves which are suitable for the transition are displayed under Applicable motion rules.
	Velocity	If you select this option, all interpolation curves which are suitable for optimizing velocity for the transition are displayed under Applicable motion rules.
	Acceleration	If you select this option, all interpolation curves which are suitable for optimizing acceleration for the transition are displayed under Applicable motion rules.
	Jerk	If you select this option, all interpolation curves which are suitable for optimizing jerk for the transition are displayed under Applicable motion rules.
Applicable motion rules (Allow interpolation by target device deactivated)		Applicable motion rules are displayed here. Select the motion rule you wish to use for the transition. If you click Accept or OK, the diagrams will update their display of the transition. Depending on the motion rule used, you can specify additional parameters on the Parameters tab.

Parameters - Interpolation curve properties

Parameters

Here, you specify the interpolation curve **parameters** for the transition.

You can set the following parameters:

Table 3-15 Parameters on the Parameters tab (Interpolation curve properties window)

Field/Button		Meaning/Operation
Jerk at boundary point (Allow interpolation by target device deactivated) (For a 6th order polynomial)		
	Automatic	If you activate **Automatic**, the system calculates the jerk at the boundary points. A 5th order polynomial is used for the calculation. **Note:** You can also activate this function via the context menu in the diagram display: Right-click the transition and select **Automatic Jerk Characteristic** in the context menu.
	Left (Automatic deactivated)	If you activate **Left**, you will be able to specify the jerk at the interpolation curve's left boundary point. Enter the jerk value in the input field.
	Right (Automatic deactivated)	If you activate **Right**, you will be able to specify the jerk at the interpolation curve's right boundary point. Enter the jerk value in the input field.
	(Jerk value) (Automatic deactivated)	If you activate the **Left** or **Right** option, you will be able to enter the jerk value here. **Note**: If you want to specify an absolute jerk value, you must select an absolute **master velocity for calculations** in the **Simulation settings** window.
Turning point of curve (Allow interpolation by target device deactivated) (For sloping sine curve) (For modified sine curve) (For modified acceleration trapezoid) (For harmonic combination)		
	Valid values are between 0 and 1	The turning point of the curve can be entered here.
	Optimum Value	If you click this button, the **optimum value** for the turning point of the curve is calculated by the system and entered under **Valid values are between 0 and 1**. **Note**: You can also activate this function via the context menu in the diagram display: Right-click the transition and select **Optimum Value** in the context menu.

Limit Values - Interpolation curve properties

Limit Values

The interpolation curve's **limit values** for the transition are displayed here.

You can set the following parameters:

Table 3-16 Parameters on the Limit Values tab (Interpolation curve properties window)

Field/Button		Meaning/Operation
Position		
	Min.	The minimum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is undershot, the minimum value will be displayed against a red background.
	Max.	The maximum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is overshot, the maximum value will be displayed against a red background.
Velocity		
	Min.	The minimum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is undershot, the minimum value will be displayed against a red background.
	Max.	The maximum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is overshot, the maximum value will be displayed against a red background.
Acceleration (v > 0)		
	Min.	The minimum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is undershot, the minimum value will be displayed against a red background.
	Max.	The maximum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is overshot, the maximum value will be displayed against a red background.
Acceleration (v < 0)		
	Min.	The minimum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is undershot, the minimum value will be displayed against a red background.
	Max.	The maximum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is overshot, the maximum value will be displayed against a red background.
Jerk (v > 0)		
	Min.	The minimum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is undershot, the minimum value will be displayed against a red background.

Field/Button		Meaning/Operation
	Max.	The maximum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is overshot, the maximum value will be displayed against a red background.
Jerk (v < 0)		
	Min.	The minimum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is undershot, the minimum value will be displayed against a red background.
	Max.	The maximum value is displayed as an absolute value and as a percentage value here, depending on the physical limit value. If the physical limit value is overshot, the maximum value will be displayed against a red background.

Note

Where the slave axis is concerned, you can accept the settings of an existing axis in the project via Cam > Simulation Settings and specify the axis limits. These simulation settings for the slave axis are used to calculate the percentage values displayed on the Limit Values tab.

3.1.5.9 Specify parameters for target device

Introduction

You can use the parameters for the target device to adapt the cam to the SIMOTION device (e.g. by scaling the cam).

Requirement

The cam must be opened with SIMOTION CamTool.

Specifying parameters for the target device

To specify parameters for the target device:

1. Click a diagram to show the **Cam** menu.
2. Click the **Cam >Target Device Parameters** menu item.
   The **Target device parameters** window appears.

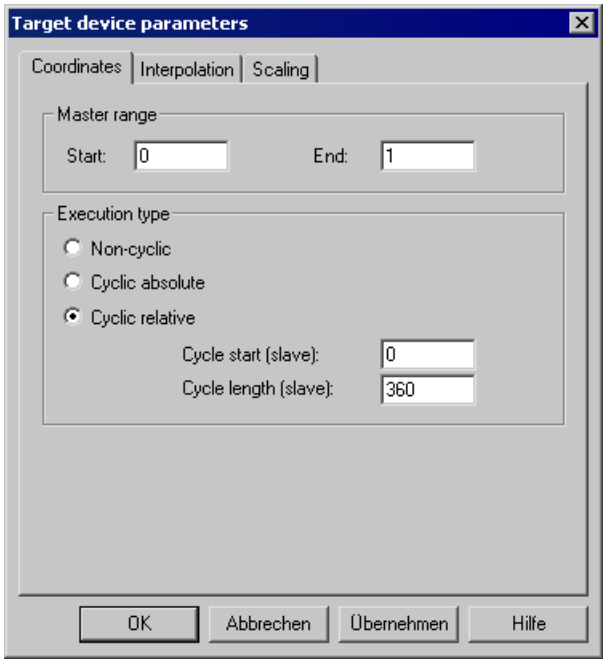

Figure 3-40 Target device parameters window

3. Specify the parameters on the Coordinates tab (Page 123).
4. Click the Interpolation tab (Page 124) and specify the parameters.
5. Click the Scaling tab (Page 125) and specify the parameters.

Note

If you specify scaling details, you will be able to show or hide the scaled cam profile via **Cam > Representation parameters > Display Scaling**.

When the scaled cam profile is displayed, you will not be able to edit the original curve in the diagram displays.

See also

Changing the representation using the toolbar (Page 59)

Target Device Parameters

Here, you specify parameters for the target device.

Coordinates - Target device parameters

Coordinates

Here, you specify the **coordinates** for the target device.

You can set the following parameters:

Table 3-17 Parameters on the Coordinates tab (position window)

Field/Button			Meaning/Operation
Master range			Specify the **master range** (definition range) for the curve by setting its start and end points. Cam segments must be contained within this master range (see also **Master range** under **S diagram (master) properties**.
	Start		Here, you enter the **start** point of the curve or the start of the curve's master range.
	End		Here, you enter the **end** point of the curve or the end of the curve's master range.
Execution type			The **execution type** specifies the cam's interpolation via the target device at the master range's boundary points.
	Non-cyclic		If you select **Non-cyclic** as the execution type, the cam's profile will end when the end value of the curve is reached. In general, the function values of the cam (slave position) are different at the start and end points of the master range. **Note:** If you activate **Non-cyclic**, the master range will be displayed once in the horizontal direction.
	Cyclic absolute		If you select the **Cyclic absolute** execution type, the position will revert from the end value to the initial value of the slave axis and the cam will be repeated. The cam's function values (slave position) at the start and end points of the master range are the same. If necessary, the target device will force these values to be the same (mean) value. **Note**: If you activate **Cyclic absolute**, the master range can be displayed in the horizontal direction again.
	Cyclic relative		If you select the **Cyclic relative** execution type, the cam will be repeated (starting from the end value of the slave axis). The cam's 1st derivative (velocity) at the start and end points of the master range are the same. If necessary, the target device will force these values to be the same (mean) value. **Note:** If you activate **Cyclic relative**, the master range can be displayed in the horizontal and vertical direction again. You can use the **Cycle start (slave)** and **Cycle length (slave)** parameters to optimize the display.
		Cycle start (slave) (Cyclic relative activated)	Enter the starting point for the display in the vertical direction under **Cycle start (slave)**.
		Cycle length (slave) (Cyclic relative activated)	Enter the length of the range displayed in the vertical direction under **Cycle length (slave)**.

Interpolation - position

Interpolation

Here, you specify the **interpolation** for the target device.

You can set the following parameters:

Table 3-18 Parameters on the Interpolation tab (position window)

Field/Button			Meaning/Operation
Interpolation type			The curve in the master range can consist of individual segments. Gaps may occur between the curve segments. If the gaps are wider than the maximum specified size, the target device will perform interpolation between the end points of the curve segments. Specify the type of interpolation performed by the target device between the gaps under **Interpolation type**.
	Linear		If you select **Linear** as the interpolation type, the gap will be closed smoothly by the insertion of straight-line sections between the interpolation points.
	Cubic splines		If you select **Cubic splines** as the interpolation type, a smooth method capable of differentiation will be used to close the gap. The curve runs through the specified interpolation points.
	Bezier splines		If you select **Bezier splines** as the interpolation type, the approximation curve will follow the specified interpolation points.
With gaps less than...			
	Master		
		Maintain gaps	Gaps may occur between the curve segments of the master axis. Here, you specify the maximum size of gaps to be retained.
		Merge points	Gaps may occur between the curve segments of the master axis. Here, you specify the maximum size of gaps to be closed by merging the end points.
	Slave		
		Maintain gaps	Gaps may occur between the curve segments of the slave axis. Here, you specify the maximum size of gaps to be retained.
		Merge points	Gaps may occur between the curve segments of the slave axis. Here, you specify the maximum size of gaps to be closed by merging the end points.

Scaling - position

Scaling

Here, you specify the **scaling** for the target device.

Note

Select **Cam > Representation parameters > Display Scaling** to display the scaled cam profile.

When the scaled cam profile is displayed, you will not be able to edit the original curve. To re-enable editing of the original curve,
select **Cam > Representation parameters > Display Scaling** again.

If a cam is scaled by selecting **Cam > Target Device Parameters** and the **Basic scaling** input field on the **Scaling** tab, or a cam which has already been scaled in SIMOTION CamEdit is opened in SIMOTION CamTool, the scaled cam profile will only be displayed for the S diagram (path diagram). The V, A, and J diagrams will only show the original (unscaled) cam profile.

You can set the following parameters:

Table 3-19 Parameters on the Scaling tab (Target device parameters window)

Field/Button			Meaning/Operation
Master axis			
	Basic scaling		Here, you enter the **basic scaling** for the master axis. The coordinate origin always forms the center of scaling. **Note**: Do not use any scaling values greater than 5. Greater values cause a roughness in the cam profile
	Scalings		Here, you can specify the **scalings** for two master axis ranges. The center of scaling forms the start point of the scaling range. **Note**: Make sure there is no overlap when specifying two ranges.
		(Range1)	Enter the range you wish to scale under **From** and **To**. Enter the scaling factor under **Factor**. **Note**: Do not use any scaling values greater than 5. Greater values cause a roughness in the cam profile
		(Range2)	Enter the range you wish to scale under **From** and **To**. Enter the scaling factor under **Factor**. **Note**: Do not use any scaling values greater than 5. Greater values cause a roughness in the cam profile
	Offset		Here, you can enter a factor for the master axis **offset**. If you have specified a scaling, the offset will relate to the scaled curve. If you have not specified a scaling, the offset will relate to the unscaled curve.
Slave axis			

Field/Button			Meaning/Operation
	Basic scaling		Here, you enter the **basic scaling** for the slave axis. The coordinate origin always forms the center of scaling. **Note**: Do not use any scaling values greater than 5. Greater values cause a roughness in the cam profile
	Scalings		Here, you can specify the **scalings** for two slave axis ranges. The center of scaling forms the start point of the scaling range. **Note**: Make sure there is no overlap when specifying two ranges.
		(Range1)	Enter the range you wish to scale under **From** and **To**. Enter the scaling factor under **Factor**. **Note**: Do not use any scaling values greater than 5. Greater values cause a roughness in the cam profile
		(Range2)	Enter the range you wish to scale under **From** and **To**. Enter the scaling factor under **Factor**. **Note**: Do not use any scaling values greater than 5. Greater values cause a roughness in the cam profile
	Offset		Here, you can enter a factor for the slave axis **offset**. If you have specified a scaling, the offset will relate to the scaled curve. If you have not specified a scaling, the offset will relate to the unscaled curve.

3.1.5.10 Specify simulation settings

Introduction

You can either take the axis settings for the master and slave axes from axes configured in the SCOUT project or specify your own.

Requirement

The cam must be opened with SIMOTION CamTool.

Specifying simulation settings

To specify the simulation settings:

1. Click a diagram to show the **Cam** menu.
2. Click the **Cam >Simulation Settings** menu item. The Simulation settings window opens.

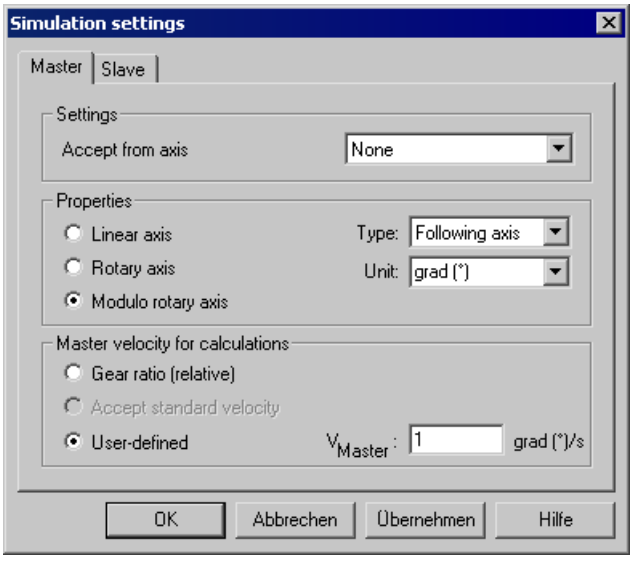

Figure 3-41 Simulation settings window

3. Specify the parameters on the Master tab (Page 127).
4. Click the Slave tab (Page 129) and specify the parameters.

See also

Changing the representation using the toolbar (Page 59)

Simulation Settings

Here, you specify the simulation settings for the **master** and **slave** axes.

Master - Simulation settings

Master tab

Here, you specify the simulation settings for the **master** axis.

You can set the following parameters:

Table 3-20 Parameters on the Master tab (Simulation settings window)

Field/Button		Meaning/Operation
Setting		
	Accept from axis	• **(Axis)** If you are creating the cam for an existing axis in the project, you can select the axis here. The configured values are accepted and displayed. You can change the **master velocity for calculations**. • **(External encoder)** If you are creating the cam for an existing external encoder in the project, you can select the external encoder here. The configured values are accepted and displayed. • **None** If you select **None**, you can specify all the parameters. • **Time axis** If you select **Time axis**, you can to specify the **dimension unit** under **Properties**.
Properties (None setting) (Time axis setting)		
	Linear axis (None setting)	If you select this option, you will simulate the master axis as a **linear axis**.
	Rotary axis (None setting)	If you select this option, you will simulate the master axis as a **rotary axis**.
	Modulo rotary axis (None setting)	If you select this option, you will simulate the master axis as a **modulo rotary axis**.
	Type (None setting)	Here, you select the **type** of axis.
	Dimension unit (None setting) (Time axis setting)	Here, you specify the dimension unit for the axis. Select a dimension unit or enter the dimension unit. If you click **Accept** or **OK**, the diagrams will update their display of the dimension unit. **Note**: The dimension unit is only used for display purposes. If the dimension unit is changed, the values displayed will not be converted.
Master velocity for calculations (Setting (axis)) (None setting)		
	Gear ratio (relative)	If you activate this option, all calculations will be based on relative values (values relative to the master axis).
	Accept standard velocity (Setting (axis))	If you activate this option, the configured default velocity for the axis which you defined under **Accept from axis** will be accepted. All calculations will be based on absolute values.

Field/Button		Meaning/Operation
	User-defined	If you activate this option, you must enter a velocity under **V Master**. All calculations will be based on absolute values.
	V Master (User-defined activated)	If you activate User-defined, you must enter the master velocity under **V Master**.

Slave - Simulation settings

Slave tab

Here, you specify the simulation settings for the **slave** axis.

You can set the following parameters:

Table 3-21 Parameters on the Slave tab (Simulation settings window)

Field/Button		Meaning/Operation
Setting		
	Accept from axis	• **(Axis)** If you are creating the cam for an existing axis in the project, you can select the axis here. The configured values are accepted and displayed. • **None** If you select **None**, you can specify all the parameters.
Properties (None setting)		
	Linear axis	If you select this option, you will simulate the slave axis as a **linear axis**.
	Rotary axis	If you select this option, you will simulate the slave axis as a **rotary axis**.
	Modulo rotary axis	If you select this option, you will simulate the slave axis as a **modulo rotary axis**.
	Type	Here, you select the **type** of axis.
	Dimension unit	Here, you specify the dimension unit for the axis. Select a dimension unit or enter the dimension unit. If you click **Accept** or **OK**, the diagrams will update their display of the dimension unit. **Note**: The dimension unit is only used for display purposes. If the dimension unit is changed, the values displayed will not be converted.
Limit (None setting)		
	Minimum	Here, you enter the **minimum** limit for the slave axis.
	Maximum	Here, you enter the **maximum** limit for the slave axis.

Field/Button		Meaning/Operation
Modulo values (None setting) (Simulation slave-axis activated as a modulo rotary axis)		
	Basis	If Modulo rotary axis is activated for slave axis simulation, you must enter the modulo **basis** here.
	Length	If Modulo rotary axis is activated for slave axis simulation, you must enter the modulo **length** here.

3.1.5.11 Edit cam created with CamTool with CamEdit

Converting a cam created with CamTool to CamEdit

To edit a cam created with CamTool using CamEdit:

1. Close the cam in SIMOTION CamTool.
2. In the project navigator, find the cam you wish to edit with SIMOTION CamEdit.
3. Right-click the cam and select **Convert to CamEdit** in the context menu that appears. The cam will be opened the next time SIMOTION CamEdit is opened.

Note

You can use SIMOTION CamEdit to edit any cam containing either polynomials only or interpolation points only. In general, such cams are those created with SIMOTION CamTool whose cam segments do not contain arc sine curves.

See also

Changing the representation using the toolbar (Page 59)

3.1.5.12 Print cam

Introduction

You can use SIMOTION SCOUT to print a cam opened with SIMOTION CamTool. The printout contains the cam's individual parameters and diagrams.

Note

The cam's printed diagrams reflect what can be seen on the screen view.

Printing a cam

To print a cam:

1. Open the cam with SIMOTION CamTool.
2. Click a diagram to show the **Cam** menu.
3. Use the **Cam > Diagrams** menu item to activate the diagrams you wish to display. The diagrams are displayed.
4. Click the **Project > Print** menu item. The printer selection window appears.
5. Specify the printer, printing range, and number of copies.
6. Click **OK**. The cam is printed out.

See also

Changing the representation using the toolbar (Page 59)

3.1.6 Menus

3.1.6.1 Arcsin, Sin, Straight line, Interpolation point context menu - CamTool

You can select the following functions:

Function	Meaning/information
Delete	Use this function to delete the cam object (arcsin, sin, straight line, or interpolation point) from the S diagram (path diagram).
Properties	Use this function to specify the parameters for the cam segment (arcsin, sin, straight line, or interpolation point).

3.1.6.2 Diagram area context menu - CamTool

You can select the following functions:

Function			Meaning/information
Insert			
	Functions		
		Arcsin	Use this function to insert an arc sine curve into the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note:** You can change the position of the arc sine curve after inserting it, by either dragging and dropping it or pulling the handles at the ends of the curve. You can also do this via the **Properties** context menu.

Function	Meaning/information
Sin	Use this function to insert a sine curve into the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note:** You can change the position of the sine curve after inserting it, by either dragging and dropping it or pulling the handles at the ends of the curve. You can also do this via the **Properties** context menu.
Fixed point	Use this function to insert a fixed point into the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note:** You can change the position of the fixed point after inserting it, by either dragging and dropping it or using the **Properties** context menu.
Straight line	Use this function to insert a straight line into the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note:** You can change the position of the straight line after inserting it, by either dragging and dropping it or pulling the handles at the ends of the line. You can also do this via the **Properties** context menu.
Interpolation point	Use this function to insert an interpolation point into the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note:** You can change the position of the interpolation point after inserting it, by either dragging and dropping it or using the **Properties** context menu.
Target Device Parameters	Use this function to edit the target device parameters.
Representation parameters	
Display Scaling	Use this function to show or hide the scaled cam profile. Specify the scaling via **Cam > Target Device Parameters**. **Note:** While the scaled cam profile is displayed, you will not be able to edit the original curve in the S diagram (path diagram).
Master	Use this function to specify the representation parameters for the master axis.
Slave	Use this function to specify the representation parameters for the slave axis.
V diagram	Use this function to specify the representation parameters for the V diagram (velocity diagram).
A diagram	Use this function to specify the representation parameters for the A diagram (acceleration diagram).
J diagram	Use this function to specify the representation parameters for the J diagram (jerk diagram).
Lines and fonts	Use this function to specify the representation parameters for the lines and fonts in the diagrams.
Simulation Settings	Use this function to specify the simulation settings for the master axis and the slave axis.
Diagrams	
Velocity	Use this function to show or hide the V diagram (velocity diagram).

Function		Meaning/information
	Acceleration	Use this function to show or hide the A diagram (acceleration diagram).
	Jerk	Use this function to show or hide the J diagram (jerk diagram).

3.1.6.3 Fixed point context menu - CamTool

You can select the following functions:

Function	Meaning/information
Delete	Use this function to delete the fixed point from the S diagram (path diagram).
Direct Entry for Acceleration	If you activate this function, you will be able to enter an acceleration value under **a** = on the **Dynamics** tab in the **Fixed point properties** window. If you deactivate **Direct Entry for Acceleration**, the system will calculate the acceleration value. The jerk diagram (J diagram) will then be constant at the fixed point.
Properties	You can use this function to specify the fixed point parameters.

3.1.6.4 Interpolation curve context menu - CamTool

You can select the following functions:

Function	Meaning/information
Optimum Value (for sloping sine curve) (for modifiied sine curve) (for modified acceleration trapezoid) (for harmonic combination)	If you activate this function, the system will calculate the **optimum value** for the interpolation curve's turning point.
Automatic Jerk Characteristic (for a 6th order polynomial)	If you activate this function, the system will calculate the jerk value at the interpolation curve's boundary points.
Properties	You can use this function to specify the interpolation curve parameters.

3.1.6.5 X-axis context menu - CamTool

You can select the following functions:

Function	Meaning/information
Diagram Properties	You can use this function to specify the representation parameters for the diagram.

3.1.6.6 Y-axis context menu - CamTool

You can select the following functions:

Function	Meaning/information
Diagram Properties	You can use this function to specify the representation parameters for the diagram.

3.1.6.7 Cam menu - CamTool

You can select the following functions:

Function			Meaning/note
Close			Use this function to close the active cam or the CamTool cam editor.
Properties			Use this function to display the properties of the active cam.
Import			Use this function to import a cam. The cam must be in the form of a text file.
Export			Use this function to export the active cam to a text file.
Insert			
	Functions		
		Arcsin	Use this function to insert an arc sine curve in the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note**: You can change the position of the arc sine curve after inserting it, by either dragging and dropping it or pulling the handles at the ends of the curve. You can also do this via the **Properties** context menu.
		Sin	Use this function to insert a sine curve in the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note**: You can change the position of the sine curve after inserting it, by either dragging and dropping it or pulling the handles at the ends of the curve. You can also do this via the **Properties** context menu.
	Fixed point		Use this function to insert a fixed point in the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note**: You can change the position of the fixed point after inserting it, by either dragging and dropping it or using the **Properties** context menu.
	Straight line		Use this function to insert a straight line in the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note**: You can change the position of the straight line after inserting it, by either dragging and dropping it or pulling the handles at the ends of the line. You can also do this via the **Properties** context menu.
	Interpolation point		Use this function to insert an interpolation point in the S diagram (path diagram). Place the modified cursor at the position where you want to insert the object and click. **Note**: You can change the position of the interpolation point after inserting it, by either dragging and dropping it or using the **Properties** context menu.
Target device parameters			Use this function to edit the target device parameters.
Representation parameters			

Function		Meaning/note
	Display scaling	Use this function to show or hide the scaled cam profile. Specify the scaling via the **Cam > Target device parameters** menu item. **Note**: While the scaled cam profile is displayed, you cannot edit the original curve in the S diagram (path diagram).
	Master	Use this function to specify the representation parameters for the master axis.
	Slave	Use this function to specify the representation parameters for the slave axis.
	V diagram	Use this function to specify the representation parameters for the V diagram (velocity diagram).
	A diagram	Use this function to specify the representation parameters for the A diagram (acceleration diagram).
	J diagram	Use this function to specify the representation parameters for the J diagram (jerk diagram).
	Lines and fonts	Use this function to specify the representation parameters for the lines and fonts in the diagrams.
Simulation settings		Use this function to specify the simulation settings for the master axis and the slave axis.
Diagrams		
	Velocity	Use this function to show or hide the V diagram (velocity diagram).
	Acceleration	Use this function to show or hide the A diagram (acceleration diagram).
	Jerk	Use this function to show or hide the J diagram (jerk diagram).
Allow interpolation of segments...		Use this function to interpolate all interpolation curves either with CamTool or by the target device. Further information can be found at Optimizing a Cam (Page 114).
Download cam		Use this function to download all the active cam's data (geometry data, scaling and offset values, etc.) to the target device.
Upload cam		Use this function to upload all the active cam's data (geometry data, scaling and offset values, etc.) from the target device to CamTool.

3.2 Getting Started SIMOTION SCOUT - sample project SIMOTION D435-2

Preface

Scope and standards

This **document** is part of the **Engineering System Handling documentation package**.

Scope of validity

This manual is valid for SIMOTION SCOUT, product version V5.1.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product level V5.1:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

3.2.1 Safety notes

3.2.1.1 Fundamental safety instructions

Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit http://www.siemens.com/industrialsecurity.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under http://www.siemens.com/industrialsecurity..

⚠ WARNING

Danger to life as a result of unsafe operating states resulting from software manipulation

Manipulation of the software, e.g. viruses, trojans, malware or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
- Make sure that you include all installed products in the integrated industrial security concept.
- Protect files on removable storage media against malware through appropriate protective measures, e.g. virus scanners.

Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

3.2.1.2 Specific safety information

Make sure your training system is fully disconnected from productive operation.

Observe the safety notes in the documentation of the devices used.

3.2.2 Getting Started with SIMOTION SCOUT

3.2.2.1 Aim of Getting Started

Getting Started introduces you to working with the SIMOTION SCOUT engineering system. You will create a simple sample project and in so doing, you will work through the typical steps involved in configuring devices, drives, and axes. You will become familiar with the most important tools that SIMOTION SCOUT provides for configuring, programming, and diagnostics.

3.2.2.2 Sample project

Getting Started provides you with instructions for creating a simple sample project.

Configuring steps

Prepare the configuration

- You reset the SIMOTION device to the factory settings.
- You configure the interface for network communication between the PG/PC and the SIMOTION device.

Create project, configure SIMOTION device and network communication with the PG/PC

- You create a project.
- You create a SIMOTION device and set up the network communication between the PG/PC and the SIMOTION device.

Configure the drive

- You commission the drive.

Configure the infeed

- You interconnect the infeed with the drive.

Configure and test the axis

- You set up an axis.
- You interconnect the axis with the drive.
- You test the axis with the axis control panel.

Configure inputs/outputs

- You configure I/Os for use in the sample program.

Program, set up and monitor SIMOTION

- You write a simple SIMOTION user program that controls the configured axis.
  - You create the variables required by the program.
  - You create the program and additional auxiliary programs with the graphical editors.
- You assign the finished programs to the tasks of the execution system.
- You start program execution in the SIMOTION runtime system.
- You monitor the program-controlled axis movement.
  - You monitor program execution.
  - You monitor the values in the symbol browser.
  - You compile values in a watch table.
  - You record the course of the axis motion with the trace.

Scope of the sample project

The SIMOTION documentation contains two versions of Getting Started with different sample project scopes:

- **Print version of Getting Started:** The present print version deals with configuring a SIMOTION D435-2 device. Auto configuration is used for configuring the drive, and only this is described.
- **Online help version of Getting Started:** The Getting Started you will find in the SIMOTION SCOUT online help is more general in nature. The sample project presented there takes account of the three platforms SIMOTION C, SIMOTION D, and SIMOTION P. The online help version also describes:
  - Configuring the drive with the drive wizard
  - Testing the drive with the drive control panel
  - Configuring a virtual axis. The virtual axis does not require a drive

  You can find the general version of Getting Started in the online help under **Getting Started SIMOTION SCOUT**.

Completed sample project

The completed sample project is included in the SIMOTION Utilities & Applications. You can find it there under **Examples > Getting Started**.

You can find information on the Utilities & Applications in the following section Utilities & applications (Page 145).

Following Getting Started

We recommend that, following Getting Started, you continue to familiarize yourself with SIMOTION SCOUT using the sample projects of the Utilities & Applications.

You can find information on the Utilities & Applications in the following section Utilities & applications (Page 145).

3.2.2.3 Preconditions

Training system

To create the sample project, you require a training system with a few components:

- SIMOTION D435-2 device with the latest firmware V4.5
- PG/PC with free Ethernet interface
  A USB Ethernet adapter is also suitable for the Ethernet connection.
- SINAMICS drive with infeed, power unit, and motor for operating an axis
- Full DRIVE-CLiQ wiring of the components; motor with DRIVE-CLiQ interface and thus with automatic encoder identification (SMI Sensor Module Integrated)
- SIMOTION SCOUT Engineering System

A SIMOTION D435-2 DP/PN device is used in the sample project. However, you can use any D4x5-2 device.

The PROFINET interface of the SIMOTION device is not used in the sample project. In the project, reference is made to PROFINET only when creating the SIMOTION device for the first time, in order to fully represent the work sequence.

Note

Getting Started deals with automatic drive configuration and not configuration using the drive wizard. To be able to carry out automatic drive configuration fully, full DRIVE-CLiQ wiring of the components involved is a necessary requirement.

Preparation of the training system

Your training system has been prepared for configuring with SIMOTION SCOUT:

- The hardware is ready installed and wired.
- The CF card with the latest firmware V4.5 is plugged in.
- The PG/PC and SIMOTION D435-2 are connected direct via Ethernet cable. The Ethernet X127 interface on the SIMOTION D435-2 is used for the connection.
- SIMOTION SCOUT has been installed on the PG/PC and correctly licensed.
- You have started SIMOTION SCOUT. The SIMOTION SCOUT Workbench is visible on the screen of the PG/PC.
- No project is open in SIMOTION SCOUT.

3.2.2.4 General information

SIMOTION SCOUT online help

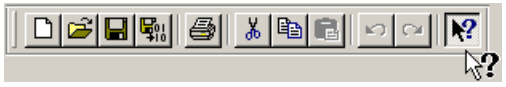
SIMOTION SCOUT has a comprehensive online help. This is divided into general help and context-sensitive help.

You open the general help as follows

- Select **Help > Help topics** in the menu, or
- press the **F1** key.

You open the context-sensitive help as follows

- Click the Help button of the dialog or window, or
- press the key combination **Shift+F1**, or
- click in the toolbar on the **Help** button.



With the mouse pointer (changed to a question mark), click the parameter or the window for which you require help.

You can find detailed information on using the context-sensitive help in the online help under **SIMOTION SCOUT > General > Use Help**.

Full text search in the online help

You can find important information on full text searching in the online help under **Basic > Use Online Help and Function Block Diagrams > Use Online Help > Full Text Search**.

Note

Full text search in the online help

Enclose the search term between asterisks * to include search results that contain the search term as part of a longer character string, e.g.

- **variable** finds only the whole words "variable" or "Variable",
- ***variable*** also finds "system variables", "variable assignment", etc.

Available documentation

Electronic documentation

The SIMOTION documentation is included in electronic form in the scope of delivery of SIMOTION SCOUT (SIMOTION SCOUT DVD Documentation, Utilities & Applications). You can search for all PDF documents in the electronic documentation with an index (SIMOTION.pdx). You can find an overview of the structure and content of the SIMOTION PDF documentation in the separate document *Overview of the SIMOTION Documentation*.

The content of the documents is also available in the SIMOTION SCOUT online help, with a few exceptions.

In the online help, you can find the *Overview of the SIMOTION Documentation* under **Overview of the SIMOTION Documentation > ... > Overview of the SIMOTION Documentation**.

Overview of SIMOTION

You can find a brief system overview of SIMOTION in the online help under **Basic > Basic Functions > System Overview**.

The manuals contain comprehensive information especially for configuring and commissioning a SIMOTION D, see the *SIMOTION D4x5-2 Manual* as well as the *SIMOTION D4x5-2 Commissioning and Hardware Installation Manual*. You can also find the SIMOTION D manuals in the online help under **SIMOTION Devices > SIMOTION D**.

Project generator

With SIMOTION easyProject, basic functions required in just about every SIMOTION application can be quickly and conveniently integrated into an existing project or a new project. The desired components and functions are selected and configured here via dialogs. There is thus no need for time-consuming programming, and a uniform and standardized project configuration is guaranteed while simultaneously reducing potential errors. As of SIMOTION SCOUT V4.4, the project generator can be started direct from SIMOTION SCOUT.

The project generator is not used in Getting Started.

Utilities & applications

The free SIMOTION Utilities & Applications provide you with a wealth of important background information on all aspects of SIMOTION, tools, special functions, blocks, SIMOTION sample projects, as well as off-the-shelf standard applications for illustration or for use in your projects. There you can also find detailed information on scripting and a host of sample scripts that facilitate working with SIMOTION.

1. **FAQs**
   Interesting FAQs such as control of hydraulic axes or communication issues.
2. **Scripts**
   A host of scripts, helpful tips, but also extensive solutions that make recurring tasks easier, for example.
3. **Tools and documentation**
   You are provided with easy-to-use tools and in-depth documentation for many tasks.
4. **Examples**
   Sample projects for first-time-users, e.g. "Getting Started", as well as examples of special topics.

5. **Applications**
   For SIMOTION, there is a host of applications available to you that provide you with a sound basic framework. With the aid of the supplied documentation, you can use the applications as a basis for your own application, and adapt and expand them.
   Furthermore, functions are available to you under "Cross-Sector applications" that are of general help when creating your own applications, e.g. a LDPV1 library for drive communication via DPV1 services (read and write SINAMICS parameters, read errors and warnings from SINAMICS, deactivate objects, ramp-up coordination and much more), or the LCom library with functions for communication with TCP/IP for SIMOTION and SIMATIC.
   The new SIMOTION easyProject project generator significantly speeds up the creation of a standardized project basis for machine applications, and therefore reduces costs.
6. **SIMOTION IT**
   Under SIMOTION IT, you can find innovative examples and tools for bringing control and drive solutions a little closer to the IT world. These include a trace function that is executed via an Internet browser, as well as examples for user-defined Web pages for the SIMOTION IT Web server or for using OPC XML DA.

3.2.3 Prepare the configuration

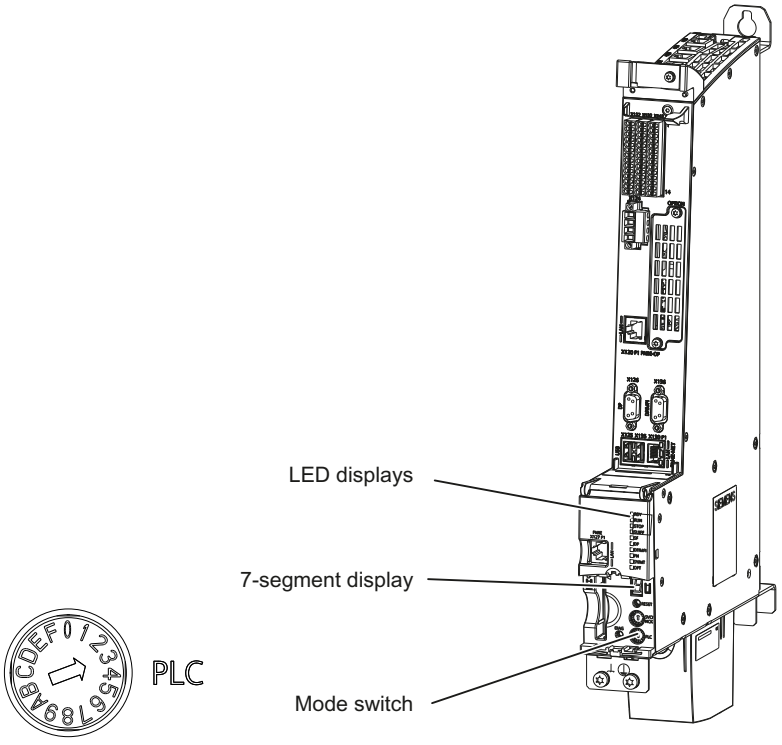
3.2.3.1 Restore factory settings

For the sample project, it is useful to reset the SIMOTION device to the factory settings.

In this way, you restore the default communications parameters and you delete user data installed on the device and the CF card by a previous configuration. The runtime licenses are retained.

You restore the factory settings on the SIMOTION D4x5-2 device as follows

1. Switch off the power supply of the SIMOTION device.
   The SIMOTION device is in a de-energized state when all the LEDs on the front of the device are off.
2. Set the mode selector switch **PLC** of the SIMOTION device to position **3**.



NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Observe the ESD regulations.

3. Switch on the power supply of the SIMOTION device.
   The default settings are loaded. The SIMOTION device switches to STOP mode.
   Wait for the procedure to finish. The elements on the front of the module indicate completion:
   - The 7-segment display shows status digit **6**: SIMOTION D4x5-2 has started up.
   - LEDs:
     LED **RDY** flashes green (0.5 Hz): the drive is ready for commissioning.
     The **STOP** LED shows a yellow light: the SIMOTION device is in STOP mode.
     All other LEDs are off.

   Startup is complete.
4. Set the mode selector switch to position **0**.
   - The **RUN** LED shows a green light: the SIMOTION device is in RUN mode.

Result

The SIMOTION device has been restored to its factory settings and the drive is ready for commissioning.

3.2.3.2 Set up interface for online communication

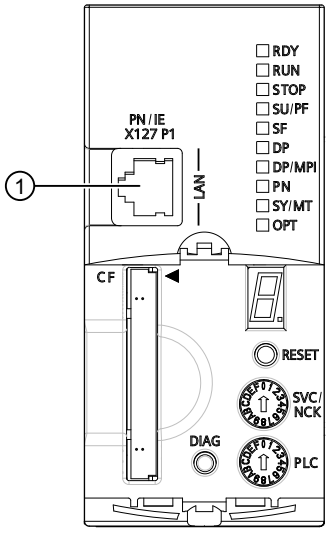
Online communication of the PG/PC with the SIMOTION device can be set up via PROFIBUS, PROFINET, or Industrial Ethernet. The sample project is restricted to the most frequent application case: communication via Industrial Ethernet.

Configuration of the Ethernet interface encompasses two steps:

- You insert the Ethernet address of the PG/PC into the default subnet of the SIMOTION device.
- You assign the Ethernet address to an access point in SIMOTION SCOUT.

Preconditions

- The PG/PC and the SIMOTION device are connected via an Ethernet cable.
- The X127 PN/IE interface on the SIMOTION device is used for the Ethernet connection.



① Ethernet interface X127 PN/IE

Figure 3-42 SIMOTION D435-2 module front

- The Ethernet interface X127 PN/IE has the default address:
  IP address: **169.254.11.22** - Subnet: **255.255.0.0**

Prepare the Ethernet interface of the PG/PC

The PG/PC must be located in the same subnet as the SIMOTION device. The subnet is specified by the factory settings of the SIMOTION device.

You insert the PG/PC into the subnet of the SIMOTION device as follows

1. In the Windows Control Panel of the PG/PC, open the Properties window of the network connection used, and then open the dialog **Properties of Internet protocol Version 4 (TCP/IPv4)**.

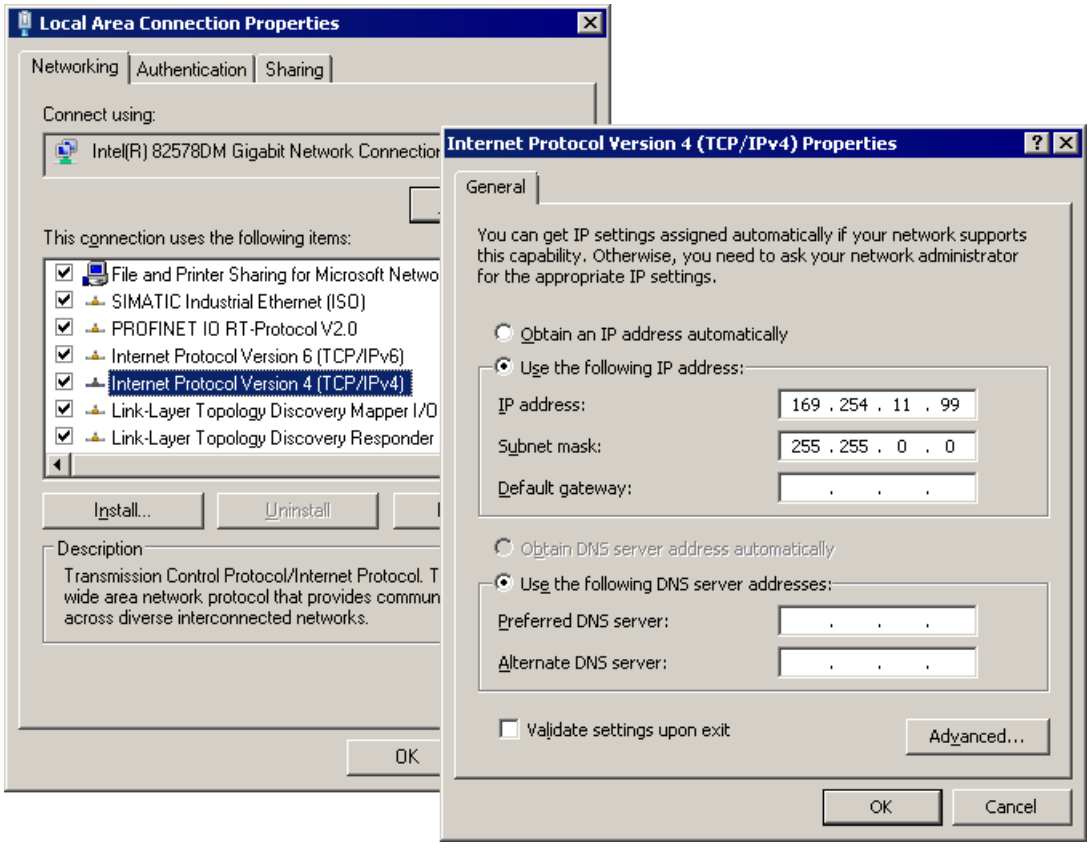


Figure 3-43 IP address of the PG/PC in subnet 169.254

2. Assign the following address:
   IP address: **169.254.11.99** - Subnet: **255.255.0.0**
3. Confirm with **OK**. Close the dialog.

Define the access point of the SIMOTION device

SIMOTION SCOUT has two access points for communication with controllers and individual drives:

- S7ONLINE
- DEVICE

In the sample project, the S7ONLINE access point is used for communication with the PG/PC.

You define the access point as follows

1. Go to SIMOTION SCOUT.
2. Select **Options > Set PG/PC interface** in the menu bar.
   The **Set PG/PC interface** dialog opens.
3. In the field **Access point of the application**, select the access point **S7ONLINE (STEP7)**.
   The interface currently still assigned to the access point is shown after the arrow pointing to the right.
4. Select the prepared Ethernet interface in the list **Interface programming used**.

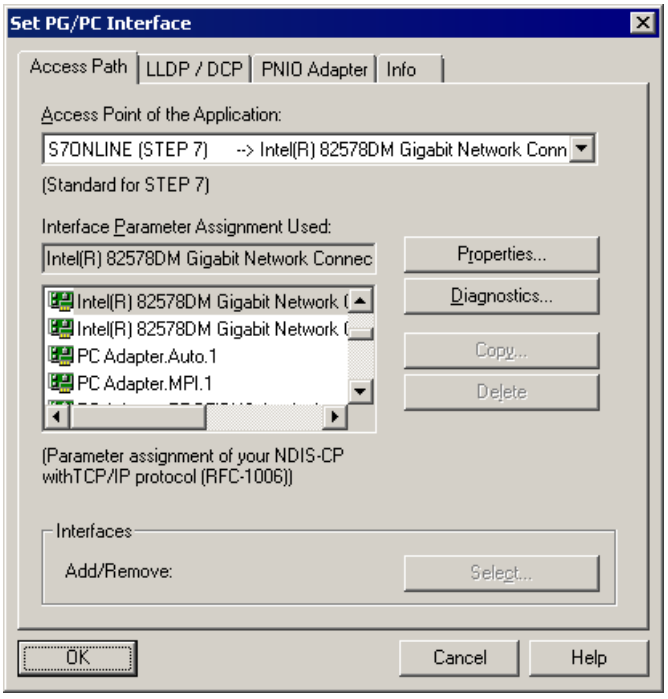

Figure 3-44 Set PG/PC interface

5. Confirm with **OK**.
   The S7ONLINE access point is activated.
   The Ethernet interface is assigned to the S7ONLINE access point.

3.2.3.3 Result in the sample project

The factory settings of the SIMOTION device have been restored.

The Ethernet interface has been prepared and can be used for configuring online communication between the PG/PC and the SIMOTION device.

3.2.4 Create a project

3.2.4.1 Overview

Aim of Getting Started

In this part of Getting Started, you create the sample project Sample_1. All of the subsequent configuring steps refer to this sample project.

Project

A project contains all the information that describes a machine and its function: configuration data, programs, motion profiles, drive data.

A project can contain several SIMOTION devices.

3.2.4.2 Create new project

You create a new project as follows

You start a new configuration in SIMOTION SCOUT by creating a new project.

1. Select **Project > New** from the menu bar. The **New Project** dialog is displayed.
2. Enter the project name under **Name**, e.g. **Sample_1**.
3. Under **Storage location (path)**, enter the path where you wish to store the project. The default path is already set.
4. Acknowledge with **OK**.
   The dialog closes.

Additional information about creating a new project

Default path of the project

The default path depends on the operating system:

- Windows XP
  C:\Program Files\Siemens\Step7\s7proj
- Windows 7
  C:\Program Files (x86)\Siemens\Step7\s7proj

Note

Displaying the project path

When you place the cursor over the project in the Project Navigator, the storage location of your project is displayed.

Project name and project directory name

The name of a SIMOTION SCOUT project can contain not more than 24 characters. The project appears under the full name in the dialogs.

When initially saving the project, SIMOTION SCOUT creates the directory name from the first 8 characters of the project name. SIMOTION SCOUT uses a numerical counter "_1", "_2", ... to resolve conflicting names resulting from the abbreviation of the 8 characters. The counter replaces the last characters of the directory name.

Note

It is useful to select project names in such a way that they can be uniquely distinguished by their first 8 characters. The project name and the directory name derived from it thus uniquely identify the same project.

3.2.4.3 Result in the sample project

The sample project of Getting Started has been created in SIMOTION SCOUT.

The project folder Sample_1 is visible in the project navigator.

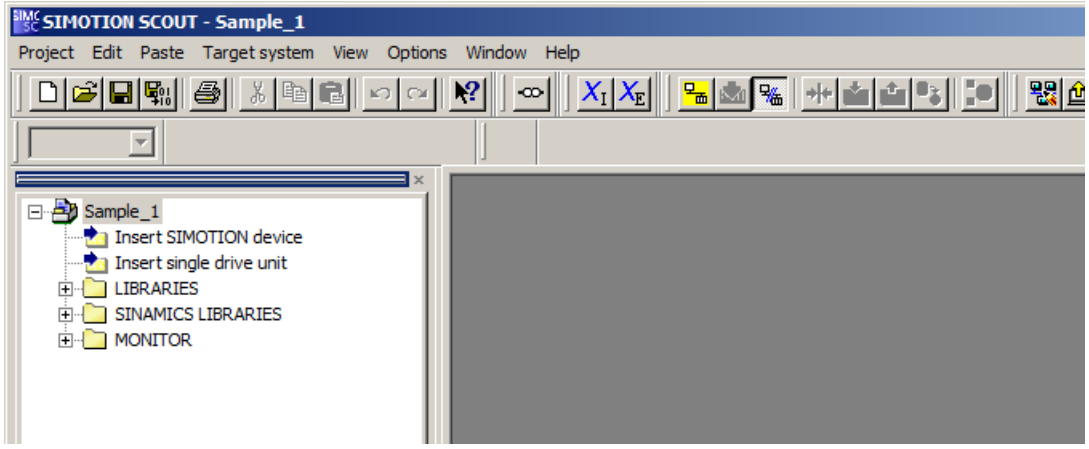

Figure 3-45 SIMOTION SCOUT Workbench, newly created sample project Sample_1

3.2.5 Create SIMOTION device and configure online communication

3.2.5.1 Overview

Aim of Getting Started

This part of Getting Started shows you how to create a SIMOTION device in the project and how to set up communication between the PG/PC and the SIMOTION device.

Steps

Creating a new SIMOTION device in the project involves three steps. SIMOTION SCOUT combines the steps into one coherent process:

1. Create a SIMOTION device.
2. Configure the PROFINET interface of the device.
   This step is omitted in the sample project. PROFINET is not used. However, SIMOTION SCOUT opens the configuration dialog if the PROFINET-supporting device version D4x5-2 DP/PN is installed in your training system.
3. Set up communication between the PG/PC and the SIMOTION device.

The newly created SIMOTION device appears in the project tree.

SIMOTION D platform

SIMOTION D is the drive-based version of the SIMOTION motion control system, based on the SINAMICS S120 family of drives. With SIMOTION D, the SIMOTION motion control functionalities and the SINAMICS drive software run on a SINAMICS-type closed-loop control hardware device. SIMOTION D devices have the following characteristic features:

- Motion control functionality and control functionality integrated directly in the drive
- Compact and with especially fast response
- Maximum scalability and flexibility as single-axis or multi-axis system in different performance versions for diverse applications
- Especially suitable for modular machine concepts with fast isochronous coupling, in the case of machines with a large number of axes, for example

The SINAMICS functionality of the closed-loop-control module of the SINAMICS S120 multi-axis drive system is integrated in SIMOTION D (SINAMICS Integrated).

You will find a brief introduction to SIMOTION D in the online help using the example of the D435 Control Unit. Click **Help > Tutorials > SIMOTION Drive-Based** in the SIMOTION SCOUT menu bar.

3.2.5.2 Create SIMOTION device

You create a SIMOTION D435-2 device in the project as follows

1. In the project navigator, double-click **Insert SIMOTION device**.
   The **Insert SIMOTION device** dialog appears.

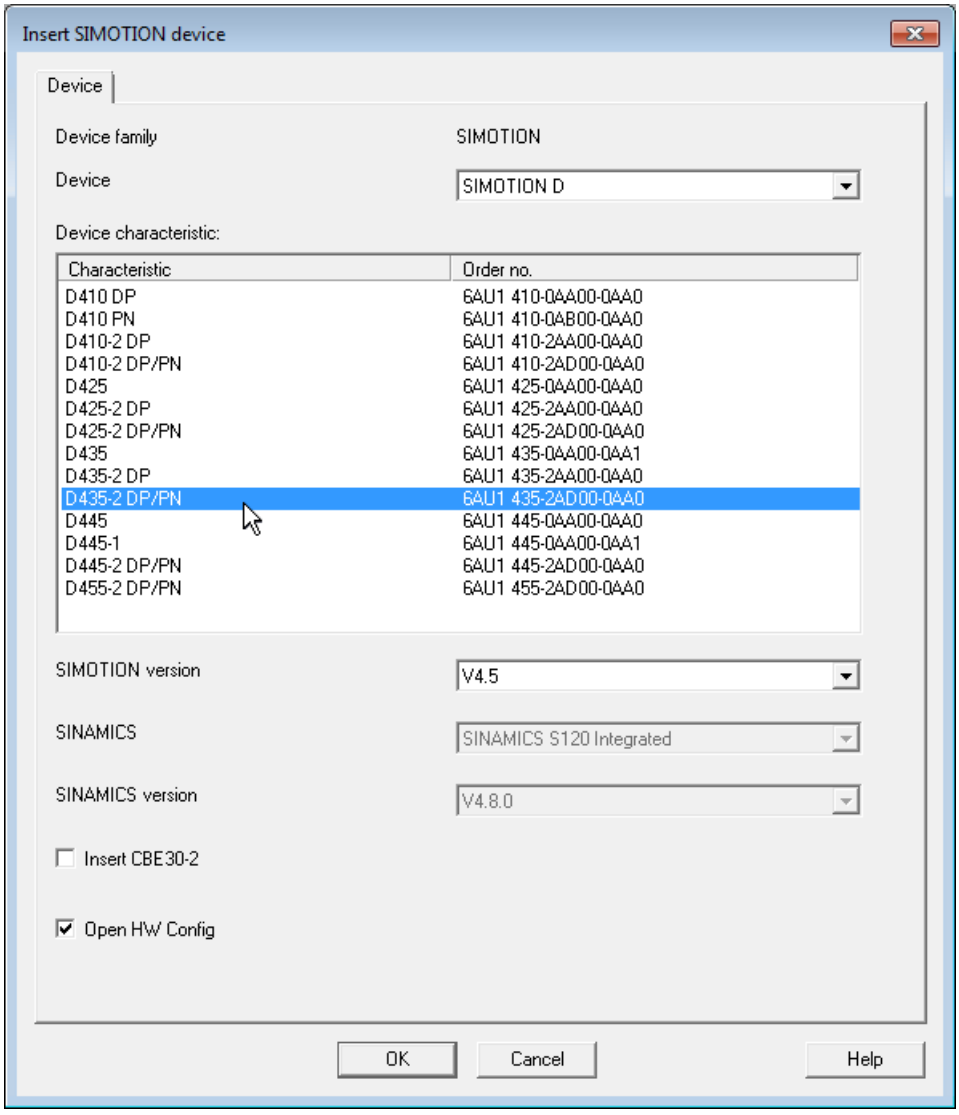

Figure 3-46 Select SIMOTION device

2. In the **Device** list field, the **SIMOTION D** platform is already pre-selected.
3. In the **Device version** list, select the SIMOTION device **D435-2 DP/PN**, and under **SIMOTION version**, select the firmware version of the device used.

Note

The selected firmware version must match the firmware version on the memory card of the SIMOTION device. Otherwise, you will receive an error message when going online with the device.

4. With the checkbox **Open HW Config**, you define whether the window for hardware configuration **HW Config** is to be opened after the new device has been created. Leave the checkbox activated.
5. Acknowledge with **OK**.
   The **Insert SIMOTION device** dialog is closed. SIMOTION SCOUT takes you to the next step Configure the PROFINET interface (Page 156).

3.2.5.3 Configure the PROFINET interface

If the SIMOTION device has a PROFINET IO interface, the dialog **Properties – Ethernet interface PNxIO** appears. The dialog enables integration of the SIMOTION device into an existing PROFINET IO subnet. If no subnet is known, you can create it here.

PROFINET is not used in the sample project. Click **Cancel**. The dialog closes. SIMOTION SCOUT takes you to the next step Set up PG/PC communication (Page 157).

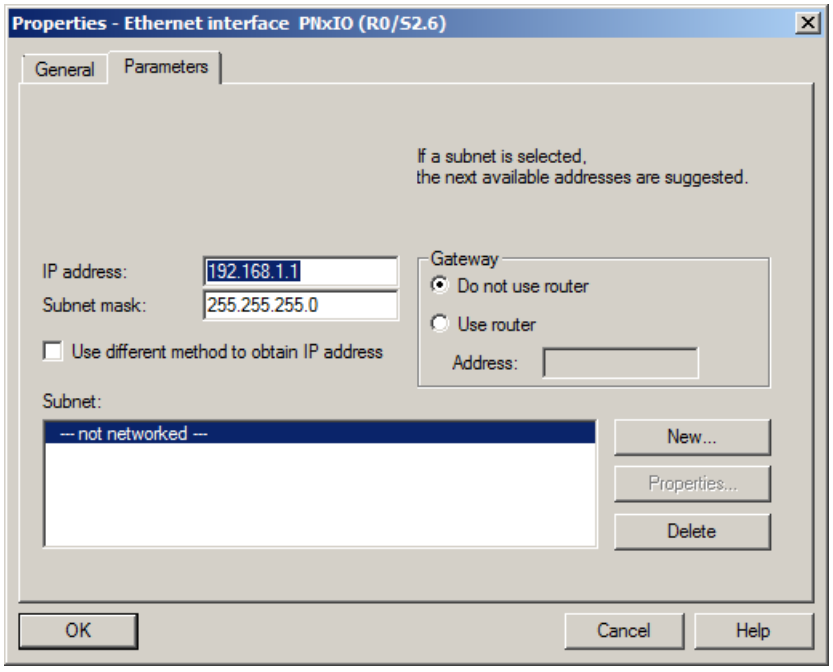

Figure 3-47 Dialog for selecting an Ethernet interface

3.2.5.4 Set up PG/PC communication

Interface Selection dialog

SIMOTION SCOUT opens the **Interface Selection** dialog. You configure the network communication between the PG/PC and the SIMOTION device in this dialog.

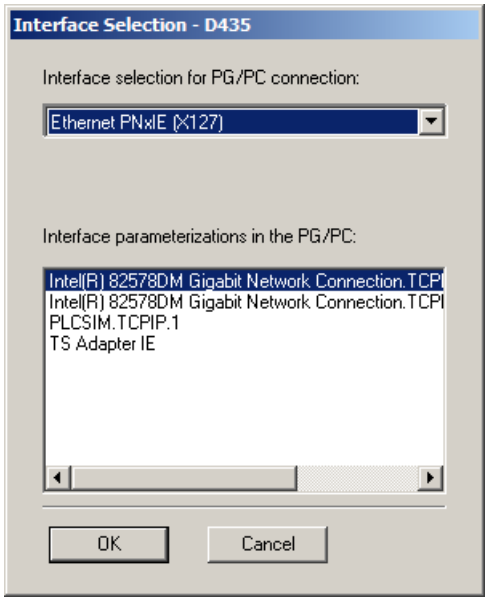

Figure 3-48 Set up PG/PC communication

Note

If a PG/PC is already available in the project and it is connected with a subnet, SIMOTION SCOUT automatically establishes the connection between the PG/PC and the SIMOTION device. In this case, the **Interface Selection** dialog does not appear.

The list field **Interface selection for PG/PC connection** in the upper half of the dialog provides the list of SIMOTION device interfaces for selection.

The lower field **Interface parameterizations in the PG/PC** lists the interfaces of the PG/PC. The upper field functions as a filter so that only the interfaces with suitable transmission protocol are available for selection.

You set up data communication between the SIMOTION device and the PG/PC as follows

1. Select the Ethernet interface **Ethernet PNxIE (X127)** for the SIMOTION D435-2 device.
2. Then select the prepared Ethernet interface of the PG/PC.
3. Confirm the configuration with **OK**.
   The **Interface Selection** dialog is closed.

3.2.5.5 Result in the sample project

Newly created SIMOTION device

Configuring of the SIMOTION device and network communication between the PG/PC and the SIMOTION device is complete.

- The newly created SIMOTION D435-2 device is shown in the project tree of the workbench.
- The PG/PC is connected with the SIMOTION device via Ethernet.
- SIMOTION SCOUT automatically opens the **HW Config** window and thus leads you to hardware configuration.

HW Config

HW Config shows the newly created SIMOTION device, the integrated SINAMICS drive unit (SINAMICS_Integrated), and the integrated PROFIBUS (DP-Integrated).

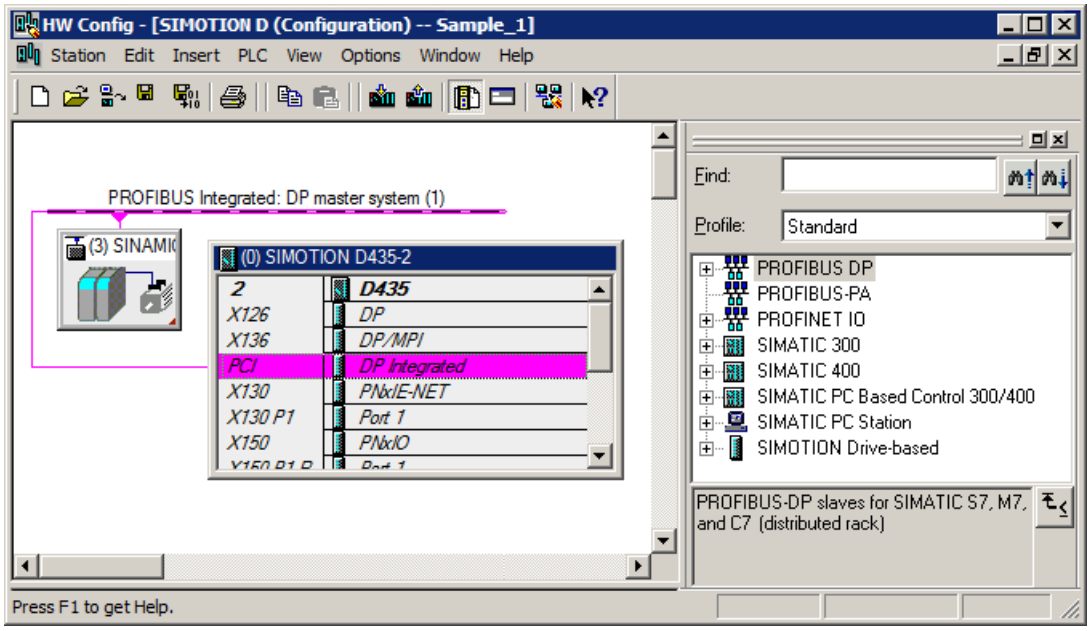

Figure 3-49 HW Config, SIMOTION D device with SINAMICS_Integrated

No other hardware configuration is required for the sample project. You can close HW Config. In the menu bar of **HW Config**, select the command **Station > Exit**.

3.2.6 Download the project to the target system

3.2.6.1 Overview

Aim of Getting Started

In this configuring step, you create the prerequisites for configuring the drive.

- You back up the created sample project to the hard disk.
- You compile the project into executable code.
- You establish online communication with the SIMOTION device.
- You download the project from the PG/PC to the SIMOTION device.

3.2.6.2 Save and compile the project

To be able to download a project created in SIMOTION SCOUT to the target system, the project must be saved in executable code.

The command **Save project and compile changes** combines both steps. The project is backed up to the hard disk. SIMOTION SCOUT searches the entire project for changes and compiles only the changes.

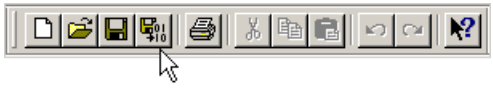
Note

Use the command **Save project and compile changes** for preference for day-to-day work.

Several variations of the "Save" command are available for selection under the menu title **Project**. You can find information on this in the online help under **Save and compile**.

You save and compile a project as follows

Select the menu command **Project > Save and compile changes** or click the relevant button in the toolbar.



SIMOTION SCOUT shows progress indicators for symbolic assignment and for compilation.

The compilation run is logged in the detail view of the workbench. Information, warning and compilation errors are shown there in plain text.

Switch on detail view

The detail view might be switched off. Click the menu item **View > Detail view** to activate the view.

3.2.6.3 Connect to selected target devices – Go online

To download project data from SIMOTION SCOUT to the hardware, or to transfer machine data in the other direction from the hardware to the SIMOTION SCOUT project, communication between the PG/PC and the SIMOTION device must be activated.

The status of the network communication is displayed in the footer of the workbench:

Online mode	Network communication is switched on. Data can be exchanged.
Offline mode	The network connection is switched off.

You go online as follows

1. Select the menu command **Project > Connect to selected target devices** or click the relevant button in the toolbar.

When the command is first called, SCOUT opens the **Target Device Selection** dialog. The dialog enables individual selection of the devices to which SIMOTION SCOUT is to connect.

2. In the dialog, select the configured SIMOTION device **D435** and the integrated drive **SINAMICS_Integrated**.

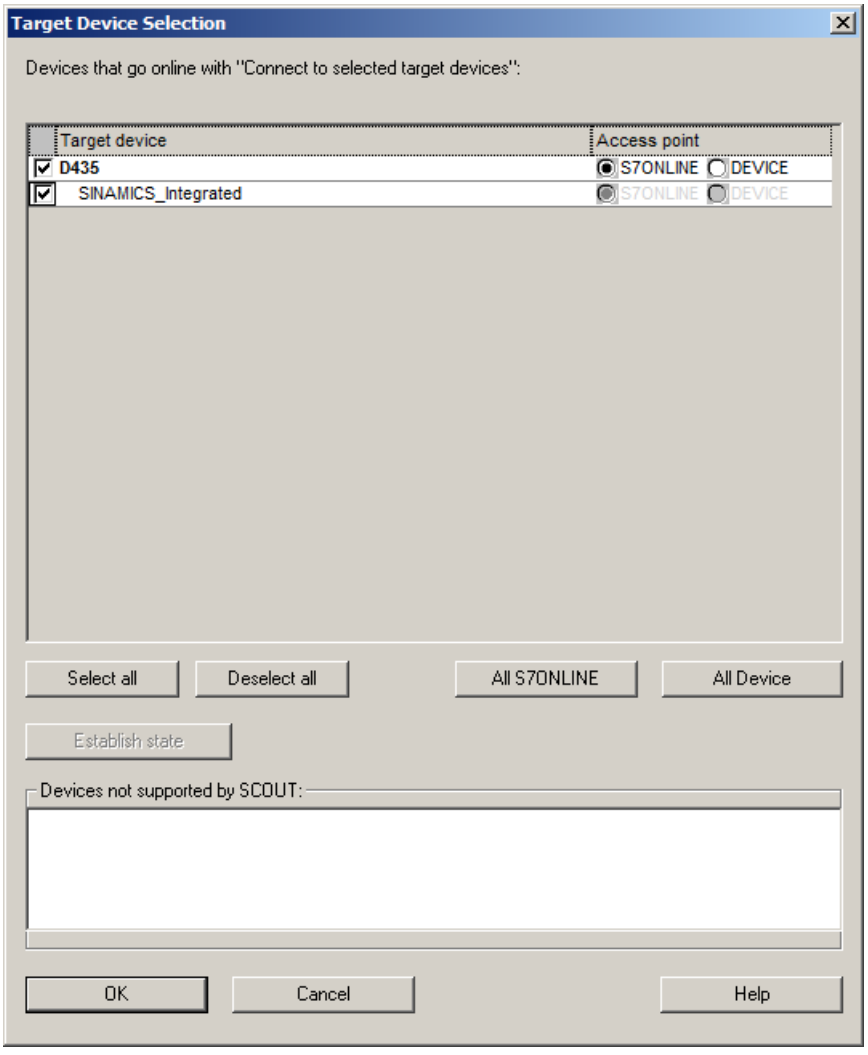


Figure 3-50 Target Device Selection dialog

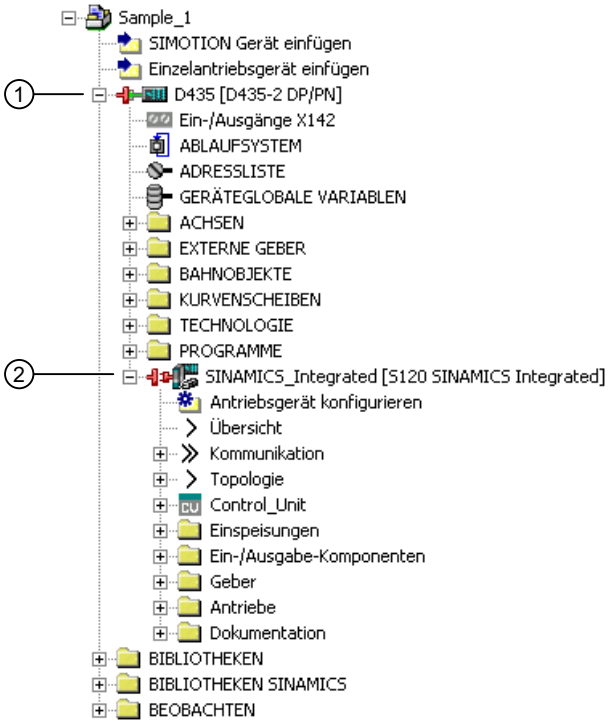
3. Click **OK**.
   SIMOTION SCOUT establishes the online connection.
4. When first going online, SIMOTION SCOUT reports that access to the drive is not possible. Close the message. Track the consistency check to completion on the **Target system output** tab in the detail area.
   In the project tree, the connector symbols on the SIMOTION device and on the integrated SINAMICS drive change. Only the connector symbol of the SIMOTION device is partially colored in green. Green indicates the existing online connection.



① Device is in ONLINE mode. There is an inconsistency between the project data of the device in the PG/PC and the current values of the device in the target system.

② Element is not in ONLINE mode.

Figure 3-51 Project tree after first going online

No connection to the drive when first going online

To allow SIMOTION SCOUT to connect with the drive, the project must be downloaded to the SIMOTION device. A project download has not yet been carried out in the sample project. You therefore receive the corresponding error messages.

3.2.6.4 Download the project to the target system

A complete project download is only possible in STOP mode. If required, SIMOTION SCOUT offers a change of operating mode during the download procedure.

You download the project as follows

1. Select **Project > Download to target system** in the menu, or click the **Download project to target system** button in the toolbar.

   The dialog **Download to target system** appears.

2. Activate the checkbox **After loading, copy RAM to ROM**. This saves the RAM of the SIMOTION device to the memory card (ROM) of the SIMOTION device. In this way, the configuration is retained after the power supply has been switched off and on again.

3. Start the download operation with **Yes**.
   The project data and the data of the hardware configuration are downloaded to the RAM of the target system.
   If you are asked whether the CPU is to be switched to STOP, confirm with **Yes**.
   SIMOTION SCOUT carries out numerous checks that are logged on the **Target system output** tab in the detail area. You will find there the concluding entry **Download to target system completed successfully**.

Note

The first download to the target system also downloads the data of the technology package. This operation can take several minutes.

Note

Depending on the firmware version on the CF card and on the SINAMICS components (DRIVE-CLiQ components such as Line Module, Motor Modules, Terminal Modules, etc.), the firmware of the components is automatically upgraded or downgraded.

The update can take several minutes and its progress is tracked by corresponding messages appearing in the output window of SIMOTION SCOUT.

A firmware update on DRIVE-CLiQ components is signaled by red-green flashing of the RDY LED:

- FW update in progress: RDY LED flashes slowly (0.5 Hz)
- FW update finished: RDY LED flashes quickly (2 Hz), POWER ON required

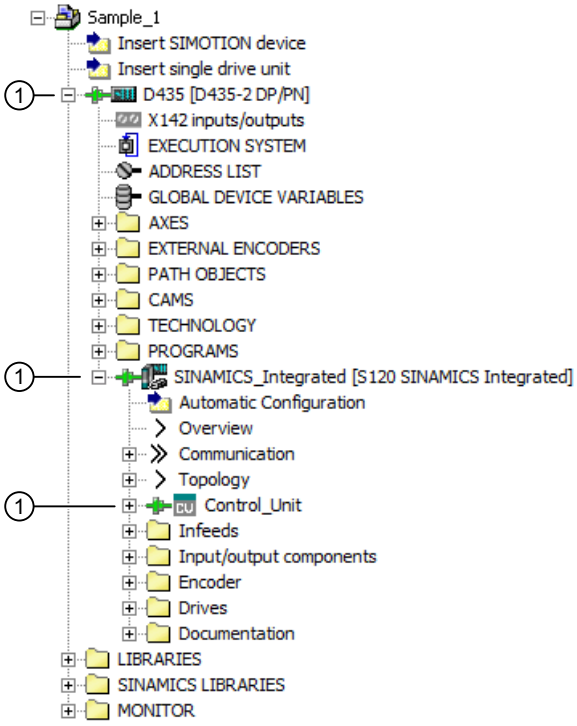
These flashing patterns are displayed additionally via a yellow RDY LED on the SIMOTION D, indicating that components connected to SIMOTION D are carrying out a firmware update or that all components have completed their firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SIMOTION SCOUT and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

Automatically established connection to the drive

SIMOTION SCOUT automatically establishes the online connection to the drive immediately following the project download.

In the project tree, the connector symbol changes on the SIMOTION device, the integrated SINAMICS drive, and the SINAMICS Control Unit. The connector symbol is entirely green, indicating that the project data in the PG/PC is identical with the project data in the target system.



① Green connector symbol: Element is in online mode. The project data in the PG/PC is identical with the project data saved in the target system.

Figure 3-52 Project tree

From this point, you can access the drive online with the PG/PC.

3.2.7 Configure the drive

3.2.7.1 Overview

Aim of Getting Started

In this part of Getting Started, you configure the integrated drive of the SIMOTION D435-2 device. You use auto-configuration for this purpose.

Preconditions

- You have downloaded the sample project to the target system, refer to the section Download the project to the target system (Page 159).
- SIMOTION SCOUT is online with the SIMOTION device and the integrated drive (green connector symbols).
- The SINAMICS drive components Infeed and Power unit, as well as Motor and Encoder, are connected to the SIMOTION Control Unit via DRIVE-CLiQ. This requirement for auto-configuration was referred to at the start of Getting Started, see the section Preconditions (Page 143).

Drive

The speed and current control functions for controlling the motor are implemented in the drive.

Automatic drive configuration

SIMOTION SCOUT can read out the electronic type plates of the SINAMICS drive components via the DRIVE-CLiQ interface and can use this data to configure the drive automatically. The data does not therefore need to be entered manually. The sample configuration of a SIMOTION D435-2 device shown here requires full DRIVE-CLiQ wiring.

As an alternative to automatic drive configuration, you can also configure a D4x5-2 device offline. Offline configuring is demonstrated in the online help version of Getting Started for SIMOTION C and SIMOTION P.

3.2.7.2 Automatic configuration of the drive

You open automatic configuration as follows

Double-click on **Automatic Configuration** in the project navigator under the drive SINAMICS_Integrated.

The **Automatic Configuration** dialog is displayed.

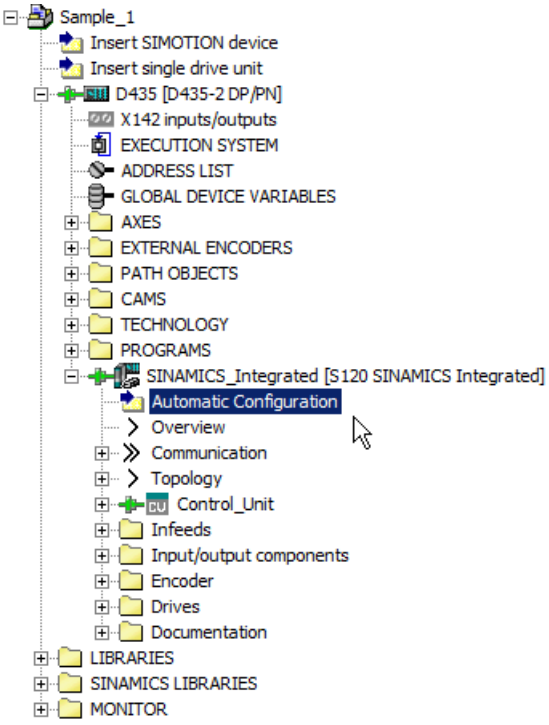


Figure 3-53 Call Project tree, Automatic Configuration

Note

In the project tree, the element **Automatic Configuration** is only visible if you have downloaded the project to the target system, and SIMOTION SCOUT is online with the SIMOTION device. The project must be consistent; see the section Download the project to the target system (Page 159).

You cause the drive to be configured automatically as follows

1. Click the **Configure** button in the **Automatic Configuration** dialog.
2. Confirm the prompt regarding restoring the factory settings with **Yes**.
   The confirmation prompt appears if the drive unit is not in the "First commissioning" state.

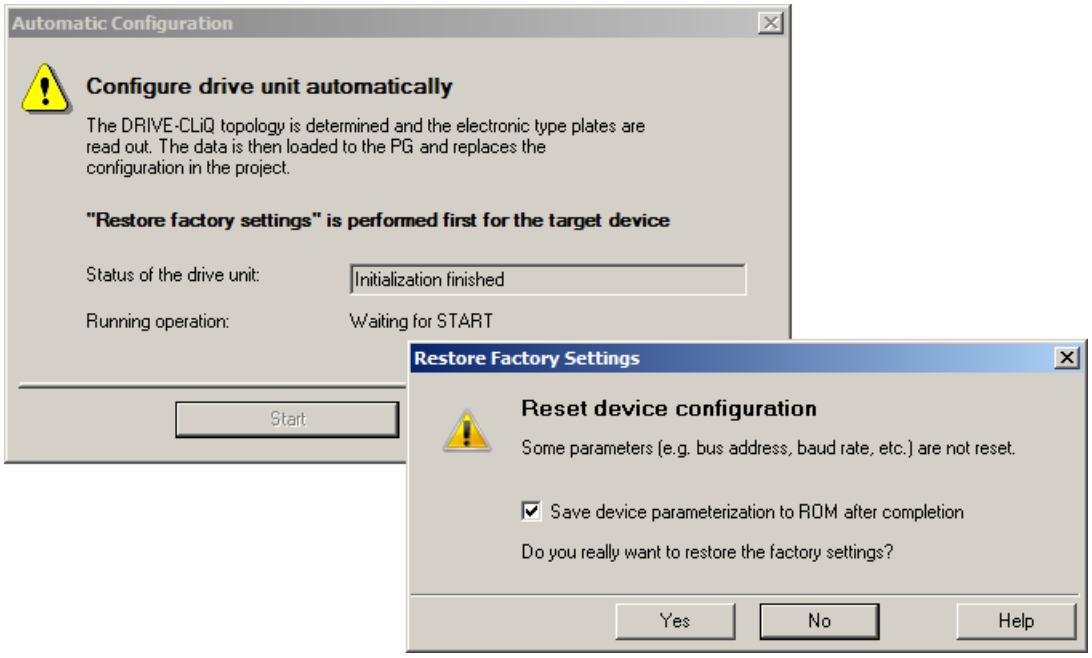

Figure 3-54 Start automatic drive configuration and restore factory settings

3. In the **Automatic Commissioning** dialog, you can specify whether you are using a drive object of the type servo or vector.
   Select **Servo**.
4. Click the **Create** button in the **Automatic Commissioning** dialog.
   Automatic configuring is started.

Note

Firmware update

If the firmware version on the DRIVE-CLiQ components is different to that on the CF card, a firmware update is performed automatically at this position.

In this case, proceed as follows:

- Wait for the procedure to finish. This can take several minutes.
- Go offline.
- Switch the power supply to the SIMOTION device off and then on again.

---

5. If a firmware update has not been performed, remain online to be able to see the changes in the project tree.

6. Open the **Infeeds** system folder in the project tree under the integrated drive.
   - If you are using an infeed with DRIVE-CLiQ interface, the auto configuration has created the infeed there.
   - If you are using an infeed without DRIVE-CLiQ interface, the folder is empty. The infeed is not known in the project.
     The other configuring requirements resulting in this way are dealt with in the next section Configure the infeed (Page 169).
7. Open the **Drives** system folder in the project tree under the integrated drive. The folder contains the drive detected by the auto configuration.

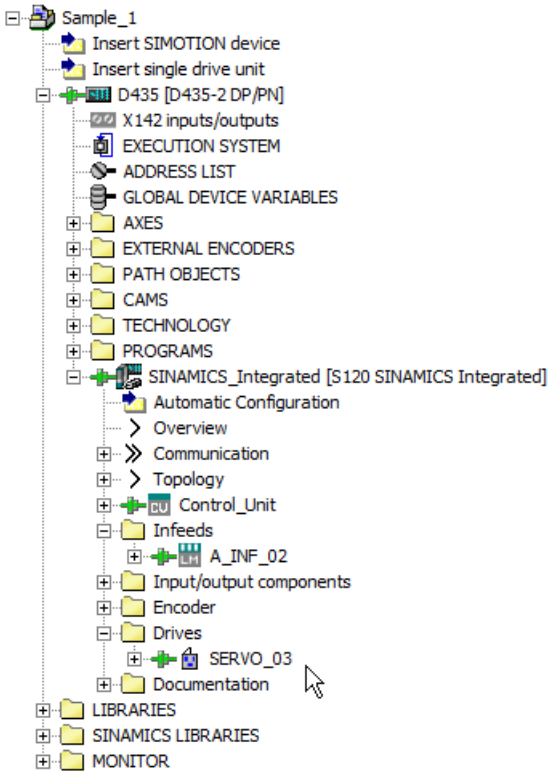

Figure 3-55 Project navigator, configured infeed and drives

8. Go offline.
   Click in the toolbar on the **Disconnect from target system** button.

In the footer of the workbench, **Offline mode** is indicated. Network communication between the PG/PC and the SIMOTION device has been cleared down.

Change the name of the drive

The automatic configuration also assigns the object name of the drive; in this example, SERVO_03.

You can change the name later. Changing is only possible in offline mode.

Proceed as follows:

1. Open the context menu of the drive by right-clicking. Select the **Rename** command there.
2. Assign the new name. Then confirm with **OK**.

As with all changes carried out in the project offline, the name change makes the project inconsistent. To restore the consistency between the "Project on the PG/PC" and the "Project on the SIMOTION device", another project download is necessary. The procedure is described in the section Download the project to the target system (Page 159).

3.2.7.3 Result in the sample project

If you are using an infeed with DRIVE-CLiQ interface, the drive is ready for operation. It can be interconnected with an axis.

3.2.8 Configure the infeed

3.2.8.1 Overview

Aim of Getting Started

In this part of Getting Started, you configure the infeed.

The integrated SINAMICS Control Unit only starts the drive when the infeed is ready. The project must therefore know the interface via which the drive receives the ready signal of the infeed.

Two cases must be distinguished here:

- Infeed with DRIVE-CLiQ interface
  If an infeed with DRIVE-CLiQ connection has already been created, the ready signal of the infeed (r0863.0) is automatically interconnected with "Infeed operation, p0864" of the drive when drives are inserted (only applies to drives that are attached to the same drive unit as the infeed).
  You can continue immediately with the next configuring step, see the section Configure the axis (Page 171).
- Infeed without DRIVE-CLiQ interface
  If you are using an infeed without a DRIVE-CLiQ interface, e.g. a Smart Line Module, you must wire the ready signal of the infeed via terminals. The following section describes the procedure.

Preconditions

- You have configured the integrated drive of the SIMOTION D435-2 device, see the section Configure the drive (Page 164).
- SIMOTION SCOUT is in offline mode.

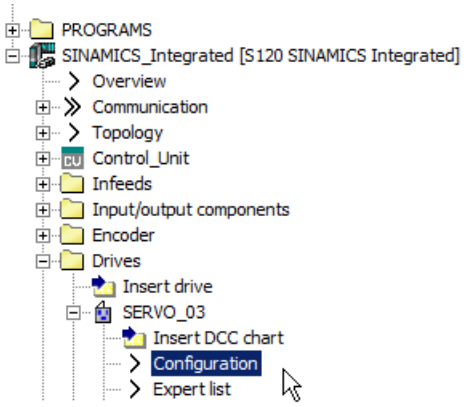
3.2.8.2 Configuring an infeed without DRIVE-CLiQ interface

An infeed without DRIVE-CLiQ interface provides the ready signal (p0863.0) via an output terminal. In the project, you specify the input (r0722) of the integrated SINAMICS Control Unit at which the signal is active. The drive supplied by the infeed uses the signal as a ready signal (p0864).

You interconnect the ready signal of the infeed as follows

In the sample project, the ready signal of the infeed (terminal "DO: Ready" of the infeed) is wired to the DI 0 of the D435-2.

1. Open the configuration dialog of the drive. To do so, double-click **Configuration** in the project tree below the drive.



2. Click in the working area on the **Configure DDS** button with the yellow background.

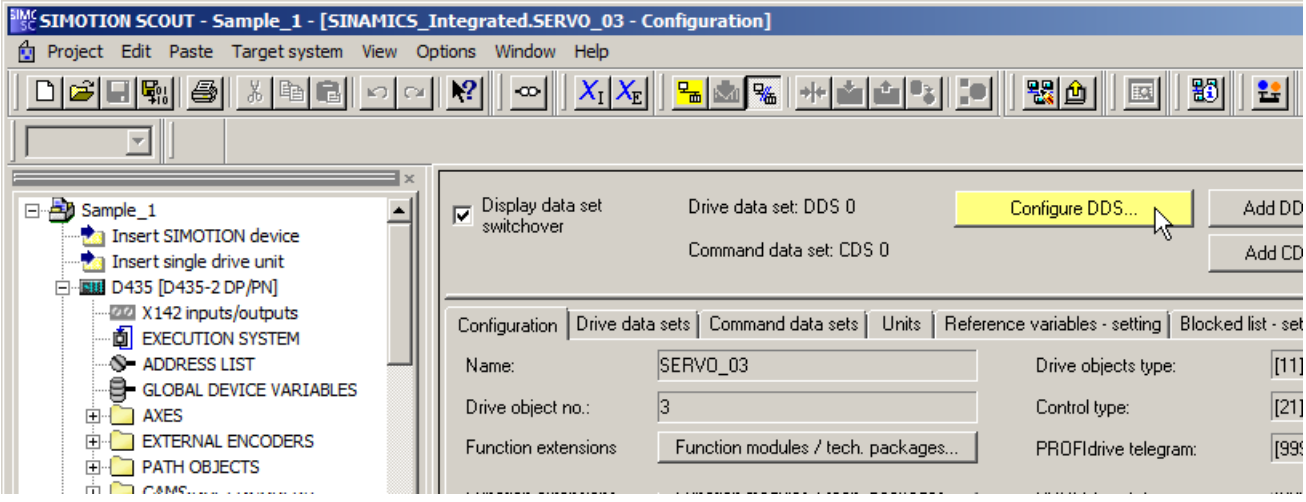


Figure 3-56 Configure DDS

The drive wizard opens.

3. Click **Next** in the drive wizard until you reach the dialog **Configuration - SINAMICS_Integrated - Power Unit BICO Technology**.

4. In the **Power unit BICO** dialog, input field **p0864**, select the digital input to which the ready signal of the infeed is wired (e.g. DI 0).

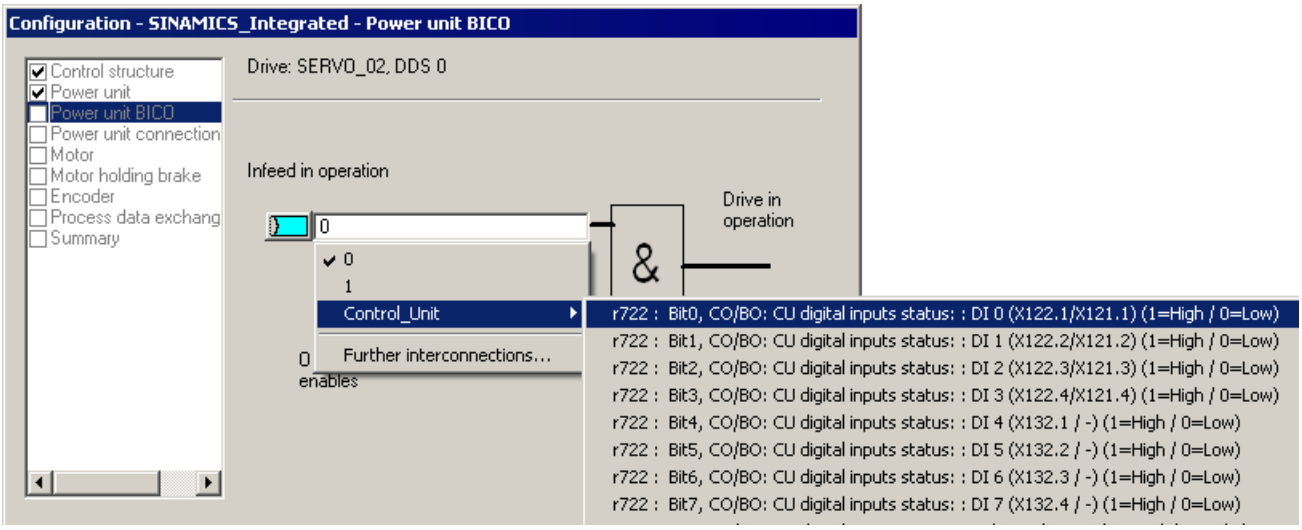

Figure 3-57 BICO interconnection in the drive wizard

5. Click **Next**. Run through all the other dialogs without change until the final **Summary** dialog.
6. Click **Finish**.
   The configuration is thus completed.
7. The configuration dialog of the drive is no longer required. Click **Close** at the bottom right of the dialog box.

3.2.9 Configure the axis

3.2.9.1 Overview

Aim of Getting Started

This part of Getting Started shows you how to create and configure an axis in the project, and how to interconnect it with the integrated drive of the SIMOTION D device. SIMOTION SCOUT provides the axis wizard for this purpose.

Preconditions

You have configured the integrated drive of the SIMOTION D device, see the section Configure the drive (Page 164).

Axis technology object

Technology objects represent the respective real objects (e.g. a position axis) in the controller.

The Axis technology object offers users a technological view of the drive and the encoder (actuator and sensor), provides technological functions for these components, and conceals the actual hardware interface.

The Axis technology object contains extensive functionality, e.g. communication with the drive, actual value processing, position control, and positioning functionality. It executes control and motion commands and indicates states and actual values.

Technological limitations and mechanical values of the axis and encoder (e.g. leadscrew pitch and gears) are set on the axis. You can then work exclusively with technological variables.

Axis wizard

SIMOTION SCOUT provides the axis wizard for creating a new axis. The wizard scans the basic settings and interconnects the TO axis with a drive.

The wizard can only be run through once. Later changes to the configuration can be entered in the corresponding dialogs of the TO.

3.2.9.2 Creating an axis

For the sample project, create the axis **Axis_2**. Assign the axis to the drive you have configured in the section Configure the drive (Page 164).

Run through the wizard and confirm all standard settings with **Next**.

Note

Axis_2

In the online help version of Getting Started, 2 axes are created, a virtual axis Axis_1 and a real axis Axis_2. In agreement with the designation there for the real axis, the designation Axis_2 is used here.

You can find Getting Started in the online help under **Getting Started SIMOTION SCOUT**.

You create a real axis in the project as follows

1. Open the **AXES** folder in the project navigator.
2. Double-click **Insert axis**. The **Insert axis** dialog appears.
3. Name the axis in the **Name** field. Use the designation **Axis_2** for the axis of the sample project.

4. Leave the preset axis technology at the default **Positioning**.

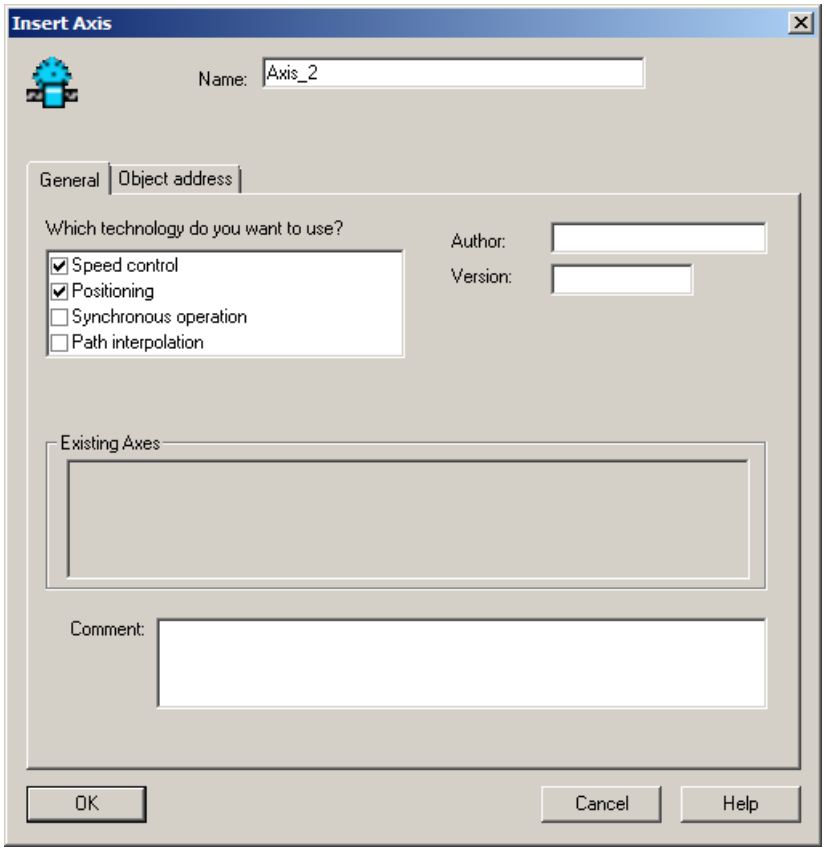

Figure 3-58 Axis wizard, create real axis

5. Click **OK**.
The axis configuration wizard appears.

6. Define the axis type.
   For the sample project, select preferably a linear axis with an interconnection to an electrical drive.
   Activate the fields **linear** and **electrical**.

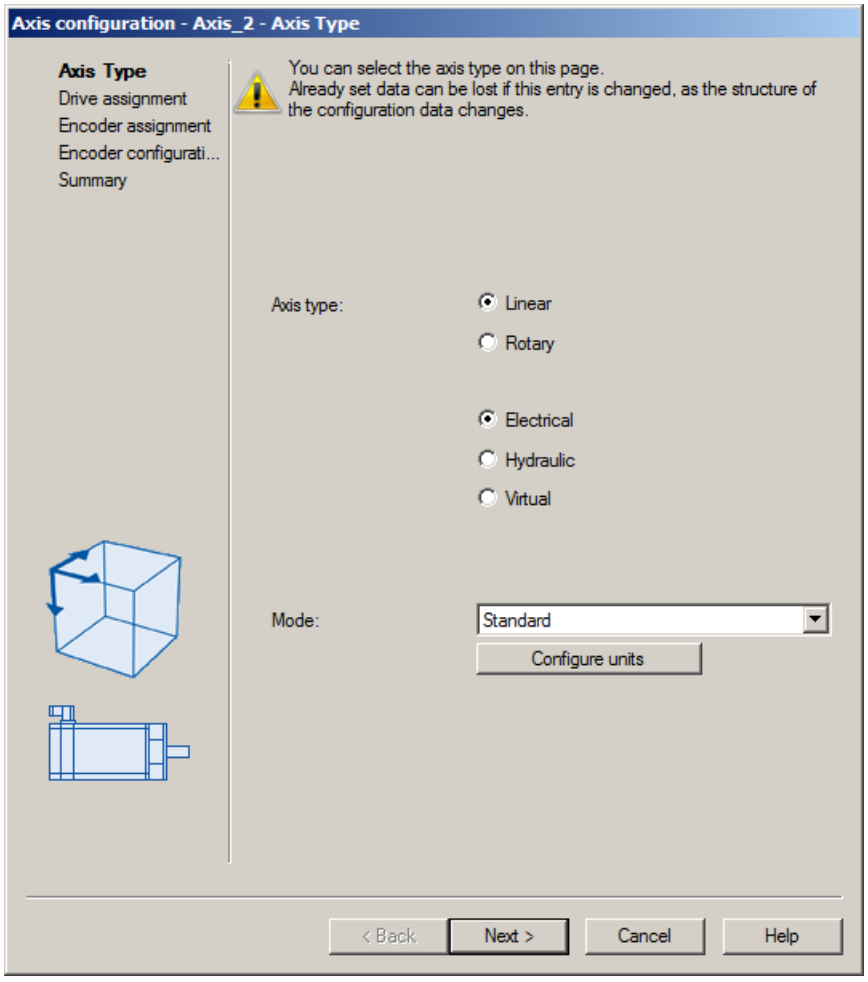

Figure 3-59 Axis wizard, determine axis type

7. Click **Next**.
   The **Drive assignment** dialog appears.

8. Assign the axis to the drive you have configured in the section Configure the drive (Page 164). To do so, click the drive unit in the **Assignment partner** column. Click in the tree under the drive object on the drive object you want to interconnect. **Assign** appears in the **Assignment** column. The axis/drive assignment is thus defined.

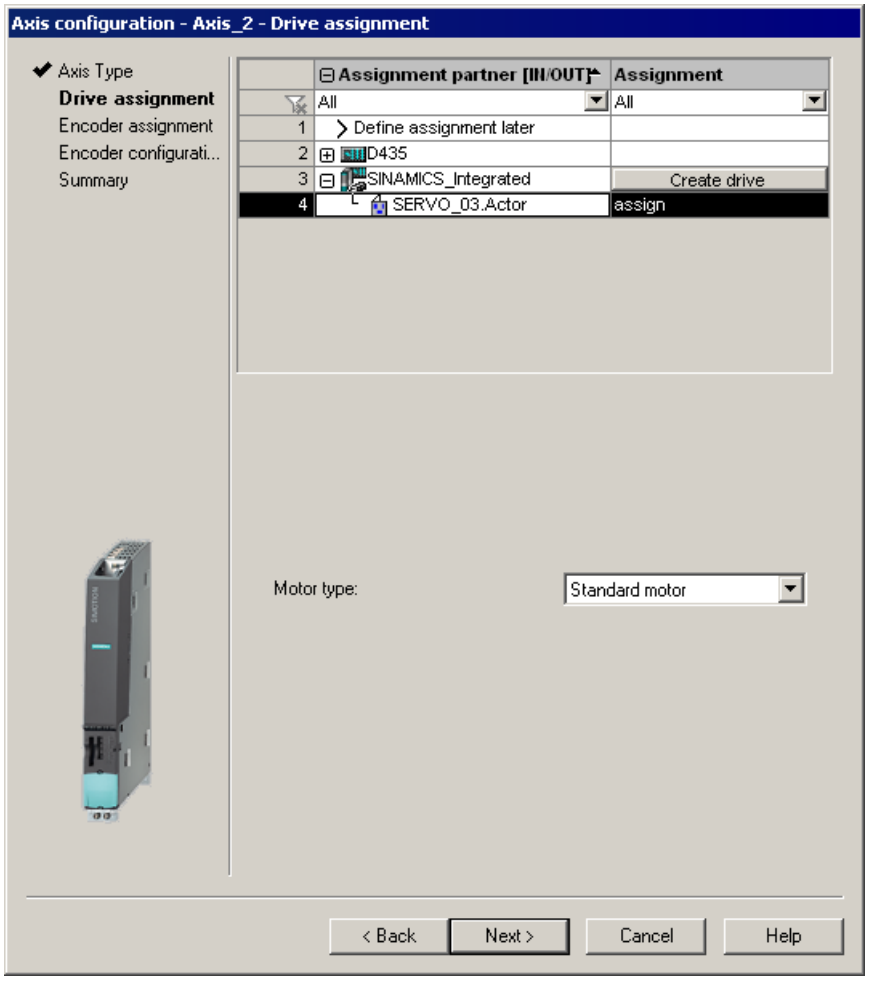

Figure 3-60 Axis wizard, assign drive

Click **Next**.

Note

As an alternative to assigning the axis to an already configured drive, the axis wizard offers two further selection options:

- Define the axis/drive assignment later:
  The axis is to be created and not assigned to a drive until later. Programming and simulation of the axis are also possible here.
- Create drive:
  The drive wizard can can be called up from the axis wizard (offline configuring). The axis can thus be created in one step along with the drive, and assigned to the drive.

The alternative procedures are not considered further in Getting Started.

9. Assign the motor encoder.
   In the **Encoder assignment** window, you use the motor encoder connected to the drive as the standard setting.
   Click **Next**.
10. The axis wizard then assembles the configuration data in an overview. You thus have an opportunity to check and correct the data before accepting it into the project.
    Close the dialog with **Finish**.
    The configured axis is displayed in the project navigator.

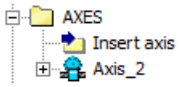

Figure 3-61 Created axis in the project navigator

Automatic settings of the engineering system

The engineering system automatically defines the PROFIdrive axis telegrams required for communication, as well as the addresses used.

In the same way, telegrams are extended and interconnections automatically created in the drive, depending on the selected TO technology (e.g. SINAMICS Safety Integrated).

Drive and encoder data, as well as reference variables, maximum variables, torque limits, and granularity in torque reduction of the SINAMICS S120 are accepted automatically for the configuration of the SIMOTION technology objects "TO axis" and "TO external encoder". This data no longer has to be entered in SIMOTION.

Further axis configuration

Further axis configuration is possible via dialogs that can be accessed in the project navigator under the axis. No other configuration is required for the sample project.

Download the axis configuration to the target system

- Save and compile the project.
- Download the sample project with the axis configuration to the target system to be able to test the functioning of the axis in the next configuration step.

See also

Download the project to the target system (Page 159)

3.2.10 Test the axis with the axis control panel

3.2.10.1 Overview

Aim of Getting Started

In this part of Getting Started, you test the configured axis. SIMOTION SCOUT provides you with the axis control panel for this purpose.

Preconditions

- You have configured the infeed, see the section Configure the infeed (Page 169).
- You have created and fully configured an axis in the sample project, see the section Configure the axis (Page 171).
- The project with the axis configuration has been downloaded to the target system, see the section Download the project to the target system (Page 159).
- SIMOTION SCOUT is in online mode.

Axis control panel

The axis control panel is used for controlling and monitoring individual axes. You can use it to traverse axes together with the drive.

You can use the control panel to perform the following tasks, for example:

- Test each part of the system individually before program-driven axis motions are initiated.
- In the event of an error, test whether the individual axes and drives can be traversed from the control panel.
- Move the axes for optimization purposes (controller optimization).
- Carry out homing.
- Set and remove an axis enable.

3.2.10.2 Working with the axis control panel

In the sample project, you traverse the set-up axis in jog mode to test the correct functioning of the axis.

You open the axis control panel as follows

Open the **AXES** folder in the project navigator. Double-click below the axis on **Control panel**.

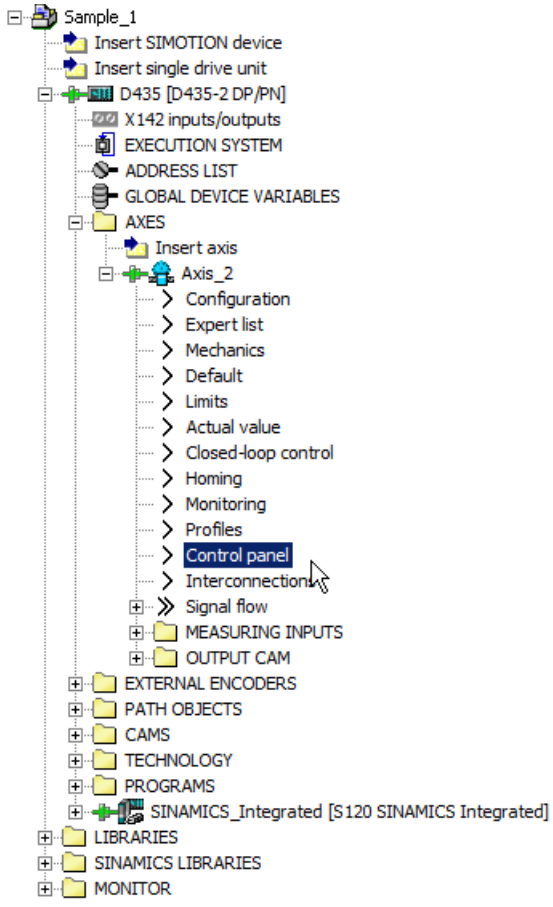

Figure 3-62 Calling the axis control panel

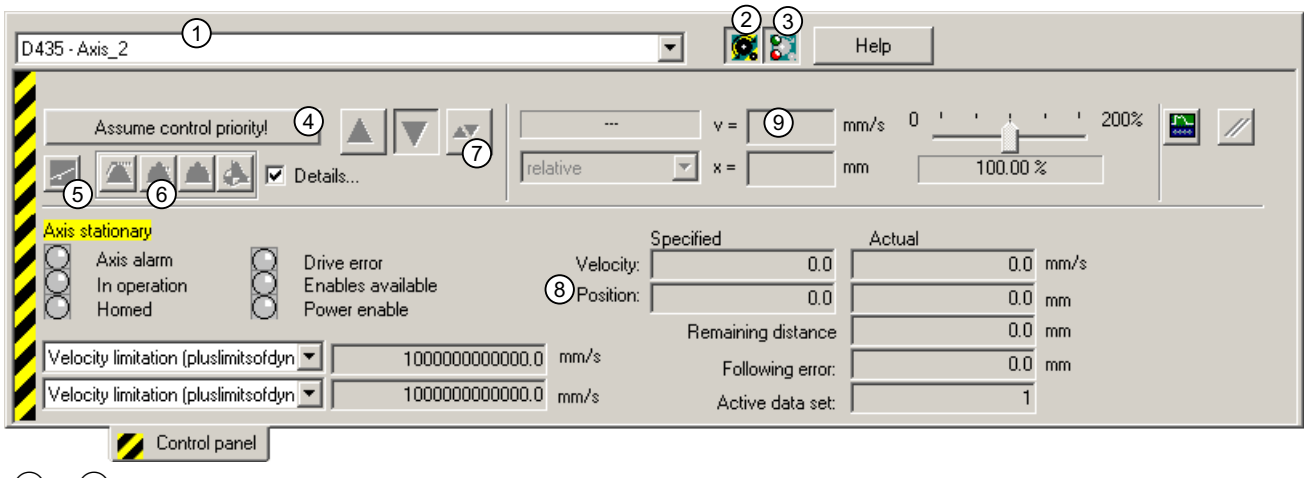
The axis control panel is opened in the detail view.



① ... ⑨ Reference is made to the circled digits in the text below.

Figure 3-63 Axis control panel

You traverse an axis with the axis control panel as follows

1. The field at top left of the control panel ① shows the currently selected axis.
2. Showing areas in the control panel:
   The control panel is divided into a control area and a diagnostics area. The areas may be hidden.
   Click the **Show/hide control area** button ② and/or the **Show/hide diagnostics area** button ③ to show the respective area.
3. Assume control priority – Observe safety regulations:
   To be able to traverse the axis from the PG/PC, the PG/PC must obtain control priority.
   Click the **Assume Control Priority** button ④.
   The **Assume Control Priority** dialog opens.

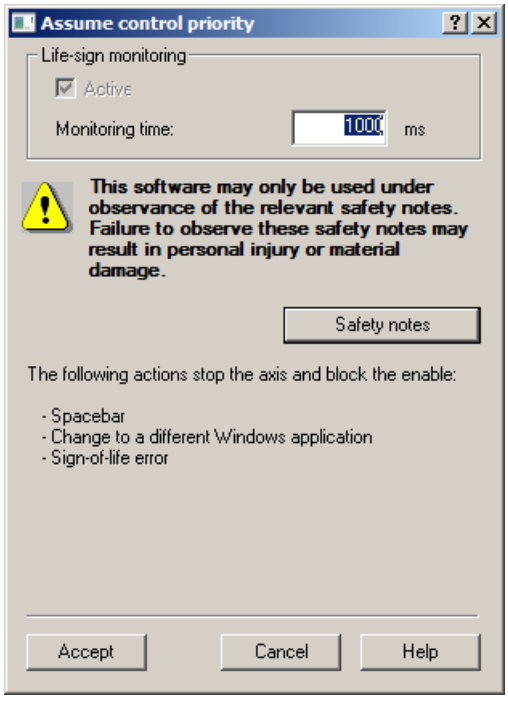


Figure 3-64 Axis control panel, assume control priority

Observe the safety regulations and confirm with **Accept**.
The PG/PC now has control priority.

Note

You can stop the axis at any time by pressing the spacebar.

4. Enable the axis:
   Click the **Set/remove enables** button ⑤ to enable the axis.

Confirm the **Switch axis enable** dialog that appears with **OK**.
The switches **Start motion**, **Stop motion** and **Jog** ⑦ are enabled.

5. Homing the axis:
   Click the **Home axis** button.
   In the dialog box, select the **Homing type Set home position**, and enter the value **0** under **Home position coordinates**.
   Confirm the dialog box with **OK** and start homing the axis.
6. Click the **Position-controlled traversing of the axis** button ⑥.

   

   The **Start axis position-controlled** dialog appears.
   Specify the velocity of the axis. Click **OK** to close the dialog.
   The velocity appears in the field **v=**⑨.
7. Start the axis motion:
   Click **Jog**⑦.

   

   The axis is traversed while you press the switch. In the fields **Velocity** and **Position**⑧, you can monitor the traverse motion.
   The axis test is thus executed.
8. Deactivate axis enable:
   Click **Set/remove enables**⑤.
   Confirm the **Disable axis** dialog with **OK**.

   Note

   If you want to traverse the axis again, acknowledge all alarms in the "Alarms" window.

9. Return control priority:
   Click **Give up control priority**④ to deactivate control of the axes from the PG/PC. In this operating state, the axes can no longer be controlled from the PG/PC.
10. Go offline:
    Select **Project > Disconnect from target system** in the menu. Or click in the toolbar on the **Disconnect from target system** button.

    

3.2.10.3 Result in the sample project

You have traversed the axis of the sample project with the axis control panel and thus ensured its correct functioning. Configuring the axis is thus completed.

3.2.11 Configure digital outputs

Aim of Getting Started

In this part of Getting Started, you configure two of the digital inputs/outputs available on the SIMOTION D device as outputs.

You require the outputs for the program you will write in the subsequent configuring step, see the section Programming the SIMOTION application (Page 182).

Preconditions

SIMOTION SCOUT is in offline mode.

I/O channels of the terminal X142

You use the I/O channels of the terminal X142 for the sample project.

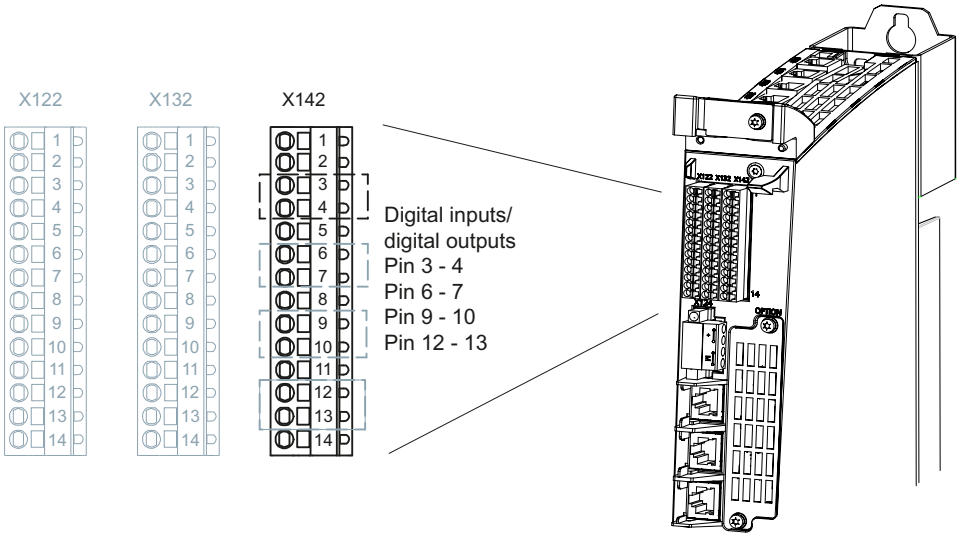

Figure 3-65 SIMOTION D445-2 DP/PN, position of the digital interface X142

The I/Os of the terminal X142 are permanently assigned to SIMOTION D4x5-2. The terminal is thus visible in the project tree under the SIMOTION device.

You define the digital outputs as follows

1. Double-click the element **Inputs/outupts X142** in the project tree below the SIMOTION device.
   The **I/O properties** dialog opens.
2. Go to the **Channels 0-7** tab.
   The terminal **X142** is represented on the tab, specifying the pin numbers and the current use of the channels.

3. Channels 0 and 1 on pins **3** and **4** are preset at the factory as digital inputs DI 0 and DI 1. Define the two channels as digital outputs DO 0 and DO 1. Select the value **DO** in each case in the **Function** list field.

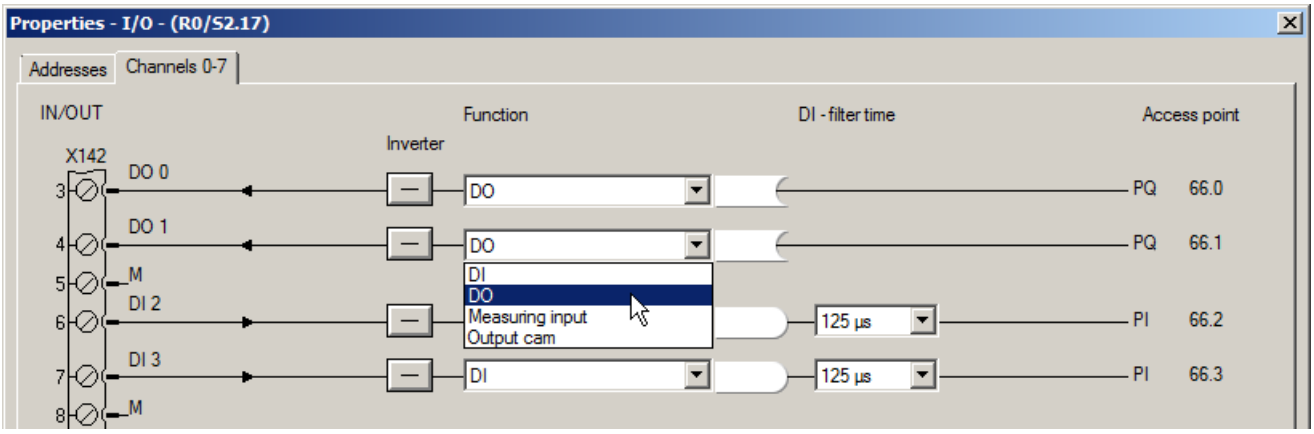

Figure 3-66 I/O properties

4. Confirm with **OK**.
Configuring the digital outputs is thus completed.

3.2.12 Programming the SIMOTION application

3.2.12.1 Overview

Aim of Getting Started

In this section, you write a simple SIMOTION user program for the sample project.

- You create the variables required by the program.
- You create the program and additional auxiliary programs with the graphical editors supplied by SIMOTION SCOUT.

Purpose of the program

The program controls the axis set up in the sample project.

- The infeed is switched on via a SINAMICS system call.
- The axis is traversed to a specific position and returned to the original position.
- The program states "Program started" and "Program end reached" are applied to digital outputs to evaluate them in the I/O.

Preconditions

- You have configured the infeed, see the section Configure the infeed (Page 169).
- You have configured an axis and tested its function, see the sections Configure the axis (Page 171) and Test the axis with the axis control panel (Page 177).
- You have prepared two digital outputs for use in the program, see the section Configure digital outputs (Page 181).
- SIMOTION SCOUT is in offline mode.

3.2.12.2 Variables

Variable types

Variable types

Several variable types are distinguished in SIMOTION:

- **System variables**
  Each SIMOTION device and each technology object has specific system variables. You can access system variables within the SIMOTION device from all programs.
- **I/O variables**
  An I/O variable is a symbolic variable name that is assigned to an I/O address of the SIMOTION device or to the I/O. Direct access to the I/O is thus possible.
  I/O variables are valid across all devices. All programs of the SIMOTION device have access to them.
- **Global device variables, unit variables, and local variables** are user-defined variables with a limited scope of validity:
  All programs of a SIMOTION device can access global device variables.
  Unit variables can be accessed by all programs, function blocks and functions defined within the same unit, e.g. ST unit, MCC unit, LAD/FBD unit.
  A unit (source) is a logic unit that you can create in your project and that can contain programs, functions and function blocks.
  Local variables can only be accessed within the program, the function or the function block in which they are defined.

You can find further information on variables in the online help under **Variable model**.

Variables of the sample project

You require the following variables for the sample project of Getting Started:

2 global device variables

- g_bo_start
- g_bo_ready

2 I/O variables

- q_bo_output0
- q_bo_output1

Additionally when using an infeed with DRIVE-CLiQ interface:

2 I/O variables

- LineModule_STW
- LineModule_ZSW

Instance

- myFB_LineControl

Use of the variables in the sample project

The variables **g_bo_start** and **g_bo_ready** redundantly describe the program states "Program started" and "Program end reached".

The I/O variables **q_bo_output0** and **q_bo_output1** apply the program state to the configured digital outputs of the SIMOTION device, e.g. for a display.

The instance **myFB_LineControl** and the I/O variables **LineModule_STW** and **LineModule_ZSW** control the infeed.

Creating global device variables

You create global device variables in the **Symbol browser** tab of the detail view.

You create global device variables as follows

Create the global device variables **g_bo_start** and **g_bo_ready** for the sample project as follows.

The variable definition encompasses:

- Variable name
- BOOL data type

Note

You can only create global device variables in offline mode.

1. Click in the project navigator under the SIMOTION device on the element **GLOBAL DEVICE VARIABLES**.
   The **Global device variables** table is displayed in the symbol browser.
2. Click in the **Name** column on the first free cell and enter the variable name **g_bo_start**. Press RETURN or TAB. The input focus jumps to the **Data type** field. Alternatively, you can click in the field to move the input focus there.
3. Enter the data type **BOOL** in the **Data type** field.

4. Press RETURN to confirm.
   The variable is created and is available in the project. A new empty line is opened for input in the symbol browser.
5. Create the global device variable **g_bo_ready** accordingly.

The figure below shows the full definition.

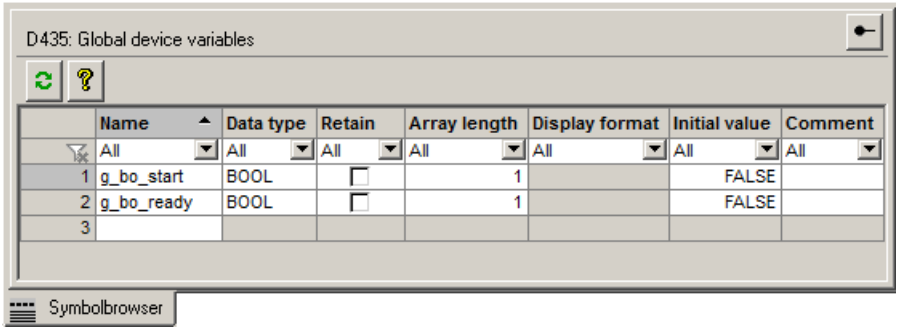

Figure 3-67 Global device variables of the sample project

Creating I/O variables

When configuring I/Os, SIMOTION SCOUT (as of Version 4.2) supports the symbolic assignment of inputs and outputs located on SIMOTION/SINAMICS components. To be able to access the drive-level I/O with an I/O variable, it is only necessary to assign the I/O variable to the I/O channel. SIMOTION SCOUT automatically sets up telegrams, BICO interconnections and addresses.

You create the I/O variables for output to the configured digital outputs as follows

You create the I/O variables **q_bo_output0** and **q_bo_output1** for the sample project as follows.

The variable declaration encompasses:

- Variable name
- Definition as output variable OUT
- BOOL data type
- Assignment to a digital output

Note

I/O variables can only be created in offline mode.

1. Double-click the element **ADDRESS LIST** in the project navigator below the SIMOTION device. The **Address list** tab opens in the detail view.
2. Click the first free cell in the **Name** column. Enter the variable name **q_bo_output0**. Press RETURN or TAB. The input focus jumps to the **I/O address** field. Alternatively, you can click in the field to move the input focus there.
3. Enter the keyword **OUT** in the **I/O address** field.

4. Enter the data type **BOOL** in the **Data type** field, or leave the field empty.
5. Assign the configured digital output to the variable:
   - Click the button ... in the **Assignment** cell. The Assignment dialog opens.
   - Open the **D435** element in the Assignment dialog.
   - Click the digital output **DO_0** below the **D435** element. **Assign** appears in the **Assignment** column.

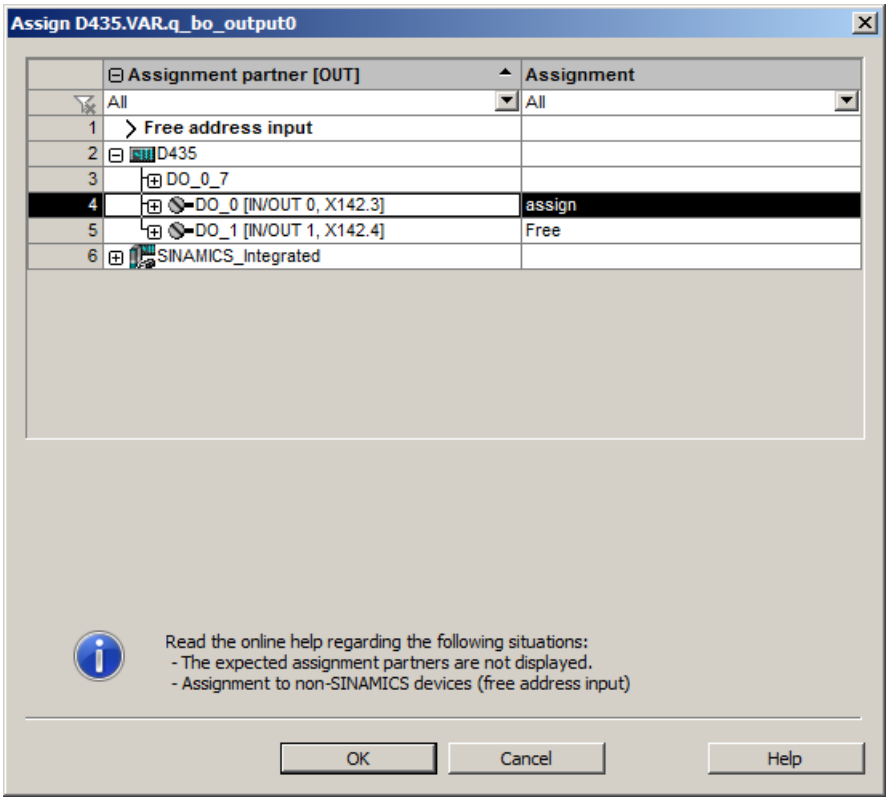

Figure 3-68 Assigning I/O variable and I/O channel

6. Confirm with **OK**.
   The assignment of I/O variable and I/O channel has been completed. The I/O variable is created and is available in the project. A new empty line is opened for input in the **Address list** table.

7. Create the I/O variable **q_bo_output1** in the same way. Assign the variable to the configured digital output DO 1.
   The figure below shows the full declaration:

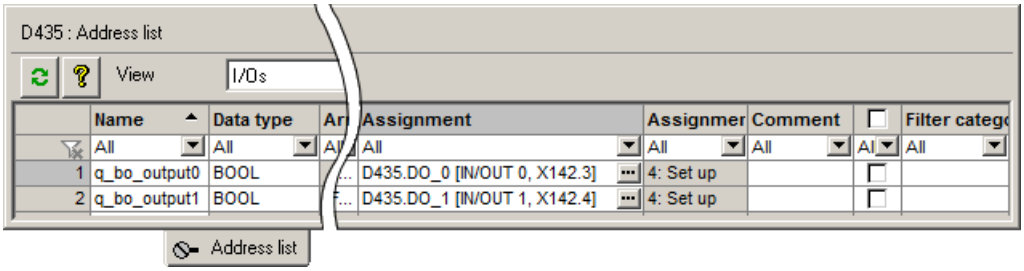

Figure 3-69 I/O variables of the sample project

8. Leave the **Address list** tab open for declaring further I/O variables.

You create the I/O variables for controlling the infeed as follows

If you are using an infeed with DRIVE-CLiQ interface, create also the I/O variables **LineModule_STW** and **LineModule_ZSW**.

Note

I/O variables can only be created in offline mode.

Proceed as for the definition of the I/O variables **q_bo_output0** and **q_bo_output1**.

1. Open the **Address list** tab in the detail area if not already visible.
2. Create the I/O variable **LineModule_STW**.
   - **I/O address**: OUT
   - **Data type**: WORD
   - **Assignment**: Control word E_STW1 of the SINAMICS infeed

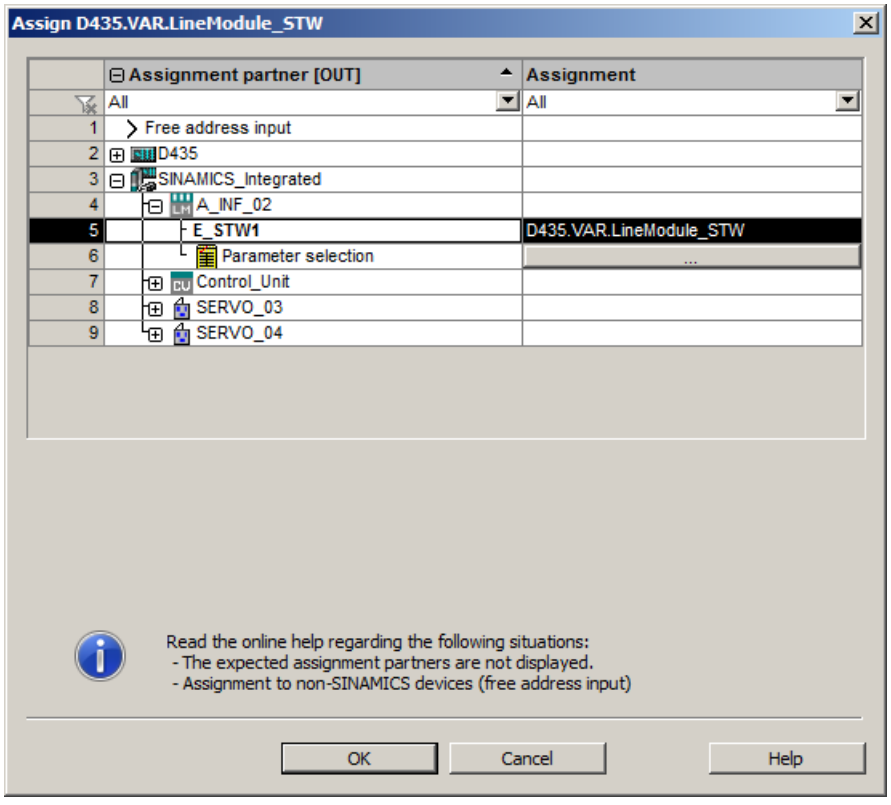

Figure 3-70 Assigning I/O variable and control word of the infeed

3. Create the I/O variable **LineModule_ZSW**.
   - **I/O address**: IN
   - **Data type**: WORD
   - **Assignment**: Status word E_ZSW1 of the SINAMICS infeed

The figure below shows the full declaration:

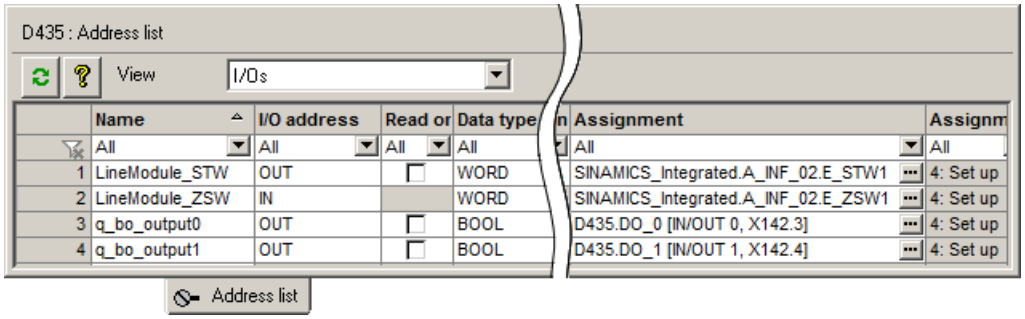

Figure 3-71 I/O variables of the sample project

Back up the configuration

Back up the variables created in the sample project.

To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.

3.2.12.3 Programming

Programming languages in the sample project

Within the scope of the sample project, you create a simple user program with the programming languages MCC and LAD/FBD.

For this, you use the variables you created in the previous section Variables (Page 183).

MCC Motion Control Chart

The programming language MCC

MCC (Motion Control Chart) is a graphical programming language.

The programmed motion sequences (machine sequences) are shown in the MCC as flowcharts (MCC charts). The structure of the flowcharts is oriented around the actual operating sequence of the machine. A sequential motion sequence is programmed.

System in SIMOTION SCOUT

The **PROGRAMS** folder under the SIMOTION device contains the MCC units created in the project.

An MCC unit contains the MCC programs that are to run on the SIMOTION device.

"MCC program" is a collective term for different program organization units (POU).

A POU can be a program, a function, or a function block. The type of the POU is indicated in the project navigator by an icon:

- Program
- Function
- Function block

An MCC chart is the graphical representation of a program organization unit POU.

An MCC unit can contain several MCC charts.

Program creation steps

Creation of an MCC program encompasses the following steps:

1. Creating the MCC unit.
2. Creating the MCC charts in the MCC unit.
3. Inserting MCC commands in the MCC chart and parameterizing the commands.

Creating the MCC unit

You create the MCC unit **motion** for the sample project as follows.

You create an MCC unit in the project as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator. Double-click **Insert MCC unit**. The **Insert MCC unit** window appears.
2. Enter the name **motion**.
3. Go to the **Compiler** tab. For diagnostics purposes, activate the options **Permit program status** and **Permit single step**. In this way, you can monitor program execution later in online mode.
4. Confirm with **OK**.
   The MCC unit is created.
   - The unit appears in the project navigator under the PROGRAMS branch.
   - In the working area of the workbench, the declaration table of the unit opens. The variables declared there apply within the MCC unit and can be linked in other units.

   No other variable declaration is required for the sample project. You have already created the necessary variables as global device variables in the symbol browser.

Creating the MCC chart

You create the MCC chart **pos_axis** for the sample project as follows. The MCC chart **pos_axis** is a POU of the type program.

You create an MCC chart as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator.
2. Open the MCC unit **motion** in the **PROGRAMS** folder.
3. Double-click **Insert MCC chart**.
   The **Insert MCC Chart** window appears.
4. Enter the name **pos_axis**.
5. Select the creation type **Program**.
6. Confirm with **OK**.
   The MCC chart is created in the project.
   - The created MCC chart **pos_axis** appears in the **PROGRAMS** folder under the **motion** unit.
   - The MCC editor is opened in the working area of the workbench. The start and end nodes are already pre-defined. You can start MCC programming.

Inserting command blocks into an MCC chart

Every newly created MCC chart already contains a start and end node.

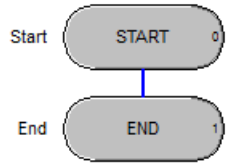

Figure 3-72 MCC chart, start and end block

You insert the MCC command blocks between these. The commands are processed in the direction from the start to the end node.

The MCC commands are available to you via:

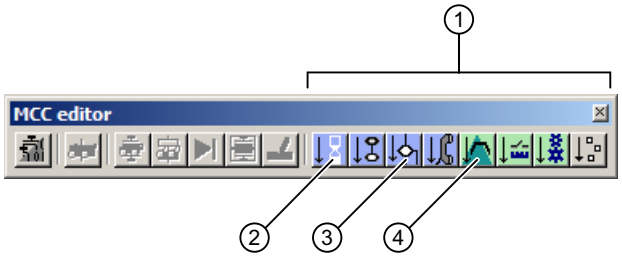
- **MCC editor** toolbar
- **MCC Chart > Paste** menu command
- Context menu of the command block

You work with the MCC editor toolbar as follows

Open the toolbar

The **MCC editor** toolbar becomes visible in the workbench as soon as you open an MCC chart.

The commands are arranged into command groups. The sample project uses commands from the command groups **Basic commands**, **Program structures**, and **Single axis commands**.



① Command groups
② Basic commands
③ Program structures
④ Single axis commands

Figure 3-73 MCC editor toolbar

Note

If you do not see the toolbar, check that the display is switched on: Open the menu **View > Toolbars**. Activate the checkbox for **MCC editor** in the **Toolbars** window.

Open the command group

Move the mouse over the colored buttons of the toolbar to show the command groups.

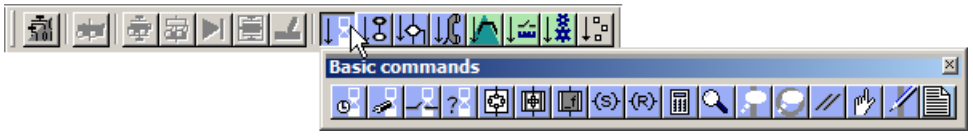


Figure 3-74 Open the command group

Keeping command groups open or closed continuously

Click the window title of a command group to keep the command group open continuously.

Select **Hide** in the context menu of a command group to close the command group.

Placing the command group as required

Drag the toolbar or the command groups of the toolbar with the mouse to any location on the workbench.

Docking the toolbar

Drag the toolbar or the command groups of the toolbar with the mouse to the edge areas of the workbench to dock them there.

Showing a tooltip for the command

Hold the mouse pointer briefly over a command button. The designation of the command is shown.

You insert commands into an MCC chart with the help of the MCC editor toolbar as follows

1. Click in the active MCC chart on the connecting line between two commands, or click the command after which the new command is to be inserted.
   The connecting line or the border of the command button is marked in blue. The marking flashes.
2. Select the command group in the **MCC editor** toolbar. Click the desired command in the command group.
   The command is inserted into the chart.

The newly inserted command is empty. It must then be parameterized; e.g. for a variable assignment, the name of the variable and the assigned value must be specified.

The following section Creating an MCC sample program: basic framework (Page 193) describes the procedure in detail.

3.2.12.4 Creating an MCC sample program: basic framework

Overview

In the sample project, you create the MCC program **pos_axis**. This program traverses an axis to a target position and back to the starting position.

Handling the infeed

If you are using an infeed without a DRIVE-CLIQ interface, the basic framework for program-controlled operation of the axis dealt with in this section is sufficient. The ready signal of the infeed is wired to the digital input DI 0 of the D435-2, see section Configure the infeed (Page 169).

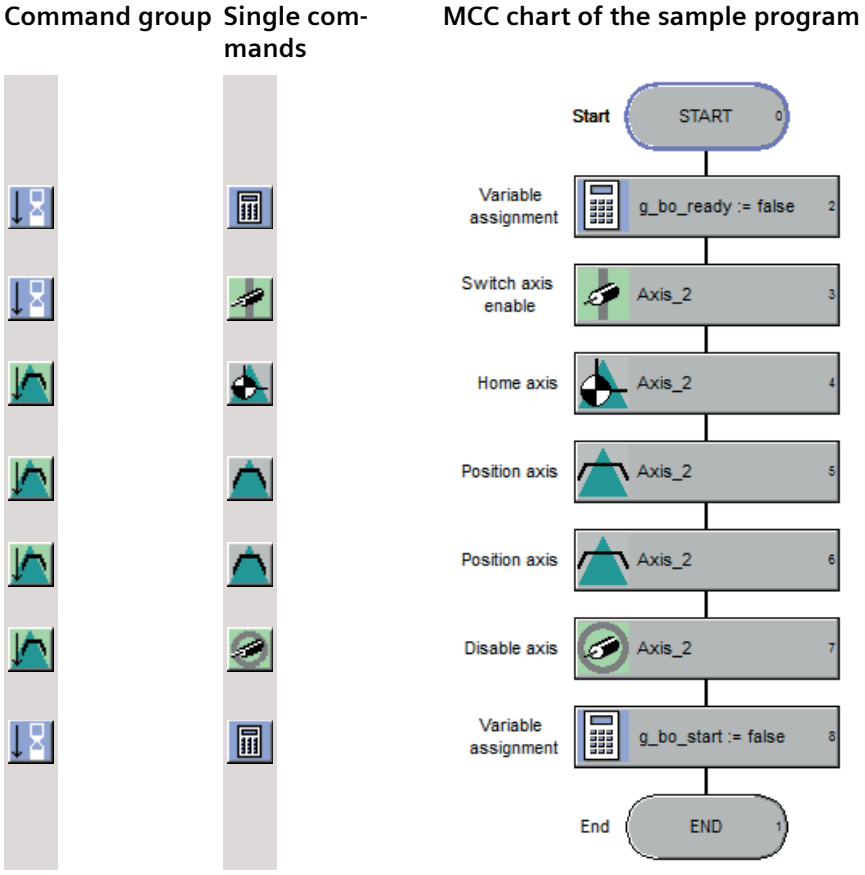
If you are using an infeed with a DRIVE-CLiQ interface, the program must switch the infeed on. Getting Started deals with this additional program sequence separately in the section Expanding the MCC sample program: control of the infeed (Page 205).

Program flow

The finished MCC chart

The figure below shows the finished MCC chart of the sample program.

The first two command blocks initialize the variables **g_bo_ready** and **g_bo_start**. The axis is then enabled, referenced, and traversed to the target position. When the position has been reached, the axis returns to the starting position. The enable is revoked. Finally, the variable **g_bo_start** is reset and the variable **g_bo_ready** is set.



Command groups and individual commands

In the figure above, the icons of the command group and of the individual command that you must click in sequence to insert the command into the MCC chart are shown in front of every MCC command.

The sections below describe the procedure in detail.

Variable assignment g_bo_ready:=false / g_bo_start:=true

The variable **g_bo_ready** is set to FALSE to set the variable to a defined starting point.

The variable **g_bo_start** is set to TRUE to indicate the start of the axis.

To assign the variables in the MCC editor, proceed as follows:

1. Mark the line between the start and end nodes.

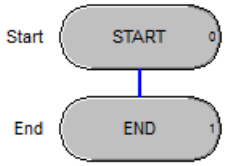


Figure 3-75 Empty MCC chart

2. Open the **Basic commands** command group in the **MCC editor** toolbar. Click the **Variable assignment** command in the command group.

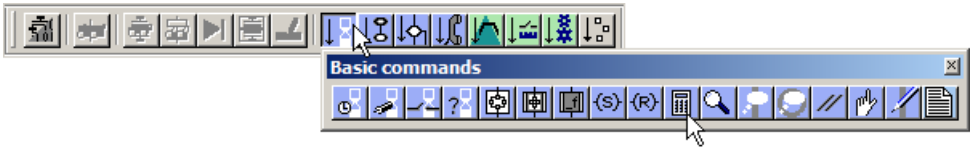

Figure 3-76 MCC editor toolbar, variable assignment command

The **Variable assignment** command block is inserted into the MCC chart after the start node.

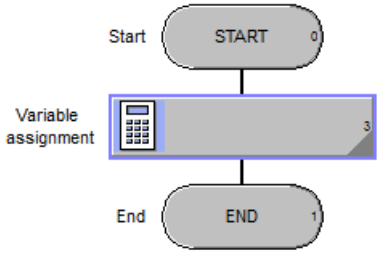

Figure 3-77 MCC chart with inserted variable assignment command block

3. Assign the value FALSE to the variable **g_bo_ready**. You transfer the variable name from the symbol browser to the command block:
   - Double-click the **Variable assignment** command block.
     The **Variable assignment** window appears.
   - Select the value **Formula** in the drop-down list.
     A table with the columns **Variables** and **Expression** appears.
   - Open the symbol browser. To do so, click **GLOBAL DEVICE VARIABLES** under the SIMOTION device in the project navigator.
   - Select the variable **g_bo_ready** in the symbol browser. To do so, click in the first column of the symbol browser on the preceding line number. The line is shown on a black background.

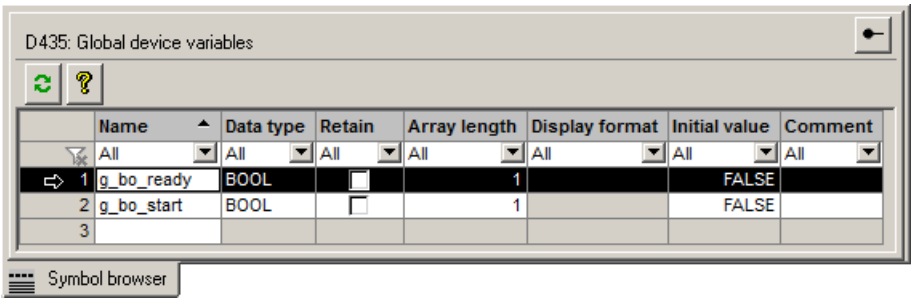

Figure 3-78 Symbol browser

   - Drag and drop the marked line to the **Variable** column of the **Variable assignment** window. The variable is inserted and its name displayed.
   - In the **Expression** column, enter the value **false** and confirm with RETURN.

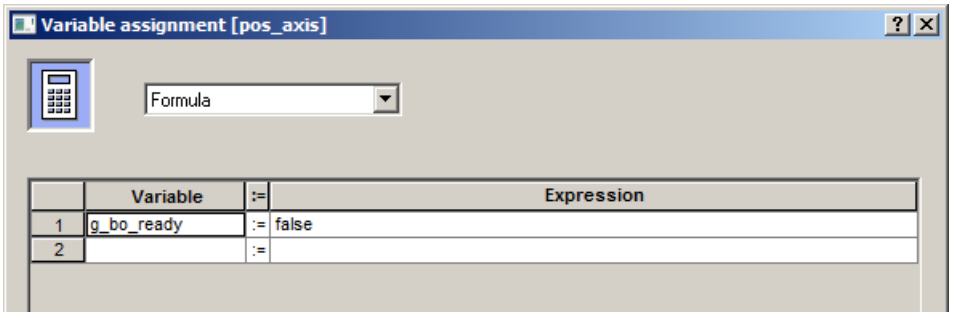

Figure 3-79 Variable assignment

4. Assign the value **true** to the variable **g_bo_ready** in the same way.

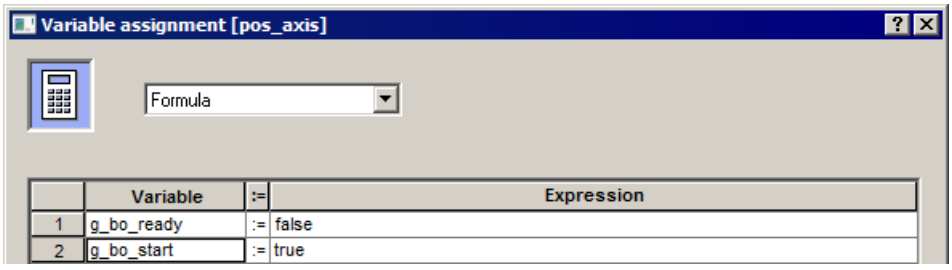

Figure 3-80 Variables assigned

5. Click **OK** to close the window.
You have set the global device variables to the values **false** and **true**.

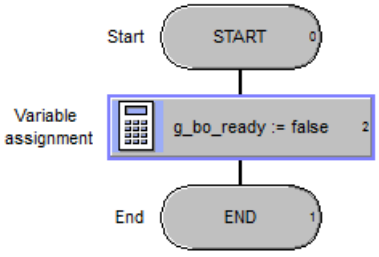

Figure 3-81 MCC chart, executed variable assignment

Switch axis enable

You switch the axis enable as follows

1. Insert the statement block **Switch axis enable** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the **Switch axis enable** command in the command group.

Figure 3-82 MCC editor toolbar, Switch axis enable command

The **Axis enable** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize the axis enable:
   - Double-click the inserted **Switch axis enable** command block in the MCC chart. The **Switch axis enable** window is displayed.
   - In the **Axis** field, select the axis that is controlled by the program.

– Make sure that the **Delay program execution** option is selected for the sample project.
The command is only finished when the axis is enabled.
Leave the other parameters at the default values.

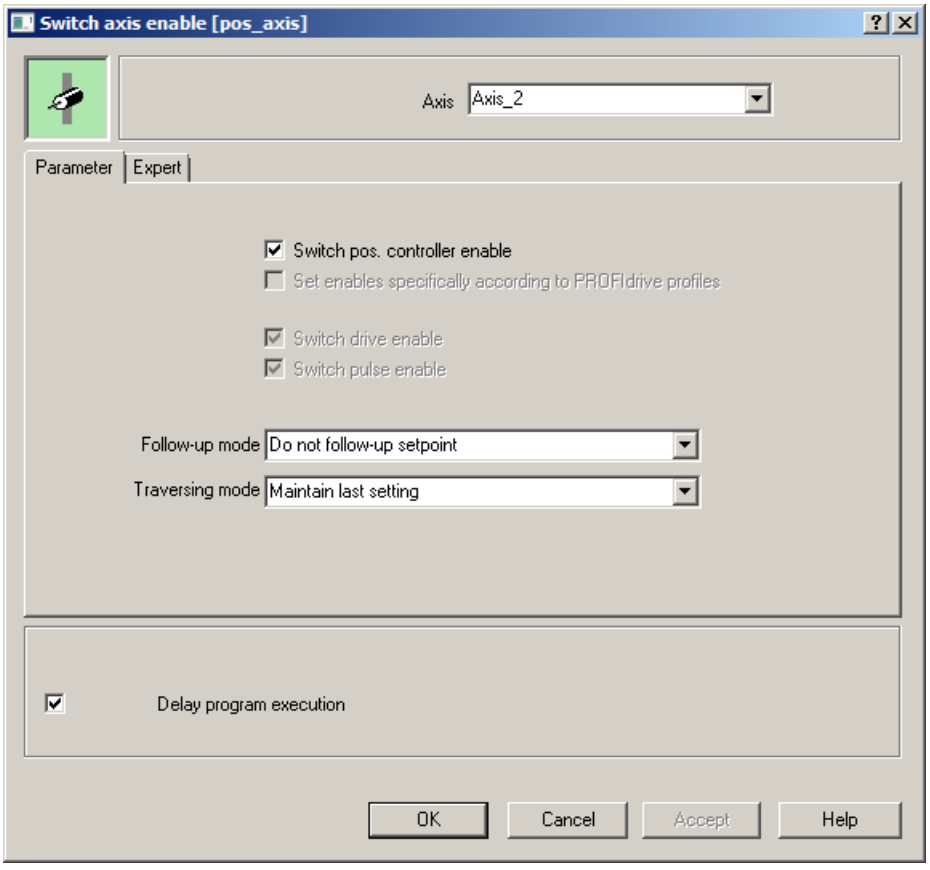

Figure 3-83 MCC chart, Switch axis enable

3. Click **OK** to close the window.
The command is parameterized.

Home axis

The position values of an axis are always in relation to the axis coordinate system. The homing procedure defines where the zero point of the coordinate system is.

Homing of the axis is implemented as follows

1. Insert the statement block **Home axis** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the command **Home axis** in the command group.

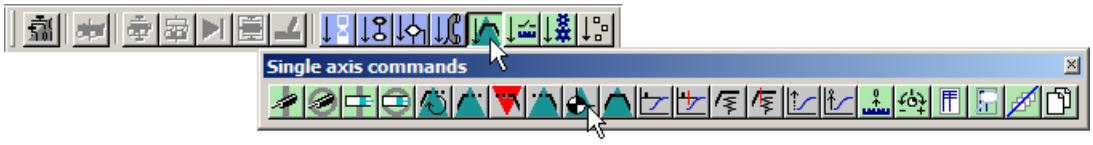

Figure 3-84 MCC editor toolbar, Home axis command

   The **Home axis** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize axis homing:
   - Double-click the inserted **Home axis** command block in the MCC chart. The **Home axis** window appears.
   - In the **Axis** field, select the axis that is controlled by the program.
   - In the **Parameters** tab, select the homing type **Set home position**. Enter the value **0** in the **Home position coordinates** field.
     With this homing type, the value of the home position coordinates are assigned to the current position of the axis (actual value). There is no active traversing motion.

– Leave the other parameters at the default values.

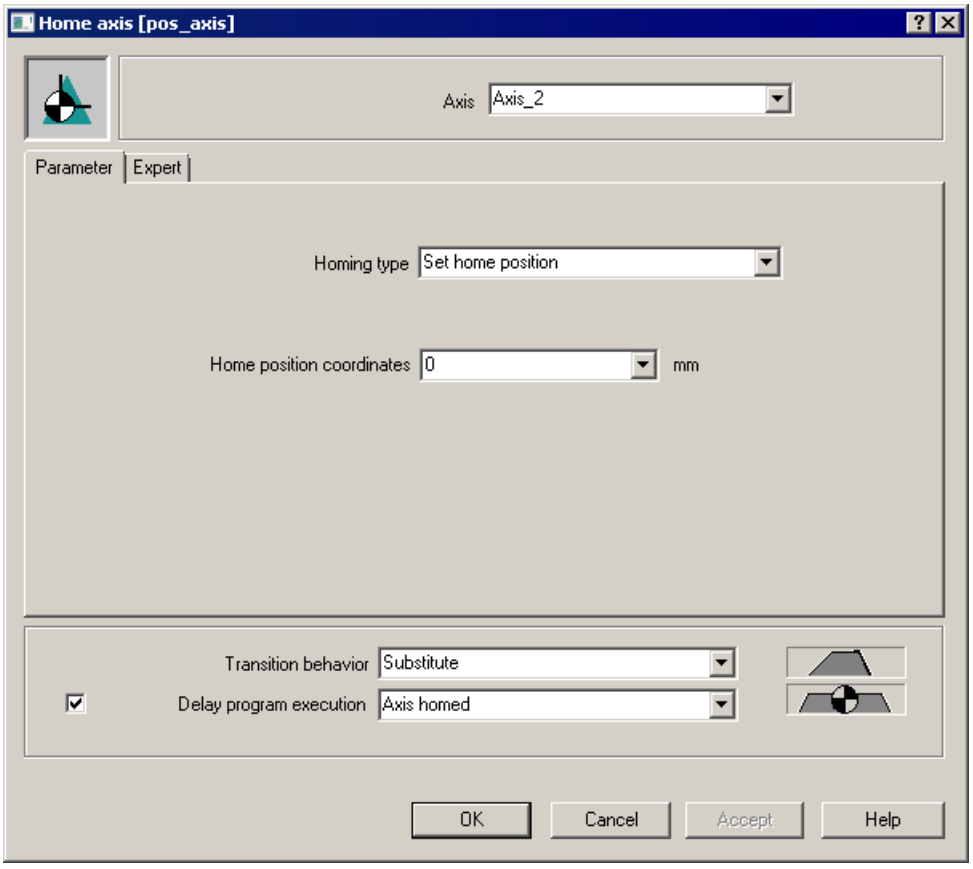

Figure 3-85 MCC chart, Home axis

3. Click **OK** to close the window.
   The command is parameterized.

Position the axis to the target position

The program is to traverse the axis at a velocity of 500 mm/s to the position 2000 mm.

You traverse the axis to the target position as follows

1. Insert the statement block **Position axis** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the **Position axis** command in the command group.

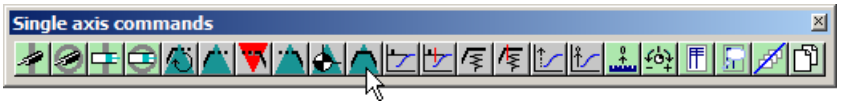

Figure 3-86 MCC editor toolbar, Position axis command

The **Position axis** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize the axis motion:
   - Double-click the inserted **Position axis** command block in the MCC chart. The **Position axis** window appears.
   - In the **Axis** field, select the axis that is controlled by the program.
   - Enter the position 2000 in the **Parameters** tab. Set the velocity to 500 mm/s.
   - Leave the other parameters at the default values.

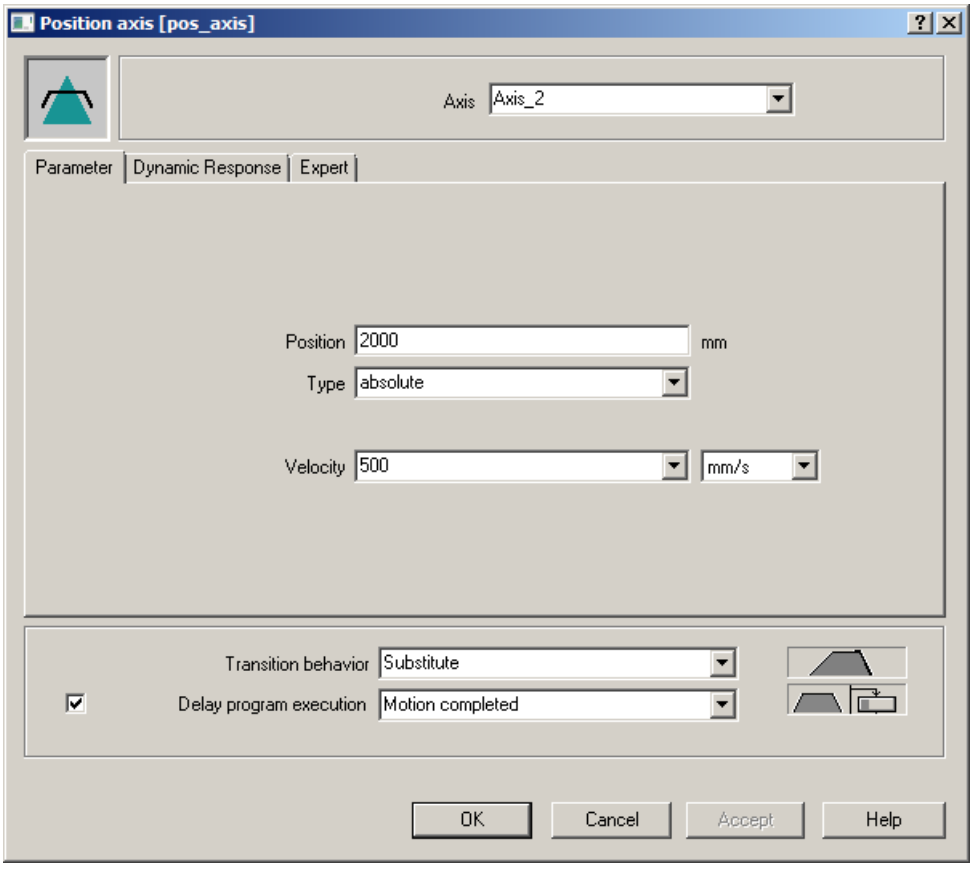

Figure 3-87 MCC chart, position the axis to the target position

3. Click **OK** to close the window.

The command is parameterized.

Position the axis to the starting position

The program is to return the axis to the starting position 0 mm at a velocity of 500 mm/s.

You return the axis to the starting position as follows

Proceed as for the step Position the axis to the target position (Page 201).

1. Insert the statement block **Position axis** into the MCC chart in front of the end node.
2. Parameterize the axis motion:
   - Enter the position 0 in the **Parameters** tab. Set the velocity to 500 mm/s.
   - Leave the other parameters at the default values.

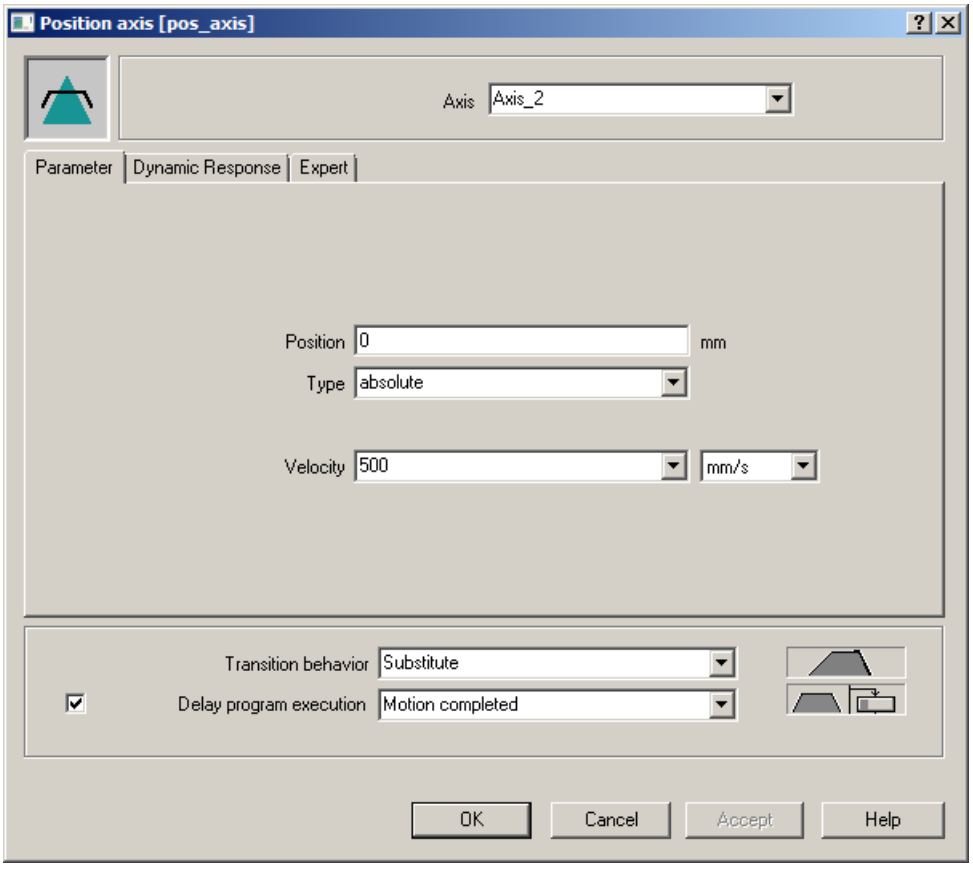

Figure 3-88 MCC chart, position the axis to the starting position

3. Click **OK** to close the window.
   The command is parameterized.

Disable axis

You disable the axis as follows

1. Insert the statement block **Disable axis** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the **Disable axis** command in the command group.

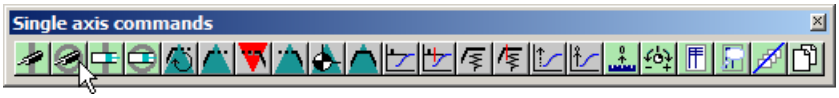

Figure 3-89 MCC editor toolbar, Disable axis command

The **Disable axis** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize the command:
   - Double-click the inserted **Disable axis** command block in the MCC chart. The **Disable axis** window is displayed.

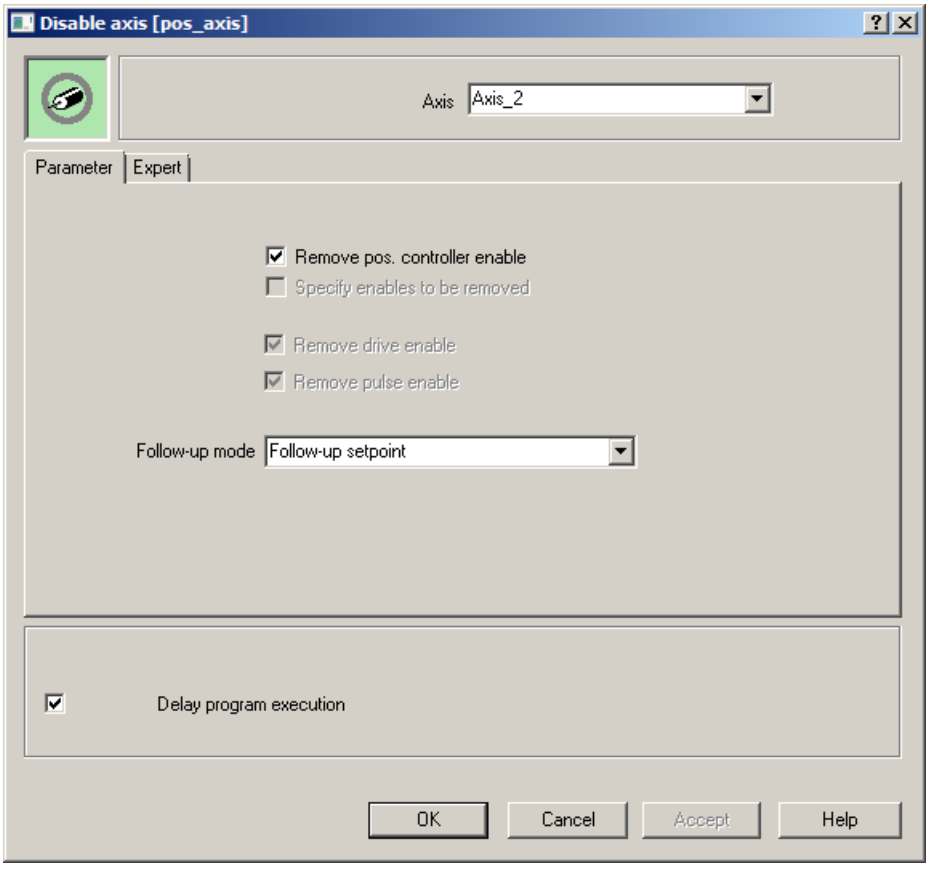

Figure 3-90 MCC chart, Disable axis

   - In the **Axis** field, select the axis that is controlled by the program.

– Leave the other parameters at the default values.

3. Click **OK** to close the window.
   The command is parameterized.

Variable assignment g_bo_start:=false / g_bo_ready:=true

The axis motion is finished. The variable **g_bo_start** is set to FALSE. The variable **g_bo_ready** is set to TRUE.

To assign the variables in the MCC editor, proceed as follows:

Proceed as for the step Variable assignment g_bo_ready:=false / g_bo_start:=true (Page 194)

1. Insert the statement block **Variable assignment** into the MCC chart in front of the end node.
2. Assign the value **false** to the variable **g_bo_start** and the value **true** to the variable **g_bo_ready**.
3. Click **OK** to close the window.
   The command is parameterized.

3.2.12.5 Expanding the MCC sample program: control of the infeed

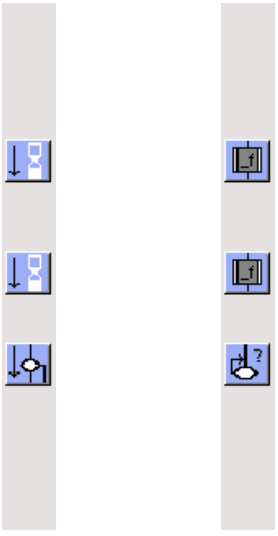
Program flow

If you are using an infeed with DRIVE-CLiQ interface, the programmed controller must switch on the infeed before the axis commands can then be issued. The program sequence shown below handles this task. The **pos_axis** program created until now must be expanded accordingly.

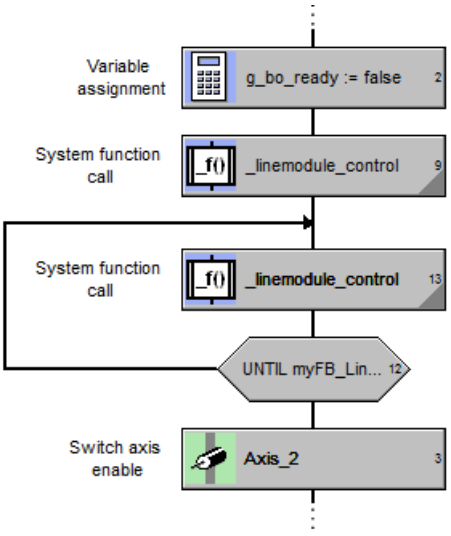
The finished MCC chart

The two times two blocks **_linemodule_control** system function call and **LineModule_STW** variable assignment are located in the MCC chart **pos_axis** before the first command for axis control **Switch axis enable**.

Command group **Single commands**



MCC chart of the sample program, control of the infeed



The first two blocks before the **UNTIL** loop reset the operating parameters of the infeed to the start values. Without this initialization, it may not be possible to switch the infeed on. In addition, this also acknowledges alarm messages that prevent enabling of the infeed.

The blocks within the **UNTIL** loop switch the infeed on. The loop repeats the switching command until the infeed is ready for operation.

Note

To avoid excess load on the performance of the round robin execution level (background task, motion tasks) during endless loops, it makes sense to use a _waitTime (T#0ms) in the loop while actively waiting for an event.

System function call _LineModule_control[FB]

You create the system function call _LineModule_control[FB] as follows

1. Insert the statement block **System function call** into the MCC chart:
   - Click the command block **g_bo_start := true**.
     The node is marked in blue.
   - Select the **Basic commands > System function call** command in the **MCC editor** toolbar.

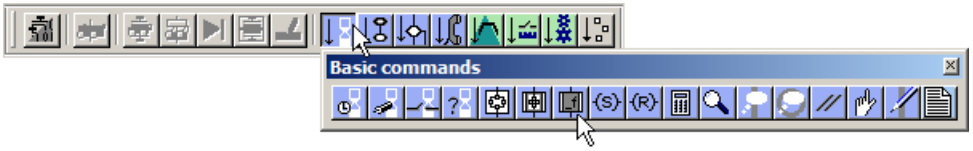


Figure 3-91 MCC editor toolbar, System function call command

The command block is inserted into the MCC chart.

2. Parameterize the function call:
   - Double-click the empty **System function call** command block in the MCC chart.
     The **System function call [pos_axis]** dialog appears.
   - Open the command library. You can find the command library in the screen area of the project navigator as a separate tab.

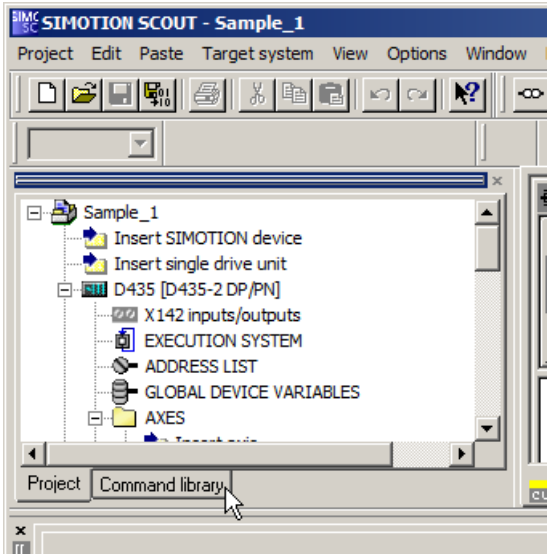

Figure 3-92 Open the command library

   - Go to the **Drives > SINAMICS** branch of the command library.
   - Drag & drop the **_LineModule_control[FB]** function call from the command library to the **System function** field of the **System function call[pos_axis]** window.

3. Define an instance for the system function call:
   – Enter the instance name **myFB_LineControl** in the **Instance** field of the **System function call [pos_axis]** window.
   As soon as you exit the field, e.g. by clicking on another element or with the TAB or RETURN keys, the **Variables declaration** dialog appears. The instance variable **myFB_LineControl** is assigned to the variable type **VAR** as default. The variable is thus valid locally within the program **pos_axis**.

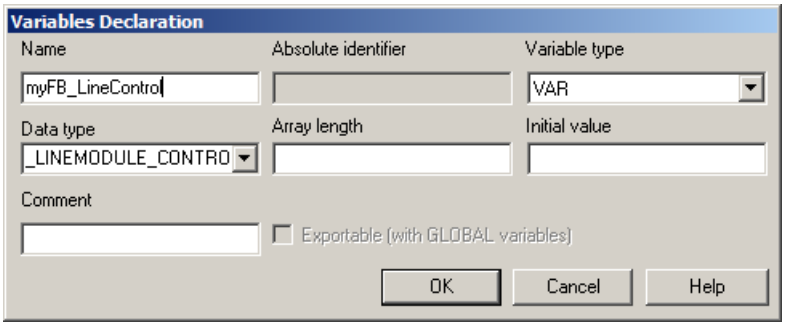

Figure 3-93 Variable declaration of the instance variable myFB_LineControl

Accept the default. Click **OK** to confirm the dialog.

– Set the input variables VAR_INPUT and the output variable VAR_OUTPUT of the instance to the following values.
Make use of the convenience of the autocomplete operator function **Ctrl+spacebar**:

Variable name	Value	Meaning
reset	true	Reset the infeed
periIn	LineModule_ZSW	Status word of the infeed
typeLM	ACTIVE_LINE_MODULE SMART_LINE_MODULE BASIC_LINE_MODULE	Type of the module to be controlled depending on the infeed used
periOut	LineModule_STW	Control word, sequence control infeed

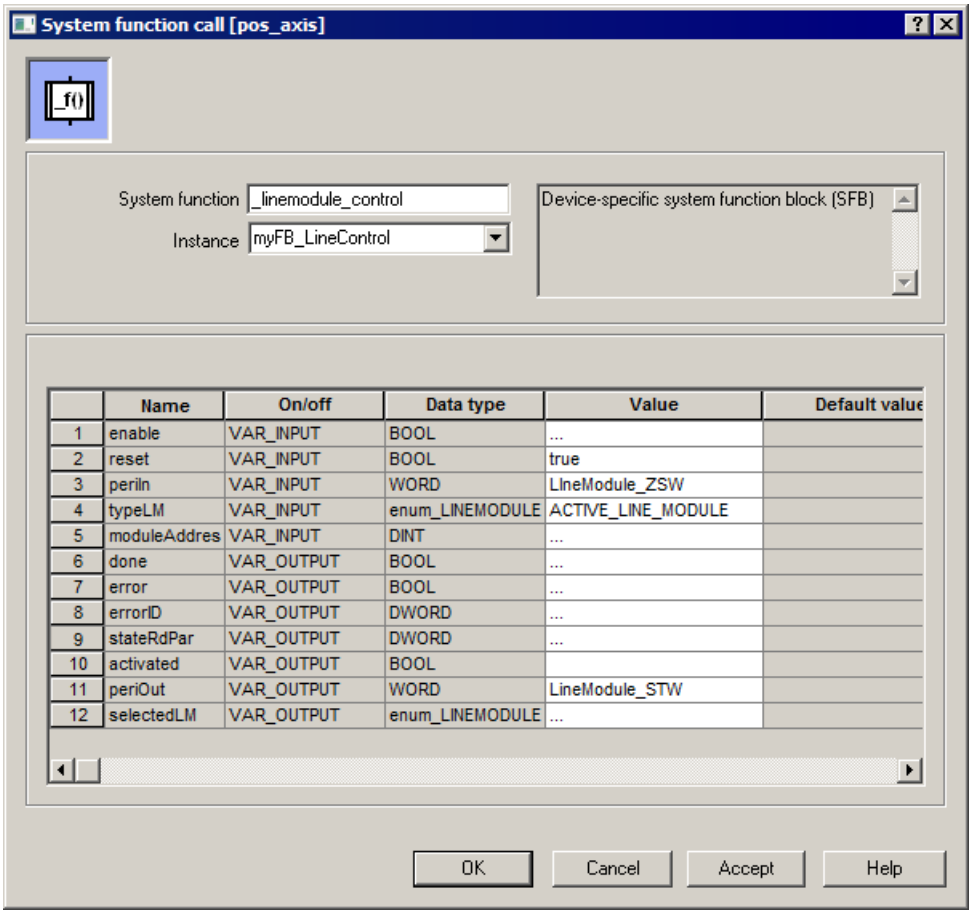

Figure 3-94 MCC chart, system function call _linemodule_control

4. Confirm with **OK**. The command is parameterized.

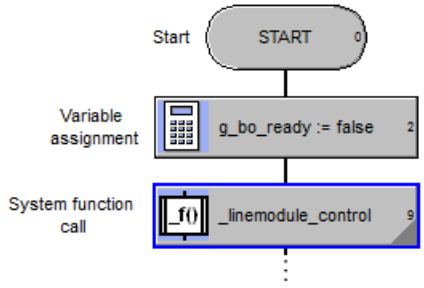

Figure 3-95 MCC chart, executed variable assignment _linemodule_control

Create UNTIL loop

You create the UNTIL loop as follows

1. Click the connecting line between the blocks **System function call** and the subsequent axis command **Switch axis enable**.
   The reference point is marked in blue.
2. In the **MCC editor** toolbar, select the command **Program structures > UNTIL: Loop with condition at end**

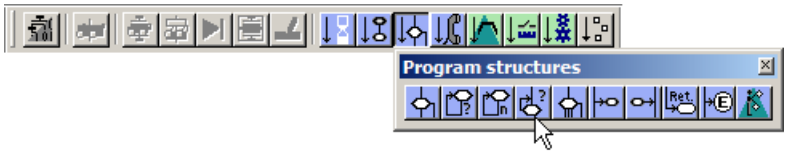

Figure 3-96 MCC editor toolbar, UNTIL loop

The **UNTIL** block with loop is inserted.

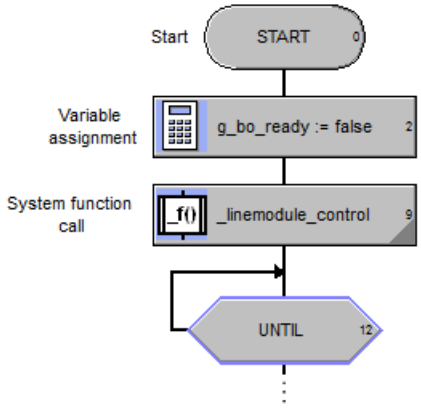

Figure 3-97 MCC editor, UNTIL loop

3. Parameterize the loop condition:
   The loop is to be run through until the infeed is ready for operation.
   - Double-click the UNTIL block. The window **UNTIL: Loop with condition at end[]pos_axis]** appears.
   - Select the value **Formula** in the field at top left.
   - Enter the loop condition in the **Until** field: **myFB_LineControl.activated=TRUE**.
     You can use the autocomplete function **Ctrl+spacebar** in this field too.
4. Confirm with **OK**.
   The loop is created and parameterized in the program.

Copy blocks

You copy the statement blocks in the MCC chart as follows

Copy the statement blocks **System function call _LineModule_control[FB]** and **Variable assignment LineModule_STW:=myFB_LineControl.periOut** into the **UNTIL** loop. Use the operator functions **Copy** and **Paste** for this purpose.

1. Mark the blocks:
   - Hold the **Shift** key down.
   - Click the blocks one after the other. Both blocks are edged in blue.
2. Copy the selected blocks to the clipboard:
   - Open the context menu with the right mouse key.
   - Select the **Copy** command in the context menu.

   Or use the **Ctrl+C** key function.
3. Select the target of the copy operation in the MCC chart:
   - Click the connecting line within the **UNTIL** loop. The connecting piece is marked in blue.

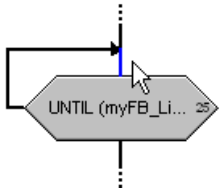

Figure 3-98 MCC chart, mark the UNTIL loop internal area

4. Insert the copied blocks at the target position:
   - Open the context menu again with the right mouse key.
   - Select the **Paste** command in the context menu.

   Or use the **Ctrl+V** key function.
   The blocks are inserted within the loop.

Adapt the system function call _linemodule_control

You change the system function call _linemodule_control as follows

The system function call **_linemodule_control** within the **UNTIL** loop switches the infeed on.

1. Open the system function block by double-clicking.
2. Adapt the parameter variables of the **myFB_LineControl** instance as shown below:

Variable name	Value	Meaning
enable	true	Switches the infeed on
reset		Empty field. The variable is thus set to **false**
periIn	LineModule_ZSW	Status word of the infeed
typeLM	ACTIVE_LINE_MODULE SMART_LINE_MODULE BASIC_LINE_MODULE	Type of the module to be controlled depending on the infeed used

3. Confirm with **OK**.

3.2.12.6 Create additional MCC programs for the sample project

Handling system events

The execution system that you will set up in the later section Configure execution system (Page 222) requires two further MCC programs:

- technology_fault
- peripheral_fault

These programs are used for handling system events. Handling is generally necessary. If a system event occurs that is not handled by the user program, the CPU goes to STOP mode.

Within the scope of the sample project, no specific handling of system events is necessary. The programs technology_fault and peripheral_fault therefore remain empty.

You create the MCC programs technology_fault and peripheral_fault as follows

1. Create the MCC unit **fault**.
   Open the **PROGRAMS** folder under the SIMOTION device in the project navigator. Double-click **Insert MCC unit**. Assign the name **fault** to the MCC unit.
2. Create the MCC chart **technology_fault**.
   Open the MCC unit **fault** in the **PROGRAMS** folder. Double-click **Insert MCC chart**. Assign the name **technology_fault** to the MCC chart. Select the creation type **Program**.
   The program remains empty.

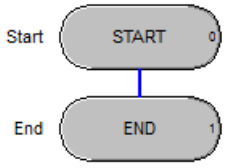

Figure 3-99 Empty program technology_fault

3. Create the MCC chart **peripheral_fault** within the MCC unit **fault**.
   This program also remains empty.

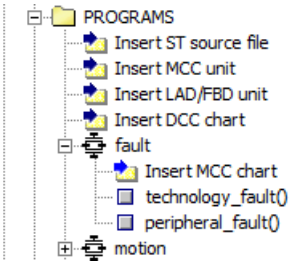

Figure 3-100 MCC programs technology_fault and peripheral_fault in the MCC unit fault

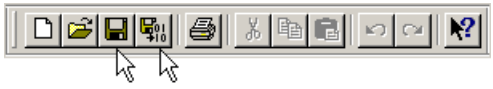
3.2.12.7 Back up MCC sample programs

Back up the created MCC programs.

To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.



Additional information

As an alternative to the command **Save project and compile changes**, you can find the command **Accept and compile** in the **MCC editor** toolbar.

This command compiles the currently selected program as well as all other programs of the same unit.

However, the command does not save the changes.

You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

3.2.12.8 LAD/FBD ladder logic/function block diagram

The LAD and FBD programming languages

LAD (ladder logic)

LAD stands for ladder logic. LAD is a graphical programming language. The syntax for the statements is similar to a circuit diagram. LAD enables simple tracking of the signal flow between conductor bars via inputs, outputs and operations. The LAD statements comprise elements and blocks that are connected graphically to form networks. LAD operations follow the rules of Boolean logic.

FBD (function block diagram)

FBD stands for function block diagram. FBD is a graphical programming language. To represent the logic relationships, it uses the logic boxes familiar from Boolean algebra. In addition, complex functions (e.g. mathematical functions) can be represented directly in conjunction with the logic boxes.

System in SIMOTION SCOUT

The **PROGRAMS** folder under the SIMOTION device contains the LAD/FBD units created in the project.

A LAD/FBD unit contains the LAD/FBD programs that are to run on the SIMOTION device. A LAD/FBD unit can contain several LAD/FBD programs.

"LAD/FBD program" is a collective term for different program organization units (POU).

A POU can be a program, a function, or a function block. The type of the POU is indicated in the project navigator by an icon:

- Program
- Function
- Function block

Program creation steps

Creation of a LAD/FBD program encompasses the following steps:

1. Creating a LAD/FBD unit.
2. Creating a LAD/FBD program in the LAD/FBD unit.
3. Inserting LAD/FBD commands in the LAD/FBD program and parameterizing the commands.
4. Saving and compiling the LAD/FBD program.

Switching the programming language

SIMOTION SCOUT allows simple switching between ladder logic and function block diagram. The LAD/FBD editor contains the command **LAD/FBD program > Switch to FBD** or **Switch to LAD**.

Create LAD/FBD unit

You create the LAD/FBD unit **bg_out** for the sample project as follows.

You create a LAD/FBD unit in the project as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator. Double-click **Insert LAD/FBD unit**. The **Insert LAD/FBD unit** window appears.
2. Enter the name **bg_out** for the unit.
3. Go to the **Compiler** tab. For diagnostics purposes, activate the option **Permit program status**. In this way, you can monitor program execution later in online mode.
4. Confirm with **OK**.
   The LAD/FBD unit is created.
   - The LAD/FBD unit **bg_out** appears in the **PROGRAMS** folder.

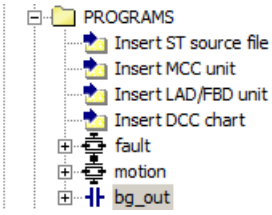


Figure 3-101 MCC and LAD/FBD units in the PROGRAMS folder

   - In the working area of the workbench, the declaration table of the unit opens. The variables declared there apply within the LAD/FBD unit and can be linked in other units. No other variable declaration is required for the sample project. You have already created the necessary variables as global device variables in the symbol browser.

Create LAD/FBD program

You create the LAD/FBD program **LAD_1** within the LAD/FBD unit **bg_out** as follows.

You create a LAD/FBD program in a LAD/FBD unit as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator.
2. Open the LAD/FBD unit **bg_out** in the **PROGRAMS** folder. Double-click **Insert LAD/FBD program**. The **Insert LAD/FBD program** window appears.
3. Enter the name **LAD_1**. The name must be unique throughout the project.

4. Select the creation type **Program**.

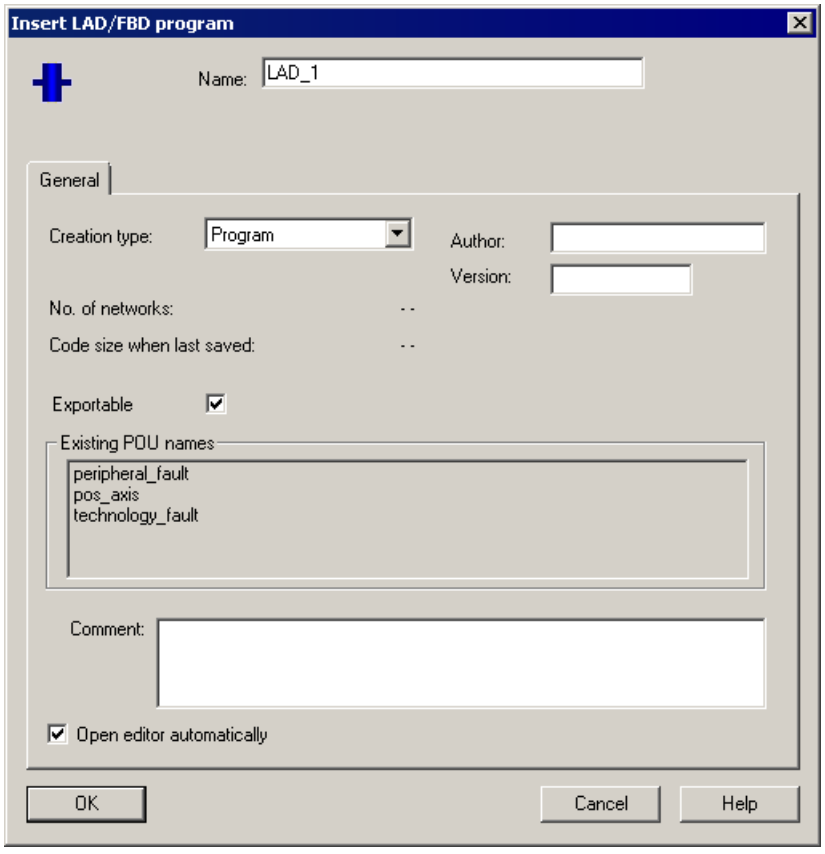

Figure 3-102 Insert LAD/FBD program

5. Confirm with **OK**.
   The LAD/FBD program **LAD_1** is created in the project.
   – The LAD/FBD program appears in the **PROGRAMS** folder.

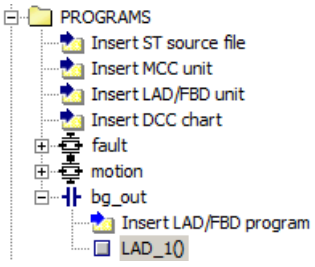

Figure 3-103 LAD program LAD_1 in the PROGRAMS folder

   – The LAD/FBD editor is opened in the working area of the workbench. You can start programming.

Creating a LAD sample program

You write the LAD program **LAD_1** for the sample project.

In this program, the global device variables **g_bo_start** and **g_bo_ready** are read cyclically, and the I/O variables **q_bo_output0** and **q_bo_output1** are set accordingly.

Transfer of the program status to the digital outputs DO 0 and DO 1 could also be programmed direct in the MCC chart **pos_axis**. However, Getting Started implements the assignment in an autonomous LAD program to introduce you to LAD programming.

You create the LAD program LAD_1 for the sample project as follows

1. Open the LAD/FBD program if it is not already visible in the working area of the workbench. For this purpose, double-click the LAD/FBD program under the LAD/FBD unit in the **PROGRAMS** folder of the project navigator.
   In the sample program, the empty LAD/FBD program **LAD_1** is already open.

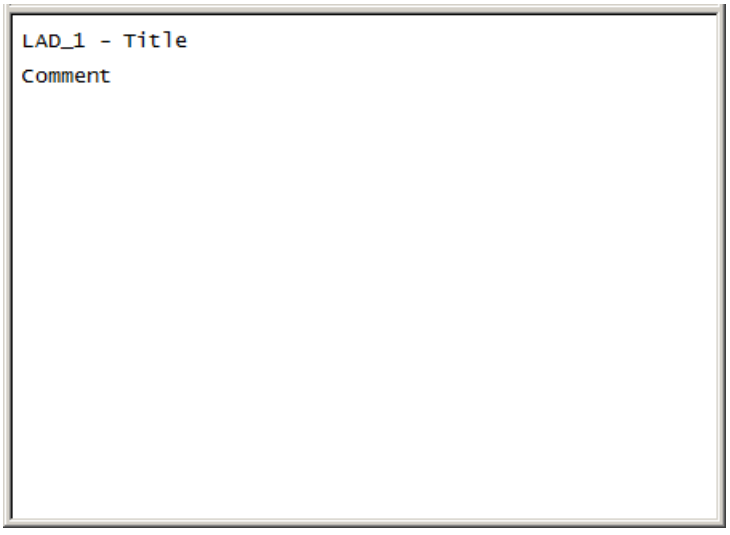

Figure 3-104 Empty LAD program following first-time creation in the LAD/FBD unit

2. Insert a network:
   – Click **Insert network** in the LAD/FBD toolbar.

   The **001** block with a coil is inserted.

3. Insert an NO contact in front of the coil:
   – Select the coil.

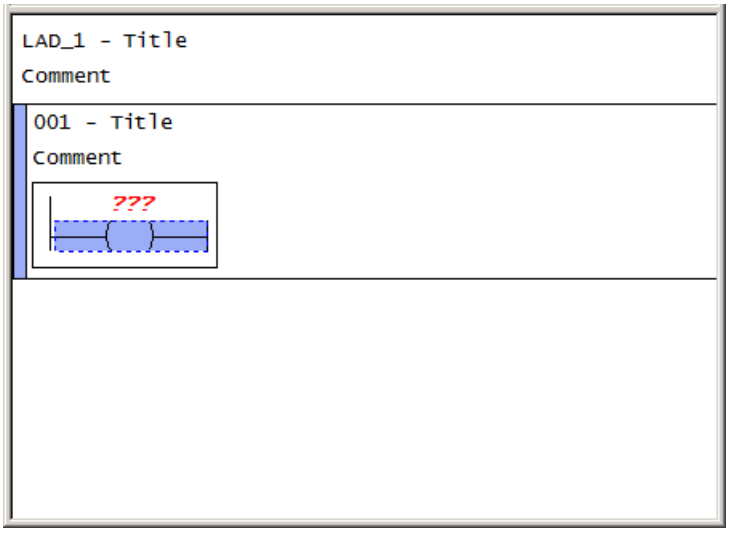

Figure 3-105 LAD program, selected coil

   – Click **NO Contact** in the toolbar.

   The NO contact is inserted in front of the coil.

4. Assign the **g_bo_start** variable to the NO contact and the **q_bo_output0** variable to the coil:
   - Click above the symbols for NO contact and coil on **???**.

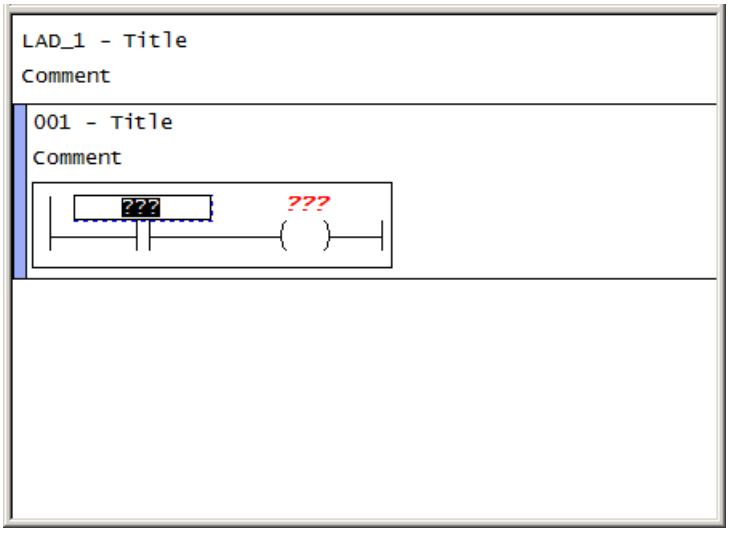

Figure 3-106 LAD program, opened field for entering the variable name

   - Transfer the variable names from the symbol browser or the ADDRESS LIST by dragging and dropping. Or use the Autocomplete function. Use RETURN to confirm each entry.

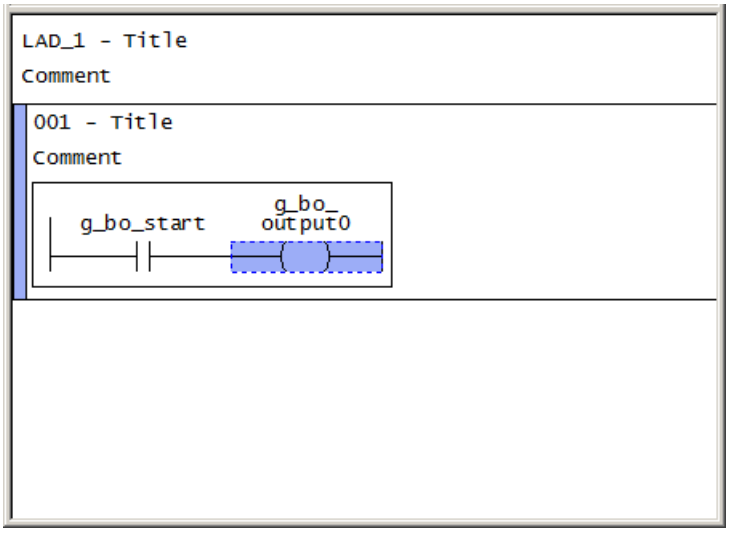

Figure 3-107 LAD program with inserted variables

5. Insert a network **002**:
   - Click the block **001** to select the block.
     A selected block has a blue background on the left edge.
   - Click **Insert network** in the LAD/FBD toolbar.
     The block **002** is inserted after the block **001**.

6. Insert an NO contact in front of the coil in network **002**.
7. Assign the **g_bo_ready** variable to the NO contact and the **q_bo_output1** variable to the coil. The LAD program is finished.

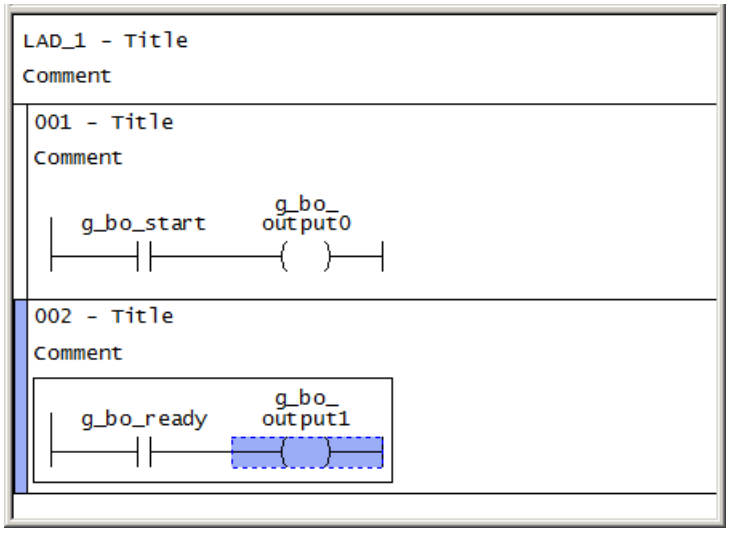

Figure 3-108 Finished LAD program LAD_1

Back up LAD/FBD sample program

Back up the created LAD/FBD sample program.

To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.

Additional information

As an alternative to the command **Save project and compile changes**, you can find the command **Accept and compile** in the **LAD/FBD toolbar**.

This command compiles the currently selected program as well as all other programs of the same unit.

However, the command does not save the changes.

You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

3.2.12.9 Other programming languages

SIMOTION SCOUT provides other programming languages in addition to MCC and LAD/FBD.

- **ST (Structured Text)**
  ST is a text-based, PASCAL-based programming language. The language is based on the international standard IEC 61131-3. This standard harmonizes the programming languages for programmable logic controllers (PLC). ST is based on the Structured Text part of this standard. In addition to the standardized programming language in accordance with IEC 61131-3, SIMOTION ST features technological commands.
  An easy-to-use text editor is provided for creating programs. The ST compiler compiles the edited program into executable code and indicates every syntax error, specifying the program line and the cause of the error.
  In the Command library tab of the project navigator, the commands and functions required for programming are shown in a tree. You can use these in all programming languages, e.g. when programming.

  Note

  In SIMOTION SCOUT V4.5 and higher, ST can also be used as a language for object-oriented programming. Further information can be found in the SIMOTION SCOUT Online Help and in the SIMOTION ST Structured Text Programming and Operating Manual.

- **DCC (Drive Control Chart)**
  Drive Control Chart (DCC) means graphic configuration and expansion of the device functionality by means of freely available control, calculation and logic blocks.
  DCC comprises the DCC editor and the DCB library (block library with standard DCC blocks). The user-friendly DCC Editor enables easy graphical configuration and a clear representation of control loop structures as well as a high degree of reusability of existing diagrams.
  The open-loop and closed-loop control functionality is defined by using multi-instance-capable blocks (Drive Control Blocks (DCBs)) from a predefined library (DCB library) that are selected and graphically linked by dragging and dropping

- **Libraries**
  Libraries allow modular software development and provide you with user-defined data types, functions and function blocks that you can use from all SIMOTION devices.
  Libraries can be written in all programming languages and used in all program sources (e.g. ST units, MCC units).

All programming languages enable you to structure the application using programs, functions and function blocks so that the application is manageable and re-usable.

To test the programs, there are comprehensive test functions available to you with program status and breakpoints in all languages. You can visualize and test your programs online.

For further information on programming languages, please refer to the respective manuals.

3.2.12.10 Result in the sample project

You have created the programs required for program-controlled traversing of the axis in the sample project of Getting Started.

3.2.13 Configure execution system

3.2.13.1 Overview

Aim of Getting Started

In this part of Getting Started, you get to know the SIMOTION execution system.

You assign the sample project programs to the tasks of the execution system. You thus transfer the programs from the SIMOTION SCOUT engineering system to the SIMOTION runtime system. The programs control the system as soon as the operating mode of the SIMOTION device is switched to RUN.

Preconditions

You have created the programs pos_axis, technology_fault, peripheral_fault, and LAD_1 for the sample project, see the section Programming the SIMOTION application (Page 182).

Execution levels and tasks

Execution levels define the chronological sequence of tasks in the execution system. A level can contain several tasks. The tasks provide the framework for program execution. A task may comprise several programs. By assigning the created programs to the tasks, you can, for example, define the priority, the time frame or the order in which the programs are to be executed.

3.2.13.2 Assign programs to tasks

Below you will assign the sample project programs to the tasks of the execution system.

Table 3-22 Assignment of programs to tasks

Programs of the sample project	Tasks
pos_axis	MotionTask_1
lad_1	BackgroundTask
technology_fault	TechnologicalFaultTask
peripheral_fault	PeripheralFaultTask

You assign programs to tasks in the execution system as follows

1. Double-click in the project navigator under the SIMOTION device on **EXECUTION SYSTEM**.
   The **EXECUTION SYSTEM** window appears in the working area.
2. Assign the MCC program **motion.pos_axis** to the task **MotionTask_1**:
   – In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > MotionTasks > MotionTask_1**.

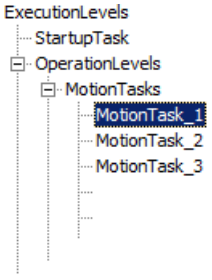

Figure 3-109 Execution system, tree view of the execution levels and tasks

The **MotionTasks** window appears on the right of the working area. The programs **pos_axis** and **LAD_1** as well as auxiliary programs of the **fault** unit are visible on the **Program assignment** tab under **Programs**.

– Select the MCC program **motion.pos_axis** and click the **>>** button. The program is displayed under **Programs used**. It is thus assigned to the task **MotionTask_1**.

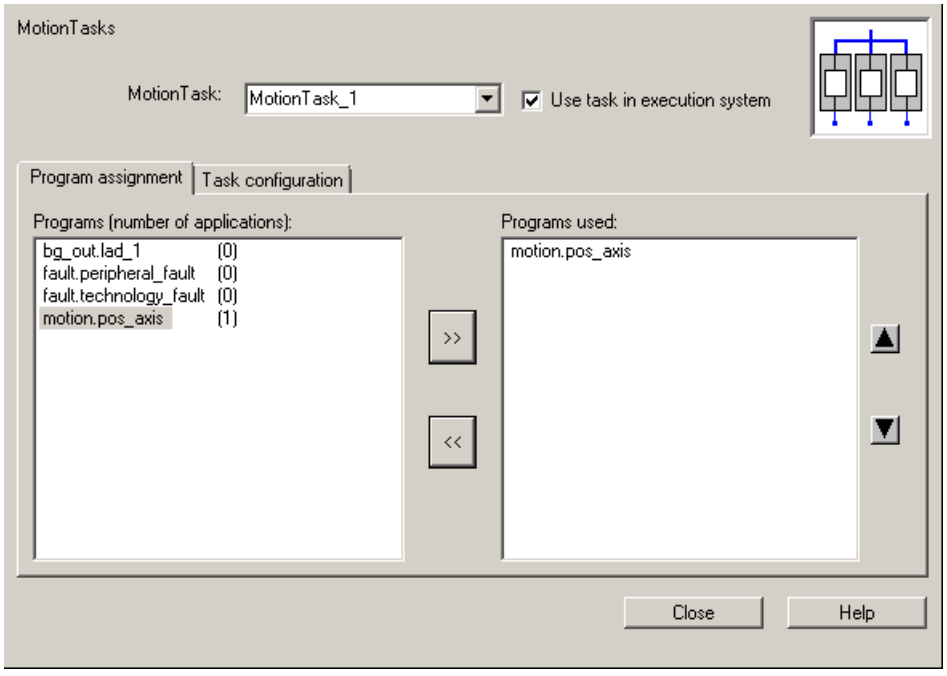

Figure 3-110 Execution system, MotionTasks window

The assignment is visible in the tree of the execution system. The program **motion.pos_axis** appears below the branch **MotionTask_1**.

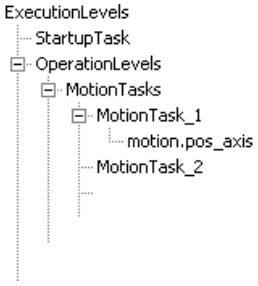

Figure 3-111 Execution system, MotionTask_1 with assigned program pos_axis

– Activate the checkbox **Activation after StartupTask** in the **Task configuration** tab. This executes the MCC program immediately after the SIMOTION device is started. If this checkbox is not activated, the program must be started explicitly by the call from another program that is assigned to the StartupTask or another active task.

3. Assign the LAD program **bg_out.kop_1** to the task **BackgroundTask**:

   – In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > BackgroundTask**. Assign the LAD program **bg_out.kop_1** to this task.

4. Assign the error handling routines:
   - In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > SystemInterruptTasks > TechnologicalFaultTask**. Assign the MCC program **fault.technology_fault** to this task.
   - In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > SystemInterruptTasks > PeripheralFaultTask**. Assign the MCC program **fault.peripheral_fault** to this task.
5. Click **Close**. Confirm with **Yes** if you are prompted to save.
   The execution system is configured.

Loading the configured execution system to the target system

- Save and compile the project.
- Go online.
- Download the sample project with the configured execution system to the target system.

See also

Download the project to the target system (Page 159)

3.2.13.3 Result in the sample project

Configuring the axis control is thus completed:

- You have set up an axis in the sample project.
- You have created a program for traversing an axis, as well as other programs that are necessary for operation.
- You have assigned these programs to the tasks of the SIMOTION runtime system.

In the following configuring steps, you will start the axis control on the SIMOTION device and monitor the program-controlled axis motion.

3.2.14 Starting and stopping the system

3.2.14.1 Overview

Aim of Getting Started

You switch the SIMOTION CPU of the sample project to RUN mode to start execution of the **pos_axis** program. You can see on the hardware that the axis rotates twice for approximately 4 seconds. After execution of the program, switch back to the STOP state.

You switch the operating mode in the dialog **Control Operating State**.

Preconditions

- You have created the programs pos_axis, technology_fault, peripheral_fault and LAD_1 for the sample project, and you have assigned them to the tasks of the SIMOTION execution system, see the sections Programming the SIMOTION application (Page 182) and Configure execution system (Page 222).
- The project has been compiled and downloaded to the target system, see the section Download the project to the target system (Page 159).
- SIMOTION SCOUT is in online mode.

3.2.14.2 RUN and STOP operating states

Operating states

In the SIMOTION SCOUT dialog **Control Operating State**, you can switch a SIMOTION CPU to RUN or STOP mode.

RUN mode

SIMOTION executes the user program and the associated system services:

- Read process image input
- Execution of the user programs assigned to the execution system
- Write process image output

The technology packages are active in this state. They can execute commands from the user program.

STOP mode

SIMOTION does not process any user program.

- It is possible to load a complete user program.
- All system services (communication, etc.) are active.
- The I/O modules are in a secure state. (This means, for example, the digital outputs are at "LOW level" and the analog outputs are de-energized)
- The technology packages are inactive, that is, all enables are deleted. No axis motions can be executed.

You can find the full description of the operating states in the online help under **SIMOTION device: Operating state**, or in the *SIMOTION SCOUT* Configuration Manual.

3.2.14.3 Mode selector switch on the software side and the hardware side

Control Operating State dialog

The menu command **Target system > Control operating state** or the button **Control operating state** in the toolbar of the workbench open the dialog **Control Operating State**.

The dialog lists all configured CPUs. The **State** column shows the current operating mode. The assigned switches in the **Control** column switch the CPU to the RUN or STOP mode. The switches are deactivated when the CPU is in offline mode.

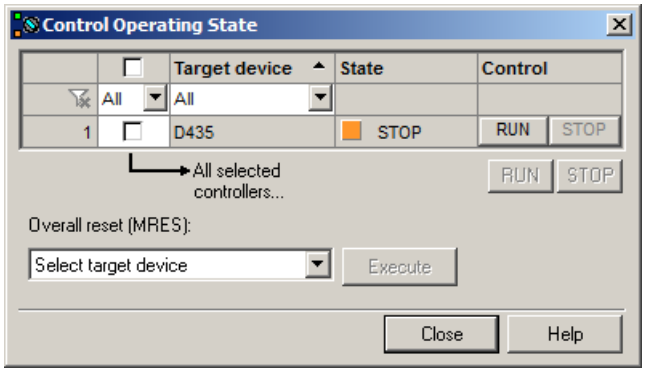

Figure 3-112 Control Operating State dialog

Note

As of SIMOTION V4.4, the **Control Operating State** dialog represents all configured SIMOTION CPUs. The previous dialog had to be opened individually for each CPU.

You can find a detailed description of the dialog in the *SIMOTION SCOUT* Configuration Manual.

Priority of the mode selector switch on the SIMOTION device

The setting of the mode selector switch on the SIMOTION device has priority. SIMOTION SCOUT can only switch a SIMOTION device to RUN mode if the mode selector switch on the device is set to 0 (RUN).

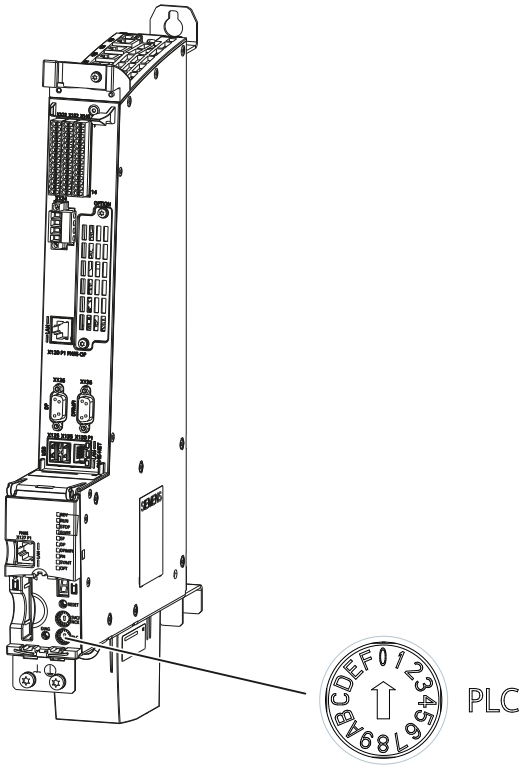

Figure 3-113 Mode selector switch of the SIMOTION D435-2, switch position 0 (RUN)

You can find detailed information on the mode selector switch of the SIMOTION D4x5-2 devices in the Manuals and Commissioning Manuals, as well as in the online help.

3.2.14.4 Start program control of the sample project

You start the axis control of the sample project on the SIMOTION device as follows

⚠ **WARNING**
Danger to life through unexpected machine movement
Make sure this presents no hazard to personnel or property.

1. Open the **Control Operating Mode** dialog. To do so, click **Control Operating Mode** in the toolbar.

2. Switch the SIMOTION CPU of the sample project to the RUN mode. To do so, click the assigned **RUN** switch in the **Control** column of the **Control Operating Mode** dialog.
   The axis starts to rotate immediately. The axis returns to a standstill after approximately 8 seconds.
   The SIMOTION device remains in the RUN mode after execution of the **pos_axis** program.
3. Switch the SIMOTION device to STOP mode. To do so, click the assigned **STOP** switch in the **Control** column.

Note

If you want to traverse the axis again, acknowledge all alarms in the "Alarms" window.

3.2.15 Monitor the application

3.2.15.1 Overview

Aim of Getting Started

In this part of Getting Started, you monitor the program-controlled axis motion.

- You monitor program execution.
- You monitor the values in the symbol browser.
- You compile certain values in a watch table.
- You record the course of the axis motion with the trace.

Preconditions

- You have created the programs pos_axis, technology_fault, peripheral_fault and LAD_1 for the sample project, and you have assigned them to the tasks of the SIMOTION execution system, see the section Configure execution system (Page 222).
- The project has been compiled and downloaded to the target system, see the section Download the project to the target system (Page 159).

- SIMOTION SCOUT is in online mode.
- Operating mode of the SIMOTION device:
  - The SIMOTION device of the sample project has been switched to STOP mode on the software side. The SIMOTION SCOUT mode selector switch, **Control Operating State** dialog, shows the STOP mode.
  - The SIMOTION device of the sample project has been switched to RUN mode on the hardware side. The mode selector switch on the SIMOTION device is at position **0** (RUN).

3.2.15.2 Monitoring program execution

SIMOTION SCOUT provides several functions for monitoring program execution.

In the sample project, you use the function **Monitor**. With this function, you can track execution of the command blocks in an MCC chart. The currently executed command block is shown against a yellow background in the chart. The marking runs at the same speed as the actual program execution. The marking is therefore only visible with the "slow" commands that wait for the machine to implement the command.

You monitor the execution of the commands in the MCC chart pos_axis as follows

1. Open the **Control Operating State** dialog.

   The SIMOTION device must be in **STOP** mode.
2. Open the MCC chart **pos_axis**.
3. Switch the monitoring function on:
   - To do so, select the command **MCC chart > Monitor** in the menu bar of the workbench. The function is switched on if a checkmark is visible next to the menu item.
   - Or click in the **MCC editor** toolbar on **Monitor**.

4. Start program control: Switch the SIMOTION device to **RUN** mode in the **Control Operating State** dialog.
   The **pos_axis** program is run through once. The currently executed command block is shown against a yellow background.

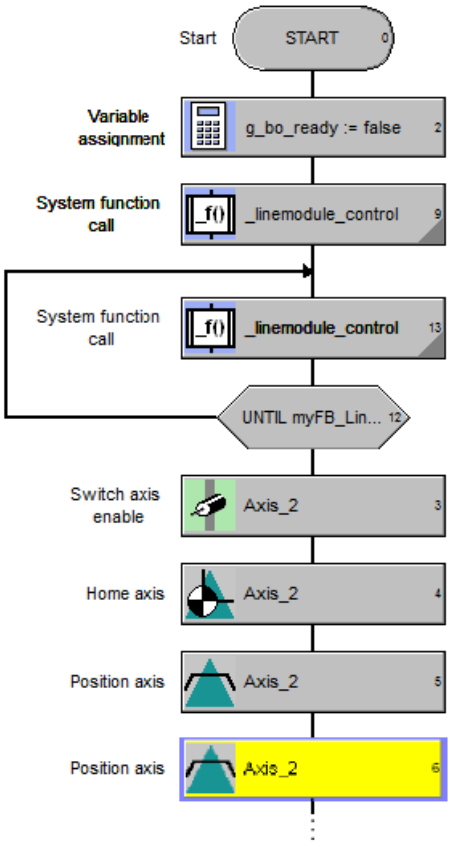

Figure 3-114 Monitor the program execution of the MCC chart pos_axis

5. Switch the SIMOTION device to **STOP** mode in the **Control Operating State** dialog.

Further information

You can find further information on program monitoring in the online help under **Monitoring program execution**.

3.2.15.3 Monitoring variables

In the symbol browser, you can monitor variables (read out status value) or assign values to them (assign control values).

For the sample project, you monitor the actual position of the axis during the program run.

Monitor variables in the symbol browser

1. In the **AXES** folder of the project navigator, select the axis created in the sample project. The system variables and configuration data of the axis are displayed on the **Symbol browser** tab of the detail view.
2. Open the system variable **positioningstate.actualposition** (actual position of the axis) in the symbol browser.
   You find the variable as follows:
   - Filter the list: You can specify a filter criterion in the filter line of the symbol browser. The last 5 criteria are saved and can be selected for re-use.
     Enter a suitable filter term, e.g.**positioningstate**, in the filter line. Press **RETURN** to confirm.
   - Search for variable: As an alternative to the filter function, you can search for the variable. Select the menu command **Edit > Find**. Enter a suitable search term in the **Find** dialog, e.g. **positioningstate**. Click **Find next**.

   The actual position of the axis is displayed in the **Status value** column of the symbol browser.
3. Start the program control via the dialog box **Control Operating State**.
   The program runs once. The changing values of the actual axis position are displayed in the symbol browser.
   The SIMOTION device is in the RUN state after the program has run.
4. Switch the SIMOTION device to STOP mode in the **Control Operating State** dialog.

Monitoring variables in watch table

Different variables, e.g. of several devices, can be combined into a table to be monitored.

To include a variable in a watch table, you must first create a watch table.

Proceed as follows:

1. Double-click in the project navigator under **MONITOR** on the entry **Insert watch table** and confirm your configuration.
2. Right-click in the symbol browser on the variable that you want to add to the watch table. Choose the **Add to watch table** command from the shortcut menu.
   The selected variable will be displayed in the table. In this way, you can add further variables to the watch table and monitor them.

You open a watch table as follows

You will find all created watch tables in the **MONITOR** folder of the project navigator. Double-click a watch table to open it.

You can find detailed information on this topic in the online help under **Working with the SCOUT Workbench > Working with lists > Watch table**.

3.2.15.4 Recording signals with the trace

Trace

You can use the trace to record and save signal characteristics and variable values. The recorded data can be used, for example, for diagnostics purposes in machine motion sequences, and for troubleshooting in user programs.

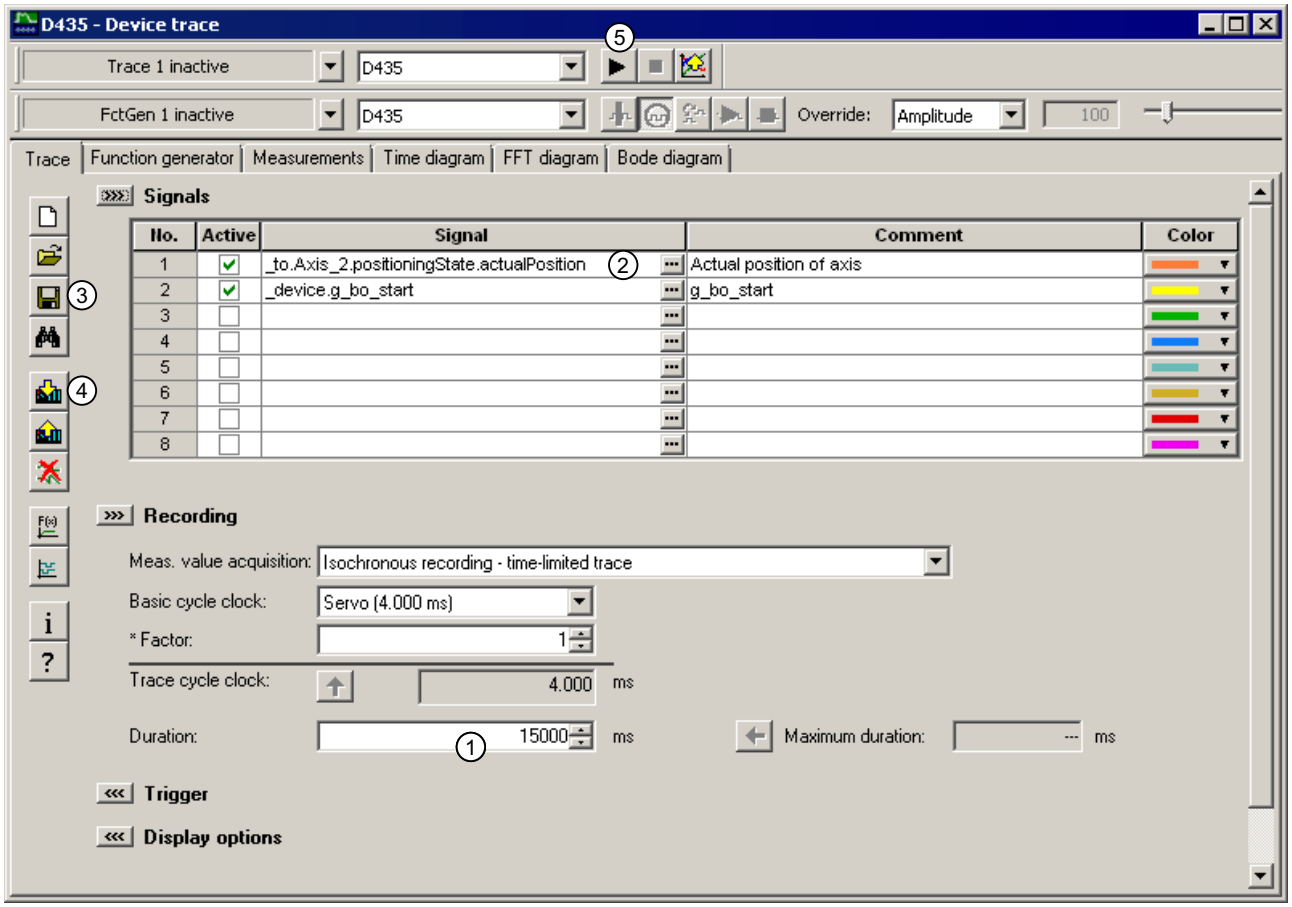
For the sample program, you record the actual position of the axis over time and represent it in the diagram.

Working with the trace

You call the trace as follows

1. Select the SIMOTION device in the project navigator.
2. Select the menu command **Target system > Device trace** or click the **Device trace function generator** button in the **Trace toolbar**.

The **Device trace** window appears in the working area.



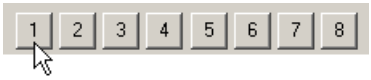
① ... ⑤ Reference is made to the circled digits in the text below.

Figure 3-115 Device trace window

You parameterize the trace for recording as follows

1. In the **Duration** field ① of the **Trace** tab, enter the recording duration 15000 ms.
2. Click the button ... ② in line **No 1** of the **Signals** table.
   The **Trace Signal Selection** window appears.

3. In the tree, select the branch **Sample_1 > (**SIMOTION device, e.g. **D435) > TO > Axis_2 > positioningstate**.
4. Select the system variable **actualPosition** in the variable table.
5. Click the button **1** to accept the system variable for channel 1.



The variable is displayed under **Signal name**.

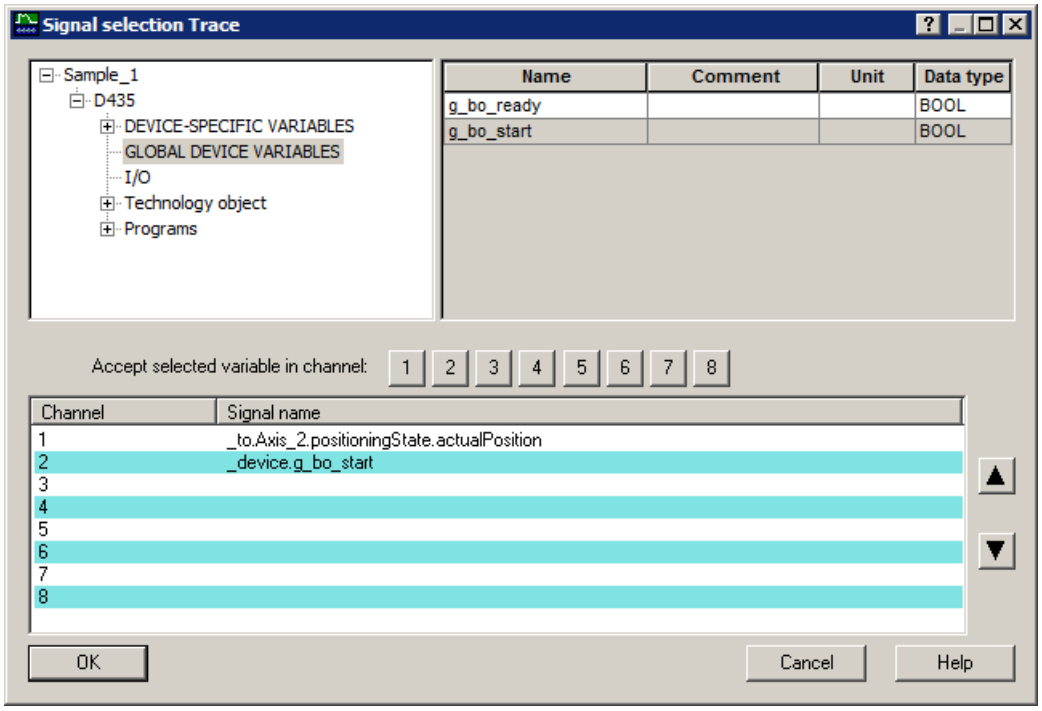


Figure 3-116 Trace signal selection

6. Repeat the channel assignment for the variable **g_bo_start**:
   Select the branch **(Project) > (SIMOTION device) >GLOBAL DEVICE VARIABLES**. Select the system variable **g_bo_start** in the variable table. Click the button **2**.

Note

You can also drag & drop the variables from the symbol browser or the watch table to the signal field of the Trace dialog. Procedure for dragging & dropping, see the section Variable assignment g_bo_ready:=false / g_bo_start:=true (Page 194).

7. Confirm with **OK**.
   The **Trace Signal Selection** window is closed.
   The trace is now parameterized for recording.

You save the parameterization of the trace as follows

The trace parameterization is not saved in the project data. When you close the project, the trace parameterization is deleted.

To save the parameterization, click the **Accept in catalog** button ③ on the **Trace** tab. In the **Catalog entry** field, enter the name under which the setting/parameterization is to be saved in the catalog of the trace.

You record with the trace as follows

1. Go online.
2. Download the parameterization of the trace to the target system:
   – Click the **Download parameterization** button ④ on the **Trace** tab.
   
   – Click **OK** to confirm the dialog that appears following successful downloading.
3. Open the **Control Operating State** dialog.
   
   The SIMOTION device must be in **STOP** mode.
4. Open the **Time diagram** tab in the **Device trace** window.

5. Start recording of the trace:
   - Click **Trace start**⑤ in the **Device trace** window.

     

   - Then immediately switch the SIMOTION device to RUN mode in the **Control Operating State** dialog.

   The program is started. The actual position of the axis is recorded and represented in the time diagram. After expiry of the recording duration, the signal profile of the actual position is displayed.

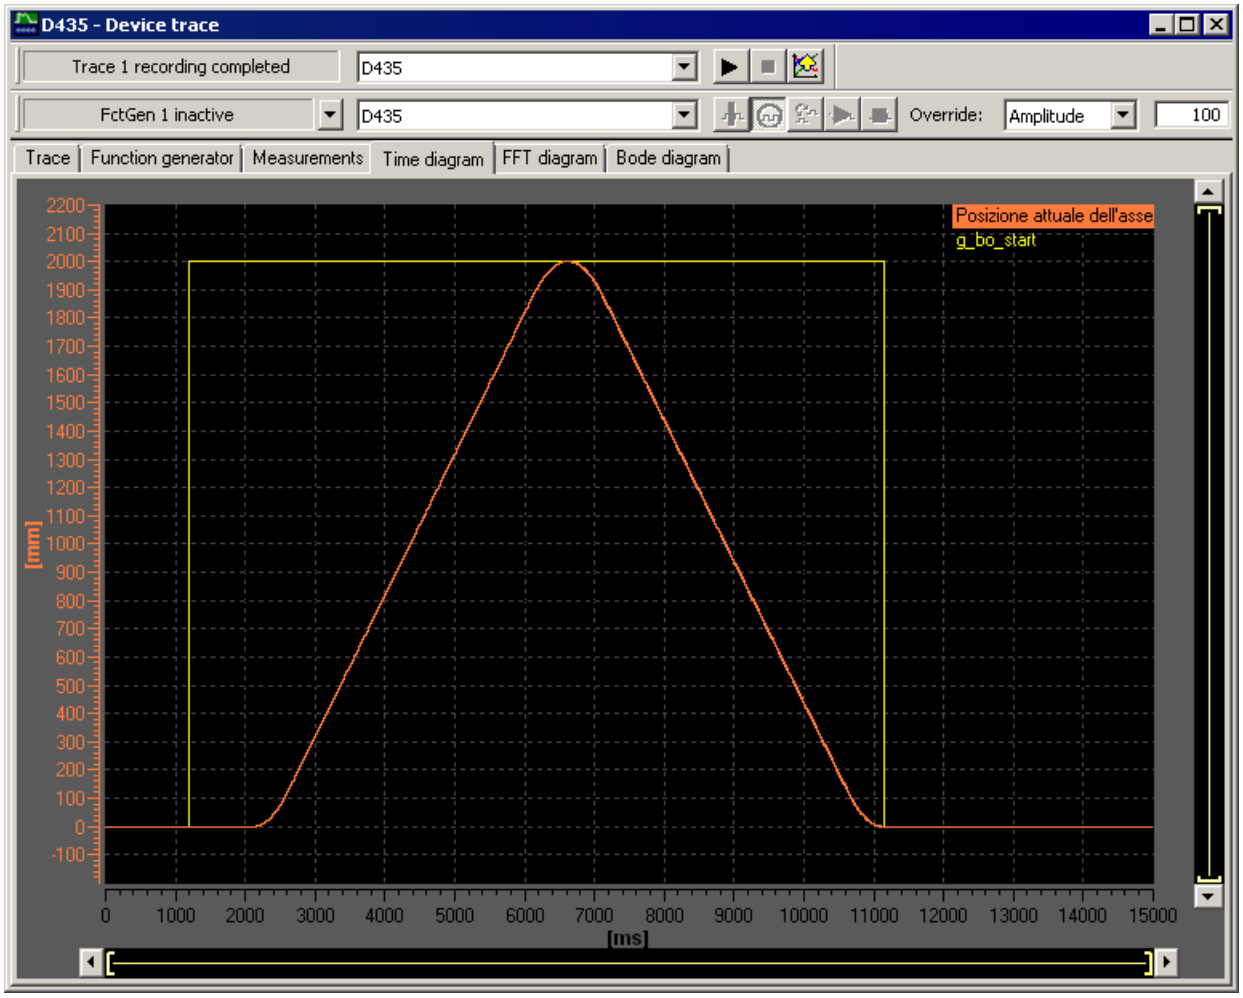

Figure 3-117 Time diagram of the axis

6. If the recorded curve is only partially displayed, select the menu item **Auto-scaling** in the context menu of the time diagram.
7. Switch the SIMOTION device to STOP mode in the **Control Operating State** dialog box.

Carrying out several measurements

You can carry out several measurements. They are shown on the **Measurements** tab and can be displayed in the diagram.

You can save and re-open recorded measurements for documentation purposes.

Further diagnostic functions

You can find a detailed overview of the extensive service and diagnostics options in the online help under **Diagnostics**, as well as in the product information *SIMOTION SCOUT Overview of service and diagnostics options*.

3.2.15.5 Result in the sample project

Creation of the trace time diagram concludes Getting Started.

We recommend that you continue to familiarize yourself with SIMOTION SCOUT using the sample projects of the Utilities & Applications.

You can find information on the Utilities & Applications in the section Utilities & applications (Page 145).

3.2.16 ESD directives

3.2.16.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

3.2.16.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

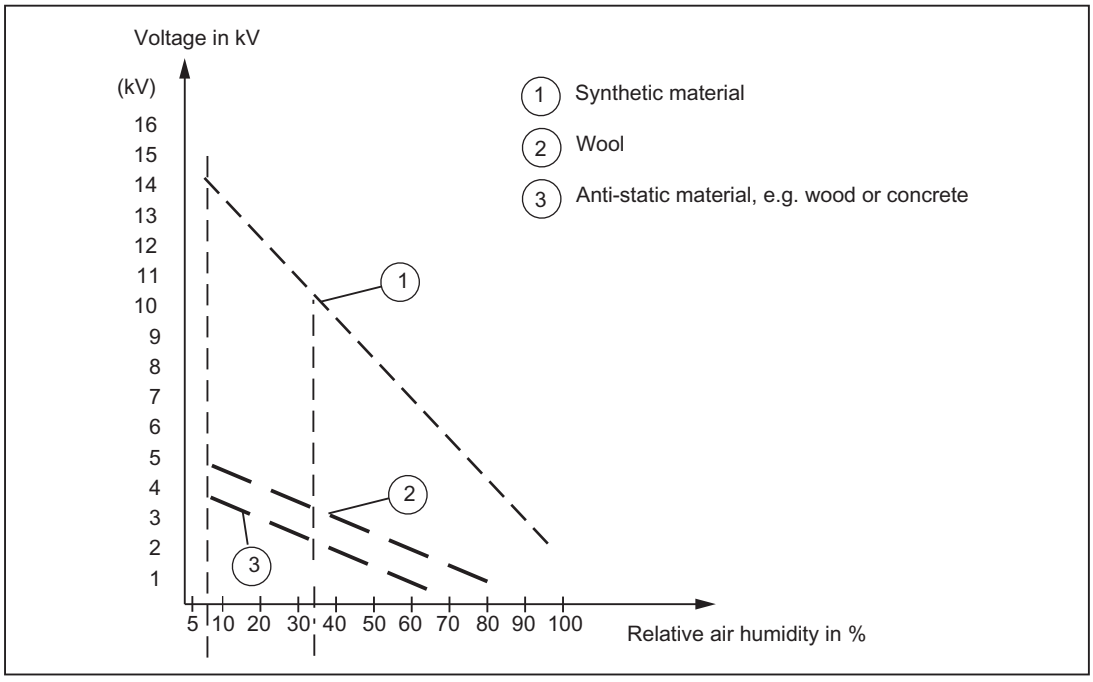

Figure 3-118 Electrostatic voltage that can accumulate on operating personnel

3.2.16.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

3.3 SIMOTION SCOUT

3.3.1 Preface

3.3.1.1 Validity

This **document** is part of the **Engineering System Handling documentation package**.

Scope of validity

This manual is valid for SIMOTION SCOUT in conjunction with the SIMOTION CamTool option package for product version V5.4.

3.3.1.2 Sections in this manual

The following is a list of sections included in this manual along with a description of the information presented in each section.

- Introduction
  This chapter contains an overview of the SIMOTION SCOUT Engineering System.
- Installation
  This chapter contains the system requirements for SIMOTION SCOUT, describes the procedure for installing and uninstalling it, and provides important information on the communications link to the SIMOTION device.
- User interface
  This chapter contains an overview of the SIMOTION SCOUT Workbench. It also provides notes concerning the language setting and the use of online help.
- Configuring/parameterizing
  This chapter describes the basic steps for operating SIMOTION SCOUT.
- Target system
  This chapter contains information on controlling the target system. You also learn how you can control the operating state with SIMOTION SCOUT and how you can upload data to the target system.
- Diagnostics
  This chapter contains information about which diagnostic functions are available and how these are operated.
- Service with SIMOTION SCOUT
  This chapter contains information about the service.
- Siemens SIMOTION Diagnostics
  This chapter contains information on how you can use the **Siemens Simotion Diagnostics** diagnostic tool for troubleshooting.
- Configuring a further connection (such as HMI)
  This chapter contains information on how to configure the HMI connection among other things.

- Product combinations
  This chapter describes topics such as compatibility and storage media as well as STEP 7, NetPro, Drive ES, HMI, and other interfaces.
- Technical specifications
  This chapter contains information about the quantity structure and the storage capacity requirement.
- Appendix
  The appendix contains the scripts for SIOMTION and a sample program for an axis configuration in SIOMOTION SCOUT.
- Index

3.3.1.3 SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

3.3.1.4 Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

3.3.2 Fundamental safety instructions

3.3.2.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

Malfunctions of the machine as a result of incorrect or changed parameter settings

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

3.3.2.2 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

3.3.2.3 Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

3.3.2.4 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

3.3.3 Introduction

3.3.3.1 Content of the configuring manual

The SIMOTION SCOUT Configuration Manual is a general description of the software. Not all available software functions are described in this document. All detailed, subject-specific information can be found in the context-sensitive online help and the corresponding documentation.

Important notes and information on the SIMOTION Motion Control system are contained in the following catalog:

- SIMOTION, SINAMICS S120 and Motors for Production Machines, PM 21 Catalog

3.3.3.2 SIMOTION SCOUT engineering system

Introduction

While the Motion Control system SIMOTION provides a wide variety of preprogrammed functions, it is also parameterizable and programmable for individual requirements. High-performance tools, which provide optimum support and ease of use for the necessary engineering steps, are required for this.

The SIMOTION SCOUT Engineering System is the environment for the uniform automation of production machines with SIMOTION and integrates into the SIMATIC environment in accordance with TIA (Totally Integrated Automation).

SIMOTION SCOUT provides a uniform, function-oriented view for your automation task, and at the same time it is very easy to use.

The possible SIMOTION applications range from simple, parameterizable, speed-controlled single axes through to complex, mechatronically-coupled and programmable multi-axis machines. Therefore, SIMOTION SCOUT provides views adapted to the task and can be expanded with additional tools (e.g. tool for the graphic creation of cams).

SIMOTION SCOUT is the engineering system for SIMOTION. It is integrated into STEP 7 and provides all the required tools for the following functionalities:

- Configuration
- Parameter assignment
- Programming
- Test
- Diagnostics

The following tasks are graphically supported with operator guidance:

- Creation of the hardware and network configuration
- Creation, configuration and parameter assignment of technology objects such as axes, output cams and cams.

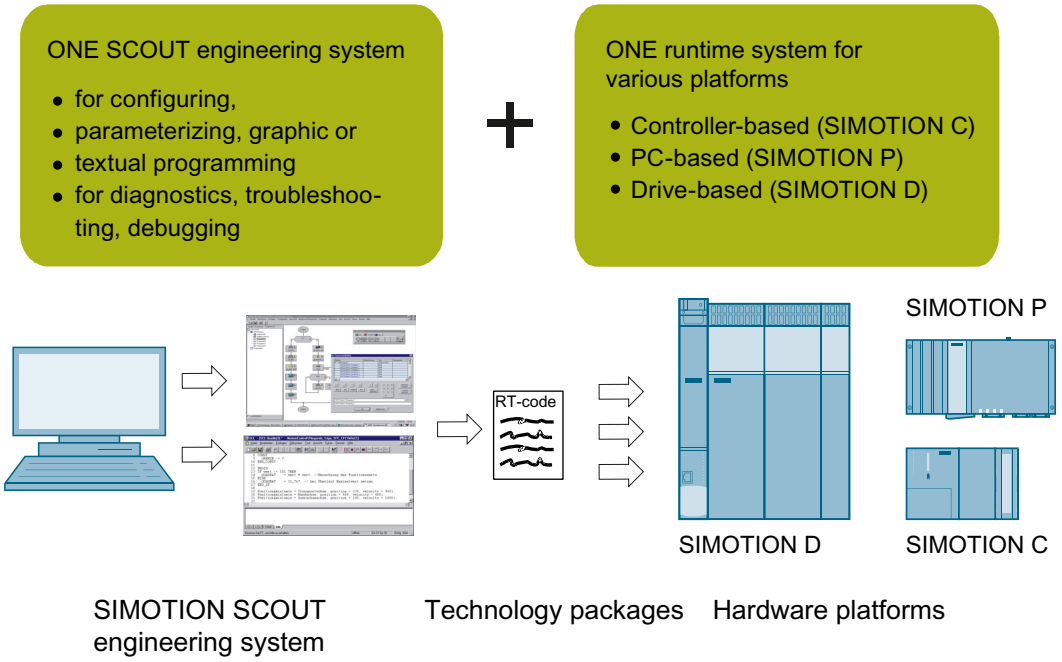

Figure 3-119 SIMOTION system overview

The automation topology is defined in the first engineering steps. The hardware and network configuration is created by parameterizing the required components and networks.

3.3.3.3 SIMOTION hardware platforms

To meet the complex requirements of machine construction, SIMOTION offers three hardware variants with different performance, packaging formats and expandability options. The basic system characteristics, like the engineering, are identical.

SIMOTION D (Drive-based)

SIMOTION D is a compact, drive-based version of SIMOTION based on the SINAMICS S120 drives family. For SIMOTION D, the SIMOTION runtime environment and the SINAMICS drive software run concurrently on the controller hardware in the SINAMICS S120 packaging format.

SIMOTION P (PC-based)

SIMOTION P is a PC-based, open motion control system from SIMOTION. Control, motion control, and HMI functions are executed together with standard PC applications on the SIMOTION P hardware platform.

SIMOTION P combines the openness of the Windows operating system with the real-time capability of SIMOTION P Runtime.

SIMOTION C (Controller-based)

SIMOTION C is the modular controller variant in the tried and trusted packaging system of the SIMATIC S7-300 with its very varied expandability options on the I/O bus. SIMOTION C240 high-performance motion controllers are available for control functions and motion control tasks. The integrated interface for four analog coupled drives makes the SIMOTION C particularly suitable for compact applications with the control of analog electrical drives and the operation of hydraulic axes. SIMOTION C also supports operation of four stepper motors at these interfaces. SIMOTION C240 PN offers a PROFINET interface instead of the encoder and drive interfaces.

3.3.3.4 Programming languages

Programming languages in SIMOTION SCOUT

SIMOTION provides different programming languages for the solution of Motion Control tasks, control logic, arithmetic calculations, etc. During runtime, the selected programming language has no effect – except in the different displays when debugging. You can create user applications in different programming languages and use them jointly in a project.

The following programming languages are available in SIMOTION SCOUT:

- **Motion Control Chart (MCC)**
  Graphical programming as a flow chart.
  In particular, for sequential tasks with a high level of motion control functionality.
- **Ladder Logic / Function Block Diagram (LAD/ FBD)**
  Graphical Programming as Ladder Logic / Function Block Diagram, supplemented by Motion Control Functions via PLCopen Function Blocks.
  In particular, for cyclic tasks with a high logic proportion.
- **Structured Text (ST)**
  textual programming in a high-level language.
  As the base language of the SIMOTION system, ST supports all system features and functions of the technology packages and is thus suitable for all tasks.
- **Drive Control Chart (DCC)**
  In many applications, the control of the drive system requires a linking logic which combines multiple statuses (e.g. entry control, system status) into one control signal (e.g. ON command).
  As well as logical links, drive systems are increasingly calling for arithmetic operations and/or saving elements. This kind of functionality is available on drive objects of the SINAMICS drive system and the SIMOTION control system in the form of a Drive Control Chart (DCC).
  With the Drive Control Chart Editor (DCC Editor) based on CFC, SIMOTION controllers and SINAMICS drives can be configured graphically.
  For further information, see Section DCC programming system (Page 443).

Sources (units)

Programs are created in program containers, the so-called sources (units). They are compiled in the engineering system. Any errors or warnings that occur during compilation are output in the diagnostics window. Sources compiled without error can then be loaded into the associated controller.

A source contains any number of programs, functions, function blocks and classes. Each executable part of a source (program, function, function block, class) is called a POU (Program Organization Unit).

A source is divided into an interface and an implementation section.

Interface section

All parts exported by the source are defined in the interface section. Other sources and external components (e.g. HMI systems) can access these parts. These include user-defined data types, data (variables and constants) as well as names of programs, functions, and function blocks.

Implementation section

The data types and data defined in the implementation section are global throughout the source and can be used by all POUs. The implementation section also contains the program code of the POUs. Any POUs not specified in the interface section can only be used within the source.

Note

Source concept

The source concept with encapsulation of code and data allows you to structure applications. For example, the functionality of an entire machine module with a defined external interface can be implemented in a single source.

Tasks

Programs are processed in tasks. A task is a job which is executed in a certain chronological sequence. The advantage of the task system (execution system) is that processes appended to the appropriate task levels can run simultaneously.

The SIMOTION Motion Control system uses high-performance CPUs on which a real-time operating system - suitable for fast control processes - is implemented. Each task is allocated a slice of the computing time. The organization of the task executions is performed by the operating system. A differentiation is made between user and system tasks that are independent of one another.

Additional references

For detailed information on the programming languages and the execution system, refer to the SIMOTION SCOUT online help and the appropriate programming and operating manuals.

Motion Control Chart (MCC)

MCC (Motion Control Chart) is a "flow diagram language" that graphically formulates the process sequences in production machines in a simple manner. The result is one or more flow diagrams, comprising MCC blocks that describe the chronological sequence of the individual machine actions. Due to its special means of expression, an MCC is ideally suited to programming sequential processes.

Motion Control Chart supports the simple description of the motion sequences of machines using powerful motion control commands, such as reference axis, position axis, synchronize or desynchronize cam, and many more.

To control the machine sequence, commands are available for awaiting conditions and for formulating computations, as well as for programming various control structures, such as polling (IF), case determination (CASE) and loops (FOR, WHILE, UNTIL). Several MCC programs may be created to describe different process situations. For example, you can create one MCC program to bring the machine to a defined initial state when it is switched on, a second MCC program for the normal production sequence, and a third MCC program to specify what the machine has to do in the event of a fault.

All MCC blocks – a selection of the most important SIMOTION functions – are available in tool bars. They are grouped according to function and are automatically inserted in the flow diagram at the marked point by means of a click. A click on the individual elements opens specific dialogs for parameterization. Obviously, you can also add your own comments for the further documentation of the process sequence. Functions from the SIMOTION command library that are not individually offered as MCC blocks can be used in an MCC program by means of a special command.

Performance features:

- Easy-to-use due to graphical illustration in the form of flow diagrams
- Hierarchical command library for motion control, PLC, and technology functions
- Control structures (IF, WHILE, CASE, etc.)
- Zooming for LAD, FBD and ST
- Subroutine calls (FB/FC, programs, methods (OOP))
- Structuring based on command module generation, i.e. combination of command sequences to form a module command
- User-friendly debug functions for online test and diagnosis, for example, single-step, program status or breakpoints for easier troubleshooting (debugging)
- Monitor, trace

Note

Implicit conversion to ST

When being compiled, programs written in MCC are implicitly converted to ST programs and then compiled.

You can export the intermediate result as an ST and use it as a basis for your own ST programs.

Additional references

Detailed information can be found in the SIMOTION SCOUT online help and in the SIMOTION MCC (Motion Control Chart) Programming and Operating Manual.

Ladder Logic / Function Block Diagram (LAD/FBD)

LAD/FBD is a graphical programming language and is available for Ladder Logic / Function Block Diagram. The statement syntax corresponds to a circuit diagram (LAD) or a function block diagram (FBD). LAD/FBD enable simple tracking of the signal flow between power rails via inputs, outputs, and operations. LAD and FBD programs are usually suitable for application in cyclic tasks (in particular, BackgroundTask).

LAD/FBD programs consist of elements and boxes that are graphically connected to networks. Their operations work mostly according to the rules of Boolean logic or simple arithmetic expressions and equations. Therefore, they are suitable only for control-relevant programs or also for motion control tasks by using the PLCopen blocks.

Functions, function blocks and programs can be programmed in LAD/FBD. A source can contain several LAD and FBD blocks. Only one POU can be implemented in an LAD or FBD block.

LAD/FBD also include commands for SIMOTION system control using standard logic functions. These commands are added from the command library. Motion Control tasks are preferably programmed with PLCopen blocks. Blocks which have been programmed in other SIMOTION languages can be called. User-friendly functions such as "on the fly" variable declarations or automatic syntax checks are available when programming in LAD or FBD. It is possible to switch over between LAD and FBD in the editor at any time. A program can therefore be viewed and processed in either LAD or FBD.

The following user-friendly debug functions are available for online testing and diagnostics:

- Program status
- Breakpoints

Note

Direct editing of motion commands is not recommended. Instead, it is better to use the PLCopen blocks. These blocks are designed for integration in logic-oriented programs.

Additional references

Detailed information can be found in the SIMOTION SCOUT online help and in the SIMOTION LAD/FBD Programming and Operating Manual.

Structured Text (ST)

Structured Text

ST is a high-level, PASCAL-based programming language. ST is based on the IEC 61131-3 standard. This standard harmonizes programming languages for programmable logic controllers (PLC).

The basic command scope is sufficient for the implementation of everything related to data management, arithmetic functions, control structures and I/O access. The addition of technology packages for Motion Control expands the scope of commands by other comprehensive, extremely flexible Motion Control commands.

In addition, applications can be subdivided into any number of sections. Such a section might be a program allocated to a runtime level, an instantiatable function block with its own memory, or a function without its own memory. In this case, the function blocks and functions are not allocated to a runtime level, but are instead called in programs.

Note

As of SIMOTION SCOUT V4.5, ST also supports object-oriented programming. Further information can be found in the SIMOTION SCOUT online help and in the SIMOTION ST (Structured Text) Programming and Operating Manual.

Performance features:

- Motion Control, PLC and technology functions in a single language
- Well-structured programs with comment capability
- Powerful editor functions, such as:
  - Syntax coloring
  - Automatic indenting
  - Automatic completion
  - Bookmarks
  - Fold (show and hide blocks)
  - Displaying sets of parentheses
  - Select text, e.g. by column
  - Using the command library
- Convenient debug functions for online testing and diagnostics, e.g. display of up-to-date variable content of the code sequence selected in the editor (program status) and breakpoints

Additional references

Detailed information can be found in the SIMOTION SCOUT online help and in the SIMOTION ST (Structured Text) Programming and Operating Manual.

3.3.3.5 CamEdit cam editor

CamEdit can be used to describe curves by means of either interpolation points or segments. A combination is not possible. If the curve is to be created from segments using polynomials, SIMOTION SCOUT provides the VDI wizard to assist in creation of the curve. Cam geometries are created in offline mode.

Information on the graphical creation of cams can be found in the CamTool section.

3.3.3.6 CamTool options package

SIMOTION CamTool is a powerful, graphical editor for creating and optimizing cams.

SIMOTION CamTool can be used as an expansion package for SIMOTION SCOUT and is completely integrated in the SIMOTION SCOUT user interface.

Basic functions

SIMOTION CamTool provides the following basic functions:

- Insert and edit cams.
  Cams can be inserted in a SIMOTION SCOUT project using the SIMOTION CamTool. You can also edit a cam created with CamEdit using CamTool: Cams can also be imported from a text file or read from a SIMOTION device.
- Customize display of the cam in CamTool.
  In SIMOTION CamTool, you can show and hide diagrams, change display parameters of the axes and diagrams and adjust the lines and fonts. You can also display auxiliary lines in the diagram.
- Convert cams from SIMOTION CamTool to SIMOTION CamEdit.
  To edit a cam that is edited in SIMOTION CamTool using SIMOTION CamEdit, the cam needs to be converted.
- Export cams to a text file.
- Load cams into a SIMOTION device.

Additional references

Detailed information can be found in the SIMOTION SCOUT online help and in the SIMOTION CamTool Configuration Manual.

CamEdit cam editor (Page 252)

3.3.3.7 Technology packages and technology objects

Technology packages in SIMOTION SCOUT

Technology packages combine software functions which are required for automation in mechanical engineering in various sectors. They are loaded into the controller during configuration and expand the basic functionality through additional system functions. The functions of the technology packages can be accessed easily during engineering in the SIMOTION SCOUT command library. Access to the technology package functions is provided by additional language commands and system variables. Programming of motional sequences is therefore simple and integrated.

The following standard technology packages are available for SIMOTION SCOUT:

CAM technology package

The SIMOTION CAM technology package contains the basic Motion Control technologies, such as drive axis, position axis, following axis, synchronous object, cam, output cam, cam track, and measuring input.

PATH technology package

The SIMOTION PATH technology package contains additionally the path interpolation technology.
Path interpolation generates the traversing profile for the path, calculates the path interpolation points in the interpolation cycle, and uses the kinematic transformation to derive the axis setpoints for the interpolation cycle points.

CAM_EXT technology package

The CAM_EXT technology package also contains objects for preparing technological data at the system level, e.g. addition object, formula object.

TControl technology package

The SIMOTION technology package for temperature control (TControl) provides temperature channels with extensive functions. These functions are also accessed via additional language commands and system variables.

DCBlib

The SIMOTION DCBlib technology package contains interconnectable DCC (Drive Control Chart) blocks for drive-related control functions.

More sector-specific technology packages are also available as separate products.

The loadable technology packages support the creation of technology objects (e.g. positioning and synchronous axis, cam tracks, external encoders) which can be accessed over system functions and system variables for use in every SIMOTION programming language.

Technology objects in SIMOTION SCOUT

SIMOTION SCOUT uses technology objects (TOs) to represent the functionality of axes, cams, output cams, etc. After creating a technology object (e.g. axis) and configuring it (e.g. as positioning axis), you can access it when programming with system functions.

Note

Missing licenses

All TOs outside the basic functionality (Motion Control Basic) must be licensed. Missing licenses are indicated by a flashing group error LED. The number and type of missing licenses is stated by the online diagnostics. They are also displayed during downloading.

Additional references

Detailed information is provided in the SIMOTION SCOUT online help and in the following documents:

- Function Manual: SIMOTION Basic Functions
- Function Manual: SIMOTION Motion Control, TO Axis, Electric/Hydraulic, TO External Encoder
- Function Manual: SIMOTION Motion Control, Synchronous Operation TO, TO Cam
- Function Manual: SIMOTION Motion Control, Supplementary Technology Objects
- Function Manual: SIMOTION Motion Control Output Cams and Measuring Inputs
- Function Manual: SIMOTION Motion Control, TO Path Object
- Function Manual: SIMOTION Motion Control, Basic Functions for Modular Machines

Licensing of the runtime components (Page 361)

3.3.3.8 CLib Studio option package

SIMOTION CLib Studio

If required, further functions and function blocks can be created in user libraries (SIMOTION CLib Studio) by means of C/C++ programming in the Windows environment.

They can be used in all SIMOTION languages (MCC, LAD, FBD, ST).

That allows the creation of application-specific and high-performance function extensions as well as adaptations including know-how protection.

3.3.4 Installation

3.3.4.1 SCOUT and SCOUT Standalone system requirements

Minimum requirements of the system

The readme file on the SIMOTION SCOUT DVD contains information on SIMOTION SCOUT system requirements; alternatively, you can access this information after installation at **Start** -> **All Programs** -> **Siemens Automation** -> **Documentation** -> **Readmes -> [English]**.

Note

Simultaneous operation of SIMOTION SCOUT, Starter and SIMATIC S7-Technology on one PC is not intended and is not possible.

SIMATIC S7-Technology is integrated as of SIMOTION SCOUT V4.0.

3.3.4.2 Installing SIMOTION SCOUT

Installing SIMOTION SCOUT

SIMOTION SCOUT is available as software packages with full license and upgrade license.

Requirements:

- SIMATIC STEP 7 is installed.
- You are logged on to the operating system with administrator rights.

Note

Read the readme file and the important information on the SIMOTION SCOUT Add-Ons DVD contained in the SIMOTION SCOUT software packages.

To install SIMOTION SCOUT

1. Insert the DVD 1 with SIMOTION SCOUT into the CD-ROM drive.
2. Start Windows Explorer and select the CD-ROM drive.
3. Open the root directory on the DVD.
4. Double-click **Setup.exe**.
5. Now follow the instructions in the installation program.
   The installation program prompts you to insert or connect the supplied data medium that contains the authorization. You can install the authorization during this setup. Or install the authorization with the Automation License Manager after installing SIMOTION SCOUT.
   For information, see the section AUTOHOTSPOT.

6. If a restart of the PC is required during the installation, carry this out.
   After restart of the operating system, log on at least as main user.
7. After the installation:
   Restart the PC and log on at least as main user.

All users who are logged on as main user are now able to start and operate SIMOTION SCOUT.

Installing SIMOTION SCOUT Standalone

Prerequisite

- No SIMATIC STEP 7 may be installed or
- No previous version of SIMOTION SCOUT Standalone must be installed.
- You are logged on to the operating system with administrator rights.

Note

Read the readme file and important information on the Add-On CD supplied with SCOUT.

To install SIMOTION SCOUT Standalone

1. Insert DVD 1 with SIMOTION SCOUT Standalone into the CD-ROM drive.
2. Start Windows Explorer and select the CD-ROM drive.
3. Open the root directory on the DVD.
4. Double-click **Setup.exe**.
5. Now follow the instructions in the installation program.
   The installation program prompts you to insert or connect the supplied data medium that contains the authorization. You can install the authorization during this setup. Or install the authorization with the Automation License Manager after installing SIMOTION SCOUT. Information on this can be found in the section titled "To install the authorization".
6. A restart of the PC is required during the installation, carry this out. You are requested to insert the CD"/".
   After the restart of the operating system, log on at least as main user.
7. After the installation:
   Restart the PC and log on at least as main user.

All users who are logged on as main user are now able to start and operate SIMOTION SCOUT.

SINAMICS Support Package (SSP)

You can use a SINAMICS Support Package (SSP) to upgrade the version of the drive units on a STARTER integrated into SIMOTION SCOUT.

This permits the use of new functions which only become available with new drive unit FW versions.

SSPs are available when installing SCOUT or can be installed at a later time.

In this regard, the following SSPs are relevant for SIMOTION SCOUT:

- "SINAMICS" SSP for upgrading single drive units (e.g. CU3xx)
- "SIMOTION SINAMICS Integrated" SSP for upgrading the SINAMICS drives integrated into SIMOTION D.

The readme files for the relevant SSP contain detailed information regarding installation.

3.3.4.3 Uninstalling SIMOTION SCOUT

Requirements:

You are logged on to the operating system with administrator rights.

Note

Note that the SIMATIC STEP 7 software must be uninstalled separately.

To uninstall SIMOTION SCOUT from the hard disk

1. Open the Windows **Control Panel**. Go to the **Programs and Functions** page (Windows 7).
2. Select **SIMOTION SCOUT Vx.x.x.x** and click **Uninstall/change** (Windows 7). Follow the instructions.
3. After the uninstall has completed, restart the PC.

Uninstalling SIMOTION SCOUT Standalone

Uninstall SIMOTION SCOUT Standalone as described in the "How to uninstall SIMOTION SCOUT from the hard disk" section.

3.3.4.4 Licenses

To install the authorization

Installing the authorization for SIMOTION SCOUT

A data medium containing the authorization is supplied along with the product CD so that you can use SIMOTION SCOUT. This contains the license key for the SIMOTION SCOUT Engineering System.

The authorization for SIMOTION SCOUT and SIMOTION SCOUT Standalone can be installed as follows:

1. Connect or insert the data medium containing the authorization and the license key.
2. Start the Automation License Manager:
   - In the start menu, **Start > All programs > Siemens Automation > Automation License Manager** or
   - Double-click the **Automation License Manager** icon
3. In the navigation area (left-hand window), select the drive where the data medium containing the authorization is located. The license key is displayed in the right-hand window.
4. Mark the license key and drag this with drag-and-drop to the target drive.
5. Exit the Automation License Manager.
6. Remove the data medium containing the authorization.

Note

Information on operating the Automation License Manager and transferring the license key can be found in the online help for the Automation License Manager.

The authorization for SIMOTION SCOUT and SIMOTION SCOUT Standalone can be upgraded as follows:

As of Version 4.0, the authorization for SIMOTION SCOUT has been upgraded from authorization (*single license*) to the licensing procedure involving a *floating license*. The Automation License Manager program manages the licenses.

1. Connect or insert the data medium containing the authorization and the upgrade license key.
2. Start the Automation License Manager:
   - In the start menu, **Start > All programs > Siemens Automation > Automation License Manager** or
   - Double-click the **Automation License Manager** icon. A new window opens.
3. In the navigation area (left-hand window), select the drive where the authorization for the old version of SIMOTION SCOUT is located. Generally, the authorization will be installed on a hard disk drive on the PC.
4. Transfer the authorization to the data medium containing the upgrade license key. To do this, select the license in the right-hand window and select **License key > Transfer...** via the menu.
5. In the **Transfer license key** dialog, select the connected data medium. Start the transfer by clicking **OK**.
   The authorization and upgrade license key will then be located on the data medium.

6. Select **License key > Upgrade...** in the menu.
   The previous authorization will be deleted and a new *floating license* will be available once the upgrade is complete.

   Note

   Do not interrupt the upgrade while it is in progress. Interrupting this process can lead to the license key being lost.

7. Now transfer the new floating license onto the hard disk drive. To do this, follow the same procedure as before: Via **License key > Transfer...** in the menu
8. After the transfer has completed successfully, remove the automation data medium.
9. Exit the Automation License Manager. SIMOTION SCOUT can now be operated without restrictions.

Saving and moving the license key

Saving and moving the license key

You can transfer the license key to a removable disk. This is useful when you want to save the license key when reinstalling a PC or when you want to use it on another PC. A copy of the license key is not created during this operation, it is moved.

Note

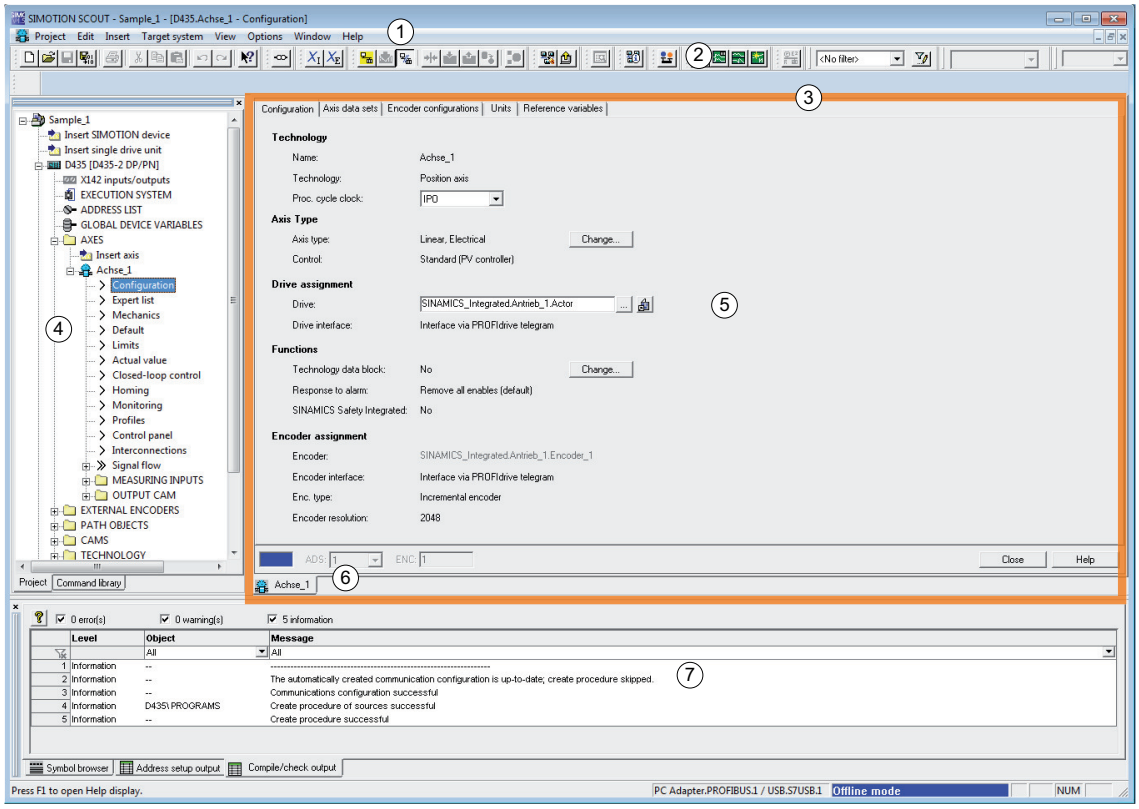
More detailed information on the license keys can be found in the online help for the Automation License Manager.

3.3.5 User interface

3.3.5.1 SIMOTION SCOUT - workbench

The SIMOTION SCOUT Workbench is the common framework for all other tools of the engineering system. The workbench is the navigation center of the individual engineering steps and offers a uniform and integrated view of all data and programs.

The following figure shows an example of the Workbench components:



① Menu bar
② Tool bars
③ Working area
④ Project navigator
⑤ Snap-in
⑥ Tab
⑦ Detail view

Workbench components

The workbench comprises the following components:

- **Menu bar**:
  You call the functions of SIMOTION SCOUT via the menus in the menu bar.
- **Tool bars:**
  Frequently used menu commands are also available in tool bars, which can be activated or deactivated as required. These provide quick access to the functions. The tool bars can be undocked from the header and relocated to a different position (e.g. at right, left, lower border) or as a window.
- **Working area**:
  The task-specific windows are displayed in the working area. In these windows, you can perform the configuration with wizards for the axis configuration and drive configuration. You also create programs in the working area. Further information about the active window in the working area is provided in the detail view.

- **Project navigator**:
  The project navigator provides an overview of the entire project. All defined elements, such as devices, drives, axes, etc., are displayed here in a tree structure.
- **Snap-in / tab:**
  A Snap-in is a program integrated automatically in the working area of the SIMOTION SCOUT Workbench. Snap-ins provide functions for processing SIMOTION SCOUT projects and are displayed as a work window in the working area of the workbench. Several Snap-ins can be opened. Open Snap-ins are displayed in the working area as tabs. The active Snap-in is visible in the foreground.
  The following Snap-ins are available:
  - Program editors
  - Wizards for the configuration of technology objects
  - Device diagnostics
  - Drive navigator
- **Detail display:**
  In the detail display, you can show more detailed information about the element selected in the project navigator and the active window in the working area, for example, variables of a program, system variables of a technology object, protocols of compiled program sources.

Additional references

Please refer to the following documents on these subjects

- Function Manual: *SIMOTION SCOUT Runtime Basic Functions*
- Function Manual: *SIMOTION Motion Control, Basic Functions for Modular Machines*
- Function Manual: *SIMOTION Motion Control, TO Axis, Electric/Hydraulic, TO External Encoder*
- Function Manual: *SIMOTION Motion Control, Synchronous Operation TO, TO Cam*
- Function Manual: *SIMOTION Motion Control Output Cams and Measuring Inputs*
- Function Manual: *SIMOTION Motion Control, TO Path Object*
- Function Manual: *SIMOTION SCOUT Supplementary Technology Objects*

and the online help.

Note

We recommend that you work through the sample configuration *Getting Started SIMOTION SCOUT*. This is a series of guided steps which teaches you how to work with SIMOTION SCOUT. For example, how to create, compile, and save a project, insert a SIMOTION device, insert and assign parameters for a technology object, and create a program.

When you have worked through all these steps, you will be able to create more complex projects.

Getting Started is available in two versions with different scopes, as a print document and in the online help.

Note

It is not recommended that you open **one** SIMOTION SCOUT project twice. This application case can result in malfunctions and is not supported by SIMOTION SCOUT. If you want to open two different projects, you must open SIMOTION SCOUT twice.

3.3.5.2 SIMOTION SCOUT - working area

The workbench displays all of the Snap-in work windows in the working area. Each Snap-in provides its own work window. You can open multiple instances of these windows. You can, for example, open several programs at the same time for editing. For further information, refer to the online help.

The following table provides an overview of the active functions in the working area of the workbench depending on the project mode (offline/online):

Function in project navigator	**Function in working area offline mode (Example)**	**Function in working area online mode (Example)**
Programs (MCC, ST, LAD/FBD) For further information, please go to: • SIMOTION MCC Motion Control Chart • SIMOTION ST • SIMOTION LAD/FBD	Create program	Monitor program
Execution system	Assign program	-
Technology objects (TO configuration)	Create and configure TO element	Change configuration data during RUN
Cam editor CamEdit/CamTool	Create cam	Change cam
Trace	Load and evaluate old recordings	Create current recordings
Axis control panel	-	Traverse axes during commissioning
Drive control panel	-	Traverse drives during commissioning
Path control panel	-	Commission kinematics

Window in the working area

You can change the size of the windows in the working area:
Click the edge of the window, hold down the left mouse button, and drag the window to the required size.

To maximize or restore a window, press <Ctrl+F11>.

Each window opened in the working area can be accessed via a tab at the bottom edge of the working area.

The following options are available to bring a window into the foreground:

- Click the relevant tab.
- Select the appropriate entry in the **Window** menu.

To close a window, proceed as follows:

- Configuration dialogs:
  Click **Close**.
- Editors for MCC, ST and LAD/FBD:
  Click the **X** button in the top right-hand corner.

Configuration dialogs and editors can also be closed with <Ctrl+F4>.

3.3.5.3 SIMOTION SCOUT project navigator

Using the project navigator

The project navigator in the SIMOTION SCOUT workbench

The project navigator has two tabs as standard, the **Project** and **Command library** tabs.

The **Project** tab displays the entire project structure and is used for managing elements within the projects.

The commands and functions required for programming are displayed in a tree on the **Command library** tab. You can search in the command library or set filters. You can use commands and functions in the ST, LAD/FBD and MCC programming languages, e.g. for the creation of conditions. In the MCC programming language, the functions are used, e.g. via the ST zoom or the system function call command.

Creating elements

Elements in SIMOTION SCOUT

There are different ways to insert elements in the project navigator tree:

Inserting hardware

Integrate hardware using:

- SIMOTION device element: **Insert SIMOTION device**

Alternatively, you can also call up the **Insert > SIMOTION device** menu.

- Drive element: **Insert single drive unit**

Note

You can insert a standalone drive (e.g. SINAMICS S120) with the **Insert single drive unit** element in the project navigator. It is commissioned using wizards in the working area of the workbench that contains the Starter functionality.

Elements within a SIMOTION device

Create the following elements within a SIMOTION device directly in the project navigator:

- Technology objects, e.g.:
  Axes, external encoders, cams, measuring inputs, output cams, synchronous operation, temperature channels, path objects
- Programs:
  - Insert ST program
  - Insert MCC source
  - Insert DCC charts
  - Insert LAD/FBD source

Other elements are created automatically, e.g.

- When creating a project:
  - Folder **LIBRARIES** (Insert library / insert DCC library)
  - Folder **LIBRARIES SINAMICS** (Insert DCC library)
  - Folder **MONITOR** (Insert watch table)
- When inserting a SIMOTION device:
  - **AXES**, **EXTERNAL ENCODERS**, **PATH OBJECTS**, **CAMS**, **TECHNOLOGY, PROGRAMS** folders
  - EXECUTION SYSTEM, ADDRESS LIST, GLOBAL DEVICE VARIABLES elements
- When creating an axis:
  - **MEASURING INPUTS**, **OUTPUT CAM, CAM TRACK** folders
  - Access to the configuration views
- Additionally when creating a following axis:
  - Synchronous operation element

Insert single drive unit

To insert a single drive unit element:

In the project navigator, double-click **Insert single drive unit**.
This enables you to insert a standalone drive (e.g. SINAMICS S120). The STARTER functionality in SCOUT is responsible for commissioning the drive concerned.

Inserting elements within a SIMOTION device

To insert technology objects, source files, or watch tables:

1. Open the SIMOTION device under which the element is to be created.
2. Select the relevant folder (e.g. **AXES**, **PROGRAMS**).
3. Select the desired function, e.g.:
   - **Insert > Technology object > ...** menu or
   - **Insert > Program > ...** menu or
   - **Insert > Watch table** menu

Displaying the station level of a SIMOTION device

This function provides a better transparency in large SIMOTION SCOUT projects. A project with several SIMOTION devices and a large number of drives can be displayed in a structure. The assignment in station levels, as known from SIMATIC STEP 7, is used.

If the function is activated, all drive units belonging to a STEP 7 station are displayed below this station.
If the function is deactivated, all drive units are displayed below the project.

Note

Optionally, the associated SIMATIC station of the SIMOTION device in the project navigator can be displayed. In this way, all drive units that are assigned to a SIMATIC station are also displayed in this structure.

Proceed as follows to activate or deactivate this function:

1. In the SIMOTION SCOUT, click the **Options > Settings** function.
2. Click the **Workbench** tab.
3. Activate/deactivate the **Display station level** function.
4. Click **OK** to confirm the change.

To become effective, the project has to be re-opened.

Opening the HW Config of a SIMOTION device

To call up the hardware configuration of a previously inserted SIMOTION device:

- In the project navigator, double-click the SIMOTION device whose hardware configuration you want to open or
- Select the desired SIMOTION device in the project navigator, open the context menu and click **Open HW configuration**.

Inserting a folder

Inserting a folder in the project navigator

For better structuring of objects in large projects, you can insert subfolders in the project navigator. Using this function, you can sort objects according to topic.

You cannot insert subfolders in DCC libraries and below slaves/devices.

To insert a subfolder, proceed as follows:

1. Select an object and perform **Insert > Folder** in the menu.
   or
2. Right-click the object and perform **Insert folder**.
   An empty folder is inserted.

Changing properties of the elements

You change the properties of an element as follows:

1. In the project navigator, select the element to be edited, e.g. a specific axis or a specific program.
2. Select the menu: **Edit > Object properties**.

Note

You define the hardware properties in the hardware configuration.

To rename an element:

1. Select the element you want to rename in the project navigator.
2. Open the context menu and select **Rename**.
3. Confirm the warning message.
4. Enter a new name and confirm the input by pressing the **Enter** key.

NOTICE
Damage resulting from errors in references to the axis Changing a name can have far-reaching consequences. References to the axis, particularly in programs, are lost. This can cause runtime errors in the program. • For this reason, make sure that you change all name references.

Wizards for configuration support

Wizards are provided to assist you in configuring axes and external encoders. The wizards guide you step-by-step through the configuration. Parameter interdependencies are taken into account.

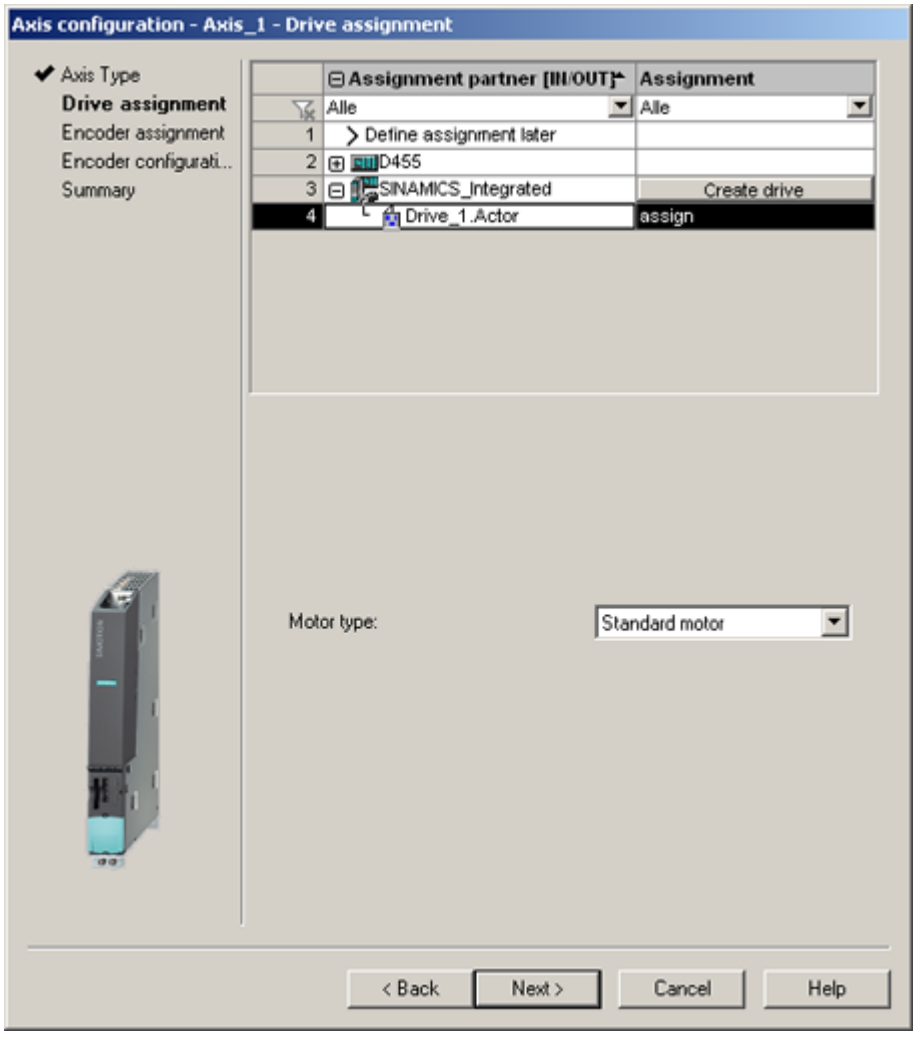


Figure 3-120 Axis configuration wizard - window for drive assignment

3.3.5.4 SIMOTION SCOUT - menus

SIMOTION SCOUT menus are subdivided into static and dynamic menus.

Static menu

Static menus are primarily used to control the workbench or a project and are permanently displayed.

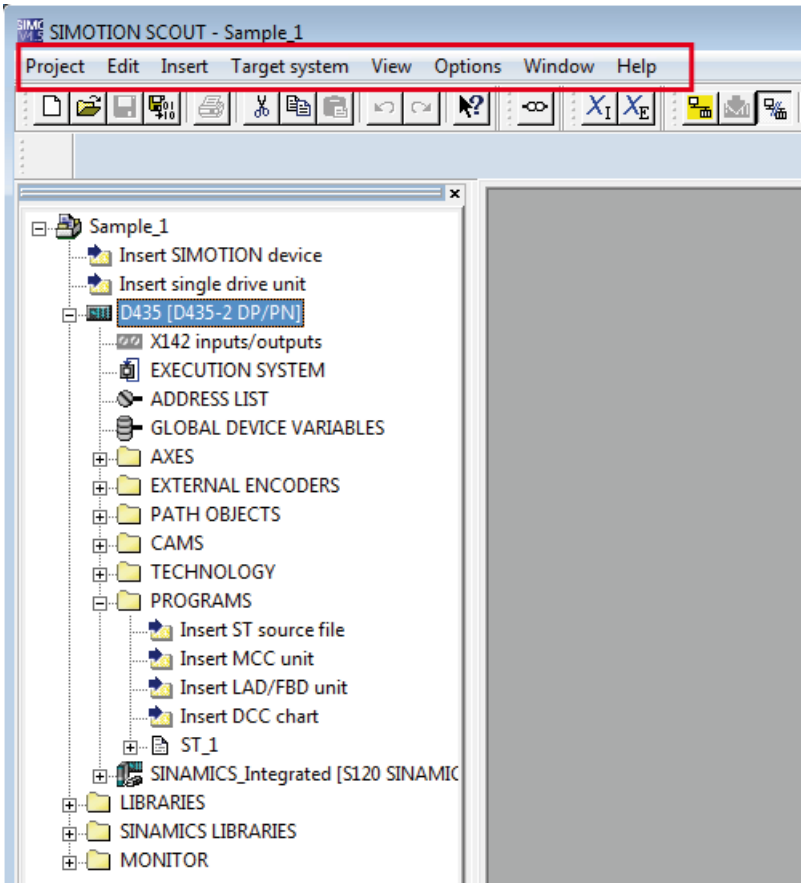

Figure 3-121 Static menu

Dynamic menu

Dynamic menus are provided by Snap-ins and are added to the static menu. The menu active in the working area is always displayed.

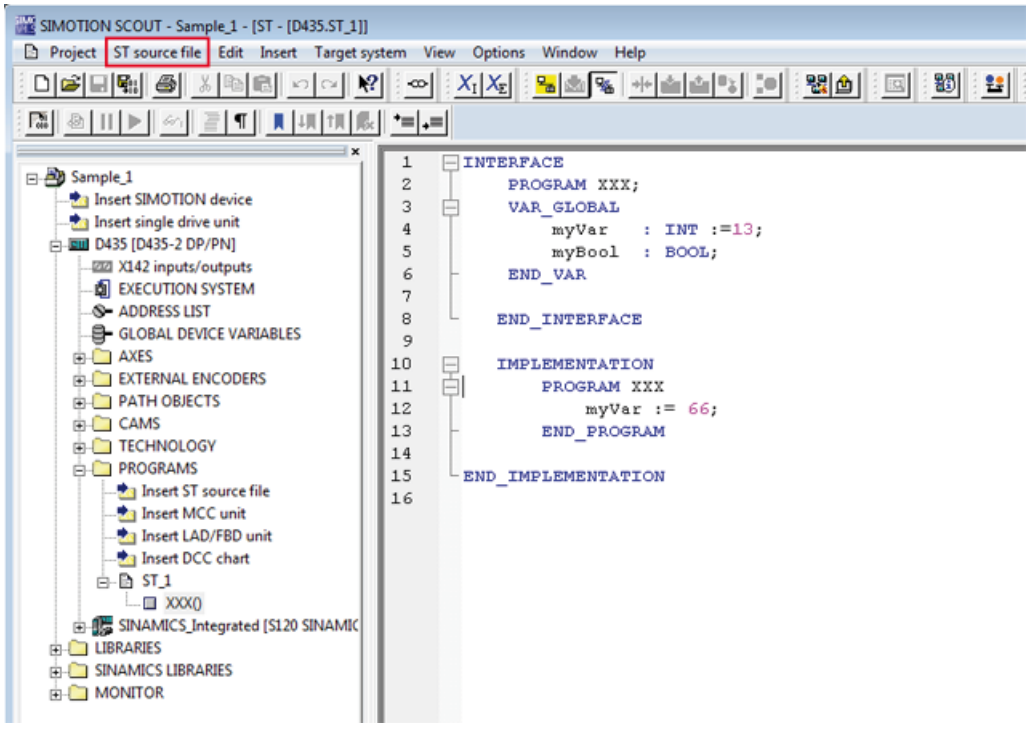

Figure 3-122 Dynamic menu

Table 3-23 Structure of the menu bar

Menu	Comment
Project	Static menu, always visible
(Dynamic menu)	See Dynamic menus table
Edit	Static menu, visible only when project has been loaded
Insert	Static menu, visible only when project has been loaded

3.3.5.5 SIMOTION SCOUT - menu items

You can use the shortcuts listed in the table to call the menu items available in SIMOTION SCOUT.

Table 3-25 Menu items in SIMOTION SCOUT

Shortcuts	Menu item	Reaction
Project...		
Ctrl+N	New	Creates a new project
Ctrl+O	Open	Opens a project
Ctrl+S	Save	Saves a project
Ctrl+Alt+K	Check consistency	Checks project consistency
Ctrl+Alt+B	Save and compile changes	Saves the project and compiles the changes made in the project since the last compilation
Ctrl+P	Print	Prints the selected window
Alt+F4	Exit	Exits the SIMOTION SCOUT program

Shortcuts	Menu item	Reaction
Edit...		
Ctrl+Z	Undo	Undoes the last action
Ctrl+Y	Redo	Redoes the last action

Shortcuts	Menu item	Reaction
Edit...		
Ctrl+X	Cut	Cuts the selection
Ctrl+C	Copy	Copies the selection
Ctrl+V	Insert	Inserts the clipboard contents
Del	Delete contents	Deletes the selection
F2	Rename	Renames the selected tree object
Alt+Enter	Object properties	Displays the properties of an object in the project tree
Ctrl+Alt+O	Open object	Opens a new object of the selected tree object
Ctrl+A	Select all	Selects the entire contents in the ST and MCC Snap-ins

Ctrl+F	Find	Opens the Find window
F3	Find next	Continues the search from the current position
Ctrl+Shift+F	Search in the project	Opens the Find window
Ctrl+Shift+G	Replace in the project	Opens the Find and Replace window

CTRL+H	Replace	Opens the Replace window
CTRL+J	Display next position	

Shortcuts	Menu item	Reaction
Target system...		
Ctrl+L	Download / target device	Downloads to individual target device
Ctrl+D Is possible only online	Device diagnostics	Opens device diagnostics
Ctrl+I Is possible only online	Control operating state	Opens the dialog for control of the operating state

Shortcuts	Menu item	Reaction
View...		
Ctrl+F11	Maximize working area	Maximizes and minimizes the view of the working area
Ctrl+F12	Maximize detail view	Maximizes and minimizes the view of the detail view
Ctrl+Num+ (Plus key on the numeric keypad)	Zoom in	Magnifies the diagram in MCC
Ctrl+Num+ (Minus key on the numeric keypad)	Zoom out	Reduces the diagram in MCC
F5	Refresh	Refreshes the view

Shortcuts	Menu item	Reaction
Options...		
Ctrl+Alt+E	Settings	Opens the Properties window

Shortcuts	Menu item	Reaction
Window...		
Ctrl+Shift+F5	Arrange cascading	Arranges the opened windows in the working area
CTRL+SHIFT+F3	Arrange vertically	

Shortcuts	Menu item	Reaction
Snap-in menu...		
Ctrl+F4	Close	Closes the selected window
Ctrl+B	Accept and compile	Compiles the active object
Ctrl+E	Expert list	Opens the expert list for the current technology object

Shortcuts	Menu item	Reaction
ST source file		
Ctrl+space		Automatic completion
Ctrl+F2		Sets and deletes bookmarks
Ctrl+F4	ST source file > Close	Closes the ST source file
Ctrl+F7	ST source file > Program status on/off	Switches the program status function on or off
Ctrl+Shift+F2		Deletes all bookmarks in the ST source file
Ctrl+Shift+F3		Arranges windows, tile horizontally
Ctrl+Shift+F5		Arranges windows, tile vertically
Ctrl+Shift+F8		Formats the selected area
Ctrl+Shift+F9		Moves the cursor to the start of the current or higher-level block
Ctrl+Shift+F10		Moves the cursor to the end of the current block
Ctrl+Shift+F11		Moves the cursor to the start of the higher-level block, 1st level
Ctrl+Shift+F12		Moves the cursor to the start of the higher-level block, 2nd level
Ctrl+D		Duplicates the selected row
Ctrl+Alt+B		Displays bracket pairs in the current ST source file
Ctrl+Alt+C		Folding: Hide all blocks of the current ST source file
Ctrl+Alt+D		Folding: Display all blocks of the current ST source file
Ctrl+Alt+F		Folding: Display or hide folding information in the current ST source file

Shortcuts	Menu item	Reaction
ST source file		
Ctrl+Alt+I		Displays indentation level in the current ST source file
Ctrl+Alt+L		Displays or hides line numbers in the current ST source file
Ctrl+Alt+R		Folding: Display all subordinate blocks
Ctrl+Alt+T		Folding: Display/hide block.
Ctrl+Alt+V		Folding: Hide all subordinate blocks
Ctrl+Alt+W		Displays or hides spaces and tabs in the current ST source file
Ctrl+ADD (numeric keypad)		Increases the font size in the current ST source file
Ctrl+MINUS (numeric keypad)		Decreases the font size in the current ST source file
Ctrl+DIV (numeric keypad)		Resets the font size in the current ST source file to 100%
Alt+Shift+arrow key		Selects text by column
Alt+Shift+L		Changes selected text to upper case
Alt+Shift+U		Changes selected text to lower case

Shortcuts	Menu item	Reaction
MCC		
Ctrl+F4	Close	Closes the MCC source
Alt+Enter	Properties	Opens the MCC Source Properties window
Ctrl+R	Insert MCC chart	Inserts a new MCC chart
Ctrl+F7	Program status	Switches monitoring on and off
Ctrl+F8	Monitor	
Ctrl+F9	Single-step	
Ctrl+F10	Next step	
Return	–	Opens the MCC configuration dialog
Arrow keys	–	Changes within the tab

Shortcuts	Menu item	Reaction
LAD/FBD (source or program)		
Ctrl+F4	Close	Closes the MCC source
Alt+Enter	Properties	Opens the MCC Source Properties window
Ctrl+R	LAD/FBD source: Insert LAD/FBD program LAD/FBD program: Insert network	Inserts a new LAD/FBD program
Ctrl+L	Jump label On/Off	Switches jump labels on and off
Ctrl+Shift+K	Display/comment On/Off	Switches comments on and off
Ctrl+Shift+B	All box parameters	Displays all box parameters

Shortcuts	Menu item	Reaction
LAD/FBD (source or program)		
Ctrl+T	Symbol check and type update	Performs symbol check and type update
Ctrl+F7	Program status	Switches monitoring on and off
Shift+F2 for LAD Shift+F2 for FBD	Insert element / Insert make contact element / AND box	Inserts a make contact Inserts an AND box
Shift+F3 for LAD Shift+F3 for FBD	Insert element / Insert break contact element / OR box	Inserts a break contact Inserts an OR box
Shift+F7 for LAD Shift+F7 for FBD	Add element / Add coil Add element / assign-ment or jump	Adds a coil Adds an assignment or a jump
Shift+F8 for LAD Shift+F8 for FBD	Insert element / Insert Open branch element / Insert binary in-put	Inserts an Open branch Inserts a binary input
Shift+F9 for LAD Shift+F9 for FBD	Insert element / Insert Close branch element / Invert binary in-put	Inserts a Close branch Inverts the binary input
Shift+Alt+F9	Insert element / empty box	Inserts an empty box
Ctrl+3 Ctrl+1	Switch to FBD Switch to LAD	Switches the display

Shortcuts	Menu item	Reaction
Help...		
F1	Help topics	Opens the entire help available for SIMOTION SCOUT
Shift+F1	Context-sensitive help	Opens the context-sensitive help function for the selected object, parameter, etc.

Shortcuts	Menu item	Reaction
Hardware configuration...		
Ctrl+U (in HW Config)	Address overview	Opens the Address Overview window
F4	Optimize layout	

Note

List of all shortcuts

A complete list of all the shortcuts in SIMOTION SCOUT is available in the online help, and in the appropriate programming and operating manuals.

3.3.5.6 SIMOTION SCOUT - keyboard operation and shortcuts

Note

There are various keyboard assignments and shortcuts for the menu items to facilitate your work in SIMOTION SCOUT.

The following table provides an overview of the keyboard assignments and shortcuts that you can use for SIMOTION SCOUT.

Table 3-26 Keyboard operation

Keyboard operation / shortcuts	**Meaning**
Workbench: Change window...	
Alt+0	Project navigator
Alt+1	Working area
Alt+2	Detail view
Ctrl+F6	Next window in the working area
Ctrl+F11	Minimize/maximize working area in relation to the whole desktop
Ctrl+F12	Minimize/maximize detail view in relation to the whole desktop

Project navigator	
Click with left mouse button	Selects the tree object at the cursor position; the detail view displays the associated details
Double-click with left mouse button	Selects the tree object at the cursor position; the detail view displays the associated details; the associated Snap-in opens
Click with right mouse button	Selects the tree object at the cursor position; the detail view displays the associated details; the context menu opens
"Up/Down" arrow keys	Selects the tree object at the cursor position
"Return"	Snap-in for the selected tree object opens
"Context menu key"	Context menu for the selected tree object opens

Program editors	
Alt + "Left/Right" arrow keys	Go to the use location (starting at the selection)

3.3.5.7 SIMOTION SCOUT - using the context menus

The tree elements of the project navigator have context menus. These provide quick access to all major functions enabled for this tree element.

To call the desired function of the tree element via context menus, proceed as follows:

1. Select the appropriate element in the project navigator.
2. Open the context menu with a right-click.
3. Left-click the appropriate command to select it.

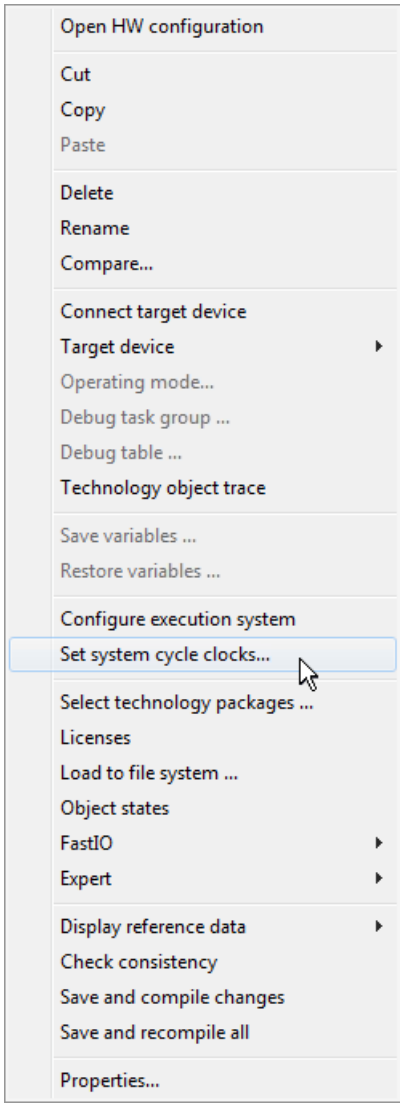

Figure 3-123 Context menu for SIMOTION device

3.3.5.8 SIMOTION SCOUT - detailed view

Using the detail view

When you select an element in the project navigator, the associated detail view will appear in the lower area of the workbench. A detailed view is not available for every element.

Depending on the selected element, different tabs are offered and information about the element is displayed therein.

To display the address list and the watch table, you must open them with a double-click. The detailed view then displays in the associated tabs the appropriate content for the selected element.

The tabs available are determined by the project mode (offline/online) and the active Snap-ins.

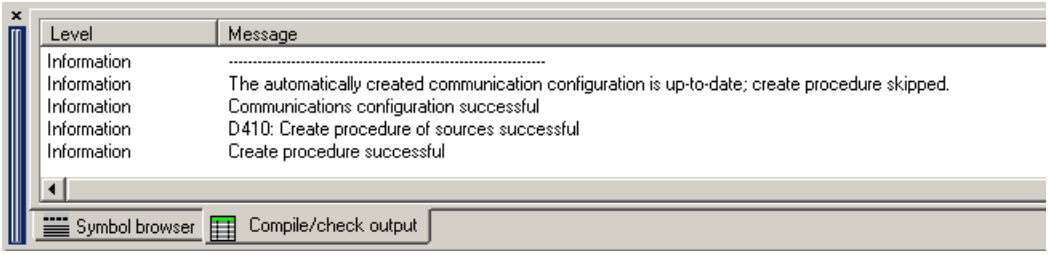

Figure 3-124 Example of detail view

Each tab is opened just once, i.e.:

- The active tab shows the details of the selected element.
- The contents of the tab change when you select a different element.

You can maximize or minimize each tab with <Ctrl+F12>.

Using the symbol browser

The symbol browser is a tab in the detail view. The symbol browser displays status values of the variables for the element selected in the project navigator.

Display symbol browser

To display the symbol browser, proceed as follows:

1. Select an element in the project navigator.
2. In the detail view, select the **Symbol browser** tab.

Displaying the symbol browser content continuously

To continuously display the content of the symbol browser for a selection, e.g. for the execution system, proceed as follows:

1. Click the symbol at the top right in the symbol browser view.

The active element remains displayed until this function is deactivated. To deactivate this function, click the pin again.

Address list

The address list is where you create I/O variables, which you then assign to a particular item of hardware. You can monitor I/O variables in the address list, and, when necessary, modify them. The I/O variables are assigned either manually or via an assignment wizard.

Opening the address list

To open the address list, proceed as follows:

1. Browse to the folder for the device in the project navigator.
2. Double-click the **Address list** element below the device.
   The address list opens in the details area.

Additional references

Further information about the address list is available in the SIMOTION SCOUT online help.

Watch table

With the symbol browser you can view the variables belonging to one object in your project; with the program status you can view the variables belonging to a selected monitoring area in the program. With watch tables, in contrast, you can monitor selected variables from different sources as a group (e.g. program sources, technology objects, SINAMICS drives - even on different devices). You can sort the variables in the watch table in any way you want, add comments regarding them, and combine them into groups. You can hide individual variables to make the watch table more manageable and also control variables via the watch table directly.

Creating a watch table

To create a watch table and assign your variables, proceed as follows:

1. In the project navigator, open the **Monitor** folder.
2. Double-click the **Insert watch table** entry to create a watch table.
3. Enter the name of the watch table.
   A watch table is created with this name in the **Monitor** folder.
4. In the project navigator, click the object from which you want to move variables to the watch table.
5. In the symbol browser, in the address list or in the expert list, select the corresponding variable line by clicking its number in the left column.
6. From the context menu, select the **Add to watch table** command and the appropriate watch table, e.g. **Watch_table_1**.
7. If you click the watch table, you will see from the **Watch table** tab of the detail view that the selected variable is now in the watch table.
8. Alternately, you can copy-and-paste variables to the watch table or enter them from the keyboard.
9. To monitor the variables of various objects, repeat steps 3 to 6.

You can also create a watch table directly by selecting a variable followed by **Add to watch table > New watch table** in the context menu.

The new watch table, containing the selected variable, is created automatically.

If you are connected to the target system, you can monitor the variable contents.

Using several watch tables (Watchtabelle_temp)

If you want to monitor several watch tables simultaneously (watch tables of different objects), create a temporary watch table.

The temporary watch table has the following properties:

- It is always called Watchtabelle_temp
- It does not save the contents when it is closed
- It can be filled using drag-and-drop
- It does not support control records
- With dropped watch tables, it does not display any control values (control checkmarks are not set).
- Transfers the control values and control checkmarks; Create copy transfers them to the copy of the temporary watch table.

Using a temporary watch table

1. Click **Watchtabelle_temp** below **Monitoring** in the project navigator.
   The temporary watch table is displayed in the detail view.
2. Drag the required watch tables to the temporary watch table using drag-and-drop.
   The watch tables are arranged one below the other.

Additional references

Detailed information on this topic is available in the SIMOTION SCOUT online help.

Working with lists

You have various options to make working with lists (e.g. watch table, address list, symbol browser or expert list) more transparent and easier to configure, and also to be able to display larger data volumes in a structure. You can hide unimportant or redundant information and focus on important information. You can also transfer and group contents quickly and easily.

Additional references

Detailed information on this topic is available in the SIMOTION SCOUT online help.

3.3.5.9 SIMOTION SCOUT - language settings

Language setting of the SIMOTION SCOUT

SIMOTION SCOUT uses the language default setting in the SIMATIC Manager. You can make changes to this setting in the SIMATIC Manager via the **Options > Settings... > Language** menu.

German, English, French and Italian languages are currently available in SIMOTION SCOUT. If a different language is set in the SIMATIC Manager, SIMOTION SCOUT uses the English setting.

Note

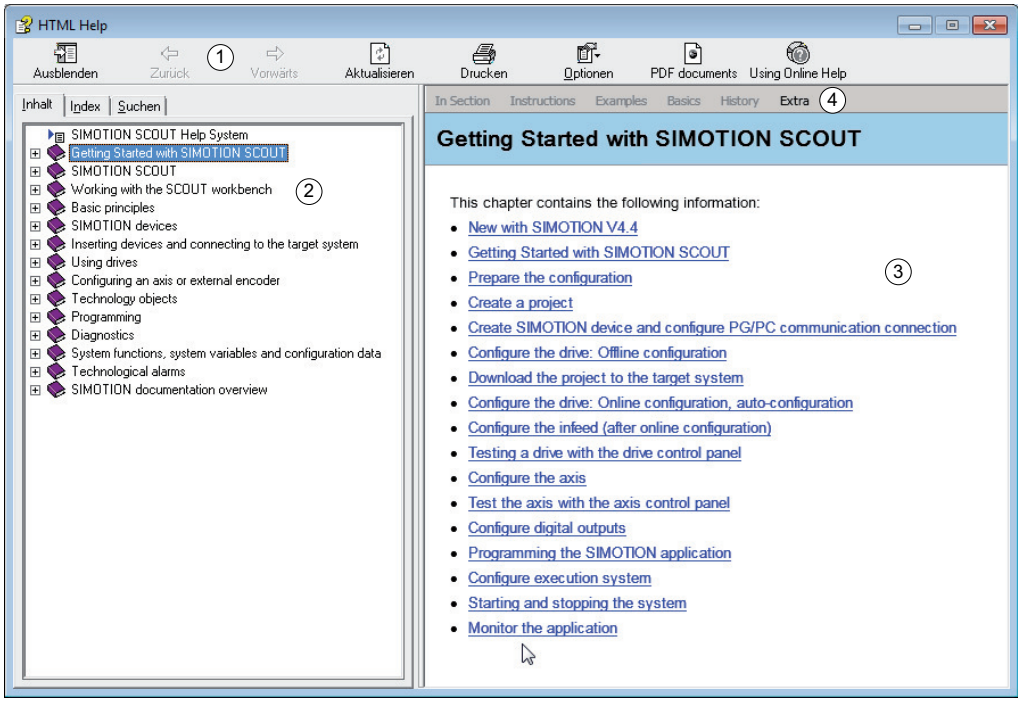
Only those languages installed in STEP 7 are available.

3.3.5.10 SIMOTION SCOUT - using help

SIMOTION SCOUT Online Help

SIMOTION SCOUT has a comprehensive context-sensitive help. The following is a description of how to work with the help system using different examples.

Structure of the online help window



1 Menu bar

You can use buttons in the menu bar to configure the help or display general information.

- Click "PDF documents" to display the available function diagrams.
- Click "Use online help" to display the help page for the full text search on the "Search" tab.

2 Navigation area

In the navigation area you can navigate through the help, open the index or search through the entire help.

- Click the "Contents", "Index", or "Search" tab to navigate through the help.
- Click the "+" in front of a book to open the table of contents.
- Click a book or help page to display its contents in the contents area.

3 Contents area

The contents for the help pages selected in the navigation area are displayed in the contents area.

Within the contents area, you can use symbols to display hidden information:

- Click the arrow to display or hide additional information.
- Click the minimized view to display a hidden figure.
- Click the copy symbol. The following program code will be saved automatically in the clipboard. You can then insert this in a program editor.

4 Link bar

The header area of many help pages has a link bar. This link bar displays further information for the selected help page. The link bar contains the following entries:

- In Section
  Links to headers of the displayed topic.
- Manuals
  Links to handling instructions.
- Examples
  Links to examples.
- Fundamentals
  Links to background information, such as definitions or details.
- History
  List of the most recently opened help pages.
- Options
  Link to the start page.
  Forwards and backwards in the previously opened help pages.

Features of online help

Features of online help	**To open the help:**	
Open entire help	Key <F1>	Press <F1>.
	or	
		Select "Help > Help topics" from the menu.
	The entire help opens.	

Features of online help	To open the help:	
Open Getting Started		Select "Help > Getting Started" from the menu.
	Getting Started opens.	
Help button	 or 	Click the Help button of the associated dialog or window.
	The context-sensitive help for the dialog opens.	
Context-sensitive help	<Shift+F1>	• Press <Shift+F1>.
	• or	
		• Click the button in the menu bar.
	• or	
		• In the menu, select "Help > Context help".
	The mouse pointer changes to a question mark.	
		• Then click with the changed mouse cursor on the dialog, the parameter, the input field or the menu item.
	The context-sensitive help for the selected entry opens.	

Examples of the context-sensitive help

Help in the project navigator		
General help		Press <Shift+F1>. Then click with the question mark on the project navigator. The general help for the project navigator opens.
Help for the technology object (only SIMOTION)		Press <Shift+F1>. Then click with the question mark on a technology object in the project navigator. The help for this technology object opens.

Help for the detail view		
General help for the symbol browser		Press <Shift+F1>. Then click with the question mark in the margin of the symbol browser. Alternatively, you can also open the help for the symbol browser by clicking . The general help for the symbol browser opens.
System variables in the symbol browser		In the project navigator, select the SIMOTION device or the technology object. The system variables of the element are displayed in the symbol browser. Press <Shift+F1>. Then click with the question mark on the system variable in the symbol browser. The associated help opens.
Help for alarms		Press <Shift+F1>. Then click with the question mark on the alarm shown on the "Alarms" tab. The help for the drive alarm or technological alarm opens.

Help for the expert list		
Configuration data		Press <Shift+F1>. Then click with the question mark on the configuration data item in the expert list. The help opens.
System variables		Press <Shift+F1>. Then click with the question mark on the system variable in the expert list. The help opens.
Parameters of the drives		Press <Shift+F1>. Then click with the question mark on the parameter in the expert list. The help opens.

Help for the LAD/FBD editor (only SIMOTION)		
Declaration area		Press <Shift+F1>. Then click with the question mark on a tab in the declaration area of the LAD/FBD editor. The help opens.
Editor area		Press <Shift+F1>. Then click with the question mark on an element in the editor area of the LAD/FBD editor. The help opens.

Searching in the online help

You can carry out a full-text search throughout the entire Help in the **Search** tab.

With a full-text search, you have to consider certain points to ensure that the search is successful. A simple search according to subject consists of the word or expression you want to find.

To refine your search, you can use wildcard expressions, nested expressions, Boolean operators, similar word hits, the previous result list or subject titles.

To carry out a full-text search:

1. In the menu bar, select **Help > Help topics** or press key **F1**. The entire help is displayed.
2. Click the **Search** tab and enter the search term. You can add Boolean operators by clicking the arrow next to the input field.

   Note

   If you enter the term *System*, this term is sought throughout the entire Help. Only the Help pages that contain the word *System* are found. Compound words, e.g. *Systemclock* are not found. Therefore it is usually more appropriate to search with wildcards if you are not searching for a definite term, e.g. **system** returns all the results that contain *system*.

3. Click **List subjects** to start the search. The search returns a maximum of the first 500 hits. If you want to sort the subject list, click **Title**, **Position** or **Order**. With many search results, it is better to sort them by position so hits are grouped together by subject matter.
4. Double-click the desired subject to display the Help page. The found terms are highlighted on the page.

   Note

   If the terms are not highlighted, of if you want to turn the highlighting off, click the **Options** button. select Activate/deactivate search term highlighting in the menu displayed.

You can also search just within the last result list, include similar word hits or only search the subject titles in the table of contents.

In the case of multiple matches, a clearer overview can be obtained by sorting them with **Position** , as the search results will then be arranged according to the associated topic.

Additional references

For more information regarding this topic, see the online help.

Getting Started with SIMOTION SCOUT

Calling Getting Started with SIMOTION SCOUT

Getting Started is displayed by default when SIMOTION SCOUT is opened.

Getting Started provides an overview of how you can work with SIMOTION SCOUT. An example shows you the different steps required to create a project and introduces the configuration, programming, and diagnostic tools.

In addition, the "New with SIMOTION V4.5" section provides an overview of which new functionalities are available in the latest version of SIMOTION.

Note

We recommend that you work through Getting Started with SIMOTION SCOUT. You will then be able to start work on more complex projects as well.

Note

Getting Started is available in two versions as of Version 4.4. The print version deals with the sample configuration based on a SIMOTION D435-2. The online help is more comprehensive. It takes account of all three SIMOTION platforms, as well as: Drive configuring with the drive wizard, testing of the drive with the drive control panel, configuring of a virtual axis.

Deactivating the Getting Started with SIMOTION SCOUT online help

To deactivate the default setting that automatically opens the online help when you launch SIMOTION SCOUT:

1. In the menu bar, select **Options > Settings...**
2. Click the **Workbench** tab.
3. Deactivate the **Display "Getting started" at start** checkbox.
4. Click **OK**.

Error remedy

In the online help, you can find detailed information about error messages appearing in the detail view of the SIMOTION SCOUT workbench. This is possible for technology object alarms and alarms for drive units and I/O devices.

To do this, click the **Help for event** button.

To call the context-sensitive help for the associated compiler error messages in the detailed view, click the button and then the question mark for the associated message.

Additional information about the error text can be found using the full-text search.

3.3.5.11 Adding add-ons to the workbench

Add-ons in SIMOTION SCOUT

SIMOTION provides you with the option of enhancing the functionality or accommodating customer-specific requirements. You can integrate add-ons. The CamTool add-on is currently available.

Note

More detailed information about the CamTool add-on is contained in the *SIMOTION SCOUT CamTool* configuration manual or the associated online help.

Add-ons are added to the workbench and are displayed as fully integrated:

- Menus and toolbars appear at the appropriate position in the workbench. After installation of add-ons, the menus are visible and the toolbars are active.
- The working windows appear in the working area of the workbench and have tabs.
- The detail view of the workbench shows details about the currently active add-on. If the associated details are distributed over several tabs, you can select the relevant tab and place it in the foreground.

3.3.6 Configuring/parameterizing

3.3.6.1 Configuration overview

In order that the machine or plant can perform the desired tasks, you must carry out the following steps with SIMOTION SCOUT:

- Create a project:
  The project is the generic term under which you store all of the relevant files.
- Configure hardware:
  Provide the SIMOTION system with information about the hardware.
- Configure technology objects (TO):
  Provide the SIMOTION system with information about the technologies used.
  SIMOTION SCOUT provides wizards for comprehensive assistance.
- Create and test open-loop and closed-loop control programs.
- Commission and optimize drives and axes.
- Test the system and utilize the diagnostic options.

SIMOTION SCOUT provides the workbench to enable you to perform these steps easily and efficiently.

3.3.6.2 SIMOTION SCOUT - basic settings

In SIMOTION SCOUT, you have the possibility of predefining various basic settings via the **Options > Settings** menu. Detailed information on the individual tabs and settings is provided in the SIMOTION SCOUT online help.

1. Open SIMOTION SCOUT.
2. Click the **Options > Settings...** menu.
   The **Settings** window opens.
3. Click the desired tab.
4. Enter the settings.
5. Click **OK**.

Note

Select **Scripts > Additional scripts > Scripts for SIMOTION SCOUT Engineering** in *Utilities&Applications* to access scripts for making useful standard settings.

3.3.6.3 Managing projects

SIMOTION SCOUT project

The project is the highest level in the data management hierarchy. SIMOTION SCOUT saves all data which belongs, for example, to a production machine, in the project directory. The project is therefore the sum of all data, programs, settings, etc.

The project encompasses all of the SIMOTION devices, drives, etc., that belong to a machine. The axes, external encoders, path objects, cams, technology, and programs are assigned hierarchically to the respective devices. This hierarchical structure is displayed in the project navigator.

Creating a new project

To create a new project

1. Open SIMOTION SCOUT from the Start menu on the Windows desktop **Start > All Programs > Siemens Automation > SIMATIC > STEP 7 > SIMOTION SCOUT** (Windows 7)**.**
   Or double-click the **SIMOTION SCOUT** icon on your PC desktop.
   SIMOTION SCOUT starts the workbench and the online help **Getting Started SIMOTION SCOUT**.
2. In the workbench menu bar, select **Project > New**.
   The **New Project** window opens.

Note

SIMOTION SCOUT creates a directory with the selected name. All files relevant to the project are stored in this directory.

Directory names and file names are shortened to 8 characters. If you assign longer names, they are displayed in SIMOTION SCOUT. However, these names are only managed with 8 characters in the Explorer.

Special characters may not be used.

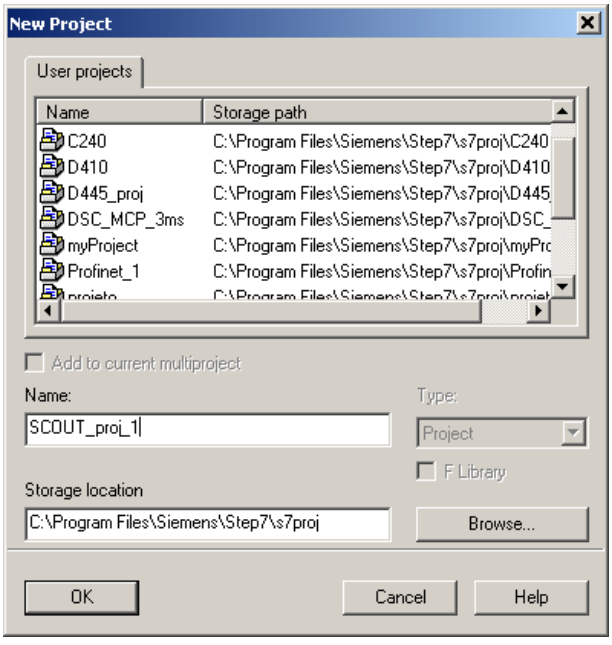


Figure 3-125 Creating a new project

3. Enter the following data in the dialog window:
   - **Name**:
     Select a name for the project.
   - **Storage location (path)**:
     The default storage location (path), where the new project is to be stored, is displayed here.
4. Click **OK** to confirm.

The new project appears in the project navigator with an icon and its full name. The associated tree is expanded.

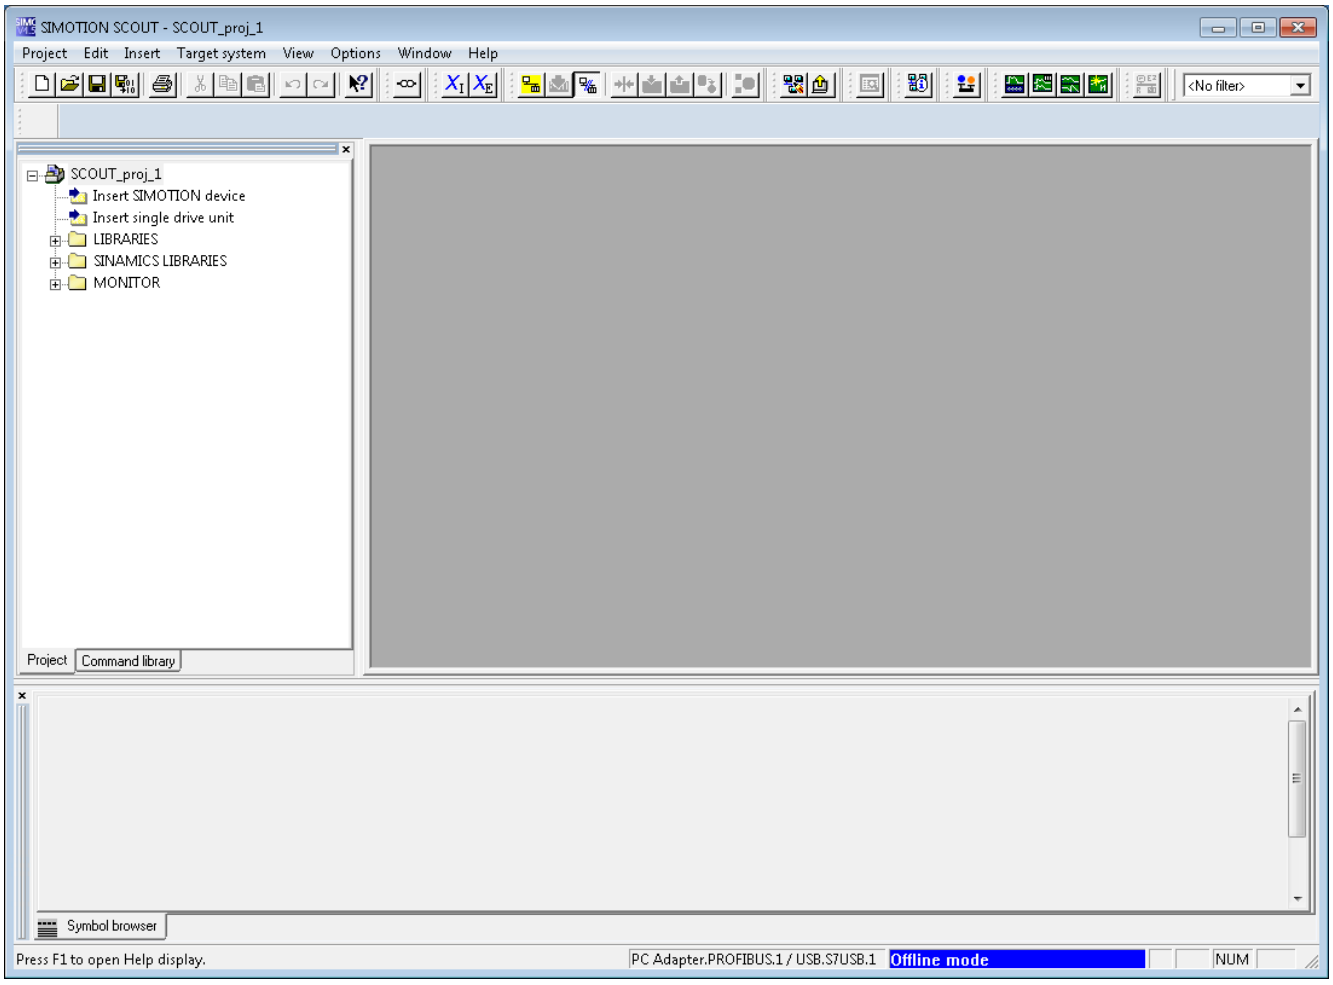

Figure 3-126 Workbench with new project

The following entries are located beneath the project name in the project navigator:

- **Insert SIMOTION device** element. Double-click this icon to select the required SIMOTION device, create and configure a new subnet and insert the new device in the HW Config program.

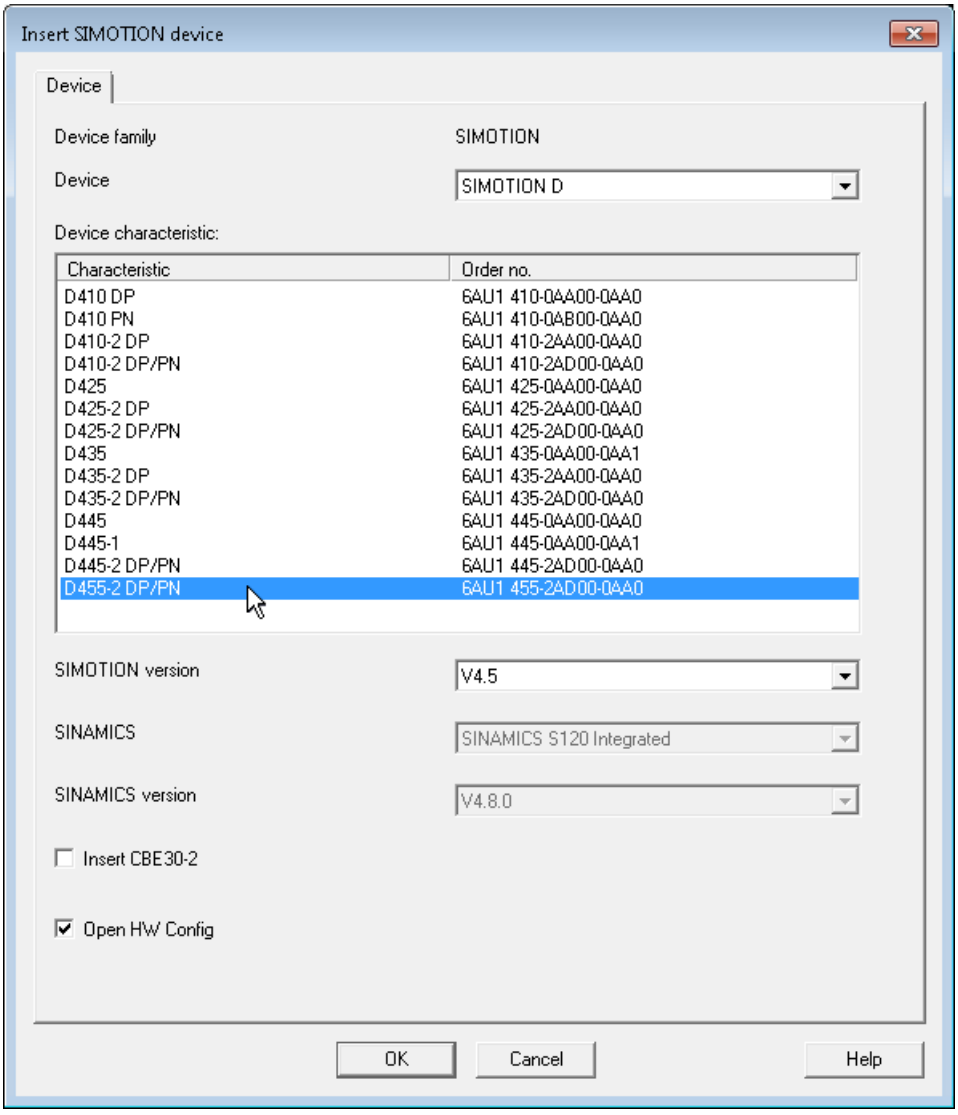

Figure 3-127 Insert SIMOTION device

- **Insert single drive unit** element. Double-click this icon to insert and commission a standalone drive (e.g. MM4 Basic). Although this drive cannot be linked to or configured in the master system of the project using a PROFIBUS DP connection, it appears in the project navigator within the project.
- Folder labeled **LIBRARIES**
- Folder labeled **MONITORING**

Open project

To open a project saved on the hard disk of the PC:

You can open projects that SIMOTION SCOUT has stored locally (e.g. on the hard disk).

1. Select the **Project > Open** menu.
2. In the **User projects** tab, select the desired project.
   If the project you want is not stored according to the default path: Click **Browse...** and follow the instructions on the screen.
3. Click **OK** to confirm.

If you want to open a project that was created in an older version, a message appears asking whether the project should be converted to the newer version. This function is available since SIMOTION SCOUT Version V3.1.

Note

The **Save as...** function saves all previously made changes with a new name (as of V4.4).

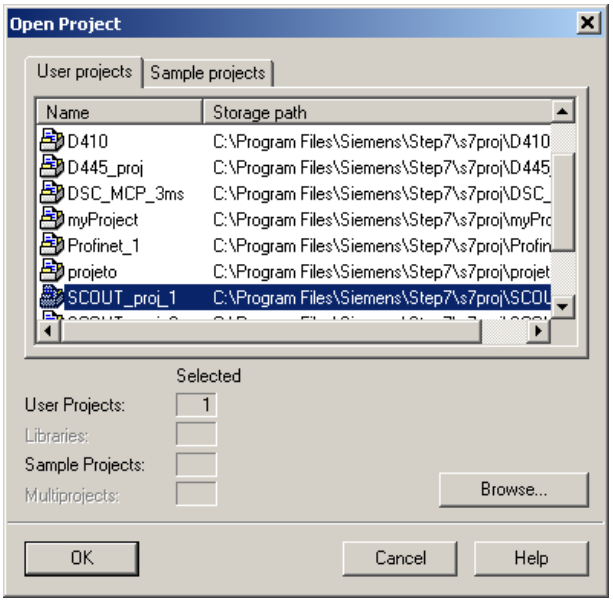

Figure 3-128 Opening a project stored on the hard disk

Note

The workbench displays one project at a time.

If you want to display two projects at the same time, e.g. in order to copy/paste parts of a project, start SIMOTION SCOUT a second time.

Saving and compiling

SIMOTION SCOUT distinguishes three commands in the main project menu that act differently when saving or saving and compiling:

- Save
- Save and compile changes
- Save and recompile all

Note

The project must be saved and compiled first before the download. For the default setting of SIMOTION SCOUT, these steps are performed automatically during the download.

Save

The project is saved to the hard disk. The changes are accepted into the project. No further processes (such as compilation or consistency checking) are triggered for the project.

Save and compile changes

On this command, the whole project is searched for changes. If a source is found which has been changed or has no compilation results, this and any linked sources are compiled and saved (e.g. during an FB call). Therefore only the changes are compiled. Use this command when performing your day-to-day tasks within a SCOUT version.

Save and recompile all

All sources of the entire project are recompiled with this command.

The **Save and recompile all** command is suitable if you are entirely sure that all the old data from older SCOUT versions has been removed and should be replaced with new compilation results. The command incorporates the following steps:

- Project-wide deletion of all compilation results
- Recompilation of all objects

Use this command if you specifically want to convert a project from an earlier SCOUT version to a later one. This involves accepting all the error correction and optimization elements in the new SCOUT. However in this case, the compilation results in the SIMOTION SCOUT and SIMOTION RT become inconsistent. The project navigator and object comparison feature then display the objects as "inconsistent" in ONLINE mode. You can only debug the project if you have loaded the entire project to the target system.

Note

The compilation results remain consistent provided there were no error messages and the compiler has not been changed.

Note

Libraries are compiled only for the device versions in which they are used.

Performing a consistency check

Checking the project for consistency and compiling the project

Before you download the project to the target system, the program sources must be compiled without error and the consistency ensured. In this process, I/O addresses or TO configurations are checked, for example.

1. Select the **Project > Save and compile all** menu.
2. SIMOTION SCOUT compiles all the changed sources.
3. Select the **Project > Check consistency** menu.

SIMOTION SCOUT checks, for example, whether all technology objects have been configured and that the source files have been compiled without errors.

To compile all programs automatically before a download and to check the consistency, the **Compile all programs before loading** and **Check consistency before loading** checkboxes must be activated via **Options > Settings** on the **Download** tab.

For further information, please refer to the online help for SIMOTION SCOUT.

Archiving and backing up projects on memory cards

Procedure

In SIMOTION SCOUT, you can back up your project to the memory card as a *.zip file.

Proceed as follows to archive the SIMOTION project on the memory card:

1. Open SIMOTION SCOUT and select the **Project -> Archive -> Normal...** menu command.
2. In the **Archive** dialog, select the SIMOTION project and save it to your drive (PG/PC).
3. Open the project.
4. Go online with SIMOTION.

5. In the project navigator, select the SIMOTION device and execute the **Target system -> Load -> Save archived project on card ... -> Normal ...** or **Reduced ...** menu command (see below).
6. In the dialog that is displayed, select the project and click **Open**. This saves the project to the CompactFlash Card as Project.zip in the directory USER\SIMOTION\HMI\PRJLOG.

Note

If you want to load the current project from the card, select the **Target system > Copy archived project from card to PG/PC...** menu command.

Prerequisite is that you have backed up the project with **Save archive project on card...** each time a change was made.

Reducing the project archive

If, for example, you want to send a project as an e-mail, the normal archived and zipped archives are too large.

You can influence the archiving of projects with the **Project > Archive > Reduced ...** function.

- Remove data from the archive to reduce the file size.
- Divide the archive into packets, so that you can create several ZIP files that are combined again when dearchiving.

For further information, please refer to the online help for SIMOTION SCOUT.

Additional references

Detailed information on loading data to the target device can be found in the *SIMOTION SCOUT Basic Functions* Function Manual.

Exporting and importing a project in XML format

A log of the export or import is displayed in the **XML export/import status display** tab in the detail view. The XML export log also contains a link to the exported file. Double-click this link to view the exported project data in the Internet browser.

Note

Projects are exported and imported version-neutral. However, if a project has version-specific properties, related errors may occur following import into another SCOUT version, e.g. when compiling ST programs.

Exporting project/objects in XML format

To export the entire project data in XML format:

1. Select **Project > Save and export**. The **Export Project** window with the **XML export/import status display** tab opens.
2. Select a target directory by clicking the **Browse** button. If you do not change the path, the export files are saved in the current project folder as standard. See also "Export of projects".
3. Click OK to confirm.
   The files in the target directory are deleted and the export of the project data is started. On completion of export, the successfully completed export and the target path are displayed in the XML export/import status display tab of the detail view.
4. Click the link silhouetted in blue to obtain more precise information about the exported project.

Importing an XML file

Select the file of the technology object / device in XML format to be imported to a new project. As import file, always select the XML file which has the name of the technology object / device. Normally the exported file is displayed in this field so that you only have to perform the following steps when you want to import another file.

To select the import file:

1. Click **Browse** to the right of the text field. A window opens.
2. Select the XML file that is to be imported.
   Only a technology object that is completely available can be imported. Always select the XML file which has the name of the previously exported technology object as the import file. If it is not possible to import the selected file, the import is aborted.
3. Click **Open** to confirm. The window closes and the source path is displayed.

Additional references

Please refer to the online help on this subject

Searching in the project

In the open project, you can search all the project data for variables or any text.

If you select a variable search, you can also search within the ST sources. All global and local variables at the declaration and use points are recognized.

Open the dialog using **Edit > Search in project...** on the menu bar or by using the shortcut **Ctrl + Shift + F**.

The results are displayed in the Search results tab of the detail view.

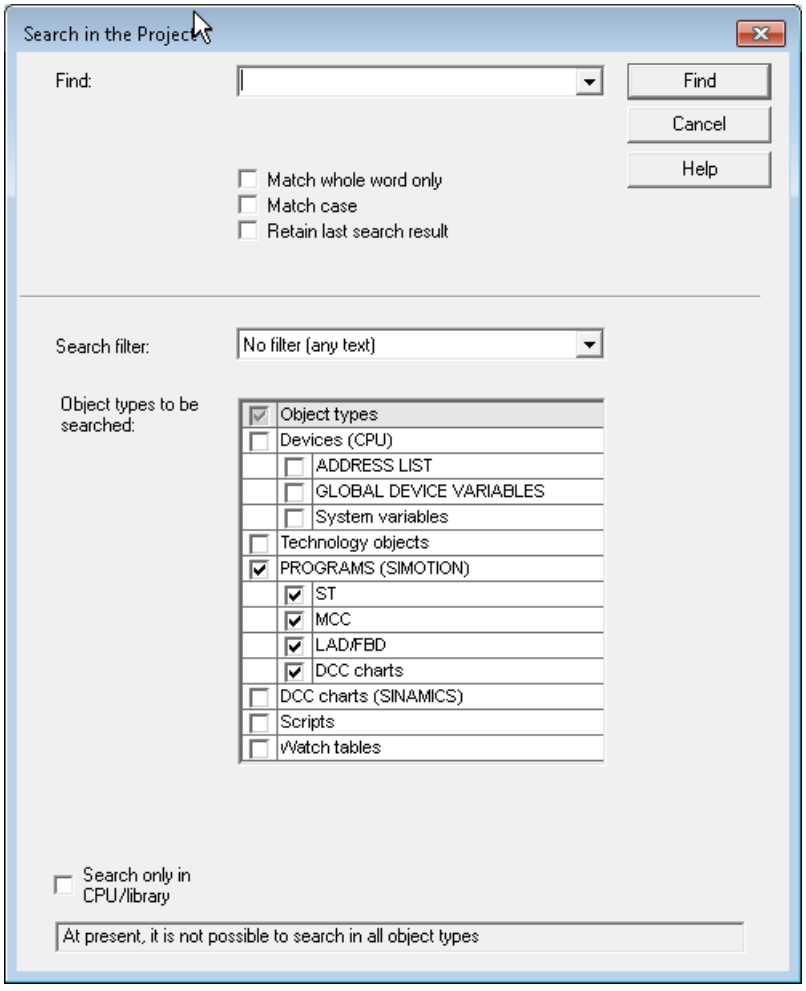

Figure 3-129 Searching in the project

Searching in CPU/Libraries only

If the "Search only in CPU/Library" checkbox is activated, a selection list of all the CPUs and user-defined libraries in the project appears. You can select one to search in this CPU/Library only.

For more information regarding this topic, see the online help.

Local search

You can search locally for a specific text in the various editors and the declaration tables. To start searching locally, open the search function with the **Ctrl+F** shortcut key while the current focus is on an editor (e.g. MCC) or the editor window for global and unit-global declarations and connections.

The *SIMOTION MCC Motion Control Chart Programming and Operating Manual* contains further information on local searches.

Replacing in the project

The **Replace in project** function is based on the **Search in project** function.

Open the dialog using **Edit > Replace in project...** on the menu bar or with the shortcut **Ctrl + Shift + G**.

When you carry out a replacement, both the results found and the replacement term are displayed in the "Search result" tab of the "detail view". The text can be edited again here.

Use the **Replace** button to replace all search results selected using the checkbox.

Boundary conditions:

- Only text can be entered.
- Replaced texts cannot be undone.

More information on this topic is available in:

- Online help.

Local replace

You can search locally for a specific text in the various editors and the declaration tables, and replace this text with freely selected text. To start the local replacement process, select the **Ctrl +H** shortcut key while the current focus is on an editor (e.g. the MCC editor) or the editor window for global and unit-global declarations and connections.

Printing projects

You can print various parts of a project or view them in the print preview in order to, for example, document settings, data, etc. The part to be printed depends on the element selected in the project navigator or the window active in the working area.

- An element is selected in the project navigator or a window is active in the working area. The data of the associated technology object, MCC chart, etc. is printed.
- The detail view is active. The data of the active tab of the detail view is printed.
- The project is selected in the project navigator. All data of the project (e.g. programs, execution system, technology objects) is printed.

Note

If you select **Print** or **Print preview** in the **Project** menu, the print dialog or the print preview is displayed immediately. If you select the context menu for **Print** or **Print preview** of the selected element in the project navigator, a window is displayed in which you can activate the components to be printed. If, for example, you only want to print certain parts of a technology object, select **Print** in the context menu.

For further information, please refer to the online help for SIMOTION SCOUT.

3.3.6.4 Configuring devices

Adding a SIMOTION device

You have created a project in SIMOTION SCOUT. The project navigator on the left of the SIMOTION SCOUT workbench is open. To insert a device, double-click the **Insert SIMOTION device** entry below the name of your project in the project navigator. The following dialog opens:

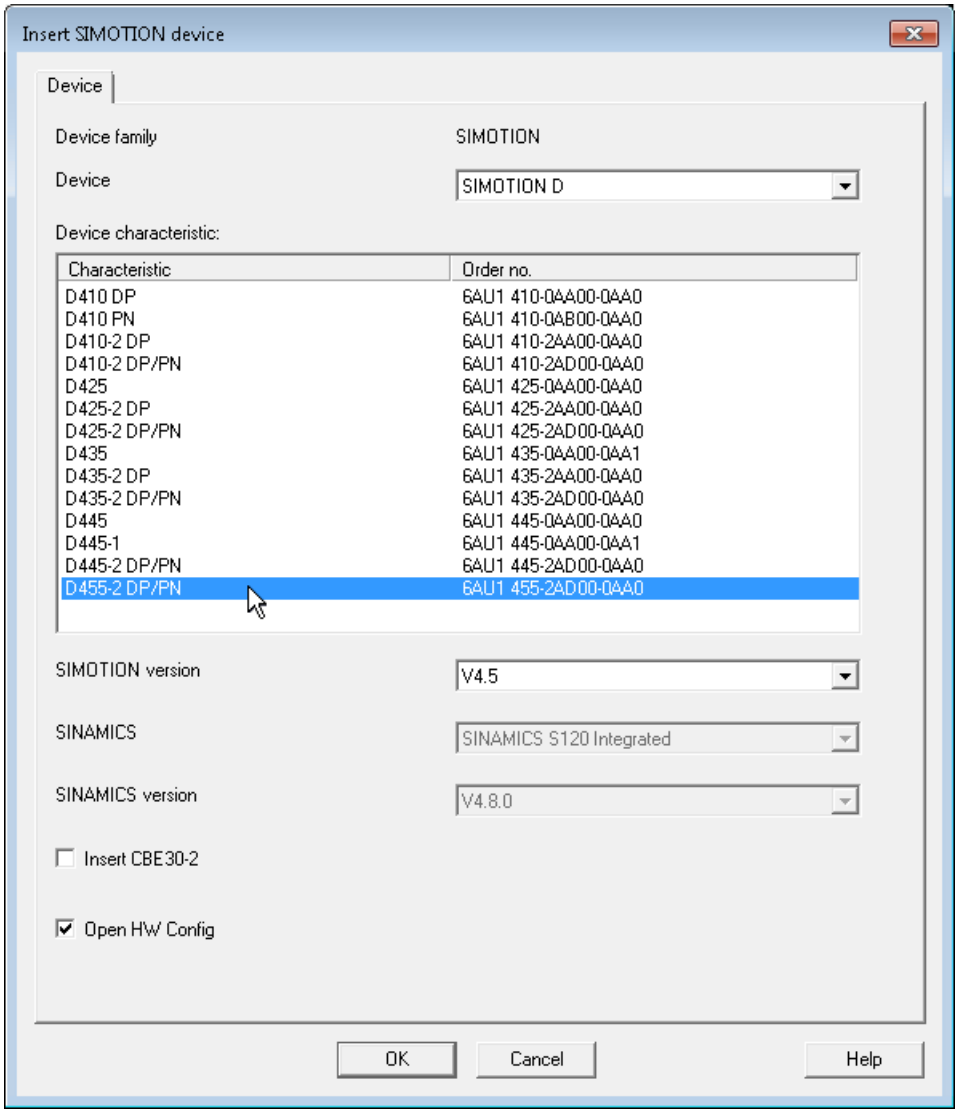

Figure 3-130 Insert SIMOTION device

Select the device platform you are working with at **Device**. The characteristics of the relevant platform then appear under **Device characteristic**.

At **SIMOTION Version**, select the firmware version of the device used.

Note

The selected firmware version must match the firmware version on the memory card of the SIMOTION device. Otherwise, you will receive an error message when going online with the device.

If the **Open HW Config** option is selected, the hardware configuration (Page 303) opens after the device has been inserted. Click **OK** to confirm.

Once you have created a SIMOTION device in the project via the **Insert SIMOTION device** element, the hardware configuration (**HW Config**) opens automatically.
In HW Config, you inform the SIMOTION system which hardware is present; for example:

- Type of the SIMOTION device
- Type of the I/O modules
- Type of the drives

In addition, you also specify which parameters the SIMOTION system should use, e.g.:

- Configuration of the SIMOTION device
- Configuration of the PROFIBUS/PROFINET
- Assignment of the hardware to PROFIBUS/PROFINET

The following sections explain how to use the HW Config tool:

- How to insert objects from the **hardware catalog**.
- How to edit objects.
- How to replace or delete objects.

Starting HW Config

HW Config can be started, e.g. to add a drive to the PROFIBUS.

To start HW Config:

- Double-click the appropriate SIMOTION device in the project navigator or
- Select the appropriate device in the project navigator and confirm your selection in the **Open HW configuration** context menu or
- Highlight the appropriate device in the project navigator and click **Edit > Open object** in the menu bar.

The HW Config program

The HW Config program is displayed as follows:

- A **hardware catalog** window
- A working window that is split into two:
  - In the upper half, you can see the rack or station frame with the CPU already inserted automatically in slot 2 (example for C240).
    Insert the objects from the hardware catalog and edit them here.
  - In the lower half, you can see detailed information about the selected objects.

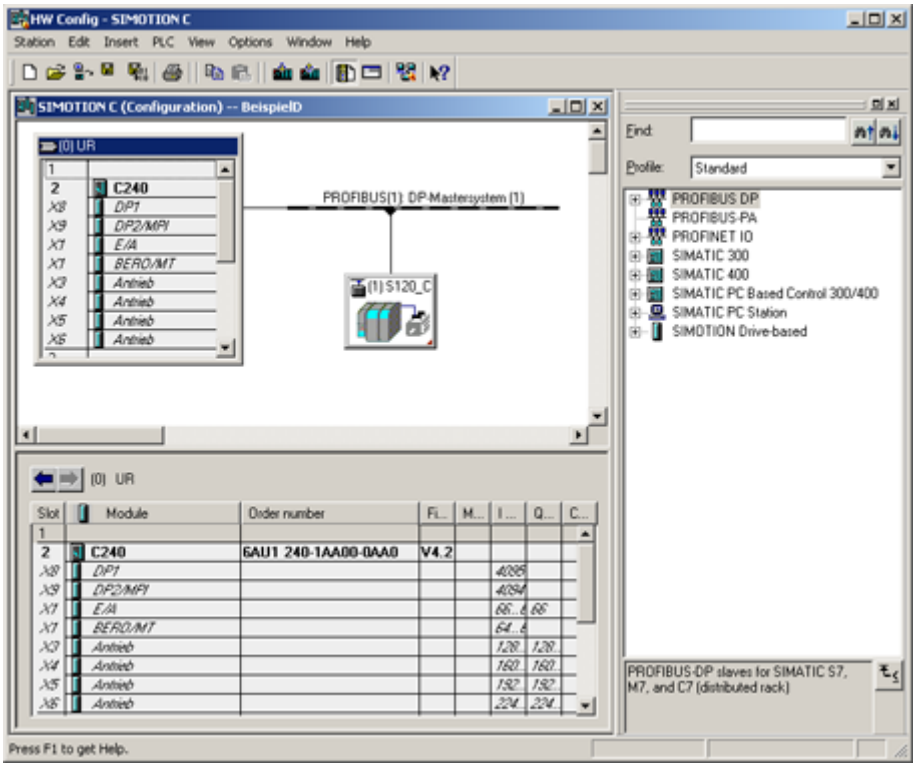

Figure 3-131 HW Config with opened hardware catalog and the CPU previously inserted in the module

HW Config: Opening the hardware catalog

You can open the hardware catalog in the following ways:

- Select the **Insert > Insert object** menu.
- Select the **View > Catalog** menu.

For further information, see Section Inserting a drive (Page 311).

SIMOTION devices in the hardware catalog

You can find the SIMOTION devices in the corresponding directories of the hardware catalog in HW Config.
With SIMOTION D, the SINAMICS version is selected in addition to the SIMOTION version. The SIMOTION version determines whether one or more SINAMICS versions are available.

Adding interfaces

After you have inserted the SIMOTION device, the dialog for configuring the interfaces opens

Note

With SIMOTION D, the PROFIBUS subnet **PROFIBUS Integrated DP master system** is created and configured automatically. The user may neither configure nor select it!

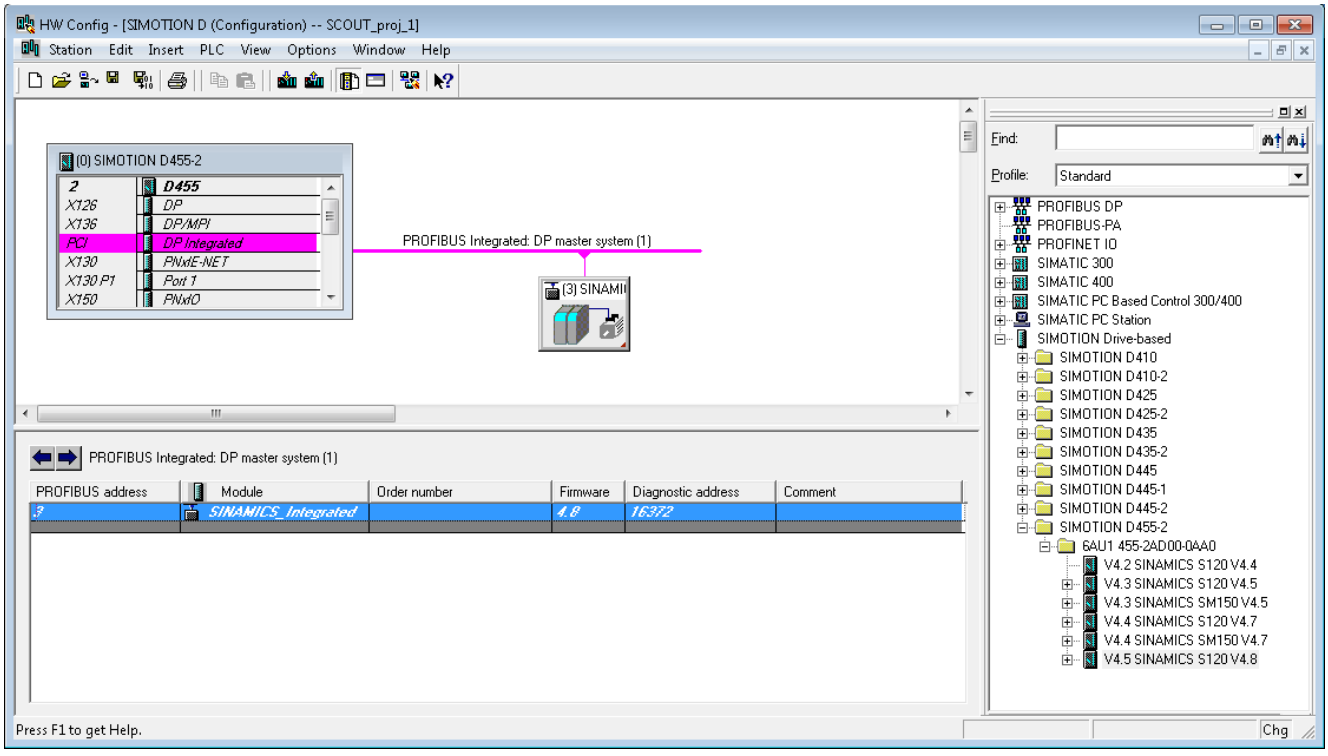

Figure 3-132 Hardware configuration of a D4x5

Detailed information on the configuration of the SIMOTION device is contained in the corresponding documentation for the SIMOTION devices.

Selecting technology packages

The technology packages (e.g. TP CAM, TP PATH, DCBlib) are available in various versions for installation purposes.

You can only use the functions of the technology objects selected if the technology objects are available in the target system. You can select the technology packages and their product versions (as well as the service packs and hotfix versions) for each SIMOTION device.

In the **Select Technology Packages** window, you can adopt a more selective approach when choosing the technology packages you want to use. To open this window, right-click a SIMOTION device in the project navigator. Then select the **Select Technology Packages** command in the context menu.

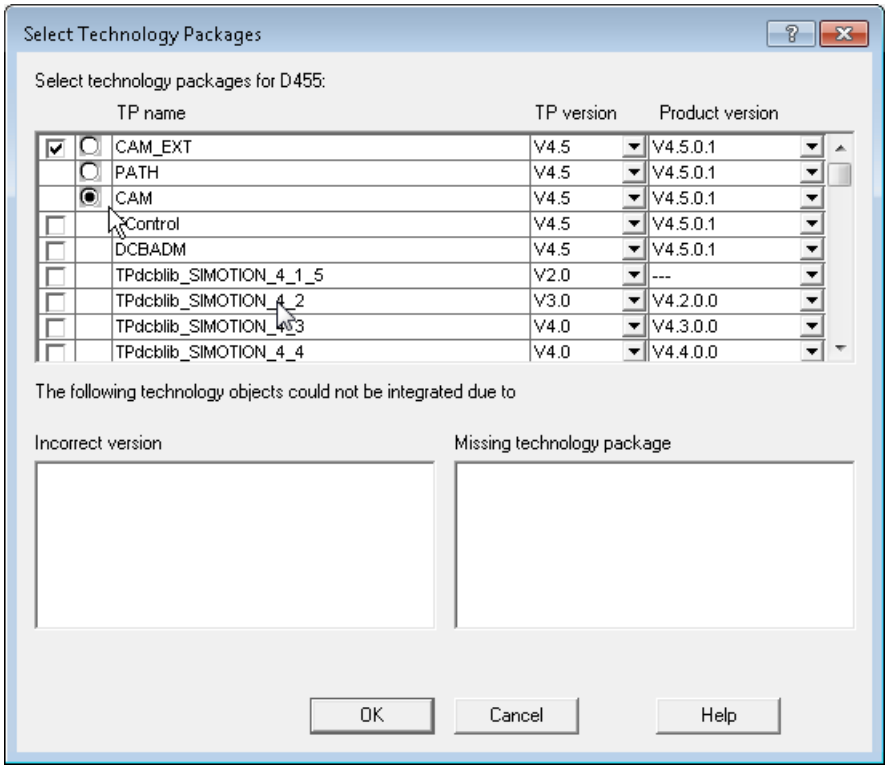

Figure 3-133 Selecting technology packages

Note

Device diagnostics can provide information on which technology package product version has been loaded to a CPU.

Loading technology packages to the target device

Technology packages are only loaded to the target device if no technology package has been loaded so far. If a technology package version changes, the technology package must be explicitly reloaded to the target device. Proceed as follows:

1. Select **Project > Download to target system** in SIMOTION SCOUT.
2. Click **Additional CPU options** in the **Download to target system** dialog.

3. Select the option **Replace product versions of the technology packages**.
4. Click **OK** to confirm.

For further information, please refer to the online help for SIMOTION SCOUT.

Connecting to the target system

Installing the interface card

Installing the interface card in the PG/PC

Communication between a SIMOTION device and a PG/PC requires an interface card for PROFIBUS or an Ethernet interface. PGs already have both, but PCs may need an interface card to be installed.
The PG/PC is used for configuration, parameter assignment, programming, and testing.

- Install the interface card in the PG/PC according to the manufacturer's installation instructions.
- Install the appropriate drivers on the PG/PC.
- Connect the interface card to the interface of the SIMOTION device indicated below using a suitable cable.

Table 3-27 Interface assignment for SIMOTION devices

SIMOTION device	Interface	As supplied
SIMOTION C230-2 / C240	X8 DP1	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X9 DP2 / MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X7 (Ethernet)	IP address: 169.254.11.22 Subnet: 255.255.0.0
SIMOTION C240 PN	X8 DP1	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X9 DP2 / MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X7 (Ethernet)	IP address: 169.254.11.22 Subnet: 255.255.0.0
	X11 (1 PROFINET interface with 3 ports)	Supplied without IP address and subnet
SIMOTION P350	X101 DP1	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X102 DP2 / MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	Ethernet	IP address: 169.254.11.22
SIMOTION P320-4	X1 Onboard Ethernet 1	Access to/from Windows: IP address: 169.254.11.21 Subnet: 255.255.0.0 Access to/from SIMOTION P Runtime: IP address: 169.254.11.22 Subnet: 255.255.0.0
	X3 PROFINET onboard interface with 3 ports	Supplied without IP address and subnet

SIMOTION device	Interface	As supplied
SIMOTION D4x5	X126 DP1	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X136 DP2 / MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X120 IE1/ OP (Ethernet)	IP address: 192.168.214.1 Subnet: 255.255.255.0
	X130 IE2/ NET (Ethernet)	IP address: 169.254.11.22 Subnet: 255.255.0.0
	With optionally inserted CBE30: X1400 (one PROFINET interface with 4 ports)	Supplied without IP address and subnet
SIMOTION D4x5-2 DP	X126 DP	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X136 DP/MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X120 P1 PN/IE-OP (Ethernet)	Supplied without IP address and subnet
	X127 P1 PN/IE (Ethernet)	IP address: 169.254.11.22 Subnet mask: 255.255.0.0
	X130 P1 PN/IE-NET (Ethernet)	Supplied without IP address and subnet
SIMOTION D4x5-2 DP/PN	X126 DP	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X136 DP/MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X127 P1 PN/IE (Ethernet)	IP address: 169.254.11.22 Subnet mask: 255.255.0.0
	X130 P1 PN/IE-NET (Ethernet)	Supplied without IP address and subnet
	X150 P1-P3 PN (1 PROFINET interface with 3 ports)	Supplied without IP address and subnet
	With the optional inserted CBE30-2: X1400 (1 PROFINET interface with 4 ports)	Supplied without IP address and subnet
SIMOTION D410 DP	X21 DP	PROFIBUS address 2, baud rate 1.5 Mbit/s
SIMOTION D410 PN	X200 and X201 (1 PROFINET interface with 2 ports)	Supplied without IP address and subnet
SIMOTION D410-2 DP	X21 DP/MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X24 DP	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X127 P1 PN/IE (Ethernet)	IP address: 169.254.11.22 Subnet mask: 255.255.0.0
SIMOTION D410-2 DP/PN	X21 DP/MPI	PROFIBUS address 2, baud rate 1.5 Mbit/s
	X127 P1 PN/IE (Ethernet)	IP address: 169.254.11.22 Subnet mask: 255.255.0.0
	X150 P1, P2 (1 PROFINET interface with 2 ports)	Supplied without IP address and subnet

Set PG/PC interface

Setting interfaces

Proceed as follows:

1. Start SIMOTION SCOUT.
2. Select the **Options > Set PG/PC interface** menu.
   The **Set PG/PC Interface** window opens.

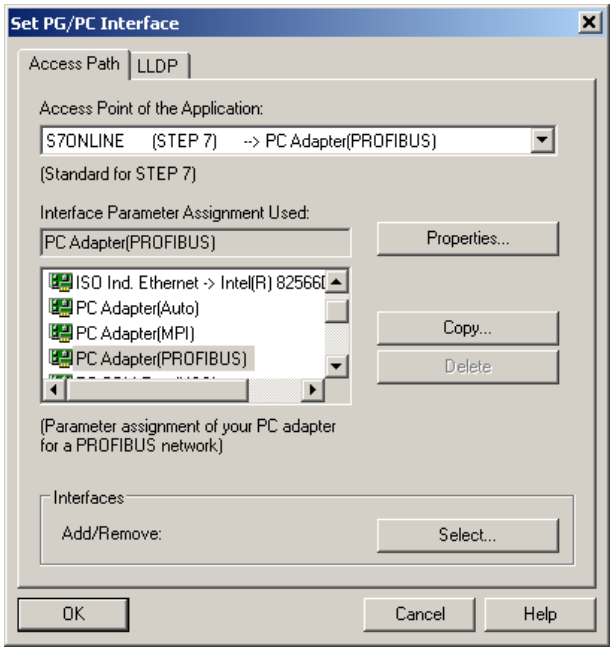

Figure 3-134 Set PG/PC interface (example)

3. Select the access point of the application.
4. Click **Select**.
   The **Install/Remove Interfaces** window opens.

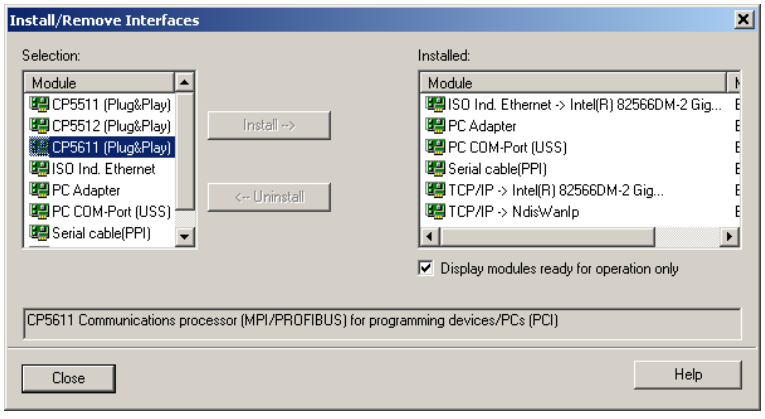

Figure 3-135 Installing/uninstalling interfaces

5. Select the module to be installed.
6. Click **Install**.

7. Click **Close** to exit the dialog.
8. Confirm the settings by clicking **OK**.

Installing/uninstalling other interfaces

Proceed as follows to install or uninstall additional interfaces:

1. In the **Set PG/PC Interface** window, select **S7ONLINE** as the access point of the application.
2. Click **Select** at **Add/remove interfaces**.
3. In the left-hand field, select the interface that you want to install, and click **Install**.
   Or select the interface that you want to uninstall in the right-hand field and click **Uninstall**.
4. Click **Close**.
5. Select the interface to be used in the **Used interface parameterization** field.
   The list of the used interface parameterization will be taken from SIMATIC STEP 7.
   With the PC Adapter (Auto) setting, the interface to which the PG/PC is connected is examined. This function automatically determines the current parameterization of the respective interface.
   Detailed information on the individual interfaces of the SIMOTION devices can be found in the relevant commissioning manuals.
6. Click **Properties** to parameterize the interface.
7. Click **OK** to confirm.

Specifying the access point

Selecting the access point

The addresses for a device to go online depend on the access point **S7ONLINE** or the alternative access point **DEVICE**.

Depending on the selected access point, you can go online via different interfaces.

Proceed as follows to select the access point:

1. Open the project.
2. Select the SIMOTION device in the project navigator.
3. Right-click and select **Properties...** in the context menu.
   The **Properties - [CPU]** window opens.
4. Go to the **Device / access point** tab. You can select the access point and specify the addresses.
5. Click **OK** to close the dialog.

Communication via PROFIBUS DP

PROFIBUS is a powerful, open, and robust bus system, which guarantees trouble-free communication. The system is fully standardized, which enables trouble-free connection of standardized components from a variety of manufacturers. Configuration, commissioning, and troubleshooting can be carried out from any side. This results in user-defined communication relationships that are very versatile, simple to implement, and easy to change.

The high-speed, cyclic exchange of data with field devices (distributed I/O) is carried out via the PROFIBUS DP protocol. Expansion of the protocol to include isochronous mode also integrates the drive components into communication via PROFIBUS DP. The individual components can be connected via the integrated interfaces, connections, interface modules or communications processors.
Important information on communication with PROFIBUS is contained in the following catalog: SIMOTION, SINAMICS S120 and Motors for Production Machines, PM 21 Catalog

The following PROFIBUS DP subnet applications are possible:

- PROFIBUS DP isochronous
  Compatible extension to the standard PROFIBUS DP:
  - Equidistance (constant synchronous bus cycle clock) enables synchronized time slices for master/slave applications.
  - Data exchange broadcast enables slave-to-slave communication.

  Digital drives (e.g. SINAMICS, MICROMASTER 4xx, ...) can be connected via PROFIBUS DP. In order to be able to operate the SIMOTION device with two isochronous PROFIBUS DP subnets, isochronous mode and the same bus cycle must be set. The cycle clock of the subnet of the second PROFIBUS interface is synchronized to the cycle clock of the subnet of the first PROFIBUS interface.
  If the bus cycle does not agree, the second PROFIBUS interface of the SIMOTION device will be operated as a PROFIBUS DP subnet.
- PROFIBUS DP (MPI)
  Standard PROFIBUS DP with DP-V0 and optional DP-V1 or DP-V2 functionality.
  - For the connection of distributed I/Os
  - For the connection to a higher-level automation system
  - For the connection of HMI devices
  - For the connection to the SCOUT engineering system

Ethernet communication

SIMOTION devices can also be connected to a PG/PC via Industrial Ethernet. Industrial Ethernet is a communication network with a transmission rate of 1 Gbit/s.

For additional information, refer to the Manual "SIMATIC NET Industrial Twisted Pair and Fiber Optic Networks." See the *SIMOTION Documentation Overview* for the Article No.

Examples for the use of Industrial Ethernet:

- For the connection of HMI devices
- For connection to the SCOUT engineering system
- For communication via UDP (User Datagram Protocol)
- TCP/IP
- IT DIAG

Communication via PROFINET

SIMOTION devices can be connected to a PROFINET subnet via interface modules or the onboard PROFINET interface. With PROFINET IO IRT/RT, IT services can be performed in parallel to realtime communication via an Ethernet cable. PROFINET IO supports parallel operation of:

- IRT (isochronous realtime Ethernet)
- RT (realtime Ethernet)
- TCP/IP, UDP, http ... (standard Ethernet services)
- For mixed operation of IRT and RT it has to be observed that the IRT-compatible devices must form an IRT domain, i.e. there must not be any non-IRT devices on the data transmission link between the IRT devices.

- SIMOTION C Operating Instructions
- SIMOTION Communication System Manual

and the SIMOTION SCOUT online help.

Inserting a drive

Drives with SIMOTION

Note the following:

Drives must be differentiated between:

- Drives that are connected to PROFIBUS/PROFINET
- Drives that are connected directly to the SIMOTION device

The following applies to drives connected to PROFIBUS/PROFINET:

- Only drives that meet the requirements of PROFIdrive profile V3.0 can be connected:
  - SINAMICS
  - MICROMASTER (PROFIBUS only)
  - COMBIMASTER 411 (PROFIBUS only)
  - MASTERDRIVES (MC, VC) (PROFIBUS only)
  - SIMODRIVE 611U (PROFIBUS only)
  - SIMODRIVE POSMO (CA, CD, SI) (PROFIBUS only)
  - ADI4 (analog drive interface for 4 axes)
  - IM 174 (interface module for 4 axes)
- These drives are taken into the hardware configuration.
- The drives of the SINAMICS and MICROMASTER drive families can be configured, assigned parameters, and commissioned with SIMOTION SCOUT.

All analog drives can be connected via one of the four analog interfaces on the SIMOTION C230-2/C240 or via the ADI4 and IM174 PROFIBUS module.

- These drives are inserted into the project via the hardware configuration.
- The SIMOTION device requires only the actual values from the encoder at the input and issues the setpoints at the analog output.
- The drives must be configured, assigned parameters, and commissioned directly on the corresponding device.

With SIMOTION D, drives on SINAMICS Integrated are not inserted via the HW Config. For more detailed information, see the *D Commissioning and Hardware Installation Manual*.

Inserting a SINAMICS drive on PROFIBUS DP

Initial situation

- The SIMOTION device is created in SIMOTION SCOUT
- A PROFIBUS subnet has been configured, for example, as **PROFIBUS DP isochronous** (by selecting **Edit > Isochronous operation**)
- The subnet interface is the master on this subnet of the SIMOTION device

Proceed as follows:

1. Open the **PROFIBUS DP** folder in the hardware catalog.
2. Open the **SINAMICS** subfolder.

3. Use drag-and-drop to drag an entry to the isochronous PROFIBUS subnet of the SIMOTION device.
4. Double-click the SINAMICS drive **Properties** to open them and set a cycle clock.

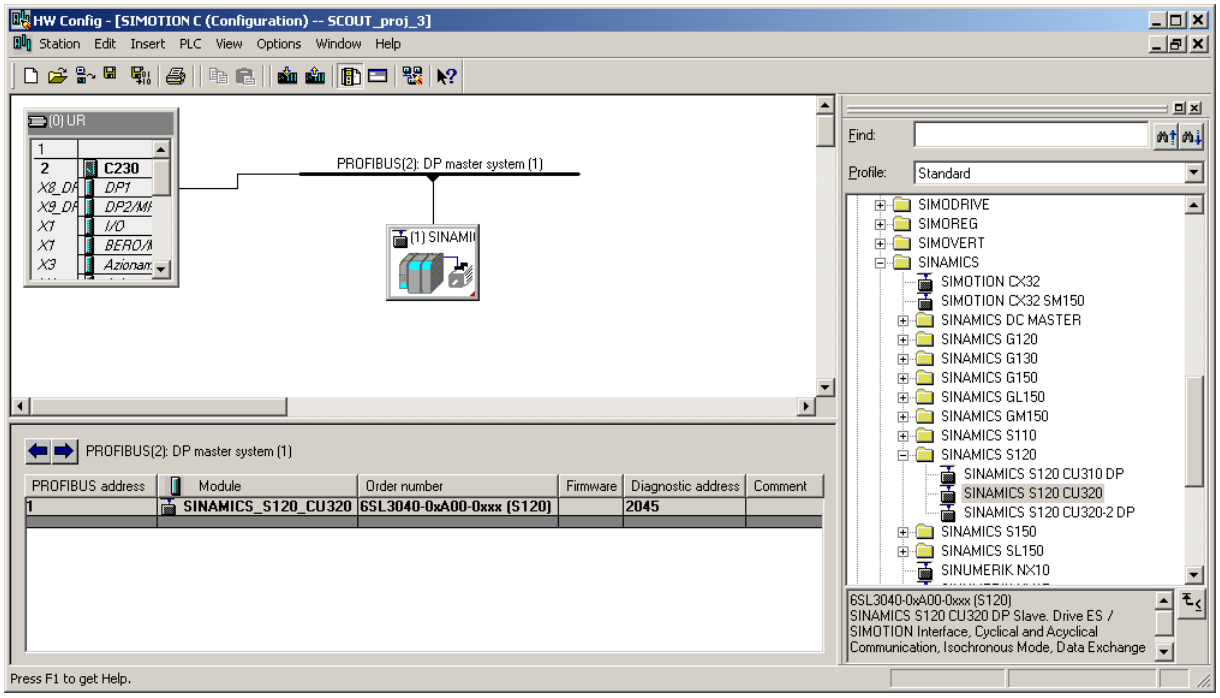

Figure 3-136 Inserting a SINAMICS drive

Inserting a SINAMICS drive on PROFINET IO

Initial situation

- The SIMOTION device is created in SIMOTION SCOUT
- A PROFINET IO system and an Ethernet subnet are configured

Proceed as follows:

1. Open the HW Config of the SIMOTION device.
2. Open the **PROFINET IO / Drives / SINAMICS** folder in the hardware catalog.

3. Select the SINAMICS S120 CBE20 drive.
4. Use drag-and-drop to drag the drive to the PROFINET IO subnet of the SIMOTION device.

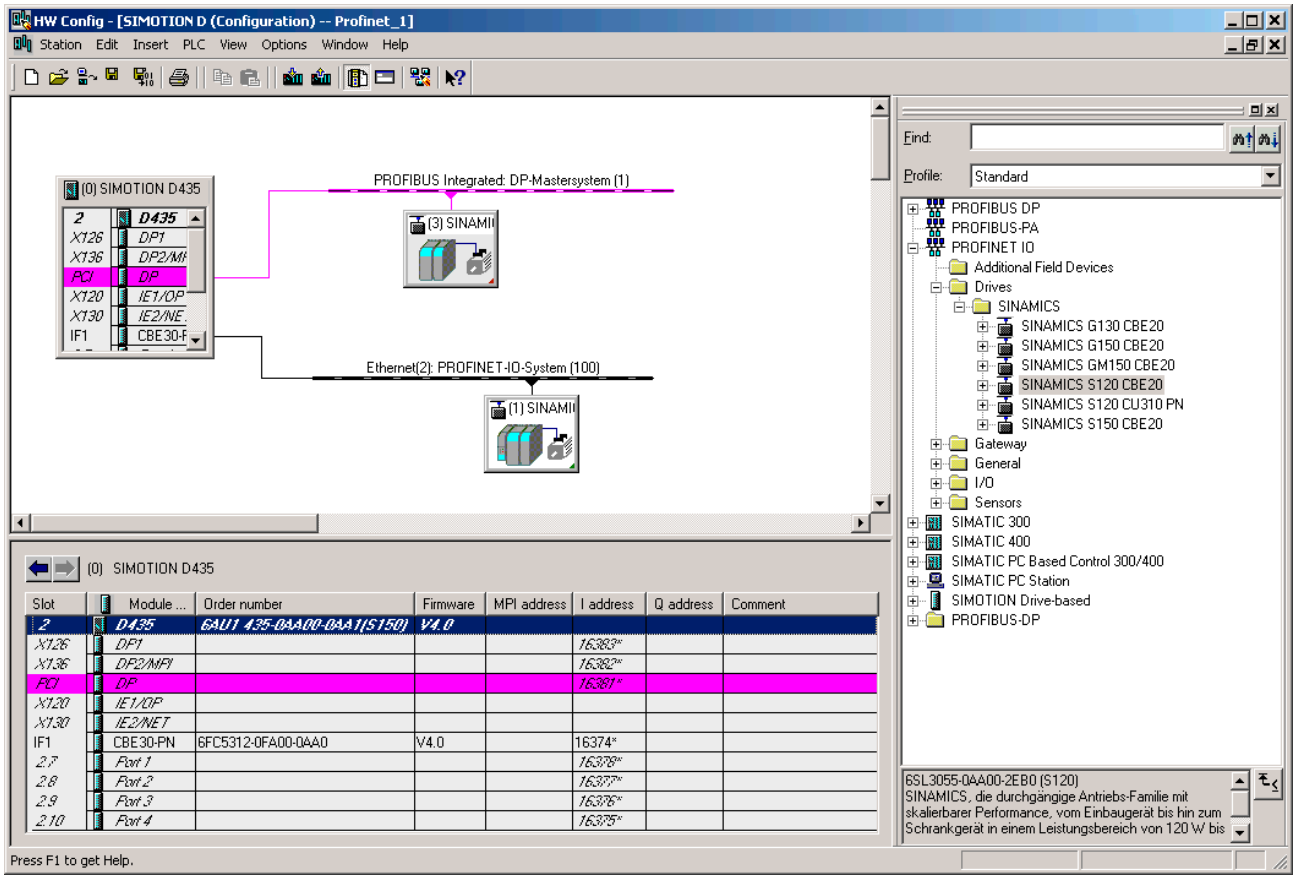

Figure 3-137 Inserting a SINAMICS drive with PROFINET

Configuration for PROFINET IRT

Information for the configuration of PROFINET IRT is contained in the Communications System Manual, Inserting and Configuring SINAMICS S120 section, as well as at the FAQ - SIMOTION & SINAMICS: Distributed synchronous operation and isochronous mode via PROFINET IRT (https://support.industry.siemens.com/cs/de/en/view/38486079)

Commissioning the drives

Drives that can be commissioned with SIMOTION SCOUT

You can use SIMOTION SCOUT to assign parameters to the following drives:

- SINAMICS
- MICROMASTER
- COMBIMASTER 411

For all other drives or for third-party drives, the appropriate commissioning program for the specific drive must be used. If required, you must commission these drives directly on the drive.

Table 3-28 Commissioning of various drives

Drive	Connection	Commissioning
SINAMICS S110, S120, S150, G110 CPM100, G120, G130, G150, GM150	PROFIBUS DP or analog interface	With SIMOTION SCOUT or STARTER
SINAMICS S120	PROFINET	With SIMOTION SCOUT or STARTER
MICROMASTER 410	analog interface	With SIMOTION SCOUT or DRIVE ES Basic or STARTER
MICROMASTER 420/430/440	PROFIBUS DP or analog interface	With SIMOTION SCOUT or DRIVE ES Basic or STARTER
COMBIMASTER 411	PROFIBUS DP or analog interface	With SIMOTION SCOUT or DRIVE ES Basic or STARTER
SIMODRIVE 611U	PROFIBUS DP or analog interface	With SIMOCOM U or DRIVE ES Basic
MASTERDRIVES MC, VC	PROFIBUS DP or analog interface	With SIMOVIS or DRIVE ES Basic
SIMODRIVE POSMO CA; CD, SI	PROFIBUS DP	With SIMOCOM U or DRIVE ES Basic
Third-party drives	Analog interface or PROFIBUS DP according to PROFIdrive profile V3.02	With commissioning tool supplied by the manufacturer

Note

If the Drive-ES Basic commissioning program is installed, it can be called by SIMOTION SCOUT in the project navigator via **Commissioning**.

SINAMICS S120 on SIMOTION

STARTER functionality in SIMOTION SCOUT

It is possible to parameterize drives directly with SIMOTION SCOUT. The following example describes how to insert a SINAMICS drive in SIMOTION SCOUT.

Requirements:

- SIMOTION SCOUT has been installed on the PG/PC
- A SIMOTION SCOUT has been created

Note

You can create the SINAMICS drive with PROFIBUS or PROFINET.

You must execute the following steps:

- Insert SIMOTION device
- Configure SINAMICS

Commissioning in SIMOTION SCOUT

1. Open the SIMOTION project in SIMOTION SCOUT.
2. Double-click **Insert SIMOTION device**.
3. Select a SIMOTION device.
4. Select the variant.
5. Click **OK** to confirm.
6. Select the PROFIBUS interface or Ethernet.
   If you have selected Ethernet, select the interface parameterization of the PG/PC.
7. Click **OK** to confirm.
8. With SIMOTION C and P only: Insert a SINAMICS device (see Inserting a drive (Page 311)).
9. Select **Station > Save and compile** in the HW Config and then close HW Config.
10. Open the structure tree of the SIMOTION device in the project navigator.
11. Open the structure tree of the drive (SINAMICS or SINAMICS_Integrated) in the project navigator.
12. Double-click **Configure drive unit**.
    The Configuration - Option Module window opens.
13. Run through the drive wizard.

The STARTER functionality now starts in SIMOTION SCOUT.

The configuring of the SINAMICS Integrated drive for SIMOTION D is described in the SIMOTION D Commissioning and Hardware Installation Manuals.

Note

You can insert a standalone drive (e.g. SINAMICS S120) with the "Insert single drive unit" element in the project navigator. It is commissioned using wizards in the working area of the workbench that contains the STARTER functionality.

Configuring the infeed

Overview

The integrated SINAMICS control unit only starts the drive when the infeed is ready. The project must therefore know the interface via which the drive receives the ready signal of the infeed.

Two cases must be distinguished here:

- Infeed with DRIVE-CLiQ interface
  If an infeed with DRIVE-CLiQ connection has already been created, the ready signal of the infeed (r0863.0) is automatically interconnected with "Infeed operation, p0864" of the drive when drives are inserted (only applies to drives that are attached to the same drive unit as the infeed).
  Further information about the infeed with the DRIVE-CLiQ interface is contained in the SIMOTION D Commissioning and Hardware Installation Manuals.
- Infeed without DRIVE-CLiQ interface
  If you are using an infeed without a DRIVE-CLiQ interface, e.g. a Smart Line Module, you must wire the ready signal of the infeed via terminals. The following section describes the procedure.

Configure the infeed without a DRIVE-CLiQ interface

Interconnecting the ready signal of the infeed

An infeed without DRIVE-CLiQ interface provides the ready signal (p0863.0) via an output terminal. In the project, you specify on which input (r0722) of SINAMICS Integrated the signal is active. The drive supplied by the infeed uses the signal as a ready signal (p0864).

Note

A drive on SINAMICS Integrated of a SIMOTION D can only be moved if the infeed is ready.

Requirements

- You have configured a drive.
- SIMOTION SCOUT is in online mode.

Procedure

In the next step, in order to wire the ready signal of the infeed (terminal "DO: Ready" of the infeed) with the DI 0 of the D4x5-2, proceed as follows in case you have not already established the interconnection during processing using the drive wizard:

1. Navigate in the project navigator to the **Drives** folder and double-click **Configuration** below the drive.

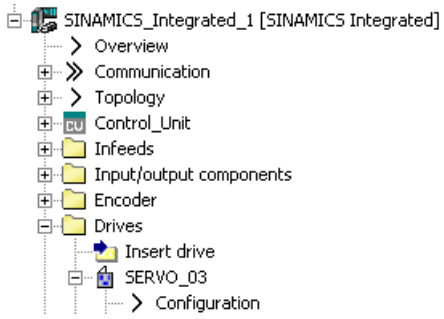

Figure 3-138 Configuring a drive

2. Click in the working area on the **Configure DDS** button with the yellow background.

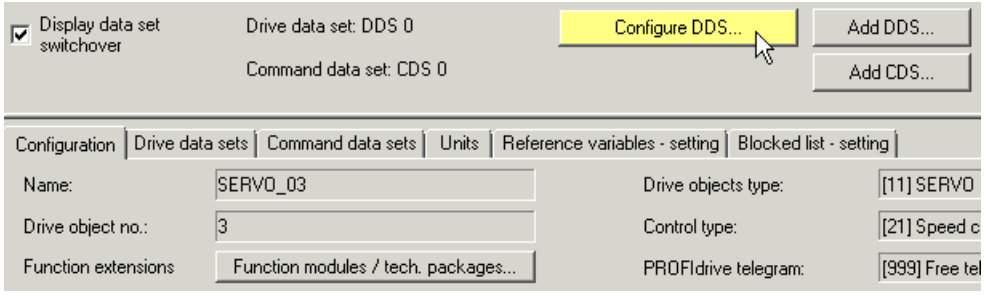

Figure 3-139 Configuring DDS

The drive wizard opens.

3. Click **Next** in the drive wizard until you reach the dialog **Configuration - SINAMICS_Integrated - BICO power unit**.

4. In the input field **p0864**, select the digital input (e.g. DI 0) to which the ready signal of the infeed is wired.

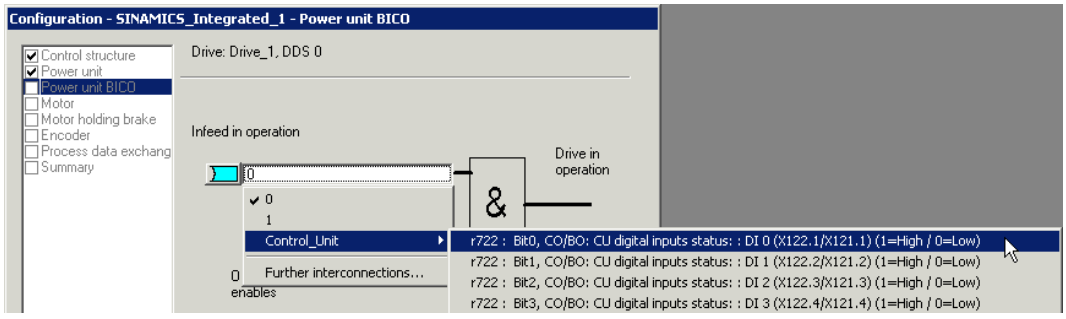

Figure 3-140 BICO interconnection

5. Click **Next**. Run through all the other dialogs without change until the final **Summary** dialog.

6. Click **Finish**.
Thus, the configuration is finished.

Testing the drive with the drive control panel

Drive control panel

The drive control panel is used to control and monitor individual drives. With the drive control panel, you can traverse drives and can:

- Test each part of the system individually before the drives are traversed in a coordinated manner by means of a program.
- Test in a fault situation whether the individual drives can be traversed by the drive control panel at all, or whether there are already problems here.

⚠ WARNING

This software may be used only when the associated safety instructions are observed! The non-observance can cause injury to persons or damage to material!

The function is released exclusively for commissioning, diagnostic and service purposes. The function should generally only be used by authorized technicians. The safety shutdowns from the higher-level control have no effect.

The **Stop with preconfigured braking ramp** function is not guaranteed in all operating states. Therefore, there must be an EMERGENCY STOP circuit in the hardware. The appropriate measures must be taken by the user.

Requirements

- You have created and fully configured a drive in the project.
- You have stored and compiled the project. The project is consistent.
- SIMOTION SCOUT is in online mode.
- The project with the drive parameterization has been loaded to the target system.

Opening the drive control panel

To open the drive control panel, proceed as follows:

1. In the project navigator, navigate to the drive unit and open the **Drives** folder.
2. Open the **Commissioning** entry and double-click **Control panel**.
   The drive control panel opens in the detail view.

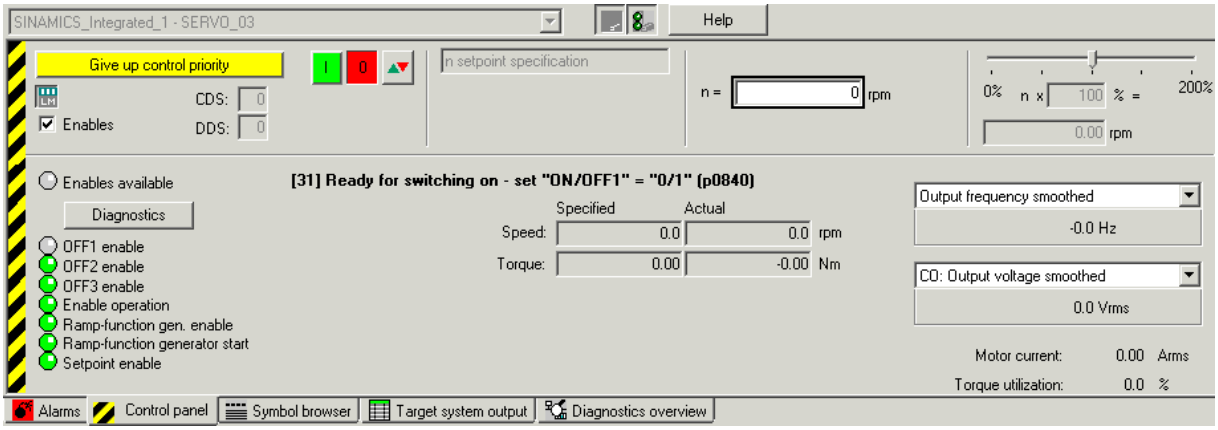

Figure 3-141 Drive control panel

Using the drive control panel

Assuming control priority

To assume control priority, proceed as follows:

1. Click the  button to show the control area in order to test the motor speed specified at **n=**.
2. Click the  button to show the diagnostics area in order to display and evaluate the defined parameters.
   You can determine the status of the required enables by clicking the **Diagnostics** button.
3. In the selection list, select the drive that you want to control or monitor using the PG/PC, **SINAMICS_Integrated_1 - SERVO_03** in the example.
4. Specify the parameters that you want to display in the selection lists on the bottom right-hand side of the diagnostics area. The values are displayed below.

5. Select **Assume control priority** to establish the connection to the PG/PC. The **Assume control priority** dialog is displayed.

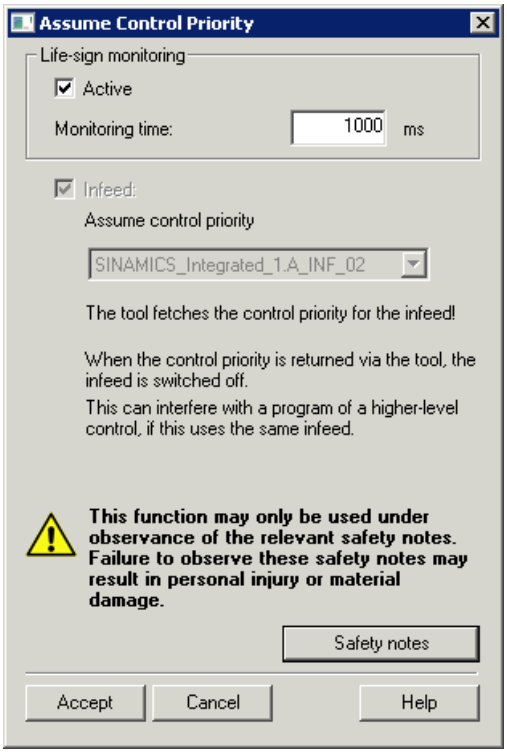

Figure 3-142 Assuming control priority

6. Consider the following infeed options for the type of connection you are using.
   - If you are using an infeed with a DRIVE-CLiQ interface, select the infeed for which the control priority is to be assumed at **Infeed** in the **Assume control priority** dialog. Activate the **Infeed** option if the infeed control priority is to be assumed and activated.
   - If you are using an infeed without a DRIVE-CLiQ interface, you must interconnect the **Infeed operation** signal (drive parameter p0864) yourself. In this case, the dialog does not contain any fields for selecting infeed.
   - If the signal of the **Closed-loop control operation** infeed is already BICO interconnected with the drive, the infeed is specified permanently. No selection is possible in the dialog, the fields are grayed out.
7. Observe the safety regulations and confirm with **Accept**.

The PG/PC has the control priority; the button caption has changed to **Return control priority**.

Note

You can also stop the drive at any time by pressing the SPACEBAR.

Activating the infeed

To switch on the infeed, proceed as follows:

1. Click the button for more information.

Activating enables

To activate the enables, proceed as follows:

1. Activate the **Enables** option to enable the drive.
   The ON and OFF buttons and are activated and the enable states are indicated by the LEDs.
   Click the "Diagnostics" button to show any missing enables.

Testing the drive

To test the drive, proceed as follows:

1. Specify a speed setpoint in the **n=** field.
2. Use the slider to set the current speed **setpoint** in relation to the maximum speed **setpoint (100%)**.
3. Click the green switch to start the drive.
   Or click the switch to control the drive in jog mode. The motion continues as long as you keep the switch pressed.
   In the diagnostics area you can monitor the set speed/torque as well as the actual speed/ torque.

Exiting the drive control panel

To exit the drive control panel, proceed as follows:

1. Click the red button to stop the drive.
2. Deactivate the **Enables** option.
   The LEDs are grayed out.
3. Deactivate the infeed. To do this, click **Infeed on/off**.
4. Click the **Return control priority** button to return the control priority of the control panel.
5. On the menu bar, select **Project > Disconnect from target system** to switch to offline mode.

Result

The drive can be operated. The drive configuration is complete.

3.3.6.5 Creating and testing an axis

TO axis technology object

Note

You create the technology object (TO) axis in SIMOTION SCOUT TIA.

You can create the axis both in offline and online mode.

Technology objects represent the respective real objects, e.g. a position axis, in the controller.

The technology object axis offers the user a technological view of the drive and the encoder (actuator and sensor) and provides technological functions, such as communication with the drive, actual value processing, position control and positioning functionality. It executes control and motion commands and indicates states and actual values.

Requirements

If you want to insert a real axis, you require a functional drive.

If you want to insert a virtual axis, you do not require a functional drive.

Note

Virtual axis

All axis types can also be virtual axes, i.e. they do not control real drives but are used as auxiliary axes, e.g. as a leading axis for several following axes (line shaft).

Axis technologies

You can use the following axis technologies:

- Speed-controlled axis
  Motion control is performed using a speed specification without position control.
- Positioning axis
  Motions are position-controlled.
- Synchronous axis
  The synchronous axis creates a grouping of the following axis and synchronous object.
- Path axis
  The path axis type can be interconnected with a path object.
  The path object can be used to calculate and traverse a linear, circular or polynomial path in the 2D/3D coordinate system for at least two path axes and up to three path axes.

Axis wizard

SIMOTION SCOUT provides the axis wizard for creating a new axis. Using the wizard, you interconnect the TO axis with a drive.

Note

Axis wizard - restriction

The wizard can only be run through once.

Subsequent changes to the axis configuration are possible in the corresponding dialogs of the TO axis.

Configuring Axes

Procedure

To insert an axis with the axis wizard and to interconnect with drive and encoder, proceed as follows:

1. Navigate to the **AXES** folder in the project navigator and open this folder with a double-click.
2. Select **Insert axis**.
   The **Insert axis** dialog opens.

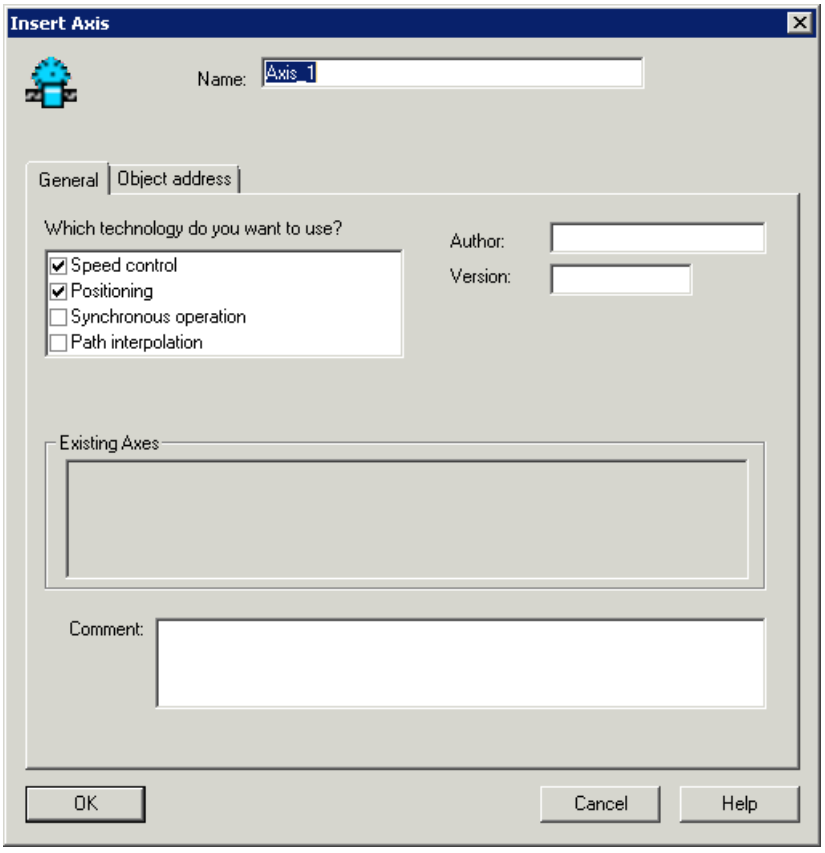

Figure 3-143 Creating an axis

3. Name the axis and select the axis technology that you want to use.
   Note here that the **Positioning** technology always requires the **Speed control** technology. Thus, this technology cannot be deactivated.

4. Click **OK** to exit the dialog.
   The **Axis configuration - Axis type** dialog opens.

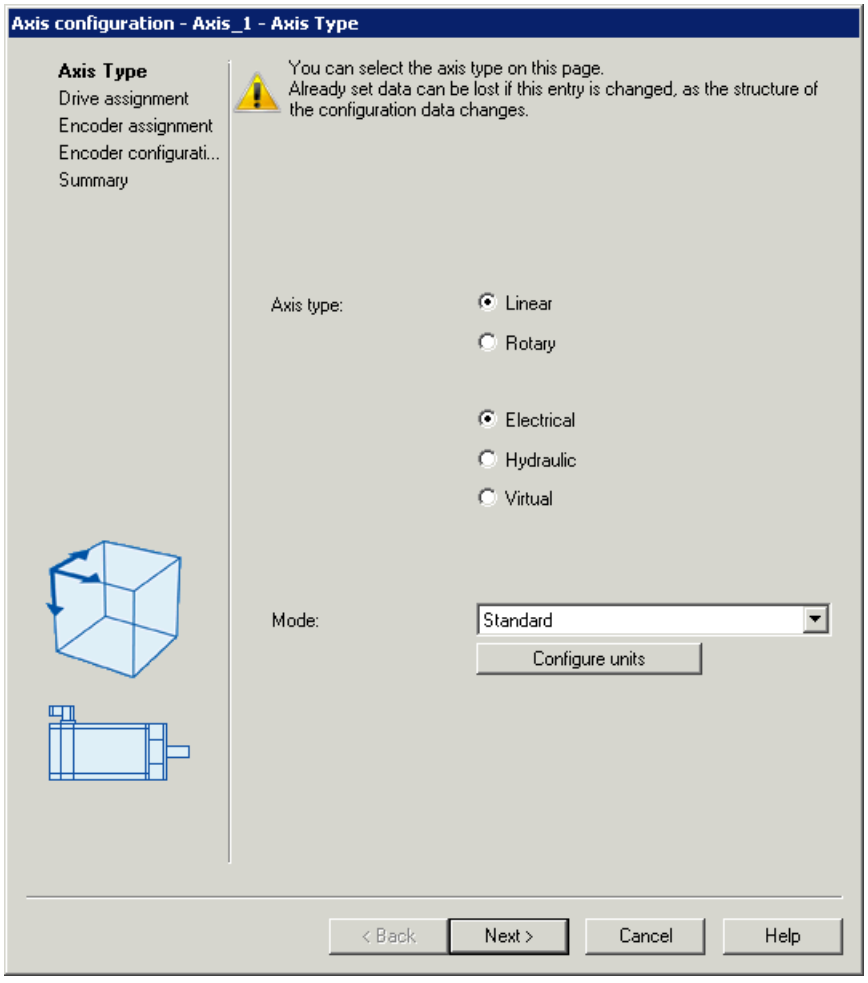

Figure 3-144 Axis configuration - defining the axis type

5. Select the axis type, and specify it. Select the mode for electric axes or hydraulic axes and confirm with **Next>**.
   The **Axis configuration - Drive assignment** dialog opens.

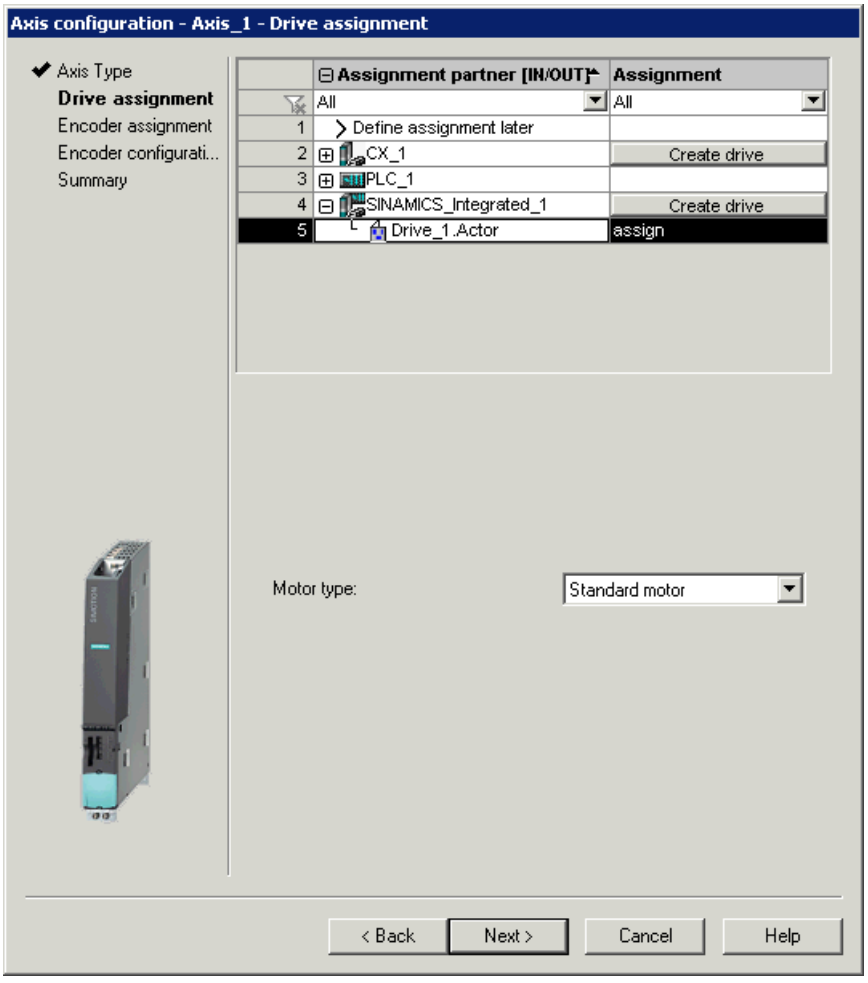

Figure 3-145 Axis configuration - Drive assignment

6. Depending on the selected axis type, with an electric axis you assign the drive which you have configured beforehand in the **Drive assignment** step.
   In the above example, (Axis configuration - Drive assignment figure), several drive units are configured and displayed:
   - SINAMICS Integrated (for the SIMOTION D)
   - DriveUnit_1 (e.g. CU320-2)
   - CX_1 (Controller Extension CX32-2)

   Note

   As an alternative to assigning the axis to an already configured drive, the axis wizard offers two further selection options:
   - Define the axis/drive assignment later:
     The axis is to be created and not assigned to a drive until later. Programming and simulation of the axis are also possible here.
   - Create drive:
     The drive wizard can be called up from the axis wizard (offline configuring). The axis can thus be created in one step along with the drive, and assigned to the drive.

   The alternative approaches are not being considered at this point.

   With an hydraulic axis, you configure the output for a Q-valve in the **Configuration of Q-output** step; the Q-valve represents the actuator for a volume flow.
   Confirm with **Next>**.
7. Specify the encoder to be used by the axis or the active axis data set in the **Encoder assignment** step.
   With an hydraulic axis, you configure the output for a Q-valve in the step **Configuration of Q-output**; the Q-valve represents the actuator for a volume flow. Confirm with **Next>**.
8. Specify the parameters for the used encoder in the **encoder configuration**. Only the encoder type has to be specified when using the symbolic assignment.
9. Once you have worked through all the steps of the configuration of a TO axis, the configured configuration is displayed once again for you to confirm.
   Close the dialog with **Finish**.

Result

The axis is displayed in the **AXES** folder of the project navigator.

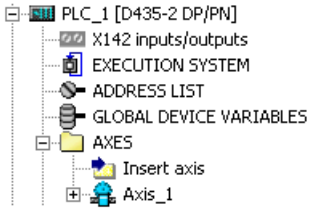

Figure 3-146 Axis created

Automatic settings of the engineering system

The engineering system automatically defines the PROFIdrive axis telegrams required for communication with the drive, as well as the addresses used.

In the same way, telegrams are extended and interconnections automatically created in the drive, depending on the selected TO technology (e.g. SINAMICS Safety Integrated).

Drive and encoder data, as well as reference variables, maximum variables, torque limits, and granularity in torque reduction of the SINAMICS S120 are accepted automatically for the configuration of the SIMOTION technology objects "TO axis" and "TO externalEncoder". This data no longer has to be entered in SIMOTION.

Loading the axis configuration to the target system

Save and compile the changes and download the axis configuration to the target system in order to be able to test the function of the axis in the next configuration step.

Additional references

For detailed information, refer to the "Configuring the axis and external encoder" section in the SIMOTION SCOUT online help.

Testing the axis with the axis control panel

Using the axis control panel you can control and monitor individual axes.

You can perform the following tasks with the axis control panel:

- Test axes before you traverse them via a program.
- Testing as to whether you can move the axis using the axis control panel if a fault is detected.
- Set/remove axis enable.

Requirements

- You have created, configured and connected an axis to the drive.
- SIMOTION SCOUT is in online mode.
- You have loaded the project to the target system.

Opening the axis control panel

To open the axis control panel, proceed as follows:

1. Open the **AXES** folder in the project navigator.
2. Double-click the **Control panel** entry below the axis to be tested.

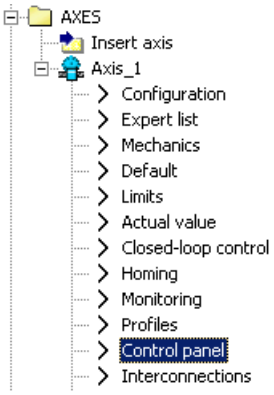

Figure 3-147 Select axis control panel

The axis control panel opens in the detail view.

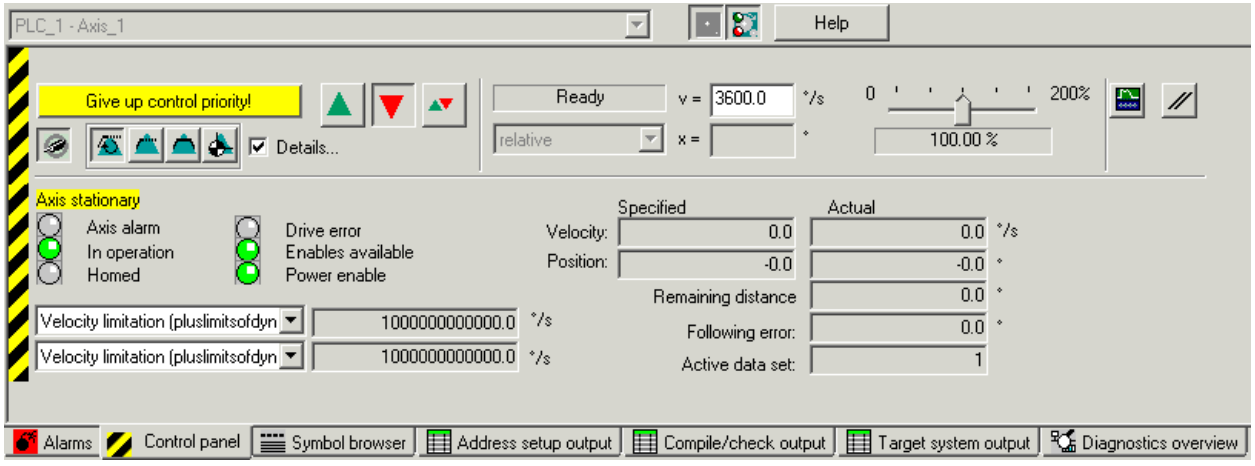

Figure 3-148 Axis control panel

Using the axis control panel

⚠ WARNING

Activating sign-of-life monitoring

Use the axis control panel in control mode only with activated sign-of-life monitoring and a suitably short monitoring time! Otherwise, if problems occur in the communication link between the control PC and the device, the axis may start moving in an uncontrollable manner.

Assume control priority

To assume control priority, proceed as follows:

1. Show the control area by clicking the button in order to test, for example, programmed traversing motions in this mode.
2. Show the diagnostic area by clicking the button in order to test traversing motions that are caused by the motion commands sent to the axis in this mode.
3. Select the axis that you want to traverse and monitor from the selection list, **PLC_1 - Axis_1** in the example.
4. Specify the parameters you want to display in the lower left side of the Diagnostics area using the selection lists. The corresponding values are shown next to them.
5. Select **Assume control priority** to establish the connection to the PG/PC.
   The **Assume control priority** dialog opens.

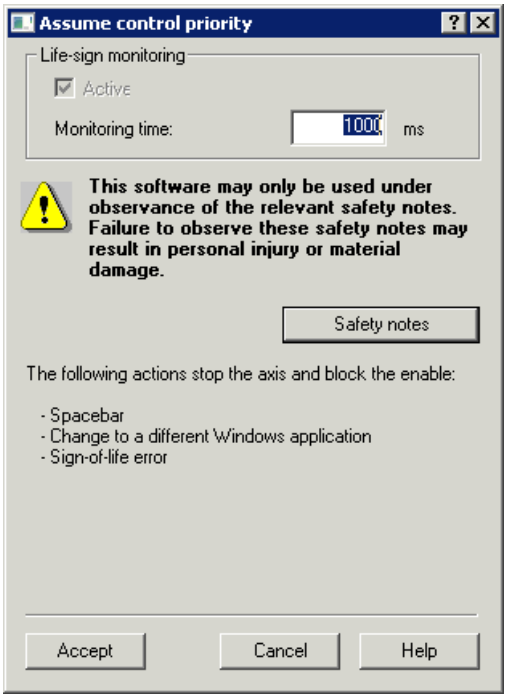

Figure 3-149 Assume control priority

6. Observe the safety regulations and confirm with **Accept**.

The PG/PC has the control priority; the button caption has changed to **Return control priority**.

Note

By pressing the SPACEBAR, you can stop the axis at any time.

Activating enables

To activate the enables, proceed as follows:

1. Click the **Set/remove enables** button to enable the axis.
   The LEDs indicate the status of the enables.

Specifying motion commands for axis

1. Specify motion commands for the axis.
   The following functions are available:

Button	Meaning/function
	Speed default This command specifies that the axis is started speed-controlled. Specify a speed setpoint to which the axis can be ramped up via a velocity profile. The command is possible for all axis types; position and following axes are operated speed-controlled.
	Start axis position-controlled This command specifies that the axis is started position-controlled. Specify a speed setpoint to which the axis can be ramped up via a velocity profile. The command is possible for position and following axes.
	Position axis With this command, you specify positioning of the axis (positioning or synchronous axis) at a specific position. The position value entered can be absolute or relative. Modulo axes can also be positioned via the shortest path. The programmed position must be within the software limit switches.
	Home axis With an absolute measuring system, homing is only required once during commissioning. When this is completed, the position value will be known when the machine is switched on. In the case of an incremental measuring system, the machine must be homed every time it is switched on.

Start axis motion

To start the axis motion, proceed as follows:

1. Click the switch to start the motion command parameterized last.
   Or click the switch to start the **Speed specification** or **Start axis position-controlled** motion commands in jog mode.
   The motion continues as long as the right-hand mouse button is pressed.

Exit axis control panel

To exit the axis control panel, proceed as follows:

1. To stop the system, click the switch.
2. Deactivate the **Set/remove enables** button. Confirm the **Disable axis** dialog with **OK**.

Note

If you want to traverse the axis again, acknowledge all alarms in the "Alarms" window.

3. Click the **Return control priority** button to return the control priority of the control panel.
4. On the menu bar, select **Project > Disconnect from target system** to switch to offline mode.

Result

The axis can be traversed. Axis configuration is complete.

Potential problems

The axis cannot be traversed.

If the axis cannot be traversed using the axis control panel, test to see if you can traverse the drive using the drive control panel.

- If you cannot traverse the drive using the drive control panel, there is a problem with the drive.
- If you can traverse the drive with the drive control panel, there is a communication problem. Check the drive.

3.3.6.6 Programming the SIMOTION application

Using tags

Variable types

Variables are used to structure programs. They are wild cards in a program and can assume values.

In SIMOTION, different types of variables are distinguished:

- **System variables**
  Each SIMOTION device and technology object has specific system variables. You can access system variables within the SIMOTION device from all programs.
- **I/O variables**
  An I/O variable is a symbolic variable name that is assigned to an I/O address of the SIMOTION device or to the I/O. Thus, direct access to the peripherals is possible.
  I/O variables are valid for all devices. All programs of the SIMOTION device have access to them.
- **Global device variables, unit variables and local variables** are user-defined variables with limited scope:
  These global device variables can be accessed from all parts of the user program. They can also be accessed from HMI devices.
  Unit variables can be accessed by all programs, function blocks and functions defined within the same source, e.g. ST source, MCC source, LAD/FBD source.
  A source is a logic unit that you can create in your project and that can contain programs, functions and function blocks.
  Local variables can only be accessed within the program, the function or function block in which they are defined.
  If variables have been defined in the interface section of a source, they can be accessed by other sources and external components, e.g. HMI systems.

Creating global device variables

Note

Global device variables can only be created in offline mode.

To create global device variables, proceed as follows:

1. Click the **GLOBAL DEVICE VARIABLES** element in the project navigator under the SIMOTION device.
   In the symbol browser, the **Unit-global variables** table is displayed.
2. In the **Name** column, click the first empty cell and enter the variable name, **g_bo_start** in the example.
   Press the **<RETURN>** or **<TAB>** key. The input focus moves to the **Data type** field.
   Alternatively, you can click the field to move the input focus to it.
3. Enter the data type in the **Data type** field, **BOOL** in the example.
4. Press **<RETURN>** to confirm.
   The variable is created and available in the project. In the symbol browser, a new line opens for input.

5. Create other global device variables in the same way, **g_bo_ready** in the example.

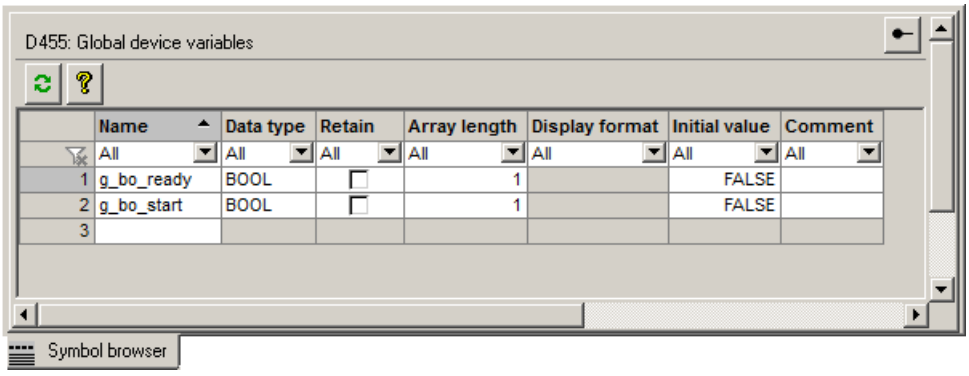

Figure 3-150 Creating global device variables

6. Select **Project > Save and compile changes** in the menu to accept the expansions in the project.

Creating I/O variables

Note

I/O variables can only be created in offline mode.

To create I/O variables, proceed as follows:

1. Double-click the **ADDRESS LIST** element below the SIMOTION device in the project navigator. In the detail view, the **Address list** tab opens.
2. Click the first free cell in the **Name** column. Enter a name for the variable.
3. Press the **<RETURN>** or **<TAB>** key. The cursor moves to the **I/O address** field.
4. Select the **IN** entry for input variable or **OUT** for variable in the **I/O address** column. [1)]
5. Click the three dots in the **Assign** column to open the Assignment dialog.[1)]
6. In the Assignment dialog, select the required variable and select the **Assign** entry in the **Assignment** column.[1)]
7. Confirm the dialog with **OK**.[1)]
8. Select **Project > Save and compile changes** in the menu to accept the expansions in the project.

1) Applies only to devices that support symbolic assignment (e.g. CU320-2).

Additional references

You will find detailed information on the creation of variables in the SIMOTION SCOUT online help and in the relevant Programming and Operating Manuals.

Using MCC

Overview

Program creation steps

Creation of an MCC program encompasses the following steps:

1. Create the MCC source.
2. Create the MCC chart in the MCC source.
3. Insert MCC commands in the MCC chart.

Creating the MCC unit

Procedure

To insert an MCC source, proceed as follows:

1. Open the **PROGRAMS** folder below the SIMOTION device in the project navigator.
2. Double-click **Insert MCC source**.
   The **Insert MCC source** dialog opens.

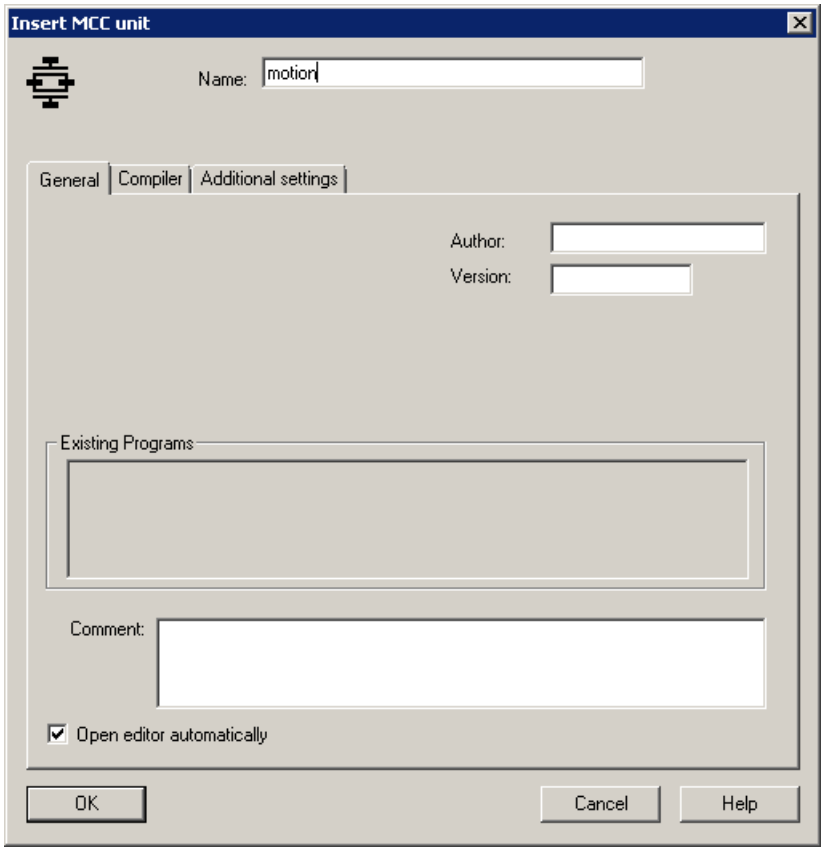

Figure 3-151 Inserting an MCC source

3. Assign a name, **motion** in the example.
4. Go to the **Compiler** tab. For diagnostics purposes, activate the options **Permit program status** and **Permit single step**. In this way, you can monitor program execution later in online mode.
5. Click **OK** to confirm.

Result

The MCC source is created.

- The source appears in the project navigator below the **PROGRAMS** branch.
- The declaration table of the source opens in the working area of the workbench. The variables declared there apply within the MCC source and can be linked in other sources.

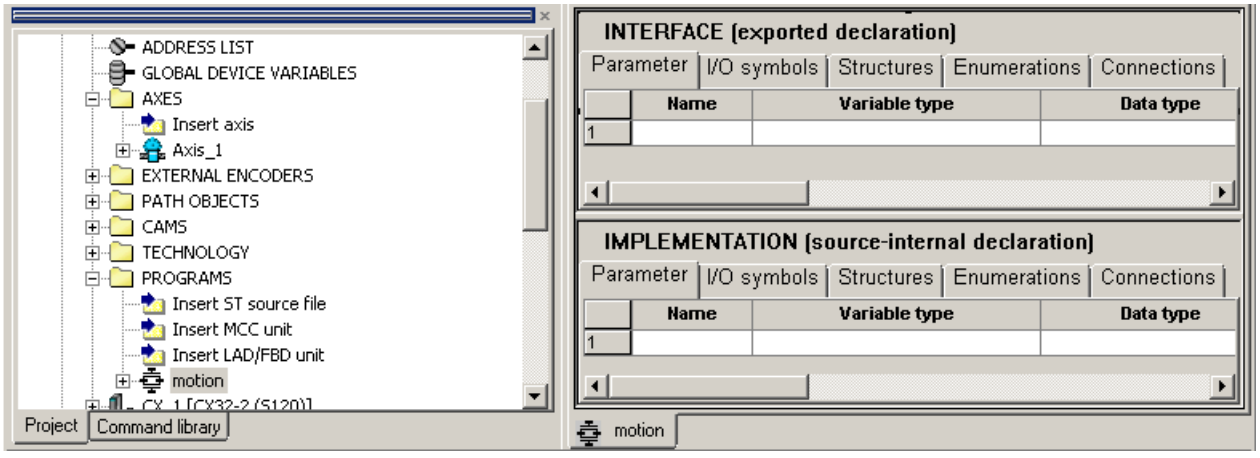

Figure 3-152 MCC source "motion" inserted

Creating an MCC chart

Procedure

To insert an MCC chart, proceed as follows:

1. Open the **PROGRAMS** folder below the SIMOTION device in the project navigator.
2. In the **PROGRAMS** folder, open the MCC source, **motion** in the example.

3. Double-click **Insert MCC chart**.
   The **Insert MCC chart** dialog opens.

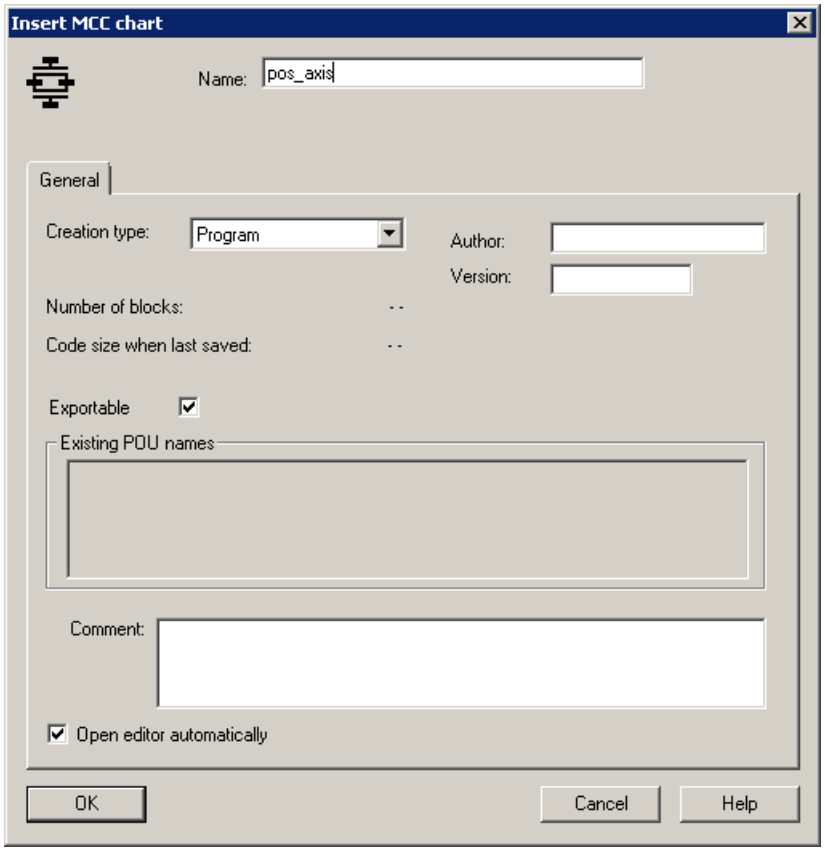

Figure 3-153 Inserting an MCC chart

4. Assign a name, **pos_axis** in the example.
5. Select the creation type **Program**.
6. Click **OK** to confirm.

Result

The MCC chart is created in the project.

- The created MCC chart **pos_axis** appears in the **PROGRAMS** folder below the **motion** source.
- The MCC editor is opened in the working area of the workbench. The start and end nodes are already pre-defined. You can start MCC programming.

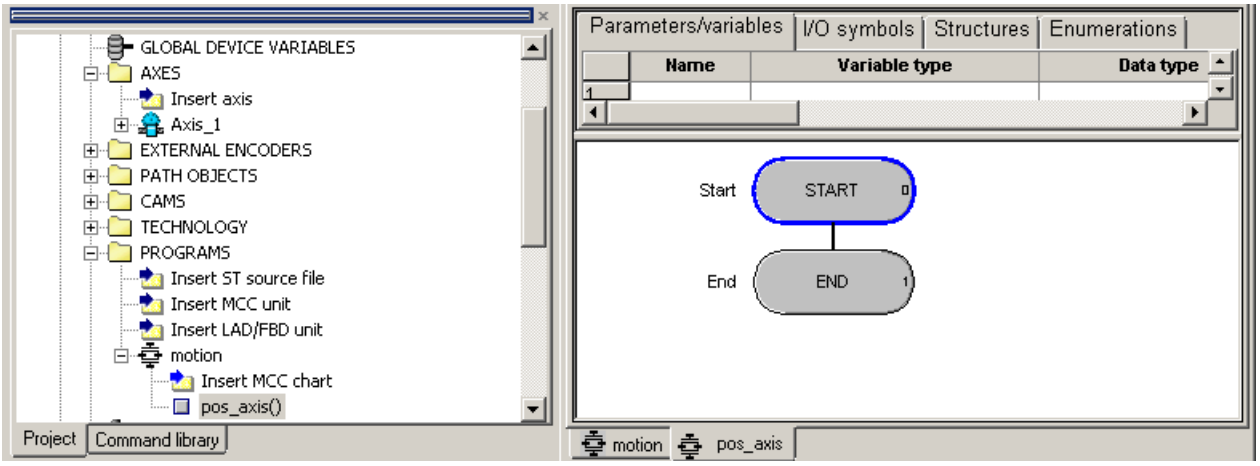

Figure 3-154 MCC chart "pos_axis" inserted

Using MCC command blocks

Every newly created MCC chart already contains a start and an end node.

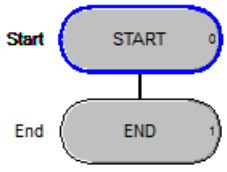

Figure 3-155 MCC chart, start/end nodes

You insert the MCC command blocks between these. The commands are processed in the direction from the start to the end node.

The MCC commands are available to you via:

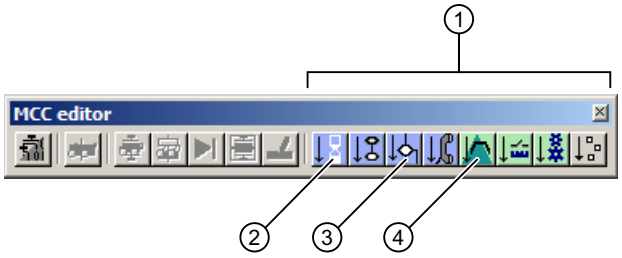
- **MCC editor** toolbar
- **MCC chart > Paste** menu command
- Context menu of the command block

Using the MCC editor toolbar

Opening the toolbar

The **MCC editor** toolbar is displayed in the workbench as soon as you open an MCC chart.

The commands are arranged as command groups.



① Command groups
② Basic commands
③ Program structures
④ Single axis commands

Note

If you do not see the toolbar, check whether the display is switched on: Open the menu **View > Toolbars**. Activate the checkbox for **MCC editor** in the **Toolbars** window.

Opening the command group

Move the cursor across the colored buttons of the toolbar to display the command groups.

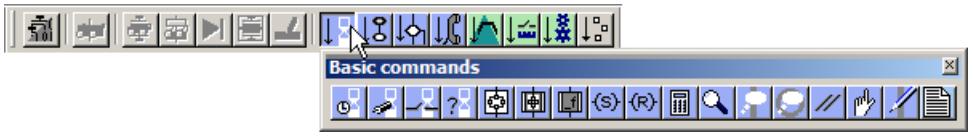


Figure 3-156 Opening the command group

Keeping command groups open or closed continuously

Click the window title of a command group to keep the command group open continuously.

Select "Hide" in the context menu of a command group to close the command group.

Placing the command group as required

Drag the toolbar or the command groups of the toolbar with the mouse to any location on the workbench.

Docking the toolbar

Drag the toolbar or the command groups of the toolbar with the mouse to the edge areas of the workbench to dock them there.

Showing a tooltip for the command

Hold the mouse pointer briefly over a command button. The designation of the command is shown.

Inserting MCC editor commands in the MCC chart

In order to insert an MCC editor command in the created MCC chart, proceed as follows:

1. In the active MCC chart, click the connecting line between two commands, or click the command after which the new command is to be inserted.
   The connecting line or the border line of the command button is marked blue. The marking flashes.
2. Select the command group in the **MCC editor** toolbar.
3. Click the desired command in the command group.

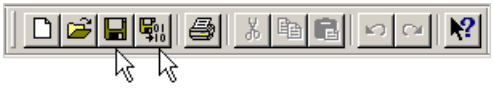
Result

The command was inserted into the chart and can now be parameterized.

Backing up the MCC program

To back up the MCC programs, proceed as follows:

1. To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.



Alternatively, you can click the **Accept and compile** command in the **MCC editor** toolbar.

This command compiles the currently selected program as well as all other programs of the same source.
However, the command does not save the changes.
You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

Additional references

For further information, refer to the SIMOTION MCC Motion Control Chart Programming and Operating Manual.

The "Getting Started section of the SIMOTION SCOUT" online help contains a detailed description of a sample programming in SIMOTION SCOUT.

Using LAD/FBD

Overview

Program creation steps

The creation of an LAD/FBD program encompasses the following steps:

1. Create an LAD/FBD source.
2. Create an LAD/FBD program in the LAD/FBD source.
3. Insert LAD/FBD commands in the LAD/FBD program.
4. Save and compile the LAD/FBD program.

Create LAD/FBD unit

Procedure

To create an LAD/FBD source, proceed as follows:

1. Open the **PROGRAMS** folder below the SIMOTION device in the project navigator.
2. Double-click **Insert LAD/FBD source**.
   The **Insert LAD/FBD source** dialog opens.

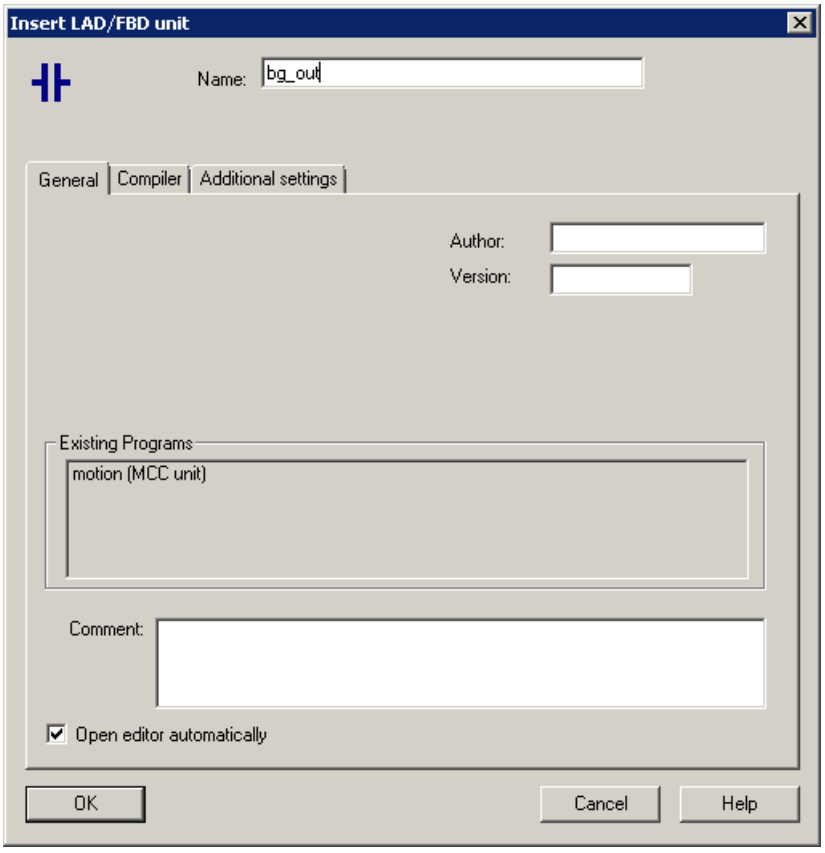


Figure 3-157 Inserting the LAD/FBD source

3. Assign a name, **bg_out** in the example.
4. Switch to the Compiler tab.
5. For diagnostics purposes, activate the option **Permit program status**. In this way, you can monitor program execution later in online mode.
6. Click **OK** to confirm.

Result

The LAD/FBD source is created.

- The LAD/FBD source **bg_out** appears in the **PROGRAMS** folder.
- The declaration table of the source opens in the working area of the workbench. The variables declared there apply within the LAD/FBD source and can be linked in other sources.

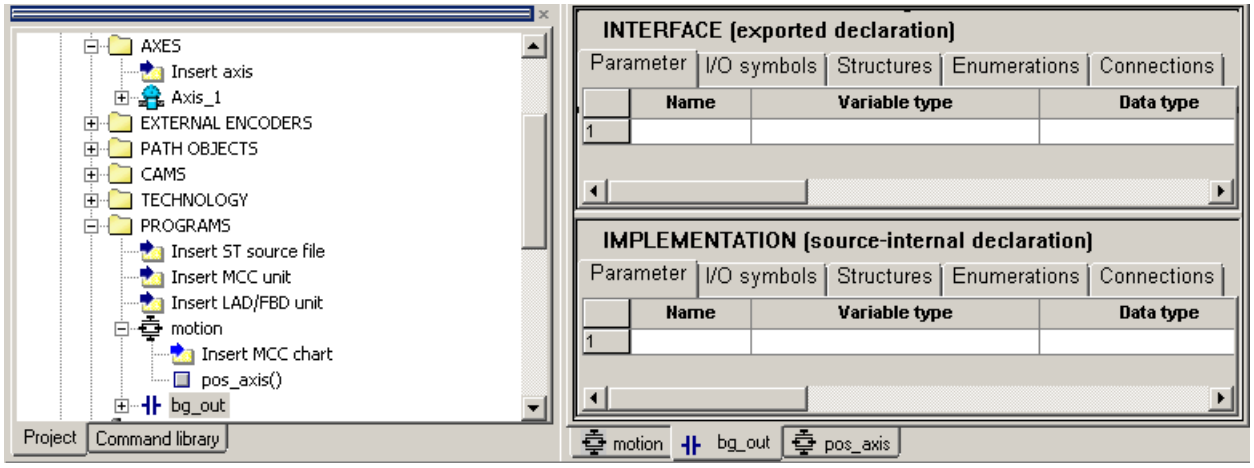

Figure 3-158 LAD/FBD source "bg_out" inserted

Create LAD/FBD program

Procedure

To insert an LAD/FBD program, proceed as follows:

1. Open the **PROGRAMS** folder below the SIMOTION device in the project navigator.
2. Open the LAD/FBD source **bg_out** in the **PROGRAMS** folder.

3. Double-click **Insert LAD/FBD program**.
   The **Insert LAD/FBD program** dialog opens.

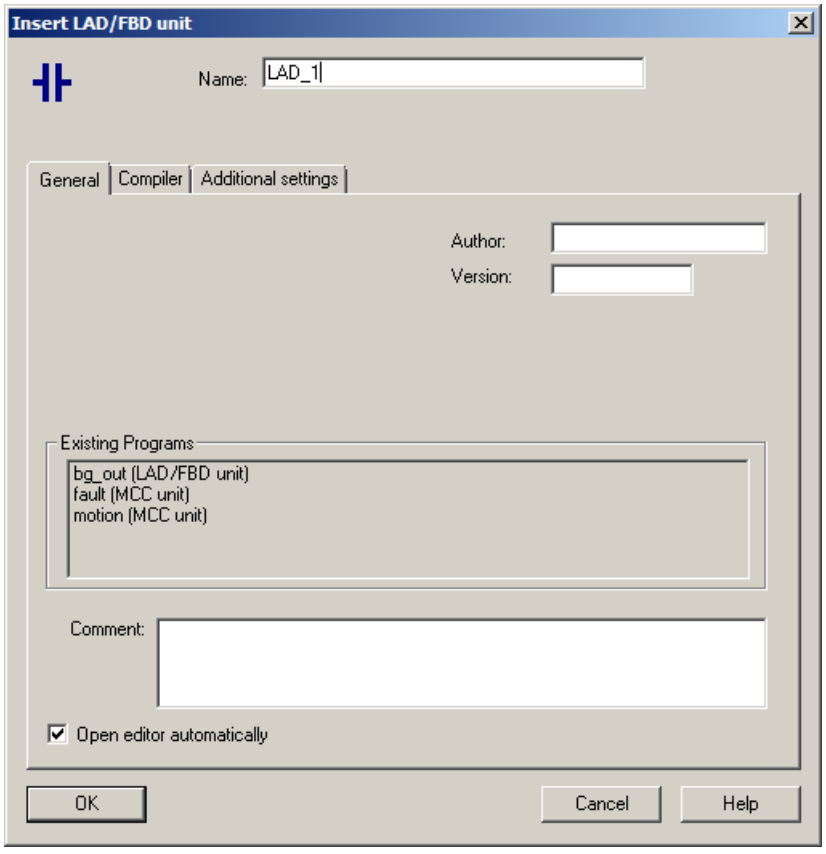

Figure 3-159 Inserting the LAD/FBD program

4. Assign a name, **LAD_1** in the example. The name must be unique throughout the project.
5. Select the creation type **Program**.
6. Click **OK** to confirm.

Result

The LAD/FBD program **LAD_1** is created in the project.

- The LAD/FBD program appears in the **PROGRAMS** folder.
- The LAD/FBD editor is opened in the working area of the workbench. You can start programming.

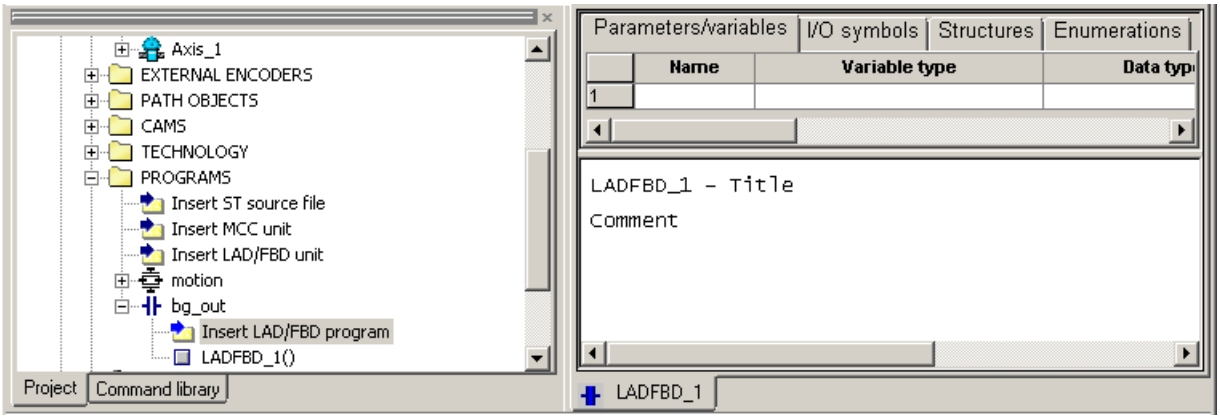

Figure 3-160 LAD/FBD program "LAD_1" inserted

Using the LAD/FBD toolbar

Opening the LAD/FBD toolbar

The LAD/FBD toolbar becomes visible in the workbench as soon as you open an LAD/FBD program.

Move the cursor across the active buttons of the toolbar to display the functions.

Note

If you do not see the toolbar, check whether the display is switched on: Open the menu **View > Toolbars**. In the **Toolbars** window, activate the checkbox for the **LAD/FBD toolbar**.

Switching the programming language

SIMOTION SCOUT allows simple switching between ladder logic and function block diagram. The LAD/FBD editor contains the command **LAD/FBD program > Switch to FBD** or **Switch to LAD**.

Backing up the LAD/FBD program

Procedure

In order to back up an LAD/FBD program, proceed as follows:

1. Click in the toolbar on the **Save project** or **Save project and compile changes** button.

Alternatively, you can click the **Accept and compile** command in the **LAD/FBD toolbar**.

This command compiles the currently selected program as well as all other programs of the same source.
However, the command does not save the changes.
You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

Additional references

For further information, refer to the Online Help and SIMOTION LAD/FBD Programming and Operating Manual.

The **Getting Started section of the SIMOTION SCOUT** online help contains a detailed description of a sample programming in SIMOTION SCOUT.

Using ST

Overview

Program creation steps

The creation of an ST program encompasses the following steps:

1. Create an ST source.
2. Save and compile the ST program.
3. Execute the ST program.

Creating an ST source

Procedure

1. In the project navigator, open the tree for your SIMOTION device (programs are assigned to the SIMOTION device on which they are to run).
2. Mark the Programs folder and select the **Insert > Program > ST source** menu command. The **Insert ST source** dialog opens.

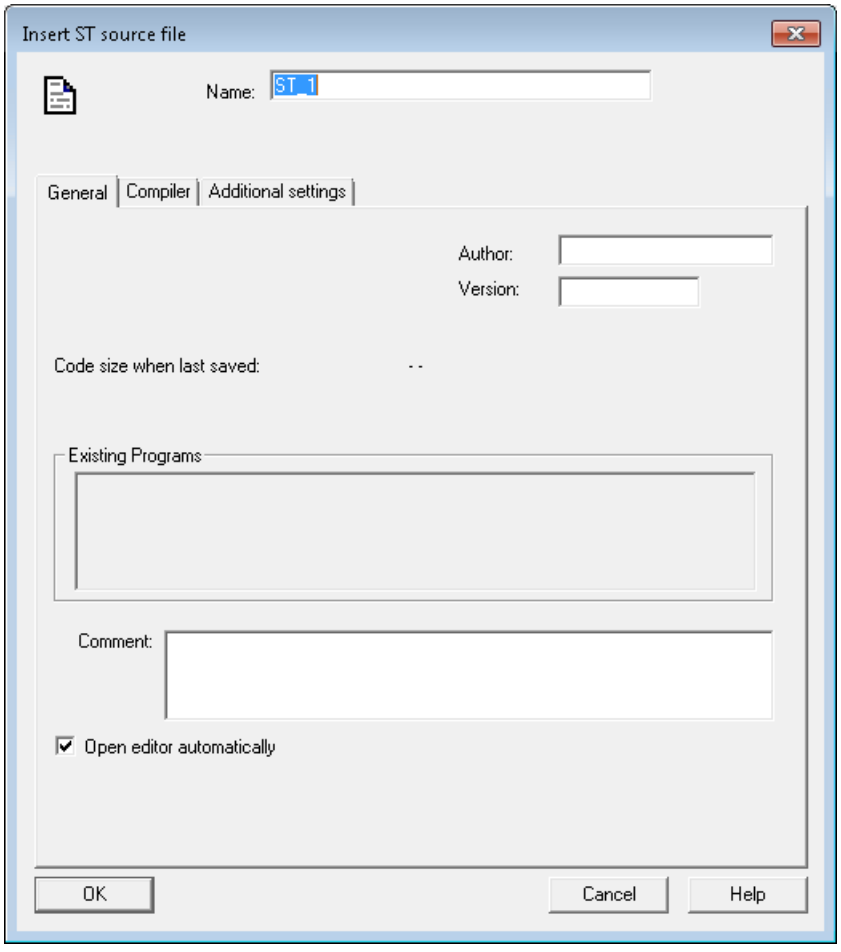

Figure 3-161 Inserting an ST source

3. Enter a name for the ST source consisting of up to 128 characters (see figure), e.g. ST_1, and click **OK** to confirm the entries.
   The ST editor appears in the working area. The ST source ST_1 is inserted in the navigator.

Result

The ST_1 ST program is created in the project.

- The ST program appears in the PROGRAMS folder.
- The ST editor opens in the working area of the workbench. You can start programming.

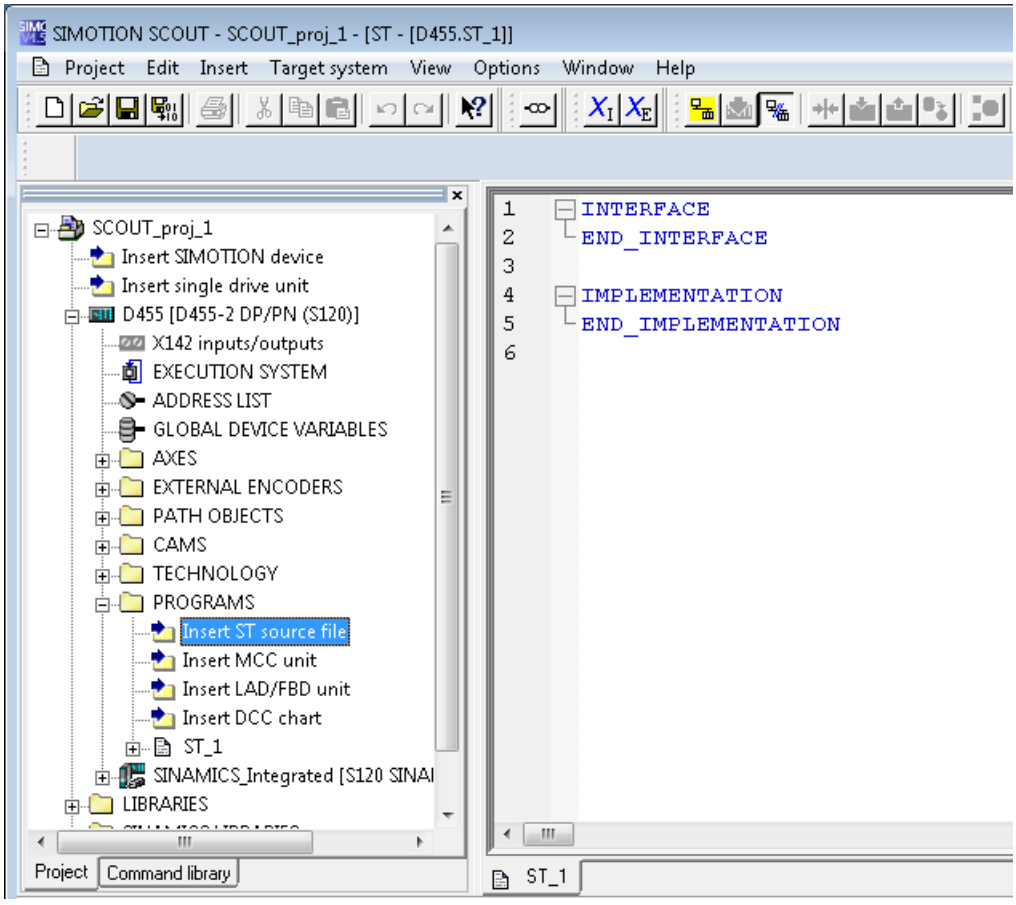

Figure 3-162 ST source "ST_1" inserted

Backing up the ST program

Procedure

To back up an ST program, proceed as follows:

1. Save the complete project with **Project > Save**.

Before you can run or test your program, you must compile it into executable machine code. The ST compiler performs this task.

Start the compiler as follows:

1. Click in the window with the ST editor to display the **ST source** menu. This menu is a dynamic menu and is only displayed if the window of the ST editor is active.
2. Start the compiler by selecting the **ST source > Accept and compile** menu command.

Additional references

Further information on ST programming can be found in the SIMOTION SCOUT online help and in the SIMOTION ST Structured Text Programming and Operating Manual.

Executing the ST program.

Before you can execute the sample program, you must assign it to an execution level or a task. When you have done this, you can establish the connection to the target system, download the program to the target system, and then start it.

Additional references

Further information on ST programming can be found in the SIMOTION SCOUT online help and in the SIMOTION ST Structured Text Programming and Operating Manual.

3.3.6.7 Configure execution system

Execution levels define the chronological sequence of tasks in the execution system. A level can contain several tasks. The tasks provide the framework for program execution. A task may comprise several programs. By assigning the created programs to the tasks, you can, for example, define the priority, the time frame or order in which the programs are to be executed.

Assigning programs to tasks

To assign programs to tasks in the execution system, proceed as follows:

1. Double-click in the project navigator below the SIMOTION device on **EXECUTION SYSTEM**.
   The **Execution System** window opens in the working area.
2. Assign the required program to the preferred task. In the sample MCC program, **motion.pos_axis** and **MotionTask_1** task.
   – In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > MotionTasks > MotionTask_1**.

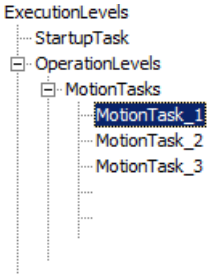

Figure 3-163 Execution system, tree view of the execution levels and tasks

The **MotionTasks** window opens on the right of the working area. The programs **pos_axis** and **LAD_1** as well as programs of the **fault** source are visible on the **Program assignment** tab at **Programs**.

– Select the MCC program **motion.pos_axis** and click the **>>** button. The program is displayed at **Programs used**. It is thus assigned to the task **MotionTask_1**.

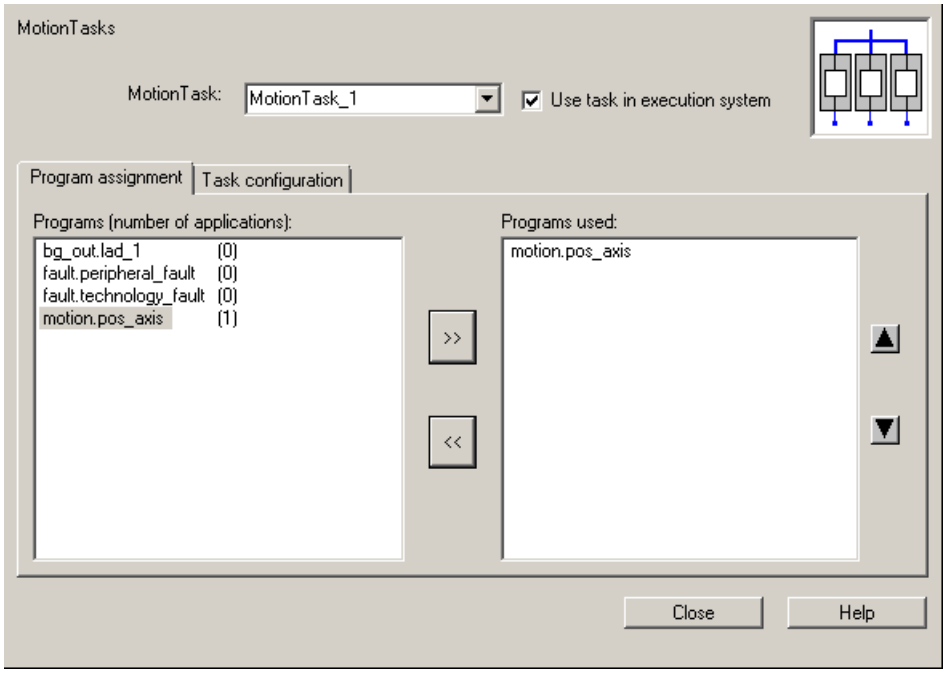

Figure 3-164 Execution system, MotionTasks window

The assignment is visible in the tree of the execution system. The program **motion.pos_axis** appears below the branch **MotionTask_1**.

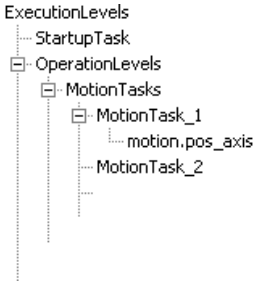

Figure 3-165 Execution system, MotionTask_1 with assigned pos_axis program

– In the **Task configuration** tab, activate the **Activation after StartupTask** option. This executes the MCC program immediately after the SIMOTION device is started. If this option is not activated, the program must be started explicitly by the call from another program that is assigned to the StartupTask or another active task.

3. Assign the LAD program **bg_out.kop_1** to the task **BackgroundTask**:

– In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > BackgroundTask**. Assign the LAD program **bg_out.kop_1** to this task.

4. Assign the fault handling routines:
   - In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > SystemInterruptTasks > TechnologicalFaultTask**. Assign the MCC program **fault.technology_fault** to this task.
   - In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > SystemInterruptTasks > PeripheralFaultTask**. Assign the MCC program **fault.peripheral_fault** to this task.
5. Click **Close**. Confirm with **Yes** if you are prompted to save.

Result

The execution system is configured.

Loading the configured execution system to the target system

Save and compile the changes, go online and load the configured execution system into the target system.

3.3.6.8 Project generator

Overview

With the project generator, you can quickly and easily create a new SIMOTION project or update an existing project on the basis of templates.

The templates include preconfigured SIMOTION devices and modules, all of which are supplied with the ProjectGenerator. These can be automatically integrated in a project with the ProjectGenerator.

Overview of the ProjectGenerator functions

You can execute the following functions with the ProjectGenerator:

- Create a new project or open and edit an existing project
- Create a new device or open and edit an existing device
- Automatic configuration of the modules on the basis of the selected hardware
- Copy files/directories in the file system
- XML interface for user-specific expansions
  - Generation of the user-interface elements
  - Generic function calls
- Assign programs to the execution system
- FTP transport of files to the SIMOTION device (e.g. SIMOTION IT pages)
- Import technology objects (TO)
- Interconnect technology objects (synchronous operation interconnection)

- Write configuration data and system variables to technology objects
- Import libraries:
  - Change code
  - Version check and version update
  - Setting and restoring constants
  - Creating and restoring user areas
- Import units
  - Change code
  - Version check and version update
  - Set and restore constants
  - Create and restore user areas

Integrating the ProjectGenerator

Integration in SCOUT

As of version V1.3, the ProjectGenerator can be integrated in SCOUT. The ProjectGenerator does not require an installation. You can integrate the ProjectGenerator via the menu **Options > Settings...**, **ProjectGenerator** tab directly from a DVD or the local hard disk. Select the path to the **ProjectGenerator.exe** file.

You then use the ProjectGenerator via the menu item **Project > ProjectGenerator**.

Note

The path must always be valid. If the DVD is removed from the drive or the local folder is deleted, an error message is issued.

Additional references

You can find additional information on this topic in the SIMATIC/SIMOTION Project Generator Application Manual.

3.3.6.9 Configuring multilingual messages

Multilingual messages and comments can be configured with the "Language-dependent texts" function. This is necessary, for example, if you want to output multilingual user-defined Alarm_S messages or diagnostic buffer entries.

To configure multilingual messages:

1. Select **Project > Language-dependent texts** in the menu. The **Select Language** window opens.
2. Set the language in which you want to configure the messages as the **current language**.
3. Click **OK**. The window closes.
4. Select **Project -> Messages -> Configure** in the menu and check the set language at **Configuration language** in the displayed window.
   The message texts and remarks are displayed in the language in which they were originally configured. These texts must then be compiled in the new configuration language.
5. In the **Message Configuration** window, double-click the messages for which you want to enter texts in the new configuration language or click the **Edit** button. The **Edit Message** window is displayed.
6. Enter the new message text and remarks in the changed language.
   The symbol name must not be changed in foreign language messages, as this symbol name is used for programming. Only the message text and remarks are language-dependent.
7. Click **OK** to confirm. The modified message text is entered in the Message configuration table.
8. Repeat steps 6 to 8 if you want to enter more message texts in the new configuration language.

For further information, please refer to the online help for SIMOTION SCOUT -> Configure multilingual texts/comments.

3.3.6.10 Know-how Protection

The know-how protection in SIMOTION SCOUT provides read- and write protection for program sources (ST sources, MCC charts, LAD/FBD programs and DCC charts) and libraries in your project. This protection prevents unauthorized viewing of the programs. You can specify different protection levels for programs and libraries. The specification applies to all protected programs and libraries.

If the know-how protection is set for a program, for example, the know-how protection is retained, even when this program is copied or exported.

Specifying the protection level

To specify the the know-how protection level, proceed as follows:

1. Select **Project > Programs know-how protection > Configure ...** in the menu bar.
2. Specify the protection level for programs and libraries.
3. Confirm your selection with **OK**.

Creating the standard login

To create the standard login for the know-how protection, proceed as follows:

1. Select **Project > Programs know-how protection > Edit standard login...** in the menu bar.
2. Enter the login and password, and confirm the entered password.
3. Confirm the input with **OK**.

Set know-how protection

To set the know-how protection, proceed as follows:

1. In the project navigator, mark the source for which you want to set the know-how protection.
2. Open the dialog for setting the know-how protection from the **Know-how protection > Set** context menu.
3. Enter the login and password, and confirm the entered password.
   Provided no standard login has been set and this login should be used as standard login, activate the **Use this login as standard login** checkbox.
4. Confirm the input with **OK**.

The lock symbol at the associated source identifies protected programs in the project navigator, e.g.  .

3.3.6.11 Saving and restoring variables from the device

Saving and restoring data with SCOUT

Using the SIMOTION SCOUT functions **Save variables** and **Restore variables** it is possible to save and then restore data (which has been changed during operation and is only saved in the SIMOTION device or on the memory card) to the hard disk. This can be used if a SIMOTION platform is changed or a version updated, for example.

The following types of data can be backed up:

- Data variables that are in the SRAM/NVRAM of the controller:
  - Retentive global device variables
  - Retentive global unit variables
  - TO retain data (as of V4.1)
- Data sets which have been backed up from the user program via _saveUnitDataSet or _exportUnitDataSet and are located on the memory card, including
  - Global unit variables of interface and implementation sections from program sources (ST, MCC or LAD/FBD sources):
    Retentive variables (VAR_GLOBAL RETAIN)
    Non-retentive variables (VAR_GLOBAL)

The **_exportUnitDataSet** function backs up unit variables in a **version-independent** format (XML).

By contrast, data is backed up in a **version-dependent** format (binary) via the **_saveUnitDataSet** function and can, therefore, only be read back in on a device/unit of the same version (e.g. V3.2) via the **_loadUnitDataSet** function.

Data sets saved via _saveUnitDataSet are automatically converted into XML format using the **Save variables** function. The data sets are available in binary format for the new version once the **Restore variables** function has been executed.

Data backed up using **Save variables** are saved as version-independent XML files in a user-defined folder on the PC's hard disk.

In addition to the data backup functions provided by SIMOTION SCOUT, backup functions are also available in the runtime system.

Note

When performing an update with a kernel version that is ≥ V4.1, the above SIMOTION SCOUT functions are only required for backing up and restoring unit data sets that have been created using _saveUnitDataSet.

Reason:

- Retain data remains valid after an update.
- Unit data backed up using _exportUnitDataSet also remains valid after an update.
- Retain data can also be backed up to a memory card **without the use of SIMOTION SCOUT:**
  - The _savePersistentMemoryData function saves **all** retain data from the SRAM/NVRAM; this can be retentive global unit variables in the interface or implementation sections of a source (VAR_GLOBAL_RETAIN) or retentive global device variables (RETAIN) and TO retain data
    (For further information, see List Manual: Device System Functions/Variables)
  - The **Back up diagnostic data** function (triggered via a service switch/diagnostic button or IT DIAG) saves **all** retain data (as above, see _savePersistentMemoryData). Subsequently executing the **Restore non-volatile data** function reactivates this backed up data.
    (For further information, see the SIMOTION D Commissioning and Installation Manuals)

A directory structure is created in the selected path using the **Save variables** function. This directory is assigned the name of the selected SIMOTION device or the selected unit, depending on whether the variables should be saved or restored for the entire device or just one unit.

The retentive global device variables are backed up in the unitdata.xml file. The number of subdirectories corresponds to the number of sources in the SIMOTION project. The names of the subdirectories correspond to the names of the sources. Each subdirectory contains the unitdata.xml file in which the retentive unit variables are stored. If necessary, a further file that contains the non-retentive global variables of the source is saved. This DS*.xml file is assigned the data set number as its name, which is transferred by specifying the parameter **ID** for the **_saveUnitDataSet** or **_exportUnitDataSet** function.

Example of a folder structure when backing up on the device:

The folder structure is as follows:

<Folder device>, e.g. D435
unitdataset.xml
DS000001.xml
<Folder device>, e.g. ST_UNIT1
Unitdataset.xml
DS000002.xml

Restore variables

If the **Restore** function is called in the context menu of a unit, select the directory with the name of this unit in the directory selection dialog.

If the **Restore** function is called in the context menu of a SIMOTION device, select the directory with the name of this device in the directory selection dialog.

Example: If the variables of the SIMOTION device have been stored in the directory D435, then this is the directory that must be selected for the restore operation.

Detailed information on this topic can be found in:

- SIMOTION Runtime Basic Functions Function Manual, Section Data backup from user programrogram

3.3.6.12 Online multiuser mode

Overview

Thanks to the new Project comparison, Device upload and Download with supplementary data functions, several users can exchange project data that has been modified via the target device, online. This allows them to synchronize the status of their own SIMOTION project with that of another one, thereby updating it.

In online multiuser mode, it is possible for two users to work online on the same SIMOTION device. The following functions can be performed:

- Read and control system variables and configuration data
- Execute measuring functions and axis control panel
- Upload configuration data
- Upload programs or technology objects and other settings (e.g. execution system)
- Edit and download programs (following prior alignment, if applicable)
- Download individual program sources (possible even when other sources are inconsistent)

The following graphic shows a schematic representation of online multiuser mode:

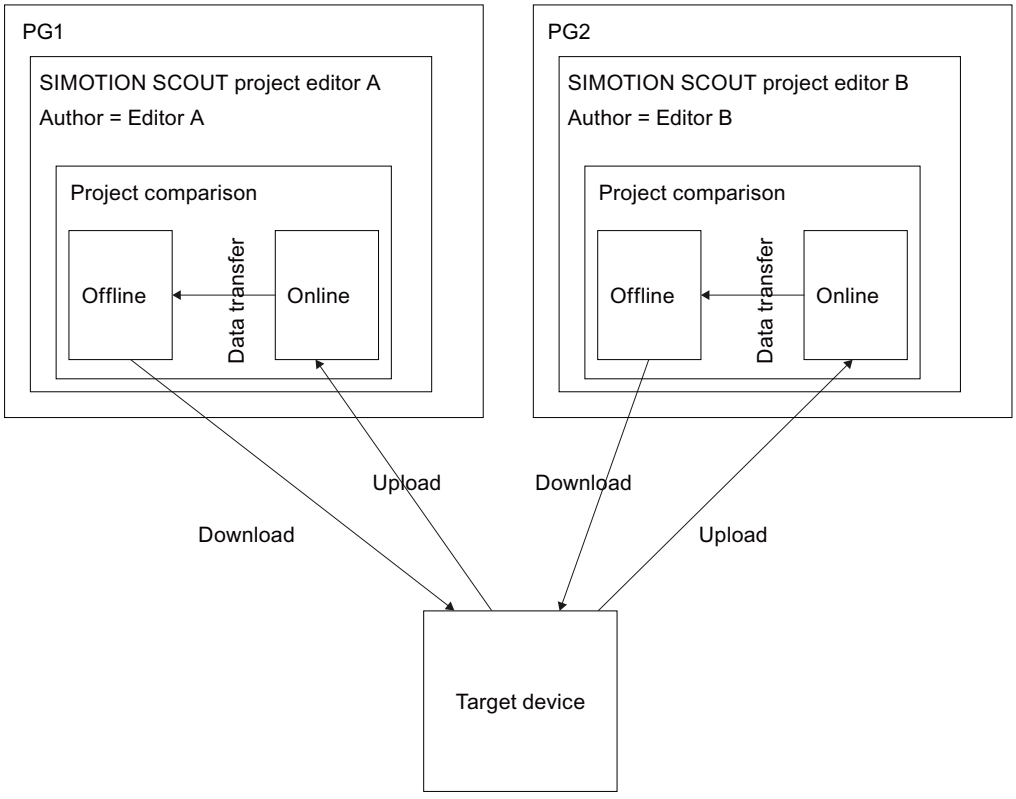

Figure 3-166 Schematic representation of online multiuser mode

Editors A and **B** are working on one SIMOTION project at the same time. Changes made by both editors are loaded to the target device. The project must be synchronized beforehand, otherwise parts of it could be found to be inconsistent and subsequently overwritten when the **Load project to target device** command is executed.

This means, for example, that **Editor A** must synchronize his project with **Editor B**'s project before loading it to the target device. This can be done via the synchronization mechanism in the project comparison facility.

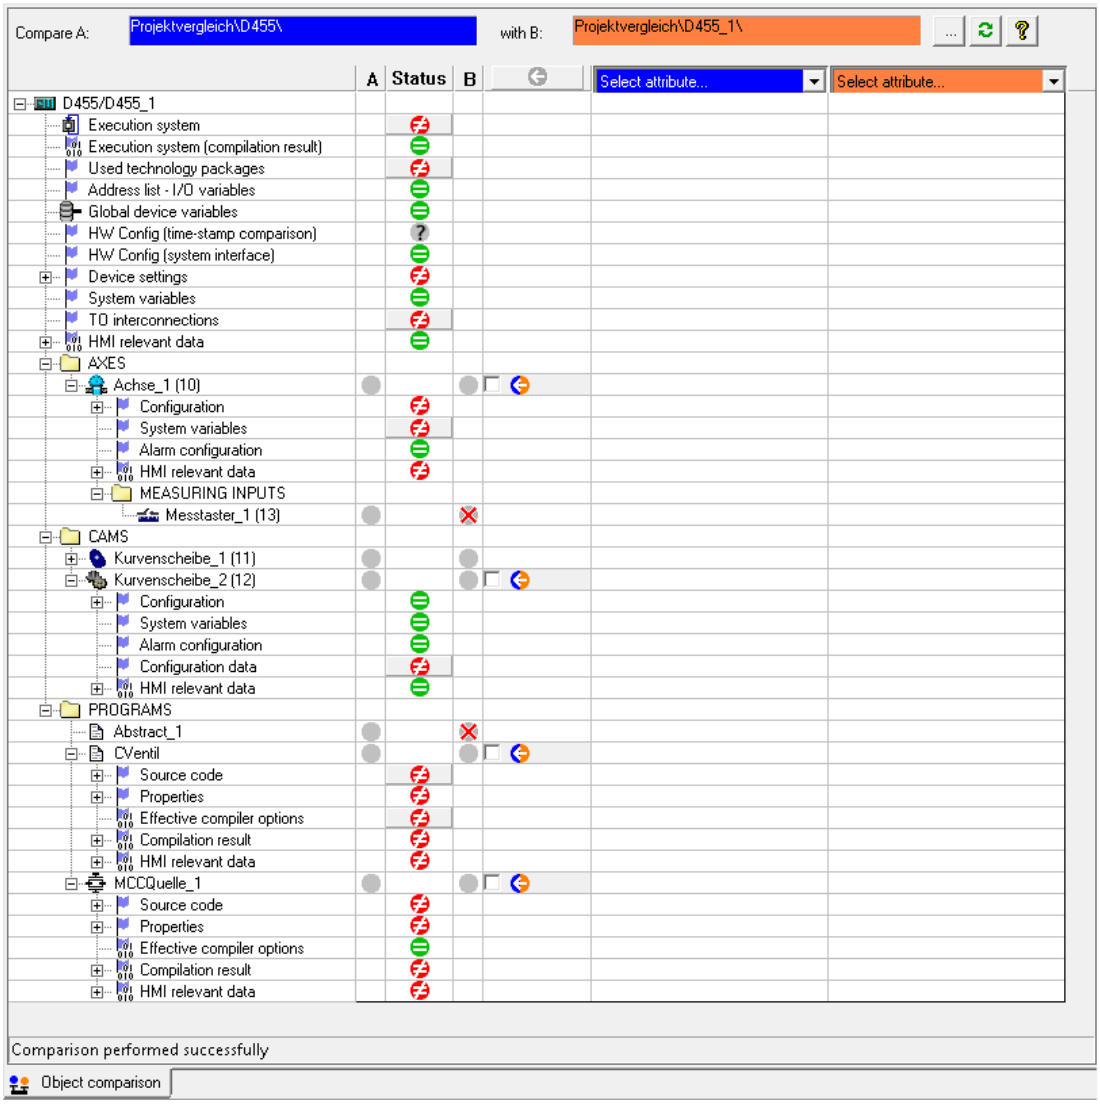

Figure 3-167 Synchronizing project data via the project comparison function

Working in online multiuser mode

Online consistency

As of V4.4, the online consistency flags are updated event-driven. As soon as a change takes place, SCOUT/STARTER is informed and the flags are updated. You can then no longer debug changed sources. The following requirements apply:

- SIMOTION controllers, as of V4.2
- SINAMICS drives, as of V2.6
- Only structural changes (genuine inconsistency) are taken into account in the case of SINAMICS drives.

Online multiuser mode

When several users work simultaneously, this can result in the following overlaps, for example:

- A user creates a program that is not known on the second computer.
- A user changes the execution system. The change is not known on the second computer.

To accept the changes of other users in your own project, various additional functions have been implemented in SIMOTION SCOUT:

- Download a number of programs: This makes it possible to load only those programs to a controller that are currently being edited, e.g. by a specific user.
- You can see changes to the execution system in the project comparison. You can then upload the changes via the detailed comparison.

Upload the source of another user

If another user has loaded a source to the controller that is part of your project, you cannot load this to the local SCOUT via the project comparison. To upload the source, proceed as follows:

1. Create an empty source with the same name in your project.
2. Perform an online/offline project comparison. An inconsistency is displayed in the comparison for the empty source.
3. Then change to the detailed comparison. The inconsistent source is displayed there.
4. Load the source to your project. By doing this, you make sure that you have a consistent project.

Avoid inconsistencies by loading via HW Config

The matching of the data by uploading to PG is supported only for SCOUT data. Furthermore, changes can be made to the hardware configuration, e.g. changes to addresses of the X142 interface. These changes must be replicated explicitly in the hardware configuration.

3.3.6.13 Licensing runtime

Licensing of the runtime components

Overview for the licensing

Functions can be licensed using the following software options:

- Motion control technology functions
  The licensing is performed axis-specifically for:
  - POS - position; use of the technology functions for position axis
  - GEAR; use of the technology functions for following axis
  - CAM; use of the technology functions for cam axis

The GEAR technology function contains the POS technology function, while the CAM technology function contains the POS and GEAR technology functions.

The MultiAxes package permits a simple licensing of the Motion control technology functions. It contains the license for the unlimited use of the CAM technology function on a SIMOTION device, e.g. a C240, a D4x5-2 or a P320-4.

- TControl technology function
  The use of the TControl technology package functions is licensed on a channel-specific basis in packages of eight temperature channels.
- IT functions, IT DIAG, and SIMOTION IT
  The use of these functions is licensed for each SIMOTION device.

Note

Another option is to order SIMOTION memory cards (MMC and CF) and SIMOTION P320-4 with pre-installed runtime licenses.

Additional references

Further important information for the licensing of the runtime software and the ordering data can be found in:

- Catalog: SIMOTION, SINAMICS S120 and Motors for Production Machines
- PM 21 catalog, section titled SIMOTION runtime software
- Configurator for SIMOTION Runtime Licenses in the Industry Mall (http://mall.automation.siemens.com)

Licenses and license key

Depending on the type and number of runtime components used in the project, licenses must be acquired as part of the licensing procedure for SIMOTION. The licenses required for a SIMOTION device are assigned to a license key. This license key is stored on the storage medium of the SIMOTION device during the licensing procedure.

There are two ways of ordering the licenses:

- Preinstalled licenses
  The license key is already stored on the card.
- Ordered licenses (Certificate of License)
  These licenses must be assigned to the storage medium using the Web-License-Manager. The determined license key is transferred to the hardware using SCOUT.

You require the following information to obtain the license key:

- The serial number of the SIMOTION device storage medium
  You can obtain the serial number from the storage medium or have it displayed online in the SIMOTION SCOUT (licensing wizard).
- The serial number of the CoL (Certificate of License)
  You have this number on paper.

Table 3-29 The serial number on the SIMOTION hardware assigned to the SIMOTION device

SIMOTION device	Hardware serial number of the module
SIMOTION C2xx	SIMOTION Micro Memory Card
SIMOTION P	The serial number is located on the rating plate of the SIMOTION P, starting with SVP...
SIMOTION D	SIMOTION CompactFlash Card

License keys can be generated separately from the licensing.

Note

When the SIMOTION Memory Card is deleted or formatted, the licensing data is also deleted. Archive the licensing data in order to be able to transfer it again to the storage medium in such a case. If the data is not backed up, you have to perform the licensing again. You can display the entered license key in the Web License Manager.

You will find additional information in the section:
License key is protected from deletion (as of kernel V4.1) (Page 366)

See also

FAQ - Dealing with licenses (http://support.automation.siemens.com/WW/view/en/36947932)

Determining licensing requirements

Note

Determine your license requirement only after you have completed the configuration! A license that has been assigned a license key cannot be withdrawn.

Once you have completed your project configuration with SIMOTION SCOUT and before you download it to the target device, you can determine the licenses required for the project. You have three options for determining license requirements. Before you begin, the project must have been saved and compiled. If you have not yet acquired any licenses, underlicensing is displayed.

Options for determining license requirements are as follows:

- **Offline mode** with open project
  The required licenses are displayed.
- **Online mode** with open project
  A comparison of the required and actual licenses is displayed.
- **Online mode** without project
  The actual licenses of the selected SIMOTION device are displayed.

Proceed as follows:

1. Select the **SIMOTION device** in the project navigator.
2. Select **Licenses** in the context menu.
   The required licenses for the project or a comparison of required and actual licenses are displayed.
3. You can close the window with **X** or continue with **Perform licensing...**.

The license check, i.e. the inspection of the license keys, is carried out in the target system. Possible responses in the case of underlicensing are described in the Underlicensing section.

Note

Memory cards can be purchased with integrated runtime licenses, which do not require separate licensing.

Displaying existing licenses of the SIMOTION device

Displaying via accessible nodes

You can use the list of **Accessible nodes** to determine the specific licenses that have already been assigned to the SIMOTION device. You can access the data of the SIMOTION device directly.

Note

This step is not necessary if the required and actual licenses are displayed within a project.

Requirements:

- SIMOTION SCOUT is running
- SIMOTION SCOUT is in online mode
- **No** projects are open

Proceed as follows:

1. Select the **Project > Accessible nodes** menu.
   The list of accessible nodes is displayed in the working area.
2. Select the relevant SIMOTION device.
3. Select **Licenses** in the shortcut menu.
   The Licenses dialog box appears, showing the actual licenses for the selected SIMOTION device.
4. You can close the window with **X** or continue with **Perform licensing...**.

Performing the licensing

To perform the licensing:

If there are no pre-installed licenses, you can acquire the licenses you need and then generate the license key required.

Requirements:

- Configuration has been completed
- The project has been saved and compiled
- The required licenses have been determined
- The license key has been determined or the serial numbers of the memory medium and the CoL are available
- SIMOTION SCOUT is in online mode

Proceed as follows:

1. Select the relevant SIMOTION device in SIMOTION SCOUT.
2. Open the context menu and click Licensing.
3. In the Licenses dialog box, click **Perform licensing...**
   If the Use wizard checkbox is activated, a wizard guides you through the licensing procedure.
   If the checkbox is not activated, the window for the expert licensing is opened. You can enter the license key there without running through the wizard.
   If you have not yet generated the license key, the wizard gives you the option to switch to the Web tool to generate one. Then switch back to the wizard.
4. If you have an online connection, continue with item 5.
   Otherwise, you can establish an online connection with **Online** in the **Step 2 of 3** window.
5. Enter the license key in the **Step 3 of 3** window.
6. Click **Finish**.
   The wizard is closed. Licensing is complete.

Note

The license key is written to the retentive memory when the project data is transferred to the target system.

Changing the license key

The license key is influenced by changes to the project, such as expanding it to include an additional axis. This is why underlicensing is displayed when the project is downloaded and the SF LED flashes at 0.5 Hz.

After you have determined the actual requirement and purchased the necessary licenses, generate the license key again. Now replace the license key already entered with the newly generated one.

License key is protected from being deleted (as from Kernel V4.1)

The license key is stored in the "KEYS" directory on the SIMOTION Memory Card.

When the controller starts up for the first time, the license key will be saved in the boot sector of the card and from this time is protected from being lost.

Operator actions cannot delete the license key in the boot sector. Also not by formatting the card or with the "Write boot sector..." function.

If the license key is no longer present on the card, it will be written again during the startup from the boot sector into the "KEYS" directory. This means that the system will repair any deletion on the "Key" file.

The license key can be changed at any time, for example, by relicensing. At the next startup, the license key will be saved again in the boot sector.

Licensing during hardware replacement

For the replacement of licensed SIMOTION components (MMC, CF, IsoPROFIBUS board or PN board), the associated license key must be assigned to the new SIMOTION component. In this case, contact the Customer Support for assistance.

Underlicensing

If SIMOTION SCOUT detects the presence of underlicensing during license verification, an entry is made in the diagnostics buffer. The verification is repeated every hour, and an entry is made in the diagnostics buffer each time underlicensing is detected.

The following information can be read from the diagnostics buffer entry:

- Number of required licenses
- Number of actual licenses
- Operating mode

As an additional warning signal, the SF LED flashes at 0.5 Hz as long as underlicensing is present on the system. Underlicensing will only be displayed if no acknowledgeable technological event is pending, as the same SF LED is used to indicate this as well.

3.3.6.14 Writing the boot sector

There are various reasons why it might prove necessary to write a boot loader, such as when new firmware is used on older hardware. Use the **Options > Write boot sector** menu in SIMOTION SCOUT to enable the boot sector on a memory card to be rewritten.

Additional references

For additional information on this topic, refer to:

- SIMOTION D4x5 Commissioning and Hardware Installation Manual
- SIMOTION D4x5-2 Commissioning and Hardware Installation Manual
- SIMOTION D410 Commissioning Manual

- SIMOTION D410-2 Commissioning and Hardware Installation Manual
- SIMOTION SCOUT Online Help

3.3.7 Target system

3.3.7.1 Overview

In online mode, you can control the SIMOTION device with SIMOTION SCOUT, e.g.:

- Change and compile program sources
- Download
- Control operating mode
- Set the internal clock of the SIMOTION device
- Change Configuration Data in RUN Mode
- Control variables in RUN
- Copy current data to RAM
- Copy RAM to ROM
- Delete the RAM of the SIMOTION device (overall reset)
- Archive project data

3.3.7.2 Going online/offline with SIMOTION SCOUT

Online access points

You have two access points for communication between SIMOTION SCOUT and controllers and single drive units:

- **S7ONLINE**

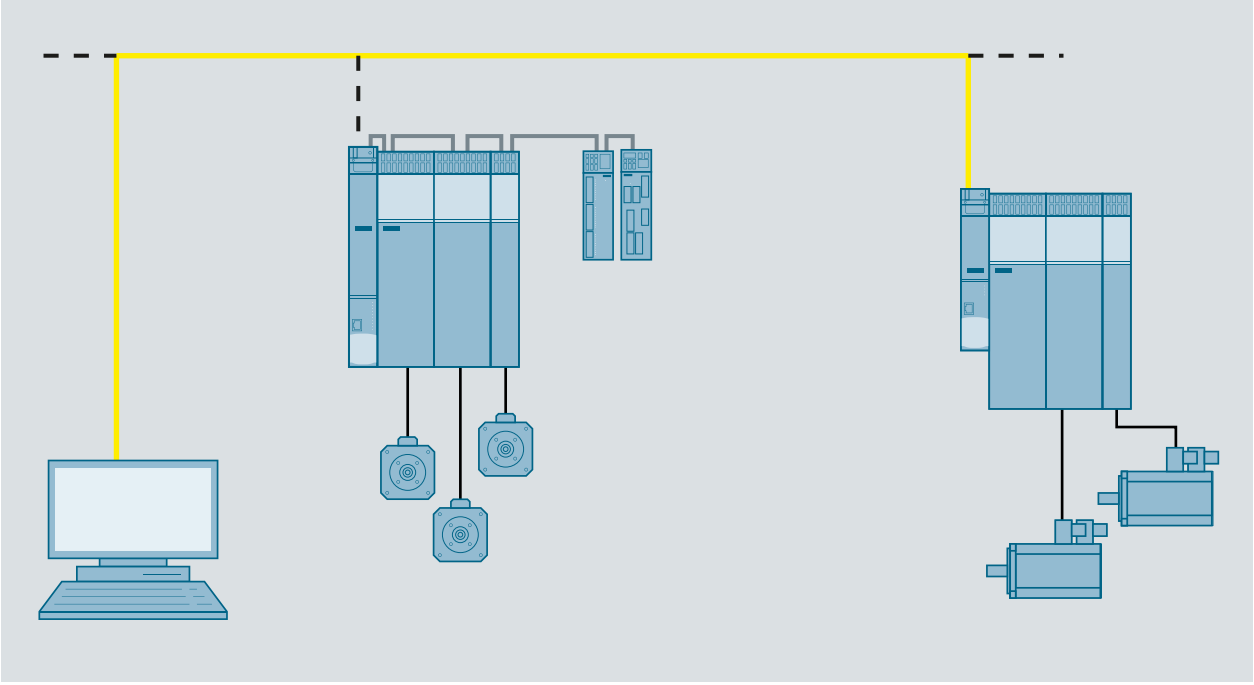

Figure 3-168 S7ONLINE

- **DEVICE**

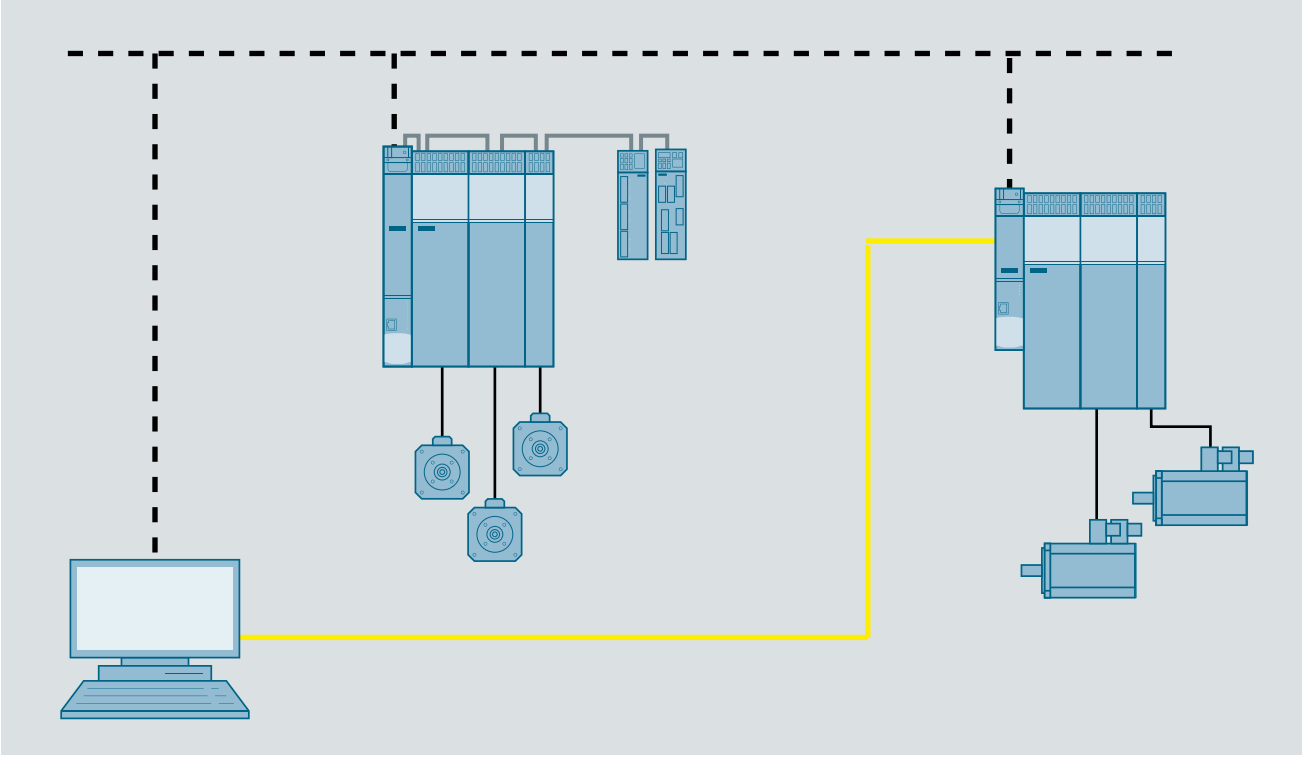

Figure 3-169 DEVICE

It is therefore possible to configure both access points for a device and to go online via these points.

Available nodes

The "Accessible nodes" function in SIMOTION SCOUT enables you to identify devices in a network, apply them to a project, and go online with them.

Note

The search for accessible nodes assumes that no online connection with an opened project exists.

Displaying accessible nodes

Proceed as follows to identify accessible nodes:

1. Select **Project > Accessible nodes** in the menu.
   All the devices found in the network are listed in the working area below the **Accessible Nodes** folder. Type information is also displayed for the devices.

Assigning interface parameterization to an access point

To create a connection between the access point, the interface parameterization, and the interface, proceed as follows:

1. Click the **PG/PC...** button to open the **Set PG/PC interface** dialog.
2. At **Access point of the application**, select the DEVICE access point to which you assign the interface parameterization.
3. Select one of the interface parameterizations to assign it to the access point, modify its properties, copy it, or delete it.
4. Click **OK** to accept the settings.
5. In the working area, click **Update** to restart the search for accessible nodes.

Searching for accessible nodes via the IP address

With TCP/IP interface parameterization you can search for nodes via the IP address. Enter the IP address in the **IP address of the sought node:** field.

For the automatic detection of accessible nodes via a PG/PC interface with TCP/IP, the nodes must be connected to the same physical Ethernet subnet as the PG/PC. Once a device is behind an IP router and so located in another physical Ethernet subnet, this device will no longer be automatically detected in the **accessible nodes**.

You can also enter an IP address and check whether it is possible to access a node downstream of an IP router with the configuration currently set on the Ethernet adapter located in the PG/PC (IP address / subnet mask).

Displaying additional information

To display additional information about identified devices, proceed as follows:

1. Right-click on a device or drive unit and select, for example, one of the following options from the context menu:
   - Device diagnostics
   - Operating state
   - Licenses

Going online with accessible nodes

Via **accessible nodes**, you can go online on devices for which no access has been configured in the project. Device type and address are determined automatically. If the device is in another subnet, you must enter the address manually in the interface properties of the device for the DEVICE access point.

Note

DEVICE must be set as access point for this function.

Assigning devices

To go online on a device that has not yet been assigned to the project, you must add the device to the project.

To add the device to the project, proceed as follows:

1. Select a device in the **Non-assigned devices - My project** or **Non-assigned devices - Accessible nodes** list.
2. Click the **Assign button to move the device to the Assigned projects** list.
3. Click **Connect to assigned devices** to go online with the devices.

Cancelling an assignment

To undo the assignment of a device to the project, proceed as follows:

1. In the **Assigned devices** list, select the desired device.
2. Click the **Cancel assignment** button.

Note

The SINAMICS Integrated or an assigned CX32-2 is always also selected for a SIMOTION D.

Setting the access point on the PG/PC

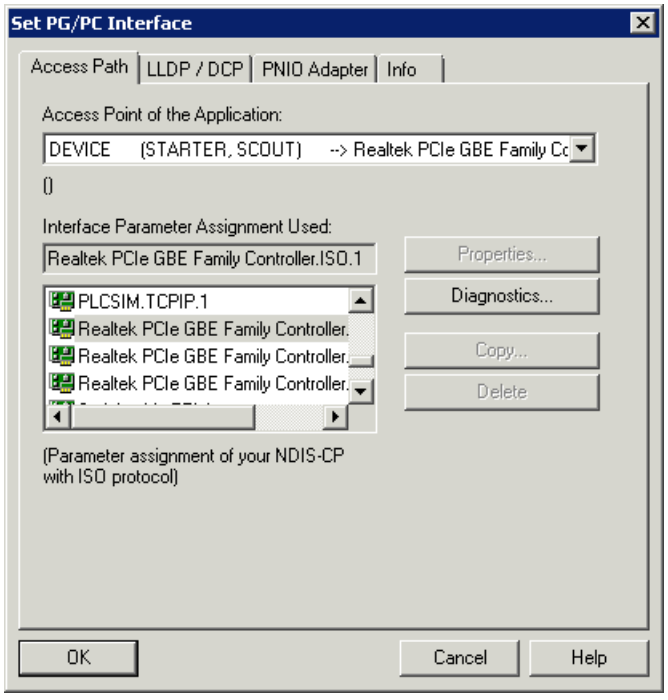
Note

The data for the PG/PC interface can only be changed when the interface is not online. If several instances of SIMOTION SCOUT have been started, an online connection may be established from only one of the instances. An attempt to go online simultaneously from several SIMOTION SCOUT applications to different CPUs results in errors.

Setting the access point

Proceed as follows to set the access point:

1. Select **Options > Set PG/PC interface** in the menu.
   The **Set PG/PC interface** dialog opens.
2. Select the desired access point at **Access point of the application**:



3. At **Interface parameterization in use**, select the interface with which you want to go online via the selected access point.
4. Confirm your selection with **OK**.

Select target devices

With the target device selection, you specify whether this device is to be used to go online when you perform "Connect to selected target devices".

Procedure

To select a target device, proceed as follows:

1. Select **Target system > Select target devices...** in the menu.
   The **Target device selection** dialog opens.

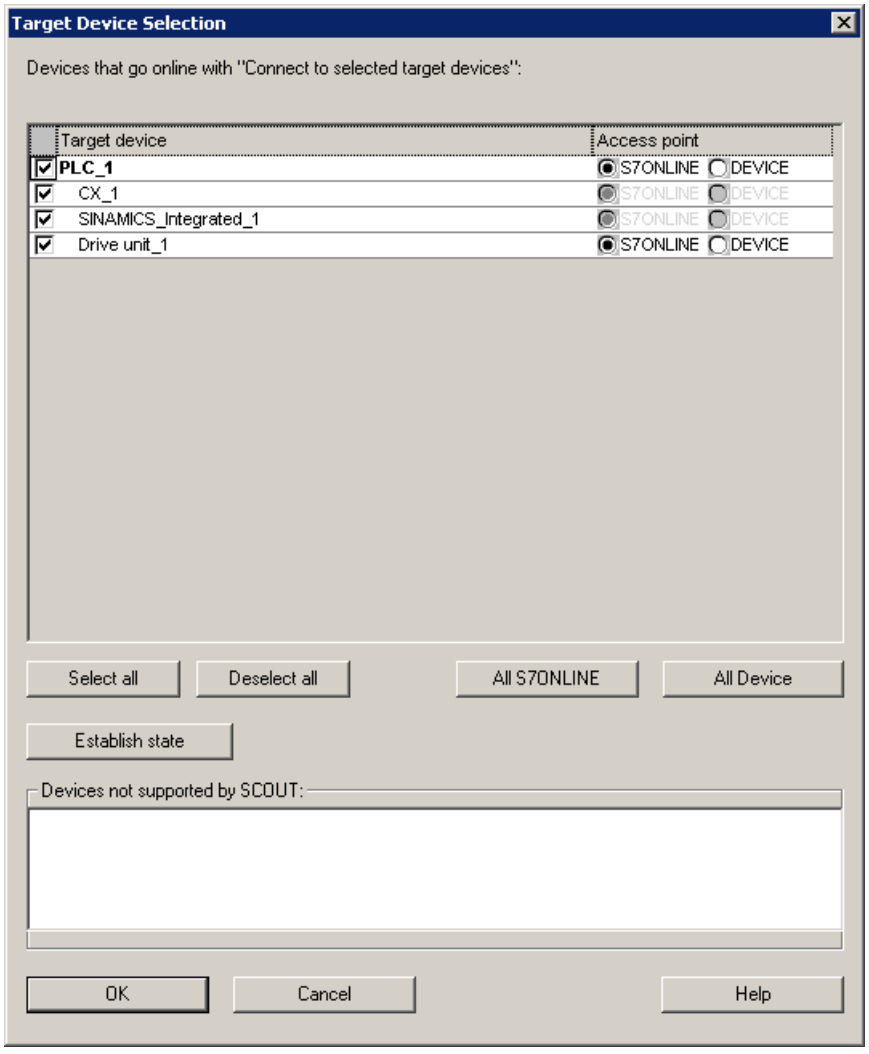


Figure 3-170 Selecting target devices and access points

2. Activate the checkbox for the respective device.
3. Click the **Establish state** button to:

- Establish a connection to a device that was deselected when going online and that has been subsequently selected.
- Separate a connection to a device that was selected when going online and that has been subsequently deselected.

3.3.7.3 Controlling the operating mode with SIMOTION SCOUT

> **⚠ WARNING**
>
> **Danger to life from unexpected machine movement**
>
> If the operating state is not switched under controlled conditions, this may endanger the safety of personnel and the machine.
>
> - Observe the safety regulations before you control a SIMOTION device via the mode selector switch in SIMOTION SCOUT.

Switching SIMOTION devices to RUN or STOP operating state

Proceed as follows:

1. Open the **Control operating state** dialog:
   Select the **Target system > Control operating state** menu. Or click the **Control Operating State** icon in the toolbar.

   The call is possible if at least one CPU of the project is in online mode.
2. In the **Control operating state** dialog, select the desired operating state **RUN** or **STOP** for the displayed devices. To do so, click the assigned button.
3. The **State** field reports whether it was possible to change the operating state.

Control operating state dialog

The dialog shows the operating state of all configured CPUs. The display can be filtered. The change of operating state is possible per device, or for several devices simultaneously.

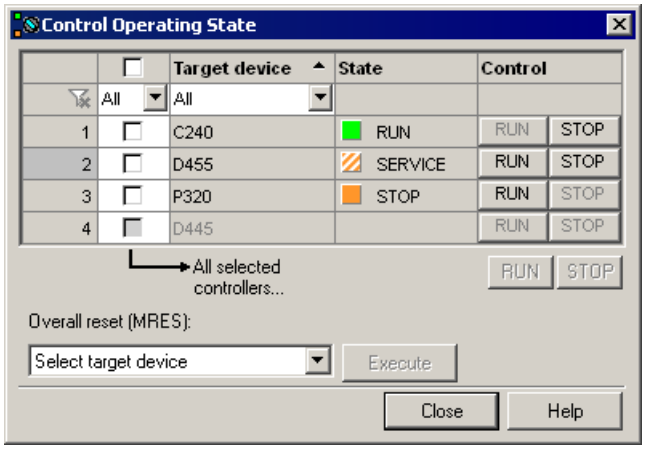

Figure 3-171 Mode selector switch as of SIMOTION V4.4

Note

As of Version 4.4, the **Control operating state** dialog represents all configured SIMOTION devices. The previous dialog had to be opened individually for each CPU.

Overall reset is possible in the dialog as before. You will find additional information about overall reset in the section Overall reset (Page 380).

The SIMOTION P State tool is retained unchanged.

Listed devices

The **Target device** column shows the names of the CPUs available in the project. The order corresponds to the order of the CPUs in the project navigator.

Offline/online distinction

If a CPU is in offline mode, the name of the CPU and all other assigned elements are grayed out in the table line.

The checkbox is always open for input.

Filtering

The list of the CPUs can be filtered using the following criteria:

- Selection by checkbox
- Name, or part of the name, of the CPU
- CPU in online mode

Filtering the display using checkboxes

The display can be restricted to CPUs that are activated in the checkbox columns. The field in the header of the checkbox column provides a choice of the following filter values.

Table 3-30 Filter values in the checkbox column

Filter value	Filter result
All	All CPUs are displayed, regardless of whether or not a checkbox is activated.
Set	Only CPUs with activated checkbox are displayed.
Not Set	Only CPUs without activated checkbox are displayed.

If the dialog is called from the context menu of a CPU, this CPU is automatically preselected (**Context menu > Target device > Operating state**).

All CPUs can be selected or deselected with the checkbox in the header.

Filtering the display by operating state or CPU name

The selection field in the header of the **Target device** column offers the following filter values:

Table 3-31 **Filter values in the Target device column**

Filter value	Filter result
All	All CPUs are displayed, regardless of whether they are in online or offline mode
Online	Only CPUs that are in online mode are displayed.
User-definable	The field can be edited, thus enabling filtering according to parts of names. Up to five user-defined filters remain for selection.

Operating states

State column: Shows the state of the CPUs in text form and via static LEDs.

Table 3-32 Operating states of a SIMOTION device

Operating state		Description
Text	**LED**	
STOP	(orange)	• Technology objects **inactive** (enables deleted, no axis motion) • User program is not executed • Loading a user program is possible • All system services are active (communication, etc.) • All analog and digital outputs set to 0 • The I/O modules (signal modules) are in the safe state (SIMOTION D)
STOP U	(orange/white)	• Technology objects are **active** • Technology objects can execute jobs for testing and commissioning functions. • Otherwise identical to STOP operating state • STOP U means stop user program • User program is not executed
RUN	(green)	• Technology objects are **active** • Execution of the user programs assigned to the execution system • Loading a user program is possible • Process image of the inputs and outputs is read or written
STOP	(orange/white)	• All tasks shut down, operating system stopped, real-time clock continues to run.
STARTUP	(orange/white)	• The display only appears if the state persists longer than 1 second, or in the event of a fault.

Operating state		Description
Text	**LED**	
SERVICE	(orange/white)	• Display, e.g. if master control has been fetched via the axis control panel.
SHUTDOWN	(orange/white)	• Display appears only if the state persists longer 1 second.
(empty)	(empty)	• CPU is in offline mode

Control operating state

A CPU can be switched to the designated operating state with the RUN and STOP switches. The switching options are dependent on the position of the mode selector switch on the SIMOTION device. The setting on the device takes priority.

Table 3-33 Switching options of the software switch dependent on the position of the mode selector switch on the SIMOTION device.

Mode selector switch position of the SIMOTION device	Switching option in the SCOUT "Control operating state" dialog
STOP	STOP
STOP U	STOP
RUN	RUN, STOP
MRES	STOP

Note

As of V4.4, manual switching to the **STOP U** operating state is no longer possible in the SCOUT **Control operating state** dialog.

If a CPU is in offline mode, both the RUN and STOP buttons are deactivated.

Simultaneous control of several CPUs

CPUs that are in online mode and that are selected in the filter column can be switched simultaneously to the RUN or STOP operating state. To do so, click the RUN or STOP switch below the list.

Observe that the switches only switch the CPUs that are visible in the dialog. For this reason, check the effect of the name filter in the **Target device** column.

Error messages

A CPU that can no longer assume the required state is indicated in color. The **State** cell changes to red or yellow/orange.

- Red: Error
- Yellow/orange: Note

A single click on the corresponding cell causes an error text or information text to appear in a roll-out tip.

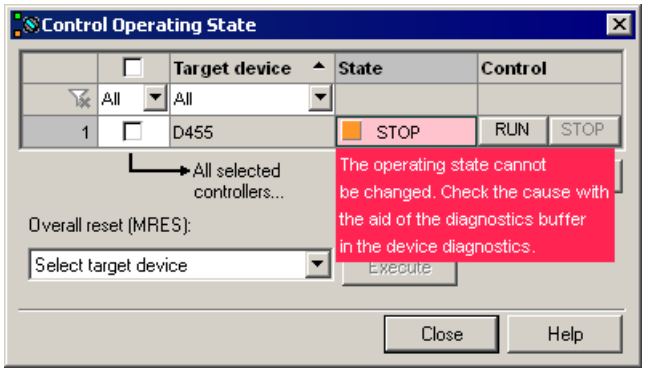

Figure 3-172 Roll-out tip with error description

Priority of the mode selector switch on the SIMOTION device

The setting of the mode selector switch on the SIMOTION device has priority. SIMOTION SCOUT can only switch a SIMOTION device to RUN mode if the mode selector switch on the device is set to **0** or **RUN**.

- **SIMOTION D**
  You can find the mode selector switch of the D410-2 and D4x5-2 in the lower area of the front behind the blanking cover.

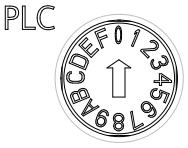

Figure 3-173 D410-2 and D4x5-2, mode selector switch, switch position 0 (RUN)

- **SIMOTION C**

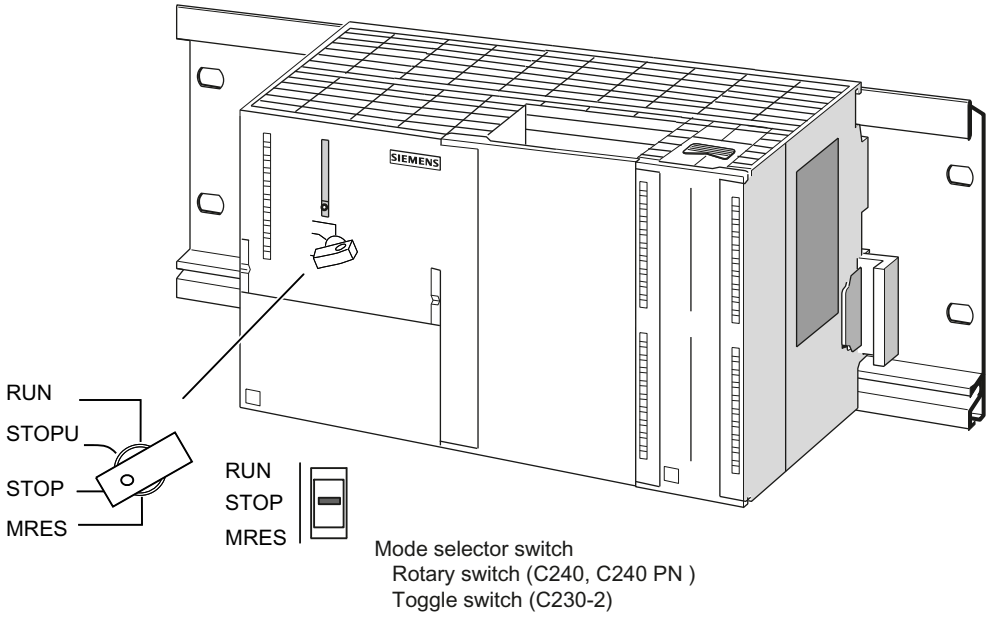

Figure 3-174 SIMOTION C240 module front

- **SIMOTION P**
  With SIMOTION P, the mode selector is displayed via the SIMOTION P Startup application. You can call this via **Start > Programs > SIMOTION P Startup**.
  For more information, see the SIMOTION P Manual.

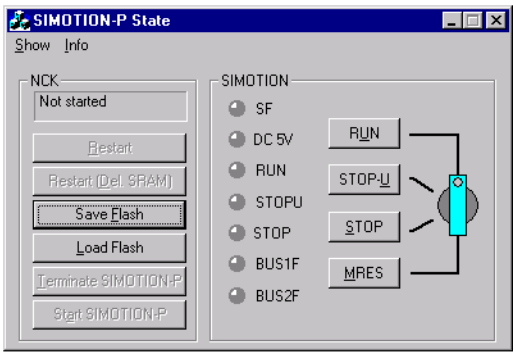

Figure 3-175 SIMOTION P state application

and the SIMOTION SCOUT online help.

3.3.7.4 Overall reset

The SIMOTION device for which overall reset is to be carried out must be online.

Proceed as follows:

1. Open the **Control Operating State** dialog. Select the **Target system > Control operating state** menu command. Or click on **Control Operating State** in the toolbar.

   The call is possible if at least one CPU of the project is in online mode.

2. Switch the SIMOTION device for which overall reset is to be carried out to **STOP** in the **Control Operating State** dialog.
3. Select the SIMOTION device under **Overall reset (MRES)**. Click the **Execute** switch. Click **Yes** to confirm the safety prompt.
   The overall reset will now be performed.

3.3.7.5 Setting the time of day

Proceed as follows:

1. Select the SIMOTION device in the project navigator.
2. Select the **Target system > Set time of day** menu.
   The current date and the time of day of the PG/PC and the SIMOTION device are displayed.
3. Change the date and time of day of the SIMOTION device, if necessary:
   If you want to accept the values from the PG/PC:
   – Activate the **Accept from PG/PC** checkbox.

   If you want to enter values:
   – Deactivate the **Accept from PG/PC** checkbox.
   – Enter the values in the corresponding fields (**Module**).

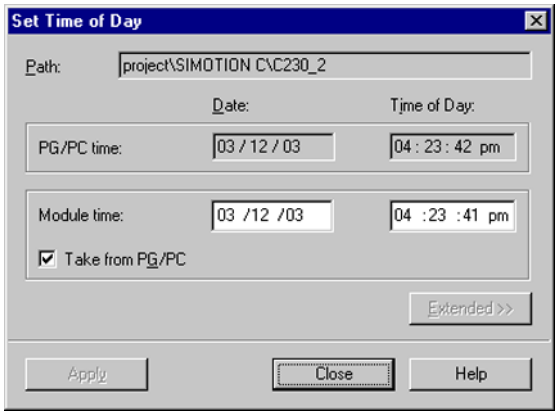

Figure 3-176 Setting the time of day

3.3.7.6 Loading data to the target system

You have to download the project data that you have created with SIMOTION SCOUT to the target system. The target system can consist of several CPUs (SIMOTION controllers).

The project data contains the programs (ST, MCC, LAD/FBD, and DCC) that you have created and compiled, the hardware configuration, and the technology objects that you have created and to which you have assigned parameters.

Additional references

The exact download procedure is described in:

- SIMOTION Basic Functions Function Manual

3.3.7.7 Archive project data to memory card

The **Target system > Load > Archive project on card...** function archives the complete SCOUT project on the MMC/CompactFlash card or the internal CFast or SSD of the P320-4 .
The **Target system > Copy archived project from card to the PG/PC...** function loads the archived SCOUT project from the card or the hard disk.

A zip file is archived. This function is only possible in the online mode. In addition to the zip file, an info file is saved. The **Target system > Load > Copy archived project from card to PG/PC** function can be used for this purpose. The following contents are written to the info file:

- The project name
- The size of the zipped project file
- The storage date

For further information, see also Section Service with SIMOTON SCOUT (Page 414).

3.3.7.8 Loading to the file system

As for a download to the target device, select **Edit > Target system > Download to file system** to save data of a device to a Memory Card / CF card directly via a card adapter on the PC. Alternatively, the device data can also be saved locally on a hard disk. The data can then be copied later to a Memory Card / CF card.

Note

A project is always created for exactly one kernel version and one device type and will only run on the relevant SIMOTION device if this exact kernel version and this device type are available. If this is not the case, the SIMOTION device remains in STOP operating state.

For further information, please refer to the online help for SIMOTION SCOUT.

3.3.8 Upgrading and project updates

3.3.8.1 General information

Prerequisite

You want to upgrade the firmware or change the platform within a station type.

Swapping modules involving SIMOTION families

Module replacement is only possible within the same device family:

- Within SIMOTION C
- Within SIMOTION D410
- Within SIMOTION D410-2
- Within SIMOTION D4x5
- Within SIMOTION D4x5-2
- Within SIMOTION P

The change involving the SIMOTION families (SIMOTION C, SIMOTION P, SIMOTION D410/ D410-2 and SIMOTION D4x5/D4x5-2) requires an XML export.

Procedure

The procedure in the Engineering System depends on what is involved:

- Upgrading the firmware version of a device within a platform
- Platform change: The platform is changed within the same SIMOTION version. For example, a SIMOTION C240 is replaced by a SIMOTION P320-4.

The sections Upgrading and changing platforms for a SIMOTION device (Page 383) and Upgrading devices and updating projects with the device update tool (Page 387) contain further information.

3.3.8.2 Upgrading and changing platforms for a SIMOTION device

Changing a SIMOTION device and subsequent TP upgrade (within a platform)

An upgrade is necessary when you want to replace the type or version of the SIMOTION device in your existing project. Perform this replacement in HW Config.

To replace a SIMOTION device:

1. Double-click the SIMOTION device to be replaced in the project navigator in SIMOTION SCOUT. HW Config opens.
2. Open the appropriate folder structure in the hardware catalog:
3. Select the module of the new version in the hardware catalog and drag this above the old module with the mouse (to the header of the rack shown in the case of SIMOTION D, to slot 2 in the case of SIMOTION C and P).

   Note

   Ensure that the module/device (SIMOTION D) to be replaced **does not get deleted.** When you change to the new module/device using drag-and-drop, the old module will be updated.

4. Confirm the displayed dialog box with **Yes** if you want to replace the SIMOTION device.
5. Alternatively, select the SIMOTION device and call the context menu by right-clicking in the header area of the device. Then select the **Replace object ...** command followed by the version required.

6. Accept the changes made to the hardware configuration with **Station > Save and compile**.
7. Close the HW Config.

Note

The data for the SIMOTION device is immediately accepted in the SIMOTION SCOUT project and the **entire project** is saved. In this way, the project also accepts all changes in the project (e.g. axis configuration).

If you are using technology packages in your project, these are updated automatically.

If the device replacement is made in the HW Config without open SIMOTION SCOUT, the update is made in SIMOTION SCOUT only after the project has been reopened.

The device replacement process differs from the platform replacement process in that it is really easy to accept project data during device replacement. Device replacement uses HW Config, whereas platform replacement (e.g. replacement involving SIMOTION C and D) requires an XML export/import.

Examples of device replacement:

- Replacement involving different power classes (e.g. D445-2 DP/PN <-> D455-2 DP/PN)
- Replacement involving generations (D4x5 -> D4x5-2)
- Replacement involving variants (D410-2 DP <-> D410-2 DP/PN; C240 <-> C240 PN)
- Replacement involving the main version (C240 V4.1 <-> C240 V4.2)

Upgrade of libraries

When the version of a SIMOTION device and the technology packages changes, the libraries created in SIMOTION SCOUT must also be adapted.

1. Select a library in the project navigator.
2. Right-click and select **Properties...** in the context menu.
   The Object Properties window opens.
3. Click in the **Technology packages** tab.
4. Activate the **Device-specific** option if the device library should be used.
5. Select in the associated tables the appropriate device and the technology packages.
6. Click **OK** to confirm the changes.
7. Select the same library.
8. Right-click and select **Save and compile** in the context menu. The upgrade is completed.
9. Repeat the operations for all created libraries.

Changing the SIMOTION platform

Platform changes involving, for example, the following SIMOTION devices:

- SIMOTION C
- SIMOTION P
- SIMOTION D

Proceed as follows:

1. Export the SIMOTION CPU data to be replaced via the **Expert > Save project and export object** context menu.
2. Create a new SIMOTION device involving a different platform. This will be automatically inserted in the project navigator.
3. Insert a new SIMOTION device or several master systems and configure them. The HW Config opens. The new station and the created master systems are already inserted.
4. Also open the old station in the HW Config. Switch to the old station.
5. Copy the DP slaves.
6. Switch to the new station.
7. Insert the DP slaves in the new station.
8. Check the configuration of the elements of the new station.
9. Close the HW Config.
10. Delete the old device in the project navigator.
11. Perform an object import on the new device with the previously exported data.

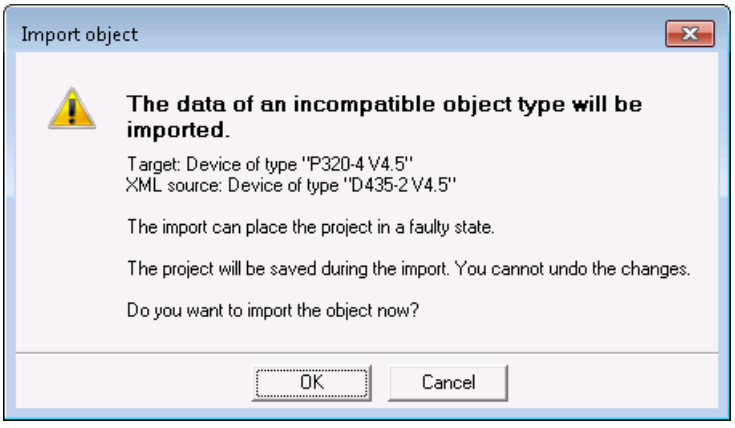

Figure 3-177 Example of importing an object with a station change

Connecting drives/slaves after platform changes

It may no longer be possible to assign drives/slaves after a platform change. To correct this, repeat the process with the original project (prior to platform replacement).

Upgrading technology packages

Overview

The SIMOTION TP technology packages (e.g. TP CAM, TP PATH, DCBlib) are available in various versions.

You can only use the functions of the technology objects selected if the technology objects are available in the target system. You can select the technology packages and their version for each SIMOTION device. Each version of SIMOTION SCOUT has a kernel (FW version) for the SIMOTION CPU and an associated technology package with the same version.

TPs during upgrades

Device replacement (in HW Config), platform replacement (XML export/import), or even upgrades may cause versions of SIMOTION technology packages (TPs), which are assigned to individual technology objects (TOs), to change.

- The TP version may change if the main version changes
  The TP version depends on the relevant main version in all cases; it may, however, remain unchanged through a number of main versions.
- If service packs and hotfixes are installed, there may even be a selection of TP product versions available for the same TP version

The TP version is automatically updated during device replacement (in HW Config). With a platform replacement (XML export/import), however, the required technology package along with the TP version and, if necessary, the product version have to be selected manually after the import.

It is also possible to define a specific TP product version (by selecting V4.1.5.3, for example).

If the product version

- "Vx.x.x.x" is displayed, the version cannot be determined (as with TP DCBlib, for example).
- "Select" is displayed, this means the TP product version has yet to be selected; if the TP is loaded to the CPU without any prior selection having been made, the latest available technology package is loaded automatically.

Selecting the TP product version

Selecting **Target device > Select Technology Packages ...** in SIMOTION SCOUT enables you to adopt a more targeted approach when choosing the technology packages you want to use.

Note

Device diagnostics can provide information on which technology package product version has been loaded to a CPU.

Loading technology packages to the target device

Technology packages are only loaded to the target device if no technology package has been loaded so far or if **Load to File System** is executed.

If a technology package version changes, the technology package must be explicitly reloaded to the target device.

Proceed as follows:

1. Select **Download project to target system** in SIMOTION SCOUT.
2. Select the **Replace product versions of the technology packages** option and confirm with **OK**.

For further information, please refer to the online help for SIMOTION SCOUT.

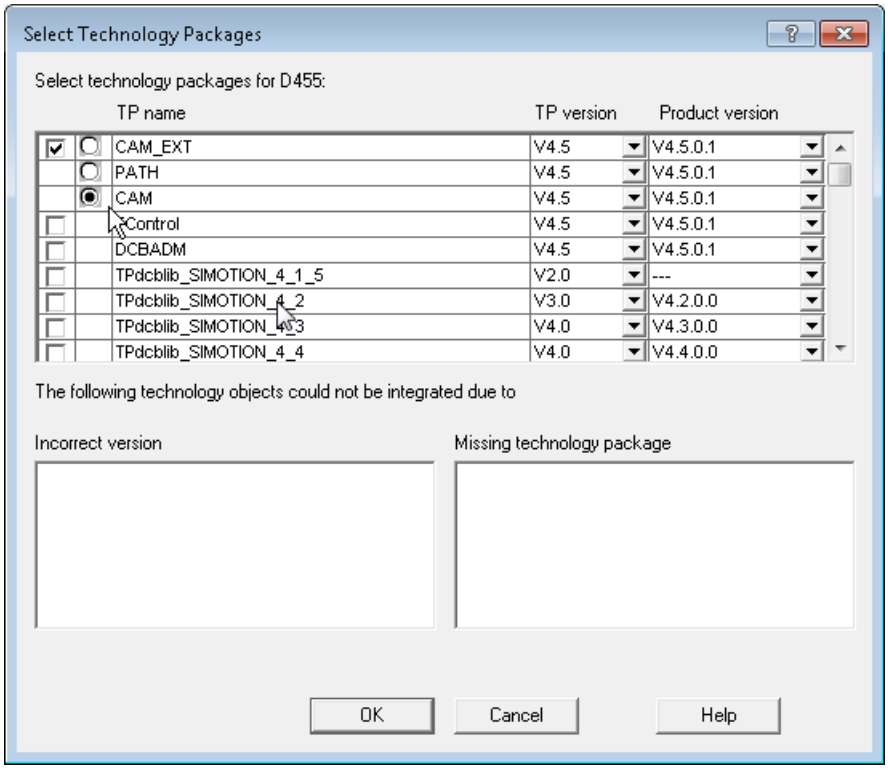

Figure 3-178 Select Technology Packages

3.3.8.3 Upgrading devices and project updates using the device update tool

Overview

SIMOTION offers a convenient solution for machine manufacturers and machine operators to update SIMOTION devices or SIMOTION projects.

Updating does not simply refer to an update to a higher version of firmware; rather, in general terms it refers to switching to a defined configuration, e.g. a project update. It is also possible to return (restore) to a previous configuration. Update or restore procedures can easily be

performed on SIMOTION devices locally or remotely. The data can be imported to a SIMOTION device via a convenient and handy storage medium or a communication connection.

Note

For SIMOTION P, there are currently only plans to update the project data, technology packages and user data. Firmware cannot be upgraded given the dependency on other Windows components.

Update data and update media

The update data is created by SIMOTION SCOUT based on one or more SIMOTION projects. All information required for the update is contained in the update data. This includes:

- SIMOTION project
- Technology packages
- User data
- Firmware

After the update data has been created, it can be handled flexibly depending on the SIMOTION device in question (SIMOTION C, D, or P). The storage or update medium can take the form of:

- CF/MMC card
- USB memory stick or
- SIMOTION IT DIAG file

Update wizard and Device Update tool

Call up the update wizard via SIMOTION SCOUT. This will give you a step-by-step guide to creating the requested update data, which is then either saved in an update archive or imported directly to an update medium.

1. Select the **Project > Start Device Update tool** menu, either directly in SIMOTION SCOUT or in an open SIMOTION project.

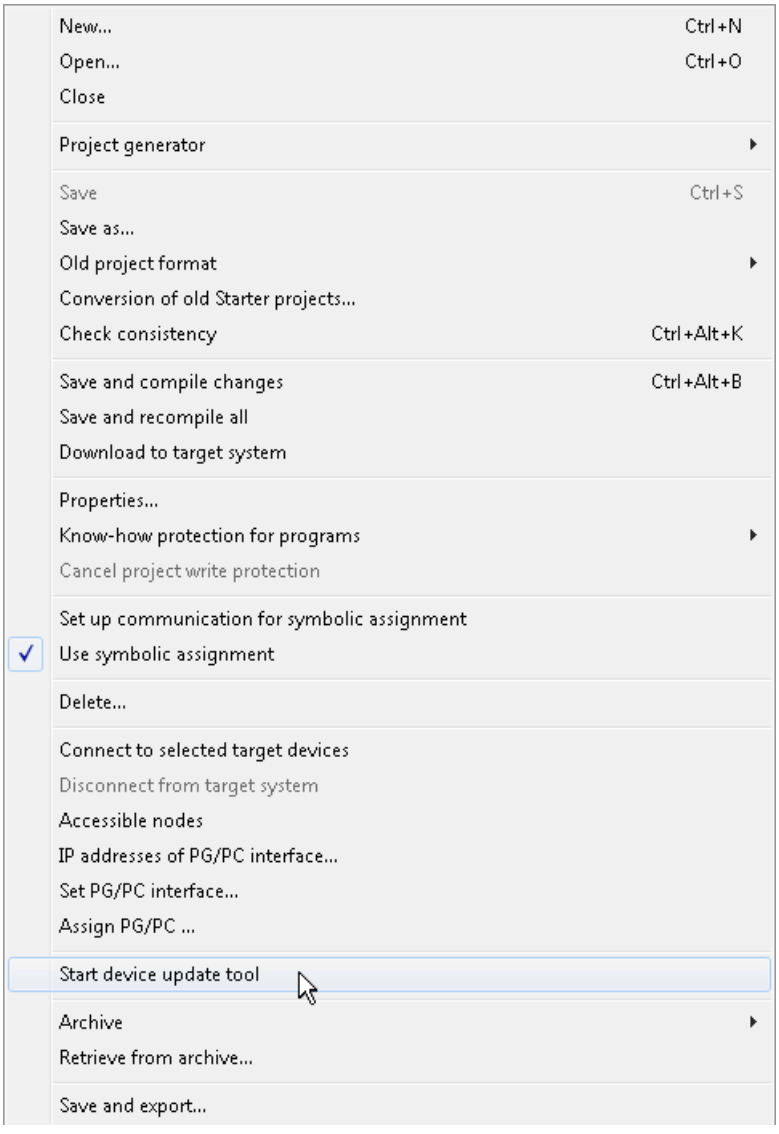

Figure 3-179 SIMOTION SCOUT - Starting the SIMOTION Device Update tool

2. The update wizard opens with the start screen. Now you can select the data for updating from the SIMOTION project to the SIMOTION device on a step-by-step basis, and specify whether you want to update subsets or the entire project.

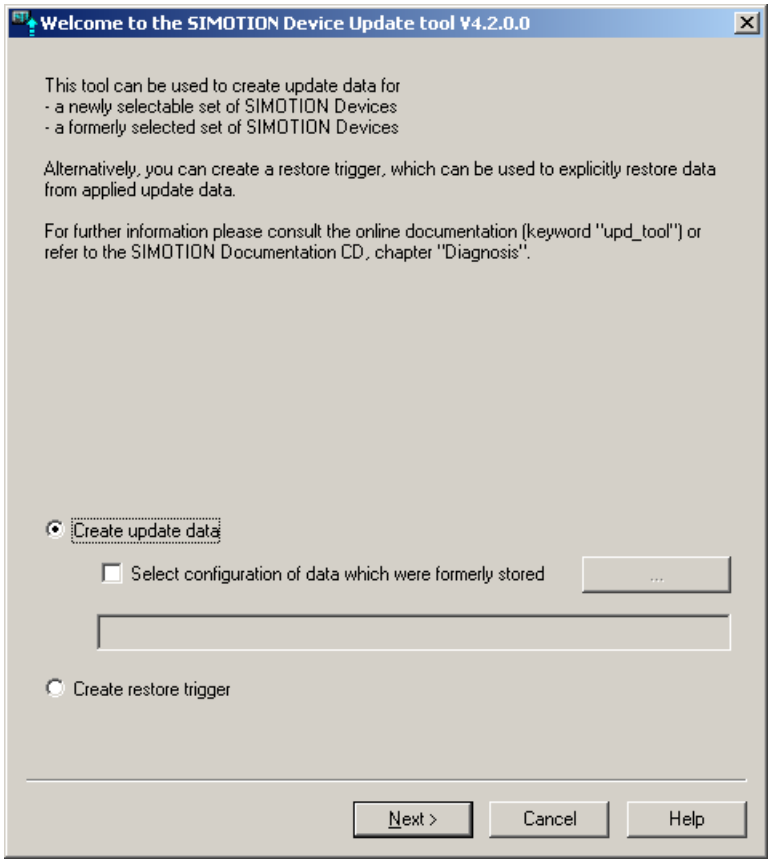

Figure 3-180 Wizard start page: Device Update tool

Additional references

A detailed overview of the update process can be found in:

- Operating Manual: Upgrading SIMOTION Devices
- SIMOTION SCOUT Online Help

3.3.9 Diagnostics

3.3.9.1 Overview of the possible diagnostic functions

A wide range of diagnostic functions can be used for the operation of SIMOTION devices in the online mode. These diagnostic options are summarized in the diagnostics overview:

- The diagnostics overview is a tab in the detail view and is available by default in online mode. You can call up detail displays from here.
- An Alarms tab is also available in the detail view. This provides a tabular overview of
  - Technological alarms (from technology objects)
  - Alarm_S messages (from user programs)
    The alarms can be acknowledged either individually or all together.
- The Address list tab in the detail area offers extended functions in terms of I/O diagnostics and hardware availability.
- Comprehensive diagnostic information (e.g. diagnostics buffer, system utilization, and task status, etc.) is accessible via Device Diagnostics as a window in the working area.
- You can record signal charts with the trace tool. The values of system variables can be recorded during runtime for diagnostic purposes.
- Program testing and debugging, e.g. variable control, program status, breakpoints

Additional diagnostic functions are available with SIMOTION V4.1 SP2 and higher. On the basis of simple operations (e.g. by setting the switch position) and without the need for the SIMOTION SCOUT engineering system, you can:

- Back up diagnostic data including non-volatile data (retain data) to CompactFlash Card (for SIMOTION D), MMC (for SIMOTION C) or hard disk (for SIMOTION P)
- Back up websites, including the most up-to-date content for diagnostic purposes, to the CompactFlash Card, MMC, or hard disk
- Restore backed up non-volatile data (retain data)

Further information can be found in the FAQs on the Utilities & Applications CD under:
FAQs > Engineering > Backing up diagnostic data and non-volatile data

SIMOTION IT DIAG also offers comprehensive diagnostic options that can be easily accessed via an Internet browser.

- *Overview of Service and Diagnostics Options*, Product Information

3.3.9.2 Using the diagnostics overview

The diagnostics overview is available as a tab in the detail view when the project is in online mode.

- In the detail view, select the **Diagnostics overview** tab.

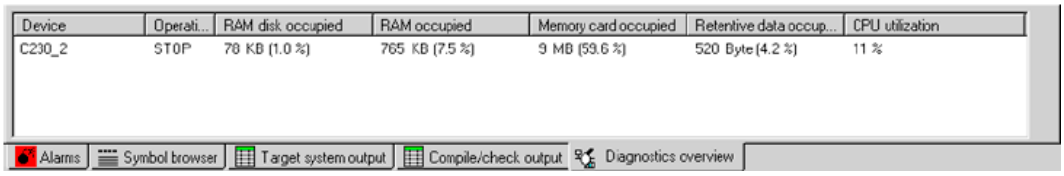

Figure 3-181 Diagnostics overview in the detail view (online mode)

The following are displayed for each accessible SIMOTION device:

- Operating mode
- Memory used (absolute and percentage display)
  RAM disk, RAM, memory card, retentive data
- CPU utilization (percentage display)

The drive devices specified in the hardware configuration are also displayed. To obtain a detailed display of the individual devices, open the device diagnostics.

3.3.9.3 Device diagnostics

Device diagnostics

In online mode, the device diagnostics function enables you to obtain a comprehensive display of diagnostics results of the individual SIMOTION devices.

Proceed as follows:

1. Select the desired SIMOTION device in the project navigator.
2. Select the **Target system > Device diagnostics...** menu.

or

1. Double-click the SIMOTION device in the Diagnostics overview tab in the detail view.

Note

You may open the device diagnostics for several SIMOTION devices simultaneously. This allows you to compare different devices.

You can also access these device diagnostics via the **Accessible nodes** function.

The **Device Diagnostics** window appears in the working area of the workbench. This window provides you with the following information:

- General information
- Diagnostics buffer
- Task runtimes
- Memory utilization

- System utilization
- User log file
- Syslog file
- Version overview
- Alarms

You have the following options:

- Print:
  Select the **Project > Print** menu.
- Save as text file:
  Click **Save as...**.
- Refresh:
  Click **Refresh** or press the **<F5>** function key.

You can also monitor and change the operating state:

- Click **Control operating state**.

Device diagnostics: General

This provides general information on the SIMOTION device:

- Select the **General** tab in the Device Diagnostics window.

The following information will be displayed:

- Name and system ID of the SIMOTION device
- Operating mode of the SIMOTION device
- MAC addresses
- IP addresses
- Subnet mask

- Standard gateway
- Article Nos. and names of the components used,
  e.g. SIMOTION device, Motion Control technology package.

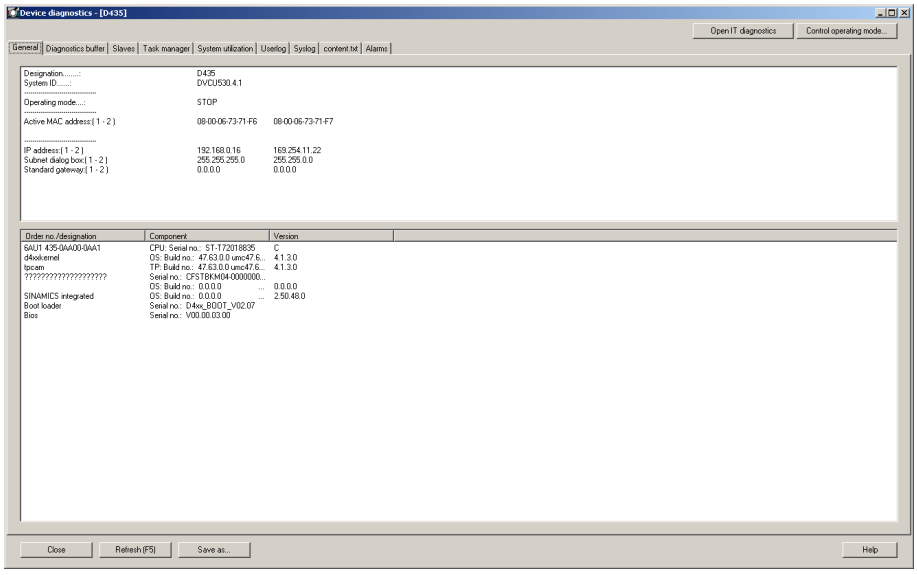

Figure 3-182 Display of general information in the device diagnostics

Device diagnostics: Diagnostics buffer

The diagnostics buffer is part of the system status list. It is possible to jump to the error position from the diagnostics buffer. It logs important events (e.g. changes in module state) in the order in which they occur. These include the following:

- Faults in a module
- Faults in the process wiring
- System faults in the CPU
- CPU operating state transitions
- Drive alarms
- Errors caused by the technology objects of SIMOTION
- Errors in the user program that caused an operating state transition (a double-click on the error message causes the cursor to jump to the error location in the program)
- User-defined entries with the _writeAndSendMessage function
- PMC error messages (SIMOTION D)
- Compatibility errors, e.g. the drive software with SIMOTION (SIMOTION D)

The SINAMICS Integrated diagnostics buffer is also displayed for SIMOTION D as of SIMOTION Version V4.1 SP2.

To work with the diagnostics buffer:

1. In the **Device Diagnostics** window, select the **diagnostics buffer** tab.
   The saved events are displayed in tabular form.
2. Select the event for which you want to obtain more information.
   Detailed information for the selected event is displayed in the lower pane of the window.

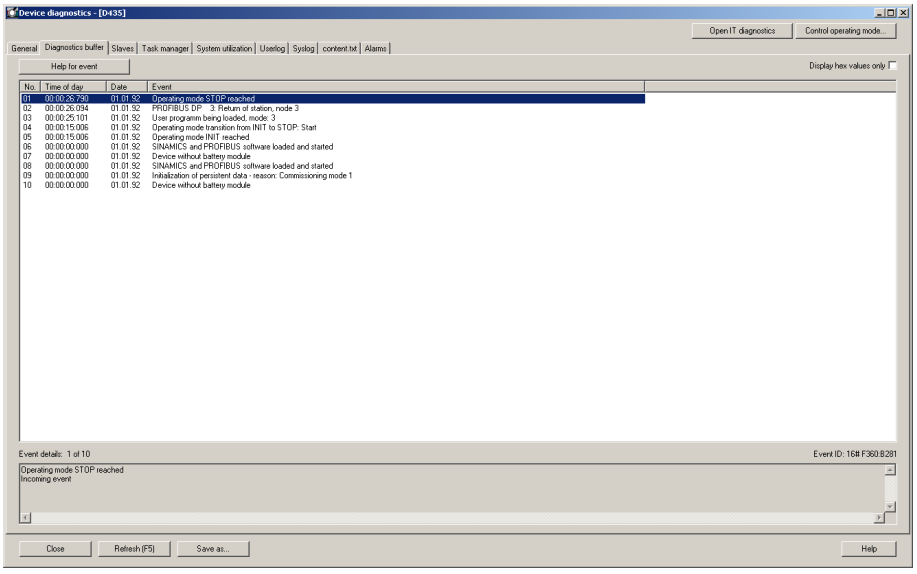

Figure 3-183 Example of the diagnostics buffer display in the device diagnostics

Device diagnostics: Task Manager

You can display the task runtimes and the status of the tasks set up in the project if you are connected online with the device. The resolution of the displayed task runtimes is performed in the servo cycle clock.

Note

The task runtimes are calculated to the µs and indicate the effective level runtime of the respective task (including the interrupt times). These thus correspond to the values of the **effectiveTaskruntime** device variables.

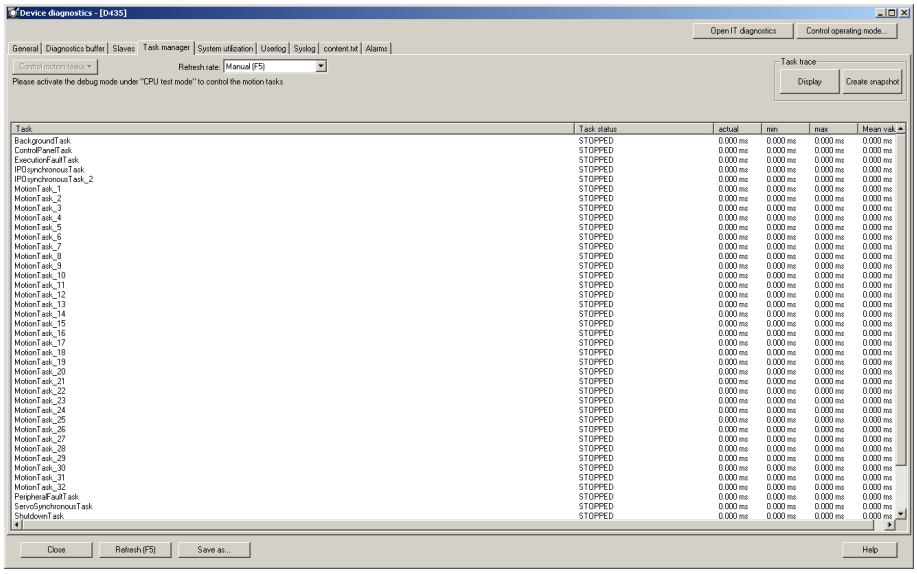

Figure 3-184 Example of the task runtimes display in the device diagnostics

The display is refreshed according to the refresh rate selected. The status and the following values are then displayed:

- Current runtime (current):
  Value of last polling
- Minimum runtime (min.):
  Minimum value since last transition from STOP to RUN
- Maximum runtime (max.):
  Maximum value since last transition from STOP to RUN
- Mean runtime (mean value):
  Value averaged from the last 10 cycles

The runtimes measured include the interruptions by higher-priority tasks.

Meaning of the various status displays:

- **RUNNING** (TASK_STATE_RUNNING)
  Task running, e.g.:
  - Via the **_startTask** function
  - As an active cyclic task
- **RUNNING_SCHEDULED** (TASK_STATE_RUNNING_SCHEDULED) (as of V4.1)
  Task interrupted by system.
  If the task status RUNNING_SCHEDULED remains pending for a long time, it identifies a long-runner in the user task, e.g. a programmed continuous loop.
- **STOP_PENDING** (TASK_STATE_STOP_PENDING)
  Task has received signal to stop; it is in a state between RUNNING and STOPPED.
  Actions may be performed until the task has stopped.
- **STOPPED** (TASK_STATE_STOPPED)
  Task stopped (e.g. via the **_resetTask** function), completed or not yet started.

- **SUSPENDED** (TASK_STATE_SUSPENDED)
  Task suspended by function **_suspendTask**.
  Use **_resumeTask***(name*) to cancel this command. The task then resumes from the point at which it was interrupted.
- **WAITING** (TASK_STATE_WAITING)
  Task is waiting due to function **_waitTime** or **WAITFORCONDITION**.
- **WAITING_FOR_NEXT_CYCLE** (TASK_STATE_WAIT_NEXT_CYCLE)
  TimerInterruptTask waiting for start trigger.
- **WAITING_FOR_NEXT_INTERRUPT** (TASK_STATE_WAIT_NEXT_INTERRUPT)
  SystemInterruptTask or UserInterruptTask is waiting for the triggering event to occur. When an interrupt occurs, the SystemInterruptTasks are started and executed once. Up to eight incoming interrupts can be stored in the buffer. If another interrupt occurs, the buffer overflows and the CPU goes into STOP operating state.
- **LOCKED** (TASK_STATE_LOCKED)
  Task locked by function **_disableScheduler**.
  This status prevents the activation of all user tasks (except the IPOSynchronousTask and IPOSynchronousTask_2) until command **_enableScheduler** is called. It does not, however, affect system tasks. The time watchdog for cyclic tasks is **not** suspended.

  Note

  This also prevents the activation of the SystemInterruptTasks and UserInterruptTasks.

Controlling MotionTasks

It is possible to control MotionTasks via SIMOTION SCOUT without a user program that has been created by the user. Consequently, you can test programs and influence MotionTask sequences in a very specific way.
Selected MotionTasks can be stopped, and locked or restarted for the sequence.

This means that programs in MotionTasks can also be downloaded in RUN mode. If you have made changes to sources and want to reload them in RUN mode, an active MotionTask can prevent this. You can then terminate specific MotionTasks with SIMOTION SCOUT and then carry out the download in RUN mode.

Additional references

Further information on downloading in RUN mode can be found in:

- *SIMOTION Basic Functions* Function Manual
- *SIMOTION SCOUT Task Trace* Function Manual

Device diagnostics: Checking memory utilization

To display the memory utilization for devices:

- Select the **Memory utilization** tab in the device diagnostics.

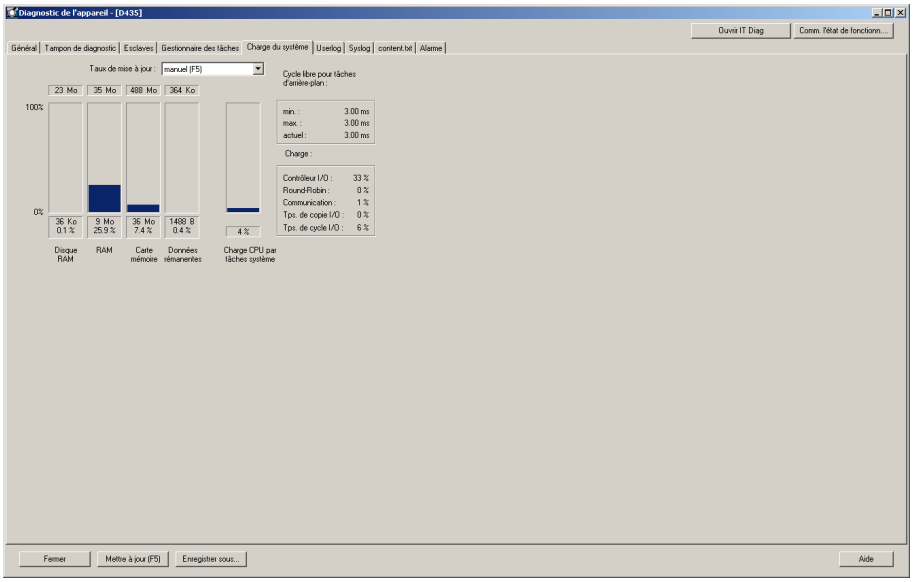

Figure 3-185 Example of the memory utilization display in the device diagnostics

Additional references

Further information on this topic can be found in:

- SIMOTION Basic Functions Function Manual, Section Overview of the memory in the target device
- SIMOTION SCOUT Online Help

Device diagnostics: Checking the system utilization

To display the system utilization:

- Select the **System Utilization** tab in the device diagnostics.

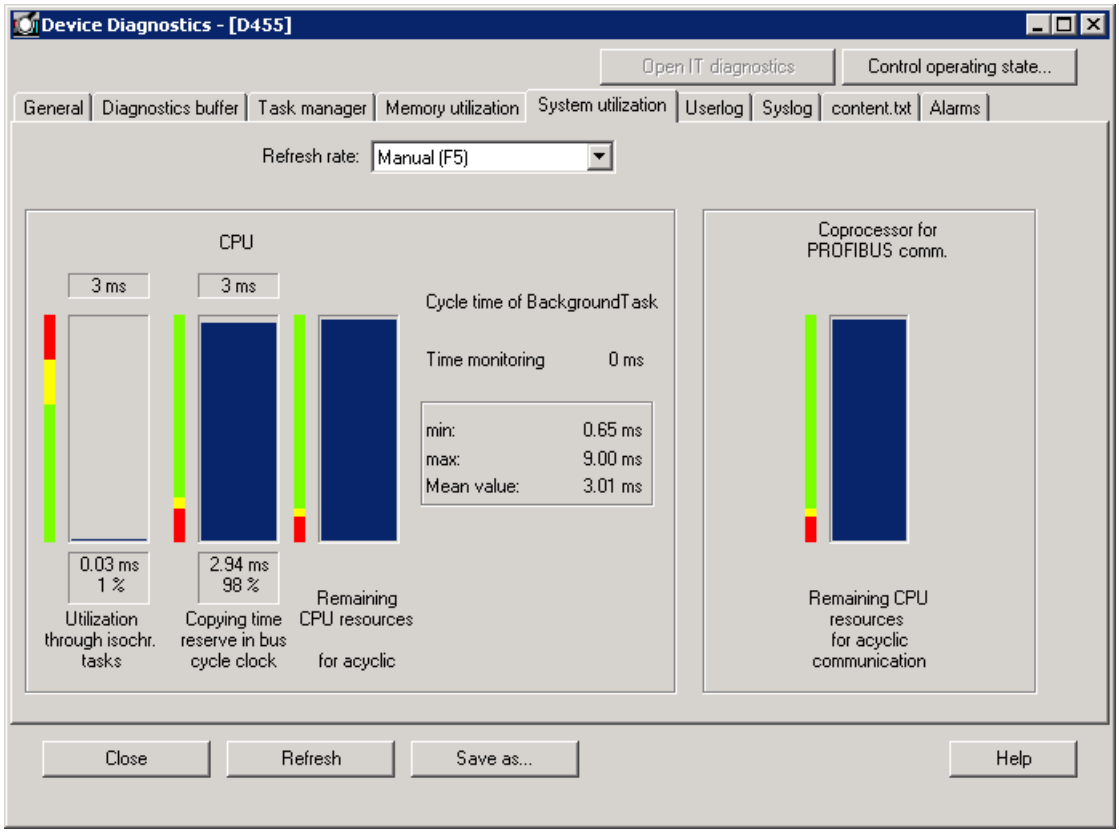

Figure 3-186 Example of the system utilization display in the device diagnostics

Additional references

Further information on this topic can be found in:

- The Function Manual "SIMOTION Basic Functions", in the chapter "Overview of Memory in Target Device"
- SIMOTION SCOUT Online Help

Device diagnostics: User log file

With the Userlog file, you can store your own text strings in the RT system. This is necessary, for example, when changes, which are to be documented, are made in the SIMOTION system on a plant which has already been commissioned.
Changes can be written in the SIMOTION SCOUT. These are loaded to the ROM of the target device. When required, the text strings can be read out again. The text editor for the Userlog file is integrated as a tab in the device diagnostics snap-in. This function is only available in online mode.

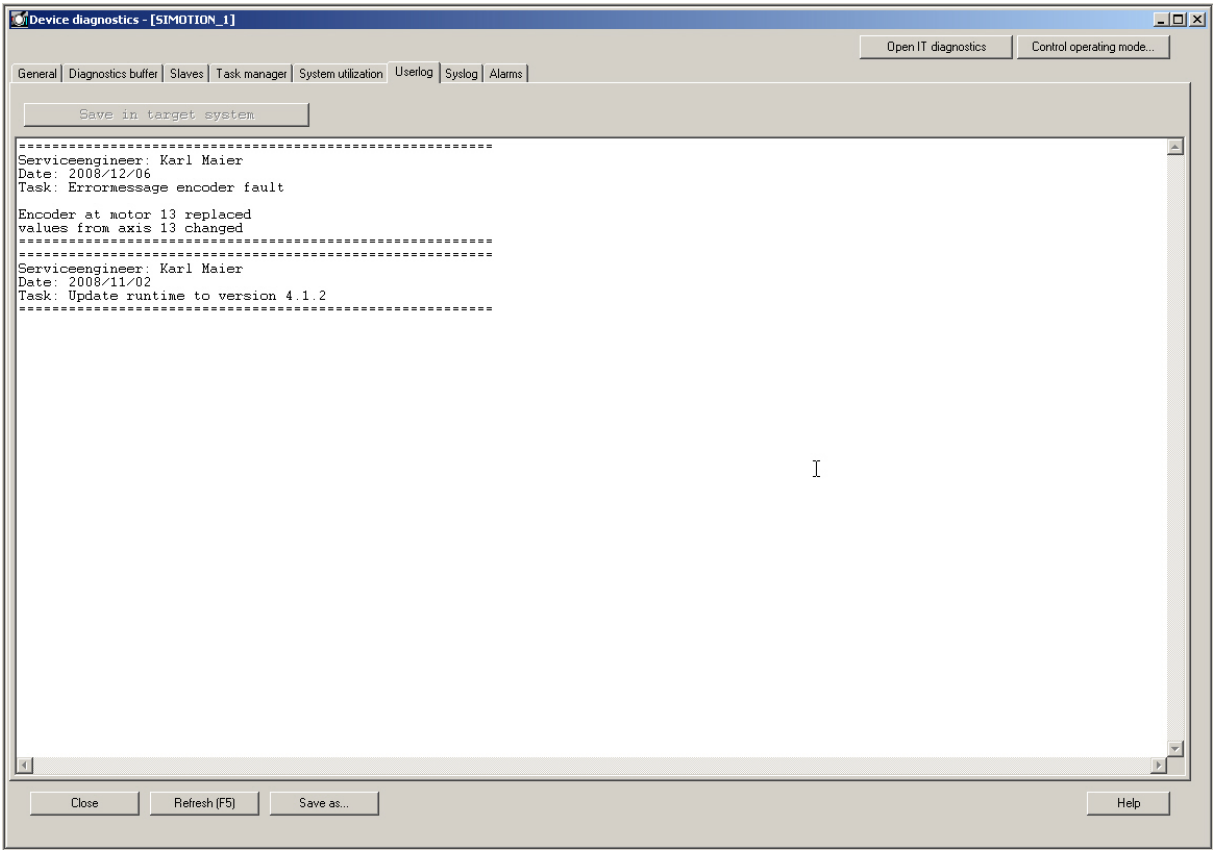

Figure 3-187 Example of the Userlog file display in the device diagnostics

How to work in the Userlog file

- Select the **Userlog** tab in the device diagnostics.
  The editor is in editing mode, i.e., you can immediately type or delete.
  The system adds no further system contents, such as date/time.
  You enter all of the necessary information.
- To save, click **Save as...** The Userlog file is stored as .txt.
  All text entries can be changed or deleted at any time.
  Access protection is not available.
- The Userlog file can also be read without a project.
  The online mode is required for this.
- The Userlog file remains after **user data are deleted**.

Device diagnostics: Syslog file

In addition to the user-defined Userlog file, the SIMOTION device also has a Syslog file. The ROM actions entered therein facilitate a subsequent diagnosis. This function is only available in online mode. The information of the Syslog file can also be read without a project.

The Syslog file logs the following actions:

- RAM2ROM
- Overall reset
- Formatting of the card from SIMOTION SCOUT

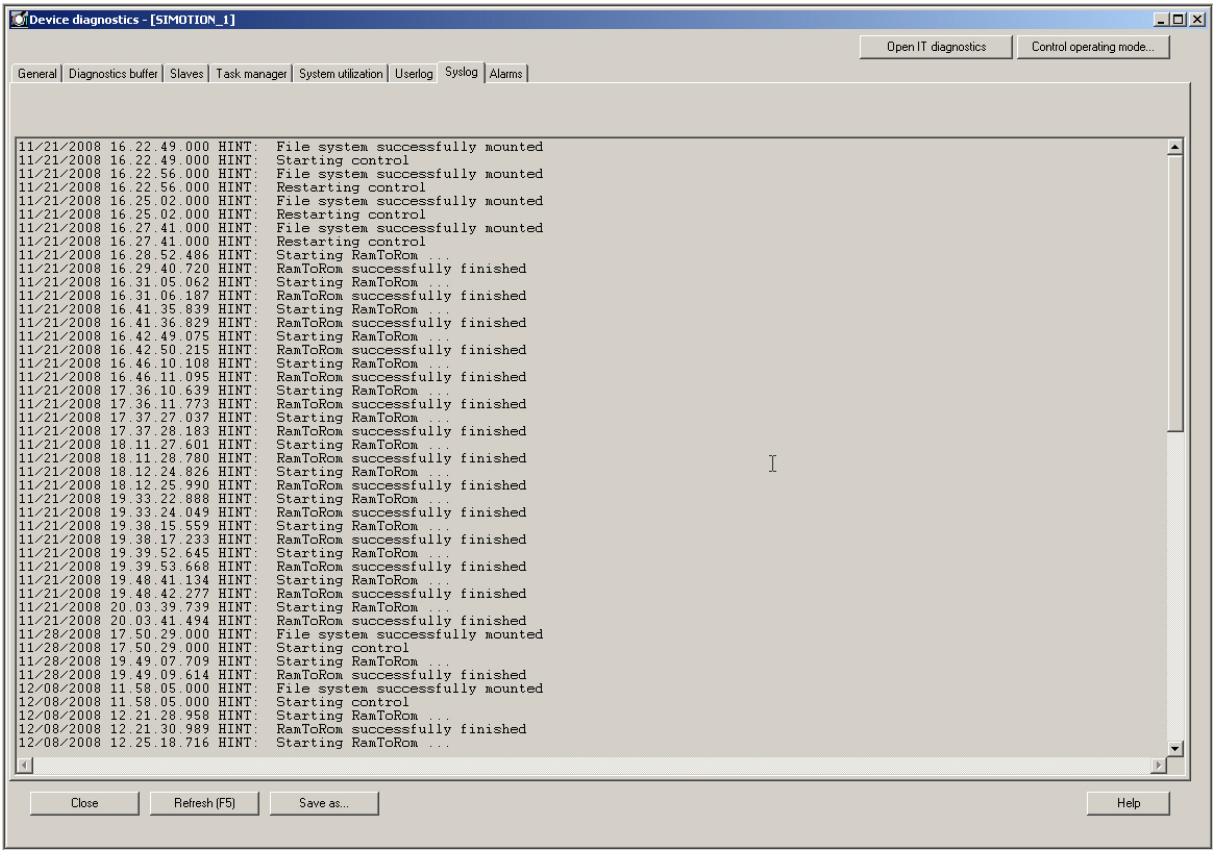

Figure 3-188 Example of the Syslog file display in the device diagnostics

Device diagnostics: Version overview

The "content.txt" tab displays the SIMOTION version and the SIMOTION device data stored in the CompactFlash card.

The following data is displayed:

- SIMOTION version
- BIOS version

- Components
  Versions of the SINAMICS components
- Internal version/stamp
  Internal components

This information is relevant for any questions to the hotline.

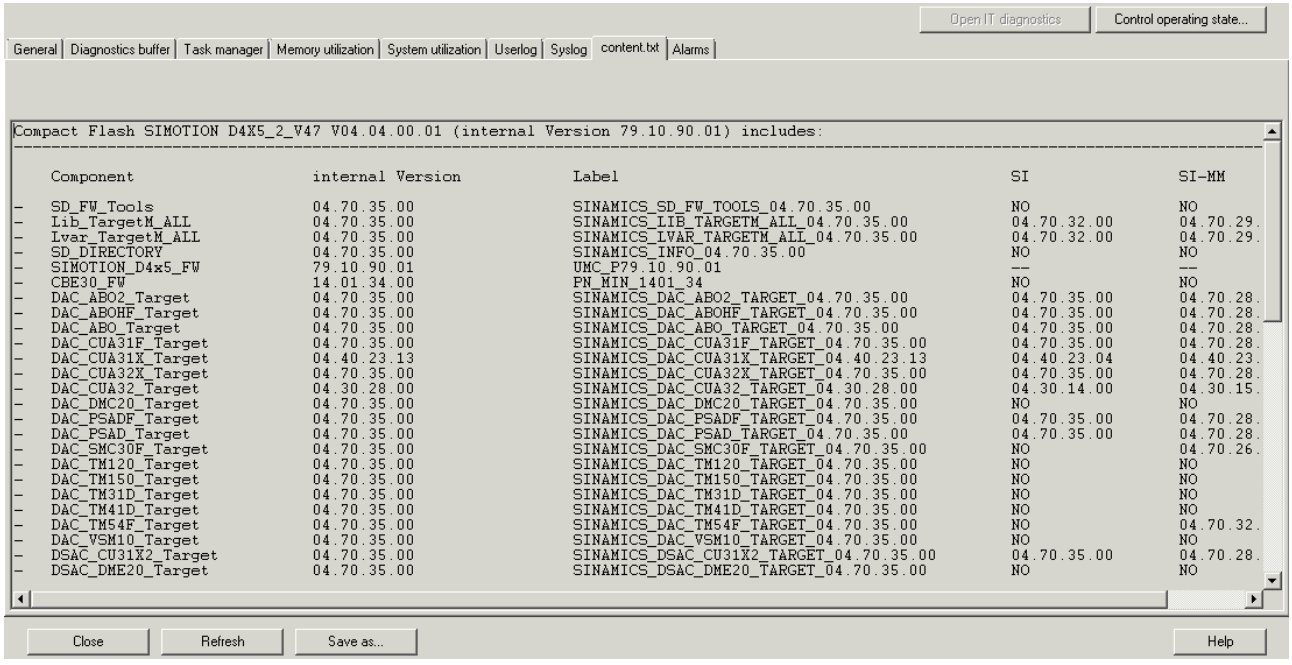

Figure 3-189 Example of the version overview display in the device diagnostics

Device diagnostics: Alarms

In the device diagnostics Alarms tab, pending alarms and configured messages are displayed in the same way as in the **Alarms** tab in the detail view.

Detailed information can be found in the SIMOTION online help, in the Alarms output window.

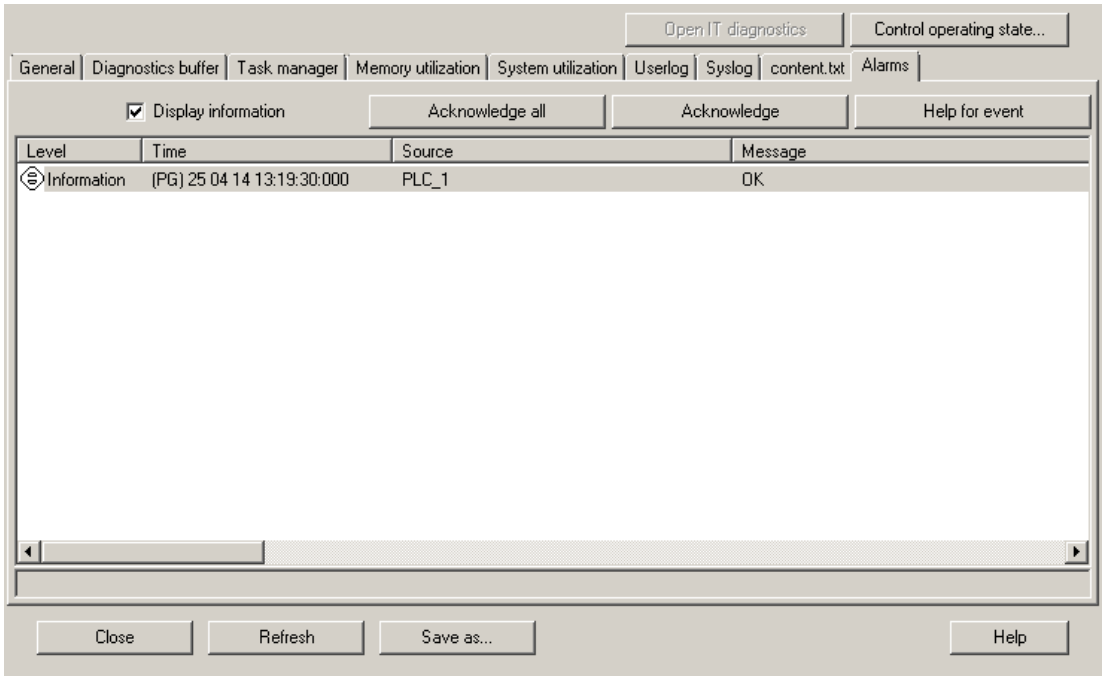

Figure 3-190 Device diagnostics - Alarms

3.3.9.4 Diagnostic functions in the address list

As of SIMOTION V4.2, the address list offers extended functions for I/O diagnostics. In online mode, the information is displayed in the **Availability** column. You can access more detailed information via a tool tip if you move the cursor over the relevant cell.

To open the address list:

1. Browse to the folder for your device in the project navigator.
2. Double-click the **ADDRESS LIST** entry.
   The address list opens in the detail area.

The summary contains the following diagnostic information:

- I/O stations which have failed completely
- Modules have been removed (e.g. for ET200S).
- Deactivated I/O stations
- I/O variables working with replacement values
- I/O stations whose set topology differs from the actual topology
- I/O stations configured to be isochronous are not isochronous
  - Distributed synchronous operation
  - Drive units
  - Isochronous I/O

- Partner device has stopped (e.g. I-device, I-slave)
- For PROFINET devices: Provider state/consumer state is showing an error
  - Controller
  - I/O device
  - Module
  - Submodule

See also the description of the **_quality()** system function in the section titled *Detailed status of I/O variables (as of kernel V4.2)* in the *SIMOTION ST Structured Text* Programming and Operating Manual.

For further information on diagnostics involving the address list, please refer to the online help.

3.3.9.5 Interconnection overview

The interconnection overview allows you to display all motion input and output interconnections of technology objects within the project. This overview is displayed in the SIMOTION SCOUT working area in the form of an interconnection tree.

The tree display enables the synchronous operation interconnections to be displayed in cascades. In the interconnection table below, you can see all the TOs interconnected on the input and output sides for the technology object selected in the interconnection tree.

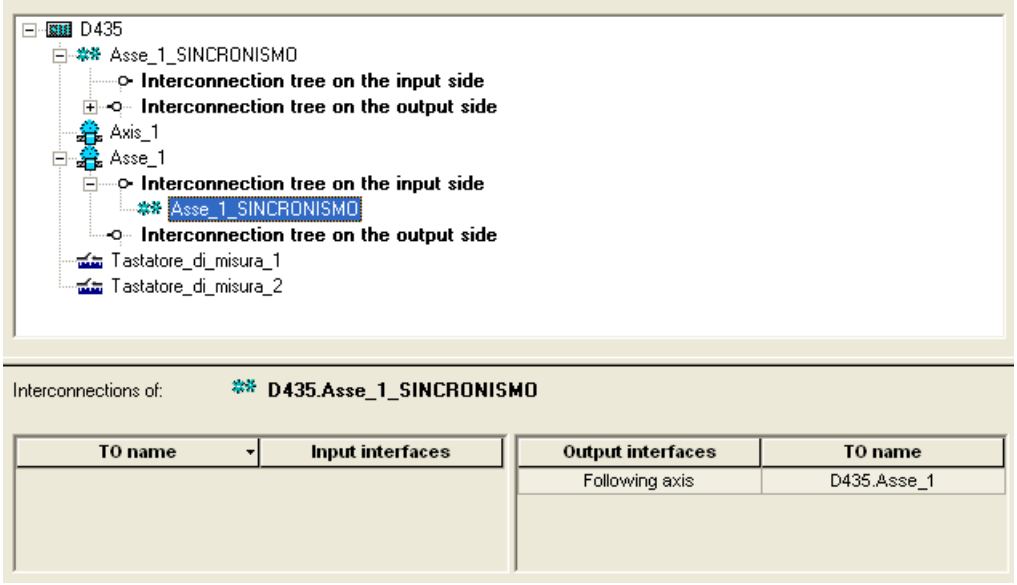

Figure 3-191 Example of an interconnection overview

Further information on this topic can be found in:

- Function Manual: SIMOTION Basic Functions
- SIMOTION SCOUT Online Help

3.3.9.6 Service Overview

In online mode, the service overview shows a tabular complete overview of all configured axes in the project. The current state (including values from system variables) is displayed along with fault conditions.

The service overview is called up via the **Target system > Service overview** menu.

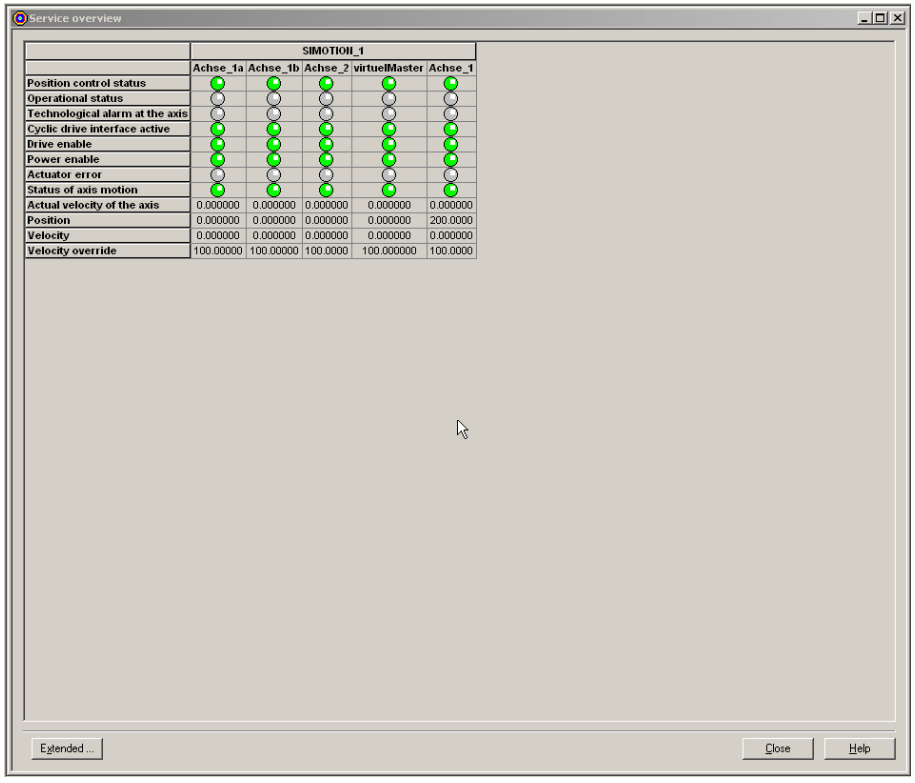

Figure 3-192 Service Overview

3.3.9.7 Trace and measuring functions

Trace, measuring function, and automatic controller setting

Overview

SIMOTION SCOUT provides support for the commissioning and optimization of technology objects and user programs: The following functions are available:

- Device trace / function generator
- System trace
- Measuring function
- Automatic controller setting

Calling trace and measuring functions

To invoke the trace and measuring functions in SIMOTION SCOUT, proceed as follows:

1. Select the SIMOTION device in the project navigator.
2. Select the **Target system** command in the menu and select the desired function.
   Or click the desired function in the toolbar.

① ② ③ ④

① Device trace / function generator
② System trace
③ Measuring function
④ Automatic controller setting

Device trace / function generator

You can use the device trace to record and evaluate parameters as well as system and program variables.

The device trace for system variables is mainly used to analyze time-synchronous sequences in the real-time system.

An automatic multiple trace is available as of SINAMICS V4.6. It can be used to trigger a recording automatically according to the trigger conditions. The measurement is stored as a YDB file (SIMOTION) or ACX file (SINAMICS) in a ring buffer on the memory card. At least five measurements can be stored in the ring buffer.
You can parameterize the multiple trace on the Trace tab at **Save to device (memory card)**.

Program variables can be traced in order to find logical errors in the execution system or in user programs. For this purpose, rather than a time-triggered measuring task, an event-triggered measuring task in the RT system can be used. The event that causes the measurement recording is the execution of a specific code position in the user program by the RT processor. To start recording, a trigger event based on the variable can be selected on the Device trace tab (on a positive edge, a tolerance range or a bit map, for example).

The function generator can be used for test purposes to dynamically generate setpoints with defined shapes (e.g. rectangle, sine) for various system variables. With the aid of the trace, for example, the system response can be recorded in order to optimize the controllers.

System trace

You can use the system trace to record and evaluate parameters, system variables, and program variables from multiple CPUs at the same time. It is essential that the CPUs communicate via PROFINET. An isochronous connection must exist between the CPUs, and the PROFINET Sync Master must be a SIMOTION device.

Function generator, mathematical processing and bit tracks are not available for recording with the system trace.

Measuring function

The measuring function is used for controller optimization.

The SIMOTION measuring functions are used to commission the axis controller without requiring a user program.

With the SINAMICS measuring function, you can directly inhibit the influence of higher-level control loops by means of simple parameterization, and analyze the dynamic response of individual drives. The free measuring function measures and averages several measurement series with parameterizable noise sources without master control. This measuring function is suitable for controller settings and for avoiding whirling resonance in magnetic suspension bearing applications with rotor systems.

Automatic controller setting

The automatic controller setting can be used to configure the speed controller in the drive. For Dynamic Servo Control (DSC), this is also possible for the position controller.

Additional references

Detailed information can be found in the SIMOTION SCOUT online help at Diagnostics.

Task Trace

Application area

The SIMOTION Task Trace supports you when troubleshooting in the SIMOTION multitasking environment. The SIMOTION Task Trace records the sequence of individual tasks, identifies user events that you can generate via a program command, and displays these graphically.

Structure of the Task Trace

The SIMOTION Task Trace includes two main components:

- The SIMOTION **Task Tracer**, which writes the task change and events to a buffer on the target device, and
- The SIMOTION **Task Profiler**, an application for displaying the recorded data

Additional references

Further information on this topic can be found in:

- Function Manual: Task Trace
- Diagnostics Manual: SIMOTION IT Ethernet-based HMI and Diagnostic Function
- SIMOTION SCOUT Online Help

Technology object trace

You can monitor commands at a technology object and track access to the system variables and configuration data.

In SIMOTION, technology objects can be influenced by configuration data, system variables, and commands during runtime. In order to represent the influences on a technology object during runtime through the user program, a TO trace / object trace, which records the last n actions at the technology object and arranges these in chronological order, is available as of V4.2.

Note

Simultaneous use of the **Trigger through program call** trigger condition for the TO trace and the device trace is not permitted.

If the TO trace and the device trace are active simultaneously, different trigger conditions must be used.

The recording can be read out from the technology object on request and represented in the ES.

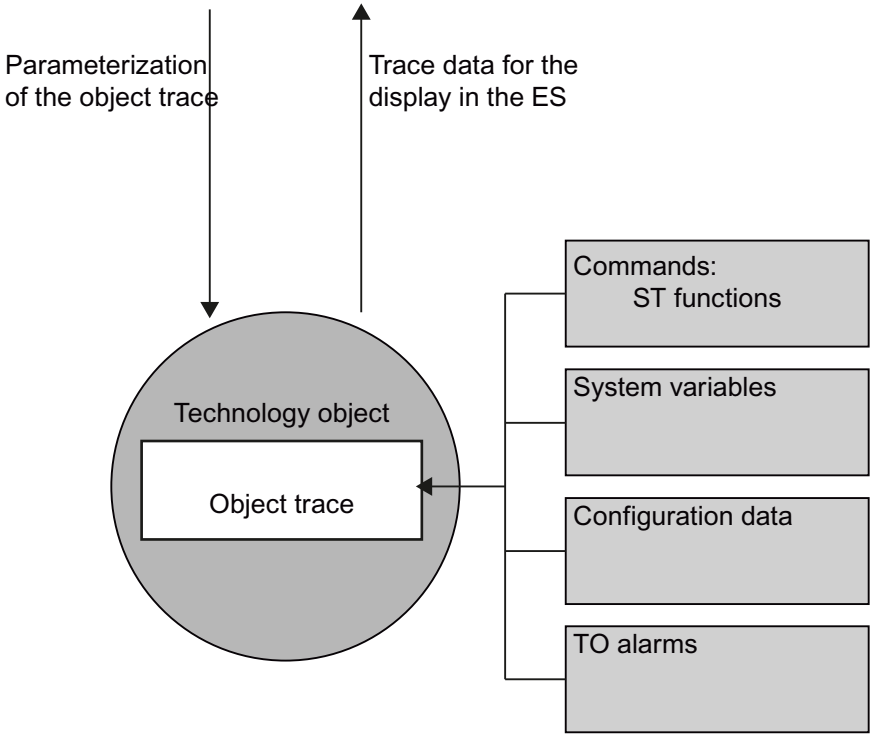

Figure 3-193 Principle of the object trace

The TO trace is used for the diagnostics of technology objects and displays the information and the events that influence a technology object during runtime in tabular form. The TO trace can be configured separately for each technology object.

It records commands and access to configuration data and system variables with their command and error statuses when the TO trace is read out. As of SIMOTION V4.4, alarms of the individual technology objects can also be recorded and an automatic trace is available. It can be used to trigger a recording automatically according to the trigger conditions immediately after a restart.

You parameterize the automatic trace in the **Settings tab** at **Save in the device (memory card)**.

The TO trace is represented in a table/list with a time stamp.

The TO trace is available for the following technology objects:

- Drive axis
- Position axis
- Following axis
- Path interpolation
- Following object
- External encoder
- Measuring input
- Output cam
- Cam track
- Addition object
- Formula object
- Sensor
- Temperature channel
- Fixed gear
- Controller object

Additional references

Additional information on this topic is contained in the SIMOTION Runtime Basic Functions Function Manual.

3.3.9.8 Accessible nodes

A list of the devices switched on and connected to the PG/PC is displayed via the **Accessible nodes** function in the SIMOTION SCOUT working area. The display is related to the PG/PC interface which is configured as the application access point in "Set PG/PC interface".

A SIMOTION project must **not** be open in order to use this function.

Proceed as follows:

1. Select the **Project > Accessible nodes** menu.
2. Select the corresponding node.
3. Right-click and select one of the following functions in the context menu. The available functions depend on the configuration.
   - Operating state ...
   - Device diagnostics ...
   - Copy from RAM to ROM ...
   - Licenses
   - Log files
   - Archived project
   - SINAMICS Upload
   - Edit Ethernet nodes...

Additional references

For additional information on this topic, refer to:

- SIMOTION SCOUT Online Help

3.3.9.9 Program testing and debugging

Comprehensive program testing and debugging functions are available in SIMOTION SCOUT. You can execute the following functions:

- Control variable
- Program status
- Breakpoints

Additional references

Please refer to the following documents on this subject:

- SIMOTION ST Structured Text Programming and Operating Manual
- SIMOTION MCC Motion Control Chart Programming and Operating Manual
- SIMOTION LAD/FBD Programming and Operating Manual
- SINAMICS/SIMOTION DCC Editor Description, Programming and Operating Manual

and the SIMOTION SCOUT online help.

3.3.9.10 Project comparison

You can use the SIMOTION SCOUT / Starter project comparison function to compare objects within the same project and/or objects from different projects (online or offline) with one another.

Objects are devices, programs, technology objects (TOs) or drive objects (DOs), and libraries.

The project comparison is available with SIMOTION SCOUT and Starter. Comparing projects is useful if you need to carry out service work on the system.

1. Start the project comparison by clicking the **Start object comparison** button.
2. The **Select comparison partners** dialog is displayed. Select the projects to be compared.

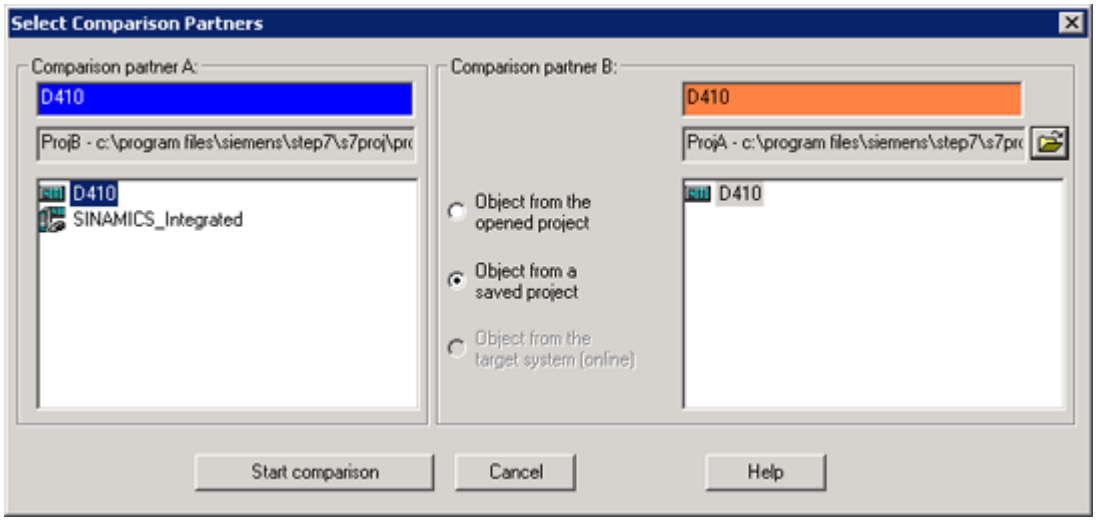

Figure 3-194 Select comparison partner dialog

Figure 3-195 Synchronizing project data via the project comparison function

Note

A detail comparison is possible only if supplementary data (e.g. program sources) has also been downloaded to the target device (**Options > Settings > Download**).

Additional references

For detailed information, refer to:

- Function Manual: SIMOTION Project Comparison
- SIMOTION SCOUT Online Help

3.3.9.11 Project overview

In Utilities&Applications, select **Scripts > Report scripts** to access scripts for generating reports on all

- TOs
- Programs, function blocks, functions
- Units
- Tasks and assigned programs

in the current SIMOTION project.

A script lists the relevant specific objects of the SIMOTION project in an HTML document, arranged in a tabular format. Once generated, the HTML document opens and is displayed automatically in the Internet Explorer. The information involved can also be saved from there in HTML or CSV format or as an Excel file.

3.3.9.12 Services and diagnostics without an Engineering System

SIMOTION devices have an integrated web server. The web server supports the display of diagnostic and system data in standard Internet browsers, even in the absence of an Engineering System, and the carrying out of project/firmware updates.

For more detailed information, see the *SIMOTION IT Ethernet-based*

HMI and Diagnostic Function Diagnostics Manual.

3.3.10 Service with SIMOTON SCOUT

3.3.10.1 Selecting the right project with SCOUT

The observation of the following recommendations for the configuring simplifies maintenance work.

Working with the right project

In order to ensure that you are always working with the right project, save the revised and archived project as a zip file on the **CF card**.

For details on how to do this, refer to the section titled Archiving and backing up projects on memory cards.
You should only use this zip file in future.

The project data can be archived on a memory card in SCOUT.

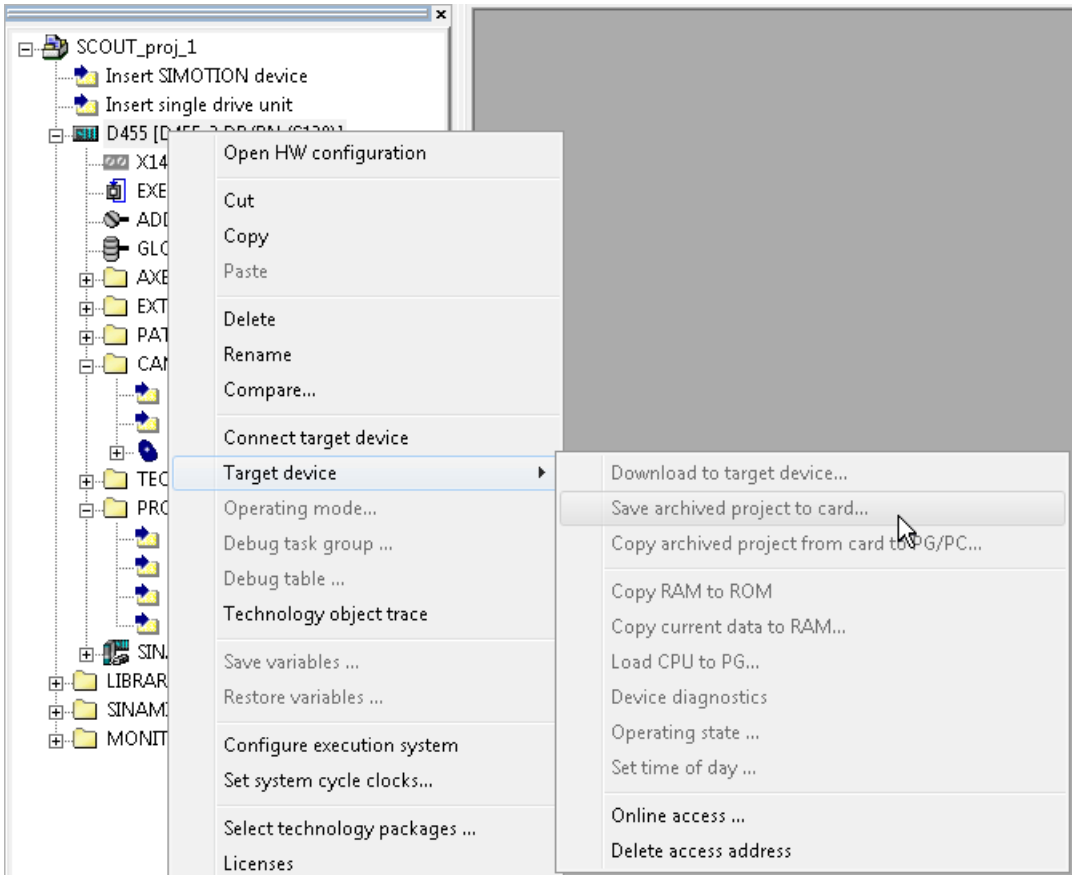

Figure 3-196 Archive SIMOTION project to card

The **accessible nodes** function can be used to determine on which CPU a Project.zip is stored.

Differences between the SCOUT project and the project data loaded to the device

Once you are online, any inconsistencies between the engineering project and the data in the target system are highlighted in the project navigator with "red" symbols.

The object comparison feature enables you to show these differences in detail and perform an alignment process.

For additional information, refer to the section titled Project comparison.

Load the project from the memory card.

The project data archived on the memory card can be transferred to "PROJEKT.ZIP" on the hard disk of the PG/PC in the **Accessible Nodes** view via context menu (right mouse button). Alternatively, the SCOUT function is also available in the **Load project from card...** context menu of the device. Next, the archive project transferred to the hard disk must be dearchived.

Use routing

The following must be considered in order to be able to use routing (e.g. for access to SINAMICS_Integrated with SIMOTION D4x5):

- If the project should be generated on another computer, a **PG/PC assignment** is necessary. The PG/PC has the unique "computer name" of the creation system and this must be adapted to the current system.
- This change can be made directly using the **Assign PG/PC** toolbar button.

The log files as additional help

The **Syslog file** and the **Userlog file** are also available to help verify the project (as of Runtime V4.0). These files are stored on the memory card and can be read out, for example, without a project on the **PG/PC** using the SCOUT function **Accessible Nodes**.

The log files on the memory card are directly accessible from the dialog (via context menu).

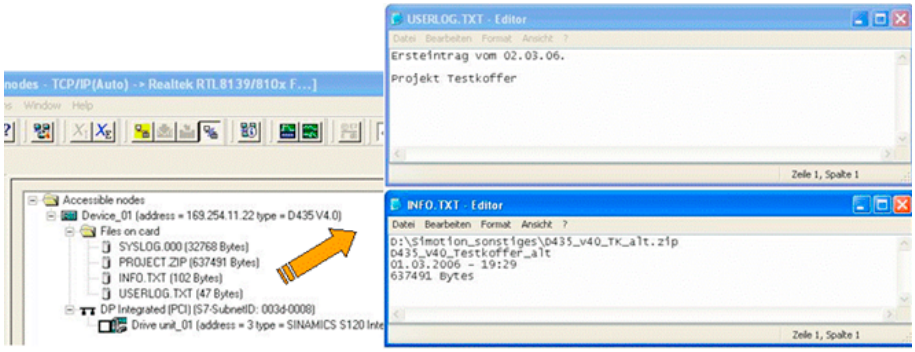

Figure 3-197 Log files via the context menu

- user\simotion\hmi\syslog\syslog.000
  System logbook: The system makes an entry here when a RAM TO ROM, an overall reset or a reformatting of the memory card is carried out.
- user\simotion\hmi\prjlog\userlog.txt
  Machine logbook: It is possible here to document the tasks carried out and the SCOUT version used for the next service worker. Call for editing from the SCOUT dialog **Device diagnostics**.

Below is other data, which is stored on the memory card and can be accessed from this dialog:

- USER/SIMOTION/HMI/PRJLOG/info.txt
  is created with the archived ES project and contains the name, size, save date.
- USER/SIMOTION/HMI/PRJLOG/project.zip
  archived ES project. Maximum one archived project can be archived on the memory card using SCOUT.

The above-named files visible in the dialog also remain on the memory card after **Delete user data**.

For a detailed description, please refer to:

- SCOUT Online Help -> Device diagnosis: Syslog / Userlog
- Device Diagnosis section: User log file
- Device Diagnosis section: Syslog file

3.3.10.2 SCOUT V4.5 and 5.1 project format

The project format of SIMOTION SCOUT V4.5 and SIMOTION SCOUT 5.1 is identical. This allows projects created with SCOUT V4.5 also to be processed with SCOUT V5.1. This also applies in the reverse case.

Nevertheless, note that SIMOTION SCOUT V5.1 includes new firmware versions for the CPUs, e.g. C240 PN V5.1. If in SIMOTION SCOUT V5.1, you add a CPU with new firmware to your project, this CPU is not known in a SIMOTION SCOUT V4.5 installation. The CPU is not displayed in the project navigator and a message appears in the detail view that the project contains unknown objects. In this case, you must continue to work with SIMOTION SCOUT V5.1.

3.3.10.3 Project was created in Version V4.1 / V4.2 / V4.3 / V4.4

If the project was created in Version V4.1 / V4.2 / V4.3 / V4.4, consider the following points:

- If SCOUT V4.5 is used to open a project created with an earlier version of SCOUT, a request is automatically made to convert the project to the current internal data format of SCOUT. In such cases, **only** the data management of the SCOUT project is converted to V4.5; the SIMOTION device version is not converted.
- After the project conversion, the system prompts whether the project should be opened write-protected.
  If the project needs to be changed, the write protection can also be revoked later.
  - To do this, select **Project > Revoke write protection** from the menu bar.

3.3.10.4 Project V4.1 / V4.2 / V4.3 / V4.4 has been edited with SCOUT V4.5

If the project of the versions V4.1 / V4.2 / V4.3 / V4.4 was edited with SCOUT V4.5, consider the following points:

- The project can be saved back in the original project version when closing the projects, exiting SCOUT or by selecting the SCOUT function **Save in old project format...**. This makes it possible to edit the project later using the corresponding SCOUT version again.

  Note

  During a reconversion, the internal compilation results of the **changed** sources may be deleted.

  This means that after the project has been opened again and the online connection made, the changed sources are inconsistent (shown in red).
  Only after the compilation and download are completed are the sources consistent again (shown in green).
  This is due to the editing with different SCOUT versions, which contain different compiler versions.

- If the project was opened write-protected for diagnostic purposes or if no changes were made in non-write protected mode, then it need not be saved.

Recommendation

After editing an earlier project version with SCOUT V4.5, the engineering project should remain in version V4.5. This eliminates the need to back-saving in the old project format so that the

project remains consistent at all times.
The engineering project is then **no longer** available in the old project version.

After the project changes are completed, they should be documented in the Userlog file.
The Userlog file is edited in the device diagnostics dialog.

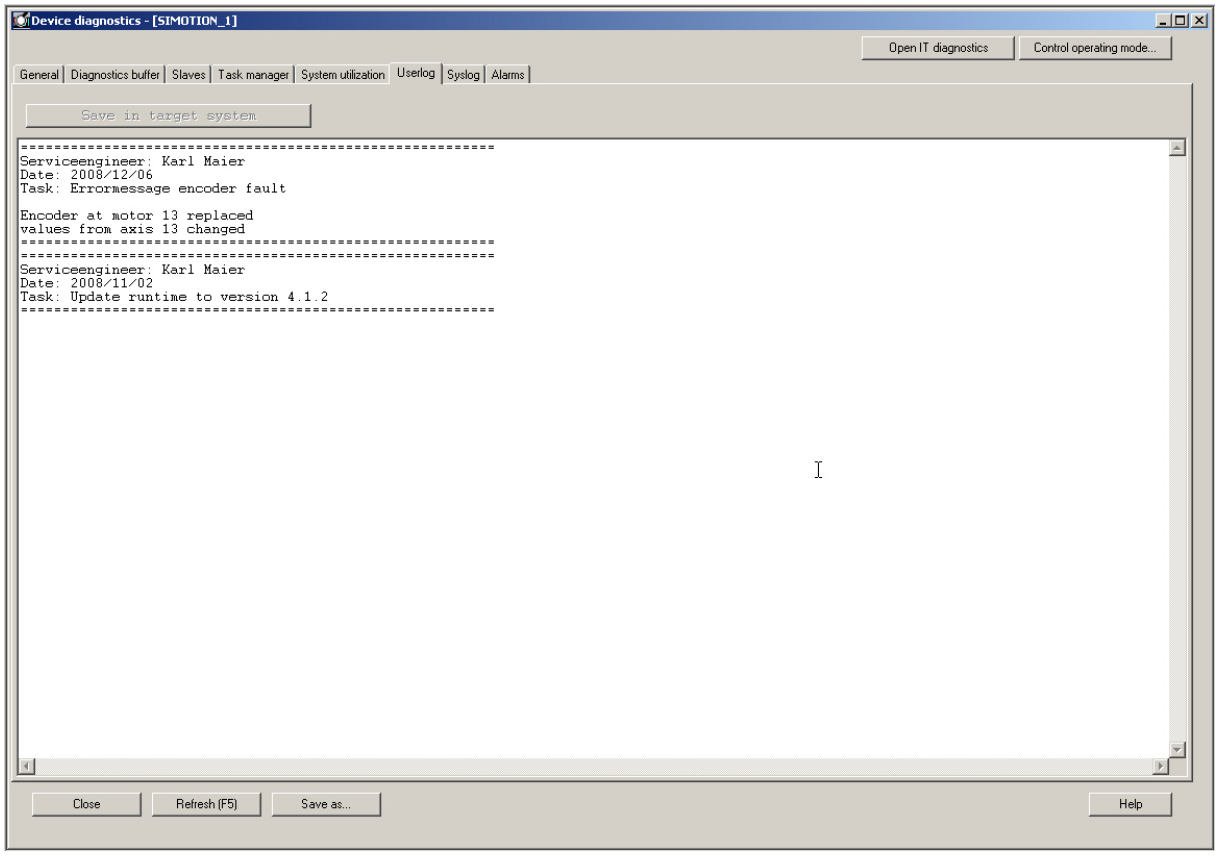

Figure 3-198 Example of the Userlog file display

3.3.10.5 Introduction of versioning with standard library and software components

It is possible to introduce versioning for any standard library and any software component during configuration, i.e., each component then has its own version identifier.

- For every unit and every library the version, author and a brief description in the comments field (offline version identifier) in the Properties dialog box in SIMOTION SCOUT.
- Each library and each software component can disclose its version identifier during runtime (online version identifier identical to offline version identifier).
  - Version identifier as constant(s) or
  - Version identifier as function return value, e.g. FCGetVersion.

- The version identifiers can be displayed separately on the available HMI systems, i.e., self-identification of all involved system components.
- A simple variant for applying versioning is in a date identifier as a constant in the format yyyy-mm-dd. This can be assigned to a variable, which is then, for example, passed on to HMI systems for the version display.

  Example, date identifier:

```
VAR_GLOBAL CONSTANT
    APP_VERSION : UDINT := 20060612; // 12.06.2006
END_VAR

VAR_GLOBAL
    G_uAppVersion : UDINT := APP_VERSION;
END_VAR
```

3.3.11 Siemens SIMOTION Diagnostics

Diagnostics dialogs in the event of a SCOUT crash

SCOUT and STARTER contain the diagnostics tool "Siemens Simotion Diagnostics". With this tool, you can help us constantly improve our product. If an internal non-recoverable fault occurs, safe continued operation is not guaranteed and consequently the application is closed. To support fast analysis and elimination of a such a fault, only data relevant to fault analysis is gathered and saved in one or more ZIP files prior to closing the application.

Fault profile:

In the event of a non-recoverable internal fault, the "SIEMENS SIMOTION Diagnostics" dialog appears.

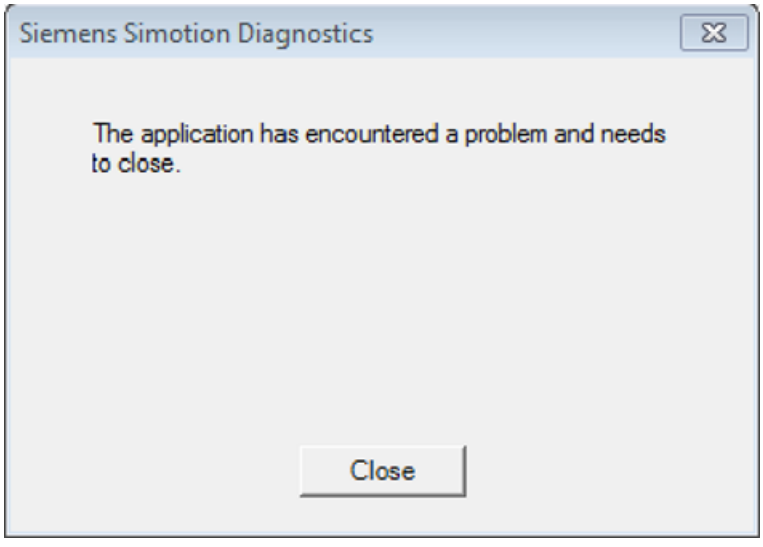

Figure 3-199 Siemens SIMOTION Diagnostics

Immediate measures:

1. Collect information about the fault (see below for instructions)
2. Contact the Siemens Hotline, http://support.automation.siemens.com

Steps for reporting the fault and support for further troubleshooting:

- Automatically created fault report
  The diagnostics tool automatically creates a fault report with technical information about the crash, such as the process image. This fault report is stored in the following directory (in compressed form as one or more ZIP files):
  <ProgramFiles>\Siemens\Step7\u7umc\data\AdvancedDiagnostics\
- Creating an error message
  The error message must include a brief description of the operator action prior to the occurrence of the problem, the software version used, and, if necessary, the configuration (installed Siemens products, hardware installation, etc.).
  After restarting SCOUT, you can see the installed versions in the "Help" menu at "Info" or by using the "System info ..." button, and you can copy and paste them into the document for fault description purposes, or to a separate text file.
- The ZIP files with the fault report must now be sent as an attachment to the Siemens Hotline http://support.automation.siemens.com together with the error message.

3.3.12 SIMOTION Runtime Simulation

3.3.12.1 Overview

Note

SIMOTION Runtime Simulation only for SIMOTION devices D4x5-2 as of V5.1

SIMOTION Runtime Simulation (SIMOSIM) is supported for SIMOTION devices D4x5-2 as of V5.1.

With SIMOTION Runtime Simulation, you can test and evaluate the general workflow of a SIMOTION runtime without connected hardware.

The simulation is so ideal for training purposes or, for example, to test and debug programs before they go online on a real module.

The projects are loaded into SIMOTION SCOUT and can be switched retentive with RamToRom. SINAMICS Integrated and external I/Os are not simulated.

Note

Simulation of SIMOTION devices

Note that not more than one device can be simulated concurrently within a project.

Restrictions

The following functions are not supported:

- CLib
- OA packages
- TPDCBADM, TPTControl, TPdcblib technology packages

Note

Technology package product versions

Note that only those technology packages integrated in the simulation (TPCAM, TPPATH, TPCAM_EXT) are supported.

3.3.12.2 Using SIMOSIM

Requirements

- You have installed SIMOTION SCOUT. SIMOSIM is part of the installation.
- You have activated the "Siemens SIMOSIM Virtual Ethernet Adapter" in the network settings of your PC.
- You have created a project in SIMOTION SCOUT and use SIMOTION D4x5-2 devices as of V5.1 in your project.
- SIMOTION devices and Siemens SIMOSIM Virtual Ethernet Adapter are contained in the same IP subnet.
- No active online connection to a real SIMOTION device exists.

Starting SIMOSIM in SIMOTION SCOUT

To start SIMOSIM and simulation mode in SIMOTION SCOUT, proceed as follows:

1. Open the project in SIMOTION SCOUT.
2. In the project navigator, select the device you want to simulate.
3. Click  "Start SIMOSIM" in the menu bar.
   The "Start Simulation Mode and SIMOSIM" dialog opens.

4. Click "PG/PC...".
   The "Set PG/PC Interface" dialog opens.

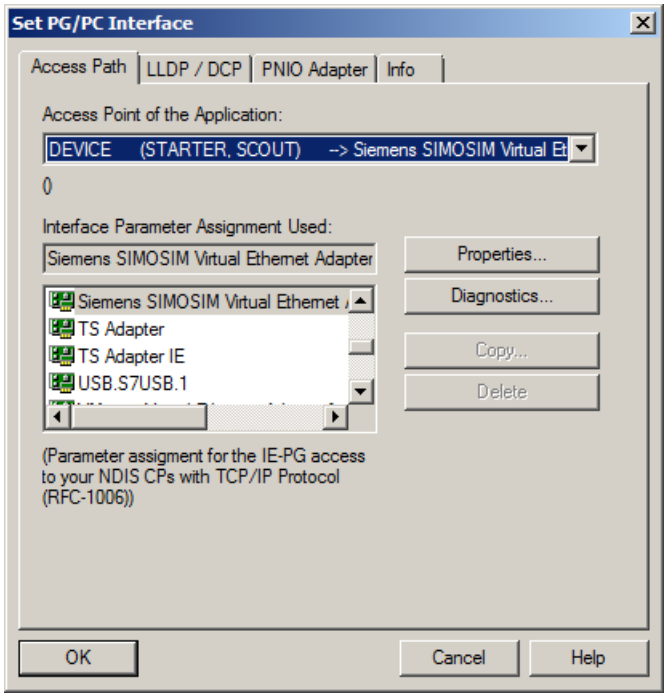

Figure 3-200 Setting the SIMOSIM PG/PC interface

5. Select "DEVICE ->Siemens SIMOSIM Virtual Ethernet Adapter.TCPIP.1" as access point of the application.
6. Confirm your selection with OK.

Note

Accepting Siemens SIMOSIM Virtual Ethernet Adapter automatically as a setting

To accept Siemens SIMOSIM Virtual Ethernet Adapter automatically as a setting, click "Accept settings" in the "Start Simulation Mode and SIMOSIM" dialog.

7. Click "Access point" in the "Start Simulation Mode and SIMOSIM" dialog.
   The "Properties > Device / Access point" dialog opens.

Figure 3-201 Access point used by SIMOSIM

8. Activate "DEVICE" as used access point.
9. Click "Set DEVICE addresses".
   The "DEVICE addresses" tab appears.

10. Activate X127 as virtual interface.
    You can use online access to the simulation only via interface X127.

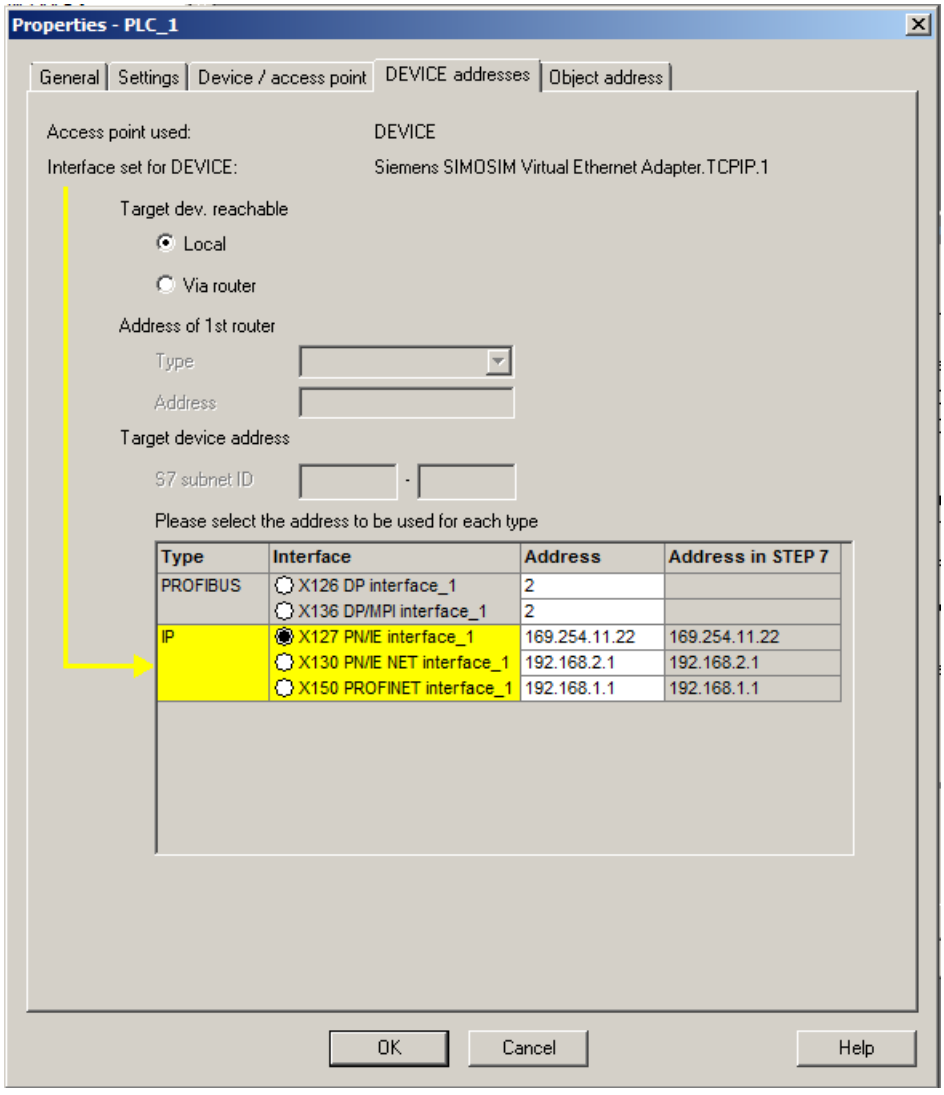

Figure 3-202 Setting the SIMOSIM DEVICE address

11. Click "OK" to confirm the selection.

12. Check your settings for the online interface.

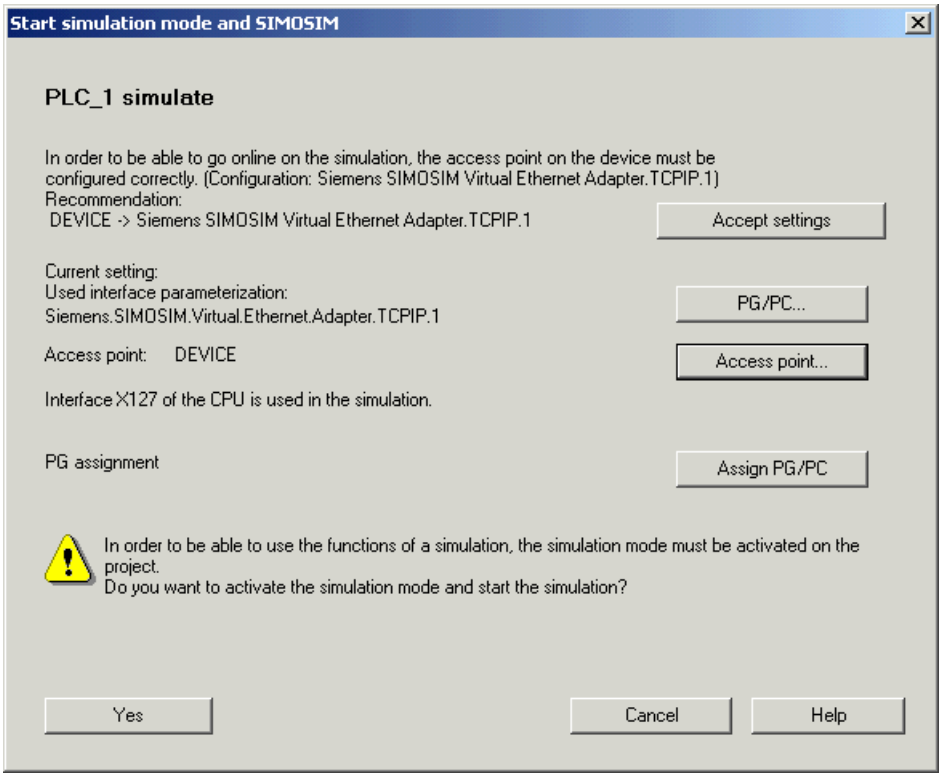

Figure 3-203 Starting simulation mode and SIMOSIM

13. To start simulation mode, click "Yes". Simulation mode is activated, SIMOTION simulation is started and a virtual controller is shown.

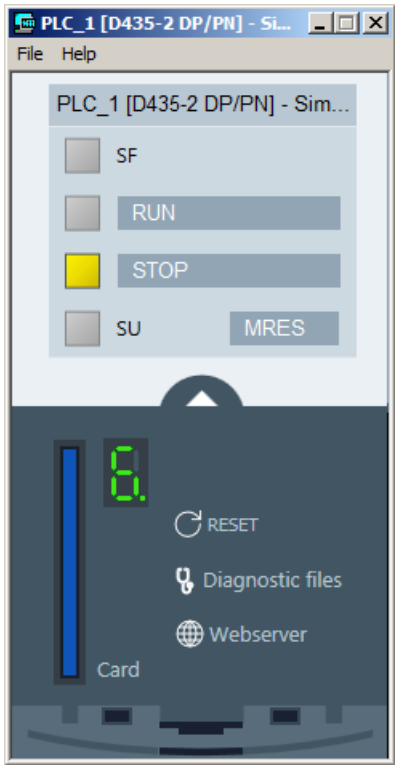

Figure 3-204 Virtual controller

The graphic user interface allows you to:

- Control the CPU operating state
- Open the Web server in the browser window
- Access the diagnostic files
- Reset the controller
- Access data on the memory card

Starting SIMOSIM in simulation mode

To start the simulation in activated simulation mode, proceed as follows:

1. Click "Start SIMOSIM" in the menu bar.
2. The "Start SIMOSIM" dialog opens.

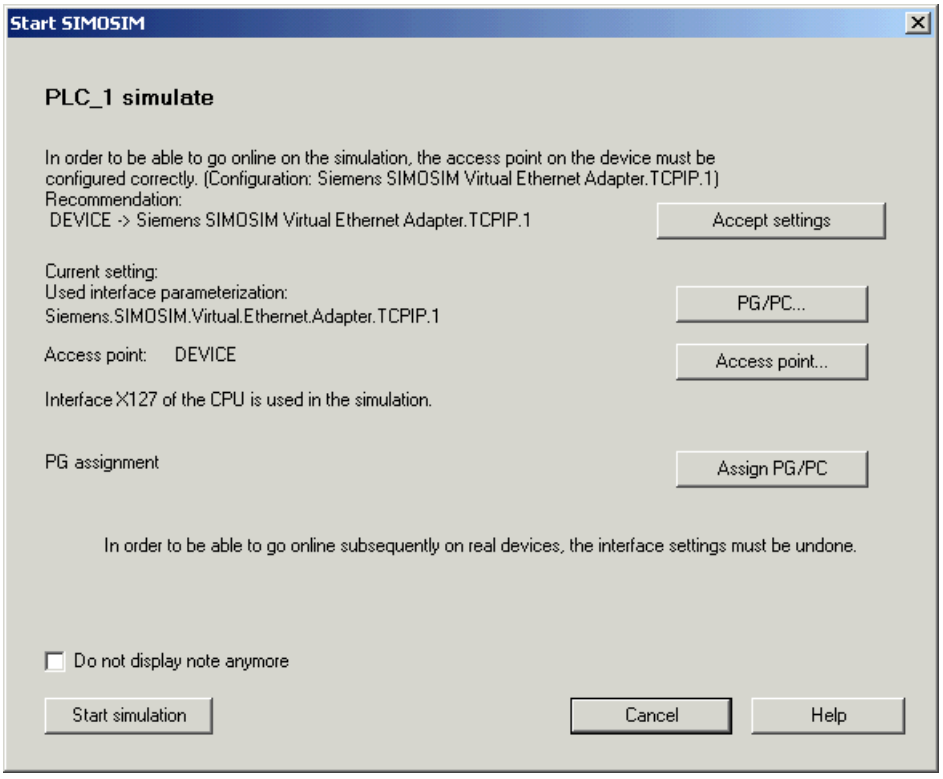

Figure 3-205 Restarting SIMOSIM

3. Click "Start simulation".

Result

SIMOSIM and simulation mode have been started.

You can now go online with a target device and download your project data into the virtual target system.

You can then simulate programs, axes, etc. You so allow SIMOSIM to write directly to the inputs.

Note

Going online in simulation mode

Note that only one device can go online in simulation mode.

Note

Simulation mode active/inactive

When simulation mode is active, this is color-highlighted in the SIMOTION SCOUT status bar.

To exit simulation mode, close the controller window by clicking the "X" in the upper area of the window. Deactivate the "Use simulation mode" option in the "Project" menu.
The flag in the status bar is reset. Simulation mode is exited.

Note

Emergency stop deactivated in debug mode

Note that in debug mode, no emergency stop is made with the space bar or by switching the application.

Note

Access to SIMOTION IT via Web browser using HTTPS

Note that the certificates must be created at the first start via HTTPS. This may take some time and corresponding messages may be displayed.

3.3.13 Configuring a further connection (such as HMI)

3.3.13.1 Rules for arranging modules in the HW Config

Slot rules

Modules must be inserted in the rack without gaps.

Exception:
Slot 3 remains empty in the configuration table. This slot is reserved.

Note

The actual arrangement has no gaps, as otherwise the bus on the backplane would be interrupted.

Table 3-34 Slot rule for SIMOTION rack 0 (SIMOTION C only)

Slot 1:	Power supply only, PS 307 xA
Slot 2:	CPU only
Slot 3:	Empty or interface module
Slots 4 to 11:	I/O modules or empty

SIMOTION SCOUT provides the following support when you configure a station:

- A message will appear if, for example, a module cannot be inserted into the desired slot.
- Address areas are also checked to prevent dual allocation of addresses.
- The status bar or messages displayed provide feedback, which you should pay attention to. Important information can also be found in the help.
- Temporary rules, that is, rules that apply only to a specific version, are not considered (such as restriction of the useable slots due to a functional restriction for individual modules).

Consult the documentation or the current product information for the modules.

Note

Modules that are installed but not configured are repeatedly addressed via the PROFIBUS. This requires additional computing time.

3.3.13.2 Routing

Routing designates the cross-network transfer of information from network x to another network y.
With SCOUT and STEP 7, it is possible to access SIMOTION, drives and S7 stations online via a PG/PC beyond the subnet boundaries, in order to, for example, load user programs or a hardware configuration or to perform test and diagnostics functions. You can connect this PG/PC to any position in the network and establish an online connection to all stations that can be reached via gateways.

Additional references

For further information, please go to:

- SIMOTION D410 Commissioning Manual
- SIMOTION D410-2 Commissioning and Hardware Installation Manual
- SIMOTION D4x5 Commissioning and Hardware Installation Manual
- SIMOTION D4x5-2 Commissioning and Hardware Installation Manual
- SIMOTION Communication System Manual

3.3.13.3 HMI (Human Machine Interface) connection

SIMOTION allows the end user to communicate with operating devices (Human Machine Interface systems) such as operator panels.

The following configuration is possible, for example, with the SIMOTION C240:

- HMI device is connected to the non-isochronous PROFIBUS of SIMOTION device 1.
- Four other SIMOTION devices are connected to the PROFIBUS DP (isochronous) of SIMOTION device 1.

SIMOTION automatically also establishes connections between the HMI device and SIMOTION devices 2 to 5 (routing). Therefore, the HMI device can also display variables, messages, and alarms for these devices.

Note

The number of routed connections depends on the device. Between 4 and 10 routed connections are possible.
A maximum of two routers is possible.
For more information, please contact your local Siemens representative.

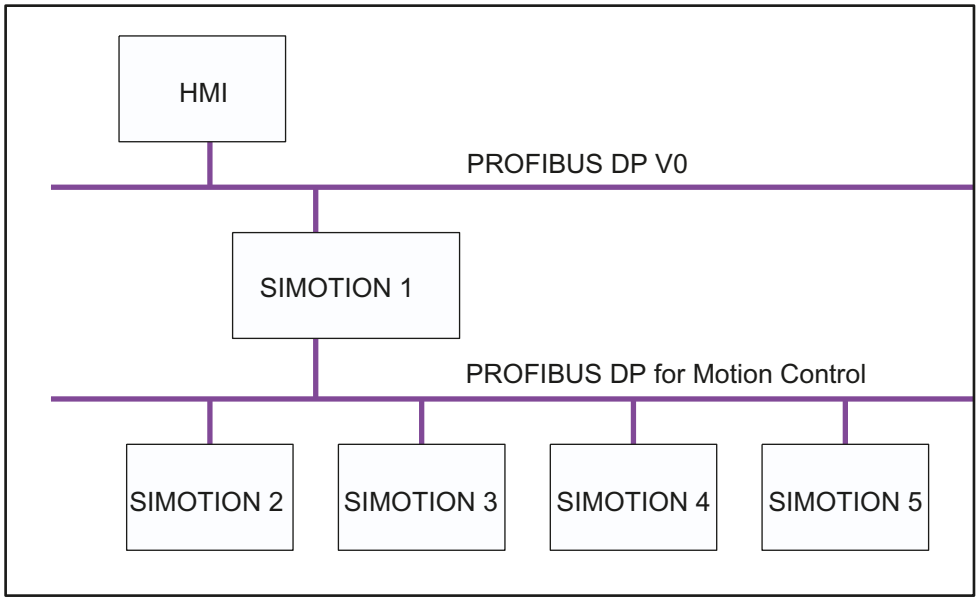

Figure 3-206 Example for the connection of an HMI device to a group of SIMOTION devices

Note

Routing by a controller (SIMOTION C, P or D) is possible only when it has been configured as active I-slave. However, please note that with an active I-slave, the PROFIBUS connection on the HMI can no longer be operated isochronously.

3.3.13.4 Higher-level automation systems

A SIMOTION device can be connected to a higher-level automation system. Communication takes place via the MPI interface of the SIMATIC STEP 7 device or the non-isochronous PROFIBUS interface of the SIMOTION device.

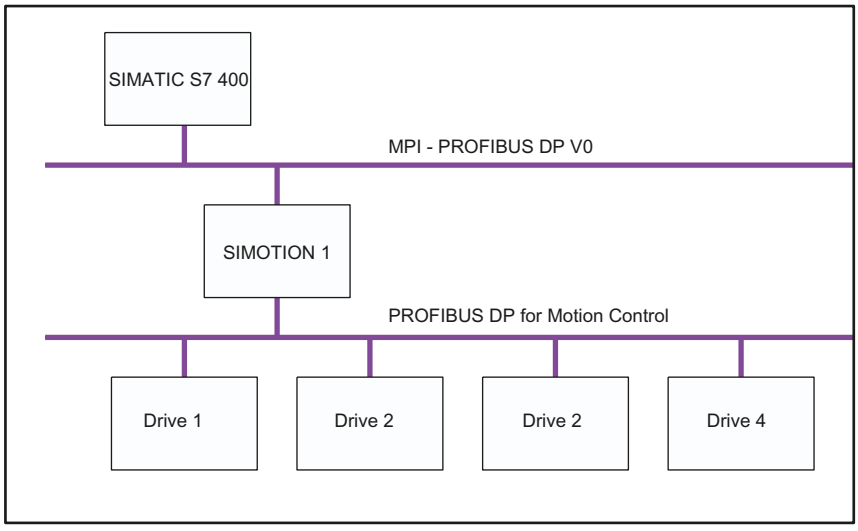

Figure 3-207 Higher-level automation system with SIMOTION device

Additional references

For additional information, refer to:

- *SIMOTION Communication* System Manual

3.3.13.5 TCP ports for access to SIMOTION/SINAMICS

TCP ports for access to SIMOTION/SINAMICS

Which TCP ports must be enabled in a router (or firewall) to permit access to a SIMOTION controller or SINAMICS drive via Ethernet?

NOTICE
Security information The functions and solutions described here are limited primarily to the implementation of the automation task. Please also note that in case of networking your plant with other parts of the plant, the company network or the Internet, appropriate protective measures within the framework of industrial security must be adopted. See also Internet (www.siemens.com/industrialsecurity).

Description

The following TCP ports must be enabled (open) for all routers and firewalls in the transmission link to permit the use of the following services: [1)]

Access to a SIMOTION controller / SINAMICS drive:

- ... via SCOUT (or STARTER) engineering software:
  - Port 102 (ISO-TSAP (Transport Service Access Point)
  - Port 5188 (only for SIMOTION)
  - Ping Request (ICMP) [2)]
- ... via web browser to the integrated web server:
  - Port 80 or 8080 (HTTP or HTTP alternate)
  - Port 443 (HTTPS)
- ... via FTP (only for SIMOTION):
  - Port 20, 21 (data communication, check)
- ... via TCP or UDP to the user program (only for SIMOTION):
  - Possible configurable port numbers are 1024 to 65535
- ... via OPC XML-DA (only for SIMOTION):
  - Port 80 or 8080 (HTTP or HTTP alternate)
  - Port 443 (HTTPS)
- ... via OPC UA (only for SIMOTION)
  - Port 4840

[1)] An open port can be verified with the following test, for example:

Under Windows, open the DOS window and enter the command "telnet <SIMOTION_IP_address> <Port>" (e.g. "telnet 192.168.214.1 102"). The space between <SIMOTION_IP_address> and the port number to be queried is important. If the screen in the DOS window turns black or if another window opens, your query has received a response via the port, i.e. the port is open. If this does not happen or if the query is canceled after some time with an error message, then SIMOTION does not respond via this port. A SIMOTION controller responds via port 5188 only if you were online via SCOUT (port 102) previously.

[2)] As of SIMOTION SCOUT / STARTER V4.3, ping-based connection monitoring can be deactivated. Therefore, the Ping Request (ICMP) may not have to be enabled. For this purpose, open the settings in SIMOTION SCOUT / STARTER at the "Tools" menu command and remove the checkmark at "Use S7-TCP connection monitoring" in the "CPU Download" tab.

3.3.14 Product combinations

3.3.14.1 Compatibility

General compatibility

Different hardware and software combinations as well as different Kernel and SIMOTION SCOUT version combinations are possible when using SIMOTION.

These possible combinations can be found in the compatibility list on the SIMOTION SCOUT add-on CD (at 1_Important) as well as on the Internet at:

Internet (https://support.industry.siemens.com/cs/ww/en/view/18857317)

Software compatibility

Technology packages with Kernel

The SIMOTION Kernel and the technology packages must always have the same version.

The current compatibility list is available online (http://support.automation.siemens.com/WW/view/en/18857317).

Project on memory card with SIMOTION Kernel

A project contains SIMOTION devices with a particular configured version. This exact SIMOTION Kernel version must be available on the relevant SIMOTION device.

SIMOTION SCOUT with project version

A project with a version earlier than the installed version of SIMOTION SCOUT will be converted to the current version when it is opened. Only the data content of the SIMOTION project will be converted to the current version, but not the SIMOTION device version.

See also

General compatibility (Page 433)

3.3.14.2 Memory media of the SIMOTION devices

Storing on storage media

The online project consisting of the technology package and the user data is saved to a non-volatile storage medium. The storage medium varies depending on the SIMOTION platform.

- SIMOTION C: Micro memory card
- SIMOTION P: Virtual memory card
  Handling and functionality correspond to the micro memory card of the SIMOTION C.
- SIMOTION P: CompactFlash card
- SIMOTION D: CompactFlash card

Note

The memory card must not be inserted or removed during operation. Removing the card in operating state triggers an overall reset, which results in the loss of stored data.

- SIMOTION C Operating Instructions

and the SIMOTION SCOUT online help.

Retentive data

Retentive data (non-volatile data) is saved to a non-volatile memory in the SIMOTION device. Depending on the SIMOTION device involved, this non-volatile memory buffers the data permanently (e.g. NVRAM for D410-2, D4x5-2).

You can also back up the non-volatile data to a memory card (e.g. CF or MMC) to protect data in the event of a spare part failing.

Use the _savePersistentMemoryData system function to back up the non-volatile data to the memory card.

In the event of a buffer failure or module replacement, the data is automatically restored at the time of ramping up.

More information on this topic is available in

- Function Manual: Basic Functions

3.3.14.3 STEP 7

SIMATIC Manager

Open a SIMOTION project

You can also open a project in the SIMATIC Manager and edit it with the tools provided. However, you do not have any direct access there to specific SIMOTION components, such as technology object and programs.
You can open the SIMOTION SCOUT from the CPU.

Note

You can use **File > Manage...** to show and hide the projects you have created in SIMOTION SCOUT in the SIMATIC Manager.

SIMATIC Logon

Overview

As of SIMOTION SCOUT V4.1, you have the option of assigning a project password to provide access protection for projects. This functionality requires the previous installation of the SIMATIC Logon STEP 7 option.
This function makes it possible to restrict project creation to authorized personnel only and to track changes in versions created with SIMATIC Logon. It also therefore provides support for the validation process of a machine or system [according to FDA 21 CFR Part 11].

Installation / Prerequisites

The STEP 7 options SIMATIC Logon and Version Trail must be installed and licensed in addition to SIMOTION SCOUT.

Characteristics

When SIMATIC Logon is installed, password protection can be activated for any project. A SCOUT project saved with SIMATIC Logon can only be opened and edited with password protection.

- When a project that has been password protected with **SIMATIC Logon** is opened in SIMOTION SCOUT, the access dialog in which the project password must be entered appears. The project so can be opened only with the correct password.
  If an incorrect password is entered, an error message appears and the project remains closed.
- Passwords are assigned in a separate administrator screen using a process configured according to the guidelines according to FDA 21 CFR Part 11.
- Every file open and every change is automatically recorded in a revision log.
- SCOUT projects created with SIMATIC Logon can be archived, managed and their changes tracked in a clearly organized fashion using the SIMATIC Version Trail option.

Activate SIMATIC logon

When SIMATIC Logon is installed, password protection can be activated for any project.

To do this, select **Options > Access Protection > Activate** in SIMATIC Manager.

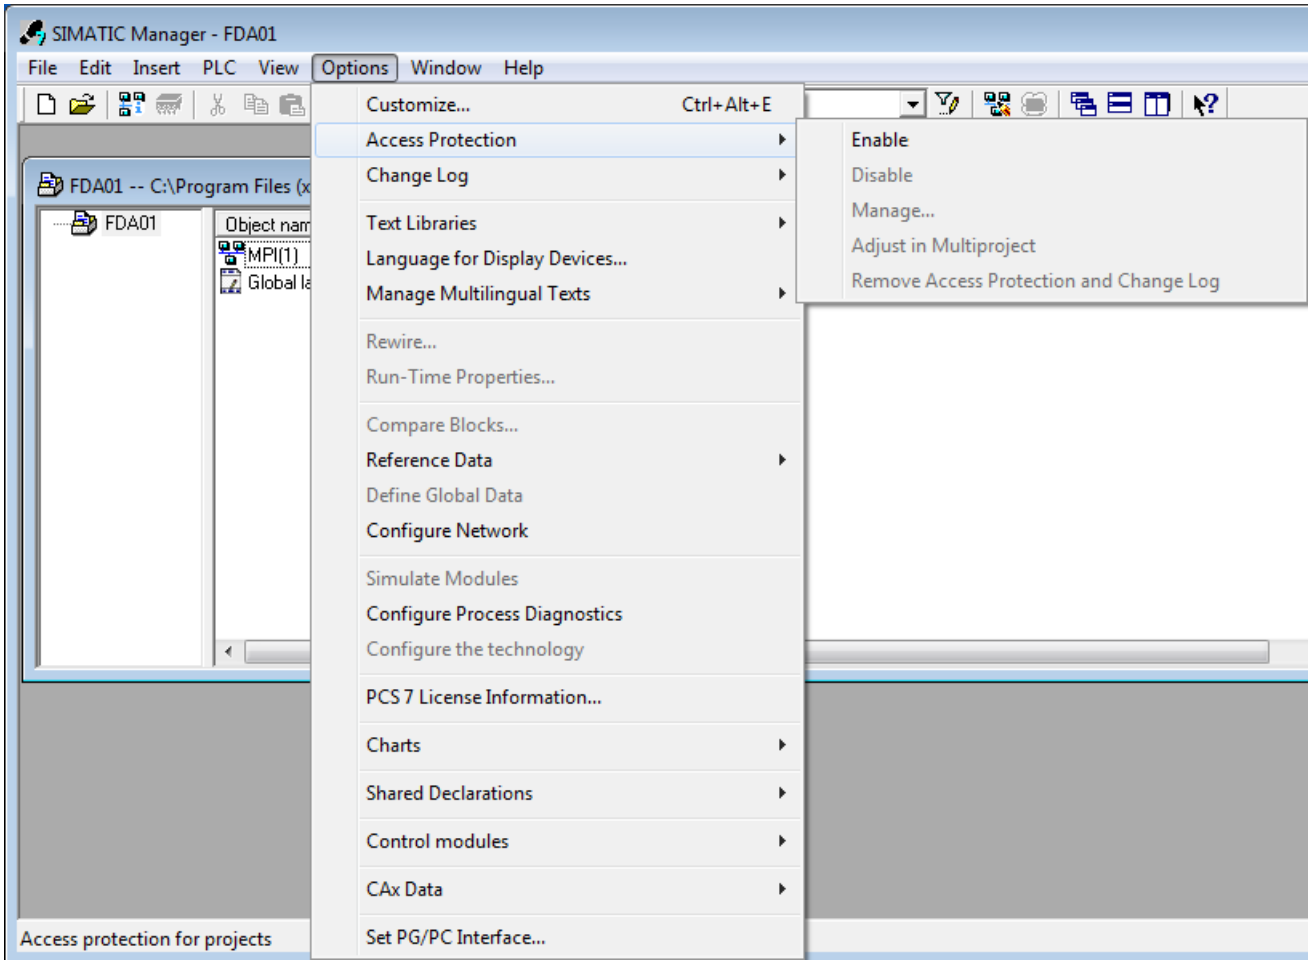

Figure 3-208 Activate SIMATIC Manager access protection

When access protection is activated, the SIMATIC Logon Service window opens. The administrator logs in here to assign a project password for this project.

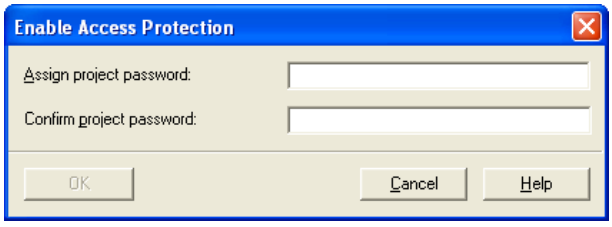

Figure 3-209 Activate access protection

Then the users are entered in the user administration for this project using drag-and-drop.

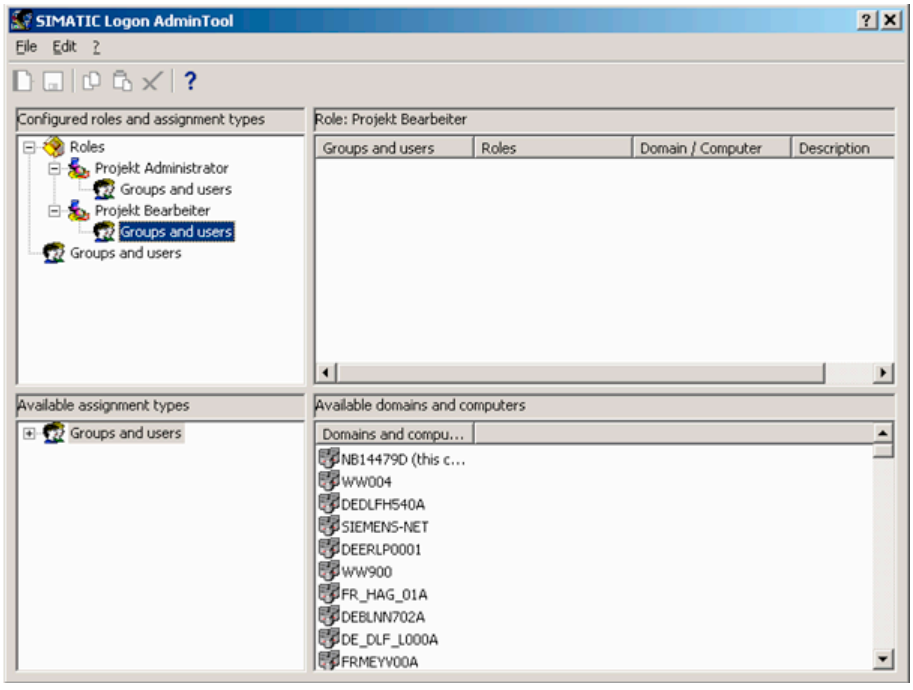

Figure 3-210 SIMATIC Logon AdminTool

Open protected project

When a protected project is opened, the following dialog appears if SIMATIC Logon is installed. Enter your user name and password here.

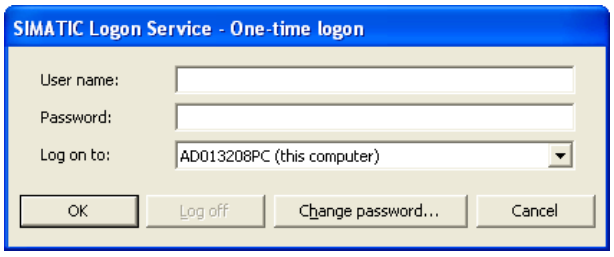

Figure 3-211 SIMATIC Logon Service

If SIMATIC Logon is not installed, the project can also be set to open only with the project password using STEP 7.

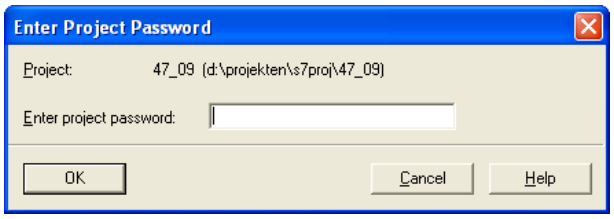

Figure 3-212 Enter the project password.

For more details on this topic, see the following document:

- SIMATIC Logon; SIMATIC Electronic Signature, Manual

SIMATIC Version Trail

Overview

SIMATIC Version Trail is a software option for SIMOTION engineering which, together with the SIMATIC Logon central user administration, can assign a version history to libraries and projects.

Installation / Prerequisites

SIMATIC Version Trail is a STEP7 option that must be installed and licensed in addition to SIMOTION SCOUT. SIMATIC Version Trail can only be used and licensed in a package together with SIMATIC Logon.

Function

When archiving, SIMATIC Version Trail creates a version history with the following information in association with SIMATIC Logon:

- Version
- Version name
- Date and time
- User
- Comment

This version history can be displayed and printed. Individual versions can be retrieved from the version history, and used further. SIMATIC Logon organizes the access protection.

View of a SIMATIC Version Trail window, showing the project name, comments and versioning data. The versions created with SIMATIC Logon can be documented and managed in a clearly organized fashion after changes.

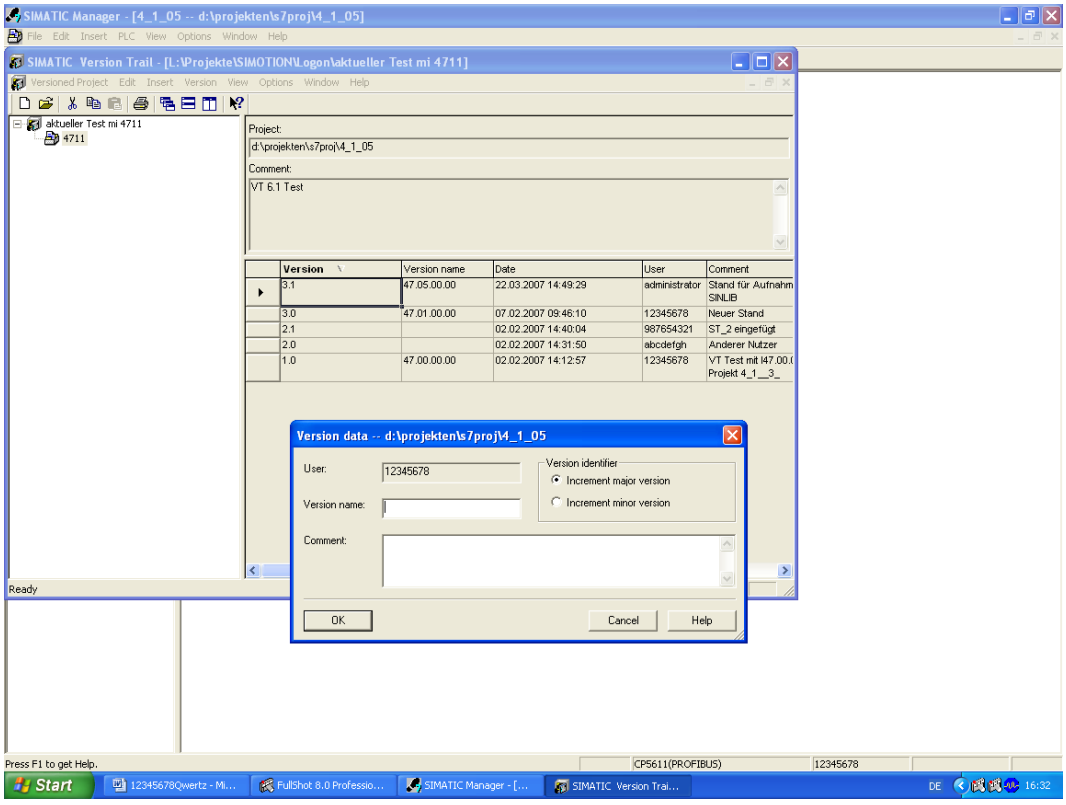

Figure 3-213 SIMATIC Version Trail - version data

Note

Please note that SIMATIC Version Trail cannot be used separately, but only in combination with SIMATIC Logon.

3.3.14.4 NetPro

NetPro in STEP 7

NetPro is integrated in the STEP 7 basic package. NetPro is a tool that supports network configuration in STEP 7.

Application for SIMOTION

So that network nodes can communicate, configure networks and/or subnets in NetPro. In NetPro, you create a graphic view of the networks and subnets and specify their properties or parameters. You can also define the node properties.

You can open NetPro in SIMOTION SCOUT using the button, whereby the NetPro application opens as a separate window. Application cases for the SIMOTION project are, for example, the connection of the engineering system via network nodes and the creation of routing connections.

Detailed information can be found in:

- Online help, *SIMOTION SCOUT Getting Started*
- *SIMOTION SCOUT Communication* System Manual

3.3.14.5 HMI

Overview

The Human Machine Interface (HMI) connects the world of automation with the individual demands of the operator. As part of TIA, SIMATIC HMI supports uniform engineering under Windows, accesses common data and communicates uniformly.

For efficient machine operation and monitoring in various performance classes, you can use the following panels recommended for SIMOTION as well as PC-based panel systems with membrane keyboards or touch screen operation:

- Panels
  For efficient machine operation and monitoring in various performance classes, either text-based or graphics-capable with membrane keyboards or touch screen operation.
- Multi-panels
  These can be used for operator control and monitoring in the same way as the panels, with operation by means of touch screens or membrane keyboards. Multi-panels (MP) also permit the installation of additional applications and therefore provide typical PC flexibility.
- Panel PCs
  Are designed for demanding environmental conditions and provide the same degree of robustness and suitability for industry.

The WinCC flexible engineering software is available for the display of the user interface.

Additional references

Detailed information can be found in:

- Catalog: SIMOTION, SINAMICS S120 and Motors for Production Machines
- PM 21 Catalog.

SIMATIC WinCC flexible

SIMATIC WinCC flexible is the innovative HMI software under Windows 7 for all applications in the machine-related area. The engineering software enables the uniform configuration of all Windows-based SIMATIC HMI operator panels.
WinCC flexible Runtime provides basic HMI functionality on PCs, including messaging and logging systems and can be expanded when required via options. The runtime functions available on SIMATIC HMI operator panels depend on the device class.
The WinCC flexible engineering software can be integrated in the central programming software of the SIMATIC world, SIMATIC STEP 7, and used for the configuration of all operator panels. The engineering software of SIMATIC HMI also accesses variable lists and message lists of the controller and uses their communication parameters.

OPC / OPC XML-DA / OPC UA

Open communications standard for automation components. The goal of the standard is to ensure a problem-free and standardized data exchange between controllers, operator control and monitoring systems, field devices and office applications from different manufacturers.

The abbreviation OPC previously meant "OLE for Process Control", because the implementation was based on Microsoft's COM/DCOM technology.
Nowadays, one uses the term "Openness, Productivity and Collaboration". Today, a number of standards defined by the OPC Foundation have evolved. The OPC Foundation is a grouping of many manufacturers from the automation technology area.

SIMOTION supports the OPC DA (Data Access) and OPC AE (Alarm & Event) standards with the SIMATIC NET Softnet package. This is based on the Windows COM technology.

SIMOTION also supports OPC XML-DA (Data Access based on XML). The OPC server is located in the SIMOTION device and is accessed from a partner station no longer using COM mechanisms but with Web services and their XML-coded function calls. This makes the partner stations independent of hardware and operating systems.

The client application on the partner station works with the symbolic SIMOTION variable names. There is no dependency on the SIMOTION SCOUT database, which means that no consistency problems arise, even when there is a switch in versions.

OPC UA (Unified Architecture) is a standardized, industrial communication protocol for access to control data, e.g. by control systems. OPC UA Data Access permits the reading and writing of SIMOTION variables.

3.3.14.6 Drive ES

Drive ES engineering system

Drive ES is the engineering system used to integrate Siemens drive technology into the SIMATIC automation world easily, efficiently and cost-effectively in terms of communication, configuration and data management. The STEP 7 Manager user interface provides the basis.

Drive ES Basic is the basic software for the parameterization of all drives, online and offline. With the Drive ES Basic software, the automation and the drives are edited on the user interface of the SIMATIC Manager. Drive ES Basic is the starting point for common data archiving from complete projects and for extending the use of the routing and SIMATIC teleservice to drives. Drive ES Basic provides the engineering tools for the new motion control functions - data exchange broadcast, equidistance and isochronous operation with PROFIBUS DP.

The following commissioning tools are contained in Drive ES:

- STARTER Standalone for SINAMICS is not required and cannot be used in conjunction with SIMOTION SCOUT because STARTER is integrated in SIMOTION SCOUT.
- SIMOCOM U for SIMODRIVE
- Drive Monitor for MASTERDRIVES
  Note:
  Drive ES Basic is within the scope of delivery for SCOUT and SCOUT Standalone.

3.3.14.7 Commissioning drives (STARTER)

STARTER supports simple and rapid commissioning, optimization, and diagnostics for all new-generation Siemens drives with only one tool.

The STARTER drive/commissioning tool supports the following drives:

- SINAMICS
- MICROMASTER 420/430/440
- MICROMASTER 411 / COMBIMASTER 411
- COMBIMASTER
- ET200pro FC
- ET200S FC ICU24

The following variants are available:

- STARTER Standalone:
  STARTER as commissioning tool for applications without SIMOTION, but with integration of the new drives in SIMATIC S7. STARTER Standalone is not required in connection with SIMOTION SCOUT and cannot be used.
- STARTER integrated in SIMOTION SCOUT:
  For SIMOTION applications, SIMOTION SCOUT contains the entire functionality of STARTER.

Performance characteristics:

- Wizards support new users by providing solution-oriented dialog guidance, whereby the uniform graphics-based display facilitates understanding.
- However, experts are also able to access the individual parameters quickly.

3.3.14.8 CamTool

Graphic creation of cams

Simple text-based editors are already integrated in the basic SIMOTION SCOUT package for the creation of cams. The CamTool option package extends SIMOTION SCOUT with a powerful tool for the full graphical creation and optimization of cams. CamTool fully integrates into the SIMOTION SCOUT user interface. In SIMOTION CamTool, you can create, edit and optimize cams with the aid of a graphical user interface.

Please refer to the following document on this subject

- Configuration Manual: SIMOTION CamTool

3.3.14.9 DCC programming system

Drive Control Chart

DCC enables SIMOTION and SINAMICS users to also implement and graphically configure drive-related tasks employing continuous closed-loop and open-loop control.

A set of Drive Control Blocks (DCB) is available in a library for this purpose. These function blocks can be graphically interconnected and configured in what are known as "charts" via a configuration tool (DCC editor).

A large number of Drive Control Blocks (DCB) are available for both DCC-SIMOTION and DCC-SINAMICS with identical functionality.

- Module library with administration, calculation, control, logic and complex modules.
- Graphical switching editor with various editing, macro, help, search, comparison and print functions.
- Sequence environment for SIMOTION with selectable, mixable scanning times and consistent data transfer between scanning periods.
- Sequence environment for SINAMICS with embedding of technology option in SINAMICS using the BICO technique, with the applications set using configured parameters
- Diagnostics environment with signal display, diagnostics and trace functions.
- Scalability with different performance features and project data volumes for DCC-SIMOTION and DCC-SINAMICS.

Note

Editing and deleting DCC charts

To edit DCC charts, a CFC editor must be installed and you require a valid license for DCC SINAMICS or DCC SIMOTION.

3.3.16 Appendix

3.3.16.1 Scripts for SIMOTION

The scripting functionality enables you to automate the configuration of devices, SIMOTION technology objects (TOs), and SINAMICS drive objects (DOs) with the help of the easy-to-learn script language VBScript. Standard scripts can be adapted to special situations occurring during runtime with interactive queries. This facilitates and speeds up commissioning. Other application possibilities include the documentation of the settings that have been made and the repetition of complex settings without error.

To access these scripts and the related documentation, select **Scripts** in **Utilities&Applications**.

The selection of documents and scripts you will find there should help you quickly get to grips with scripting in SIMOTION. As well as demonstration-only scripts for studying the code, there are also scripts and script libraries you can actually use yourself.

For further information, please also see *Scripts for sequence automation* in the online help.

3.3.16.2 Creating an example program for axis positioning in SIMOTION SCOUT

Program overview

In this section, a program for positioning the connected axis is created in the **MCC** (Motion Control Chart) editor.

The Getting Started section of the SIMOTION SCOUT online help contains a detailed description of an example configuration.

Requirements

- You need to have created a SIMOTION device
- You need to have created an *Axis 1* technology object (e.g. as a virtual axis).

Inserting the programs

Create four programs with MCC.

- motion_1
- backgr
- perfault
- tecfault

Creating a program with MCC

1. Open the **Programs** folder for the created SIMOTION device in the project navigator.
2. Double-click **Insert MCC unit**.
3. Enter the name **motion_1** for the MCC unit.
4. Click the **Compiler** tab.
5. Activate the required settings.
6. Click **OK**. An MCC unit is created in the project navigator.
7. Double-click the MCC unit motion_1 in the project navigator.
8. Double-click **Insert MCC chart**.
9. Enter the name **motion_1** for the MCC.
10. Click **OK**. The MCC is opened.
11. Click the **Single-axis commands > Switch axis enable** icon.
    The command is inserted.
12. Click the **Single-axis commands > Position axis** icon.
    The command is inserted.

13. Click the **Single-axis commands > Remove axis enable** icon. The command is inserted.

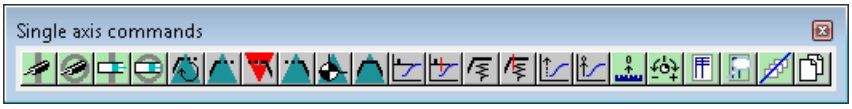

Figure 3-214 Menu bar of the single-axis commands

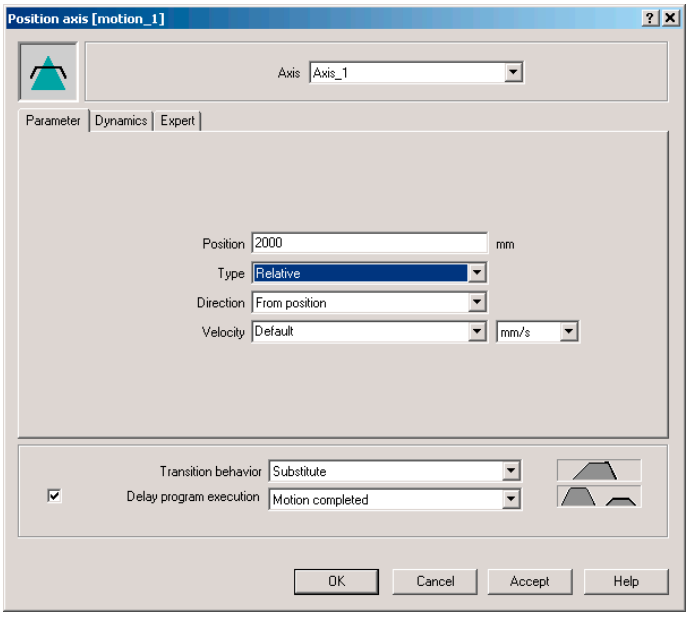

Figure 3-215 Opened command: Position axis

14. Double-click the **Switch axis enable** command.
15. Click **OK**.
16. Double-click the **Position axis** command.
17. Enter the value 2000 at Position.

18. Select **Relative** in the Type field.

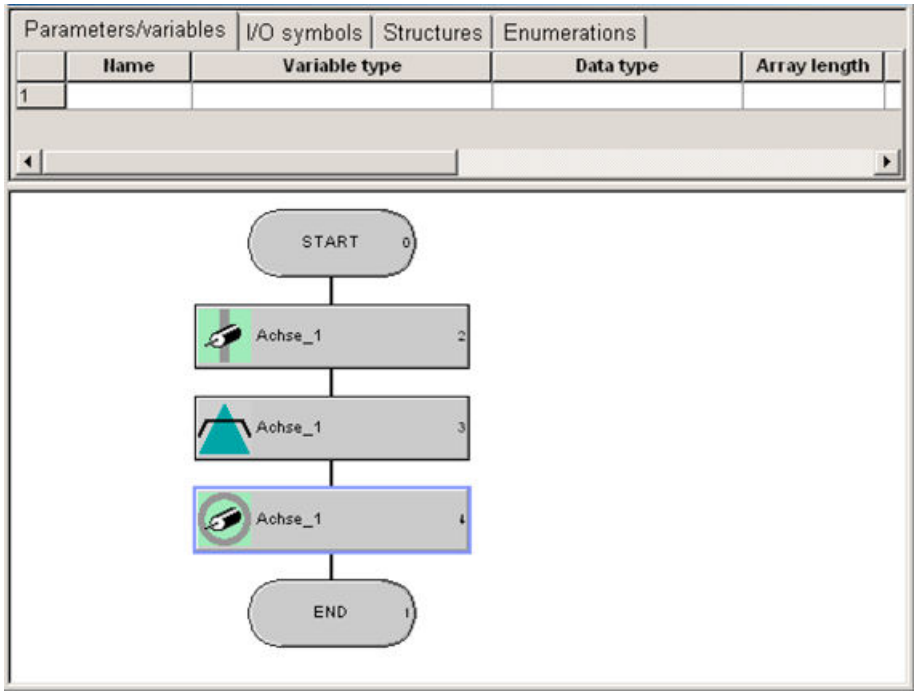

Figure 3-216 Arrangement of the single-axis commands in MCC motion_1

19. Click **OK**.
20. Double-click the **Remove axis enable** command.
21. Click **OK**.
22. Compile using the menu command **MCC chart > Apply and compile**.

Creating the backgr program

1. Double-click **Insert MCC unit**.
2. Enter the name **backgr** for the MCC unit.
3. Click the **Compiler** tab.
4. Activate the required settings.
5. Click **OK**. An MCC unit is created in the project navigator.
6. Double-click the MCC unit **backgr** in the project navigator.
7. Double-click **Insert MCC chart**.
8. Enter the name **backgr** for the MCC.
9. Click **OK**. The MCC is opened.

10. Enter the following variable data in the MCC unit **backgr**.
    - In the Name field: Run
    - As the variable type, select: VAR_GLOBAL
    - As the data type, select: BOOL
    - In the Initial value field: False

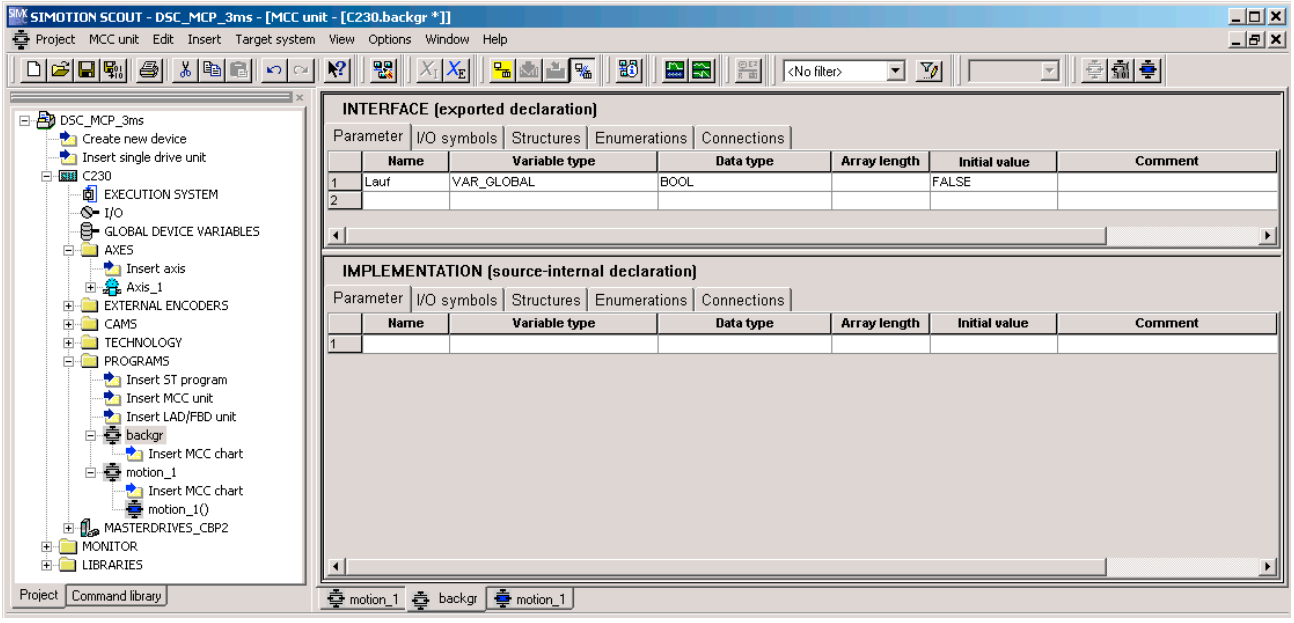

Figure 3-217 Entering a global variable

11. Switch to the MCC Chart **backgr** tab.

12. In the **Program structures** command bar, click on the **IF program branch** icon.

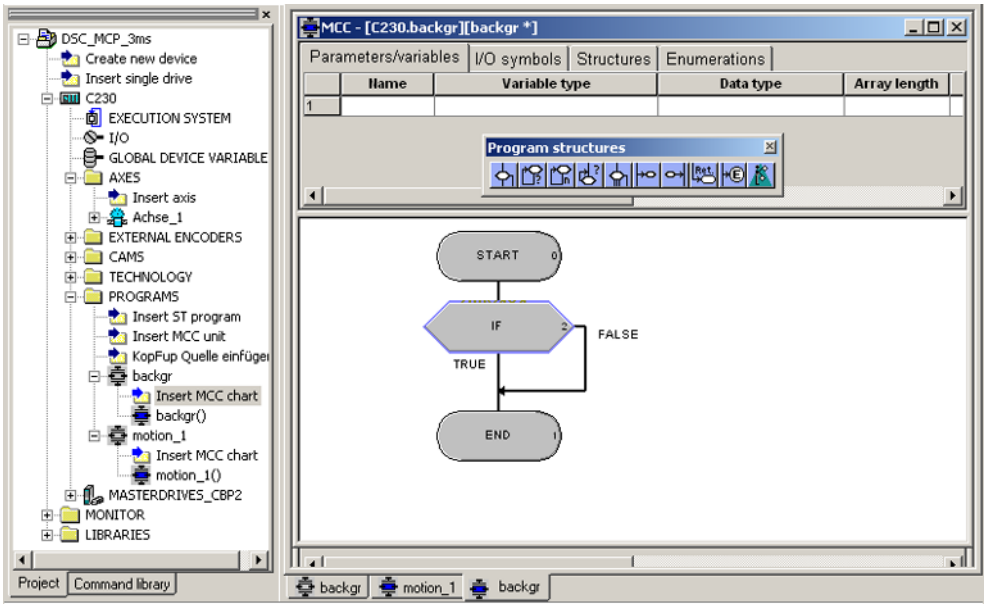

Figure 3-218 IF program branch at basic commands

13. Double-click the **IF program branch** command.
14. Select **Formula** and enter the condition **Run=true**.

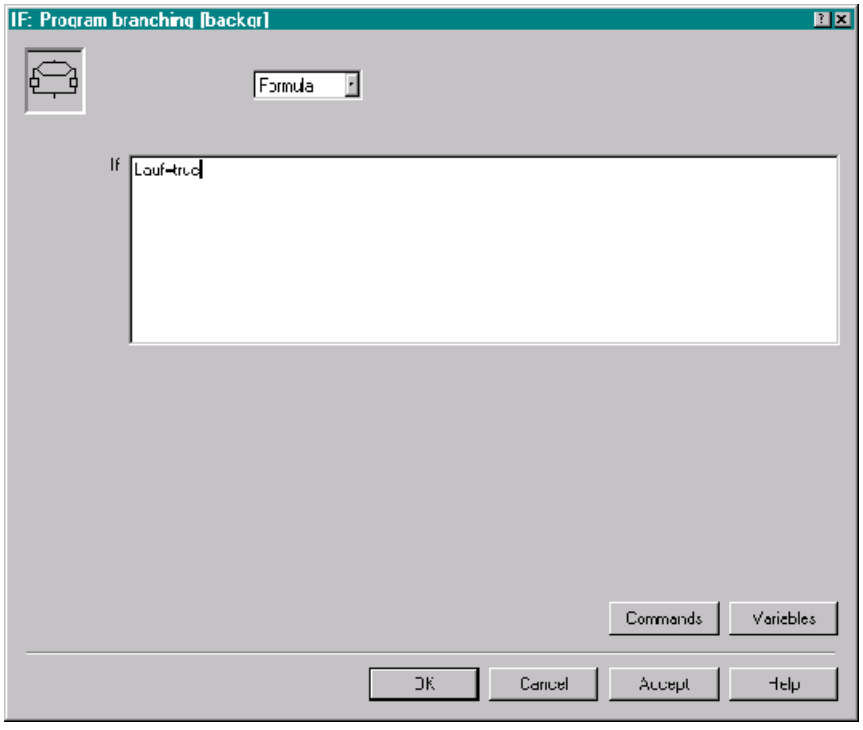

Figure 3-219 Configuration of the IF program branch

15. Confirm the input with **OK**.
16. In the **Task commands** command bar, select the command **Start task**.
    This inserts the command.
17. In the **Important commands** command bar, select the command **Variable assignment**.
    This inserts the command.
18. Double-click the **Start task** command.
19. Click **OK** to confirm.
20. Double-click the **Variable assignment** command.

21. Enter the statement **Run:=false**.

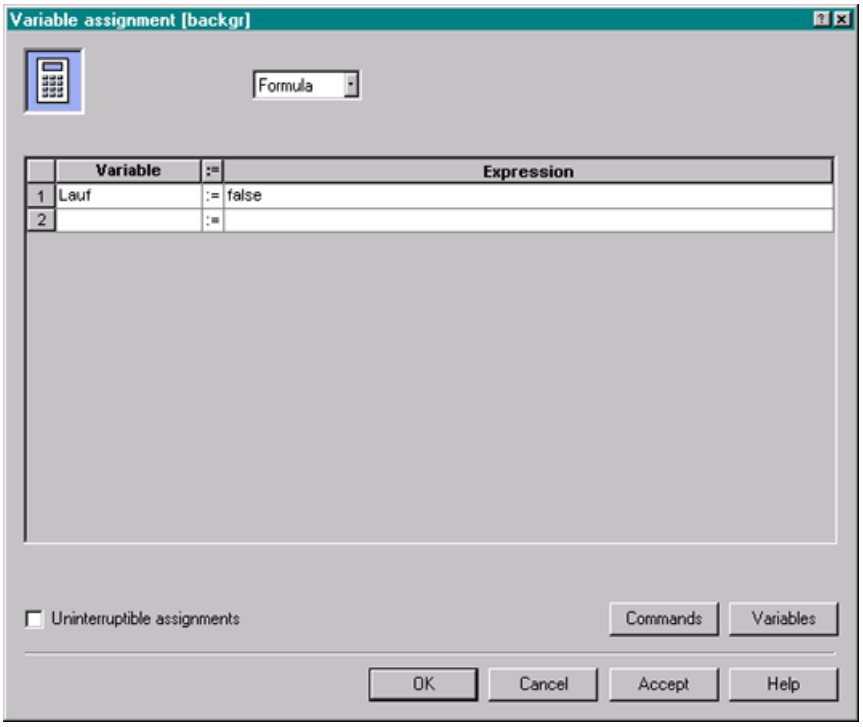

Figure 3-220 Configuration of the variable assignment

22. Click **OK** to confirm.

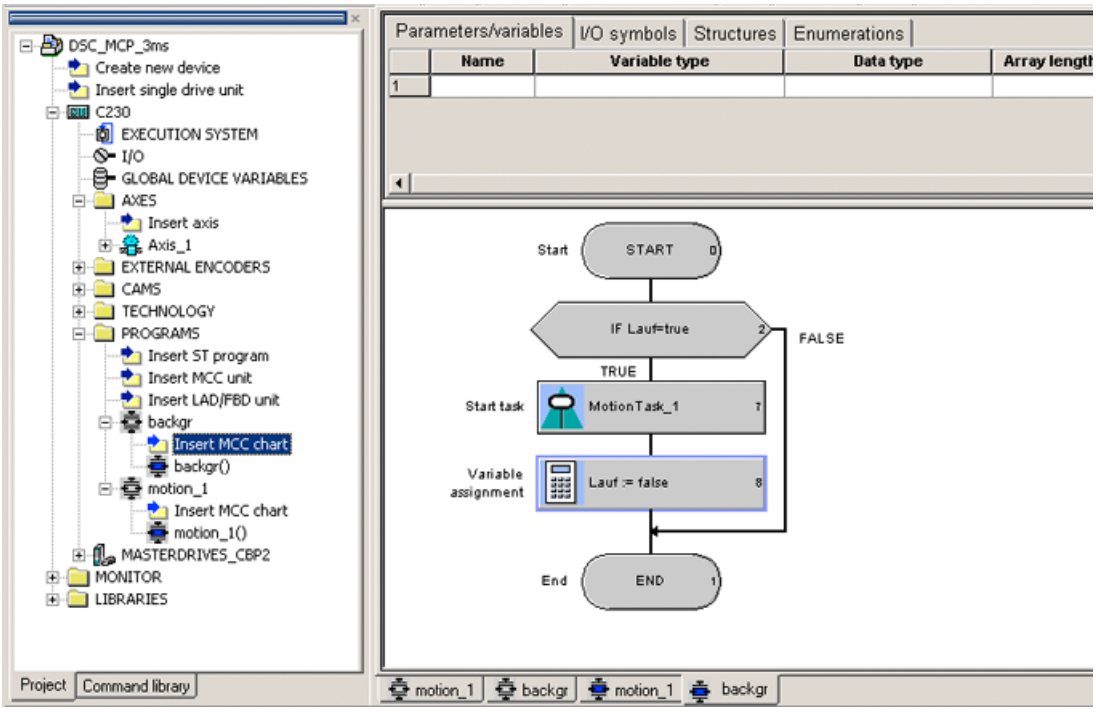

Figure 3-221 Completed program of the BackgroundTask

23. Select **MCC Chart > Accept and compile** from the menu bar.
    The detail display in the Compile/Check output tab indicates how compilation is progressing and when it is complete.

Creating the perfault program

1. Double-click **Insert MCC unit**.
2. Enter the name **perfault** for the MCC unit.
3. Click the **Compiler** tab.
4. Activate the required settings.
5. Click **OK**. An MCC unit is created in the project navigator.
6. Double-click the MCC unit perfault in the project navigator.
7. Double-click **Insert MCC chart**.
8. Enter the name **perfault** for the MCC.
9. Click **OK**. The MCC is opened.
10. Select from the menu bar **MCC chart > Apply and compile**.

Creating the tecfault program

The procedure for creating the **tecfault** program is exactly the same as for the perfault program.

In the MCC unit and MCC chart, enter **tecfault** as the name.

Assigning programs to the execution system

1. In the project navigator, double-click **Execution system** for the SIMOTION device. The execution system is opened in the working area.

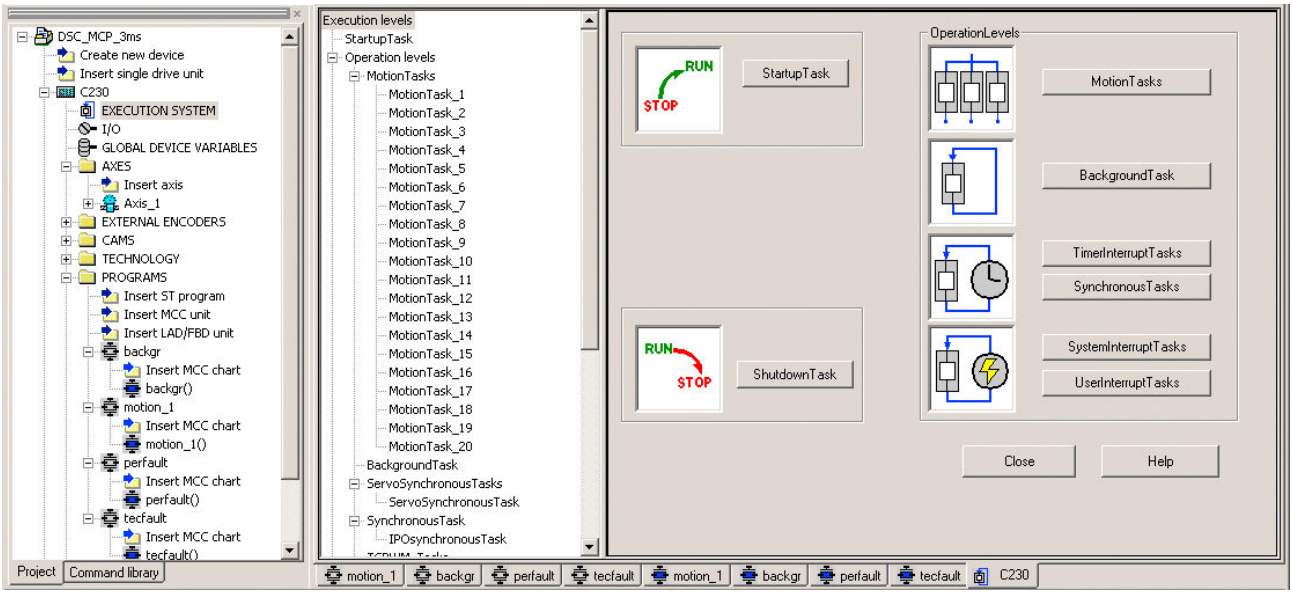

Figure 3-222 Execution system of the SIMOTION device

2. Click the **MotionTasks** button.
3. Assign the **motion_1** program to MotionTask_1.
4. Assign the **backgr** program to the BackgroundTask.
5. Assign the **perfault** program to the PeripheralFaultTask.

6. Assign the **tecfault** program to the TechnologicalFaultTask.

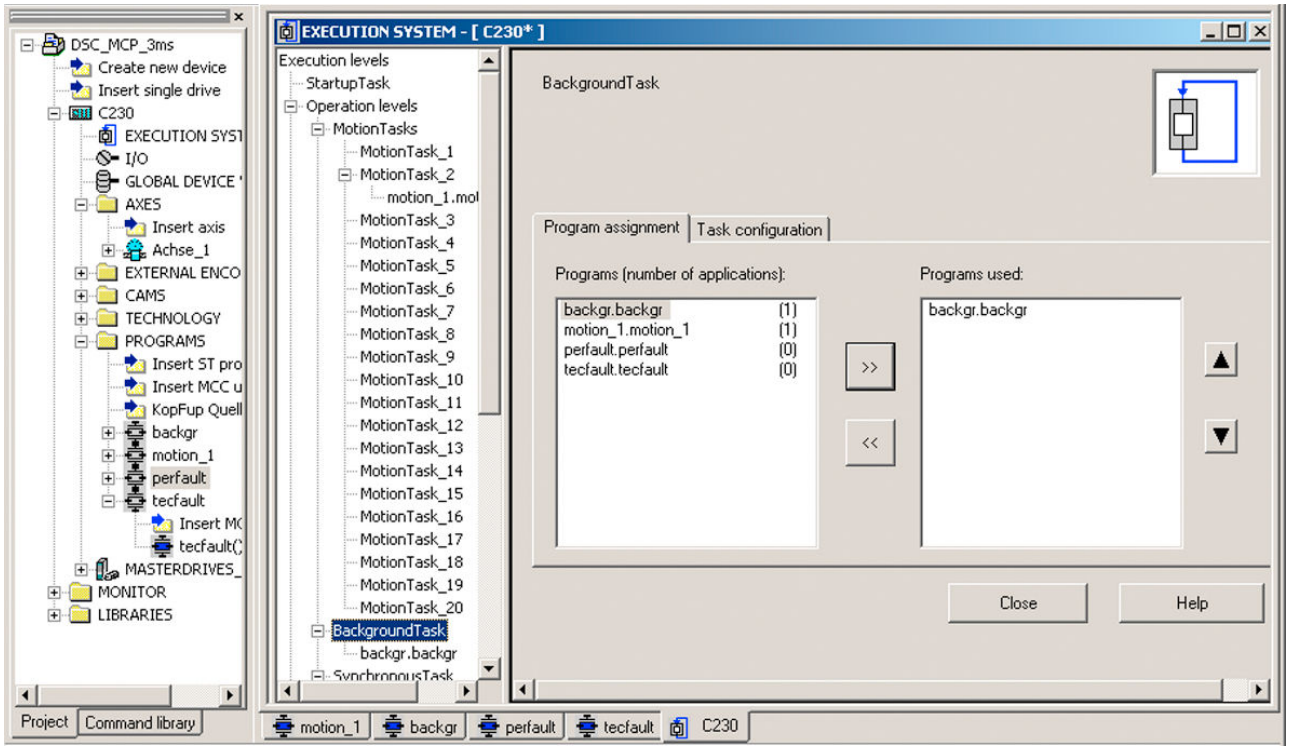

Figure 3-223 Assignment of the tasks in the task system

7. Click the **Save and compile changes** button.

Loading the programs to the SIMOTION device and switching to RUN

The toggle switch of the SIMOTION device is still set to **STOP**.

1. Establish an online connection. To do this, click the **Connect to selected target devices** button.
2. Click the **Download project to target system** button.
   This can take several minutes.
3. Switch the SIMOTION device to **RUN** via the **switch** after the project has been downloaded to the target system. Two LEDs, the green 5 VDC and the RUN LED, light up.

Monitoring and controlling in SIMOTION SCOUT

1. Click the **Connect to selected target devices** button.
2. Select the **backgr** program.
3. Activate the **Monitor** function in the MCC toolbar.
4. Select the **Symbol browser** tab.
5. As **control value**, enter the variable **Run** "**TRUE**".
6. Activate the setting in Status value.

7. Click **Start status**. The value **FALSE** is displayed.

8. Activate the setting in Control value.
9. Click **Control**. The active command is highlighted in yellow in the program.

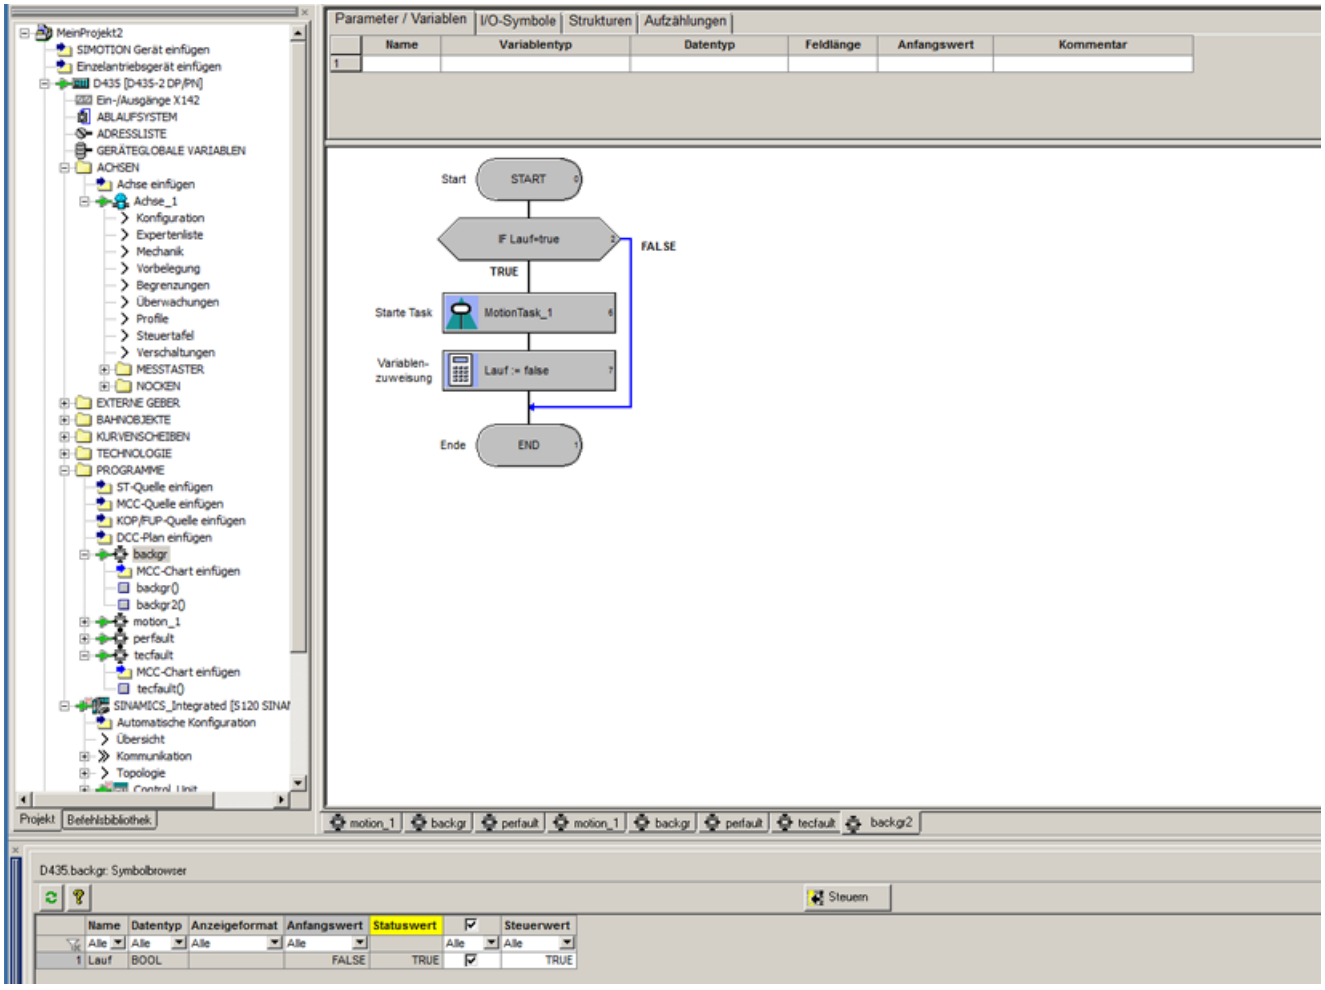

Figure 3-224 Monitoring and controlling the variable in the BackgroundTask

The motor now rotates at 6000 rpm and approaches the position 2000 mm. You can check this by selecting **Axis_1** at **Axes**, opening **basicMotion** in the symbol browser, and observing the **position**. The values are refreshed automatically when an online connection exists.

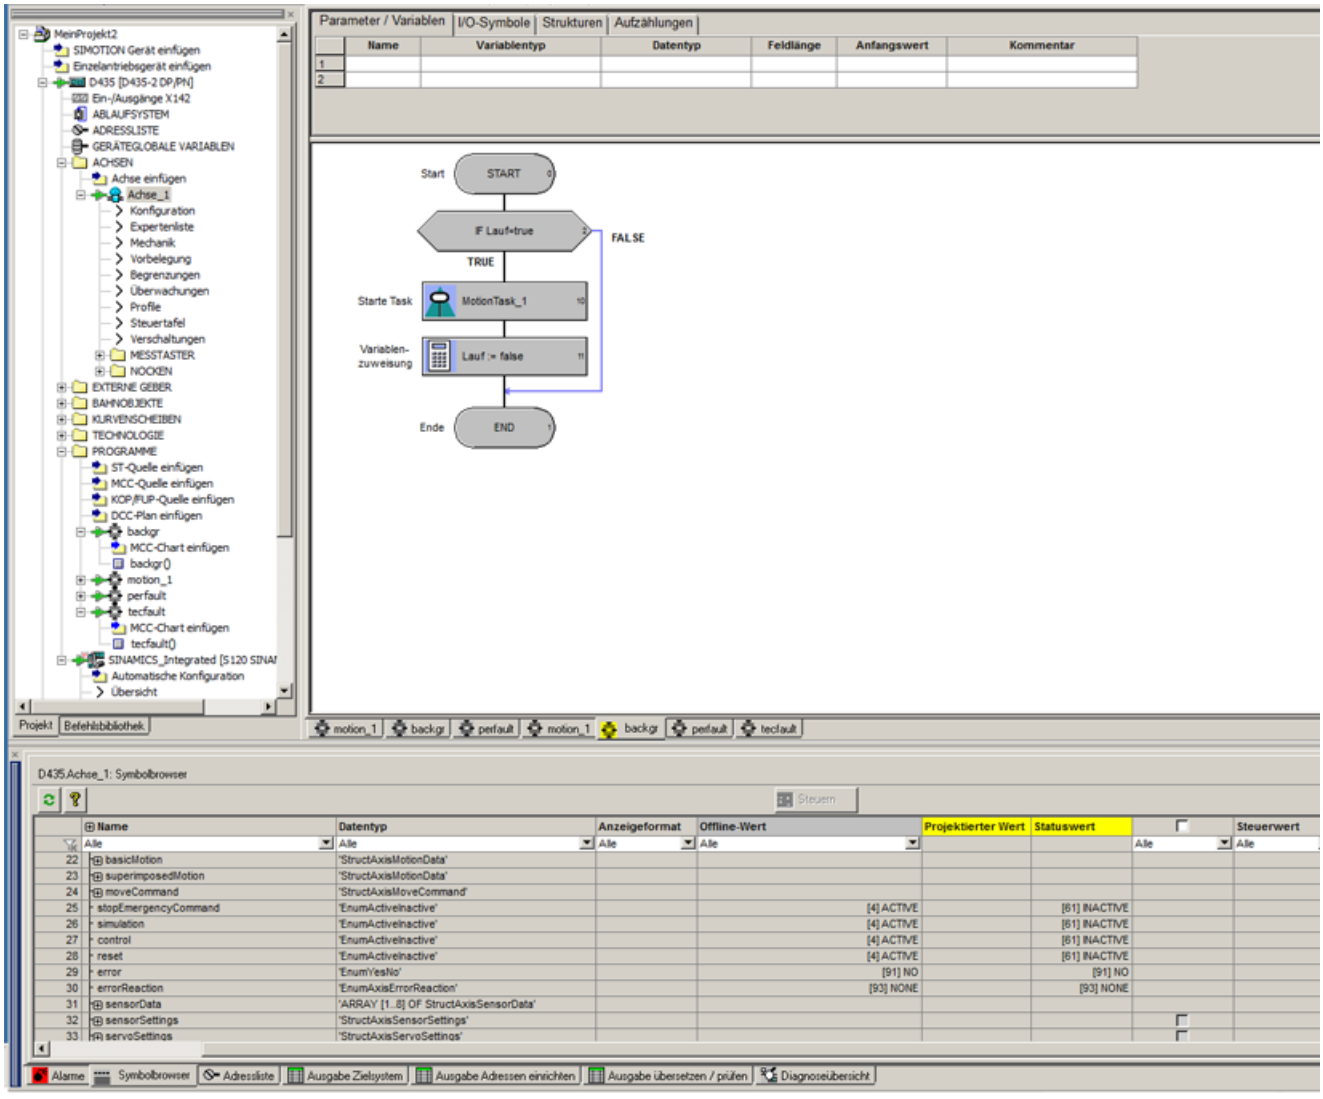

Figure 3-225 Checking the positioning motion in the symbol browser of Axis_1

When the axis has finished positioning, a value of 2000 mm appears here. If the positioning is restarted, the actual position value increases by 2000 mm for each motion.

3.4 Getting Started with SIMOTION SCOUT TIA

Preface

Scope and standards

This **document** is part of the **Engineering System Handling documentation package**.

Scope of validity

This manual is valid for SIMOTION SCOUT, product version V5.1.

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT TIA and it comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.1:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/de/view/109480700

Additional information

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT TIA, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

3.4.1 Fundamental safety instructions

3.4.1.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life caused by machine malfunctions caused by incorrect or changed parameterization

Incorrect or changed parameterization can cause malfunctions on machines that can result in injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

3.4.1.2 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions only form one element of such a concept.

Customer is responsible to prevent unauthorized access to its plants, systems, machines and networks. Systems, machines and components should only be connected to the enterprise network or the internet if and to the extent necessary and with appropriate security measures (e.g. use of firewalls and network segmentation) in place.

Additionally, Siemens' guidance on appropriate security measures should be taken into account. For more information about industrial security, please visit http://www.siemens.com/industrialsecurity.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends to apply product updates as soon as available and to always use the latest product versions. Use of product versions that are no longer supported, and failure to apply latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under http://www.siemens.com/industrialsecurity..

⚠ WARNING

Danger to life as a result of unsafe operating states resulting from software manipulation

Manipulation of the software, e.g. viruses, trojans, malware or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.
- Make sure that you include all installed products in the integrated industrial security concept.
- Protect files on removable storage media against malware through appropriate protective measures, e.g. virus scanners.

3.4.1.3 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

3.4.2 Getting Started with SIMOTION SCOUT TIA

3.4.2.1 Aim of Getting Started

Getting Started introduces you to working with the SIMOTION SCOUT TIA engineering system. You will create a simple sample project and in so doing, you will work through the typical steps involved in configuring devices, drives, and axes. You will become familiar with the most important tools that SIMOTION SCOUT TIA provides for configuring, programming, and diagnostics.

3.4.2.2 Sample project

Getting Started provides you with instructions for creating a simple sample project.

Configuring steps

Prepare the configuration

- You reset the SIMOTION device to the factory settings.
- You configure the interface for network communication between the PG/PC and the SIMOTION device.

Create project, configure SIMOTION device and network communication with the PG/PC

- You create a project.
- You create a SIMOTION device and set up the network communication between the PG/PC and the SIMOTION device .

Configure the drive

- You commission the drive.

Configure the infeed

- You interconnect the infeed with the drive.

Configure and test the axis

- You set up an axis.
- You interconnect the axis with the drive.
- You test the axis with the axis control panel.

Configure inputs/outputs

- You configure I/Os for use in the sample program.

Program, set up and monitor SIMOTION

- You write a simple SIMOTION user program that controls the configured axis.
  - You create the variables required by the program.
  - You create the program and additional auxiliary programs with the graphical editors.
- You assign the finished programs to the tasks of the execution system.
- You start program execution in the SIMOTION runtime system.
- You monitor the program-controlled axis movement.
  - You monitor program execution.
  - You monitor the values in the symbol browser.
  - You compile values in a watch table.
  - You record the course of the axis motion with the trace.

3.4.2.3 Requirements

Getting Started provides you with instructions for creating a simple sample project.

Trainings system

To create the sample project, you require a training system with a few components:

- SIMOTION D4x5-2 device with the latest firmware
- PG/PC with free Ethernet interface
  A USB Ethernet adapter is also suitable for the Ethernet connection.

  Note

  A USB PROFIBUS adapter, e.g. PC Adapter USB A2 (article number: 6GK1571-0BA00-0AA0) can be used for the PROFIBUS connection. Performance problems may occur if a previous version is used.

- Full DRIVE-CLiQ wiring of the components; motor with DRIVE-CLiQ interface and thus with automatic encoder identification (SMI Sensor Module Integrated)
- TIA Portal and SIMOTION SCOUT TIA engineering system

A SIMOTION D435-2 DP/PN device is used in the sample project.

The PROFINET interface of the SIMOTION device is not used in the sample project.

Note

Getting Started deals with automatic drive configuration and not configuration using the drive wizard. To be able to carry out automatic drive configuration fully, full DRIVE-CLiQ wiring of the components involved is a necessary requirement.

Preparation of the training system

Your training system has been prepared for configuring with TIA Portal and SIMOTION SCOUT TIA:

- The hardware is ready installed and wired.
- The CF card with the latest firmware is inserted.
- The PG/PC and SIMOTION D435-2 are connected direct via Ethernet cable. The Ethernet X127 interface on the SIMOTION D435-2 is used for the connection.
- TIA Portal (as of V14) is installed on the PG/PC.
- SIMOTION SCOUT TIA (as of V4.5) is installed on the PG/PC and licensed correctly.
- You have started the TIA Portal. The portal view is visible on the screen of the PG/PC.

Overview of configuring steps

The table below provides an overview of the individual configuring steps and where you implement them.

Configuring step	Where	Chapter
① Create project	TIA Portal	see Creating project (Page 471)
② Create the SIMOTION device and configure online communication (incl. compilation of the hardware configuration and downloading to the SIMOTION device)	TIA Portal	see Creating the SIMOTION device and configuring online communication (Page 472)
③ Start SIMOTION SCOUT TIA	TIA Portal	see Starting SIMOTION SCOUT TIA (Page 486)
④ Download the project to the target system (incl. compilation)	SIMOTION SCOUT TIA	see Downloading the project to the target system (Page 487)
⑤ Configure the drive	SIMOTION SCOUT TIA	see Configuring the drive (Page 494)
⑥ Configure the infeed	SIMOTION SCOUT TIA	see Configuring the infeed (Page 499)
⑦ Configuration of technology objects (in the TO Axis example)	SIMOTION SCOUT TIA	see Configuring axis (Page 501) / Testing the axis using the axis control panel (Page 507)
⑧ Configure digital outputs	SIMOTION SCOUT TIA	see Configuring digital outputs (Page 511)
⑨ Creation of user programs	SIMOTION SCOUT TIA	see Programming the SIMOTION application (Page 512)
⑩ Configuring the execution system	SIMOTION SCOUT TIA	see Configuring the execution system (Page 552)
⑪ Starting and stopping the system	SIMOTION SCOUT TIA	see Starting and stopping the system (Page 557)
⑫ Monitor the application	SIMOTION SCOUT TIA	see Monitoring the application (Page 560)

3.4.2.4 General information

TIA Portal online help

The TIA Portal has an extensive online help system.

How to open the online help

- Select **Help > Show help** in the menu, or
- press the **F1** key.

After calling the online help, you will be in the information system. What help is available to you and how you can operate the help in the TIA Portal is explained in **Further support > Help on the information system**.

SIMOTION SCOUT TIA Online Help

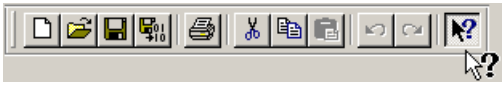
SIMOTION SCOUT TIA has a comprehensive online help. You can optionally search for specific topics in the online help or call the help from the context of your work.

How to open the online help

- Select **Help > Help topics** in the menu, or
- press the **F1** key.

How to open the context-sensitive online help

- Click the Help button of the dialog or window, or
- press the key combination **Shift+F1**, or
- click in the toolbar on the **Help** button.



With the mouse pointer (changed to a question mark), click the parameter or the window for which you require help.

You can find detailed information on using the context-sensitive help in the online help under **SIMOTION SCOUT TIA > General > Use Help**.

Full text search in the online help

You can find important information on full text searching in the online help under **Basic > Use Online Help and Function Block Diagrams > Use Online Help > Full Text Search**.

Note

Full text search in the online help

Enclose the search term between asterisks * to include search results that contain the search term as part of a longer character string, e.g.

- **variable** finds only the whole words "variable" or "Variable",
- ***variable*** also finds "system variables", "variable assignment", etc.

Available documentation

Electronic documentation

The documentation is included in electronic form in the scope of delivery of SIMOTION SCOUT TIA (SIMOTION SCOUT DVD Documentation, Utilities & Applications). You can search for all PDF documents in the electronic documentation with an index (SIMOTION.pdx). You can find an overview of the structure and content of the SIMOTION PDF documentation in the separate document *Overview of the SIMOTION Documentation*.

The content of the documents is also available in the SIMOTION SCOUT TIA online help, with a few exceptions.

In the online help, you can find the *Overview of the SIMOTION Documentation* under **Overview of the SIMOTION Documentation > ... > Overview of the SIMOTION Documentation**.

Note

You will find the *SIMOTION SCOUT TIA Configuration Manual* as a PDF document on the SIMOTION SCOUT DVD.

Overview of SIMOTION

You can find a brief system overview of SIMOTION in the online help under **Basic > Basic Functions > System Overview**.

The manuals contain comprehensive information especially for configuring and commissioning a SIMOTION D, see the *SIMOTION D4x5-2 Manual* as well as the *SIMOTION D4x5-2 Commissioning and Hardware Installation Manual*. You can also find the SIMOTION D manuals in the online help under **SIMOTION Devices > SIMOTION D**.

Additional information

You will find additional information and documents on SIMOTION in the Industry Online Support. Here, you are provided with an overview of the most important technical information and solutions for SIMOTION.

http://support.automation.siemens.com/WW/view/de/10805436/130000

You can also access the Online Support via the hardware catalog of the TIA Portal (select the relevant modules and open the shortcut menu).

Utilities & applications

The free SIMOTION Utilities & Applications provide you with a wealth of important background information on all aspects of SIMOTION, tools, special functions, blocks, SIMOTION sample projects, as well as off-the-shelf standard applications for illustration or for use in your projects. There you can also find detailed information on scripting and a host of sample scripts that facilitate working with SIMOTION.

1. **FAQs**
   Interesting FAQs such as control of hydraulic axes or communication issues.
2. **Scripts**
   Many scripts, helpful tips, but also comprehensive solutions that make recurring tasks easier, for example.

   Note

   As part of SIMOTION SCOUT TIA (TIA Portal), only scripts can be used that influence or use pure SIMOTION SCOUT/SIMOTION SCOUT TIA data and functionalities.

   Scripting of the data/functionalities of the HWCN and the project handling of the TIA Portals (framework) is not possible.

   The following is explicitly impossible by scripting:
   - Creating, deleting and renaming of objects that have a representation in the TIA Portal (such as all SIMOTION devices).
   - Creating, deleting and renaming of projects.
   - File system accesses to TIA Portal projects.
   - Use functionality provided by the TIA Portal (framework), e.g.
   - Archiving/dearchiving.
   - All handling of TIA Portal data.

   The SIMOTION easyProject project generator cannot be used for projects with SIMOTION SCOUT TIA, because the scripting functionality is not yet available in the TIA Portal.

   Note also that external scripting of SIMOTION SCOUT TIA is not supported.
3. **Tools and documentation**
   You are provided with easy-to-use tools and in-depth documentation for many tasks.
4. **Examples**
   Sample projects for first-time-users, e.g. "Getting Started", as well as examples of special topics.

5. **Applications**
   For SIMOTION, there is a host of applications available to you that provide you with a sound basic framework. With the aid of the supplied documentation, you can use the applications as a basis for your own application, and adapt and expand them.
   Furthermore, functions are available to you under "Cross-Sector applications" that are of general help when creating your own applications, e.g. a LDPV1 library for drive communication via DPV1 services (read and write SINAMICS parameters, read errors and warnings from SINAMICS, deactivate objects, ramp-up coordination and much more), or the LCom library with functions for communication with TCP/IP for SIMOTION and SIMATIC.
6. **SIMOTION IT**
   Under SIMOTION IT, you can find innovative examples and tools for bringing control and drive solutions a little closer to the IT world. These include a trace function that is executed via an Internet browser, as well as examples for user-defined Web pages for the SIMOTION IT Web server or for using OPC XML DA.

Specific safety information

Make sure your training system is fully disconnected from productive operation.

Observe the safety notes in the documentation of the devices used.

3.4.3 Prepare the configuration

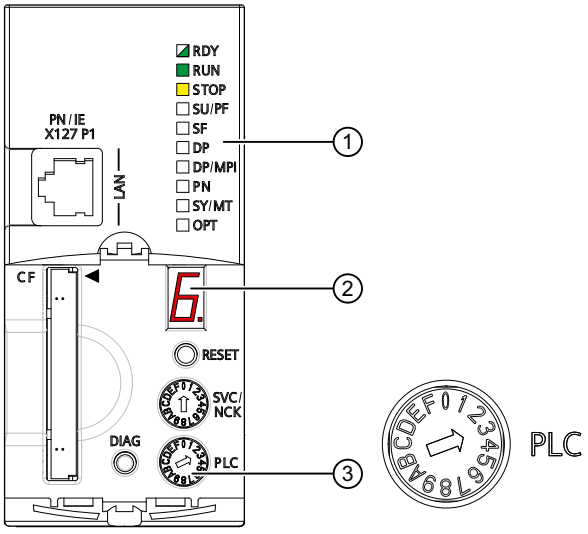
3.4.3.1 Restore factory settings

For the sample project, it is useful to reset the SIMOTION device to the factory settings.

In this way, you restore the default communications parameters and you delete user data installed on the device and the CF card by a previous configuration. The runtime licenses are retained.

You restore the factory settings on the SIMOTION device as follows

1. Switch off the power supply of the SIMOTION device.
2. Set the mode selector switch ③ of the SIMOTION device to position **3**.



① LED display
② 7-segment display
③ Mode selector switch in position 3

Figure 3-226 SIMOTION D435-2 module front

NOTICE
Damage from electrostatic discharge
The rotary switch can be destroyed by static electricity.
Operate the rotary switch only with an insulated screwdriver.
Observe the ESD regulations.

3. Switch on the power supply of the SIMOTION device.
   The default settings are loaded. SIMOTION D435-2 switches to STOP mode.
   Wait for the procedure to finish. The elements on the front of the module indicate completion:
   - The 7-segment display ② shows status digit **6**: SIMOTION D435-2 has started up.
   - LEDs ①:
     LED **RDY** flashes green (0.5 Hz): the drive is ready for commissioning.
     LED **STOP** shows a yellow light: the SIMOTION device is in STOP mode.
     All other LEDs are off.
4. Turn the mode selector switch ③ to position **0**.
   - The LED **RUN** shows a green light: the SIMOTION device is in RUN mode.

Result

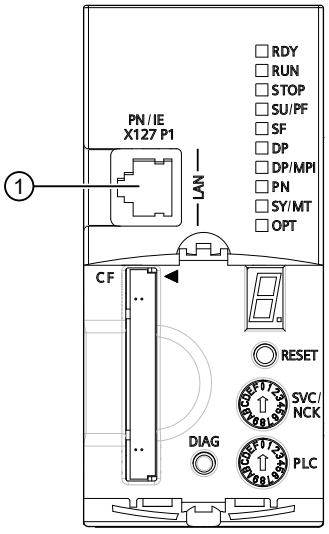
The SIMOTION device has been restored to its factory settings and is ready for commissioning.

3.4.3.2 Requirements for online communication

Online communication of the PG/PC with the SIMOTION device can be set up via PROFIBUS, PROFINET, or Industrial Ethernet. The sample project is restricted to the most frequent application case: communication via Industrial Ethernet.

Requirements

- The PG/PC and the SIMOTION device are connected via an Ethernet cable.
- The X127 PN/IE interface on the SIMOTION device is used for the Ethernet connection.



① Ethernet interface X127 PN/IE

Figure 3-227 SIMOTION D435-2 module front

- The Ethernet interface X127 PN/IE has the default address:
  IP address: **169.254.11.22** - Subnet: **255.255.0.0**

See also

Configure Ethernet interface (2) (Page 475)

3.4.3.3 Result in the sample project

The factory settings of the SIMOTION device have been restored. The requirements for online communication of the PG/PC with the SIMOTION device are fulfilled.

3.4.4 Create a project

3.4.4.1 Overview

Aim of Getting Started

In this part of Getting Started, you create the sample project Sample_1 in the TIA Portal. All of the subsequent configuring steps refer to this sample project.

Project

A project contains all the information that describes a machine and its function: configuration data, programs, motion profiles, drive data.

A project can contain several SIMOTION devices.

3.4.4.2 Create new project

After opening the TIA Portal, you are in the portal view. The portal view offers a task-oriented view of the tools, and provides the basic functions for the individual task areas.

You create a new project as follows

You start a new configuration by creating a new project in the TIA Portal.

1. Select **Start > Create new project** in the navigation of the portal view. The **Create new project** dialog appears.

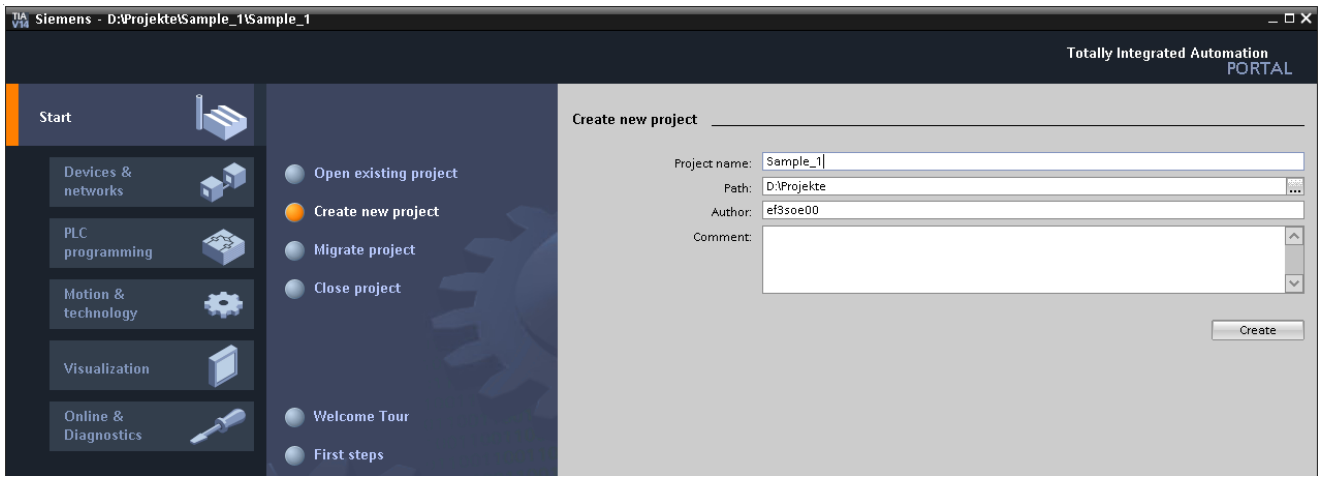


Figure 3-228 Create a project

2. Enter the project name under **Project name**, e.g. **Sample_1**.
3. Under **Path**, enter the path in which the project is to be stored. The default path is already set.
4. Confirm with **Create**.

3.4.4.3 Result in the sample project

The sample project of Getting Started has been created in the TIA Portal.

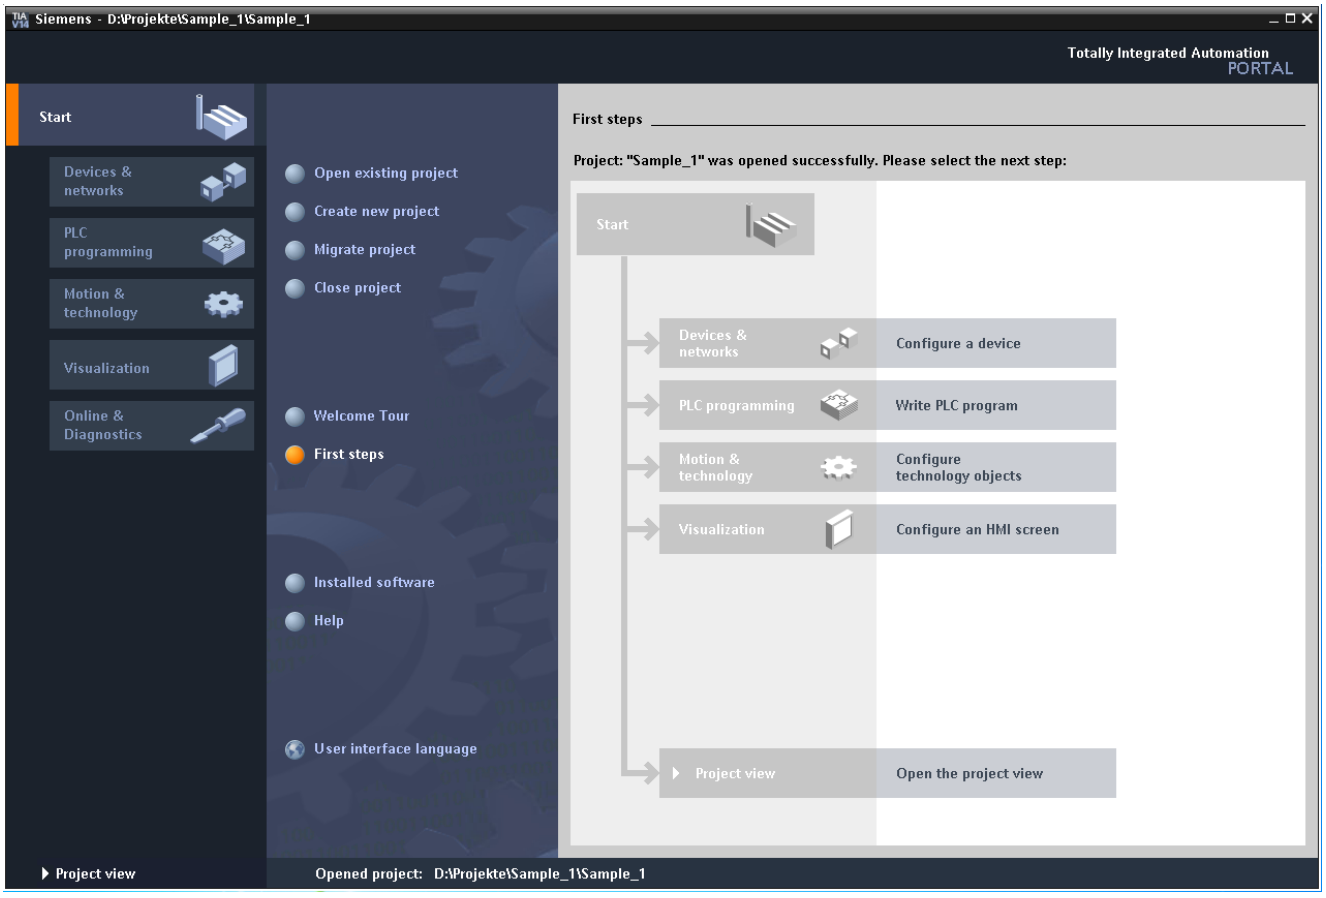

Figure 3-229 Project created

3.4.5 Create SIMOTION device and configure online communication

3.4.5.1 Overview

Aim of Getting Started

This part of Getting Started shows you how to create a SIMOTION device in the project in the TIA Portal and how to set up communication between the PG/PC and the SIMOTION device.

Steps

The following steps are executed in order to create a SIMOTION device in the project:

1. Create a SIMOTION device.
2. Configure the Ethernet interface.
3. Set up communication between PG/PC and SIMOTION device, compile the project, and download to the device.

SIMOTION D platform

SIMOTION D is the drive-based version of the SIMOTION motion control system, based on the SINAMICS S120 family of drives. With SIMOTION D, the SIMOTION motion control functionalities and the SINAMICS drive software run on a SINAMICS-type closed-loop control hardware device. SIMOTION D devices have the following characteristic features:

- Motion control functionality and control functionality integrated directly in the drive
- Compact and with especially fast response
- Maximum scalability and flexibility as single-axis or multi-axis system in different performance versions for diverse applications
- Especially suitable for modular machine concepts with fast isochronous coupling, in the case of machines with a large number of axes, for example

The SINAMICS functionality of the closed-loop-control module of the SINAMICS S120 multi-axis drive system is integrated in SIMOTION D (SINAMICS Integrated).

You will find a brief introduction to SIMOTION D in the online help using the example of the D435 Control Unit. Click **Help > Tutorials > SIMOTION Drive-Based** in the SIMOTION SCOUT menu bar.

3.4.5.2 Create SIMOTION device (1)

You create a SIMOTION controller in the project as follows

1. Select **Start > Devices & Networks > Add new device** in the navigation of the portal view. The dialog **Add new device** appears.
2. Under **Controller**, open the desired device variant (e. g.: SIMOTION D - Drivebased).
3. Select the desired SIMOTION device **D435-2 DP/PN**.
4. Click the Article No. to display its device-specific information.

5. Under **Version**, select the firmware version of the installed SIMOTION device.

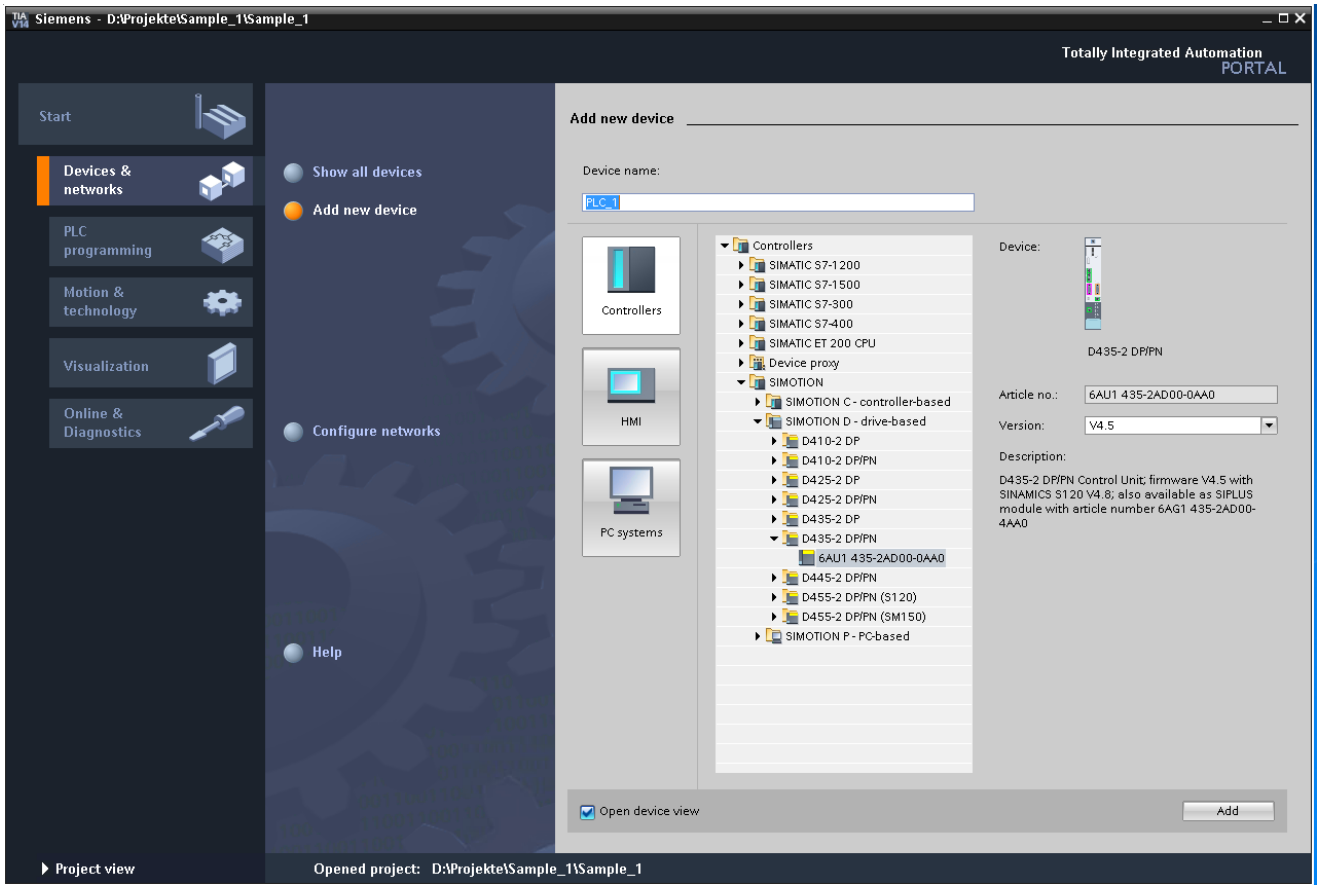

Figure 3-230 Select SIMOTION D435-2 DP/PN

6. Click **OK** to apply the settings and create the SIMOTION device.

Result

The SIMOTION device is created in the project. After you have created the device, you will be in the project view on the Device View tab.

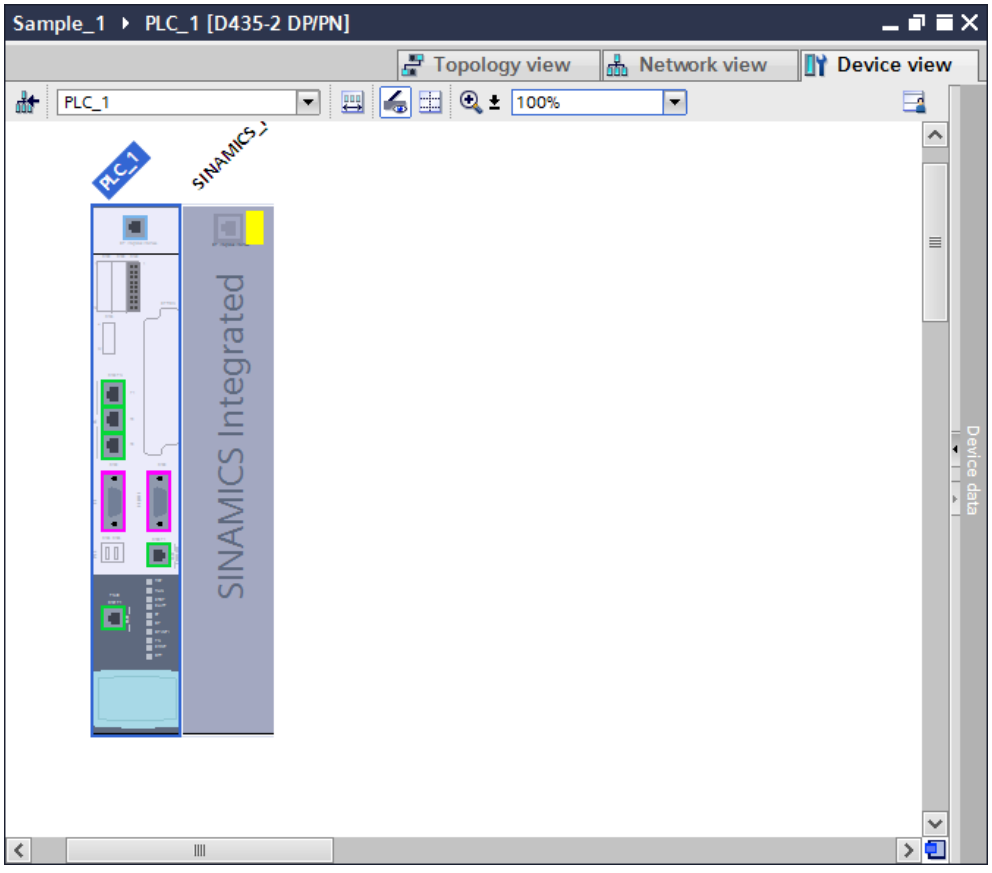

Figure 3-231 SIMOTION **D435-2 DP/PN** in the device view

Note

The selected firmware version must match the firmware version on the memory card of the device. Otherwise an error message will appear as soon as you switch to online mode.

3.4.5.3 Configure Ethernet interface (2)

You can set up online communication of the PG/PC with the SIMOTION device via PROFIBUS, PROFINET, or Industrial Ethernet.

The most common use case is communication via Industrial Ethernet (communication via PROFINET protocol).

It is necessary to create a subnet if you are configuring IO devices. The following example shows how a subnet is created.

Procedure

Proceed as follows to create a subnet:

1. To do so, first switch to the network view in the project view.
2. Click with the mouse on the Ethernet interface **X127** of the SIMOTION device on which you want to
   create a subnet.
3. Right-click to select **Add Subnet** from the shortcut menu.

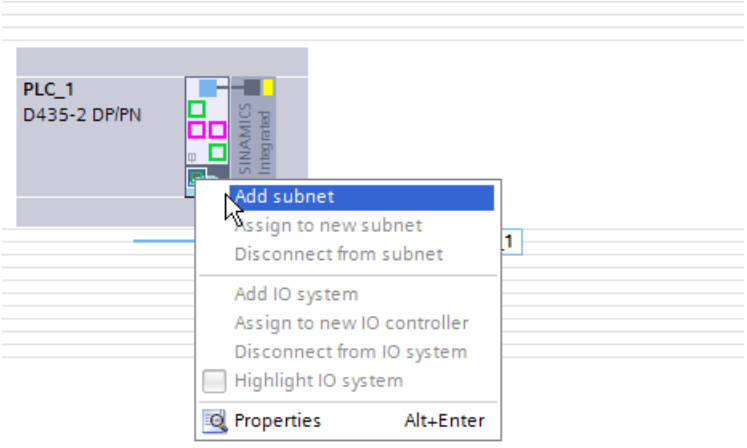

Figure 3-232 Adding a subnet

Result

The Ethernet subnet is shown in the network view.

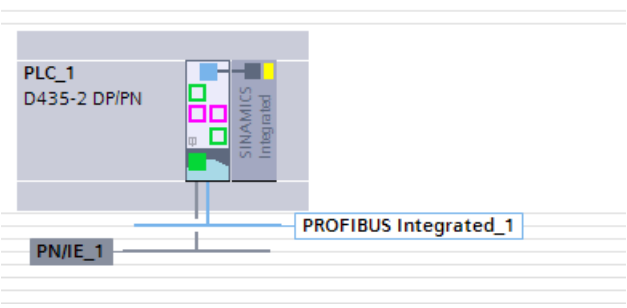

Figure 3-233 Ethernet subnet in the network view

3.4.5.4 Set up PG/PC interface (3)

Note

You assign the PG/PC interface in the TIA Portal.

Communication between a SIMOTION device and a PG/PC requires a conditioner card (for PROFIBUS) or an Ethernet interface. You configure, parameterize, program and test using the PG/PC.

You have the following functions to assign the PG/PC interface:

- **Connect online** function
  The function is available until the PG/PC interface has been successfully set up.
- **Online & diagnostics** function
- **Online access** function

Assign PG/PC interface

The following procedure describes the process for the Ethernet interface type by using the "Online access" function.

To assign the interfaces, proceed as follows:

1. Navigate to the relevant interface in the project navigation under **Online access**.
2. In the shortcut menu, click **Properties**.

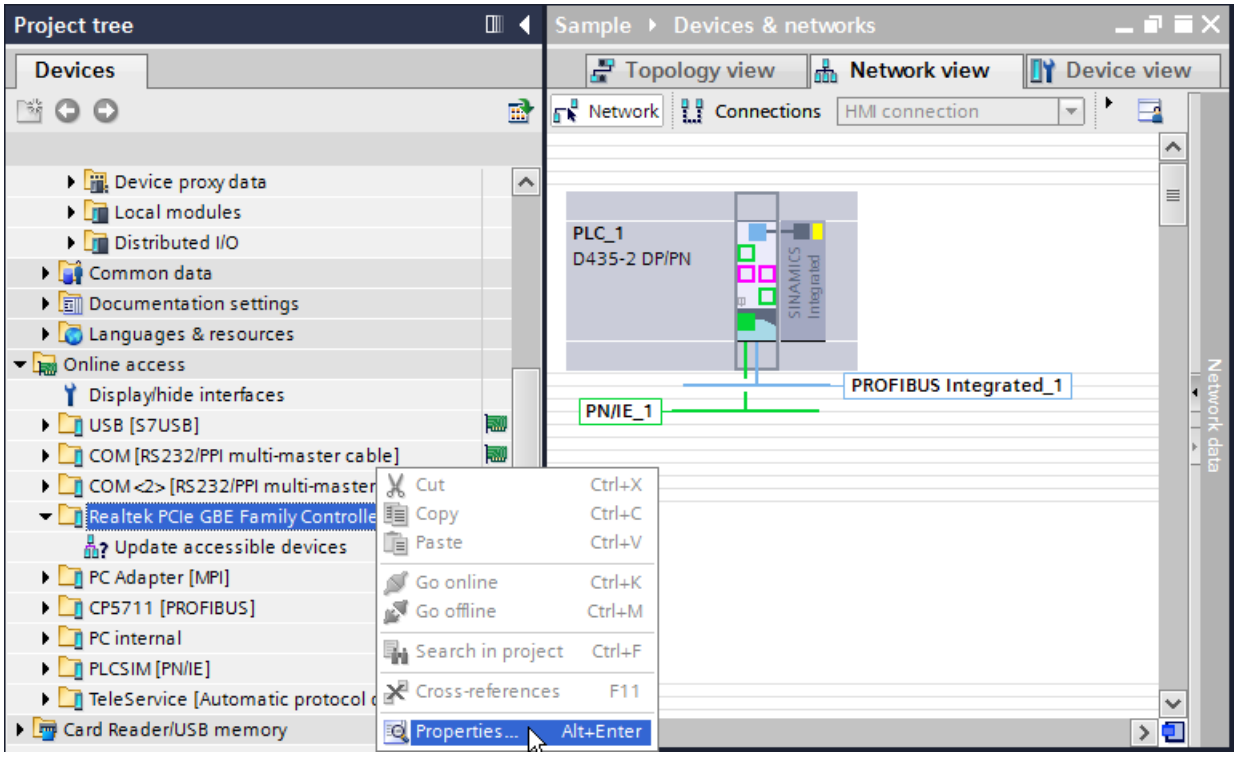

Figure 3-234 Online access properties

3. In the next step, select the subnet and apply the setting with **OK**.

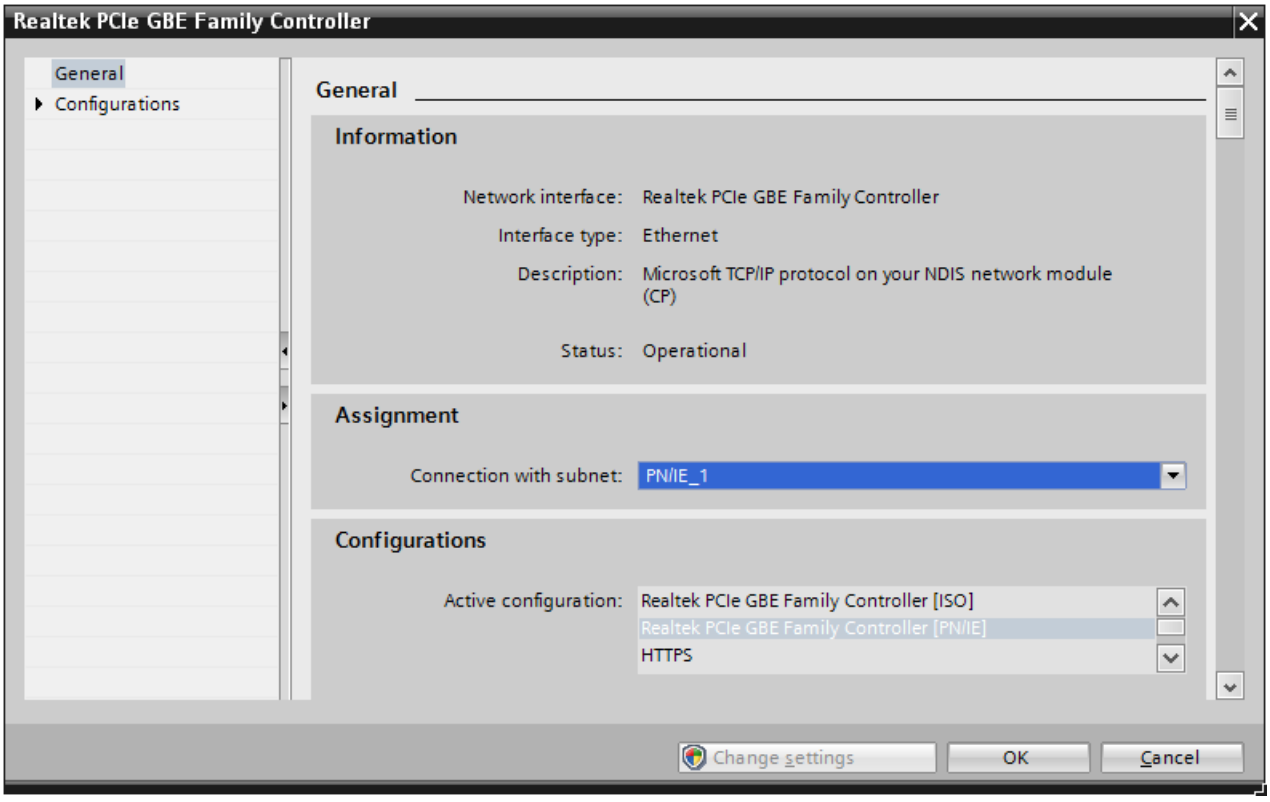

Figure 3-235 Assigning a subnet

Adding an IP address in the subnet

If the SIMOTION device and the PG/PC are not in the same subnet, add a suitable IP address from the subnet of the device to the PG/PC.

To automatically add an IP address in the subnet, proceed as follows:

1. Click Go online in the toolbar.
   The **Connect online** dialog opens.

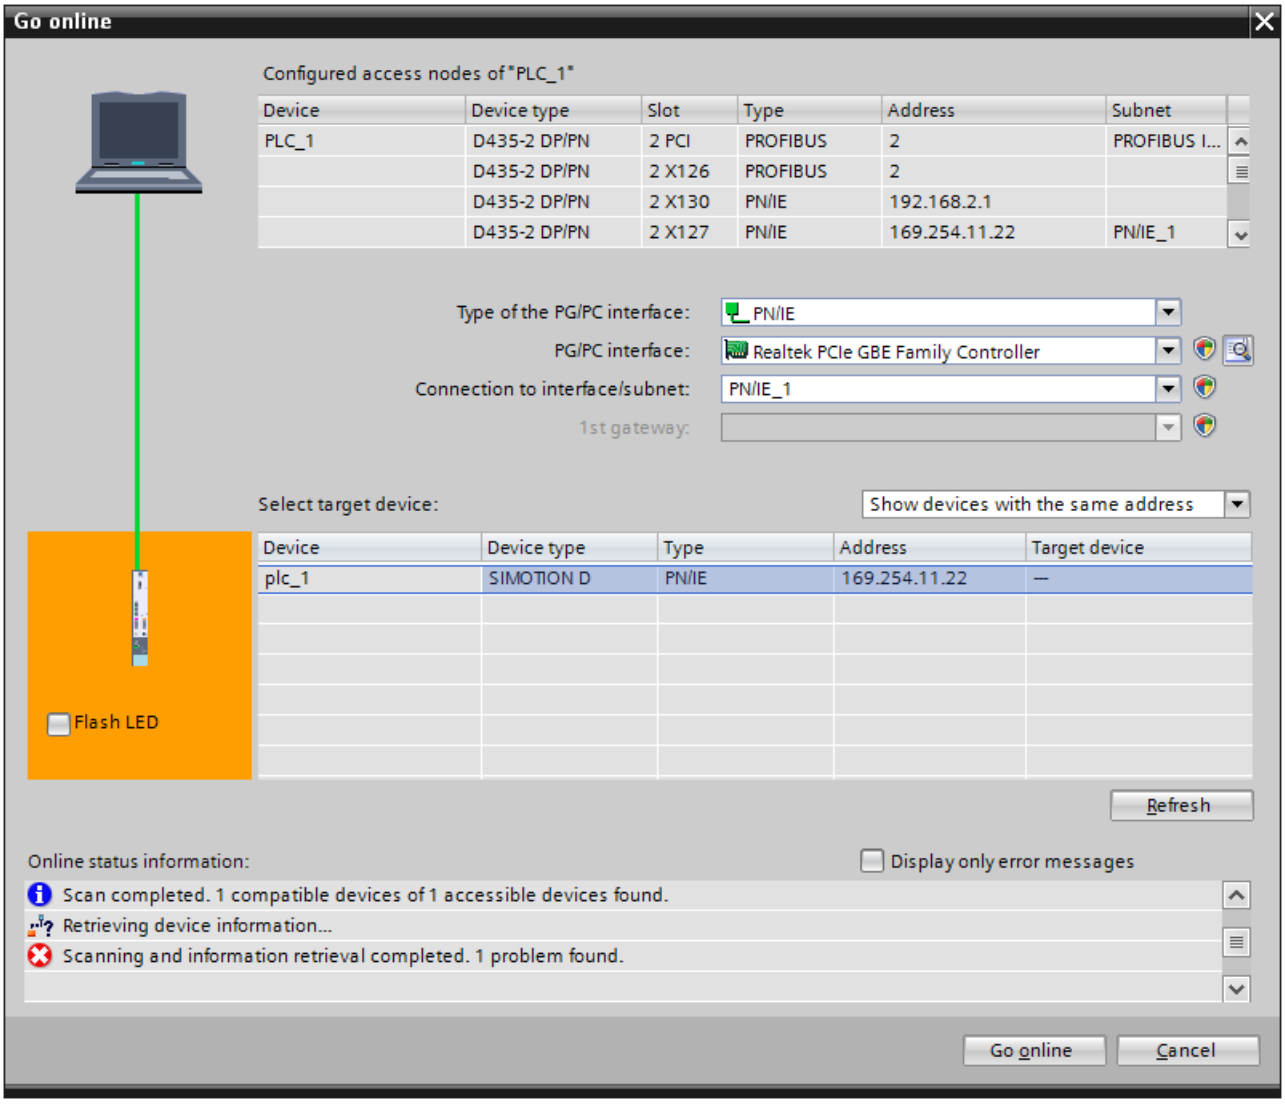

Figure 3-236 Selecting a device for online connection

2. Click **Connect** to establish a connection to the device located by the search.

3. If the SIMOTION device and the PG/PC are not in the same subnet, a message is displayed offering you the option of temporarily assigning a suitable IP address from the subnet of the device.

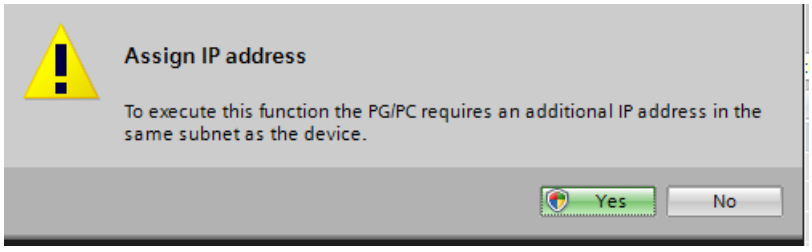

Figure 3-237 Assigning an IP address

4. Click **Yes** to confirm.

Figure 3-238 IP address assigned

Result

- You have assigned the PG/PC interface.
- The TIA Portal has assigned an IP address internally within the project.
- The online connection has been established.
  The title bar of the project navigation is now orange.

Displaying and deleting temporary IP addresses

You can have all temporarily assigned addresses displayed and delete them again.

1. Navigate to the relevant interface in the project navigator under Online access.
2. In the shortcut menu, click **Properties**.
3. Under **configuration**, select the item **IE-PG access**.

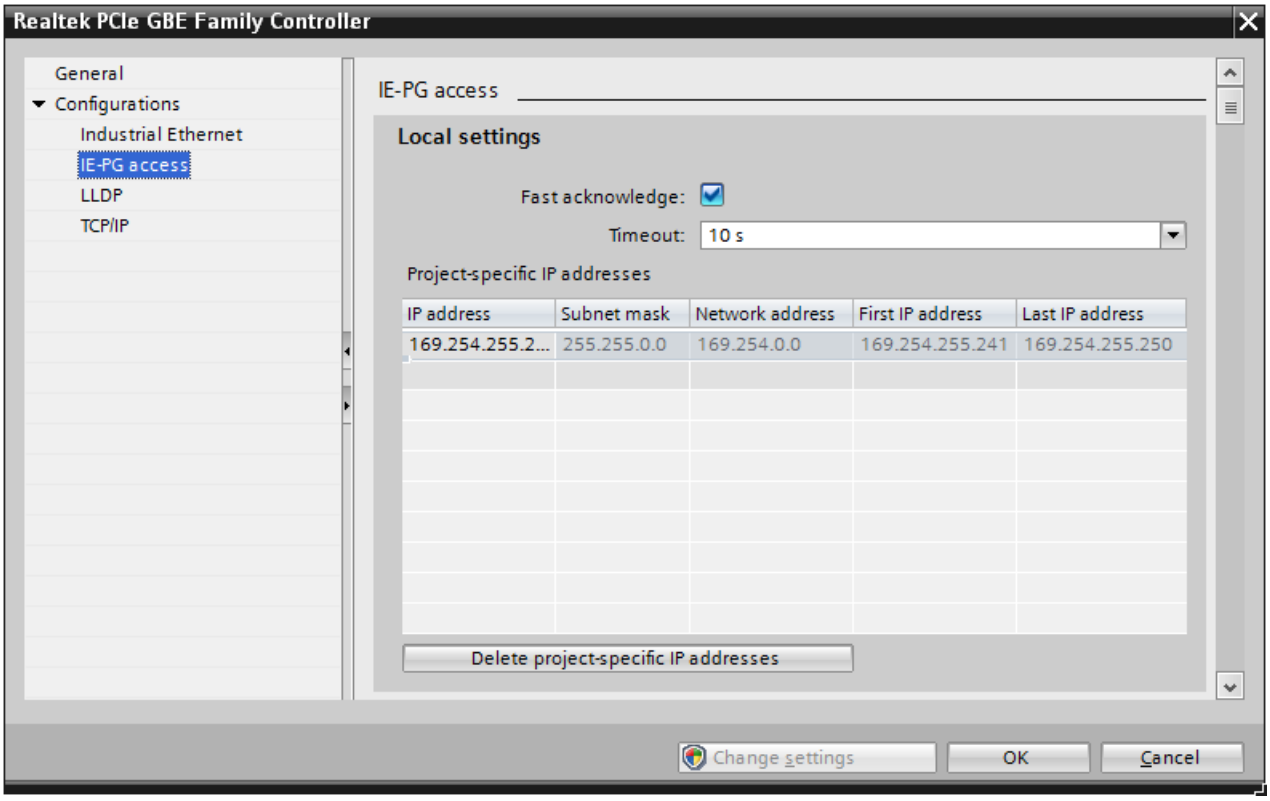

Figure 3-239 Displaying and deleting temporary IP addresses

Compiling the project and downloading the hardware configuration to the SIMOTION device

Note

Before you continue configuration in the SIMOTION SCOUT TIA, you should download the hardware configuration in the TIA Portal to the SIMOTION device.

Downloading to the SIMOTION device from the TIA Portal is necessary, for example, if you want to change the device names of the IP address. Moreover, downloading to the TIA Portal causes the routing information to be loaded.

Requirement

The online connection with the SIMOTION device is disconnected.

Procedure

To compile the hardware configuration and download to the SIMOTION device, proceed as follows:

1. Select the SIMOTION device and select via the shortcut menu **Compile > Hardware (changes only)**.

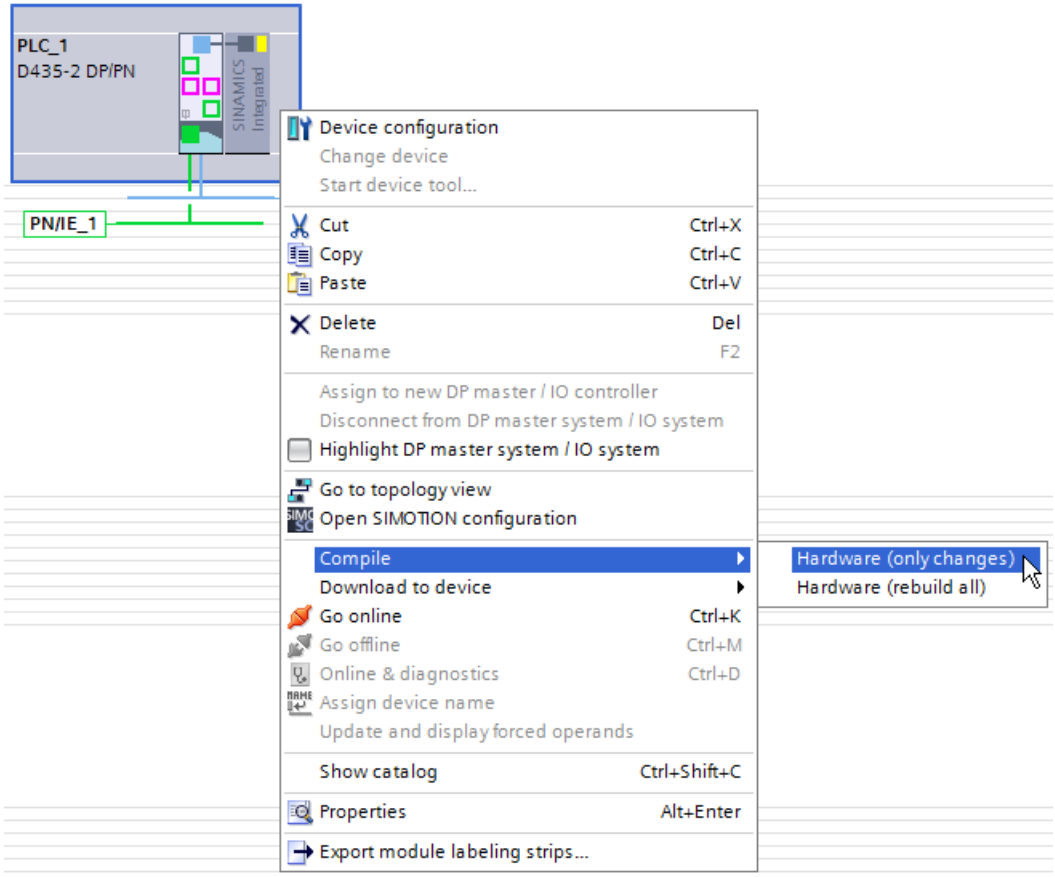

Figure 3-240 Compiling hardware

2. Select the SIMOTION device and select via the shortcut menu **Download to device > Hardware configuration**.

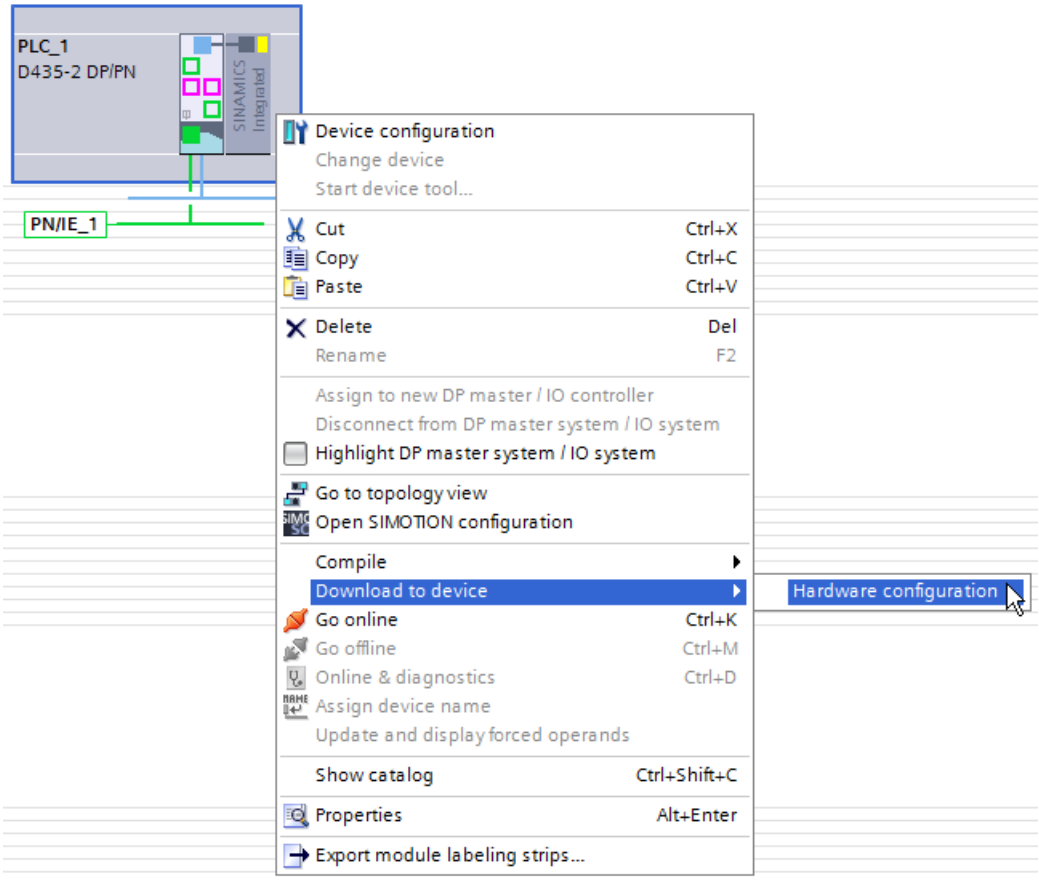

Figure 3-241 Loading hardware

Result

You have compiled the current hardware configuration and loaded it to the target device.

Additional references

For detailed information about the configuration of the online access, refer to the information system of the TIA Portal "Configuring online access".

3.4.5.5 Result in the sample project

Newly created SIMOTION device

Configuring of the SIMOTION device and network communication between the PG/PC and the SIMOTION device is complete.

- The newly created SIMOTION D435-2 device is shown in the project tree of the Project view.
- The PG/PC is connected with the SIMOTION device via Ethernet.
- The project is compiled and the hardware configuration is loaded into the SIMOTION device.

No other hardware configuration is required for the sample project.

3.4.6 Start SIMOTION SCOUT TIA

Note

You can only start SIMOTION SCOUT TIA from the TIA Portal.

After you have created the project in the TIA Portal and you have configured the hardware and communication, start SIMOTION SCOUT TIA to configure the technology.

Procedure

You can start SIMOTION SCOUT TIA in the following ways:

In the portal view

1. Click the "Motion & Technology" function.
2. Click the "Open SIMOTION configuration" entry in the secondary navigation.

In the project view

1. Start SIMOTION SCOUT TIA via the "Project > Open SIMOTION configuration" menu.
   Or double-click the "SIMOTION configuration" menu entry below the SIMOTION device in the project tree.

Note

Disconnecting the online connection to the TIA Portal

You should not go online simultaneously in the TIA Portal and SIMOTION SCOUT TIA.

Always disconnect the online connection in the TIA Portal before going online with SIMOTION SCOUT TIA. You need to do this so that programs can be compiled in SIMOTION SCOUT TIA.

Making basic settings

In SIMOTION SCOUT TIA, you can make various basic settings via the "Options > Settings..." menu.

To make the settings, proceed as follows:

1. In the "Options" menu, select the "Settings..." command.
   The "Settings" dialog opens.
2. Switch to the desired tab.
3. Make the settings.
4. Confirm with "OK".

Additional references

You will find detailed information on the individual tabs and settings in the SIMOTION SCOUT TIA Online Help.

3.4.7 Download the project to the target system

3.4.7.1 Overview

Aim of Getting Started

In this configuring step, you create the prerequisites for configuring the drive.

- You back up the created sample project to the hard disk.
- You compile the project into executable code.
- You establish online communication with the SIMOTION device.
- You download the project from the PG/PC to the SIMOTION device.

3.4.7.2 Save and compile the project

To be able to download a project created in SIMOTION SCOUT TIA to the target system, the project must be saved in executable code.

The command **Save project and compile changes** combines both steps. The project is backed up to the hard disk. SIMOTION SCOUT TIA searches the entire project for changes and compiles only the changes.

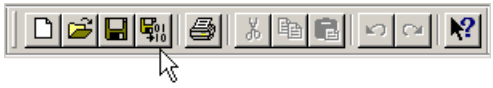
Note

Use the command **Save project and compile changes** for preference for day-to-day work.

Several variations of the "Save" command are available for selection under the menu title **Project**. You can find information on this in the online help under **Save and compile**.

You save and compile a project as follows

Select the menu command **Project > Save and compile changes** or click the relevant button in the toolbar.



The compilation run is logged in the detail view of the workbench. Information, warning and compilation errors are shown there in plain text.

Switch on detail view

The detail view might be switched off. Click the menu item **View > Detail view** to activate the view.

3.4.7.3 Connect to selected target devices – Go online

To download project data from SIMOTION SCOUT TIA to the hardware, or to transfer machine data in the other direction from the hardware to the SIMOTION SCOUT TIA project, communication between the PG/PC and the SIMOTION device must be activated.

The status of the network communication is displayed in the footer of the workbench:

Network communication is switched on. Data can be exchanged.

The network connection is switched off.

You go online as follows

1. Select the menu command **Project > Connect with selected target devices** or click the relevant button in the toolbar.

When the command is first called, SIMOTION SCOUT TIA opens the **Target Device Selection** dialog box. The dialog enables individual selection of the devices to which SIMOTION SCOUT TIA is to connect.

Note

For fast working with SCOUT TIA, we recommend only selecting devices that are currently needed (e.g. deselection of the SINAMICS drives if drive commissioning has been completed).

You will find the setting in the menu under **Target system** > **Select target devices...**. Selection and deselection of the device online can also be

performed via the shortcut menu **Connect to target device** on the device.

2. In the dialog box, select the configured SIMOTION device **PLC_1** and the integrated drive **SINAMICS_Integrated_1**.

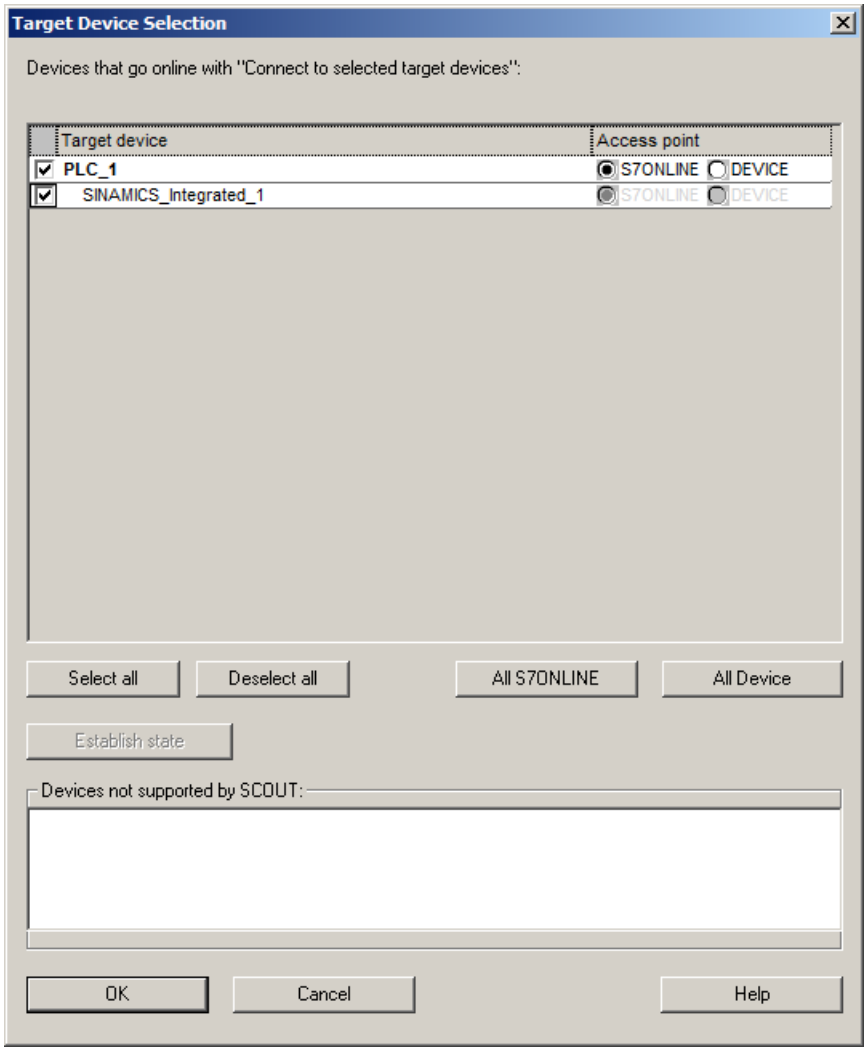


Figure 3-242 Target Device Selection dialog

Note

The properties of the access point S7ONLINE are defined in the TIA Portal. With this access point, you go online via the interface that you have configured in the TIA Portal.

The DEVICE (STARTER) access point provides the option of connecting SIMOTION SCOUT TIA either in parallel or alternatively to S7ONLINE, directly to a device, e.g. via the Ethernet interface. The properties configured in SIMOTION SCOUT TIA are only applied for the DEVICE access point.

3. Click **OK**.
   SIMOTION SCOUT TIA establishes the online connection.
4. Track the consistency check to completion on the **Target system output** tab in the detail area.

Note

If the hardware configuration has not yet been loaded, SIMOTION SCOUT TIA will indicate on the first attempt to go online that access to the SINAMICS Integrated is not possible. Access to the SINAMICS Integrated is only possible when the hardware configuration has been loaded (see Chapter AUTOHOTSPOT, Compiling the project and downloading the hardware configuration to the SIMOTION device). Close the message.

In the project tree, the connector symbols on the SIMOTION device and on the integrated SINAMICS drive change. Only the connector symbol of the SIMOTION device is partially colored green. Green indicates the existing online connection.

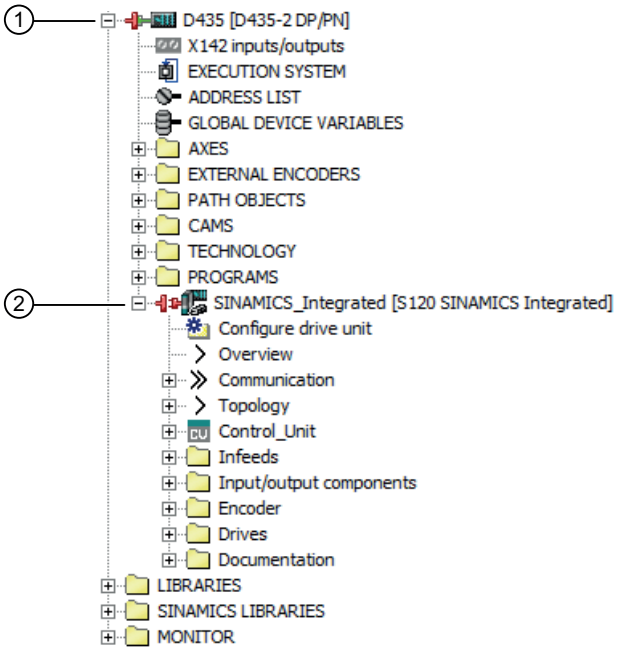

Figure 3-243 Project tree after first going online

Additional references

You will find detailed information on configuration of the DEVICE access point *SIMOTION SCOUT TIA Configuration Manual*.

3.4.7.4 Download the project to the target system

A complete project download is only possible in STOP mode. If required, SIMOTION SCOUT TIA offers a change of operating mode during the download procedure.

Note

A project download is necessary when you have made changes to the configuration and programming in SIMOTION SCOUT TIA.

You download the project as follows

1. Select **Project > Download to target system** in the menu, or click the **Download project to target system** button in the toolbar.

   The dialog **Download to target system** appears.

2. Activate the checkbox **After loading, copy RAM to ROM**. This saves the RAM of the SIMOTION device to the memory card (ROM) of the SIMOTION device. In this way, the configuration is retained after the power supply has been switched off and on again.

3. Start the download operation with **Yes**.
   The project data and the data of the hardware configuration are downloaded to the RAM of the target system.
   If you are asked whether the CPU is to be switched to STOP, confirm with **Yes**.
   SIMOTION SCOUT TIA performs numerous checks that are logged on the **Target system output** tab in the detail area. You will find there the concluding entry **Download to target system completed successfully**.

Note

The first download to the target system also downloads the data of the technology package. This operation can take several minutes.

Note

Depending on the firmware version on the CF card and on the SINAMICS components (DRIVE-CLiQ components such as Line Module, Motor Modules, Terminal Modules, etc.), the firmware of the components is automatically upgraded or downgraded.

Updating can take several minutes and is indicated by the relevant messages in the output window of the SIMOTION SCOUT TIA.

A firmware update on DRIVE-CLiQ components is signaled by red-green flashing of the RDY LED:

- Firmware update in progress: RDY LED flashes slowly (0.5 Hz)
- Firmware update ended: RDY LED flashes quickly (2 Hz), POWER ON required

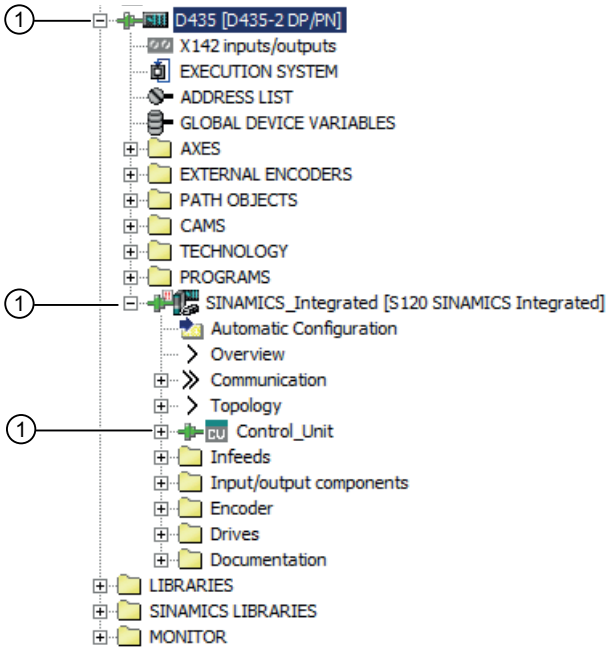
These flashing patterns are displayed additionally via a yellow RDY LED on the SIMOTION D, indicating that components connected to SIMOTION D are performing a firmware update or that all components have completed their firmware update.

Components requiring POWER ON following a firmware update signal this by means of the fast flashing RDY LED. Go offline with SIMOTION SCOUT TIA and switch the 24 V supply to the relevant components off/on (POWER ON) to initialize.

Automatically established connection to the drive

SIMOTION SCOUT TIA automatically establishes the online connection to the drive immediately following the project download.

In the project tree, the connector symbol changes on the SIMOTION device, the integrated SINAMICS drive, and the SINAMICS control unit. The connector symbol is entirely green, indicating that the project data in the PG/PC is identical with the project data in the target system.



① Green connector symbol: Element is in online mode. The project data in the PG/PC is identical with the project data saved in the target system.

Figure 3-244 Project tree

From this point, you can access the drive online with the PG/PC.

3.4.8 Configure the drive

3.4.8.1 Overview

Aim of Getting Started

In this part of Getting Started, you configure the integrated drive of the SIMOTION D435-2 device. You use auto-configuration for this purpose.

Requirements

- You have downloaded the sample project to the target system, refer to the section Download the project to the target system (Page 487).
- SIMOTION SCOUT TIA is online with the SIMOTION device and the integrated drive (green connector symbols).
- The SINAMICS drive components Infeed and Power unit, as well as Motor and Encoder, are connected to the SIMOTION control unit via DRIVE-CLiQ. This requirement for auto-configuration was referred to at the start of the Getting Started, see the section AUTOHOTSPOT.

Drive

The speed and current control functions for controlling the motor are implemented in the drive.

Automatic drive configuration

SIMOTION SCOUT can read out the electronic type plates of the SINAMICS drive components via the DRIVE-CLiQ interface and can use this data to configure the drive automatically. The data does not therefore need to be entered manually. The sample configuration of a SIMOTION D435-2 device shown here requires full DRIVE-CLiQ wiring.

As an alternative to automatic drive configuration, you can also configure a D4x5-2 device offline. Offline configuring is demonstrated in the online help version of Getting Started for SIMOTION C and SIMOTION P.

3.4.8.2 Automatic configuration of the drive

You open the Automatic Configuration as follows

Double-click on **Automatic Configuration** in the project navigator under the drive SINAMICS_Integrated.

The **Automatic Configuration** dialog is displayed.

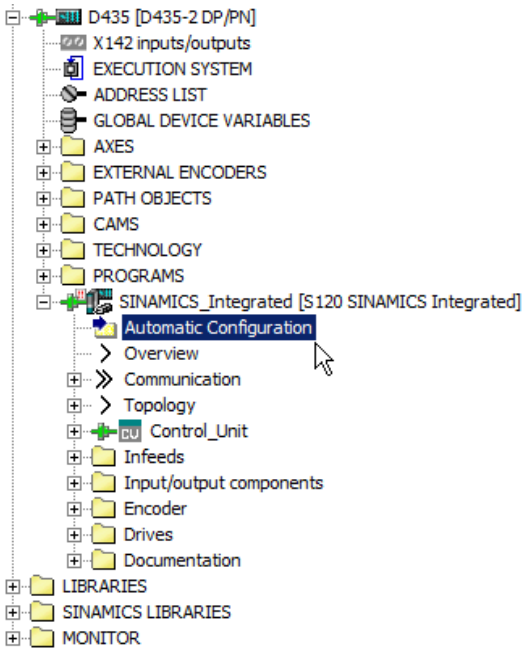


Figure 3-245 Call up Project tree, Automatic Configuration

Note

In the project tree, the element **Automatic Configuration** is only visible if you have downloaded the project to the target system and SIMOTION SCOUT TIA is online with the SIMOTION device. The project must be consistent; see the section Download the project to the target system (Page 487).

You cause the drive to be configured automatically as follows

1. Click the **Configure** button in the **Automatic Configuration** dialog.
2. Confirm the prompt regarding restoring the factory settings with **Yes**.
   The confirmation prompt appears if the drive unit is not in the "First commissioning" state.

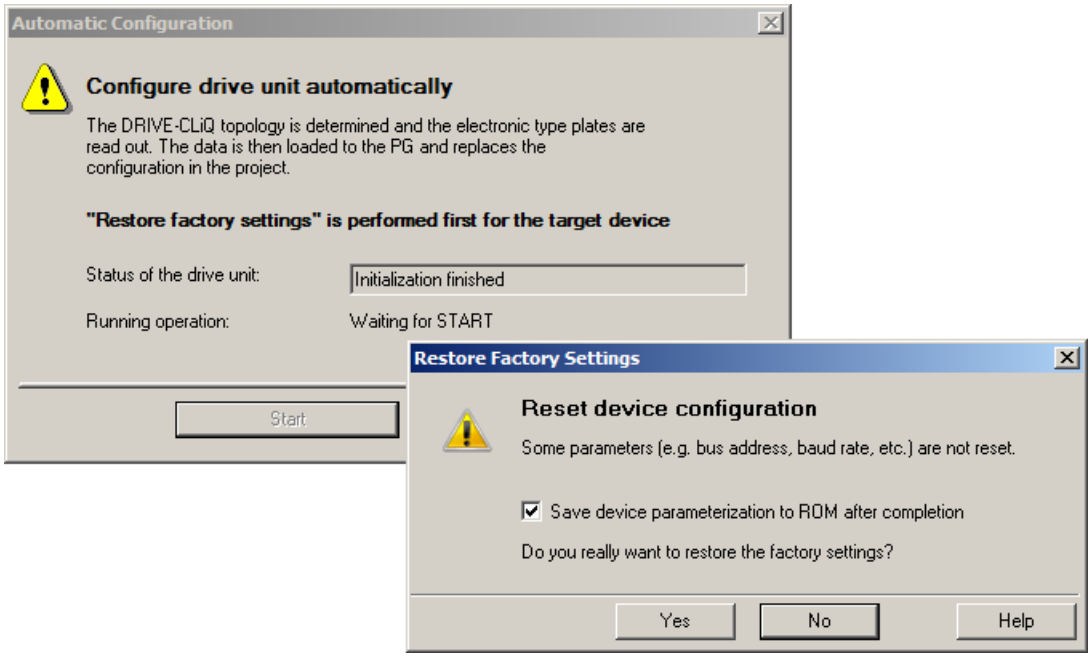

Figure 3-246 Start automatic drive configuration and restore factory settings

3. In the **Automatic Commissioning** dialog, you can specify whether you are using a drive object of the type servo or vector.
   Select **Servo**.
4. Click the **Create** button in the **Automatic Commissioning** dialog.
   Automatic configuring is started.

Note

Firmware update

If the firmware version on the DRIVE-CLiQ components is different to that on the CF card, a firmware update is now performed automatically.

In this case, proceed as follows:

- Wait for the procedure to finish. This can take several minutes.
- Go offline.
- Switch the power supply to the SIMOTION device off and then on again.

5. If a firmware update has not been performed, remain online to be able to see the changes in the project tree.

6. Open the **Infeeds** system folder in the project tree under the integrated drive.
   - If you are using an infeed with DRIVE-CLiQ interface, the auto configuration has created the infeed there.
   - If you are using an infeed without DRIVE-CLiQ interface, the folder is empty. The infeed is not known in the project.
     The other configuring requirements resulting in this way are dealt with in the next section Configure the infeed (Page 499).
7. Open the **Drives** system folder in the project tree under the integrated drive. The folder contains the drive detected by the auto configuration.

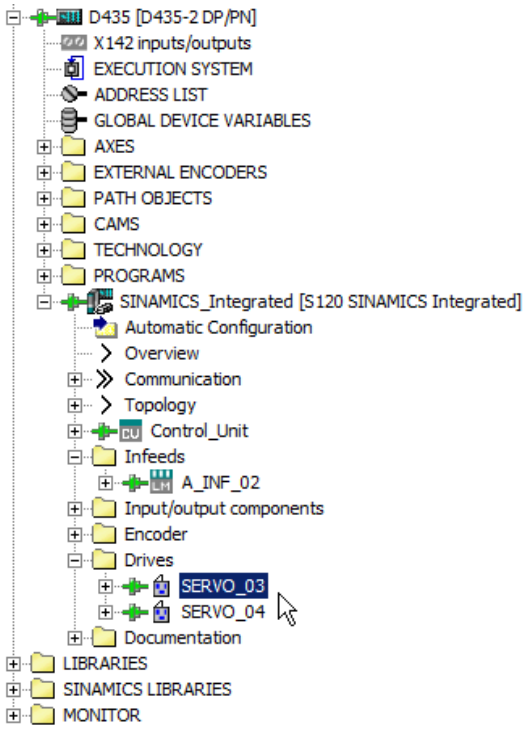

Figure 3-247 Project navigator, configured infeed and drives

8. Go offline.
   Click in the toolbar on the **Disconnect from target system** button.

In the footer of the workbench, **Offline mode** is indicated. Network communication between the PG/PC and the SIMOTION device has been cleared down.

Change the name of the drive

The automatic configuration also assigns the object name of the drive; in this example, SERVO_03.

You can change the name later. Changing is only possible in offline mode.

Proceed as follows:

1. Open the context menu of the drive by right-clicking. Select the **Rename** command there.
2. Assign the new name. Then confirm with **OK**.

As with all changes carried out in the project offline, the name change makes the project inconsistent. To restore the consistency between the "Project on the PG/PC" and the "Project on the SIMOTION device", another project download is necessary. The procedure is described in the section Download the project to the target system (Page 487).

3.4.8.3 Result in the sample project

If you are using an infeed with DRIVE-CLiQ interface, the drive is ready for operation. It can be interconnected with an axis.

3.4.9 Configure the infeed

3.4.9.1 Overview

Aim of Getting Started

In this part of Getting Started, you configure the infeed.

The integrated SINAMICS control unit only starts the drive when the infeed is ready. The project must therefore know the interface via which the drive receives the ready signal of the infeed.

Two cases must be distinguished here:

- Infeed with DRIVE-CLiQ interface
  If an infeed with DRIVE-CLiQ connection has already been created, the infeed ready signal (r0863.0) is automatically interconnected to "Infeed operation, p864" of the drive when drives are inserted (only applies to drives that are attached to the same drive unit as the infeed).
  You can continue immediately with the next configuring step, see the section Configure the axis (Page 501).
- Infeed without DRIVE-CLiQ interface
  If you are using an infeed without a DRIVE-CLiQ interface, e.g. a Smart Line Module, you must interconnect the ready signal of the infeed via terminals. The following section describes the procedure.

Requirements

- You have configured the integrated drive of the SIMOTION D435-2 device, see the section Configure the drive (Page 494).
- SIMOTION SCOUT TIA is in offline mode.

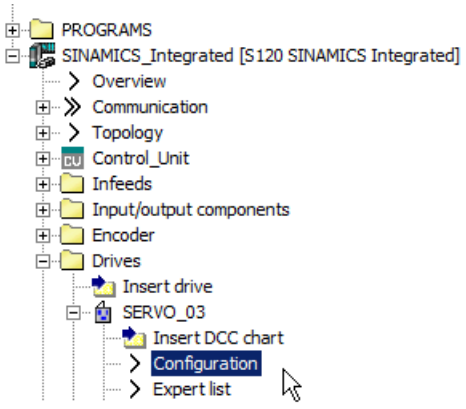
3.4.9.2 Configuring an infeed without DRIVE-CLiQ interface

An infeed without DRIVE-CLiQ interface provides the ready signal (p0863.0) via an output terminal. In the project, you specify the input (r0722) of the integrated SINAMICS Control Unit at which the signal is active. The drive supplied by the infeed uses the signal as a ready signal (p0864).

You interconnect the ready signal of the infeed as follows

In the sample project, the ready signal of the infeed (terminal "DO: Ready" of the infeed) is wired to the DI 0 of the D435-2.

1. Open the configuration dialog of the drive. To do so, double-click **Configuration** in the project tree below the drive.



2. Click in the working area on the **Configure DDS** button with the yellow background.

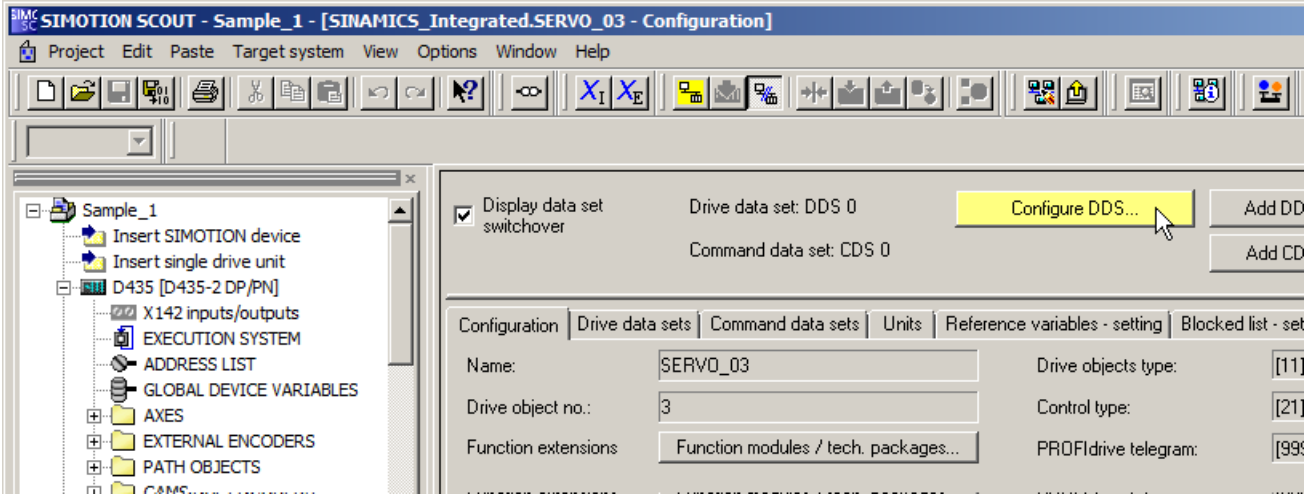


Figure 3-248 Configure DDS

The drive wizard opens.

3. Click **Next** in the drive wizard until you reach the dialog **Configuration - SINAMICS_Integrated - Power Unit BICO Technology**.

4. In the **Power unit BICO** dialog, input field **p0864**, select the digital input to which the ready signal of the infeed is wired (e.g. DI 0).

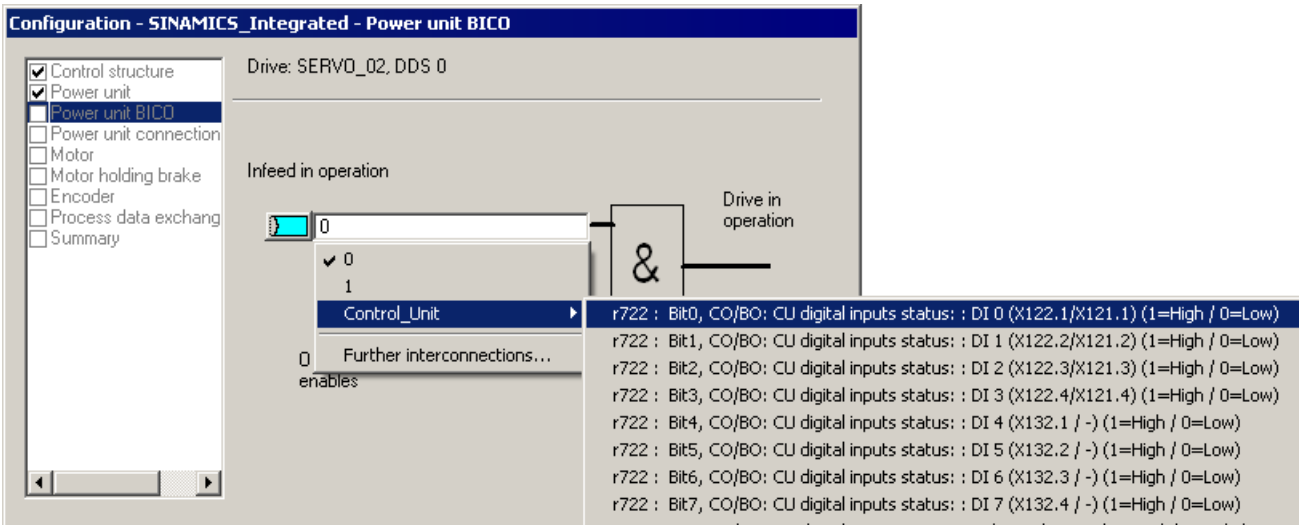

Figure 3-249 BICO interconnection in the drive wizard

5. Click **Next**. Run through all the other dialogs without change until the final **Summary** dialog.
6. Click **Finish**.
   The configuration is thus completed.
7. The configuration dialog of the drive is no longer required. Click **Close** at the bottom right of the dialog box.

3.4.10 Configure the axis

3.4.10.1 Overview

Aim of Getting Started

This part of Getting Started shows you how to create and configure an axis in the project, and how to interconnect it with the integrated drive of the SIMOTION D device. SIMOTION SCOUT TIA provides the axis wizard for this purpose.

Requirements

You have configured the integrated drive of the SIMOTION D device, see the section Configure the drive (Page 494).

Axis technology object

Technology objects represent the respective real objects (e.g. a position axis) in the controller.

The Axis technology object offers users a technological view of the drive and the encoder (actuator and sensor), provides technological functions for these components, and conceals the actual hardware interface.

The Axis technology object contains extensive functionality, e.g. communication with the drive, actual value processing, position control, and positioning functionality. It executes control and motion commands and indicates states and actual values.

Technological limitations and mechanical values of the axis and encoder (e.g. leadscrew pitch and gears) are set on the axis. You can then work exclusively with technological variables.

Axis wizard

SIMOTION SCOUT provides the axis wizard for creating a new axis. The wizard scans the basic settings and interconnects the TO axis with a drive.

The wizard can only be run through once. Later changes to the configuration can be entered in the corresponding dialogs of the TO.

3.4.10.2 Creating an axis

For the sample project, create the axis **Axis_1**. Assign the axis to the drive you have configured in the section Configure the drive (Page 494).

Run through the wizard and confirm all standard settings with **Next**.

You create a real axis in the project as follows

1. Open the **AXES** folder in the project navigator.
2. Double-click **Insert axis**. The **Insert axis** dialog appears.
3. Name the axis in the **Name** field. Use the designation **Axis_1** for the axis of the sample project.

4. Leave the preset axis technology at the default **Positioning**.

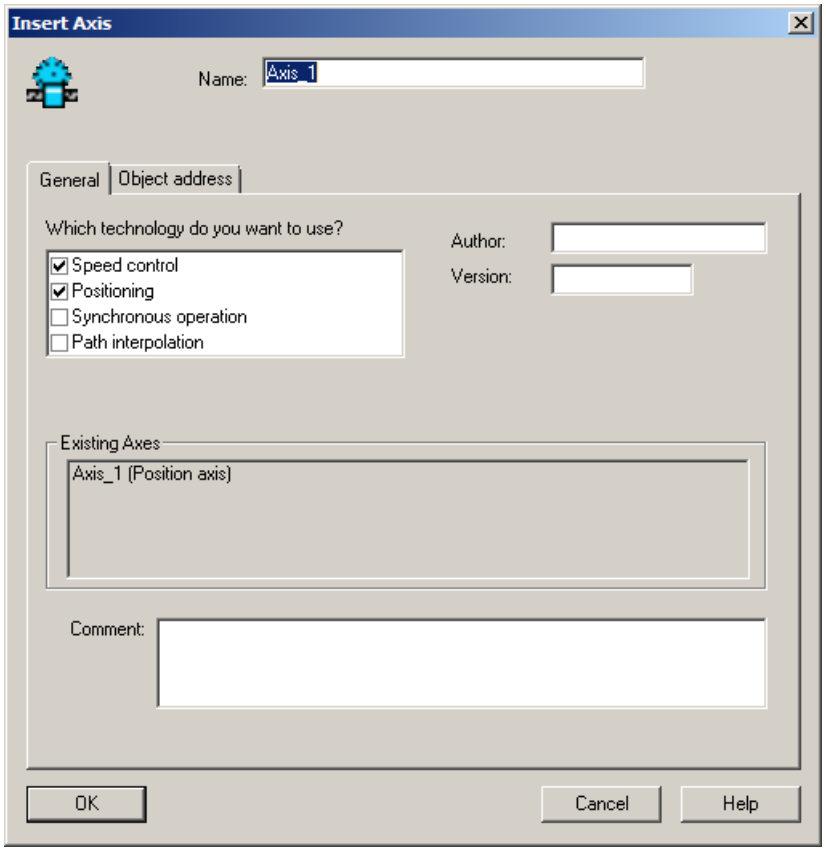

Figure 3-250 Axis wizard, creating a real axis

5. Click **OK**.
The axis configuration wizard appears.

6. Define the axis type.
   For the sample project, select preferably a linear axis with an interconnection to an electrical drive.
   Activate the fields **linear** and **electrical**.

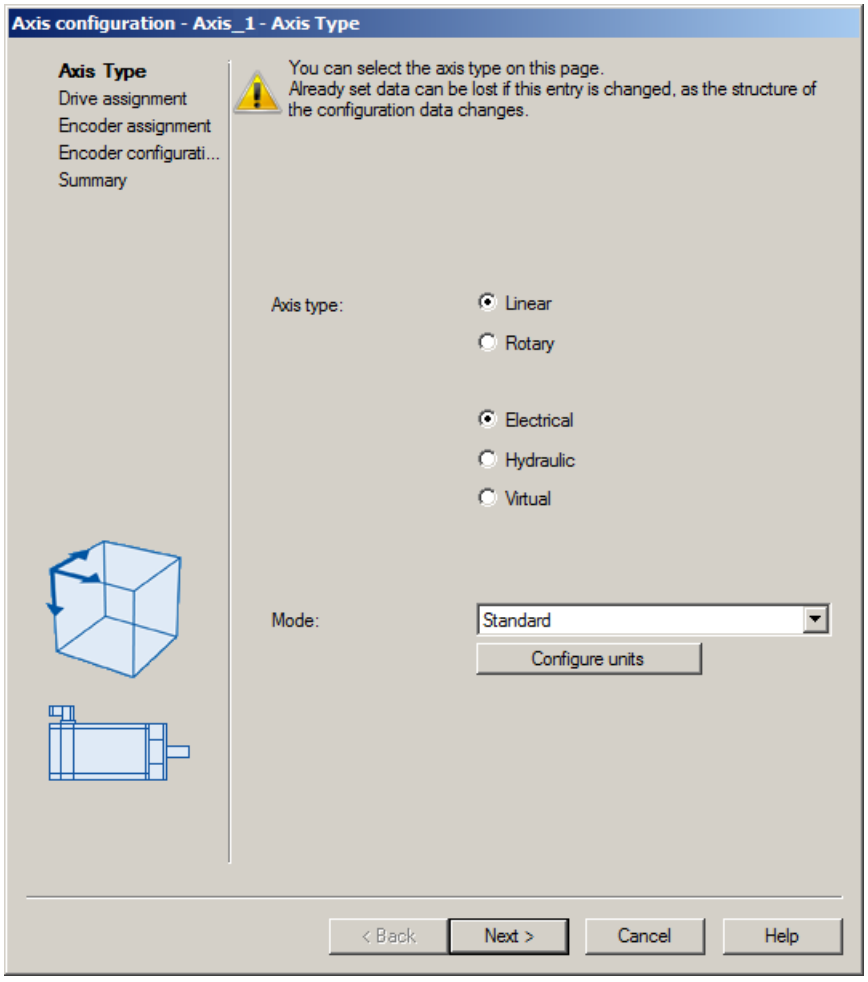

Figure 3-251 Axis wizard, determining the axis type

7. Click **Next**.
   The **Drive assignment** dialog appears.

8. Assign the axis to the drive you have configured in the section Configure the drive (Page 494). To do so, click the drive unit in the **Assignment partner** column. Click in the tree under the drive object on the drive object you want to interconnect. **Assign** appears in the **Assignment** column. The axis/drive assignment is thus defined.
   Click **Next**.

   Note

   As an alternative to assigning the axis to an already configured drive, the axis wizard offers two further selection options:

   - Define the axis/drive assignment later:
     The axis is to be created and not assigned to a drive until later. Programming and simulation of the axis are also possible here.
   - Create drive:
     The drive wizard can can be called up from the axis wizard (offline configuring). The axis can thus be created in one step along with the drive, and assigned to the drive.

   The alternative procedures are not considered further in Getting Started.

9. Assign the motor encoder.
   In the **Encoder assignment** window, you use the motor encoder connected to the drive as the standard setting.
   Click **Next**.
10. The axis wizard then assembles the configuration data in an overview. You thus have an opportunity to check and correct the data before accepting it into the project.
    Close the dialog with **Finish**.
    The configured axis is displayed in the project navigator.

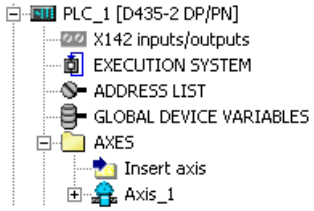

Figure 3-252 Axis created

Automatic settings of the engineering system

The engineering system automatically defines the PROFIdrive axis telegrams required for communication, as well as the addresses used.

In the same way, telegrams are extended and interconnections automatically created in the drive, depending on the selected TO technology (e.g. SINAMICS Safety Integrated).

Drive and encoder data, as well as reference variables, maximum variables, torque limits, and granularity in torque reduction of the SINAMICS S120 are accepted automatically for the configuration of the SIMOTION technology objects "TO axis" and "TO external encoder". This data no longer has to be entered in SIMOTION.

Further axis configuration

Further axis configuration is possible via dialogs that can be accessed in the project navigator under the axis. No other configuration is required for the sample project.

Downloading the axis configuration to the target system

- Save and compile the project.
- Download the sample project with the axis configuration to the target system to be able to test the functioning of the axis in the next configuration step.

3.4.10.3 Download the axis configuration to the target system

Download the sample project with the axis configuration to the target system to be able to test the functioning of the axis in the next configuration step.

Steps

1. Save project and compile changes.
2. Establish online connection if offline.
3. Download the project to the target system.

Save and compile changes

Click in the toolbar on the **Save project and compile changes** button.

Establish the online connection

Click in the toolbar on the **Connect to selected target devices** button.

Download to target system

Click in the toolbar on the **Download project to target system** button.

3.4.11 Test the axis with the axis control panel

3.4.11.1 Overview

Aim of Getting Started

In this part of Getting Started, you test the configured axis. SIMOTION SCOUT TIA provides you with the axis control panel for this purpose.

Requirements

- You have configured the infeed, see the section Configure the infeed (Page 499).
- You have created and fully configured an axis in the sample project, see the section Configure the axis (Page 501).
- The project with the axis configuration has been downloaded to the target system, see the section Download the axis configuration to the target system (Page 506).
- SIMOTION SCOUT TIA is in online mode.

Control and monitoring of individual axes

The axis control panel is used for controlling and monitoring individual axes. You can use it to traverse axes together with the drive.

You can use the control panel to perform the following tasks, for example:

- Test axes before you traverse them via a program.
- Test whether the axes can be traversed using the control panel when a fault occurs.
- Set and remove an axis enable.

3.4.11.2 Working with the axis control panel

In the sample project, you traverse the set-up axis in jog mode to test the correct functioning of the axis.

You open the axis control panel as follows

Open the **AXES** folder in the project navigator. Double-click below the axis on **Control panel**.

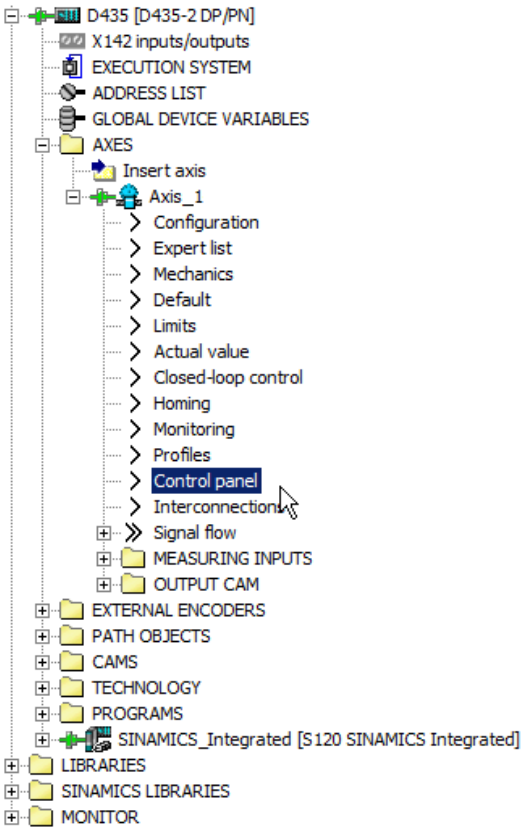

Figure 3-253 Calling the axis control panel

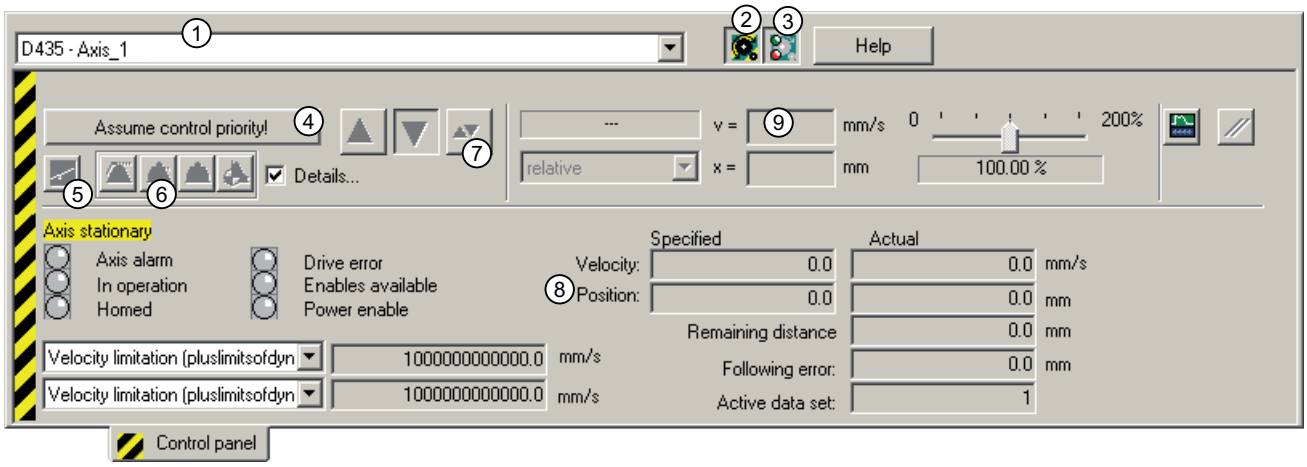
The axis control panel is opened in the detail view.



① ... ⑨ Reference is made to the circled digits in the text below.

Figure 3-254 Axis control panel

You traverse an axis with the axis control panel as follows

1. The field at top left of the control panel ① shows the currently selected axis.
2. Showing areas in the control panel:
   The control panel is divided into a control area and a diagnostics area. The areas may be hidden.
   Click the **Show/hide control area** button ② and/or the **Show/hide diagnostics area** button ③ to show the respective area.
3. Assume control priority – Observe safety regulations:
   To be able to traverse the axis from the PG/PC, the PG/PC must obtain control priority.
   Click the **Assume Control Priority** button ④.
   The **Assume Control Priority** dialog opens.

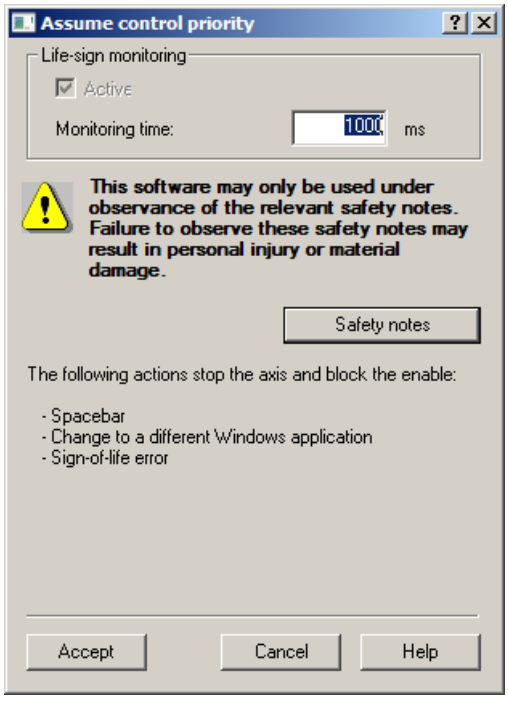


Figure 3-255 Axis control panel, assume control priority

Observe the safety regulations and confirm with **Accept**.
The PG/PC now has control priority.

Note

You can stop the axis at any time by pressing the space bar.

4. Enable the axis:
   Click the **Set/remove enables** button ⑤ to enable the axis.

Confirm the **Switch axis enable** dialog that appears with **OK**.
The switches **Start motion**, **Stop motion** and **Jog** ⑦ are enabled.

5. Homing the axis:
   Click the **Home axis** button.
   In the dialog box, select **Homing type Set home position**, and enter the value **0** under **Home position coordinates**.
   Confirm the dialog box with **OK** and start homing the axis.
6. Click the **Position-controlled traversing of the axis** button ⑥.

   

   The dialog **Start axis position-controlled** dialog appears.
   Specify the velocity of the axis. Click **OK** to close the dialog.
   The velocity appears in the field **v=**⑨.
7. Start the axis motion:
   Click **Jog**⑦.

   

   The axis is traversed while you press the switch. In the fields **Velocity** and **Position**⑧, you can monitor the traverse motion.
   The axis test is thus executed.
8. Deactivate axis enable:
   Click **Set/remove enables**⑤.
   Confirm the **Disable axis** dialog with **OK**.

   Note

   If you want to traverse the axis again, acknowledge all alarms in the "Alarms" window.

9. Return control priority:
   Click **Give up control priority**④ to deactivate control of the axes from the PG/PC. In this operating state, the axes can no longer be controlled from the PG/PC.
10. Go offline:
    Select **Project > Disconnect from target system** in the menu. Or click in the toolbar on the **Disconnect from target system** button.

    

3.4.11.3 Result in the sample project

You have traversed the axis of the sample project with the axis control panel and thus ensured its correct functioning. Configuring the axis is thus completed.

3.4.12 Configure digital outputs

Aim of Getting Started

In this part of Getting Started, you configure two of the digital inputs/outputs available on the SIMOTION D device as outputs.

You require the outputs for the program you will write in the subsequent configuring step, see the section AUTOHOTSPOT.

Requirements

SIMOTION SCOUT TIA is in offline mode.

I/O channels of the terminal X142

You use the I/O channels of the terminal X142 for the sample project.

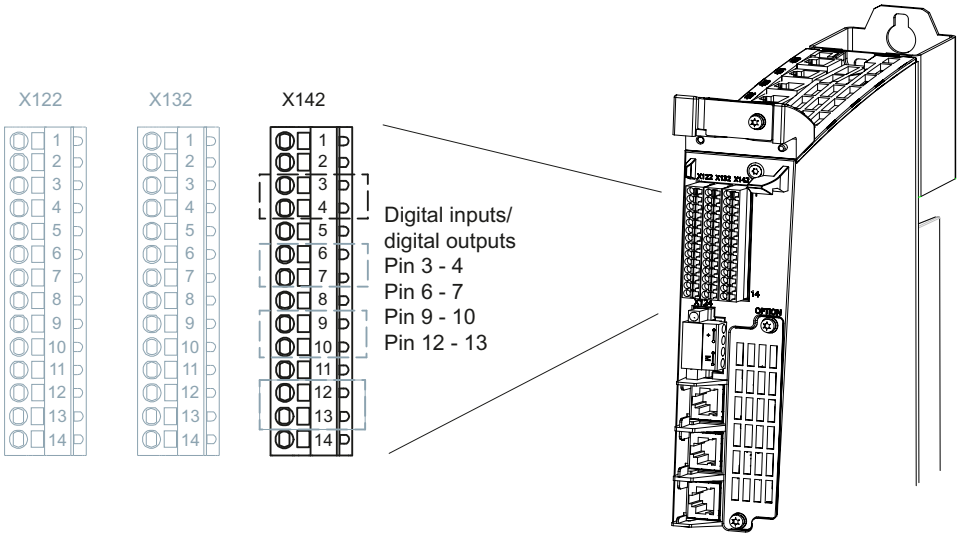

Figure 3-256 SIMOTION D445-2 DP/PN, position of the digital interface X142

The I/Os of the terminal X142 are permanently assigned to SIMOTION D4x5-2. The terminal is thus visible in the project tree under the SIMOTION device.

You define the digital outputs as follows

1. Double-click the element **Inputs/outupts X142** in the project tree below the SIMOTION device.
   The **I/O properties** dialog opens.
2. Go to the **Channels 0-7** tab.
   The terminal **X142** is represented on the tab, specifying the pin numbers and the current use of the channels.

3. Channels 0 and 1 on pins **3** and **4** are preset at the factory as digital inputs DI 0 and DI 1. Define the two channels as digital outputs DO 0 and DO 1. Select the value **DO** in each case in the **Function** list field.

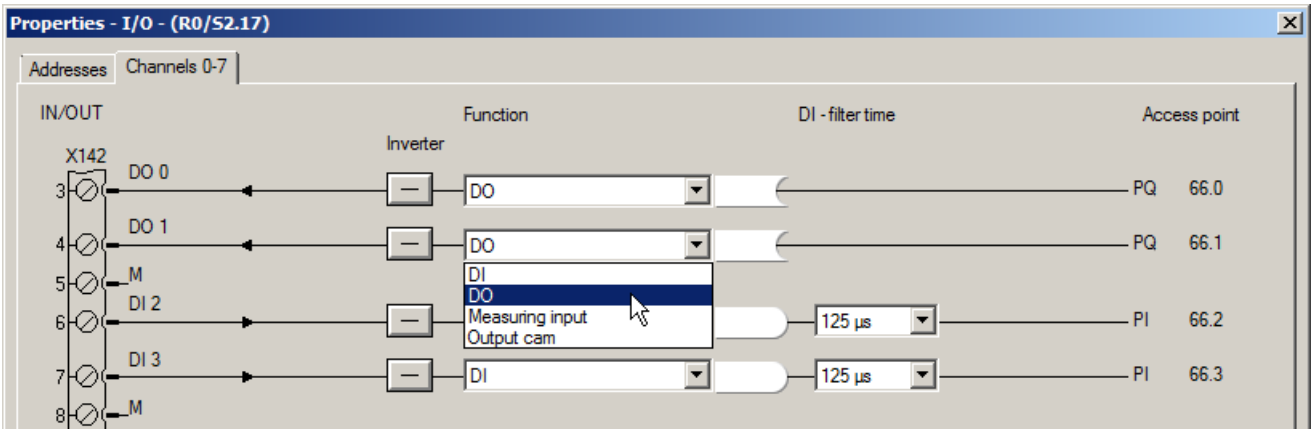

Figure 3-257 I/O properties

4. Confirm with **OK**.
Configuring the digital outputs is thus completed.

3.4.13 Programming the SIMOTION application

3.4.13.1 Overview

Aim of Getting Started

In this section, you write a simple SIMOTION user program for the sample project.

- You create the variables required by the program.
- You create the program and additional auxiliary programs with the graphical editors supplied by SIMOTION SCOUT TIA.

Purpose of the program

The program controls the axis set up in the sample project.

- The infeed is switched on via a SINAMICS system call.
- The axis is traversed to a specific position and returned to the original position.
- The program states "Program started" and "Program end reached" are applied to digital outputs to evaluate them in the I/O.

Requirements

- You have configured the infeed, see the section AUTOHOTSPOT.
- You have configured an axis and tested its function, see the sections AUTOHOTSPOT and AUTOHOTSPOT.
- You have prepared two digital outputs for use in the program, see the section AUTOHOTSPOT.
- SIMOTION SCOUT TIA is in offline mode.

3.4.13.2 Variables

Variable types

Variable types

Several variable types are distinguished in SIMOTION:

- **System variables**
  Each SIMOTION device and technology object has specific system tags. You can access system tags within the SIMOTION device from all programs.
- **I/O variables**
  An I/O tag is a symbolic tag name that is assigned to an I/O address of the SIMOTION device or to the I/O. Direct access to the I/O is thus possible.
  I/O variables are valid across all devices. All programs of the SIMOTION device have access to them.
- **Global device variables, unit variables, and local variables** are user-defined variables with a limited scope of validity:
  All programs of a SIMOTION device can access global device variables.
  All programs, function blocks, and functions that are defined within the same unit, e.g. ST source, MCC source, LAD/FBD source, can access unit variables. It is also possible to access variables of other units via the keyword USES.
  A unit (source) is a logical unit that you can create in your project and that can contain programs, functions, and function blocks.
  Local variables can only be accessed within the program, the function or the function block in which they are defined.

You can find further information on variables in the online help under **Variable model**.

Variables of the sample project

You require the following variables for the sample project of Getting Started:

2 global device variables

- g_bo_start
- g_bo_ready

2 I/O variables

- q_bo_output0
- q_bo_output1

Additionally when using an infeed with DRIVE-CLiQ interface:

2 I/O variables

- LineModule_STW
- LineModule_ZSW

Instance

- myFB_LineControl

Use of the variables in the sample project

The variables **g_bo_start** and **g_bo_ready** redundantly describe the program states "Program started" and "Program end reached".

The I/O variables **q_bo_output0** and **q_bo_output1** apply the program state to the configured digital outputs of the SIMOTION device, e.g. for a display.

The instance **myFB_LineControl** and the I/O variables **LineModule_STW** and **LineModule_ZSW** control the infeed.

Creating global device variables

You create global device variables in the **Symbol browser** tab of the detail view.

You create global device variables as follows

Create the global device variables **g_bo_start** and **g_bo_ready** for the sample project as follows.

The variable definition encompasses:

- Variable name
- BOOL data type

Note

You can only create global device variables in offline mode.

1. Click the **GLOBAL DEVICE VARIABLES** element in the project navigator under the SIMOTION device.
   The **Global device variables** table is displayed in the symbol browser.
2. Click in the **Name** column on the first free cell and enter the variable name **g_bo_start**. Press RETURN or TAB. The input focus jumps to the **Data type** field. Alternatively, you can click in the field to move the input focus there.
3. Enter the data type **BOOL** in the **Data type** field.

4. Press RETURN to confirm.
   The variable is created and is available in the project. A new empty line is opened for input in the symbol browser.
5. Create the global device variable **g_bo_ready** accordingly.

The figure below shows the full definition.

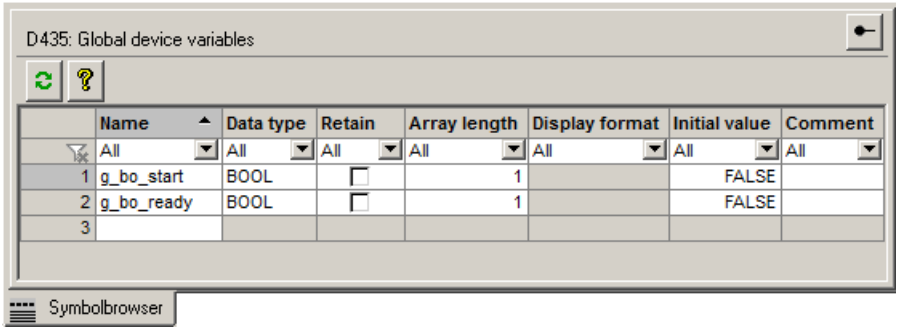

Figure 3-258 Global device variables of the sample project

Creating I/O variables

When configuring I/Os, SIMOTION SCOUT TIA supports the symbolic assignment of inputs and outputs located on SIMOTION/SINAMICS components. To be able to access the drive-level I/O with an I/O variable, it is only necessary to assign the I/O variable to the I/O channel. SIMOTION SCOUT TIA automatically sets up telegrams, BICO interconnections and addresses.

You create the I/O variables for output at the configured digital outputs as follows

You create the I/O variables **q_bo_output0** and **q_bo_output1** for the sample project as follows.

The variable declaration encompasses:

- Variable name
- Definition as output variable OUT
- BOOL data type
- Assignment to a digital output

Note

I/O variables can only be created in offline mode.

1. Double-click the element **ADDRESS LIST** in the project navigator below the SIMOTION device. The **Address list** tab opens in the detail view.
2. Click the first free cell in the **Name** column. Enter the variable name **q_bo_output0**. Press RETURN or TAB. The input focus jumps to the **I/O address** field. Alternatively, you can click in the field to move the input focus there.
3. Enter the keyword **OUT** in the **I/O address** field.
4. Enter the data type **BOOL** in the **Data type** field, or leave the field empty.

5. Assign the configured digital output to the variable:
   - Click the button ... in the **Assignment** cell. The Assignment dialog opens.
   - Open the **D435** element in the Assignment dialog.
   - Click the digital output **DO_0** below the **D435** element. **Assign** appears in the **Assignment** column.

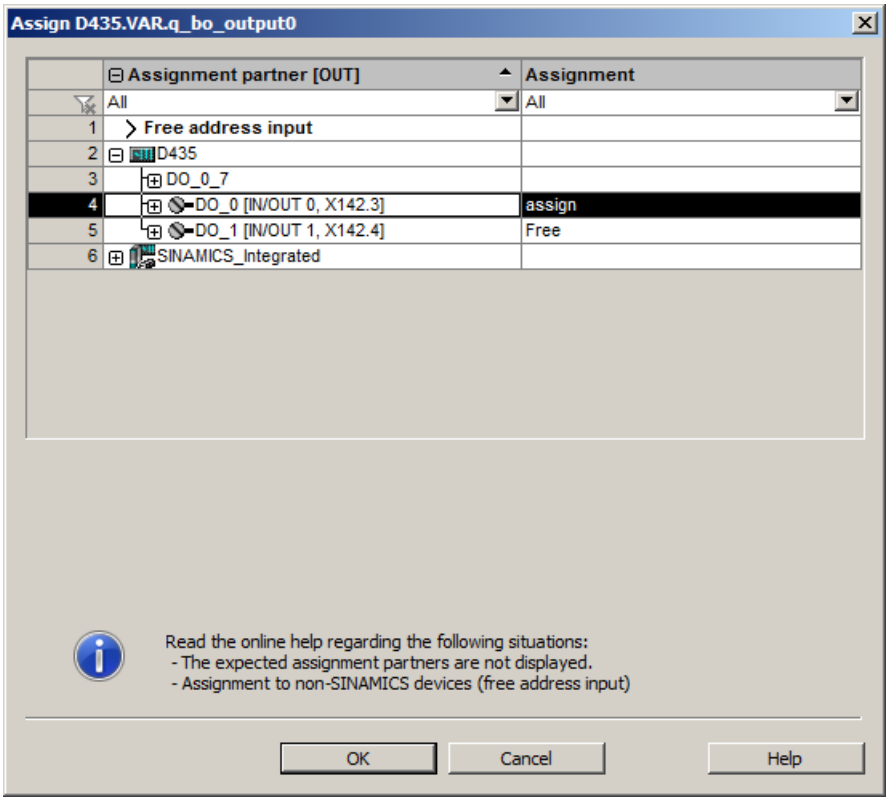

Figure 3-259 Assigning I/O variable and I/O channel

6. Confirm with **OK**.
   The assignment of I/O variable and I/O channel has been completed. The I/O variable is created and is available in the project. A new empty line is opened for input in the **Address list** table.

7. Create the I/O variable **q_bo_output1** in the same way. Assign the variable to the configured digital output DO 1.
   The figure below shows the full declaration:

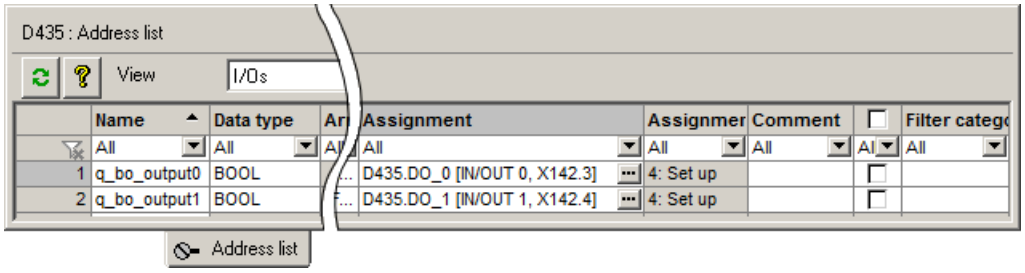

Figure 3-260 I/O variables of the sample project

8. Leave the **Address list** tab open for declaring further I/O variables.

You create the I/O variables for controlling the infeed as follows

If you are using an infeed with DRIVE-CLiQ interface, create also the I/O variables **LineModule_STW** and **LineModule_ZSW**.

Note

I/O variables can only be created in offline mode.

Proceed as for the definition of the I/O variables **q_bo_output0** and **q_bo_output1**.

1. Open the **Address list** tab in the detail area if not already visible.
2. Create the I/O variable **LineModule_STW**.
   - **I/O address**: OUT
   - **Data type**: WORD
   - **Assignment**: Control word E_STW1 of the SINAMICS infeed

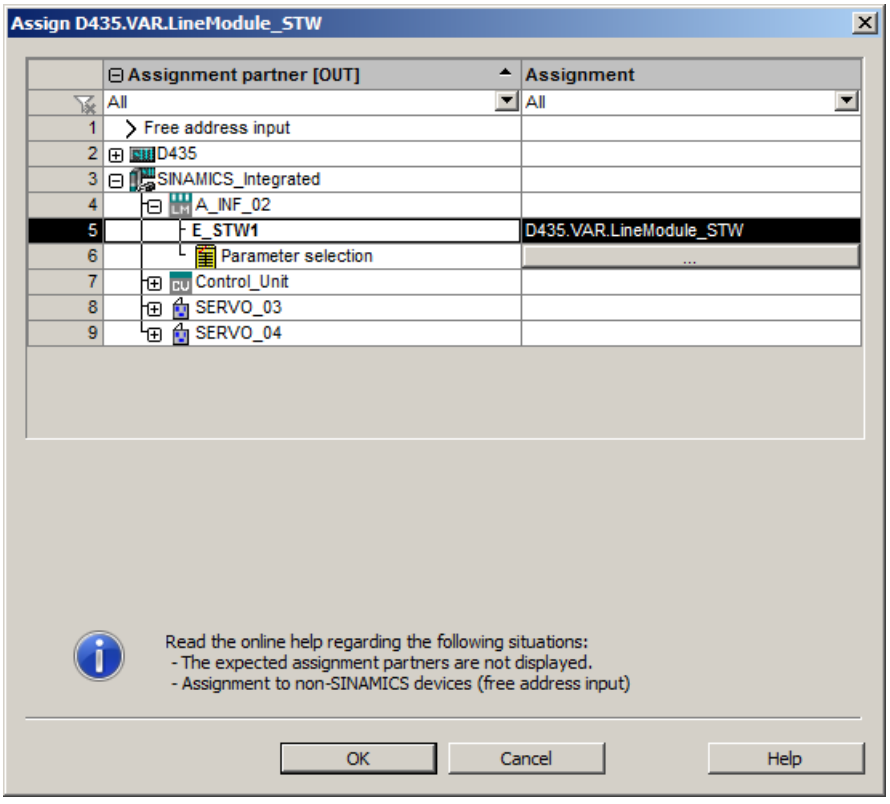

Figure 3-261 Assigning I/O variable and control word of the infeed

3. Create the I/O variable **LineModule_ZSW**.
   - **I/O address**: IN
   - **Data type**: WORD
   - **Assignment**: Status word E_ZSW1 of the SINAMICS infeed

The figure below shows the full declaration:

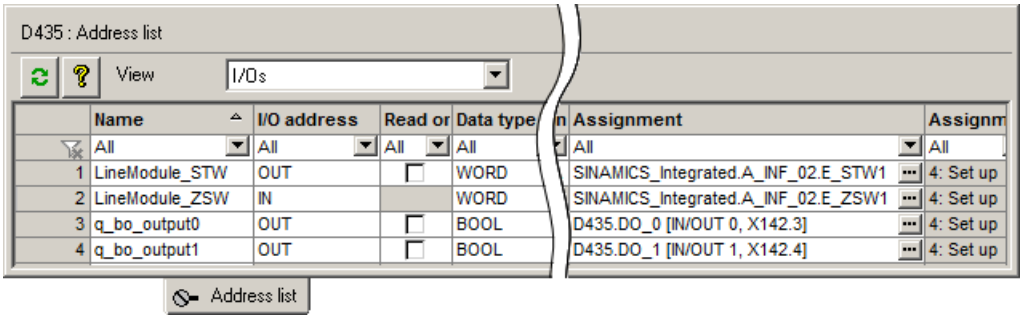

Figure 3-262 I/O variables of the sample project

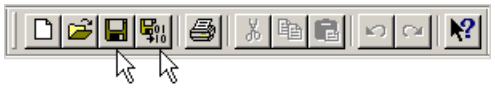
Back up the configuration

Back up the variables created in the sample project.

To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.



3.4.13.3 Programming

Programming languages in the sample project

Within the scope of the sample project, you create a simple user program with the programming languages MCC and LAD/FBD.

For this, you use the variables you created in the previous section Variables (Page 513).

MCC Motion Control Chart

The programming language MCC

MCC (Motion Control Chart) is a graphical programming language.

The programmed motion sequences (machine sequences) are shown in the MCC as flowcharts (MCC charts). The structure of the flowcharts is oriented around the actual operating sequence of the machine. A sequential motion sequence is programmed.

System in the SIMOTION SCOUT TIA

The **PROGRAMS** folder under the SIMOTION device contains the MCC units created in the project.

An MCC unit contains the MCC programs that are to run on the SIMOTION device.

"MCC program" is a collective term for different program organization units (POE).

A POE can be a program, a function, or a function block. The type of the POE is indicated in the project navigator by an icon:

- Program
- Function
- Function block

An MCC chart is the graphical representation of a program organization unit POE.

An MCC unit can contain several MCC charts.

Program creation steps

Creation of an MCC program encompasses the following steps:

1. Creating the MCC unit.
2. Creating the MCC charts in the MCC unit.
3. Inserting MCC commands in the MCC chart and parameterizing the commands.

Creating the MCC unit

You create the MCC unit **motion** for the sample project as follows.

You create an MCC unit in the project as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator. Double-click **Insert MCC unit**. The **Insert MCC unit** window appears.
2. Enter the name **motion**.
3. Go to the **Compiler** tab. For diagnostics purposes, activate the options **Permit program status** and **Permit single step**. In this way, you can monitor program execution later in online mode.
4. Confirm with **OK**.
   The MCC unit is created.
   - The unit appears in the project navigator under the PROGRAMS branch.
   - In the working area of the workbench, the declaration table of the unit opens. The variables declared there apply within the MCC unit and can be linked in other units.

   No other variable declaration is required for the sample project. You have already created the necessary variables as global device variables in the symbol browser.

Creating the MCC chart

You create the MCC chart **pos_axis** for the sample project as follows. The MCC chart **pos_axis** is a POE of the type program.

You create an MCC chart as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator.
2. Open the MCC unit **motion** in the **PROGRAMS** folder.
3. Double-click **Insert MCC chart**.
   The **Insert MCC Chart** window appears.
4. Enter the name **pos_axis**.
5. Select the creation type **Program**.
6. Confirm with **OK**.
   The MCC chart is created in the project.
   - The created MCC chart **pos_axis** appears in the **PROGRAMS** folder under the **motion** unit.
   - The MCC editor is opened in the working area of the workbench. The start and end nodes are already pre-defined. You can start MCC programming.

Inserting command blocks into an MCC chart

Every newly created MCC chart already contains a start and end node.

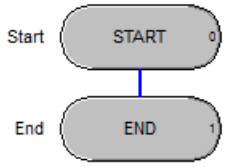


Figure 3-263 MCC chart, start and end block

You insert the MCC command blocks between these. The commands are processed in the direction from the start to the end node.

The MCC commands are available to you via:

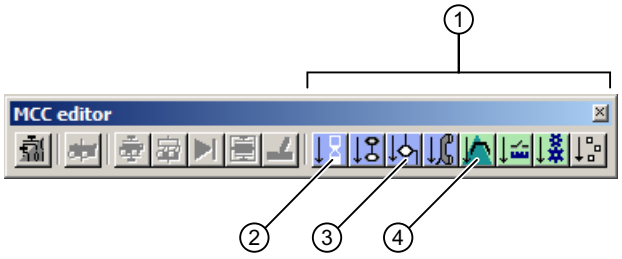
- The **MCC editor** toolbar
- **MCC Chart > Paste** menu command
- Context menu of the command block

You work with the MCC editor toolbar as follows

Open the toolbar

The **MCC editor** toolbar becomes visible in the workbench as soon as you open an MCC chart.

The commands are arranged into command groups. The sample project uses commands from the command groups **Basic commands**, **Program structures**, and **Single axis commands**.



① Command groups
② Basic commands
③ Program structures
④ Single axis commands

Figure 3-264 MCC editor toolbar

Note

If you do not see the toolbar, check that the display is switched on: Open the menu **View > Toolbars**. Activate the checkbox for **MCC editor** in the **Toolbars** window.

Open the command group

Move the mouse over the colored buttons of the toolbar to show the command groups.

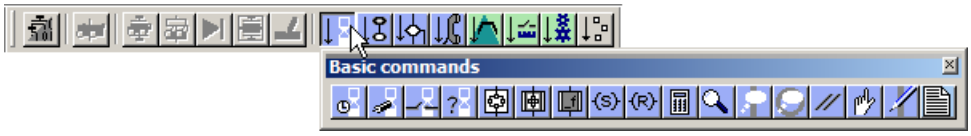


Figure 3-265 Open the command group

Keeping command groups open or closed continuously

Click the window title of a command group to keep the command group open continuously.

Select **Hide** in the context menu of a command group to close the command group.

Placing the command group as required

Drag the toolbar or the command groups of the toolbar with the mouse to any location on the workbench.

Docking the toolbar

Drag the toolbar or the command groups of the toolbar with the mouse to the edge areas of the workbench to dock them there.

Showing a tooltip for the command

Hold the mouse pointer briefly over a command button. The designation of the command is shown.

You insert commands into an MCC chart with the help of the MCC editor toolbar as follows

1. Click in the active MCC chart on the connecting line between two commands, or click the command after which the new command is to be inserted.
   The connecting line or the border of the command button is marked in blue. The marking flashes.
2. Select the command group in the **MCC editor** toolbar. Click the desired command in the command group.
   The command is inserted into the chart.

The newly inserted command is empty. It must then be parameterized; e.g. for a variable assignment, the name of the variable and the assigned value must be specified.

The following section Creating an MCC sample program: basic framework (Page 522) describes the procedure in detail.

3.4.13.4 Creating an MCC sample program: basic framework

Overview

In the sample project, you create the MCC program **pos_axis**. This program traverses an axis to a target position and back to the starting position.

Handling the infeed

If you are using an infeed without a DRIVE-CLIQ interface, the basic framework for program-controlled operation of the axis dealt with in this section is sufficient. The drive has a continuous ready signal of the infeed because the parameter is set to p0864=1, see the section AUTOHOTSPOT.

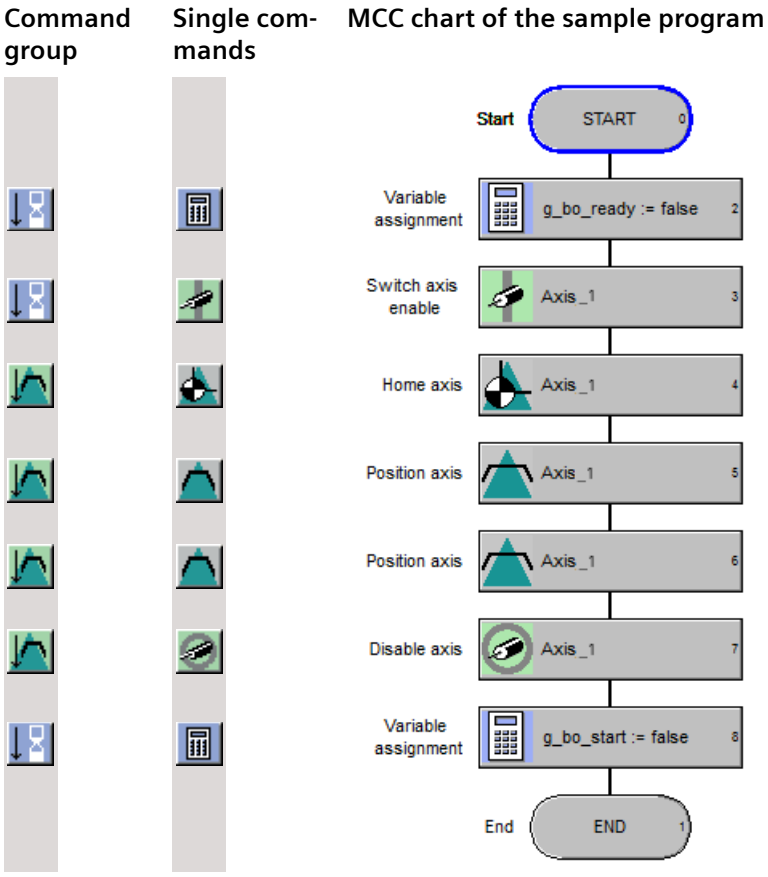
If you are using an infeed with a DRIVE-CLiQ interface, the program must switch the infeed on. Getting Started deals with this additional program sequence separately in the section Expanding the MCC sample program: control of the infeed (Page 535).

Program flow

The finished MCC chart

The figure below shows the finished MCC chart of the sample program.

The first two command blocks initialize the variables **g_bo_ready** and **g_bo_start**. The axis is then enabled, referenced, and traversed to the target position. When the position has been reached, the axis returns to the starting position. The enable is revoked. Finally, the variable **g_bo_start** is reset and the variable **g_bo_ready** is set.



Command groups and individual commands

In the figure above, the icons of the command group and of the individual command that you must click in sequence to insert the command into the MCC chart are shown in front of every MCC command.

The sections below describe the procedure in detail.

Variable assignment g_bo_ready:=false / g_bo_start:=true

The variable **g_bo_ready** is set to FALSE to set the variable to a defined starting point.

The variable **g_bo_start** is set to TRUE to indicate the start of the axis.

To assign the variables in the MCC editor, proceed as follows:

1. Mark the line between the start and end nodes.

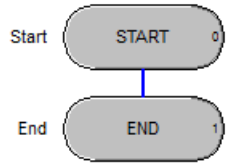


Figure 3-266 Empty MCC chart

2. Open the **Basic commands** command group in the **MCC editor** toolbar. Click the **Variable assignment** command in the command group.

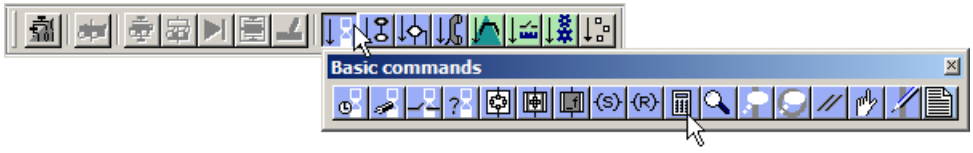

Figure 3-267 MCC editor toolbar, variable assignment command

The **Variable assignment** command block is inserted into the MCC chart after the start node.

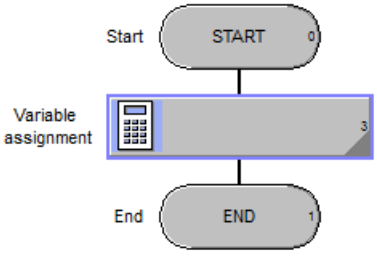

Figure 3-268 MCC chart with inserted variable assignment command block

3. Assign the value FALSE to the variable **g_bo_ready**. You transfer the variable name from the symbol browser to the command block:
   - Double-click the **Variable assignment** command block.
     The **Variable assignment** window appears.
   - Select the value **Formula** in the drop-down list.
     A table with the columns **Variables** and **Expression** appears.
   - Open the symbol browser. To do so, click **GLOBAL DEVICE VARIABLES** under the SIMOTION device in the project navigator.
   - Select the variable **g_bo_ready** in the symbol browser. To do so, click in the first column of the symbol browser on the preceding line number. The line is shown on a black background.

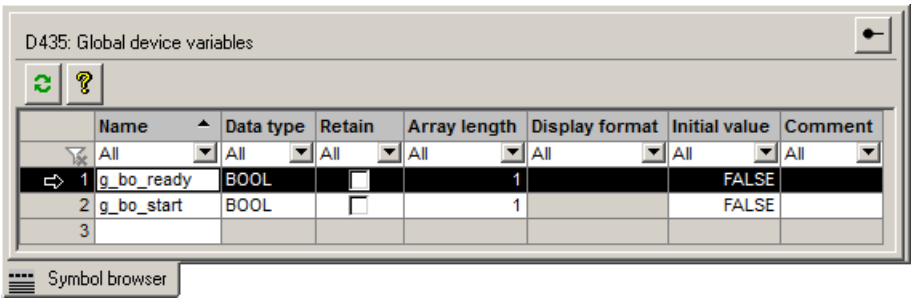

Figure 3-269 Symbol browser

   - Drag and drop the marked line to the **Variable** column of the **Variable assignment** window. The variable is inserted and its name displayed.
   - In the **Expression** column, enter the value **false** and confirm with RETURN.

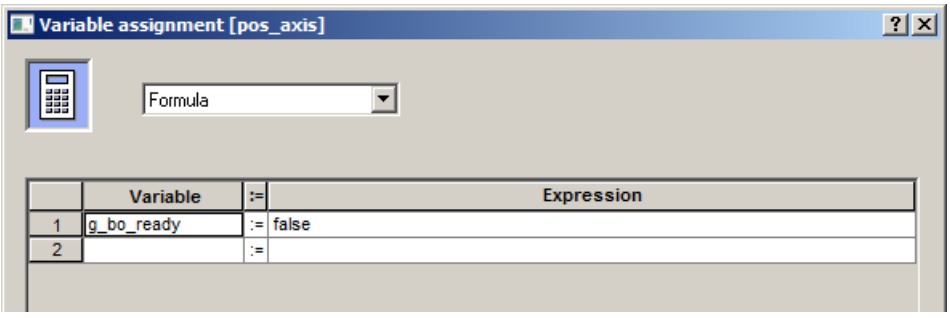

Figure 3-270 Variable assignment

4. Assign the value **true** to the variable **g_bo_ready** in the same way.

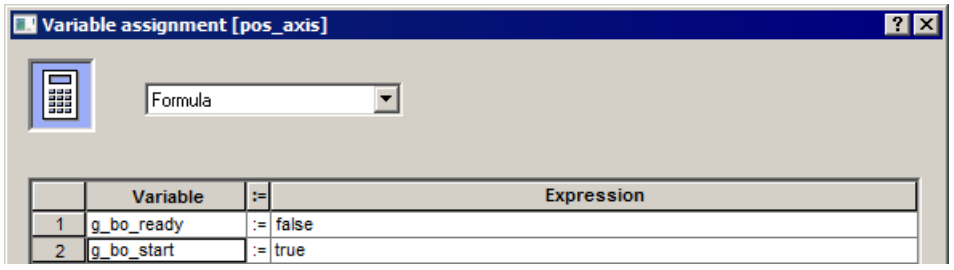

Figure 3-271 Variables assigned

5. Click **OK** to close the window.
   You have set the global device variables to the values **false** and **true**.

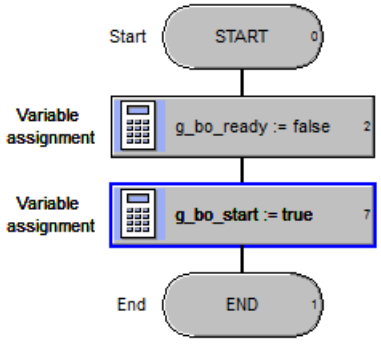

Figure 3-272 MCC chart, executed variable assignment

Variable assignment g_bo_start:=true

The variable **g_bo_start** is set to TRUE to indicate the start of the axis.

You assign the value TRUE to the variable g_bo_start as follows

1. Insert a second **Variable assignment** block into the MCC chart in front of the end node:
   - Click the command block to be followed by the new block.
     The node is marked in blue.
   - Select the **Basic commands > Variable assignment** command in the **MCC editor** toolbar.
     The **Variable assignment** command block is inserted into the MCC chart.
2. Assign the value TRUE to the variable **g_bo_start**. Use the Autocomplete function to select the variable:
   - Double-click on the empty **Variable assignment** command block in the MCC chart.
     The **Variable assignment** window appears.
   - Select the value **Formula** in the drop-down list.
   - Enter the initial characters of the variable name **g_bo_start** in the **Variable** column. Press the keys **Ctrl+space bar** for autocomplete. Select the variable from the list.

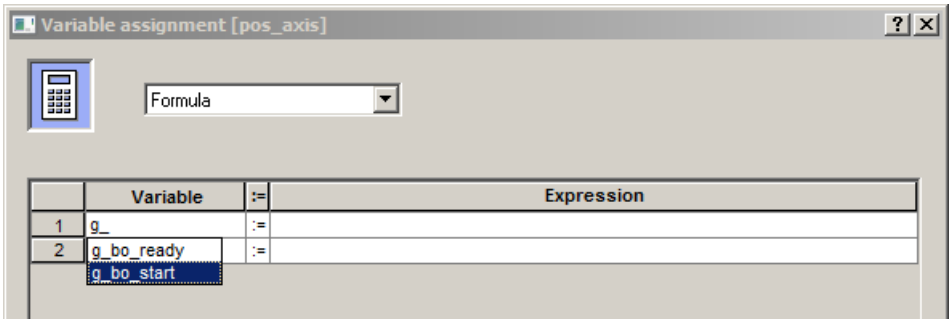

Figure 3-273 MCC chart, selection of the variable using the Autocomplete function

   - In the **Expression** column, enter the value **true** and confirm with RETURN.
3. Click **OK** to close the window.
   The command is parameterized.

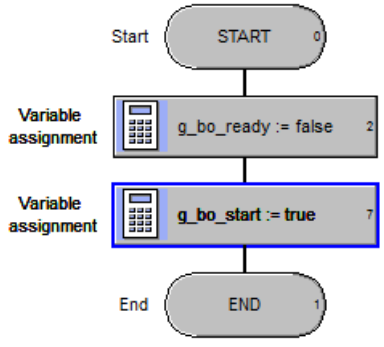

Figure 3-274 MCC chart, executed variable assignment

Switch axis enable

You switch the axis enable as follows

1. Insert the statement block **Switch axis enable** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the **Switch axis enable** command in the command group.

Figure 3-275 MCC editor toolbar, Switch axis enable command

The **Axis enable** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize the axis enable:
   - Double-click the inserted **Switch axis enable** command block in the MCC chart. The **Switch axis enable** window is displayed.
   - In the **Axis** field, select the axis that is controlled by the program.

– Make sure that the **Delay program execution** option is selected for the sample project.
The command is only finished when the axis is enabled.
Leave the other parameters at the default values.

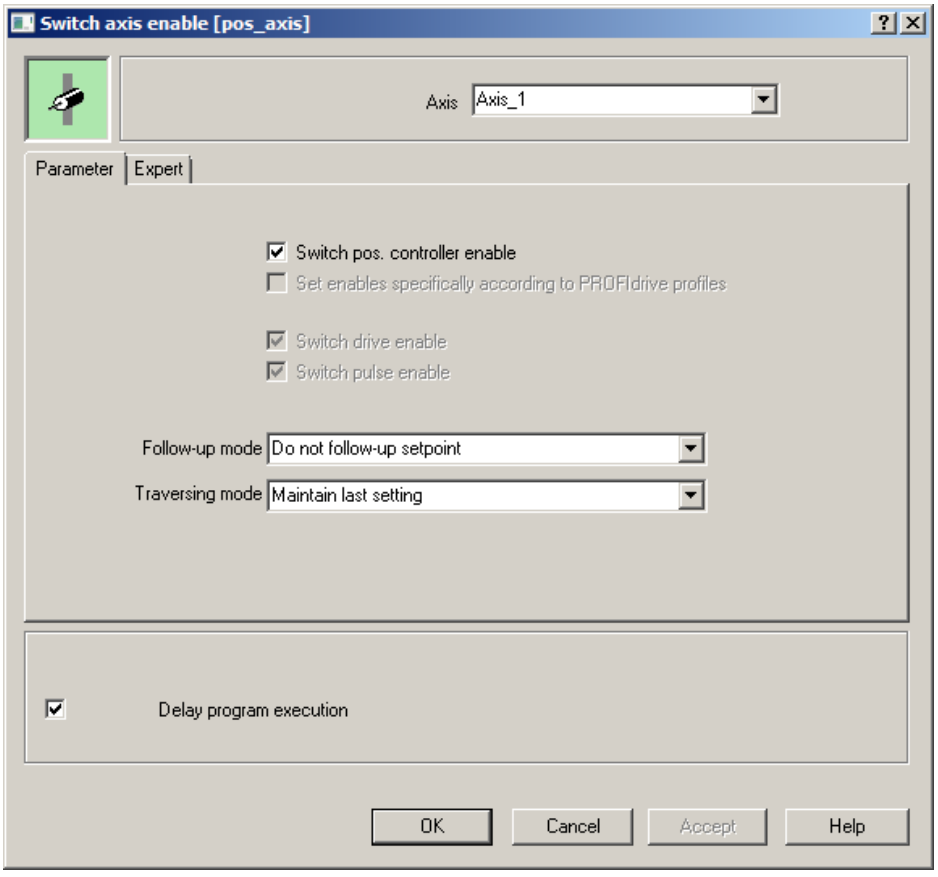

Figure 3-276 MCC chart, Switch axis enable

3. Click **OK** to close the window.
The command is parameterized.

Home axis

The position values of an axis are always in relation to the axis coordinate system.

The homing procedure defines where the zero point of the coordinate system is.

Homing of the axis is implemented as follows

1. Insert the statement block **Home axis** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the command **Home axis** in the command group.

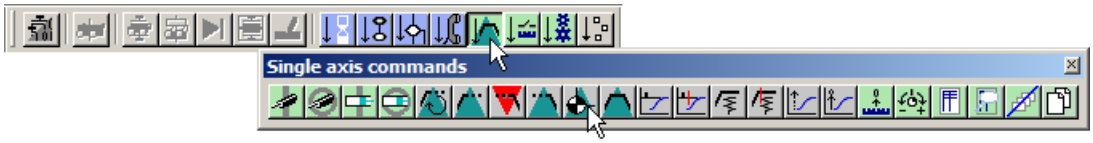

Figure 3-277 MCC editor toolbar, Home axis command

   The **Home axis** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize axis homing:
   - Double-click the inserted **Home axis** command block in the MCC chart. The **Home axis** window appears.
   - In the **Axis** field, select the axis that is controlled by the program.
   - In the **Parameters** tab, select the homing type **Set home position**. Enter the value **0** in the **Home position coordinates** field.
     With this homing type, the value of the home position coordinates are assigned to the current position of the axis (actual value). There is no active traversing motion.

– Leave the other parameters at the default values.

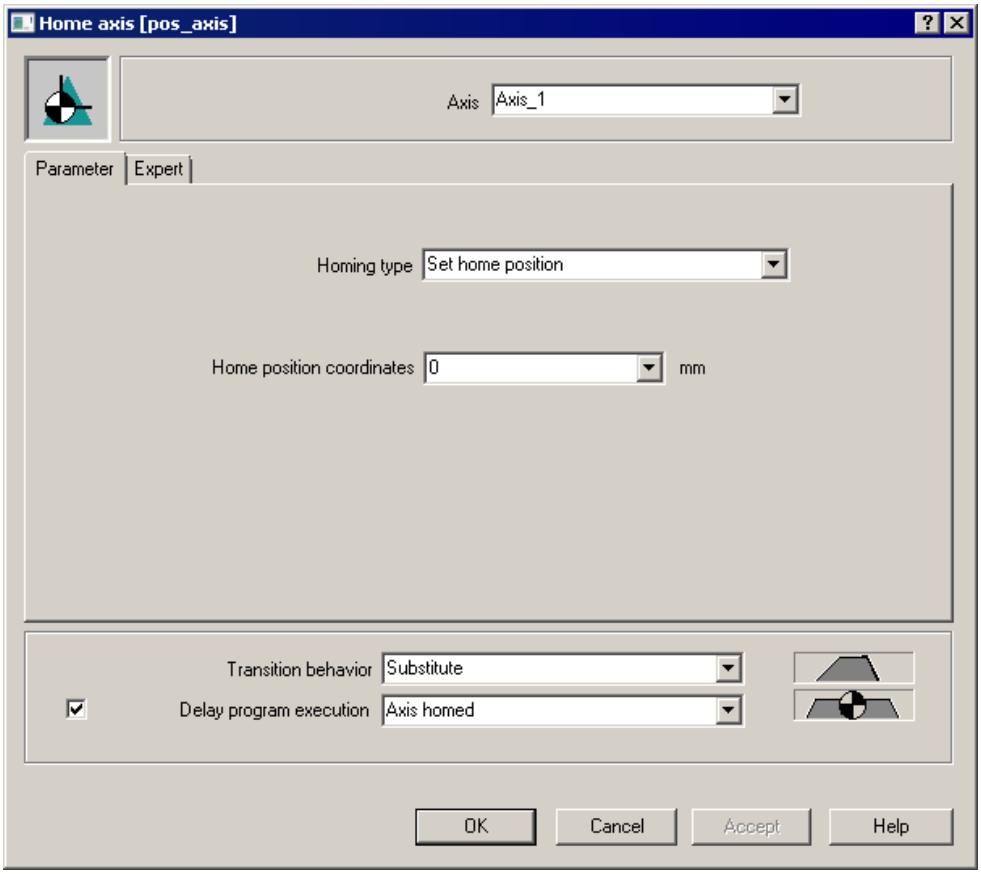

Figure 3-278 MCC chart, Home axis

3. Click **OK** to close the window.
   The command is parameterized.

Position the axis to the target position

The program is to traverse the axis at a velocity of 500 mm/s to the position 2000 mm.

You traverse the axis to the target position as follows

1. Insert the statement block **Position axis** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the **Position axis** command in the command group.

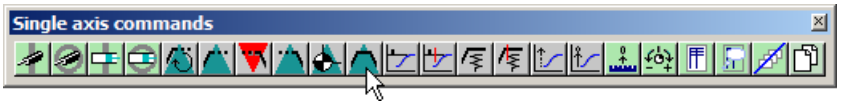

Figure 3-279 MCC editor toolbar, Position axis command

The **Position axis** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize the axis motion:
   - Double-click the inserted **Position axis** command block in the MCC chart. The **Position axis** window appears.
   - In the **Axis** field, select the axis that is controlled by the program.
   - Enter the position 2000 in the **Parameters** tab. Set the velocity to 500 mm/s.
   - Leave the other parameters at the default values.

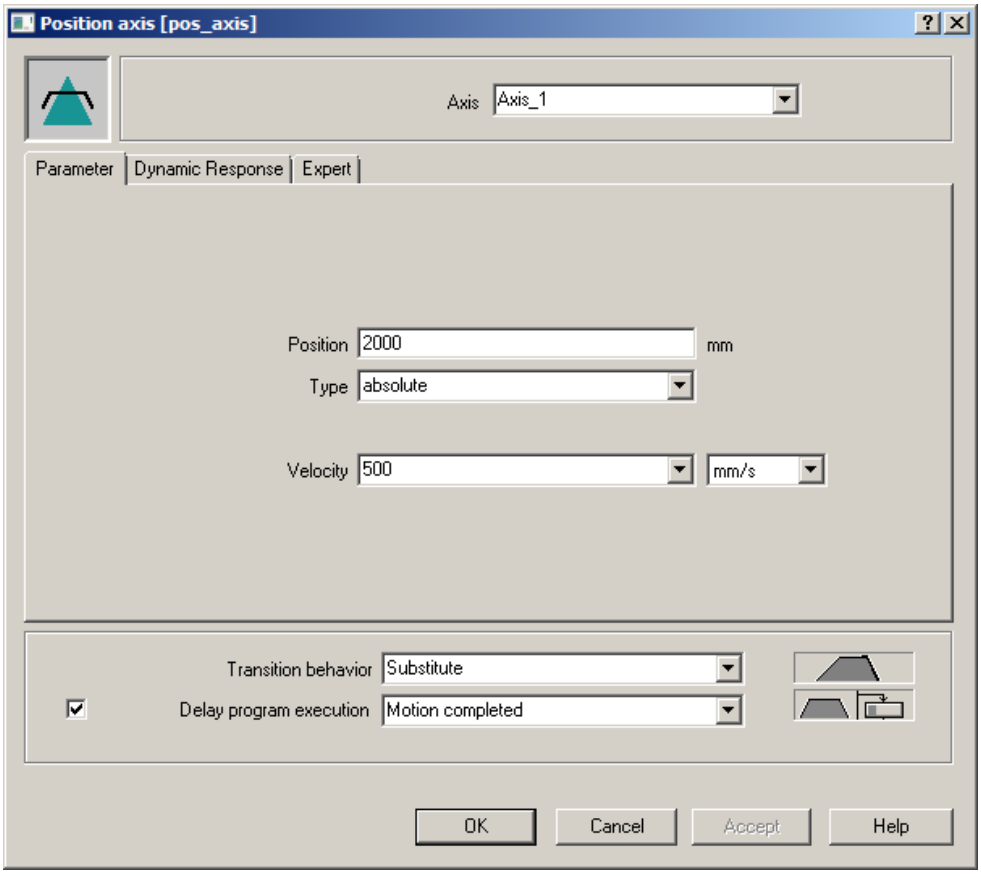

Figure 3-280 MCC chart, position the axis to the target position

3. Click **OK** to close the window.

The command is parameterized.

Position the axis to the starting position

The program is to return the axis to the starting position 0 mm at a velocity of 500 mm/s.

You return the axis to the starting position as follows

Proceed as for the step Position the axis to the target position (Page 531).

1. Insert the statement block **Position axis** into the MCC chart in front of the end node.
2. Parameterize the axis motion:
   - Enter the position 0 in the **Parameters** tab. Set the velocity to 500 mm/s.
   - Leave the other parameters at the default values.

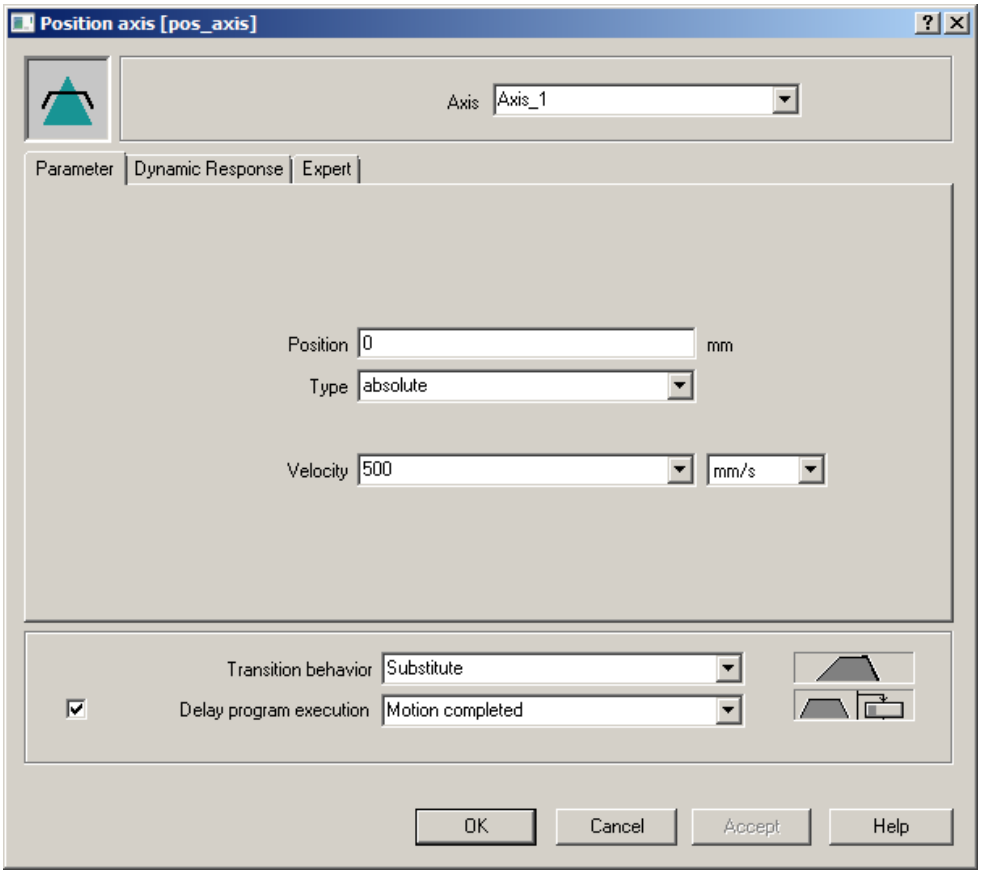

Figure 3-281 MCC chart, position the axis to the starting position

3. Click **OK** to close the window.
   The command is parameterized.

Disable axis

You disable the axis as follows

1. Insert the statement block **Disable axis** into the MCC chart in front of the end node:
   - Click the last block before the end node. The node is marked in blue.
   - Open the **Single axis commands** command group in the **MCC editor** toolbar. Click the **Disable axis** command in the command group.

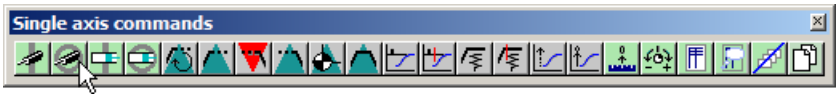

Figure 3-282 MCC editor toolbar, Disable axis command

The **Disable axis** command block is inserted into the MCC chart after the selected block and marked in blue.

2. Parameterize the command:
   - Double-click the inserted **Disable axis** command block in the MCC chart. The **Disable axis** window is displayed.

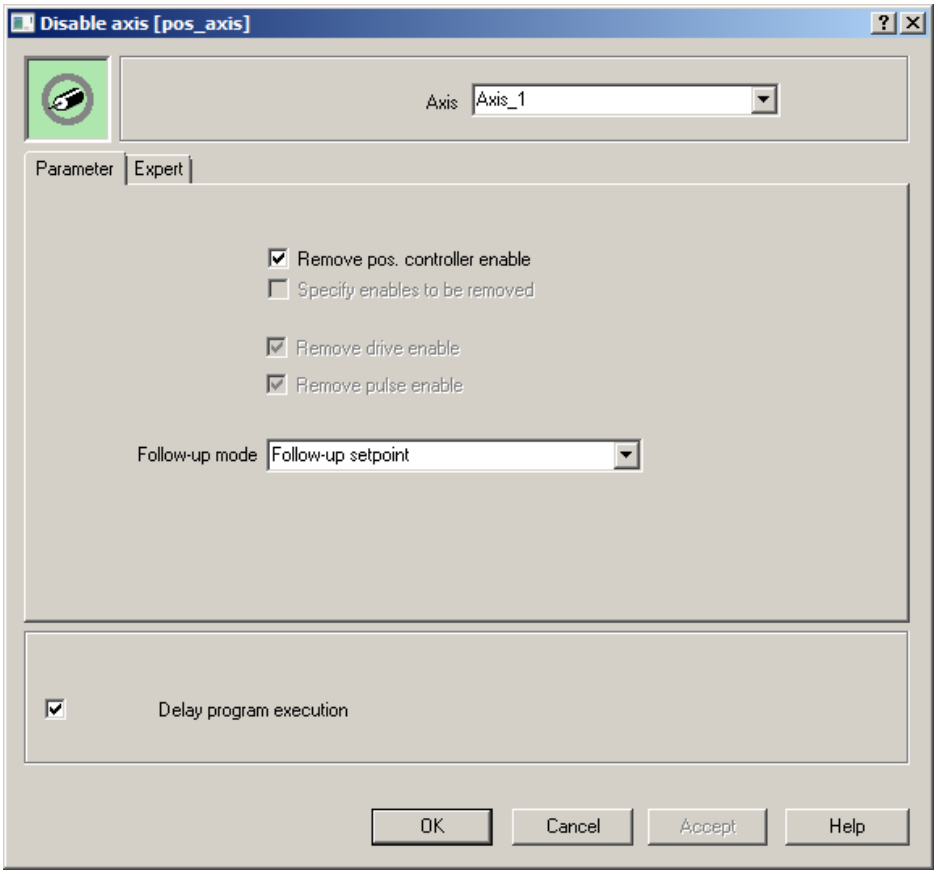

Figure 3-283 MCC chart, Disable axis

   - In the **Axis** field, select the axis that is controlled by the program.

– Leave the other parameters at the default values.

3. Click **OK** to close the window.
   The command is parameterized.

Variable assignment g_bo_start:=false / g_bo_ready:=true

The axis motion is finished. The variable **g_bo_start** is set to FALSE. The variable **g_bo_ready** is set to TRUE.

You assign the value FALSE to the variable g_bo_start as follows

Proceed as for the step Variable assignment g_bo_start:=true (Page 526).

1. Insert the statement block **Variable assignment** into the MCC chart in front of the end node.
2. Assign the value **false** to the variable **g_bo_start** and the value **true** to the variable **g_bo_ready**.
3. Click **OK** to close the window.
   The command is parameterized.

Variable assignment g_bo_ready:=true

The axis motion is finished. The variable **g_bo_ready** is set to TRUE.

You assign the value TRUE to the variable g_bo_ready as follows

Proceed as for the step Variable assignment g_bo_ready:=false / g_bo_start:=true (Page 523).

1. Insert the statement block **Variable assignment** into the MCC chart in front of the end node.
2. Assign the value **true** to the variable **g_bo_ready**.
3. Click **OK** to close the window.
   The command is parameterized.

3.4.13.5 Expanding the MCC sample program: control of the infeed

Program flow

If you are using an infeed with DRIVE-CLiQ interface, the programmed controller must switch on the infeed before the axis commands can then be issued. The program sequence shown below handles this task. The **pos_axis** program created until now must be expanded accordingly.

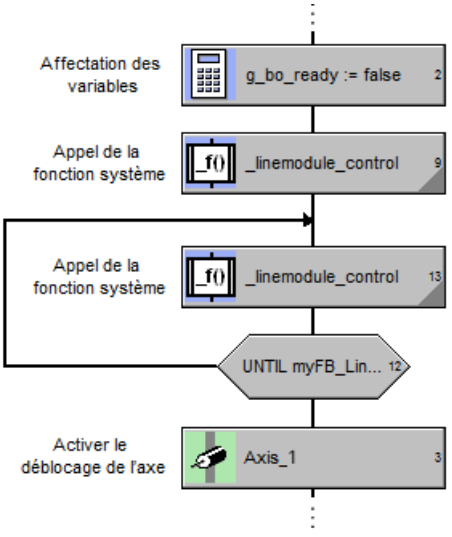
The finished MCC chart

The two times two blocks **_linemodule_control** system function call and **LineModule_STW** variable assignment are located in the MCC chart **pos_axis** before the first command for axis control **Switch axis enable**.

Command group

Single command

MCC chart of the sample program, control of the infeed



The first two blocks before the **UNTIL** loop reset the operating parameters of the infeed to the start values. Without this initialization, it may not be possible to switch the infeed on. In addition, this also acknowledges alarm messages that prevent enabling of the infeed.

The blocks within the **UNTIL** loop switch the infeed on. The loop repeats the switching command until the infeed is ready for operation.

Note

To avoid making excessive demands on the performance of RoundRobin execution level (Background Task, Motion Tasks) in infinite loops, it is better to use a _waitTime(T#0ms) in the loop for active waiting for an event."

System function call _LineModule_control[FB]

You create the system function call _LineModule_control[FB] as follows

1. Insert the statement block **System function call** into the MCC chart:
   - Click the command block **g_bo_start := true**.
     The node is marked in blue.
   - Select the **Basic commands > System function call** command in the **MCC editor** toolbar.

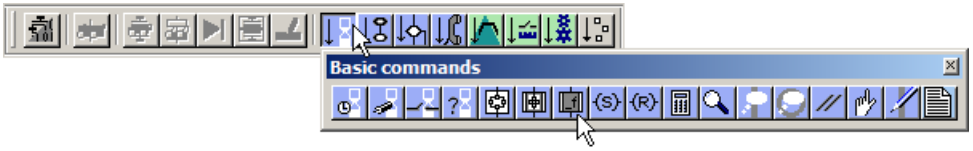


Figure 3-284 MCC editor toolbar, System function call command

The command block is inserted into the MCC chart.

2. Parameterize the function call:
   - Double-click the empty **System function call** command block in the MCC chart.
     The **System function call [pos_axis]** dialog appears.
   - Open the command library. You can find the command library in the screen area of the project navigator as a separate tab.

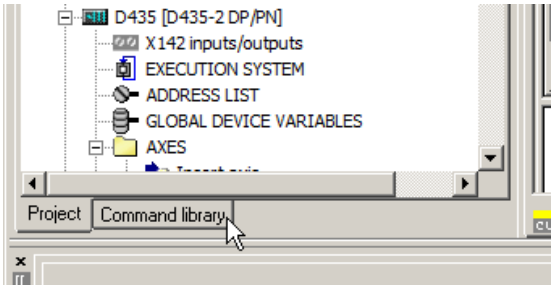

Figure 3-285 Open the command library

   - Go to the **Drives > SINAMICS** branch of the command library.
   - Drag & drop the **_LineModule_control[FB]** function call from the command library to the **System function** field of the **System function call[pos_axis]** window.

3. Define an instance for the system function call:
   – Enter the instance name **myFB_LineControl** in the **Instance** field of the **System function call [pos_axis]** window.
   As soon as you exit the field, e.g. by clicking on another element or with the TAB or RETURN keys, the **Variables declaration** dialog appears. The instance variable **myFB_LineControl** is assigned to the variable type **VAR** as default. The variable is thus valid locally within the program **pos_axis**.

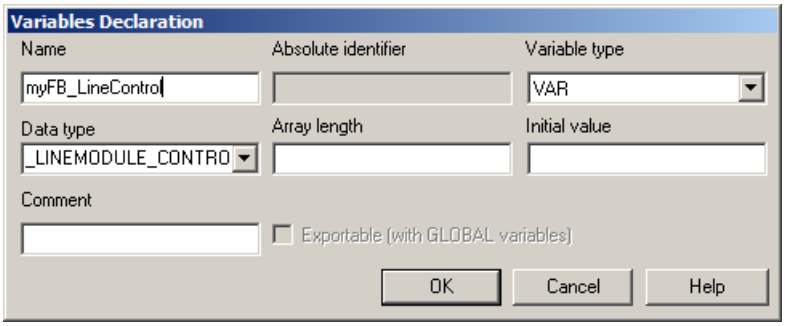

Figure 3-286 Variable declaration of the instance variable myFB_LineControl

Accept the default. Click **OK** to confirm the dialog.

– Set the input variables VAR_INPUT of the instance to the following values. Make use of the convenience of the autocomplete operator function **Ctrl+space bar**:

Variable name	Value	Meaning
reset	true	Reset the infeed
periIn	LineModule_ZSW	Status word of the infeed
typeLM	ACTIVE_LINE_MODULE SMART_LINE_MODULE BASIC_LINE_MODULE	Type of the module to be controlled depending on the infeed used
periOut	LineModule_STW	Control word, sequence control infeed

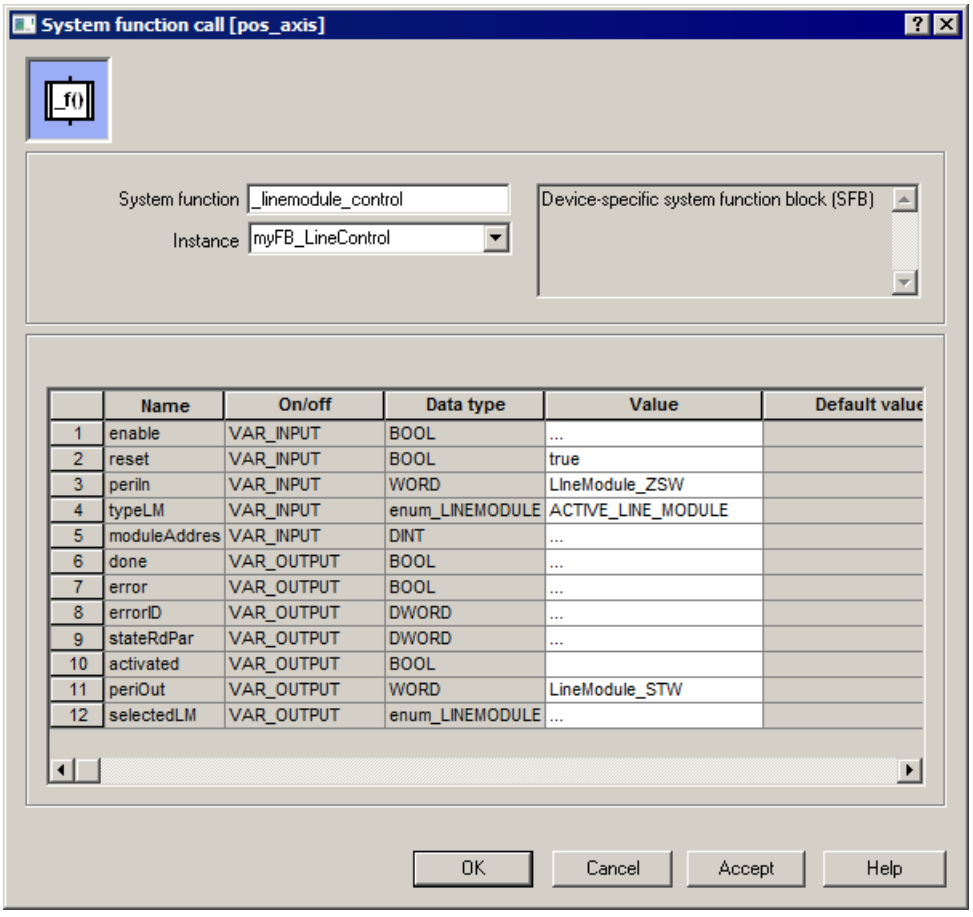

Figure 3-287 MCC chart, system function call _linemodule_control

4. Confirm with **OK**. The command is parameterized.

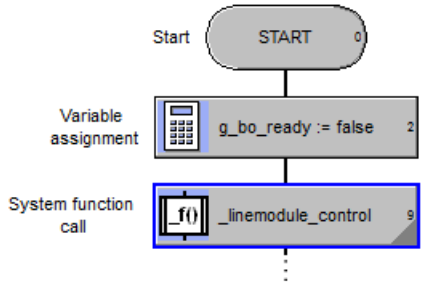

Figure 3-288 MCC chart, executed variable assignment _linemodule_control

Variable assignment LineModule_STW:=myFB_LineControl.periOut

You assign the myFB_LineControl.periOut variable to the LineModule_STW variable as follows

1. Create a **Variable assignment** block after the **System function call** block.
2. Assign the **myFB_LineControl.periOut** variable to the **LineModule_STW** I/O variable. You can use autocomplete or drag & drop in both **Variable** and **Expression** fields.

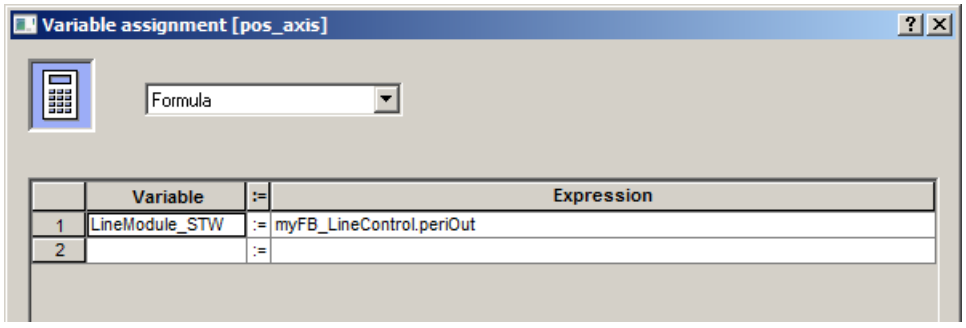

Figure 3-289 MCC chart, variable assignment LineModule_STW:=myFB_LineControl.periOut

3. Click **OK** to close the window.
   The command is parameterized.

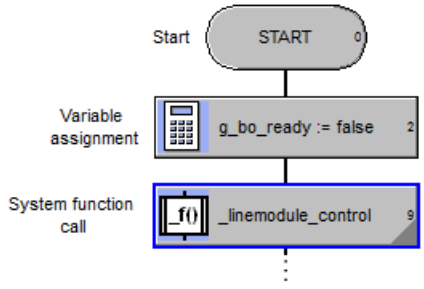

Figure 3-290 MCC chart, system function call and variable assignment

Create UNTIL loop

You create the UNTIL loop as follows

1. Click the connecting line between the blocks **System function call** and the subsequent axis command **Switch axis enable**.
   The reference point is marked in blue.
2. In the **MCC editor** toolbar, select the command **Program structures > UNTIL: Loop with condition at end**

Figure 3-291 MCC editor toolbar, UNTIL loop

The **UNTIL** block with loop is inserted.

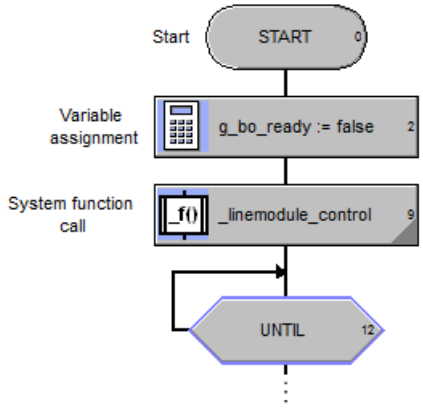

Figure 3-292 MCC editor, UNTIL loop

3. Parameterize the loop condition:
   The loop is to be run through until the infeed is ready for operation.
   - Double-click the UNTIL block. The window **UNTIL: Loop with condition at end[]pos_axis]** opens.
   - Select the value **Formula** in the field at top left.
   - Enter the loop condition in the **Until** field: **myFB_LineControl.activated=TRUE**.
     You can use the autocomplete function **Ctrl+space bar** in this field too.
4. Confirm with **OK**.
   The loop is created and parameterized in the program.

Copy blocks

You copy the statement blocks in the MCC chart as follows

Copy the statement blocks **System function call _LineModule_control[FB]** and **Variable assignment LineModule_STW:=myFB_LineControl.periOut** into the **UNTIL** loop. Use the operator functions **Copy** and **Paste** for this purpose.

1. Mark the blocks:
   - Hold the **Shift** key down.
   - Click the blocks one after the other. Both blocks are edged in blue.
2. Copy the selected blocks to the clipboard:
   - Open the context menu with the right mouse key.
   - Select the **Copy** command in the context menu.

   Or use the **Ctrl+C** key function.
3. Select the target of the copy operation in the MCC chart:
   - Click the connecting line within the **UNTIL** loop. The connecting piece is marked in blue.

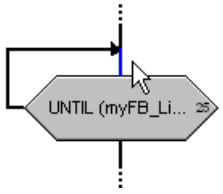

Figure 3-293 MCC chart, mark the UNTIL loop internal area

4. Insert the copied blocks at the target position:
   - Open the context menu again with the right mouse key.
   - Select the **Paste** command in the context menu.

   Or use the **Ctrl+V** key function.
   The blocks are inserted within the loop.

Adapt the system function call _linemodule_control

You change the system function call _linemodule_control as follows

The system function call **_linemodule_control** within the **UNTIL** loop switches the infeed on.

1. Open the system function block by double-clicking.
2. Adapt the parameter variables of the **myFB_LineControl** instance as shown below:

Variable name	Value	Meaning
enable	true	Switches the infeed on
reset		Empty field. The variable is thus set to **false**
periIn	LineModule_ZSW	Status word of the infeed
typeLM	ACTIVE_LINE_MODULE SMART_LINE_MODULE BASIC_LINE_MODULE	Type of the module to be controlled depending on the infeed used

3. Confirm with **OK**.

3.4.13.6 Create additional MCC programs for the sample project

Handling system events

The execution system that you will set up in the later section Configure execution system (Page 552) requires two further MCC programs:

- technology_fault
- peripheral_fault

These programs are used for handling system events. Handling is generally necessary. If a system event occurs that is not handled by the user program, the CPU goes to the STOP mode.

Within the scope of the sample project, no specific handling of system events is necessary. The programs technology_fault and peripheral_fault therefore remain empty.

You create the MCC programs technology_fault and peripheral_fault as follows

1. Create the MCC unit **fault**.
   Open the **PROGRAMS** folder under the SIMOTION device in the project navigator. Double-click **Insert MCC unit**. Assign the name **fault** to the MCC unit.
2. Create the MCC chart **technology_fault**.
   Open the MCC unit **fault** in the **PROGRAMS** folder. Double-click **Insert MCC chart**. Assign the name **technology_fault** to the MCC chart. Select the creation type **Program**.
   The program remains empty.

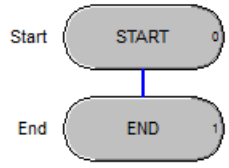

Figure 3-294 Empty program technology_fault

3. Create the MCC chart **peripheral_fault** within the MCC unit **fault**.
   This program also remains empty.

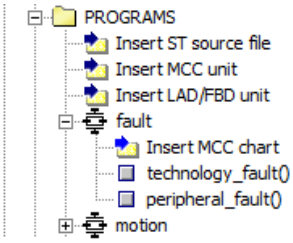

Figure 3-295 MCC programs technology_fault and peripheral_fault in the MCC unit fault

3.4.13.7 Back up MCC sample programs

Back up the created MCC programs.

To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.

Additional information

As an alternative to the command **Save project and compile changes**, you can find the command **Accept and compile** in the **MCC editor** toolbar.

This command compiles the currently selected program as well as all other programs of the same unit.

However, the command does not save the changes.

You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

3.4.13.8 LAD/FBD ladder logic/function block diagram

The LAD and FBD programming languages

LAD (ladder logic)

LAD stands for ladder logic. LAD is a graphical programming language. The syntax for the instructions is similar to a circuit diagram. LAD enables simple tracking of the signal flow between conductor bars via inputs, outputs and operations. The LAD statements comprise elements and blocks that are connected graphically to form networks. LAD operations follow the rules of Boolean logic.

FBD (function block diagram)

FBD stands for function block diagram. FBD is a graphical programming language. To represent the logic relationships, it uses the logic boxes familiar from Boolean algebra. In addition, complex functions (e.g. mathematical functions) can be represented directly in conjunction with the logic boxes.

System in SIMOTION SCOUT

The **PROGRAMS** folder under the SIMOTION device contains the LAD/FBD units created in the project.

A LAD/FBD unit contains the LAD/FBD programs that are to run on the SIMOTION device. A LAD/FBD unit can contain several LAD/FBD programs.

"LAD/FBD program" is a collective term for different program organization units (POE).

A POE can be a program, a function, or a function block. The type of the POE is indicated in the project navigator by an icon:

- Program
- Function
- Function block

Program creation steps

Creation of a LAD/FBD program encompasses the following steps:

1. Creating a LAD/FBD unit.
2. Creating a LAD/FBD program in the LAD/FBD unit.
3. Inserting LAD/FBD commands in the LAD/FBD program and parameterizing the commands.
4. Saving and compiling the LAD/FBD program.

Switching the programming language

SIMOTION SCOUT TIA allows simple switching between ladder logic and function block diagram. The LAD/FBD editor contains the command **LAD/FBD program > Switch to FBD** or **Switch to LAD**.

Create LAD/FBD unit

You create the LAD/FBD unit **bg_out** for the sample project as follows.

You create a LAD/FBD unit in the project as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator. Double-click **Insert LAD/FBD unit**. The **Insert LAD/FBD unit** window appears.
2. Enter the name **bg_out** for the unit.
3. Go to the **Compiler** tab. For diagnostics purposes, activate the option **Permit program status**. In this way, you can monitor program execution later in online mode.
4. Confirm with **OK**.
   The LAD/FBD unit is created.
   – The LAD/FBD unit **bg_out** appears in the **PROGRAMS** folder.

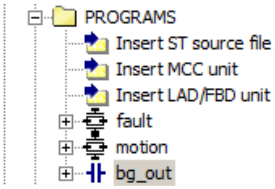

Figure 3-296 MCC and LAD/FBD units in the PROGRAMS folder

   – In the working area of the workbench, the declaration table of the unit opens. The variables declared there apply within the LAD/FBD unit and can be linked in other units. No other variable declaration is required for the sample project. You have already created the necessary variables as global device variables in the symbol browser.

Create LAD/FBD program

You create the LAD/FBD program **LAD_1** within the LAD/FBD unit **bg_out** as follows.

You create a LAD/FBD program in a LAD/FBD unit as follows

1. Open the **PROGRAMS** folder under the SIMOTION device in the project navigator.
2. Open the LAD/FBD unit **bg_out** in the **PROGRAMS** folder. Double-click **Insert LAD/FBD program**. The **Insert LAD/FBD program** window appears.
3. Enter the name **LAD_1**. The name must be unique throughout the project.

4. Select the creation type **Program**.

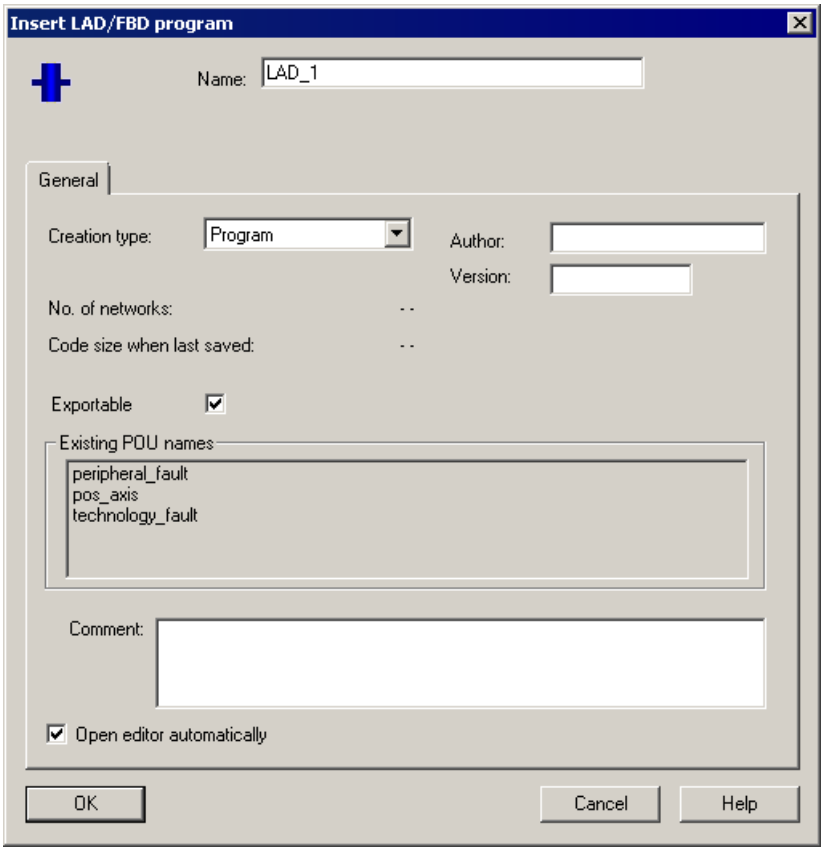

Figure 3-297 Insert LAD/FBD program

5. Confirm with **OK**.
   The LAD/FBD program **LAD_1** is created in the project.
   – The LAD/FBD program appears in the **PROGRAMS** folder.

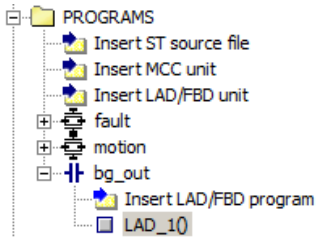

Figure 3-298 LAD program LAD_1 in the PROGRAMS folder

   – The LAD/FBD editor is opened in the working area of the workbench. You can start programming.

Creating a LAD sample program

You write the LAD program **LAD_1** for the sample project.

In this program, the global device variables **g_bo_start** and **g_bo_ready** are read cyclically, and the I/O variables **q_bo_output0** and **q_bo_output1** are set accordingly.

Transfer of the program status to the digital outputs DO 0 and DO 1 could also be programmed direct in the MCC chart **pos_axis**. However, Getting Started implements the assignment in an autonomous LAD program to introduce you to LAD programming.

You create the LAD program LAD_1 for the sample project as follows.

1. Open the LAD/FBD program if it is not already visible in the working area of the workbench.
   For this purpose, double-click the LAD/FBD program under the LAD/FBD unit in the **PROGRAMS** folder of the project navigator.
   In the sample program, the empty LAD/FBD program **LAD_1** is already open.

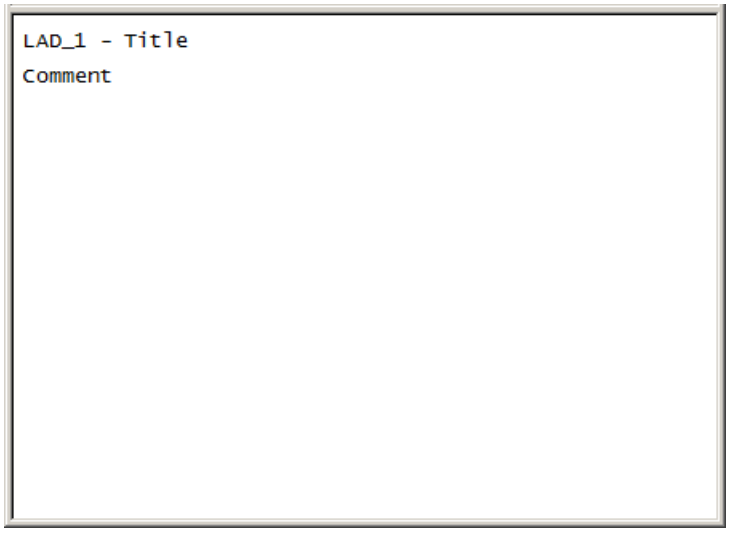

Figure 3-299 Empty LAD program following first-time creation in the LAD/FBD unit

2. Insert a network:
   – Click **Insert network** in the LAD/FBD toolbar.

   The **001** block with a coil is inserted.

3. Insert an NO contact in front of the coil:
   – Select the coil.

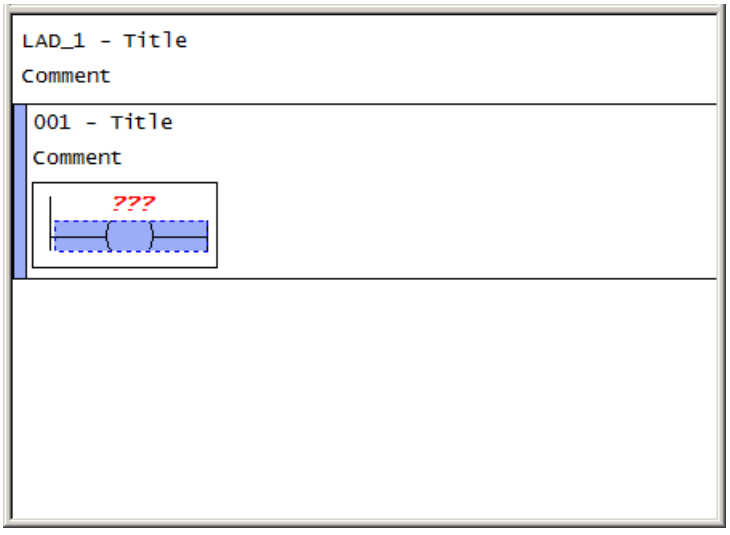

Figure 3-300 LAD program, selected coil

   – Click **NO Contact** in the toolbar.

   The NO contact is inserted in front of the coil.

4. Assign the **g_bo_start** variable to the NO contact and the **q_bo_output0** variable to the coil:
   – Click above the symbols for NO contact and coil on **???**.

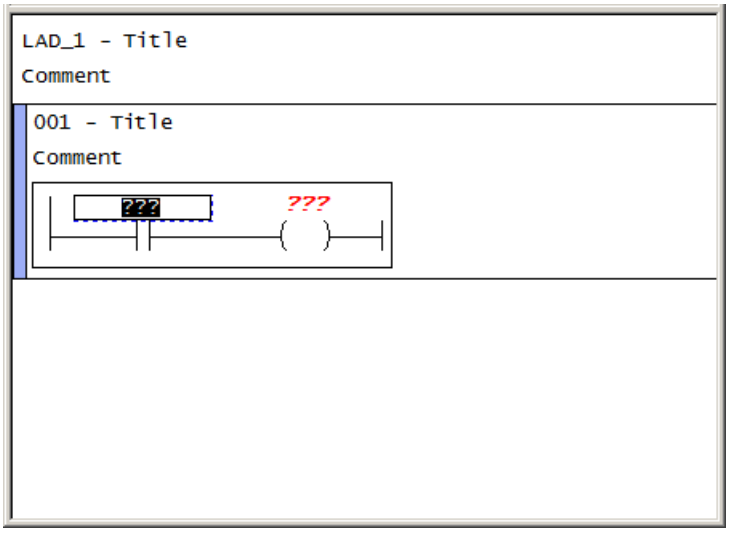

Figure 3-301 LAD program, opened field for entering the variable name

   – Transfer the variable names from the symbol browser or the ADDRESS LIST by dragging and dropping. Or use the Autocomplete function. Use RETURN to confirm each entry.

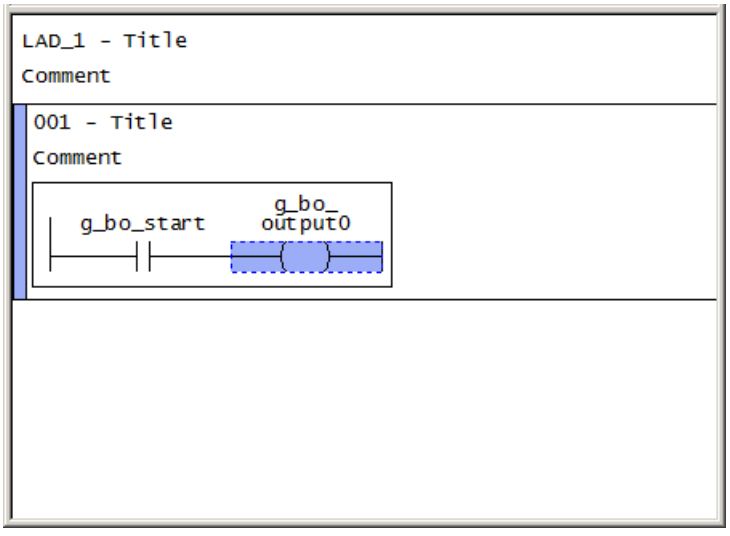

Figure 3-302 LAD program with inserted variables

5. Insert a network **002**:
   – Click the block **001** to select the block.
   A selected block has a blue background on the left edge.
   – Click **Insert network** in the LAD/FBD toolbar.
   The block **002** is inserted after the block **001**.

6. Insert an NO contact in front of the coil in network **002**.
7. Assign the **g_bo_ready** variable to the NO contact and the **q_bo_output1** variable to the coil. The LAD program is finished.

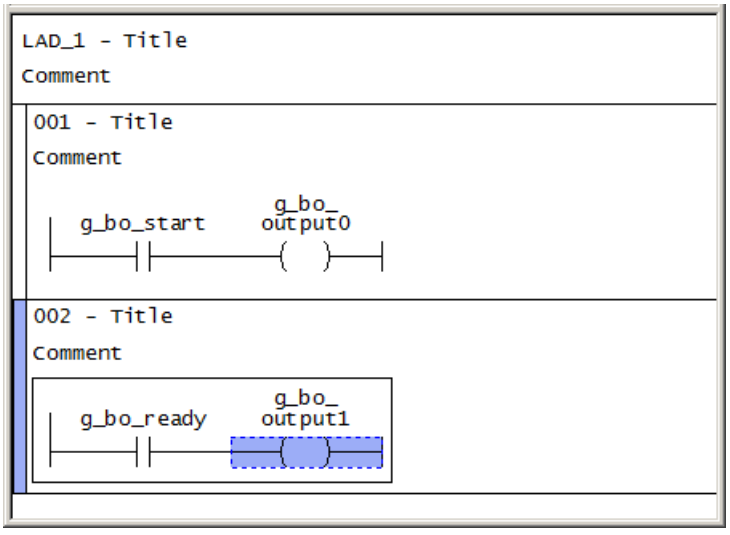

Figure 3-303 Finished LAD program LAD_1

Back up LAD/FBD sample program

Back up the created LAD/FBD sample program.

To do so, click in the toolbar on the **Save project** or **Save project and compile changes** button.

Additional information

As an alternative to the command **Save project and compile changes**, you can find the command **Accept and compile** in the **LAD/FBD toolbar**.

This command compiles the currently selected program as well as all other programs of the same unit.

However, the command does not save the changes.

You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

3.4.13.9 Further programming options

SIMOTION SCOUT TIA provides other programming languages in addition to MCC and LAD/FBD.

- **ST (Structured Text)**
  ST is a text-based, PASCAL-based programming language. The language is based on the international standard IEC 61131-3. This standard harmonizes the programming languages for programmable logic controllers (PLC). ST is based on the Structured Text part of this standard. In addition to the standardized programming language in accordance with IEC 61131-3, SIMOTION ST features technological commands.
  An easy-to-use text editor is provided for creating programs. The ST compiler compiles the edited program into executable code and indicates every syntax error, specifying the program line and the cause of the error.
  In the Command library tab of the project navigator, the commands and functions required for programming are shown in a tree. You can use these in all programming languages, e.g. when programming.

  Note

  In SIMOTION SCOUT V4.5 and higher, ST can also be used as a language for object-oriented programming. Further information can be found in the SIMOTION SCOUT Online Help and in the SIMOTION ST Structured Text Programming and Operating Manual.

- **Libraries**
  Libraries allow modular software development and provide you with user-defined data types, functions, and function blocks that you can use from all SIMOTION devices.
  Libraries can be written in all programming languages and used in all program sources (e.g. ST units, MCC units).

All programming languages enable you to structure the application using programs, functions and function blocks so that the application is manageable and re-usable.

To test the programs, there are comprehensive test functions available to you with program status and breakpoints in all languages. You can visualize and test your programs online.

For further information on programming languages, please refer to the respective manuals.

3.4.13.10 Result in the sample project

You have created the programs required for program-controlled traversing of the axis in the sample project of Getting Started.

3.4.14 Configure execution system

3.4.14.1 Overview

Aim of Getting Started

In this part of Getting Started, you get to know the SIMOTION execution system.

You assign the sample project programs to the tasks of the execution system. You thus transfer the programs from the SIMOTION SCOUT TIA engineering system to the SIMOTION runtime system. The programs control the system as soon as the operating mode of the SIMOTION device is switched to RUN.

Requirements

You have created the programs pos_axis, technology_fault, peripheral_fault, and LAD_1 for the sample project, see the section Programming the SIMOTION application (Page 512).

Execution levels and tasks

Execution levels define the chronological sequence of tasks in the execution system. A level can contain several tasks. The tasks provide the framework for program execution. A task may comprise several programs. By assigning the created programs to the tasks, you can, for example, define the priority, the time frame or the order in which the programs are to be executed.

3.4.14.2 Assign programs to tasks

Below you will assign the sample project programs to the tasks of the execution system.

Table 3-37 Assignment of programs to tasks

Programs of the sample project	Tasks
pos_axis	MotionTask_1
lad_1	BackgroundTask
technology_fault	TechnologicalFaultTask
peripheral_fault	PeripheralFaultTask

You assign programs to tasks in the execution system as follows

1. Double-click in the project navigator under the SIMOTION device on **EXECUTION SYSTEM**.
   The **EXECUTION SYSTEM** window appears in the working area.
2. Assign the MCC program **motion.pos_axis** to the task **MotionTask_1**:
   – In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > MotionTasks > MotionTask_1**.

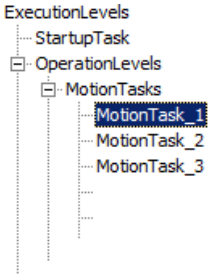

Figure 3-304 Execution system, tree view of the execution levels and tasks

The **MotionTasks** window appears on the right of the working area. The programs **pos_axis** and **LAD_1** as well as auxiliary programs of the **fault** unit are visible on the **Program assignment** tab under **Programs**.

– Select the MCC program **motion.pos_axis** and click the **>>** button. The program is displayed under **Programs used**. It is thus assigned to the task **MotionTask_1**.

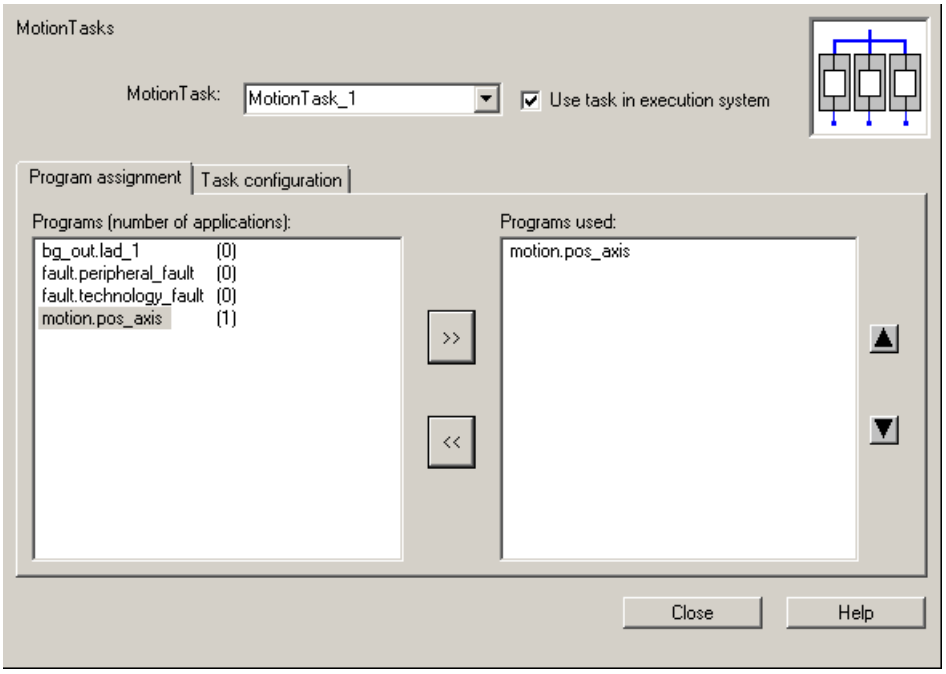

Figure 3-305 Execution system, MotionTasks window

The assignment is visible in the tree of the execution system. The program **motion.pos_axis** appears below the branch **MotionTask_1**.

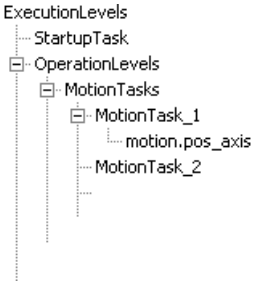

Figure 3-306 Execution system, MotionTask_1 with assigned program pos_axis

– Activate the checkbox **Activation after StartupTask** in the **Task configuration** tab. This executes the MCC program immediately after the SIMOTION device is started. If this checkbox is not activated, the program must be started explicitly by the call from another program that is assigned to the StartupTask or another active task.

3. Assign the LAD program **bg_out.kop_1** to the task **BackgroundTask**:

   – In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > BackgroundTask**. Assign the LAD program **bg_out.kop_1** to this task.

4. Assign the error handling routines:
   - In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > SystemInterruptTasks > TechnologicalFaultTask**. Assign the MCC program **fault.technology_fault** to this task.
   - In the tree of the execution system, select the branch **ExecutionLevels > OperationLevels > SystemInterruptTasks > PeripheralFaultTask**. Assign the MCC program **fault.peripheral_fault** to this task.
5. Click **Close**. Confirm with **Yes** if you are prompted to save.
   The execution system is configured.

Loading the configured execution system to the target system

Save and compile the project. Go online. Download the sample project with the configured execution system to the target system.

3.4.14.3 Download the configured execution system to the target system

Download the sample project with the configured execution system to the target system.

Steps

1. Save project and compile changes
2. Establish the online connection
3. Download the project to the target system

Save and compile changes

Click in the toolbar on the **Save project and compile changes** button.

Establish the online connection

Click in the toolbar on the **Connect to selected target devices** button.

Download to target system

Click in the toolbar on the **Download project to target system** button.

3.4.14.4 Result in the sample project

Configuring the axis control is thus completed:

- You have set up an axis in the sample project.
- You have created a program for traversing an axis, as well as other programs that are necessary for operation.
- You have assigned these programs to the tasks of the SIMOTION runtime system.

In the following configuring steps, you will start the axis control on the SIMOTION device and monitor the program-controlled axis motion.

3.4.15 Starting and stopping the system

3.4.15.1 Overview

Aim of Getting Started

You switch the SIMOTION CPU of the sample project to the RUN mode to start execution of the **pos_axis** program. You can see on the hardware that the axis rotates twice for approximately 4 seconds. After execution of the program, switch back to the STOP state.

You switch the operating mode in the dialog **Control Operating Mode**.

Requirements

- You have created the programs pos_axis, technology_fault, peripheral_fault and LAD_1 for the sample project, and you have assigned them to the tasks of the SIMOTION execution system, see the sections Programming the SIMOTION application (Page 512) and Configure execution system (Page 552).
- The project has been compiled and downloaded to the target system, see the section Download the configured execution system to the target system (Page 556).
- SIMOTION SCOUT TIA is in online mode.

3.4.15.2 RUN and STOP operating modes

Operating modes

In the SIMOTION SCOUT TIA dialog **Control Operating Mode**, you can switch a SIMOTION CPU to the RUN or STOP mode.

RUN mode

SIMOTION executes the user program and the associated system services:

- Read process image input
- Execution of the user programs assigned to the execution system
- Write process image output

The technology packages are active in this state. They can execute commands from the user program.

STOP mode

SIMOTION does not process any user program.

- It is possible to load a complete user program.
- All system services (communication, etc.) are active.
- The I/O modules are in a secure state. (that is, for example, the digital outputs are at "LOW level" and the analog outputs are de-energized)
- The technology packages are inactive, that is, all enables are deleted. No axis motions can be executed.

You can find the full description of the operating states in the online help under **SIMOTION device: Operating mode**.

3.4.15.3 Mode selector switch on the software side and the hardware side

Control Operating Mode dialog

The menu command **Target system > Control Operating Mode** or the button **Control Operating Mode** in the toolbar of the workbench open the dialog **Control Operating Mode**.

The dialog lists all configured CPUs. The **State** column shows the current operating mode. The assigned switches in the **Control** column switch the CPU to the RUN or STOP mode. The switches are deactivated when the CPU is in offline mode.

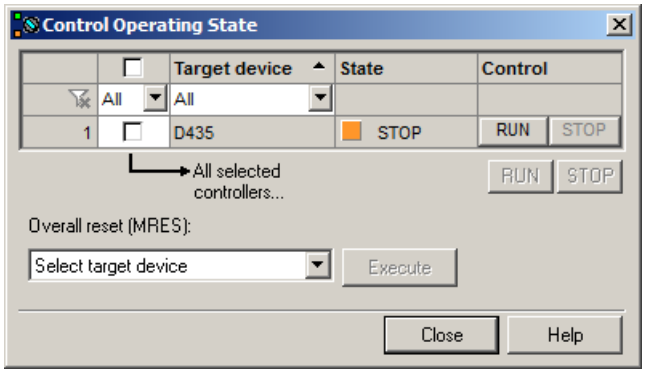

Figure 3-307 Control Operating Mode dialog

Priority of the mode selector switch on the SIMOTION device

The setting of the mode selector switch on the SIMOTION device has priority. SIMOTION SCOUT TIA can switch a SIMOTION device to the RUN operating mode only if the mode selector on the device is set to 0 (RUN).

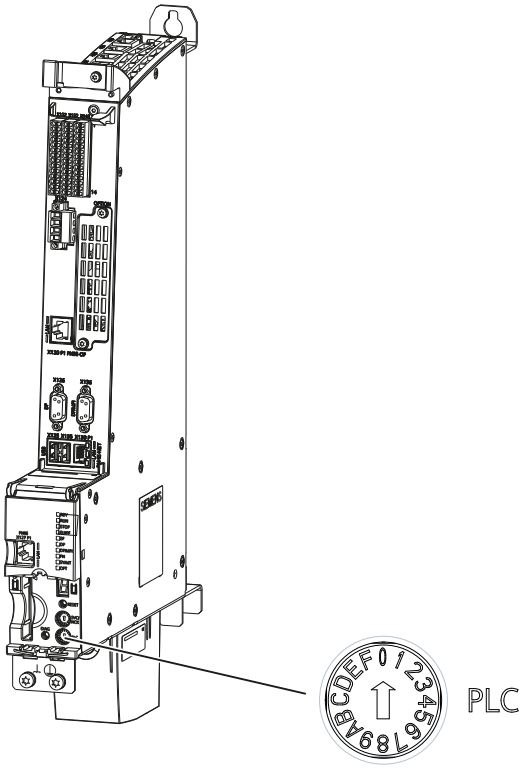

Figure 3-308 Mode selector switch of the SIMOTION D435-2, switch position 0 (RUN)

You can find detailed information on the mode selector switch of the SIMOTION D4x5-2 devices in the Manuals and Commissioning Manuals, as well as in the online help.

3.4.15.4 Start program control of the sample project

You start the axis control of the sample project on the SIMOTION device as follows

⚠ **WARNING**
Danger to life through unexpected machine movement
Make sure this presents no hazard to personnel or property.

1. Open the **Control Operating Mode** dialog. To do so, click **Control Operating Mode** in the toolbar.

2. Switch the SIMOTION CPU of the sample project to the RUN mode. To do so, click the assigned **RUN** switch in the **Control** column of the **Control Operating Mode** dialog.
   The axis starts to rotate immediately. The axis returns to a standstill after approximately 8 seconds.
   The SIMOTION device remains in RUN mode after execution of the **pos_axis** program.
3. Switch the SIMOTION device to STOP mode. To do so, click the assigned **STOP** switch in the **Control** column.

Note

If you want to traverse the axis again, acknowledge all alarms in the "Alarms" window.

3.4.16 Monitor the application

3.4.16.1 Overview

Aim of Getting Started

In this part of Getting Started, you monitor the program-controlled axis motion.

- You monitor program execution.
- You monitor the values in the symbol browser.
- You compile certain values in a watch table.
- You record the course of the axis motion with the trace.

Requirements

- You have created the programs pos_axis, technology_fault, peripheral_fault and LAD_1 for the sample project, and you have assigned them to the tasks of the SIMOTION execution system, see the section Configure execution system (Page 552).
- The project has been compiled and downloaded to the target system, see the section Download the configured execution system to the target system (Page 556).

- SIMOTION SCOUT TIA is in online mode.
- Operating mode of the SIMOTION device:
  - The SIMOTION device of the sample project has been switched to the STOP mode on the software side. The SIMOTION SCOUT TIA mode selector switch, **Control Operating Mode** dialog, shows the STOP mode.
  - The SIMOTION device of the sample project has been switched to the RUN mode on the hardware side. The mode selector switch on the SIMOTION device is at position **0** (RUN).

3.4.16.2 Monitoring program execution

SIMOTION SCOUT TIA provides several functions for monitoring program execution.

In the sample project, you use the function **Monitor**. With this function, you can track execution of the command blocks in an MCC chart. The currently executed command block is shown against a yellow background in the chart. The marking runs at the same speed as the actual program execution. The marking is therefore only visible with the "slow" commands that wait for the machine to implement the command.

You monitor the execution of the commands in the MCC chart pos_axis as follows

1. Open the **Control Operating Mode** dialog.

   The SIMOTION device must be in **STOP** mode.
2. Open the MCC chart **pos_axis**.
3. Switch the monitoring function on:
   - To do so, select the command **MCC chart > Monitor** in the menu bar of the workbench. The function is switched on if a checkmark is visible next to the menu item.
   - Or click in the **MCC editor** toolbar on **Monitor**.

4. Start program control: Switch the SIMOTION device to the **RUN** mode in the **Control Operating Mode** dialog box.
   The **pos_axis** program is run through once. The currently executed command block is shown against a yellow background.

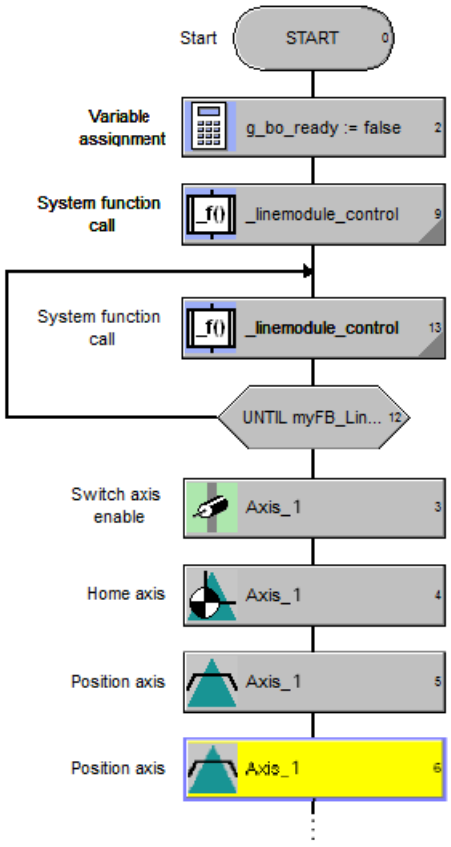

Figure 3-309 Monitor the program execution of the MCC chart pos_axis

5. Switch the SIMOTION device to **STOP** mode in the **Control Operating State** dialog box.

Further information

You can find further information on program monitoring in the online help under **Monitoring program execution**.

3.4.16.3 Monitoring variables

In the symbol browser, you can monitor variables (read out status value) or assign values to them (assign control values).

For the sample project, you monitor the actual position of the axis during the program run.

Monitor variables in the symbol browser

1. In the **AXES** folder of the project navigator, select the axis created in the sample project. The system variables and configuration data of the axis are displayed on the **Symbol browser** tab of the detail view.
2. Open the system variable **positioningstate.actualposition** (actual position of the axis) in the symbol browser.
   You find the variable as follows:
   - Filter the list: You can specify a filter criterion in the filter line of the symbol browser. The last 5 criteria are saved and can be selected for re-use.
     Enter a suitable filter term, for example, **positioningstate**, in the filter line. Press **RETURN** to confirm.
   - Search for variable: As an alternative to the filter function, you can search for the variable. Select the menu command **Edit > Find**. Enter a suitable search term in the **Find** dialog box, for example, **positioningstate**. Click **Find next**.

   The actual position of the axis is displayed in the **Status value** column of the symbol browser.
3. Start the program control via the dialog box **Control Operating Mode**. The program is run through once. During this time, the changing values of the actual axis position are displayed in the symbol browser.
   After the program has completed this run, the SIMOTION device is in the RUN state.
4. Switch the SIMOTION device to STOP mode in the **Control Operating State** dialog box.

Monitoring variables in watch table

Different variables, even of several devices, can be combined into a table in order to monitor them at the same time.

To add a variable to a watch table, you must first create a watch table.

Proceed as follows:

1. In the project navigator under **MONITOR**, double-click on the entry **Insert watch table** and confirm your configuration.
2. In the symbol browser, right-click on the variable you want to add to the watch table. Select the **Add to watch table** command in the shortcut menu.
   The selected variable is displayed in the table. In this way, you can add further variables to the watch table and monitor them.

You open a watch table as follows

You will find all created watch tables in the **MONITOR** folder of the project navigator. Double-click a watch table to open it.

You can find detailed information on this topic in the online help under **Working with the SCOUT Workbench > Working with lists > Watch table**.

3.4.16.4 Recording signals with the trace

Trace

You can use the trace to record and save signal characteristics and variable values. The recorded data can be used, for example, for diagnostics purposes in machine motion sequences, and for troubleshooting in user programs.

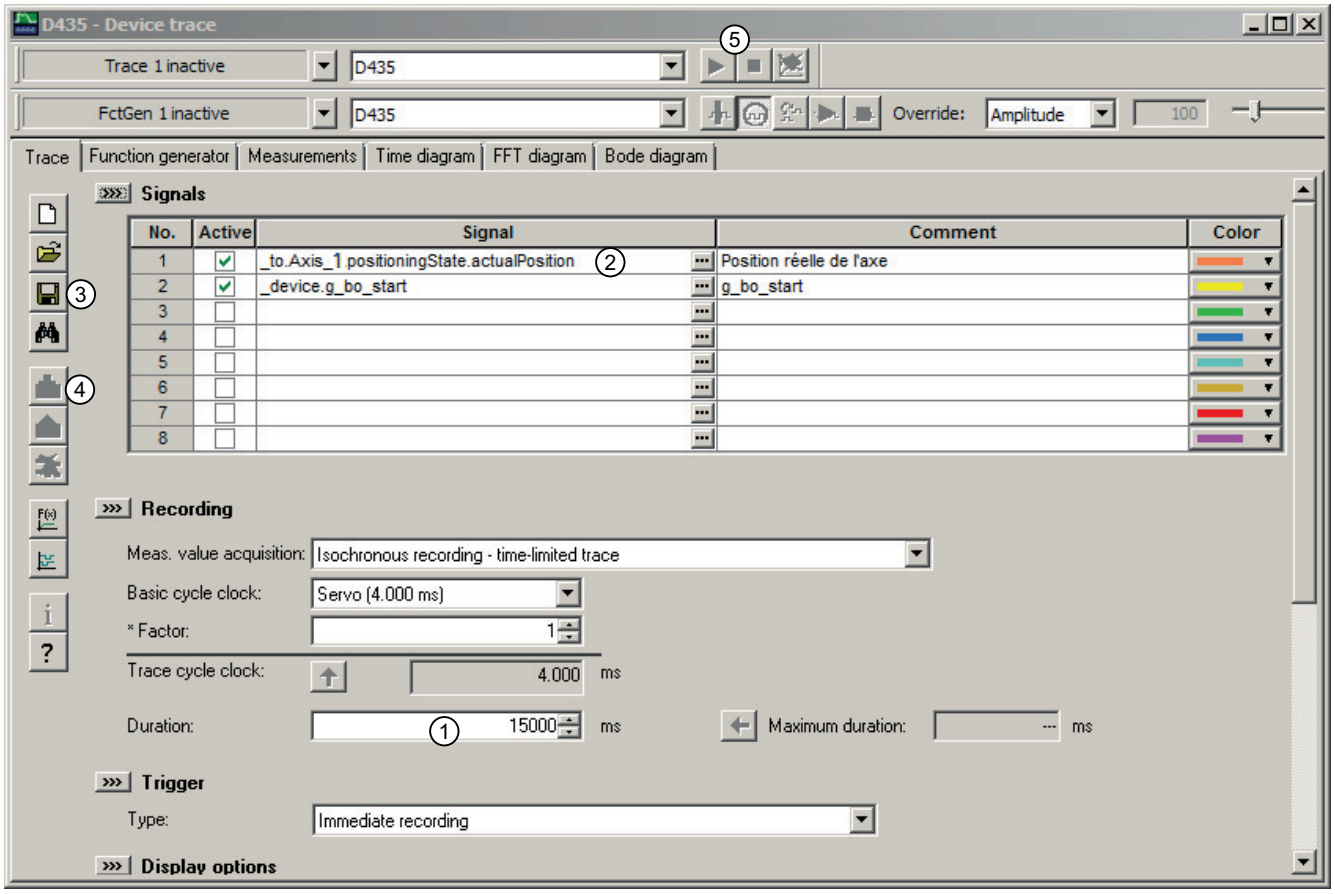
For the sample program, you record the actual position of the axis over time and represent it in the diagram.

Working with the trace

You call the trace as follows

1. Highlight the SIMOTION device in the project navigator.
2. Select the menu command **Target system > Device trace** or click the **Device trace function generator** button in the **Trace toolbar**.

The **Device trace** window appears in the working area.



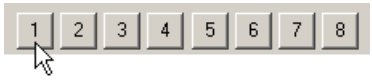
① ... ⑤ Reference is made to the circled digits in the text below.

Figure 3-310 Device trace window

You parameterize the trace for recording as follows

1. In the **Duration** field ① of the **Trace** tab, enter the recording duration 15000 ms.
2. Click the button ... ② in line **No 1** of the **Signals** table.
   The **Trace Signal Selection** window appears.

3. In the tree, select the branch **Sample_1 > (**SIMOTION device, e.g. **D435) > TO > Axis_1 > positioningstate**.
4. Select the system variable **actualPosition** in the variable table.
5. Click the button **1** to accept the system variable for channel 1.



The variable is displayed under **Signal name**.

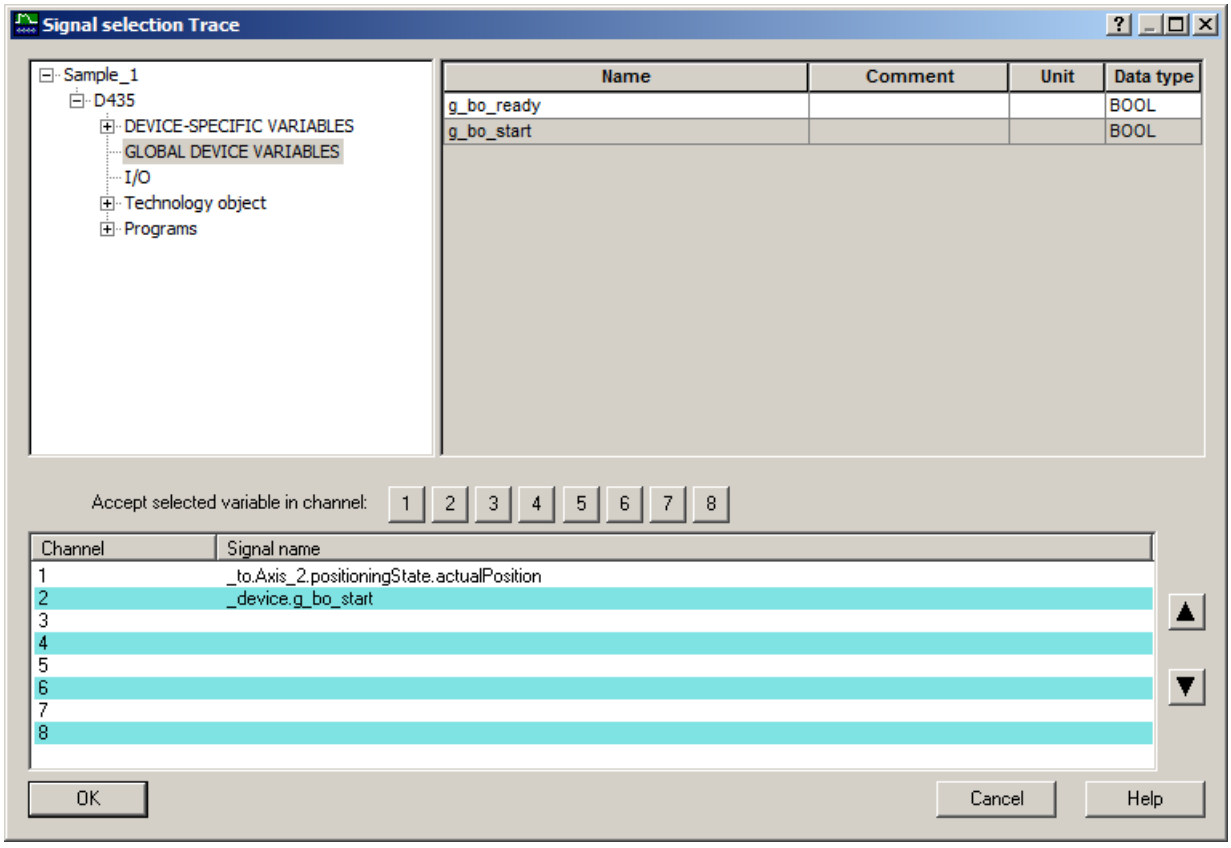


Figure 3-311 Trace signal selection

6. Repeat the channel assignment for the variable **g_bo_start**:
   Select the branch **(Project) > (SIMOTION device) >GLOBAL DEVICE VARIABLES**. Select the system variable **g_bo_start** in the variable table. Click the button **2**.

   Note

   You can also drag & drop the variables from the symbol browser or the watch table to the signal field of the Trace dialog. For how to drag & drop, see Section Variable assignment g_bo_ready:=false / g_bo_start:=true (Page 523).

7. Confirm with **OK**.
   The **Trace Signal Selection** window is closed.
   The trace is now parameterized for recording.

You save the parameterization of the trace as follows

The trace parameterization is not saved in the project data. When you close the project, the trace parameterization is deleted.

To save the parameterization, click the **Accept in catalog** button ③ on the **Trace** tab. In the **Catalog entry** field, enter the name under which the setting/parameterization is to be saved in the catalog of the trace.

You record with the trace as follows

1. Go online.
2. Download the parameterization of the trace to the target system:
   - Click the **Download parameterization** button ④ on the **Trace** tab.

     
   - Click **OK** to confirm the dialog that appears following successful downloading.
3. Open the **Control Operating Mode** dialog.

   

   The SIMOTION device must be in **STOP** mode.
4. Open the **Time diagram** tab in the **Device trace** window.

5. Start recording of the trace:
   - Click **Trace start**⑤ in the **Device trace** window.

     

   - Then immediately switch the SIMOTION device to the RUN mode in the **Control Operating Mode** dialog box.

   The program is started. The actual position of the axis is recorded and represented in the time diagram. After expiry of the recording duration, the signal profile of the actual position is displayed.

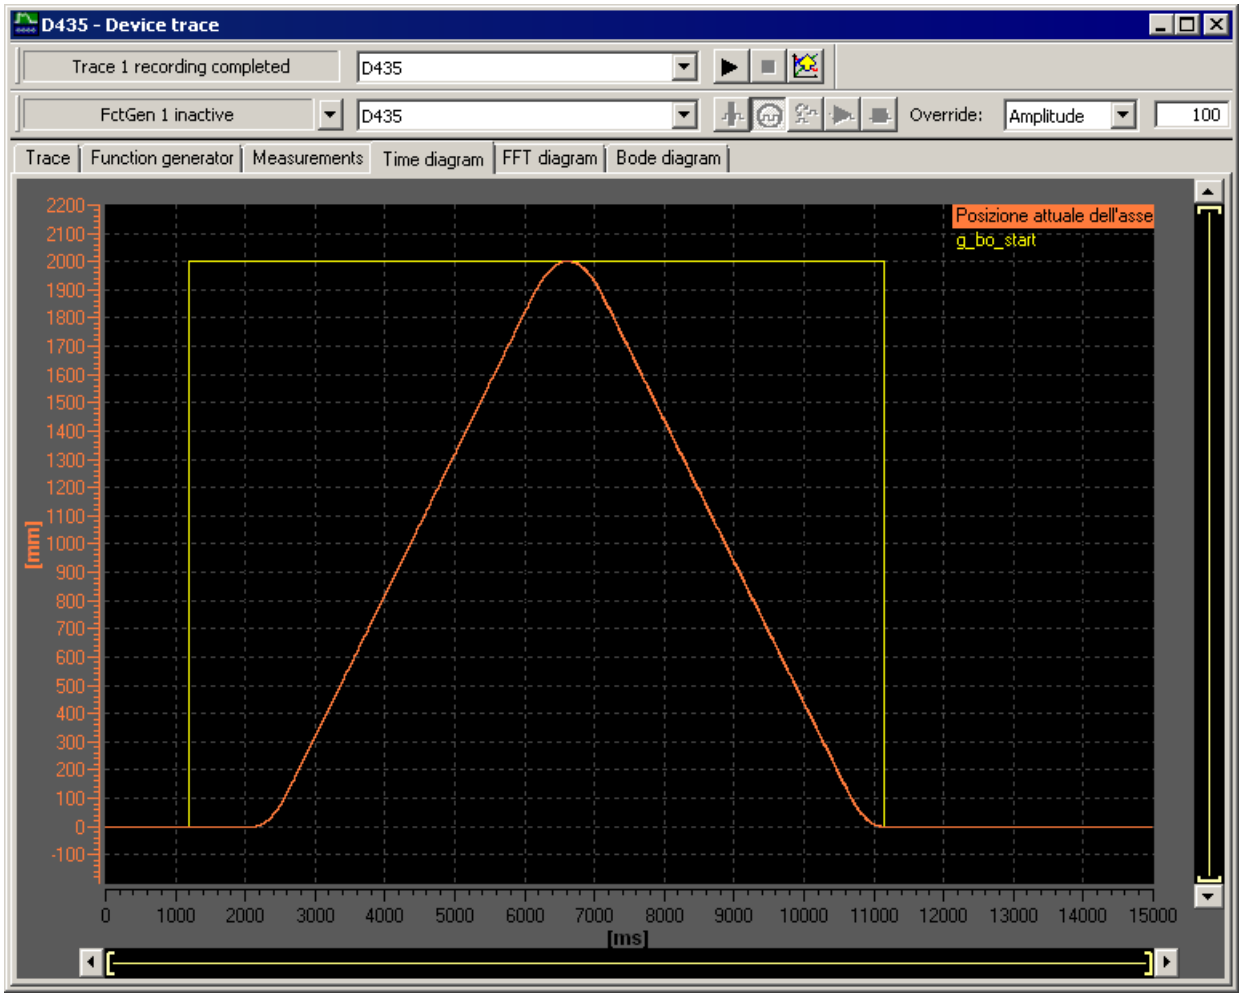

Figure 3-312 Time diagram of the axis

6. If the recorded curve is only partially displayed, select the menu item **Auto-scaling** in the context menu of the time diagram.
7. Switch the SIMOTION device to the STOP mode in the **Control Operating Mode** dialog.

Carrying out several measurements

You can carry out several measurements. They are shown on the **Measurements** tab and can be displayed in the diagram.

You can save and re-open recorded measurements for documentation purposes.

3.4.16.5 Result in the sample project

Creation of the trace time diagram concludes Getting Started.

3.4.17 ESD directives

3.4.17.1 ESD definition

What does ESD mean?

Electrostatic sensitive devices (ESDs) are individual components, integrated circuits, modules or devices that may be damaged by either electrostatic fields or electrostatic discharge.

NOTICE

Damage caused by electric fields or electrostatic discharge

Electric fields or electrostatic discharge can result in malfunctions as a result of damaged individual parts, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber or aluminum foil.
- Only touch components, modules and devices if you are first grounded by applying one of the following measures:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

3.4.17.2 Electrostatic charging of individuals

Any person who is not conductively connected to the electrical potential of the environment can accumulate an electrostatic charge.

This figure indicates the maximum electrostatic charges that can accumulate on an operator when he comes into contact with the indicated materials. These values comply with the specifications in IEC 801-2.

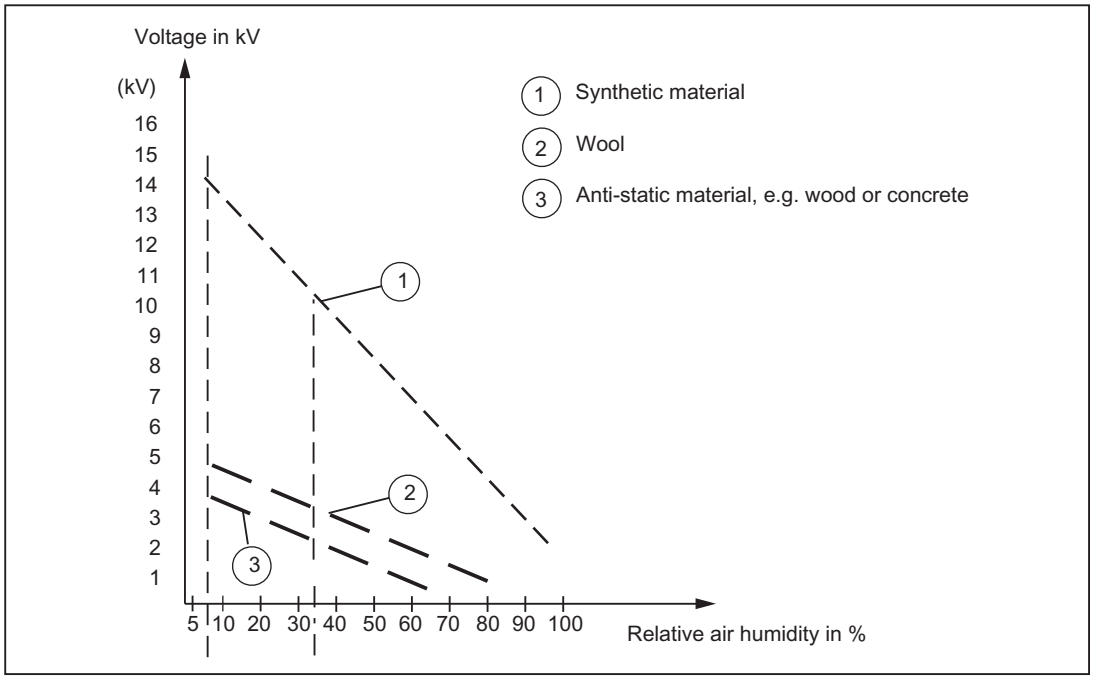

Figure 3-313 Electrostatic voltage that can accumulate on operating personnel

3.4.17.3 Basic measures for protection against discharge of static electricity

Ensure sufficient grounding

When working with electrostatic sensitive devices, make sure that the you, your workstation, and the packaging are properly grounded. This prevents the accumulation of static electricity.

Avoid direct contact

You should only touch ESD components if unavoidable (for example, during maintenance work). When you touch modules, make sure that you do not touch either the pins on the modules or the printed conductors. If you follow these instructions, electrostatic discharge cannot reach or damage sensitive components.

If you have to take measurements on a module, make sure that you first discharge any static that may have accumulated in your body. To do this, touch a grounded metal object. Only use grounded measuring instruments.

3.5 SIMOTION SCOUT TIA

Preface

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT TIA and it comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/de/view/109480700

Additional information

Click the following link to find information on the following topics:

- Documentation overview
- Additional links to download documents
- Using documentation online (find and search manuals/information)

https://support.industry.siemens.com/cs/ww/en/view/109479653

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

https://support.industry.siemens.com/My/ww/en/documentation

Training

Click the following link for information on SITRAIN - Siemens training courses for automation products, systems and solutions:

http://www.siemens.com/sitrain

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT TIA, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

3.5.1 Fundamental safety instructions

3.5.1.1 General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following six steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Electric shock if there is no ground connection

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply

When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage

Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Spread of fire from built-in devices

In the event of fire outbreak, the enclosures of built-in devices cannot prevent the escape of fire and smoke. This can result in serious personal injury or property damage.

- Install built-in units in a suitable metal cabinet in such a way that personnel are protected against fire and smoke, or take other appropriate measures to protect personnel.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Unexpected movement of machines caused by radio devices or mobile phones

The use of radio devices or mobile telephones in the immediate vicinity of the components can result in equipment malfunction. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- If you come closer than around 2 m to such components, switch off any radios or mobile phones.
- Use the "SIEMENS Industry Online Support app" only on equipment that has already been switched off.

⚠ WARNING

Fire due to inadequate ventilation clearances

Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position

The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

⚠ WARNING

Unrecognized dangers due to missing or illegible warning labels

Dangers might not be recognized if warning labels are missing or illegible. Unrecognized dangers may cause accidents resulting in serious injury or death.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, where necessary in the national language.
- Replace illegible warning labels.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions

Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for Safety Integrated functions

If you want to use Safety Integrated functions, you must observe the safety notices in the Safety Integrated manuals.

Malfunctions of the machine as a result of incorrect or changed parameter settings

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

3.5.1.2 Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

3.5.1.3 Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

3.5.1.4 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

3.5.1.5 Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

3.5.1.6 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

3.5.1.7 Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage

3. Hazardous shock voltages caused by, for example:
   – Component failure
   – Influence during electrostatic charging
   – Induction of voltages in moving motors
   – Operation and/or environmental conditions outside the specification
   – Condensation/conductive contamination
   – External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

3.5.2 Introduction

3.5.2.1 Target group and content of the configuration manual

The SIMOTION SCOUT TIA Configuration Manual is a general description of the software for new users and experienced users switching from SIMOTION SCOUT.

To differentiate the two versions from each other, the SIMOTION SCOUT designation refers to SCOUT in the SIMATIC Manager environment and the SIMOTION SCOUT TIA designation to SCOUT in the TIA Portal environment.

At the beginning of each section a note is included that indicates whether each configuration step is performed in the TIA Portal or in SIMOTION SCOUT TIA.

For an overview of the configuration step and its place of execution, refer to section Configuration - Overview.

Not all available software functions are described in this document. For detailed, topic-specific information, refer to the information system of the TIA Portal, the context-sensitive online help of SIMOTION SCOUT TIA, and the corresponding documentation.

Important notes and information on the SIMOTION Motion Control system are described in the following catalog:

- SIMOTION, Equipment for Production Machines, PM 21 Catalog

Note

Getting Started with SIMOTION SCOUT TIA

We recommend that you work through "Getting Started with SIMOTION SCOUT TIA" in the online help or the "SIMOTION SCOUT TIA Getting Started" tutorial. There you find guidelines how you work with SIMOTION SCOUT TIA, for example, how you create a project, compile and save it, insert a SIMOTION device, insert and parameterize a technology object, and how to create a program. When you have worked through all these steps, you will be able to create more complex projects.

Additional references

The "SIMOTION SCOUT TIA Getting Started" tutorial is available at (https://support.industry.siemens.com/cs/ww/en/view/109474299)

3.5.2.2 SIMOTION in the TIA Portal

By integrating the SIMOTION motion control system in the **T**otally **I**ntegrated **A**utomation Portal, Siemens has expanded the efficient engineering framework within the "Integrated Drive System" concept to include another powerful tool. The full range of SIMOTION motion control functions can now also be used in the TIA Portal. All the SIMOTION components can be configured and engineered simply and efficiently using the TIA Portal's intuitive user interface.

This enables the efficient and user-friendly mechanisms of this engineering framework to be used for commissioning, configuring and designing SIMOTION components. That includes, for example, merging of the hardware and network configuration into one consistent editor, thus enabling intuitive and fully graphical configuration and powerful diagnostics of the configured and networked components. In the device view, the SIMOTION CPU is displayed fully graphically with all its interfaces and properties. All the parameters can be selected and modified intuitively. In the network view, further automation components such as the HMI (Human Machine Interface) or drives can be connected to the CPU, and configuration of the PROFINET network topology is just as intuitive.

With SIMOTION SCOUT TIA, configuration is as easy as ever. Not only can you configure telegrams and integrate technology and drive objects, you can also configure automatic communication for distributed synchronous operation between two CPUs.

Figure 3-314 SIMOTION in the TIA Portal

SIMOTION devices in the TIA Portal

As of Version 13 of the TIA Portal, you can also configure SIMOTION devices.

A SIMOTION configuration comprises the following steps:

- Configuring the hardware
- Configuring the technology

The following overview shows which configuration steps you perform in the TIA Portal and which configuration steps you perform in SIMOTION SCOUT TIA:

Configuration steps in the TIA Portal

- Managing a project
- Configuring the hardware
- Saving and compiling the hardware configuration
- Configuring communication
- Creating F-programs

- Integrating HMI
- Set up and test online connection

Configuration steps in SIMOTION SCOUT TIA

- Configure the drive
- Configure the technology (e.g. axis, external encoder)
- Create user programs
- Saving and compiling
- Establishing online/offline connection
- Using diagnostic functions
- Using trace functions

Integration of SIMOTION SCOUT TIA as an option package of the TIA Portal has resulted in the following special features of use:

- You can only start SIMOTION SCOUT TIA from the TIA Portal.
- As soon as you close the TIA Portal, SIMOTION SCOUT TIA is also closed.
- When you switch to SIMOTION SCOUT TIA, you cannot undo the actions you last performed in the TIA Portal.

3.5.2.3 SIMOTION SCOUT TIA Engineering System

Introduction

The SIMOTION motion control system provides not only a range of ready-to-use functions, but can also be individually parameterized and programmed. High-performance tools, which provide optimum support and ease of use for the necessary engineering steps, are required for this.

The SIMOTION SCOUT TIA Engineering System is the environment for the uniform automation of production machines with SIMOTION and integrates into the SIMATIC environment in accordance with TIA (Totally Integrated Automation).

SIMOTION SCOUT TIA provides a uniform, function-oriented view for your automation task and it is also very user-friendly.

The possible SIMOTION applications range from simple, parameterizable, speed-controlled single axes through to complex, mechatronically-coupled and programmable multi-axis machines. Therefore, SIMOTION SCOUT TIA provides views that are adapted to the task, and it can be expanded by additional tools.

SIMOTION SCOUT TIA provides all the necessary tools for the following functions:

- Configuration
- Parameterization
- Programming

- Testing
- Diagnostics

The following tasks are graphically supported with operator guidance:

- Creation of the hardware and network configuration
- Creation, configuration and parameterization of technology objects such as axes, output cams and cams

3.5.2.4 SIMOTION hardware platforms

To meet the complex requirements of machine construction, SIMOTION offers three hardware variants with different performance, packaging formats and expandability options. The basic system characteristics, like the engineering, are identical.

SIMOTION D (Drive-based)

SIMOTION D is a compact, drive-based version of SIMOTION based on the SINAMICS S120 drives family. For SIMOTION D, the SIMOTION runtime environment and the SINAMICS drive software run concurrently on the controller hardware in the SINAMICS S120 packaging format.

SIMOTION P (PC-based)

SIMOTION P is a PC-based, open motion control system from SIMOTION. Control, motion control, and HMI functions are executed together with standard PC applications on the SIMOTION P hardware platform.

SIMOTION P combines the openness of the Windows operating system with the real-time capability of SIMOTION P Runtime.

SIMOTION C (Controller-based)

SIMOTION C is the modular controller variant in the tried and trusted packaging system of the SIMATIC S7-300 with its very varied expandability options on the I/O bus. The SIMOTION C240 high-performance motion controller is available for control and motion control tasks. The integrated interface for four analog coupled drives makes the SIMOTION C particularly suitable for compact applications with the control of analog electrical drives and the operation of hydraulic axes. SIMOTION C also supports operation of four stepper motors at these interfaces. SIMOTION C240 PN offers a PROFINET interface instead of the encoder and drive interfaces.

Note

In the current version, SIMOTION SCOUT TIA supports only specific SIMOTION devices.

To find out which SIMOTION devices are supported, see Supported devices (Page 584).

3.5.2.5 Supported devices

Not all devices that are available in SIMOTION SCOUT are currently supported by SIMOTION SCOUT TIA.

The following table lists the devices that are supported in the current version of SIMOTION SCOUT TIA:

SIMOTION devices	SINAMICS devices
As of SIMOTION firmware/kernel V4.3 and SINAMICS Integrated V4.5: • SIMOTION C240/C240 PN • SIMOTION D410-2 / D4x5-2 / CX32-2 As of SIMOTION firmware/kernel V4.5: • SIMOTION P320-4	SINAMICS V4.5 and as of 4.7: • SINAMICS S120 CU310-2 / CU320-2

Note

The SINAMICS devices listed in the table can be found in the TIA Portal in the "hardware catalog" task card at "Controller > SIMOTION > SIMOTION drives".

You can parametrize these devices in SIMOTION SCOUT TIA only if you have networked them with a SIMOTION device via PROFIBUS/PROFINET.

The following devices are not supported:

- Single drive devices

Migrating a SIMOTION SCOUT project (Page 632)

SIMOTION hardware platforms (Page 583)

Overview (Page 824)

3.5.2.6 Supported functionalities

SIMOTION SCOUT TIA generally supports the same functionality as SIMOTION SCOUT and the TIA Portal.

The following functionality from SIMOTION SCOUT is not currently supported in SIMOTION SCOUT TIA:

- DCC SIMOTION / DCC SINAMICS
- Scripting for HWCN data
- XML import/export of hardware data
- SIMOTION Easy Project

See also

Migrating a SIMOTION SCOUT project (Page 632)

3.5.2.7 Programming languages

SIMOTION provides different programming languages for the solution of Motion Control tasks, control logic, arithmetic calculations, etc. During runtime, the selected programming language has no effect – except in the different displays when debugging. You can create user applications in different programming languages and use them jointly in a project.

The following programming languages are available in SIMOTION SCOUT TIA:

- **Motion Control Chart (MCC)**
  Graphical programming as a flow chart.
  In particular, for sequential tasks with a high level of motion control functionality.
- **Ladder Logic / Function Block Diagram (LAD/ FBD)**
  Graphical Programming as Ladder Logic / Function Block Diagram, supplemented by Motion Control Functions via PLCopen Function Blocks.
  In particular, for cyclic tasks with a high logic proportion.
- **Structured Text (ST)**
  Textual Programming in a High-level Language.
  As the base language of the SIMOTION system, ST supports all system features and functions of the technology packages and is thus suitable for all tasks.

Sources (units)

Programs are created in program containers, the so-called sources (units). They are compiled in the engineering system. Any errors or warnings that occur during compilation are output in the diagnostics window. Sources compiled without error can then be loaded into the associated controller.

A source contains any number of programs, functions, function blocks and classes. Each executable part of a source (program, function, function block, class) is called a POU (Program Organization Unit).

A source is divided into an interface and an implementation section.

Interface section

All parts exported by the source are defined in the interface section. Other sources and external components (e.g. HMI systems) can access these parts. These include user-defined data types, data (variables and constants) as well as names of programs, functions, and function blocks.

Implementation section

The data types and data defined in the implementation section are global throughout the source and can be used by all POEs. The implementation section also contains the program code of the POUs. Any POUs not specified in the interface section can only be used within the source.

Note

Source concept

The source concept with encapsulation of code and data allows you to structure applications. For example, the functionality of an entire machine module with a defined external interface can be implemented in a single source.

Tasks

Programs are processed in tasks. A task is a job which is executed in a certain chronological sequence. The advantage of the task system (execution system) is that processes appended to the appropriate task levels can run simultaneously.

The SIMOTION Motion Control system uses high-performance CPUs on which a real-time operating system - suitable for fast control processes - is implemented. Each task is allocated a slice of the computing time. The organization of the task executions is performed by the operating system. A differentiation is made between user and system tasks that are independent of one another.

Additional references

For detailed information on the programming languages and the execution system, refer to the online help of SIMOTION SCOUT TIA and the respective programming and operating manuals.

See also

Motion Control Chart (MCC) (Page 587)

Ladder Logic / Function Block Diagram (LAD/FBD) (Page 588)

Structured Text (ST) (Page 589)

Motion Control Chart (MCC)

MCC (Motion Control Chart) is a "flow diagram language" that graphically formulates the process sequences in production machines in a simple manner. The result is one or more flow diagrams, comprising MCC blocks that describe the time execution of the individual machine actions. Due to its special means of expression, an MCC is ideally suited to programming sequential processes.

Motion Control Chart supports the simple description of the motion sequences of machines using powerful motion control commands, such as reference axis, position axis, synchronize or desynchronize cam, and many more.

To control the machine sequence, commands are available for awaiting conditions and for formulating computations, as well as for programming various control structures, such as polling (IF), case determination (CASE) and loops (FOR, WHILE, UNTIL). Several MCC programs may be created to describe different process situations. For example, you can create one MCC program to bring the machine to a defined initial state when it is switched on, a second MCC program for the normal production sequence, and a third MCC program to specify what the machine has to do in the event of a fault.

All MCC blocks – a selection of the most important SIMOTION functions – are available in tool bars. They are grouped according to function and are automatically inserted in the flow diagram at the marked point by means of a click. A click on the individual elements opens specific dialogs for parameterization. Obviously, you can also add your own comments for the further documentation of the process sequence. Functions from the SIMOTION command library that are not individually offered as MCC blocks can be used in an MCC program by means of a special command.

Performance features:

- Easy-to-use due to graphical illustration in the form of flow diagrams.
- Hierarchical command library for motion control, PLC, and technology functions
- Control structures (IF, WHILE, CASE, etc.)
- Zooming for LAD, FBD and ST
- Subroutine calls (FB/FC, programs, etc.)
- Structuring based on command module generation, i.e. combination of command sequences to form a module command
- User-friendly debug functions for online test and diagnosis, for example, single-step, program status or breakpoints for easier troubleshooting (debugging)
- Monitor, trace

Note

Implicit conversion to ST

When being compiled, programs written in MCC are implicitly converted to ST programs and then compiled.

You can export the intermediate result as an ST and use it as a basis for your own ST programs.

Additional references

Detailed information can be found in the online help of SIMOTION SCOUT TIA and in the SIMOTION MCC Motion Control Chart Programming and Operating Manual.

Ladder Logic / Function Block Diagram (LAD/FBD)

LAD/FBD is a graphical programming language and is available for Ladder Logic / Function Block Diagram. The statement syntax corresponds to a circuit diagram (LAD) or a function block diagram (FBD). LAD/FBD enable simple tracking of the signal flow between power rails via inputs, outputs, and operations. LAD and FBD programs are usually suitable for application in cyclic tasks (in particular, BackgroundTask).

LAD/FBD programs consist of elements and boxes that are graphically connected to networks. Their operations work mostly according to the rules of Boolean logic or simple arithmetic expressions and equations. Therefore, they are suitable only for control-relevant programs or also for motion control tasks by using the PLCopen blocks.

Functions, function blocks and programs can be programmed in LAD/FBD. A source can contain several LAD and FBD blocks. Only one POU can be implemented in an LAD or FBD block.

LAD/FBD also include commands for SIMOTION system control using standard logic functions. These commands are added from the command library. Motion Control tasks are preferably programmed with PLCopen blocks. Blocks which have been programmed in other SIMOTION languages can be called. User-friendly functions such as "on the fly" variable declarations or automatic syntax checks are available when programming in LAD or FBD. It is possible to switch over between LAD and FBD in the editor at any time. A program can therefore be viewed and processed in either LAD or FBD.

The following user-friendly debug functions are available for online testing and diagnostics:

- Monitor variables in the symbol browser or a watch table
- Program status
- Trace tool with measurement functions for drives and function generators
- Breakpoints

Note

Direct editing of motion commands is not recommended. Instead, it is better to use the PLCopen blocks. These blocks are designed for integration in logic-oriented programs.

Additional references

Detailed information can be found in the online help of SIMOTION SCOUT TIA and in the SIMOTION LAD/FBD Programming and Operating Manual.

Structured Text (ST)

Structured Text

ST is a high-level, PASCAL-based programming language. ST is based on the IEC 61131-3 standard. This standard harmonizes programming languages for programmable logic controllers (PLC).

The basic command scope is sufficient for the implementation of everything related to data management, arithmetic functions, control structures and I/O access. The addition of technology packages for Motion Control expands the scope of commands by other comprehensive, extremely flexible Motion Control commands.

In addition, applications can be subdivided into any number of sections. Such a section might be a program allocated to a runtime level, an instantiatable function block with its own memory, or a function without its own memory. In this case, the function blocks and functions are not allocated to a runtime level, but are instead called in programs.

Performance features:

- Motion Control, PLC and technology functions in a single language
- Well-structured programs with comment capability
- Powerful editor functions, such as:
  - Syntax coloring
  - Automatic indenting
  - Automatic completion
  - Bookmarks
  - Fold (show and hide blocks)
  - Displaying sets of parentheses
  - Select text, e.g. by column
  - Using the command library
- Convenient debug functions for online testing and diagnostics, e.g. display of up-to-date variable content of the code sequence selected in the editor (program status) and breakpoints.

Note

Object-oriented programming (OOP)

As of version V4.5, the Structured Text programming language supports object-oriented programming.

Additional references

Detailed information can be found in the online help of SIMOTION SCOUT TIA and in the SIMOTION ST Structured Text Programming and Operating Manual.

3.5.2.8 CamEdit cam editor

CamEdit can be used to describe curves by means of either interpolation points or segments. A combination is not possible. If the curve is to be created from segments using polynomials, SIMOTION SCOUT TIA provides the VDI wizard as assistance. Cam geometries are created in offline mode.

Information on the graphical creation of cams can be found in the section CamTool options package (Page 590).

Additional references

Detailed information on the topic can be found in the SIMOTION SCOUT TIA online help and in the SIMOTION Motion Control, Synchronous Operation TO, TO Cam Function Manual.

3.5.2.9 CamTool options package

SIMOTION CamTool is a powerful, graphical editor for creating and optimizing cams.

SIMOTION CamTool can be used as an expansion package for SIMOTION SCOUT TIA and is completely integrated in the SIMOTION SCOUT TIA user interface.

Basic functions

SIMOTION CamTool provides the following basic functions:

- Inserting and editing cams.
  Cams can be inserted in a SIMOTION SCOUT TIA project using SIMOTION CamTool. You can also edit a cam created with CamEdit using CamTool: Cams can also be imported from a text file or read from a SIMOTION device.
- Customize display of the cam in CamTool.
  In SIMOTION CamTool, you can show and hide diagrams, change display parameters of the axes and diagrams and adjust the lines and fonts. You can also display auxiliary lines in the diagram.
- Convert cams from SIMOTION CamTool to SIMOTION CamEdit.
  To edit a cam that is edited in SIMOTION CamTool using SIMOTION CamEdit, the cam needs to be converted.
- Export cams to a text file.
- Load cams into a SIMOTION device.

Additional references

Detailed information can be found in the online help of SIMOTION SCOUT TIA and in the SIMOTION CamTool Configuration Manual.

CamEdit cam editor (Page 590)

3.5.2.10 Technology packages and technology objects

Technology packages in SIMOTION SCOUT TIA

Technology packages combine software functions which are required for automation in mechanical engineering in various sectors. They are loaded into the controller during configuration and expand the basic functionality through additional system functions. The functions of the technology packages can be accessed easily in the SIMOTION SCOUT TIA command library during engineering. Access to the technology package functions is provided by additional language commands and system variables. Programming of motional sequences is therefore simple and integrated.

The following standard technology packages are available for SIMOTION SCOUT TIA:

CAM technology package

The SIMOTION CAM technology package contains the basic Motion Control technologies, such as drive axis, position axis, following axis, synchronous object, cam, output cam, cam track, and measuring input.

PATH technology package

The SIMOTION PATH technology package contains additionally the path interpolation technology.
Path interpolation generates the traversing profile for the path, calculates the path interpolation points in the interpolation cycle, and uses the kinematic transformation to derive the axis setpoints for the interpolation cycle points.

CAM_EXT technology package

The CAM_EXT technology package also contains objects for preparing technological data at the system level, e.g. addition object, formula object.

TControl technology package

The SIMOTION technology package for temperature control (TControl) provides temperature channels with extensive functions. These functions are also accessed via additional language commands and system variables.

More sector-specific technology packages are also available as separate products.

The loadable technology packages support the creation of technology objects (e.g. positioning and synchronous axis, cam tracks, external encoders) which can be accessed over system functions and system variables for use in every SIMOTION programming language.

Technology objects in SIMOTION SCOUT TIA

SIMOTION SCOUT TIA uses technology objects (TOs) to represent the functionality of axes, cams, output cams, etc. After creating a technology object (e.g. axis) and configuring it (e.g. as positioning axis), you can access it when programming with system functions.

Note

Missing licenses

All TOs outside the basic functionality (Motion Control Basic) must be licensed. Missing licenses are indicated by a flashing group error LED. The number and type of missing licenses is stated by the online diagnostics. They are also displayed during downloading.

Additional references

Detailed information is provided in the online help of SIMOTION SCOUT TIA and in the following documents:

- SIMOTION Runtime Basic Functions Function Manual
- Function Manual: SIMOTION Motion Control, TO Axis, Electric/Hydraulic, TO External Encoder
- Function Manual: SIMOTION Motion Control, Synchronous Operation TO, TO Cam
- Function Manual: SIMOTION Motion Control, Supplementary Technology Objects
- Function Manual: SIMOTION Motion Control Output Cams and Measuring Inputs
- Function Manual: SIMOTION Motion Control, TO Path Object
- Function Manual: SIMOTION Motion Control, Basic Functions for Modular Machines

See also

Licensing of the runtime components (Page 897)

3.5.2.11 CLib Studio option package

SIMOTION CLib Studio

If required, further functions and function blocks can be created in user libraries (SIMOTION CLib Studio) by means of C/C++ programming in the Windows environment.

They can be used in all SIMOTION languages (MCC, LAD, FBD, ST).

That allows the creation of application-specific and high-performance function extensions as well as adaptations including know-how protection.

3.5.3 Installation

3.5.3.1 SIMOTION SCOUT TIA and TIA Portal system preconditions

Note

Note, as of V14, TIA Portal supports only 64-bit operating systems.

Further details for the system requirements are contained in the *Readme* file in the start menu at "Start > All programs > Siemens Automation > Documentation > Readmes".

Compatibility details can be found in the Internet compatibility list at: Compatibility list (https://support.industry.siemens.com/cs/ww/en/view/18857317)

3.5.3.2 Install SIMOTION SCOUT TIA

Requirements

The following requirements apply to the installation of SIMOTION SCOUT TIA:

- Hardware and software of the PG/PC meet the system preconditions.
- You require administrator rights on your PG/PC.
- All running programs are closed.
- The TIA Portal (framework) is installed, for example with the STEP 7 or WinCC software package.
- The SIMOTION SCOUT TIA version to be installed (not part of the TIA Portal) is compatible with the installed TIA Portal version.

Side-by-side installations

The following combinations are possible:

- Different versions of the TIA Portal
- Different SIMOTION SCOUT TIA versions (V4.4 and V4.5 or V4.4 and V5.4)
- SIMOTION SCOUT (as of V4.4) and different SIMOTION SCOUT TIA versions
- STARTER (as of V4.4) and different SIMOTION SCOUT TIA versions
- S7T Config and different SIMOTION SCOUT TIA versions

Note

You cannot install STARTER, S7T Config and SIMOTION SCOUT at the same time.

Procedure

To install SIMOTION SCOUT TIA, proceed as follows:

1. Insert the installation data medium into the appropriate computer drive.
   The Setup program will start automatically provided Autostart is not disabled on the PG/PC.
   If the Setup program does not start automatically, start it manually by double-clicking the "Start.exe" file.
2. If necessary, click the "Yes" button for the Windows confirmation prompt.
3. Select the installation language of the Setup program.
4. Read the product information and installation instructions. To do this, click the "Read installation notes" or "Read product information" button.
5. Close the online help and click the "Next >" button.
6. The "Product Languages" dialog box shows those languages that were installed with the TIA Portal Framework. All languages supported by the product are installed automatically for SIMOTION SCOUT TIA from the activated languages. Click the "Next >" button.
7. In the following dialog box, select the product configuration.
   The required memory and the target directory are also listed. Click the "Next >" button.
8. Read and accept all the listed licensing agreements. Click the "Next >" button.
9. Read and accept all the listed safety instructions for safe operation. Click the "Next >" button.
10. All installation settings are listed in the overview. If you want to change the settings, navigate with the "< Back" button to the appropriate installation dialog box, and perform the change there.
    Otherwise, click the "Install" button to start the installation.

    Note

    License transfer

    If a license key is found during installation, you can transfer it to your PC. If you skip the license transfer, you can transfer it later using the Automation License Manager.

    You will find further information on licensing in section Licensing for SIMOTION SCOUT TIA (Page 596).

11. The computer may need to be restarted. Activate the "Yes, restart computer now" checkbox. Then click the "Restart" button.
12. If the computer does not need to be restarted, click the "Exit" button.

Result

SIMOTION SCOUT TIA has been installed in the specified directory on the PG/PC.

3.5.3.3 Uninstall SIMOTION SCOUT TIA

Requirements

The following requirements are valid for uninstalling SIMOTION SCOUT TIA:

- You require administrator rights on your PG/PC.
- All running programs are closed.

Note

Uninstalling TIA Portal

When an upgrade is made to a different TIA Portal version, the TIA Portal and SIMOTION SCOUT TIA must be uninstalled beforehand.

Procedure

To uninstall SIMOTION SCOUT TIA, proceed as follows:

1. Open the Control Panel via "Start > Control Panel".
2. Double-click the "Programs and functions" entry.
   The "Uninstall or Change a Program" dialog opens.
3. Double-click the "Siemens Totally Integrated Automation portal Vxx" entry.
4. If necessary, click the "Yes" button for the Windows confirmation prompt.
5. Select the installation language and click the "Next >" button.
   The dialog for selecting the products to be uninstalled opens.
6. Select SIMOTION SCOUT TIA and click the "Next >" button.
7. Check in the "Overview" dialog the list of products to be uninstalled. To make changes, click the "Back" button.
8. Click the "Uninstall" button.
   The uninstall is started.
   The expected time until completion of uninstalling is displayed in the dialog.
9. The computer may need to be restarted. Activate the "Yes, restart computer now" checkbox. Then click the "Restart" button.
10. If the computer does not need to be restarted, click the "Exit" button.

Result

The selected SIMOTION SCOUT TIA version is uninstalled.

3.5.3.4 Licenses

Licensing for SIMOTION SCOUT TIA

To use SIMOTION SCOUT TIA, in addition to the product DVDs, you will also receive a data medium containing the authorization data medium on which you will find the license key for SIMOTION SCOUT TIA.

Because the license key is identical for SIMOTION SCOUT TIA and SIMOTION SCOUT, it is valid for both.

The *Automation License Manager* program manages the license.

Installing the license for SIMOTION SCOUT TIA

1. Insert the authorization data medium with the license key.
2. Start the *Automation License Manager* program as follows:
   – In the start menu, select "Start > All programs > Siemens Automation > Automation License Manager".
   Or double-click the "Automation License Manager" symbol.
3. In the navigation area, select the drive with the authorization data medium.
   The license key is displayed in the right-hand window.
4. Select the license key and drag-and-drop it to the target drive.
5. Exit the Automation License Manager.
6. Remove the authorization data medium.

Result

SIMOTION SCOUT TIA has been licensed.

Installing the license upgrade for SIMOTION SCOUT TIA

1. Insert the authorization data medium with the upgrade license key.
2. Start the *Automation License Manager* program as follows:
   – In the start menu, select "Start > All programs > Siemens Automation > Automation License Manager".
   Or double-click the "Automation License Manager" symbol.

   In the navigation area, select the drive where the authorization for the old version of SIMOTION SCOUT TIA is located. Generally, the authorization will be installed on a hard disk drive on the PG/PC.
3. Transfer the authorization to the data medium containing the upgrade license key.
   To do this, select the license in the right-hand window and select "License key > Transfer..." in the menu.
   The "Transfer license key" dialog opens.

4. Select the connected data medium and click "OK" to start the transfer.
   When the transfer is complete, the authorization and the upgrade license key will be stored on the data medium.
5. Select the "Upgrade..." command in the "License Key" menu.
   The older authorization will be deleted. After the upgrade, you will have a new floating license.

   Note

   Do not interrupt the upgrade while it is in progress. Interrupting this process can result in the license key being lost.

6. Now transfer the new floating license onto the hard disk drive.
   Proceed as described under item 3.
7. Exit the Automation License Manager.
8. Remove the automation data medium.

Result

SIMOTION SCOUT TIA has been upgraded.

Additional references

Detailed information about license keys is provided in the online help of the *Automation License Manager*.

3.5.4 User interfaces

3.5.4.1 Introduction

The TIA Portal serves as framework for the hardware and network configuration (HWCN).

Call SIMOTION SCOUT TIA from this framework with the "SIMOTION configuration" entry. SIMOTION SCOUT TIA is the workbench for configuring and programming the motion control.

As you are working both in the TIA Portal and in SIMOTION SCOUT TIA, both user interfaces are briefly described in the following sections.

Additional references

Detailed information about the user interfaces is provided in the information system of the TIA Portal and in the help system of SIMOTION SCOUT TIA.

See also

TIA Portal (Page 598)

SIMOTION SCOUT TIA (Page 603)

3.5.4.2 TIA Portal

Views in the TIA Portal

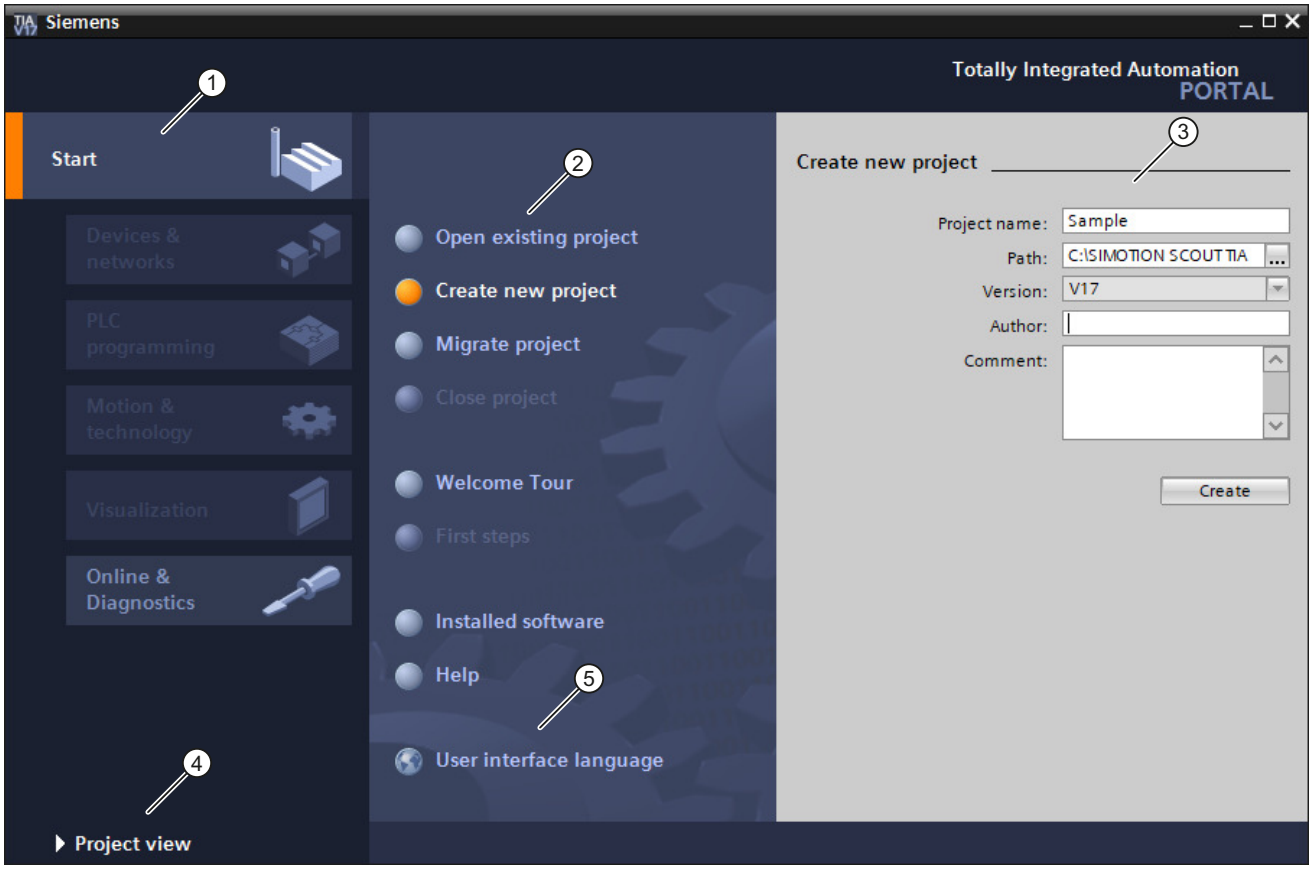
The following views are available in the TIA Portal:

- Portal view
- Project view

Portal view

The portal view provides an overview of all configuration steps and enables a task-based entry to your automation solution.

The individual portals ("Start", "Devices & Networks", "PLC Programming", "Visualization", "Online & Diagnostics", etc.) provide the basic functions for the individual tasks.



① **Portals for the various tasks**

The portals provide the basic functions for the individual task areas. The portals provided in the portal view depend on the products that have been installed.

Start SIMOTION SCOUT TIA from the "Motion & Technology" portal.

② **Actions for the selected portal**

Depending on the selected portal, the actions are offered that can be executed in this portal. You can open context-sensitive help in every portal.

③ **Selection window for the selected action**

The selection window is available in all portals. The content of the window adapts to your current selection.

④ **Change to the project view**

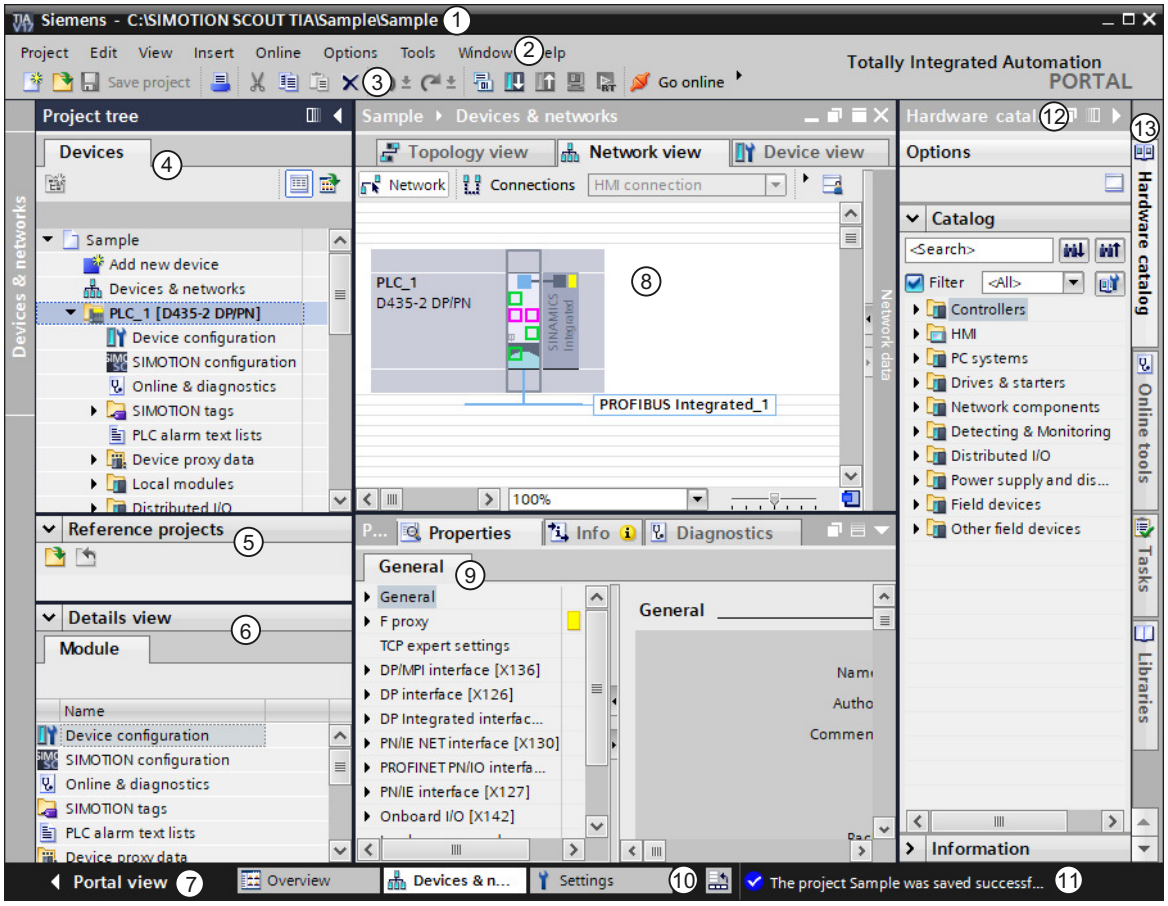
Use the "Project view" link to change to the project view.

⑤ **Select user interface language**

Use the "User interface language" link to set the user interface language.

Project view

The project view is a hierarchically structured view of all components in a project. The project view enables quick access to all objects in the project, the relevant working areas and editors. The various work windows show all the associated data for the selected objects.



① **Title bar**

The name of the project is displayed in the title bar.

② **Menu bar**

The menu bar contains all the commands that you require for your work.

③ **Toolbar**

The tool bar provides you with buttons for commands you will use frequently. This allows you to access these commands faster.

④ **Project tree**

The project tree provides access to all components and project data. For example, you can perform the following actions in the project navigation:

- Add new components
- Edit existing components
- Query and change the properties of existing components

⑤ **Reference projects**

In the "Reference projects" view, you can open further projects in addition to the current project. Although these reference projects are write-protected, you can copy individual devices from a reference project and add them to your current project where they can be further processed.

⑥ **Details**

The details view shows certain contents of a selected object. Possible contents include text lists and variables.

⑦ **Changing to the portal view**

Use the "Portal view" link to change to the portal view.

⑧ **Working area**

The objects that you can open for editing purposes are displayed in the working area.

⑨ **Inspector window**

The Inspector window displays additional information on a selected object or on executed actions.

⑩ **Editor bar**

The opened editors are displayed in the editor bar. If you have many open editors, they are shown grouped. The editor bar can be used to change quickly between the opened elements.

⑪ **Status bar with progress display**

The status bar contains the progress display for those background processes that are running currently.

⑫/⑬ **Task cards**

Depending on the edited or selected objects, task cards are provided to perform further actions, such as

- Select objects from a library or from the hardware catalog
- Search for objects in the project and replace
- Drag objects to the working area

The available task cards are found in a bar at the right-hand edge of the screen. You can expand and collapse the task cards at any time.

Additional references

For detailed information about the user interface and operation of the TIA Portal, refer to the "Introduction to the TIA Portal" section in the information system of the TIA Portal.

TIA Portal - language settings

User interface language

The TIA Portal allows you to switch the user interface language during operation. SIMOTION SCOUT TIA takes over the language setting of the TIA Portal. However, change in the language setting takes effect only after a restart of the SIMOTION SCOUT TIA.

The TIA Portal supports the following languages:

- German
- English
- French
- Italian

- Spanish
- Chinese (simplified)

Note

Not all languages of the TIA Portal are supported by SIMOTION SCOUT TIA.

If you have selected a user interface language not supported by SIMOTION SCOUT TIA, the SIMOTION SCOUT TIA user interface is displayed in English.

Changing the user interface language

Proceed as follows to change the user interface language:

1. Switch to the TIA Portal.
2. Switch to the "General" group in the "Tools > Settings" menu.
3. Select the preferred language from the "User interface language" drop-down menu of the "General Settings".

Note

Multiple languages in SIMOTION SCOUT TIA

After switching the language, the SIMOTION SCOUT TIA texts and messages may be displayed in both the previous and the new selected user interface language.
In this case, exit SIMOTION SCOUT TIA and restart the TIA Portal.

TIA Portal - Using Help

TIA Portal information system

The TIA Portal has an extensive information system. Start the information system in the Portal view via the "Help" button or in the Project view via the "Help -> View Help" menu and read how to work with the help in Section "Introduction to the TIA Portal".

Additional references

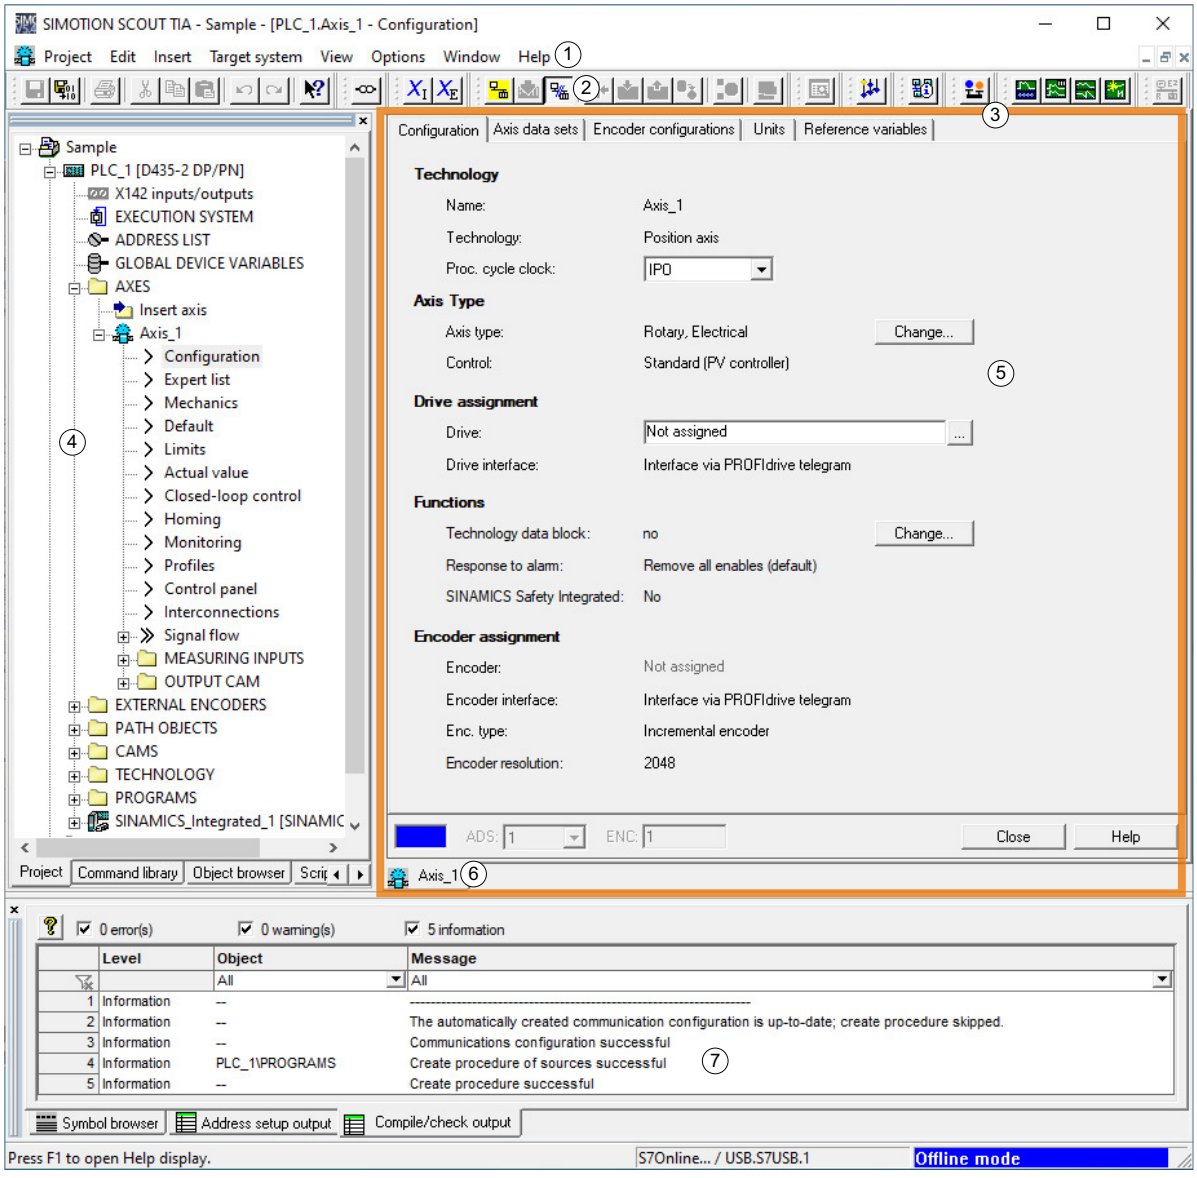
You will find detailed information on all steps that you perform for SIMOTION configuration in the TIA Portal (e.g. configuring hardware, setting up communications, etc.) in the information system of the TIA Portal in the "Configuring SIMOTION devices" section.

3.5.4.3 SIMOTION SCOUT TIA

SIMOTION SCOUT TIA - using workbench

The SIMOTION SCOUT TIA workbench is the common framework for all other tools of the engineering system. The workbench is the navigation center of the individual engineering steps and offers a uniform and integrated view of all data and programs.

The following figures shows an example of the Workbench components:



① Menu bar
② Tool bars
③ Working area
④ Project navigator
⑤ Snap-in
⑥ Tab
⑦ Detail view

Workbench components

The workbench comprises the following components:

- **Menu bar**:
  You call the functions of SIMOTION SCOUT TIA via the menus in the menu bar.
- **Tool bars:**
  Frequently used menu commands are also available in tool bars, which can be activated or deactivated as required. These provide quick access to the functions. The tool bars can be undocked from the header and relocated to a different position (e.g. at right, left, lower border) or as a window.
- **Working area**:
  The task-specific windows are displayed in the working area. In these windows, you can perform the configuration with wizards for the axis configuration and drive configuration. You also create programs in the working area. Further information about the active window in the working area is provided in the detail view.
- **Project navigator**:
  The project navigator provides an overview of the entire project. All defined elements, such as devices, drives, axes, etc., are displayed in a tree structure.
  The following tabs are also available in the project navigator:
  - Command library - depending on the configuration, contains all the commands and functions required for the programming
  - Object browser - clearly displays the object structure of the configuration in a hierarchical structured tree
  - Scripting library - contains all scripting objects and methods in alphabetical order
- **Snap-in / tab:**
  A Snap-in is a program integrated automatically in the working area of the SIMOTION SCOUT TIA Workbench. Snap-ins provide functions for processing SIMOTION SCOUT TIA projects and are displayed as a work window in the working area of the workbench. You can open several snap-ins. Open Snap-ins are displayed in the working area as tabs. The active Snap-in is visible in the foreground.
  The following Snap-Ins are available:
  - Program editors
  - Wizards for the configuration of technology objects
  - Device diagnostics
  - Drive navigator
- **Detail display:**
  In the detail display, you can show more detailed information about the element selected in the project navigator and the active window in the working area, for example, variables of a program, system variables of a technology object, protocols of compiled program sources.

Additional references

Detailed information can be found in the SIMOTION SCOUT TIA online help.

SIMOTION SCOUT TIA - using the working area

The workbench displays all of the Snap-in work windows in the working area. Each Snap-in provides its own work window. You can open multiple instances of these windows. You can, for example, open several programs at the same time for editing.

The following table provides an overview of the active functions in the working area of the workbench depending on the project mode (offline/online):

Function in project navigator	**Function in working area offline mode (Example)**	**Function in working area online mode (Example)**
Programs (MCC, ST, LAD/FBD) For further information, please go to: • SIMOTION MCC Motion Control Chart • SIMOTION ST • SIMOTION LAD/FBD	Create program	Monitor program
Execution system	Assign program	-
Technology objects (TO configuration)	Create and configure TO element	Change configuration data during RUN
Cam editor CamEdit/CamTool	Create cam	Change cam
Trace	Load and evaluate old recordings	Create current recordings

Window in the working area

You can change the size of the windows in the working area:
Click the edge of the window, hold down the left mouse button, and drag the window to the required size.

To maximize or restore a window, press <Ctrl+F11>.

Each window opened in the working area can be accessed via a tab at the bottom edge of the working area.

The following options are available to bring a window into the foreground:

- Click the relevant tab.
- Select the appropriate item in the "Window" menu.

To close a window, proceed as follows:

- Configuration dialogs:
  Click the "Close" button.
- Editors for MCC, ST and LAD/FBD:
  Click the "X" button in the top right-hand corner.

Configuration dialogs and editors can also be closed with <Ctrl+F4>.

SIMOTION SCOUT TIA - using the project navigator

By default, the project navigator comprises the "Project" tab and the "Command library", "Object browser" and "Scripting library" tabs.

Project tab

The "Project" tab displays the entire project structure and is used for managing elements within the projects.

In addition to the elements created automatically via the hardware configuration, create the following elements manually in the project navigator:

- Technology objects
  e. g. axes, external encoders, measuring inputs, cams
- Programs
  e. g. ST source files, MCC chart
- Watch tables
- Libraries

You can change the properties, e.g. the name of an element.

To improve clarity in the project navigator, you can sort and group lower-level objects into topics.

Command library tab

Depending on the configuration, the commands and functions required for the programming are displayed in a tree on the "Command library" tab. You can use these commands to program in the ST editor, LAD/FBD editor and MCC editor, e.g. to create conditions. You can search in the command library or set filters.

Object browser tab

The object structure of the configuration is clearly displayed in a tree in the "Object browser" tab. The tree is structured hierarchically and clearly shows the individual objects, classes, interfaces and references.

Scripting library tab

The scripting structure is clearly displayed in a tree in the "Scripting library" tab. The tree contains the individual objects and methods of scripting in alphabetical order.

SIMOTION SCOUT TIA - menus

SIMOTION SCOUT TIA menus are subdivided into static and dynamic menus.

Static menu

Static menus are primarily used to control the workbench or a project. Static menus are permanently displayed.

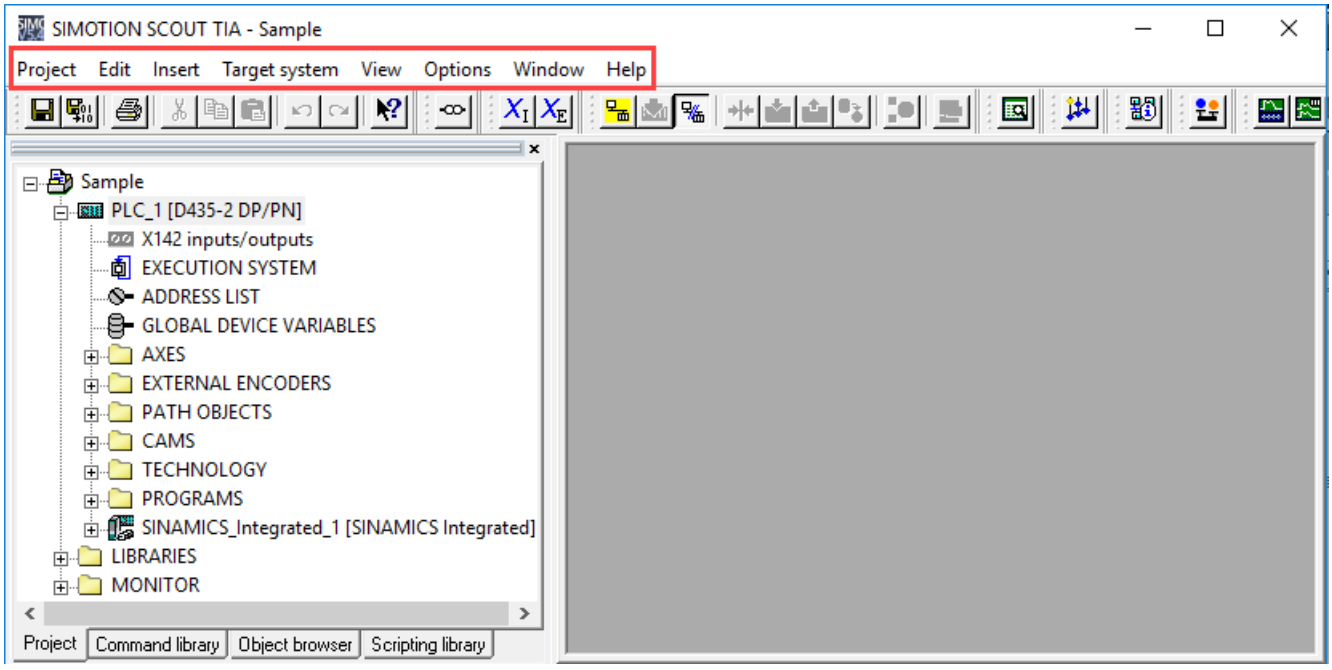


Figure 3-315 Static menu

Dynamic menu

Dynamic menus are provided by Snap-ins and are added to the static menu. The menu with active Snap-in in the working area is always displayed.

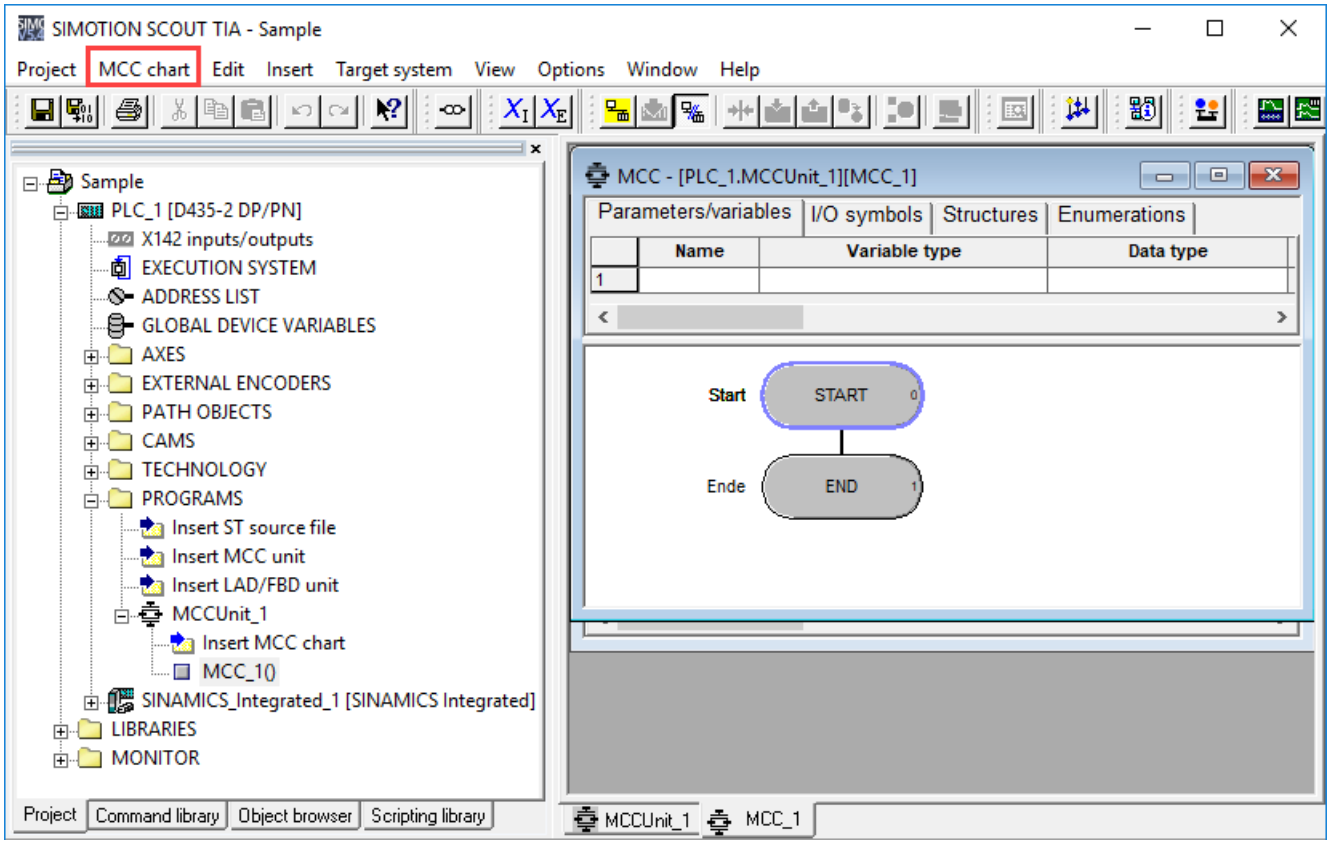

Figure 3-316 Example of a dynamic menu

Table 3-38 Structure of the menu bar

Menu	Comment
Project	Static menu, always visible
(Dynamic menu)	See "Dynamic menus" table
Edit	Static menu, always visible
Paste	Static menu, always visible
Target system	Static menu, always visible
View	Static menu, always visible
Options	Static menu, always visible
Window	Static menu, always visible
Help	Static menu, always visible

Table 3-39 Dynamic menus

Dynamic menu	Comment
Axis	Visible only when the project is open and the associated Snap-in is active in the working area. The dynamic menus appear in the menu bar between the "Project" and "Edit" static menus.
Output cam	
Measuring input	
Synchronous operation	
Cam	
External encoder	
Sensor	
Controller object	
Drive	
Fixed gear	
Formula object	
Addition object	
Drive control panel	
Trace	
ST source	
MCC source	Visible only when a project has been loaded and the associated Snap-in is active in the working area. The dynamic menus appear in the menu bar between the "Project" and "Edit" static menus.
MCC chart	
LAD/FBD source	
LAD/FBD program	

SIMOTION SCOUT TIA - menu items

You can use the shortcuts listed in the table to call the menu items available in SIMOTION SCOUT TIA.

Table 3-40 Menu items in SIMOTION SCOUT TIA

Shortcuts	Menu item	Response
Project...		
Ctrl+Alt+K	Check consistency	Checks project consistency
Ctrl+Alt+B	Save and compile changes	Saves the project and compiles the changes made in the project since the last compilation
Ctrl+P	Print	Prints the selected window
Alt+F4	Exit	Exits the SIMOTION SCOUT TIA program

Shortcuts	Menu item	Response
Edit...		
Ctrl+Z	Undo	Undoes the last action
Ctrl+Y	Redo	Redoes the last action
Ctrl+X	Cut	Cuts the selection
Ctrl+C	Copy	Copies the selection
Ctrl+V	Paste	Inserts the clipboard contents

Shortcuts	Menu item	Response
Edit...		
Del	Delete contents	Deletes the selection
F2	Rename	Renames the selected tree object
Alt+ENTER	Object properties	Displays the properties of an object in the project tree
Ctrl+Alt+O	Open object	Opens a new object of the selected tree object
Ctrl+A	Select all	Selects the entire contents in the ST and MCC Snap-ins

Ctrl+F	Search	Opens the Search window
F3	Find next	Continues the search from the current position
Ctrl+Shift+F	Search in the project	Opens the Search window
Ctrl+Shift+G	Replace in the project	Opens the "Search and Replace" window

CTRL+H	Replace	Opens the "Replace" window
CTRL+J	Display next position	-
Ctrl+G	Go to in the project navigator...	Opens the "Go To in the Project Navigator" dialog box

Shortcuts	Menu item	Response
Target system...		
Ctrl+L Is only possible online	Download / target device	Loads individual target device
Ctrl+D Is only possible online	Device diagnostics	Opens device diagnostics
Ctrl+I Is only possible online	Control operating state	Opens the dialog box for controlling the operating state

Shortcuts	Menu item	Response
View...		
Ctrl+F11	Maximize working area	Maximizes and restores the view of the working area
Ctrl+F12	Maximize detail view	Maximizes and restores the view of the detail view
Ctrl+Num+ (Plus key on the numeric keypad)	Zoom in	Enlarges the graphic in the program editors
Ctrl+Num+ (Minus key on the numeric keypad)	Zoom out	Scales down the graphic in the program editors
F5	Refresh	Refreshes the view

Shortcuts	Menu item	Response
Options...		
Ctrl+Alt+E	Settings	Opens the "Options > Settings" dialog box

Shortcuts	Menu item	Response
Window...		
Ctrl+Shift+F5	Arrange cascading	Arranges the opened windows in the working area
Ctrl+Shift+F3	Arrange vertically	

Shortcuts	Menu item	Response
Snap-in menu...		
Ctrl+F4	Close	Closes the selected window
Ctrl+B	Accept and compile	Compiles the active object
Ctrl+E	Expert list	Opens the expert list for the current technology object

Shortcuts	Menu item	Response
Help...		
F1	Help topics	Opens the entire help available for SIMOTION SCOUT TIA
SHIFT+F1	Context-sensitive help	Opens the context-sensitive help function for the selected object, parameter, etc.

Note

List of all shortcuts

The online help of SIMOTION SCOUT TIA includes a complete list of all the shortcuts available in SIMOTION SCOUT TIA and the programming and operating instruction manuals.

SIMOTION SCOUT TIA - keyboard operation and shortcuts

There are various keyboard assignments and shortcuts for the menu items to facilitate your work in SIMOTION SCOUT TIA.

The following table provides an overview of the keyboard assignments or shortcuts that you can use for SIMOTION SCOUT TIA.

Table 3-41 Keyboard action

Keyboard action / shortcuts	Meaning
Workbench: Change window...	
Alt+0	Project navigator
Alt+1	Working area

Keyboard action / shortcuts	Meaning
Workbench: Change window...	
Alt+2	Detail view
Ctrl+F6	Next window in the working area
Ctrl+F11	Minimize/maximize working area in relation to the whole desktop
Ctrl+F12	Minimize/maximize detail view in relation to the whole desktop

Project navigator	
Left mouse button	Selects the tree object at the cursor position; detail view displays the associated details
Double-click with left mouse button	Selects the tree object at the cursor position; detail view displays the associated details; corresponding Snap-in opens
Right mouse button	Selects the tree object at the cursor position; detail view displays the associated details; corresponding context menu opens
UP/DOWN arrow keys	Selects the tree object at the cursor position
"ENTER"	Snap-in for the selected tree object opens
"Context menu key"	Context menu for the selected tree object opens

SIMOTION SCOUT TIA - using the context menus

The tree elements of the project navigator have context menus. Context menus give you fast access to all important functions permitted for this tree element.

To call the desired function of the tree element via context menus, proceed as follows:

1. Select the appropriate element in the project navigator.
2. Open the context menu with a right-click.
3. Left-click the appropriate command to select it.

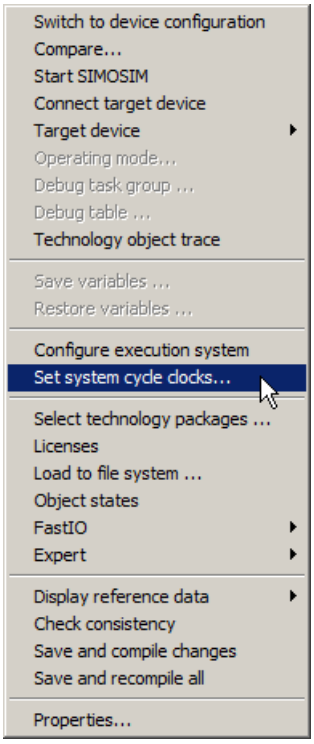

Figure 3-317 Context menu for SIMOTION device

SIMOTION SCOUT TIA - detail view

Using the detail view

When you select an element in the project navigator, the associated detail view will appear in the lower area of the workbench.

To display the detailed view for the address list and the watch table, double-click this element in the project navigator.

Depending on the selected element, different tabs are offered and information about the element is displayed therein.

The tabs available are determined by the project mode (offline/online) and the active snap-ins.

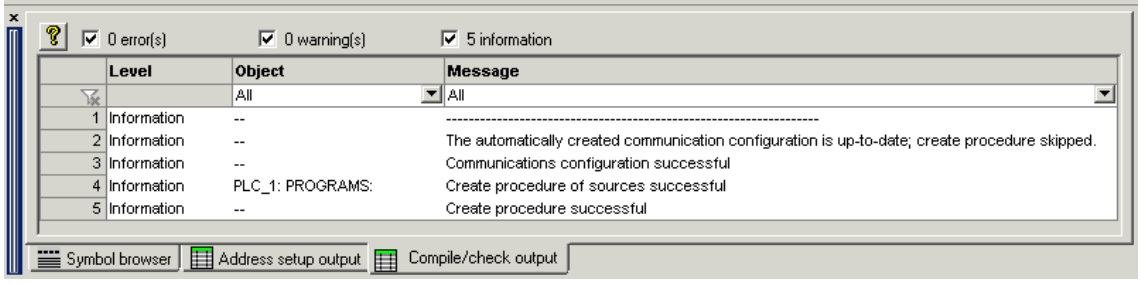

Figure 3-318 Example of detail view

Each tab is only opened once. This means:

- The active tab shows the details of the selected element/action.

You can maximize or minimize each tab with <Ctrl+F12>.

Using the symbol browser

The symbol browser is a tab in the detail view and is always displayed. The symbol browser displays status values of the variables for the element selected in the project navigator.

Permanently retain the display in the symbol browser

You can permanently retain the display in the symbol browser. The display remains even when, for example, other device or technology objects are selected in the project navigator.

To permanently retain the display in the symbol browser, proceed as follows:

1. Click the pin at the top right of the symbol browser view.

The active element remains displayed until this function is deactivated. To deactivate this function, click the pin again.

Using the address list

The address list is where you create I/O variables, which you then assign to a particular item of hardware. You can monitor I/O variables in the address list, and, when necessary, modify them. The I/O variables are assigned either manually or via an assignment wizard.

Opening the address list

To open the address list, proceed as follows:

1. Browse to the folder for the device in the project navigator.
2. Double-click the "Address list" element below the device.
   The address list opens in the details area.

Additional references

Further information about the the address list is available in the SIMOTION SCOUT TIA online help.

Using the watch table

With the symbol browser you can view the variables belonging to one object in your project; with the program status you can view the variables belonging to a selected monitoring area in the program. With watch tables, in contrast, you can monitor selected variables from different sources as a group (e.g. program sources, technology objects, SINAMICS drives - even on different devices). You can sort the variables in the watch table in any way, add comments and combine them into groups. You can hide individual variables to make the watch table more manageable and also control variables via the watch table directly.

Creating a watch table

To create a watch table and assign your variables, proceed as follows:

1. Open the "Monitor" folder in the project navigator.
2. Double-click the "Insert watch table" entry to create a watch table.
3. Enter the name of the watch table.
   A watch table is created with this name in the "Monitor" folder.
4. In the project navigator, click the object from which you want to move variables to the watch table.
5. In the symbol browser, in the address list, or in the expert list, select the corresponding variable line by clicking its number in the left column.
6. From the context menu, select the "Add to watch table" command and the appropriate watch table, e.g. "Watch_table_1".
7. If you click the watch table, you will see in the detail view of the"Watch table" tab that the selected variable is now in the watch table.
8. Alternately, you can copy-and-paste variables to the watch table.
9. To monitor the variables of various objects, repeat steps 3 to 6.

You can also create a watch table direct by selecting a variable followed by "Add to watch table > New watch table" in the context menu.

The new watch table is created automatically and filled with the selected variables.

If you are connected to the target system, you can monitor the variable contents.

Using multiple watch tables (>Watchtable_temp<)

To monitor variables simultaneously in different watch tables, create temporary watch tables.

To create a temporary watch table ">Watchtable_Temp<", proceed as follows:

1. Open the "Monitor" folder in the project navigator.
2. Double-click ">Watchtable_Temp<".
   The temporary watch table is displayed in the detail view.
3. Drag-and-drop the desired watch tables from the project navigator to the temporary watch table.
   The watch tables are arranged below each other.
   The contents are lost when the temporary watch table is closed.

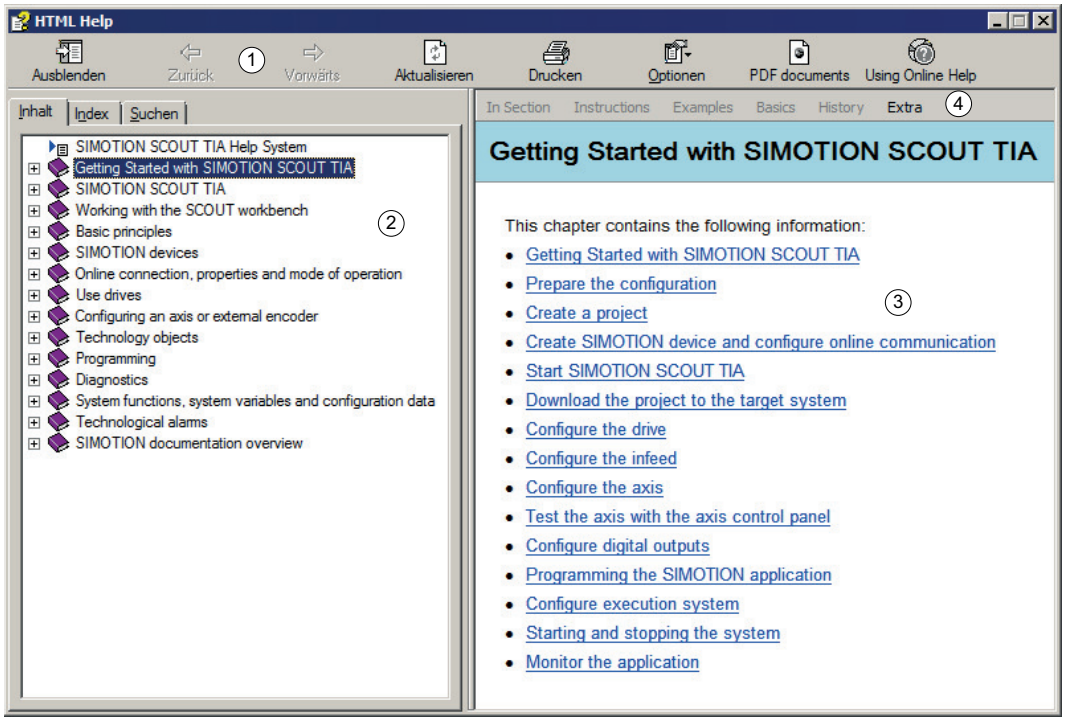
Additional references

Detailed information about the use of watch tables is contained in the "Watch table" section in the SIMOTION SCOUT TIA online help.

SIMOTION SCOUT TIA - using the help

SIMOTION SCOUT TIA has a comprehensive context-sensitive help. The following is a description of how to work with the help system using different examples.

Structure of the Online help window



1 Menu bar

You can use buttons in the menu bar to configure the help or display general information.

- Click "PDF documents" to display the available function diagrams.
- Click "Use online help" to display the help page for the full text search on the "Search" tab.

2 Navigation area

In the navigation area you can navigate through the help, open the index or search through the entire help.

- Click the "Contents", "Index", or "Search" tab to navigate through the help.
- Click the "+" in front of a book to open the table of contents.
- Click a book or help page to display its contents in the contents area.

3 Contents area

The contents for the help pages selected in the navigation area are displayed in the contents area.

Within the contents area, you can use symbols to display hidden information:

- Click the arrow to display or hide additional information.
- Click the minimized view to display a hidden figure.
- Click the copy symbol. The following program code will be saved automatically in the clipboard. You can then insert this in a program editor.

4 Link bar

The header area of many help pages has a link bar. This link bar displays further information for the selected help page. The link bar contains the following entries:

- In Section
  Links to headers of the displayed topic.
- Programming Manuals
  Links to handling instructions.
- Examples
  Links to examples.
- Fundamentals
  Links to background information, such as definitions or details.
- History
  List of the most recently opened help pages.
- Options
  Link to the start page.
  Forwards and backwards in the previously opened help pages.

Features of online help

Features of online help	To open the help:	
Open entire help	Key <F1>	Press <F1>.
	or	
		Select "Help > Help topics" from the menu.
	The entire help opens.	

Features of online help	To open the help:	
Open Getting Started		Select "Help > Getting Started" from the menu.
	Getting Started opens.	
Help button	 or 	Click the Help button of the respective dialog box or window.
	The context-sensitive help for the dialog box opens.	
Context-sensitive help	<Shift+F1>	• Press <Shift+F1>.
	• or	
		• Click the button in the menu bar.
	• or	
		• In the menu, select "Help > Context help".
	The mouse pointer changes to a question mark.	
		• Then click with the changed mouse cursor on the dialog box, the parameter, the input field or the menu item.
	The context-sensitive help for the selected entry opens.	

Examples of the context-sensitive help

Help in the project navigator		
General help		Press <Shift+F1>. Then click with the question mark on the project navigator. The general help for the project navigator opens.
Help for the technology object (only SIMOTION)		Press <Shift+F1>. Then click with the question mark on a technology object in the project navigator. The help for this technology object opens.

Help for the detail view		
General help for the symbol browser		Press <Shift+F1>. Then click with the question mark in the margin of the symbol browser. Alternatively, you can also open the help for the symbol browser by clicking . The general help for the symbol browser opens.
System variables in the symbol browser		In the project navigator, select the SIMOTION device or the technology object. The system variables of the element are displayed in the symbol browser. Press <Shift+F1>. Then click with the question mark on the system variable in the symbol browser. The associated help opens.
Help for alarms		Press <Shift+F1>. Then click with the question mark on the alarm shown on the "Alarms" tab. The help for the drive alarm or technological alarm opens.

Help for the expert list		
Configuration data		Press <Shift+F1>. Then click with the question mark on the configuration data item in the expert list. The help opens.
System variables		Press <Shift+F1>. Then click with the question mark on the system variable in the expert list. The help opens.
Parameters of the drives		Press <Shift+F1>. Then click with the question mark on the parameter in the expert list. The help opens.

Help for the LAD/FBD editor (SIMOTION only)		
Declaration area		Press <Shift+F1>. Then click with the question mark on a tab in the declaration area of the LAD/FBD editor. The help opens.
Editor area		Press <Shift+F1>. Then click with the question mark on an element in the editor area of the LAD/FBD editor. The help opens.

3.5.5 Basics of SIMOTION configuration in the TIA Portal

3.5.5.1 Configuration overview

Configuring requirements

The following requirements apply to configuring:

- The TIA Portal (framework) is installed, for example with the STEP 7 or WinCC software package.
- SIMOTION SCOUT TIA has been installed and licensed for the PG/PC.
- The hardware has been installed and wired.
- The PG/PC has been connected to the SIMOTION device via the PROFIBUS, Ethernet or PROFINET IO interface.
- For configuring the drives with the drive wizard, you need the article number of the drive unit and the components (power supply, power unit, motors and encoders).

The following table provides an overview of the individual configuring steps and where to implement them.

Configuring step	Where
① Create a new project	TIA Portal
② Insert SIMOTION devices	TIA Portal
③ Insert a SIMOTION drive	TIA Portal
④ Compile hardware configuration	TIA Portal
⑤ Configure online access	TIA Portal
⑥ Configure communication	TIA Portal
⑦ Configure HMI connection	TIA Portal
⑧ Go online	SIMOTION SCOUT TIA
⑨ Configure the drives	SIMOTION SCOUT TIA
⑩ Configure the technology objects	SIMOTION SCOUT TIA
⑪ Create user programs	SIMOTION SCOUT TIA
⑫ Test and diagnostics	SIMOTION SCOUT TIA

See also

Target group and content of the configuration manual (Page 579)

3.5.5.2 Managing projects

Basic principles

Projects are used for the orderly storage of data and programs that result in the creation of an automation solution. You create projects in the TIA Portal and manage them there. The data summarized in a project shall include, in particular:

- Configuration data on the hardware structure and parameter data for modules
- Configuration data for communication via networks
- Configuration data for the devices
- Reports
- Configuration data
- User programs
- Motion profiles
- Drive data

The following table provides an overview of the individual configuration steps and where to implement them.

Project management	Where
Creating a new project	TIA Portal
Open project	TIA Portal
Delete a project	TIA Portal
Close a project	TIA Portal
Save project as	TIA Portal
Migrating a project	TIA Portal
Save project	SIMOTION SCOUT TIA
Save project and compile changes	SIMOTION SCOUT TIA
Save project and recompile everything	SIMOTION SCOUT TIA
Load project to the target system	SIMOTION SCOUT TIA
Saving and exporting a project	SIMOTION SCOUT TIA

See also

Creating a new project (Page 625)

Transferring SIMOTION SCOUT projects (Page 631)

Creating a new project

Note

You can only create a project in the TIA Portal.

Procedure

To create a project, proceed as follows:

1. Start the TIA Portal.
2. Select the "Create new project" entry in the secondary navigation in the Portal view.
3. Assign a name for the new project below "Project name".
4. Click the "..." button to set the storage location.
5. Enter any required comments in the comment field.
6. Create the project using the "Create" button.

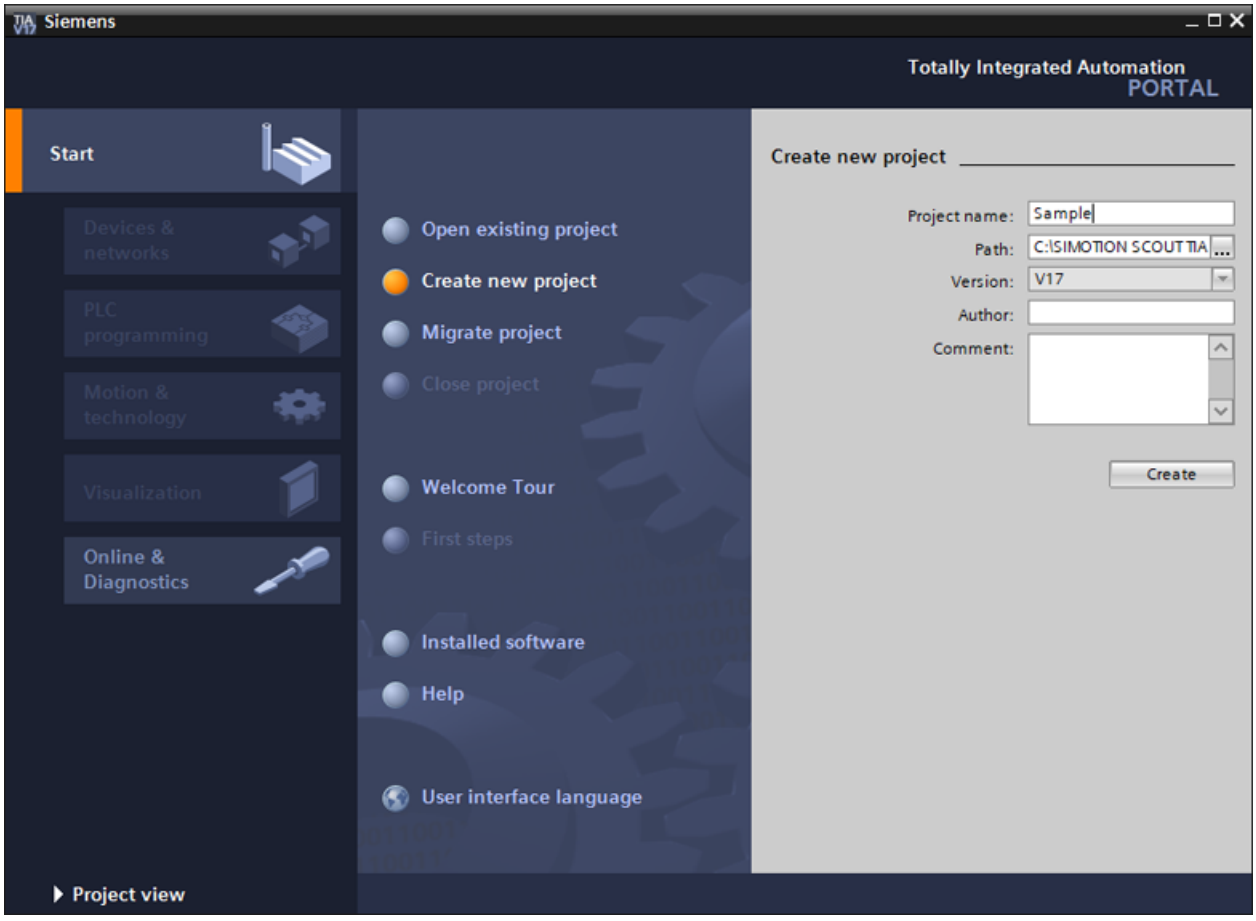


Figure 3-319 Creating a project

Result

You have created a project that was saved in the specified directory.

Note

Maximum number of characters

If necessary, change the storage location or project name because a maximum of 94 characters are available for the project name and 143 characters for the path.

Open project

Note

You can only open a project in the TIA Portal.

Procedure

To open a project, proceed as follows:

1. Start the TIA Portal.
2. Select the "Open existing project" entry in the secondary navigation in the Portal view.
3. Select the project you want to open in the right-hand window at "Recently used".
4. Click the "Open" button to open the project.

If the project to be opened is not listed, proceed as follows:

1. Click the "Browse" button and navigate to the project you want to open in the subsequent "Open existing project" dialog.
2. Double-click the project file.

Result

You have opened the project and are in the Portal view.
Switch to the Project view to continue with the configuration.

Close a project

Note

You can only close a project in the TIA Portal.

Procedure

To close a project, proceed as follows:

1. Switch to the TIA Portal.
2. Open the "Close" entry in the "Project" menu in the Portal view.
   Or select the "Close project" command in the secondary navigation in the Portal view.
3. If you have made changes in the project, you will be prompted in "The project has been changed" dialog whether or not you want to save the changes.

Result

You have closed the selected project. SIMOTION SCOUT TIA has been closed.

Save project as

Note

You can only perform "Save project as" in the TIA Portal.

Procedure

To save a project at the required target location, proceed as follows:

1. Switch to the TIA Portal.
2. Select the "Save project as ..." command in the "Project" menu in the Portal view.
3. In the "Save current project as ..." dialog, navigate to the storage location where you want to save the project.
4. Assign a file name to the project.
5. Save the project at the set storage location by clicking the "Save" button.

Result

You have saved the project in the specified location.

Note

Maximum number of characters

If necessary, change the storage location or project name because a maximum of 94 characters are available for the project name and 143 characters for the path.

Delete a project

Note

You can only delete a project in the TIA Portal.

Requirement

- The project is not opened.

Procedure

To delete a project, proceed as follows:

1. In the "Project" menu, select the "Delete project..." command.
   The "Delete project" dialog opens and a list of recently used projects is displayed. The project currently open is not displayed in the list.
2. Select the project you want to delete.
   If the required project is not in the list, click the "Browse" button. Navigate to the project folder and open the project file.
3. Click the "Delete" button.
4. Confirm the prompt with "Yes" to delete the project permanently.

Result

The complete project folder has been deleted from the file system.

Search and replace

Browsing a project

You can use the following search options within the TIA Portal:

- Browse the complete project
- Search and replace within an editor
- Browse the hardware catalog

Note

Search in SIMOTION SCOUT TIA

To search for any text or variables within the Motion Control configuring, switch to SIMOTION SCOUT TIA in the "Edit > Search in the project..." menu.

Procedure

To start the search editor in the TIA Portal, proceed as follows:

1. In the "Edit" menu, select the "Browse project" command.
   The search editor opens.
2. Enter the search text as "Search for:".
3. If the search results need to be restricted, activate the appropriate options for "Restrict search to:".
4. Start the search with the "Start search" command.

Result

All found objects are listed. Double-click a hit to open the source.

Search and replace in the project

The following methods are available within an editor to search for and replace texts.

Note

Searching and replacing in SIMOTION SCOUT TIA

To search for or replace any text or variables within the Motion Control configuring, switch to SIMOTION SCOUT TIA in the "Edit > Replace in the project..." menu.

Procedure

To start the editor for the "Search and replace " function in the TIA Portal, proceed as follows:

1. In the "Edit" menu, select the "Search and replace" command.
   The "Search and replace" editor opens.
2. Enter the search text as "Search for:".
3. Activate the desired additional options for the search.
4. Click "Search".
5. The first search hit is selected in the editor.
6. Enter the text with which you want to replace the search hit as "Replace".
7. To replace the selected hit, click "Replace".

Result

The found term is replaced with the desired text.

Print project

Print project content

The "Print" function allows you to print the complete project, individual objects, visible information from an editor or a compact project overview.

Note

Printing in SIMOTION SCOUT TIA

To print a complete project overview or individual parts from the configuring within the Motion Control configuring, e.g. programs or technology objects, switch to SIMOTION SCOUT TIA, select the element to be printed, and select the "Project > Print..." menu.

Procedure

To print content from the hardware configuration in the TIA Portal, proceed as follows:

1. Select in the project navigation the element to be printed.
2. Select the "Print project..." menu.
   The "Print" dialog opens.
3. Select the desired print options.
4. To start the print operation, click "Print".

Result

The selected project content is printed.

Archiving a project

The archiving of a project has the advantage of reducing the project size for large projects, for example, to send a project as e-mail.

Procedure

To archive a project, proceed as follows:

1. Save the currently open project.
2. Select the "Archive..." command in the "Project" menu in the project view.
3. Select the required archiving settings.
   To save a compressed project archive, activate the "Archive as compressed file" option.
   If you do not want to back up restorable data when the project is archived, select the option "Discard restorable data".
   To automatically add the date and time of day to the file name, select the option "Add date and time to target name".
4. Under "Target path:", navigate to the storage location where the archive should be saved.

5. Assign a file name for the archive.
6. Archive the project at the set storage location by clicking the "Archive" button.

Result

A compressed archive with the file extension ".zapVersion" is created. A project archived in TIA Portal V17 has the file extension ".zap17".

Additional references

Detailed information about creating project archives can be found in the information system of the TIA Portal under "Archiving and retrieving projects".

Transferring SIMOTION SCOUT projects

To transfer a SIMOTION SCOUT project to SIMOTION SCOUT TIA, the following possibilities are available:

- Migration with the migration tool in the TIA Portal (complete, including the hardware and network configuration, and the SCOUT data).
- Migration with the migration tool outside the TIA Portal as dual-computer solution and import the SIMOTION SCOUT project using an intermediate file into the TIA Portal.
- Export of the SIMOTION SCOUT project and import into SIMOTION SCOUT TIA (only SCOUT data).

Note

Readiness Check Tool TIA Portal

With the TIA Portal Readiness Check Tool, you can easily check whether the hardware included in your projects is supported by the TIA Portal.

Detailed information about the tool and a download link online are available in the Internet at Readiness Check Tool TIA Portal (https://support.industry.siemens.com/cs/ww/en/view/60162195).

See also

Migrating a SIMOTION SCOUT project (Page 632)

Exporting and importing projects (Page 637)

Examples of export/ import (Page 641)

Migrating a SIMOTION SCOUT project

Migration of a SIMOTION SCOUT project

Note

Migration, including the hardware configuration

You can migrate a SIMOTION SCOUT project only together with the hardware configuration.

A SIMOTION SCOUT TIA project cannot be converted to a SIMOTION SCOUT project. However, you can export the SIMOTION SCOUT TIA data without the hardware configuration and import it into SIMOTION SCOUT by XML export/import. See Section Exporting and importing projects (Page 637). In this case, you must manually create the hardware configuration in SIMOTION SCOUT so that it is identical to the TIA Portal project.

Note

Alarm_S messages

Alarm_S messages are incremented in the number range starting at 60,000,000 hex for the migration from SIMOTION SCOUT to SIMOTION SCOUT TIA.

As of SIMOTION SCOUT TIA V5.2, you can edit the number value in this range.

Note that the Alarm_S information text is limited to the same characters as the Alarm_S text.

Note that the associated values in the Alarm_S text can be only displayed formatted appropriately for the data type.

Note the TIA Portal specifications for data type formattings for previously configured Alarm_S messages.

If you reconfigure Alarm_S messages in SIMOTION SCOUT, check the message text for compatibility with TIA Portal.

To do this, activate the "Check compatibility with TIA Portal" option.

Detailed information is contained in the information system of the TIA Portal at "Configuring messages".

You must migrate a SIMOTION SCOUT project to use it in SIMOTION SCOUT TIA.

The following procedures are available for this purpose:

- Migration with the migration tool in the TIA Portal (complete, including the hardware and network configuration, and the SCOUT data).
- Migration with the migration tool outside the TIA Portal as dual-computer solution and import the SIMOTION SCOUT project using an intermediate file into the TIA Portal.

Migration in the TIA Portal

During the migration, the project data from a SIMOTION SCOUT project can be converted for processing in SIMOTION SCOUT TIA. The migration is performed in the TIA Portal using the migration tool.

Requirements

The following requirements must be satisfied for a migration:

- The TIA Portal migration tool (integral part of SIMATIC STEP 7 Professional as of V13) and the migration tool plug-in for SIMOTION SCOUT TIA (included on the installation DVD for SIMOTION SCOUT/SIMOTION SCOUT TIA) are installed.
- The TIA Portal migration tool and the migration tool plug-in must be mutually compatible in the version.
- STEP 7 as of V5.5 SP4 is installed.
- SIMATIC STEP 7 Safety Advanced is installed so that Safety projects can be migrated.
- WinCC flexible 2008 as of SP3 is installed provided that an HMI is available.
- SIMOTION SCOUT as of V4.4 is installed.
- SIMOTION SCOUT TIA as of V4.4 is installed.
- SIMOTION SCOUT and STEP 7 must be mutually compatible in the version.
- The SIMOTION SCOUT project is consistent and can be compiled without error.
- You have saved the SIMOTION SCOUT project in SIMOTION SCOUT as of version 4.4.
- The SIMOTION SCOUT project does not use any devices, objects or functionality not supported by SIMOTION SCOUT TIA.
  (See Section Supported devices (Page 584) and Section Supported functionalities (Page 584).)

Note

SIMOTION SCOUT TIA V4.5 and V5.1 in the same project format

TIA Portal projects that you created with SIMOTION SCOUT TIA V5.1 still have the project format of version V4.5.

Once you have used SIMOTION Version V5.1 devices in your TIA Portal project, a TIA Portal project becomes version V14 SP1. You then require a compatible version for the migration tool and the SCOUT version for the migration.

Note

Save and compile in SIMOTION SCOUT

Save and compile the project in SIMOTION SCOUT with the "Save and recompile everything" command before you start the migration.

Procedure

To migrate a SIMOTION SCOUT project, proceed as follows:

1. Start the TIA Portal.
2. Select the "Migrate project" entry in the secondary navigation in the Portal view.
3. Use the "..." button to set the source path to the SIMOTION SCOUT project that you want to migrate.
4. Activate the "Include hardware configuration" option.
5. Assign a name to the migrated project.
6. Click the "..." button to set the target path.
7. Enter any required comments in the comment field.
8. Start the migration with the "Migrate" button.

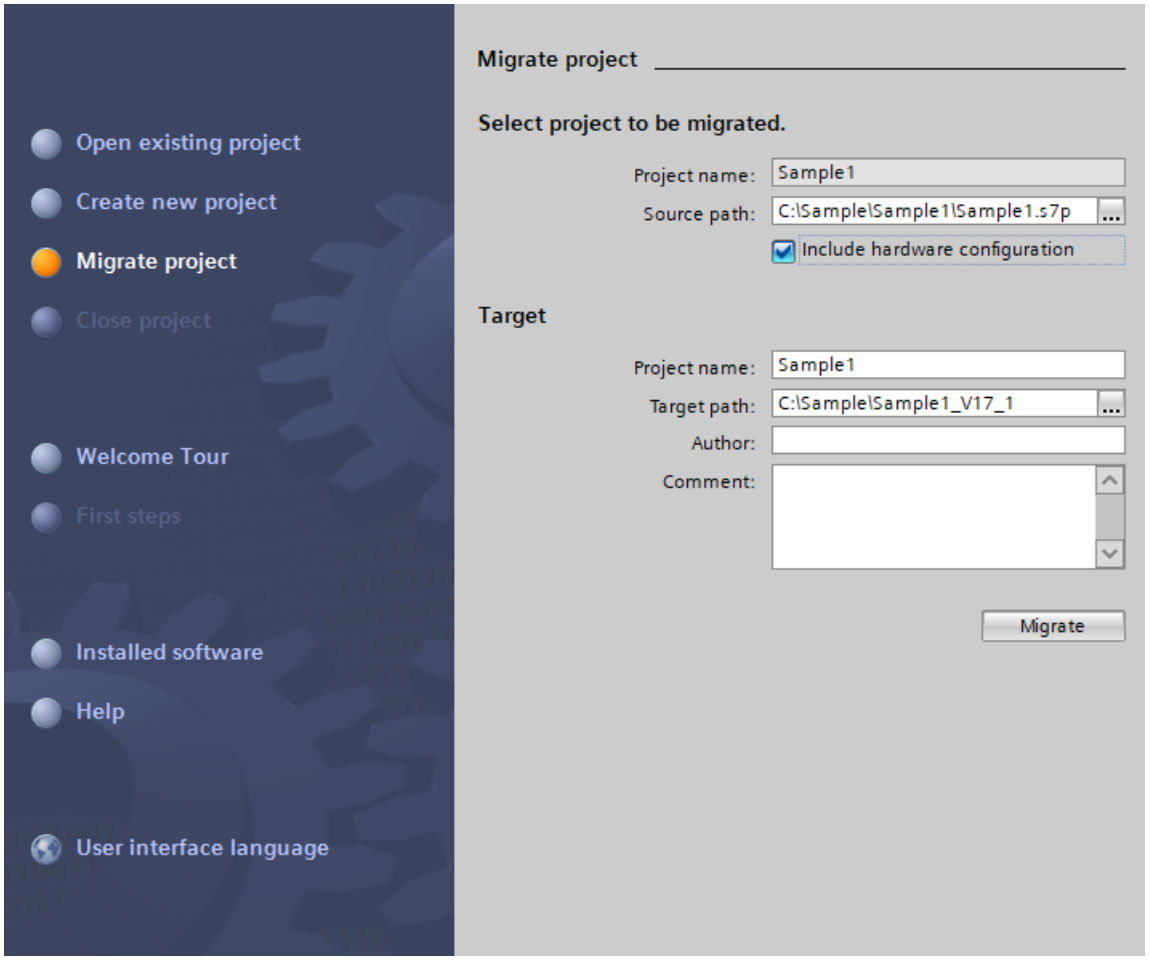

Figure 3-320 Migration

Result

The migrated project opens in the TIA Portal.

You can find the migrated project in the selected target directory.

Note

Save and compile in SIMOTION SCOUT TIA

Save and compile the project in SIMOTION SCOUT TIA with the "Save and recompile everything" command before you start working with the project.

Note

Abort of the migration

The migration is aborted with an error message if the SIMOTION SCOUT project to be migrated uses SIMOTION/SINAMICS devices that are not supported by SIMOTION SCOUT TIA, or the SIMOTION SCOUT project contains objects that are not supported.

In the event of an error, open the project in SIMOTION SCOUT and remove the devices/objects that are not supported, or upgrade the firmware of the devices used.

For information on which devices/objects/functionalities are supported, see Section Supported devices (Page 584) and Section Supported functionalities (Page 584).

Detailed information on the firmware upgrade can be found in Section "Upgrade" of the SIMOTION SCOUT TIA online help.

If the project includes further components in addition to SIMOTION components, such as SIMATIC components and HMI, then the migration conditions specified therein are also applicable.

Migration outside TIA Portal as dual-computer solution

In many cases, the project that you want to migrate is not located on the same PG/PC on which the TIA Portal is installed. The migration tool converts the initial project into a compatible format. This file can be imported and further process in the TIA Portal.

Procedure

To migrate a SIMOTION SCOUT project, proceed as follows:

1. Start the migration tool on computer 1.

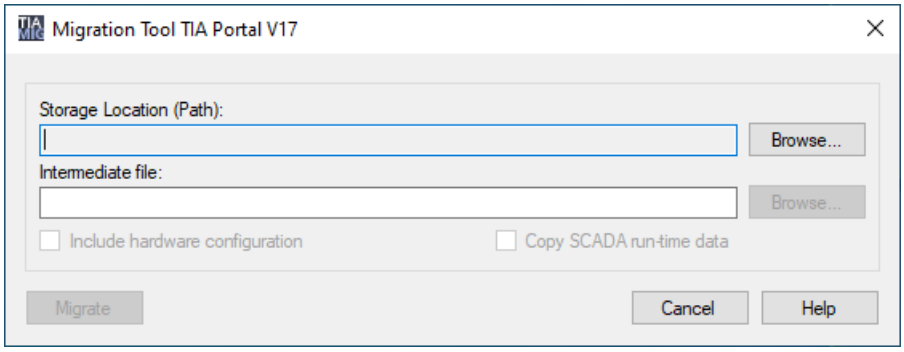

Figure 3-321 Migration tool

2. Navigate to your source project.
3. At "Intermediate file:", set the target path under which the migration file is to be saved.

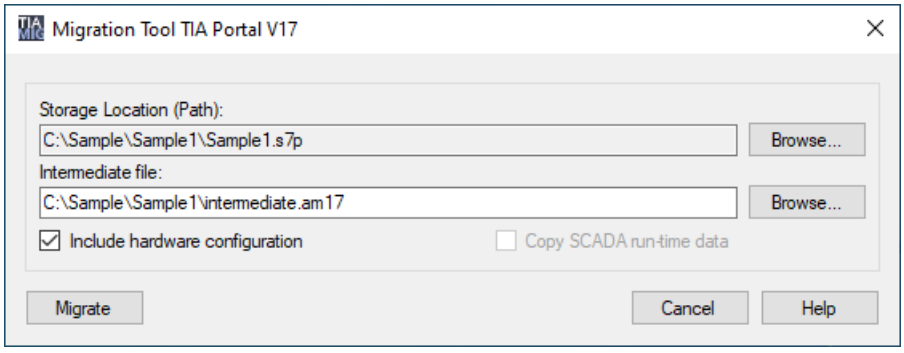

Figure 3-322 Setting the paths

4. Activate the "Include hardware configuration" option (include hardware configuration).
5. Migrate the source project in the migration file format with the appropriate file extension ".amxx".
6. Copy the migration file to the target system, computer 2.
7. Perform the migration within the TIA Portal using the procedure described under "Migration in the TIA Portal".
   Under "Source path", select the generated migration file ".amxx" as the project to be migrated.

Result

The migrated project opens in the TIA Portal.

You can find the migrated project in the selected target directory.

Note

Save and compile in SIMOTION SCOUT TIA

Save and compile the project in SIMOTION SCOUT TIA with the "Save and recompile everything" command before you start working with the project.

Exporting and importing projects

Fundamentals

You can export a whole project or individual projects and subsequently import them into another project.

This functionality is available to you both in SIMOTION SCOUT and in SIMOTION SCOUT TIA. An exchange of project data is thus possible via export and import.

Restrictions

You can only export the SCOUT data with SIMOTION SCOUT TIA because hardware and network configuration is performed in the TIA Portal. Similarly, you can only import projects in SIMOTION SCOUT TIA without the hardware configuration.

Note

Export/import is only possible in offline mode.

Export and import functions

The following functions are available to you in each of the applications:

SIMOTION SCOUT	SIMOTION SCOUT TIA
Export/import of complete projects (with and without hardware configuration)	Export/import of a project without hardware configuration
Export/import of individual devices	Export/import of an existing project without hardware configuration
Export/import of individual data or objects	Export/import of technology objects, watch tables, programs, drive objects, scripts (see restrictions in Section Appendix A (Page 948)), and global device and I/O variables.

The export and import functions for complete projects are described below.

Requirements

Complete projects can only be exchanged between SIMOTION SCOUT and SIMOTION SCOUT TIA via the export/import function if the hardware is identical.

The SCOUT data exported from SIMOTION SCOUT must have identical device properties (name, type, version) in order to be able to import it into SIMOTION SCOUT TIA. From the point of view of configuration, a SIMOTION D435-2 DP V4.5 and a D435-2 DP/PN V4.5 are the same type.

Procedure for exporting from SIMOTION SCOUT

To export a project from SIMOTION SCOUT, proceed as follows:

1. Start SIMOTION SCOUT.
2. Open the project that you want to export.
3. Compile the project.
4. Change to offline mode.
5. Mark the project in the project navigator, right-click to open the context menu and select "Project > Expert > Save and export...".
6. In the next dialog, enter a target directory for the export.

   Note

   Access violation to target directory

   Before the export, all files in the specified target directory are deleted. Therefore make sure that no application accesses a subdirectory or file of the specified target directory (e.g. Windows Explorer). In case of an error, export will be interrupted with an error message. In this case, close the associated application or the opened file and restart the export.

7. If necessary, activate the "Use optimized export format" option.
   In this format, the storage volume is reduced because only the data required for a running system is exported. For example, all comments, minimum and maximum values of parameters from files are suppressed.
8. If necessary, deactivate the "Export, including hardware configuration (STEP 7 data)" option.
9. Confirm with "OK".

Result

The project has been exported into the specified target directory.

Procedure for exporting from SIMOTION SCOUT TIA

To export a project from SIMOTION SCOUT TIA, proceed as follows:

1. Start the TIA Portal.
2. Open the project that you want to export.
3. Switch to SIMOTION SCOUT TIA.
4. Compile the project.

5. Change to offline mode.
6. Mark the project in the project navigator, right-click to open the context menu and select "Project > Expert > Save and export...".
7. In the next dialog, enter a target directory for the export.

   Note

   Access violation to target directory

   Before the export, all files in the specified target directory are deleted. Therefore make sure that no application accesses a subdirectory or file of the specified target directory (e.g. Windows Explorer). In case of an error, export will be interrupted with an error message. In this case, close the associated application or the opened file and restart the export.

8. If necessary, activate the "Use optimized export format" option.
   In this format, the storage volume is reduced because only the data required for a running system is exported. For example, all comments, minimum and maximum values of parameters from files are suppressed.

Procedure for importing into SIMOTION SCOUT

To import XML data for projects that you exported previously from SIMOTION SCOUT or SIMOTION SCOUT TIA, proceed as follows:

1. Open the project into which you want to import the data.
2. Change to offline mode.
3. Mark the project in the project navigator, right-click to open the context menu and select "Project > Expert > Import SCOUT data...".
4. Select the XML file to be imported under "Source path and name of the import file" in the next dialog box.
5. Select the target path and target name of the project file.
   This displays the target path and target name of the currently opened project.
6. Confirm with "OK".
7. Compile the project.

Result

You have imported the project.

Procedure for importing into SIMOTION SCOUT TIA

You only import the SIMOTION SCOUT data without hardware configuration into SIMOTION SCOUT TIA. If there is any hardware configuration data in the import file it will be ignored. You can optionally delete any libraries, watch tables, messages contained in the target project when you import. Please note that you can only import SCOUT data if a corresponding hardware configuration exists in the target project. You overwrite the existing SCOUT data when you import.

Note

Backup copy before importing

If necessary, make a backup copy of the project before you import because deleted and replaced data cannot be restored after being imported.

To import the SIMOTION SCOUT data, proceed as follows:

1. Open the project into which you want to import the data.
2. Change to offline mode.
3. Select "Project > Expert > Import SCOUT data..." or select the project in the project navigator and select "Expert > Import SCOUT data..." in the context menu.
4. In the dialog that then opens, select the source path and the source name for the import.
5. Confirm with "OK".
6. Compile the project.

Note

Alarm_S messages

Alarm_S messages are incremented in the number range starting at 60,000,000 hex for the migration from SIMOTION SCOUT to SIMOTION SCOUT TIA.

As of SIMOTION SCOUT TIA V5.2, you can edit the number value in this range.

Note that the Alarm_S information text is limited to the same characters as the Alarm_S text.

Note that the associated values in the Alarm_S text can be only displayed formatted appropriately for the data type.

Configure Alarm_S messages in SIMOTION SCOUT TIA in accordance with the TIA Portal specifications for data type formatting.

If you reconfigure Alarm_S messages in SIMOTION SCOUT, check the message text for compatibility with TIA Portal.

To do this, activate the "Check compatibility with TIA Portal" option.

Note also for previously configured Alarm_S messages the TIA Portal specifications for data type formatting.

Detailed information is contained in the information system of the TIA Portal at "Configuring messages".

Result

You have imported the project.

Additional references

You will find detailed information about exporting and importing individual objects or devices, for example, in section "Exporting and importing" of the SIMOTION SCOUT TIA online help.

Examples of export/ import (Page 641)

Migrating a SIMOTION SCOUT project (Page 632)

Examples of export/ import

The migration of a project via export and import by two examples is illustrated below.

Export/import of SIMOTION SCOUT data to SIMOTION SCOUT TIA (Example 1)

A project of SIMOTION SCOUT is migrated to SIMOTION SCOUT TIA via export and import of the SIMOTION SCOUT data.

Requirements

- A project with two C240 CPUs with distributed synchronization via PROFIBUS or PROFINET.
- A SIMOTION D CPU with an axis interconnected with a drive to the SINAMICS Integrated.
- An ST program with a P1 program that runs in the BackgroundTask.
- The project can be compiled without errors.

Procedure

1. Export the project to SIMOTION SCOUT.
   – Deactivate the "Export including hardware configuration (STEP 7 data)" option during export.
2. Create a new project in the TIA Portal.
3. Configure the hardware in the TIA Portal same as in SIMOTION SCOUT.
4. Open SIMOTION SCOUT TIA and import the previously exported SIMOTION SCOUT data.
5. Compile the project.

Result

- The distributed synchronization is established.
- The connection of the axis to the drive is established.

- Program P1 is entered in the execution system (BackgroundTask).
- The project can be compiled without errors.

Export/import of SIMOTION SCOUT TIA data to SIMOTION SCOUT (Example 2)

A project of SIMOTION SCOUT TIA is migrated to SIMOTION SCOUT via export and import of the SIMOTION SCOUT data.

Requirements

Modify the sample project previously imported into SIMOTION SCOUT TIA as follows:

- Move the program P1 from the BackgroundTask to the MotionTask_1.
- Add a further drive to the SINAMICS Integrated.
- The axis is connected with the new drive.
- The project can be compiled without errors.

Procedure

1. Export the project to SIMOTION SCOUT TIA.
   – SCOUT data without hardware configuration
2. Start SIMOTION SCOUT.
3. Open the previously exported project from example 1.
4. Import the previously exported project from example 2.
5. Compile the project.

Result

- The axis is connected with the new drive.
- The program P1 is entered in the MotionTask_1.
- The program can be compiled without errors.

Commissioning the drives (Page 824)

Converting projects

Project conversion is necessary when a SIMOTION SCOUT TIA project was created with an older version of the TIA Portal (<V14) and is to be processed further in a newer version of the TIA Portal (V15.1).

The conversion creates a copy of the project for the current version. The project data is converted and saved in the current version.

Note

Converting projects from TIA Portal V13 to TIA Portal ≥V14

To convert a SIMOTION SCOUT TIA V4.4 project from TIA Portal V13 to a SIMOTION SCOUT TIA V4.5 project in TIA Portal V14 or to a SIMOTION SCOUT TIA V5.4 project in TIA Portal V17, you must first upgrade the project to V13 SP1 of the TIA Portal.

Upgraded projects can no longer be edited with the old TIA Portal version.

Note

Converting projects from TIA Portal V14 to TIA Portal V14 SP1

In versions V14 and V14 SP1 of the TIA Portal, you can open and process projects alternately within a SCOUT TIA version provided you do not use any new functions.

If in TIA Portal V14 SP1 you use new functions or devices in your project or different SCOUT TIA versions, you must upgrade the project.

Upgraded projects can no longer be edited with the old TIA Portal version.

Note

Global libraries

If the project contains libraries, they must also be upgraded.

When a global library in the current version of the TIA Portal opens, a copy of the library is created and it is upgraded to the current version of the TIA Portal.

3.5.5.3 Configure the device.

Adding a SIMOTION device

Note

You can add a SIMOTION device only in the TIA Portal.

A SIMOTION device can be added in several ways.

SIMOTION SCOUT TIA does not support all devices that can be configured with SIMOTION SCOUT.

To find out which SIMOTION devices are supported, see Supported devices (Page 584).

To find out which functionality is supported, see Supported functionalities (Page 584).

Procedure

To add a SIMOTION device via the project tree, proceed as follows:

1. Switch to the project view.
2. Double-click "Add new device" in the project navigation.
   The "Add new device" dialog opens.
3. Under "Controller," open the desired device variant, e.g. SIMOTION D - Drive based.
4. Select the desired SIMOTION device.
5. To display device-specific information, click the article number.
6. Select the firmware version of the installed SIMOTION device at "Version".

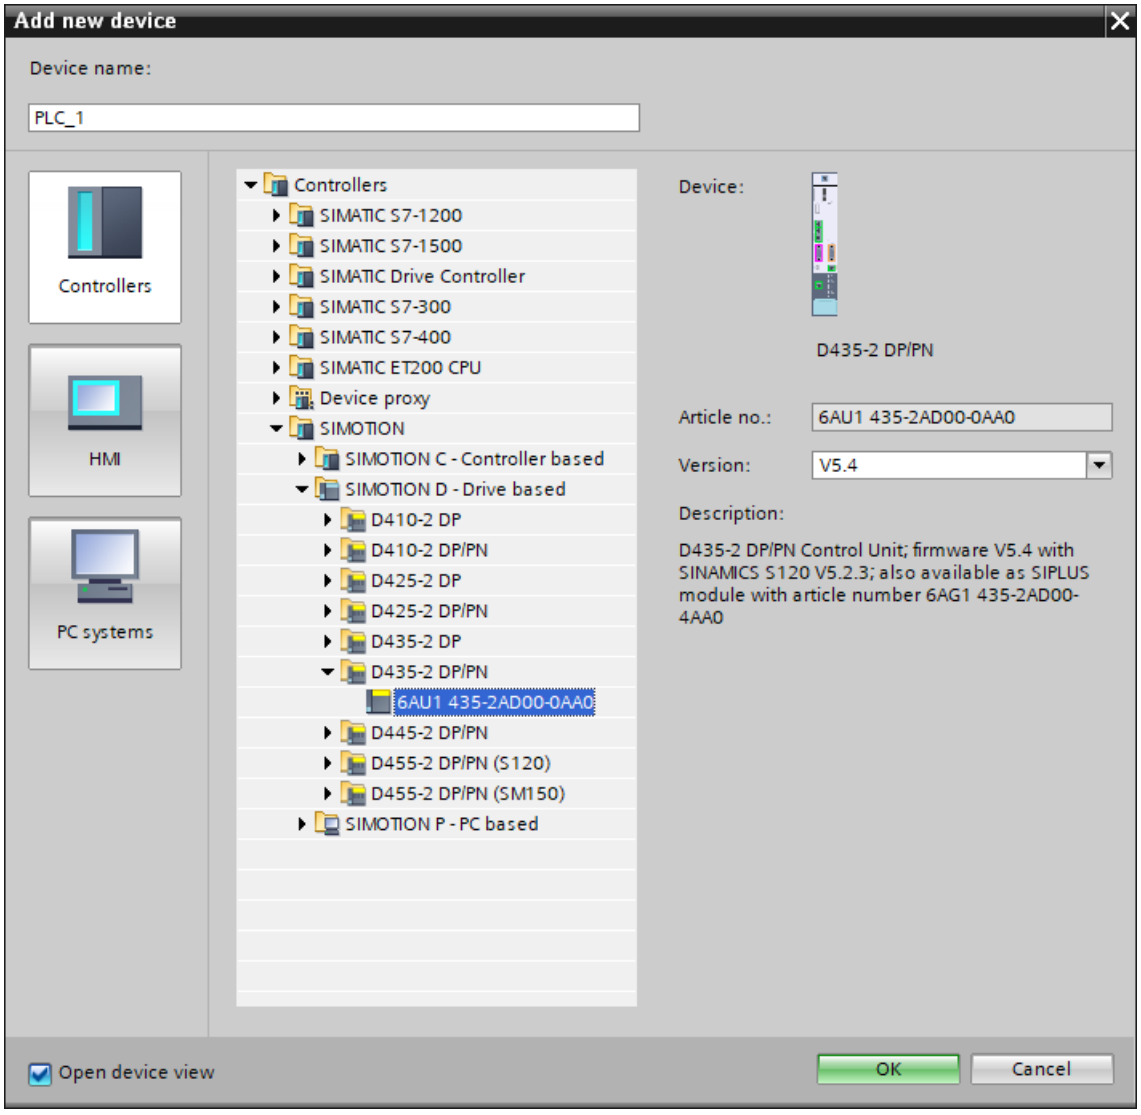

Figure 3-323 Project tree - Add device

7. Click "OK" to apply the settings and add the SIMOTION device.

Result

You have now created a SIMOTION device.

In the device view, the SIMOTION device is displayed in full graphics, showing all interfaces and properties.

In the Inspector window at "Properties", you can configure and parameterize the interfaces easily and intuitively.

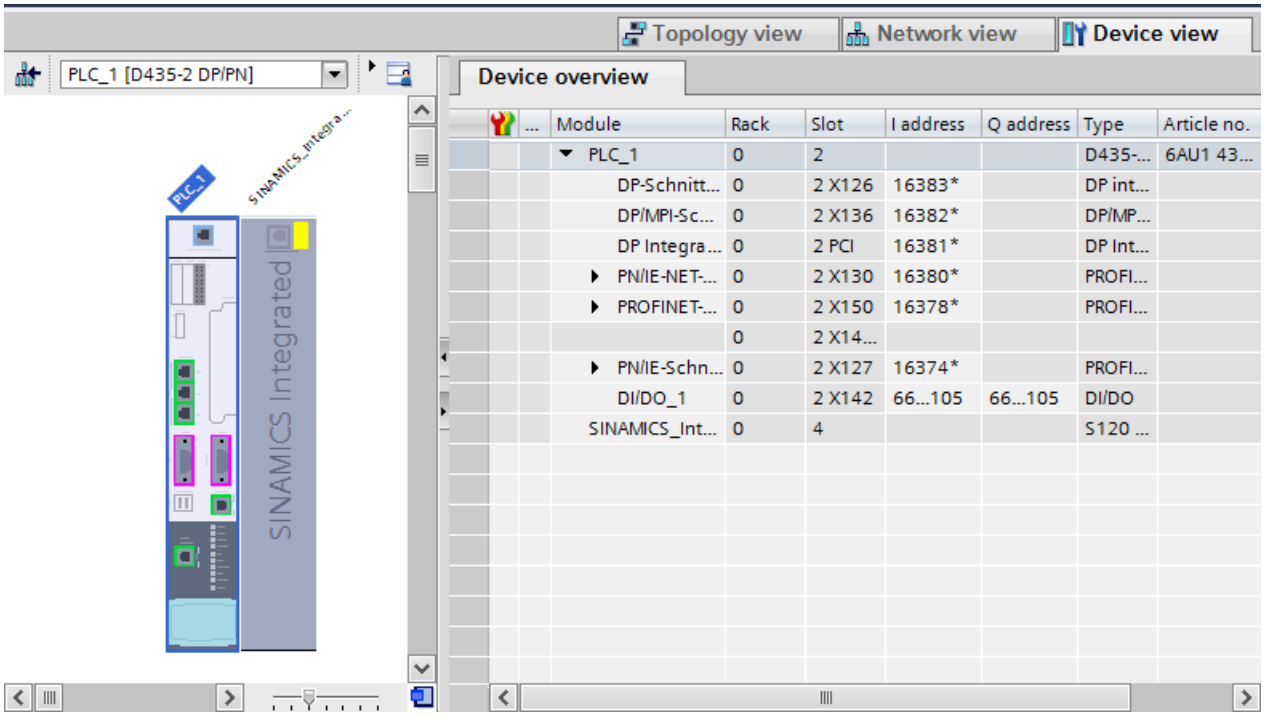

Figure 3-324 SIMOTION device in the device view

All inserted devices are also visible in the project tree.

As soon as you have inserted the SIMOTION device in the TIA Portal, it is also visible in SIMOTION SCOUT TIA.

Note

The selected firmware version must match the firmware version on the memory card of the device, otherwise you receive an error message when you switch to online mode.

Replacing a SIMOTION device

Note

You can replace a SIMOTION device only in the TIA Portal.

Procedure

To replace a SIMOTION device, proceed as follows:

1. In the TIA Portal, select the SIMOTION device that you want to replace in one of the views (topology view, network view or device view).
2. In the context menu, select the "Replace device..." command.
   The "Replace device" dialog opens.

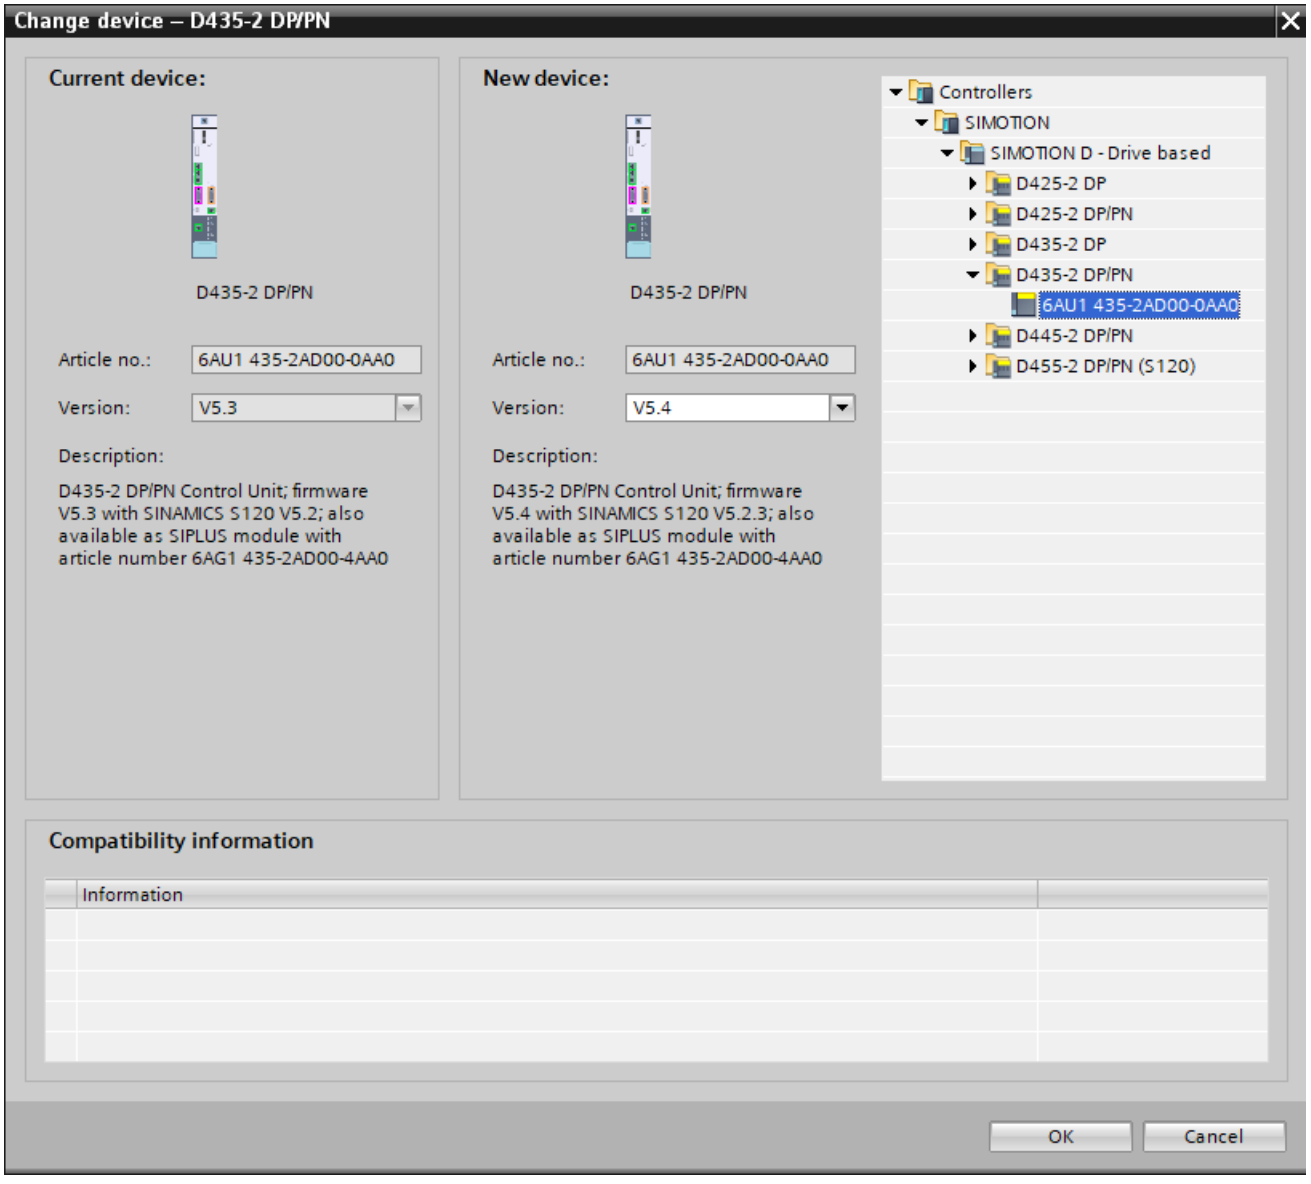

Figure 3-325 Replace device

   – The device that you want to replace is displayed in the "Current device:" area.
   – In the right-hand area, only those devices are listed that are compatible with the device that you want to replace.
3. In the right-hand area, select the new device.
   The selected device is displayed in the "New device:" area.

4. Select the correct firmware version at "Version".
   Observe the compatibility information.
5. Close the dialog with the "OK" button.
6. Save the project.

Result

You have replaced a SIMOTION device.

When you replace the device in the TIA Portal and save the project, it will also be replaced in SIMOTION SCOUT TIA.

Note

Devices must be mutually compatible.

You can only replace devices with devices that are compatible. If you select an incompatible device or an incompatible firmware version, the "OK" button remains inactive.

A SIMOTION D can be replaced with another SIMOTION D only when the associated SINAMICS version is the same or higher. It is not possible to downgrade to an earlier SINAMICS version

Replacing hardware components may result in inconsistencies in the project. The consistency check indicates any inconsistencies.

Eliminate these inconsistencies as appropriate.

Deleting a SIMOTION device

Note

You can delete a SIMOTION device only in the TIA Portal.

Procedure

To delete a device, proceed as follows:

1. Select the device you want to delete from one of the following views.
   - Device view
   - Network view
     In the graphical view or in the "Network overview" tab.
   - Topology view
     In the graphical view or in the "Topology overview" tab.
   - Project navigation
     In the tree structure of the project.
2. Press "Del".
3. Save the project.

Result

The SIMOTION device has been deleted.

Once you have deleted the device in the TIA Portal, it is also deleted in SIMOTION SCOUT TIA.

Note

Inconsistencies caused by deleting hardware components

Deletion of hardware components may lead to inconsistencies in the project.

The inconsistencies are indicated in the consistency check.

Eliminate these inconsistencies as appropriate.

Configuring an Ethernet interface

Creating an Ethernet subnet

You set up online communication of the PG/PC with the SIMOTION device via PROFIBUS, PROFINET, or Industrial Ethernet.

The most common application is the communication via Industrial Ethernet (communication via PROFINET protocol).

To configure I/O devices, you must create a subnet. The following step shows how a subnet is created.

Requirement

You have connected the PG/PC and the SIMOTION device with an Ethernet cable.

Procedure

To add a subnet to the SIMOTION device in the network view, follow these steps:

1. Click the Ethernet "X127" interface of the SIMOTION device where you would like to create a subnet.
2. Open the context menu with a right-click and select the "Add subnet" command.

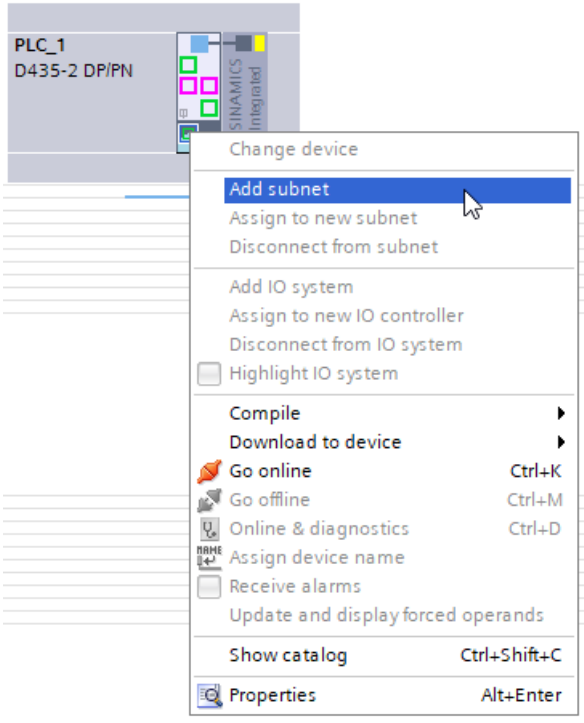

Figure 3-326 Adding a subnet

Result

You have added a subnet.

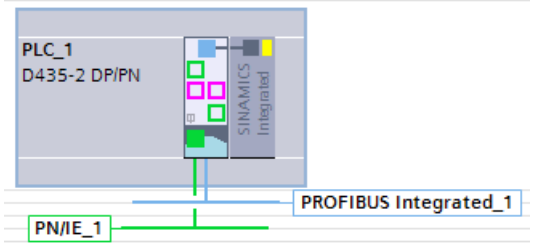

Figure 3-327 Subnet added

Add the expansion module SIMOTION - CX32-2

Note

You can insert a CX32-2 only via the hardware catalog in the TIA Portal.

If the computing performance of SINAMICS Integrated is not sufficient and you wish to use additional drives, you can insert an CX32-2 to increase performance. This module is connected via DRIVE-CLiQ and is thus networked via PROFIBUS Integrated.

Requirement

You have now created a SIMOTION device.

Procedure

To insert a CX32-2 in the network view, proceed as follows:

1. Switch to the "Hardware Catalog" task card and open the "Controller" component.
2. Open the "SIMOTION" folder and then "SIMOTION D - Drive-based".
3. At "Controller extensions", select the CX32-2 that you wish to use.

4. Drag-and-drop the CX32-2 to the PROFIBUS Integrated.
   The "Wiring between controller and CX" dialog opens.

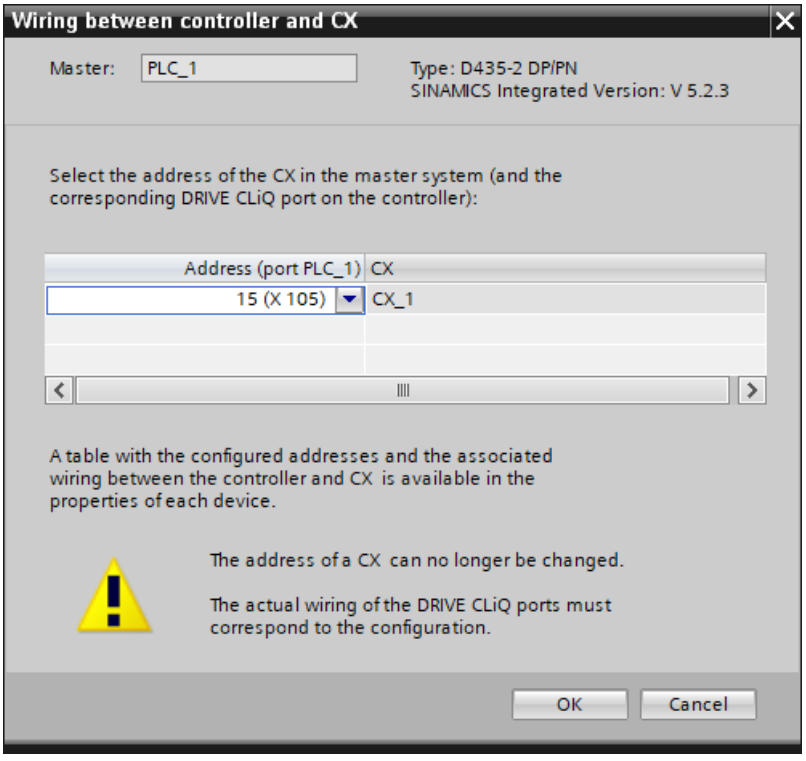

Figure 3-328 CX32-2 wiring

5. Select the address (DRIVE-CLiQ interface) to which your CX32-2 is connected. Make sure that the configured wiring is the same as the real wiring.

DP address of the CX32-2 in the master system	DRIVE-CLiQ socket on the SIMOTION device
10	X100
11	X101
12	X102
13	X103
14	X104
15	X105

6. Click OK to apply the settings.

Note

The configured address cannot be changed.

Once you have created the CX32-2 in the network view, you can no longer change the configured address.

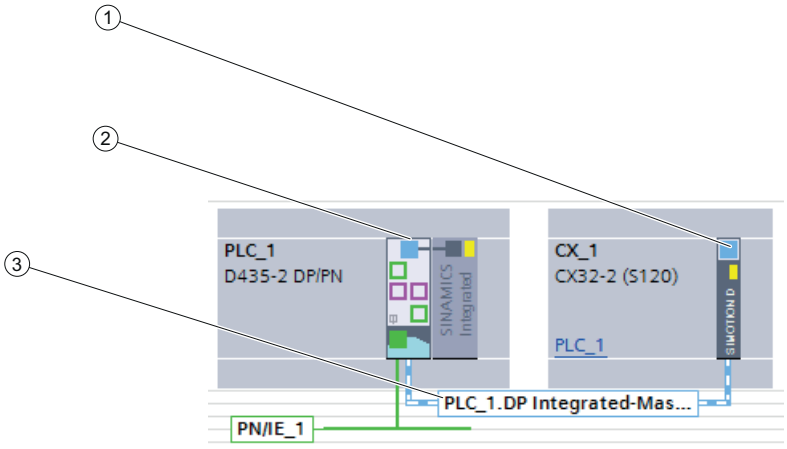
If you want to change the address anyway, you must delete the CX32-2 in the network view and then create a new one.

Result

The CX32-2 is inserted in PROFIBUS Integrated and assigned to the SIMOTION module.

PROFIBUS Integrated and the interfaces are configured in the "Properties" tab in the Inspector window.

The following figure shows a CX32-2 on a SIMOTION D435-2.



① DRIVE-CLiQ interface CX32-2
② DRIVE-CLiQ interface SIMOTION D435-2
③ PROFIBUS Integrated

Note

Configuring the CX32-2

Configure the CX32-2 interface in SIMOTION SCOUT TIA.

Using communication modules

CBE20

The device is connected to PROFINET IO using the CBE20 communication board for SINAMICS S120. The module supports PROFINET IO with isochronous Realtime Ethernet (IRT), PROFINET IO with RT, and standard TCP/IP communication.

The following SINAMICS drive devices support the onboard version.

- SINAMICS S120 CU320-2 DP CBE20 V4.5
- SINAMICS S120 CU320-2 DP CBE20 V4.7
- SINAMICS S120 CU320-2 DP CBE20 V4.8

- SINAMICS S120 CU320-2 DP CBE20 V5.1
- SINAMICS S120 CU320-2 DP CBE20 V5.1.1
- SINAMICS S120 CU320-2 DP CBE20 V5.2
- SINAMICS S120 CU320-2 PN CBE20 V4.5
- SINAMICS S120 CU320-2 PN CBE20 V4.7
- SINAMICS S120 CU320-2 PN CBE20 V4.8
- SINAMICS S120 CU320-2 PN CBE20 V5.1
- SINAMICS S120 CU320-2 PN CBE20 V5.1.1
- SINAMICS S120 CU320-2 PN CBE20 V5.2
- SINAMICS S120 CU320-2 PN CBE20 V5.2.3

When selecting a drive unit from the hardware catalog, you can decide whether to use the CBE20 communication board.

Choose the appropriate variant of the SINAMICS S120 CU320-2. You can find the CBE20 communication modules in the hardware catalog under "Controllers > SIMOTION > SIMOTION drives > SINAMICS S120".

CBE30-2

A second PROFINET interface can be implemented for the SIMOTION D4x5-2 DP/PN with the CBE30-2 communication board.

It is not possible to use a CBE30-2 in SIMOTION D4x5-2 DP controllers.

Adding a communications module

To add the CBE30-2 communication module, proceed as follows:

1. Select the SIMOTION device.
2. Switch to the device view.
3. Switch to the "Hardware Catalog" task card and open the "Controller" component
4. Open the folder "SIMOTION D – Drive-based".
5. Select the CBE30-2 communication module in the "Communication modules" folder under "PROFINET".
6. Drag-and-drop the communication board into the device view onto the interface of the device.

Inserting a SIMOTION drive

Note

You can insert a SIMOTION drive only via the hardware catalog in the TIA Portal.

A SIMOTION drive in the current version of SIMOTION SCOUT TIA is a drive of the SINAMICS S120 type (interconnection via PROFINET or PROFIBUS) interconnected with a SIMOTION CPU. The explicit SIMOTION drives you can insert can be found in Supported devices (Page 584).

These SIMOTION drives can be configured and parameterized only under these conditions (interconnection with SIMOTION CPU). The latter is configured in SIMOTION SCOUT TIA.

Procedure

To insert a SIMOTION drive (SINAMICS S120), proceed as follows:

1. Insert a SIMOTION device, if not available yet.
2. Create the bus system, e.g. DP master system or PN/IO system.
3. Navigate in the hardware catalog to the "Controller" component and open the "SIMOTION" folder.
4. Open the "SINAMICS S120" sub-folder in the "SIMOTION drives" folder and select the desired drive, in the example "CU310-2 PN".
5. Drag-and-drop the drive to the bus system.
6. Assign the master system.
   To do this, click "Unassigned" and select the device with which the drive is to be networked.

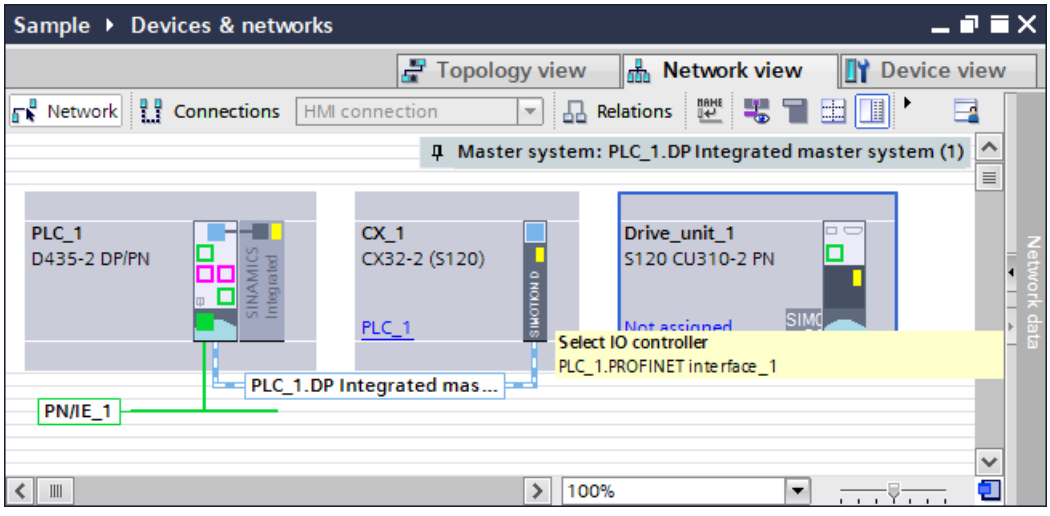


Figure 3-329 Networking the drive

Result

You have networked the drive with the SIMOTION device via the bus system.

The settings on the bus system are adapted in the "Properties" tab in the Inspector window.

Some the following settings can be made:

- Specify the transmission rate
- Configure the line
- Set the bus parameters and constant bus cycle time.

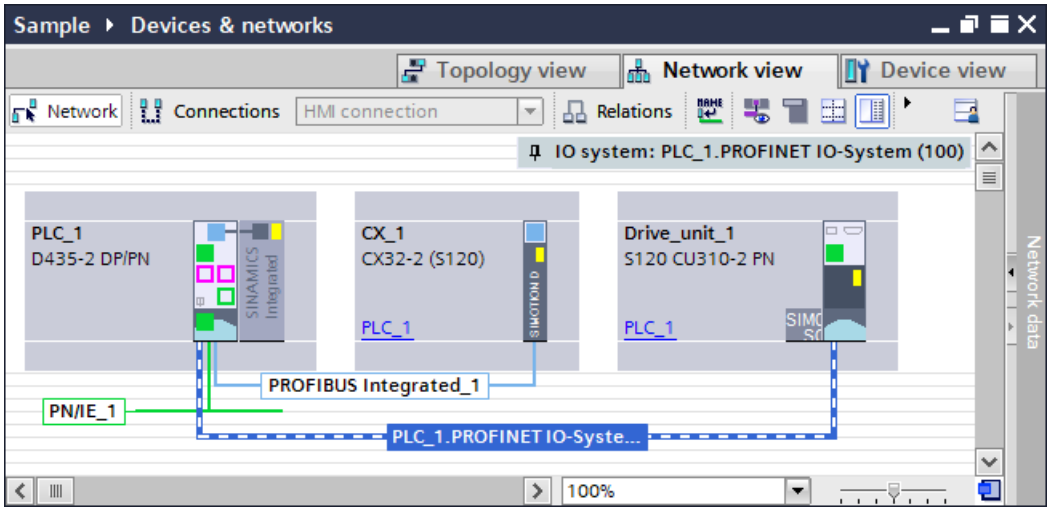

Figure 3-330 Networked drive

Note

The drive is configured in SIMOTION SCOUT TIA.

Inserting a Startdrive drive

Requirements

- You have installed the compatible "Startdrive" option package for the TIA Portal.
- You have now added a SIMOTION device.

Procedure

Inserting a drive and assigning it to a controller

To insert a Startdrive drive (e.g. SINAMICS G120, SINAMICS G110M,...), proceed as follows:

1. Add a higher-level controller, e.g. SIMOTION D435-2.
2. Switch to the network view.
3. Double-click "Add new device" in the project navigation.
   The "Add new device" dialog opens.
4. Open the variant of the drive you require at "Drives".
5. Then select the desired drive.

6. To display device-specific information, click the drive.
7. Select the firmware version of the drive at "Version".

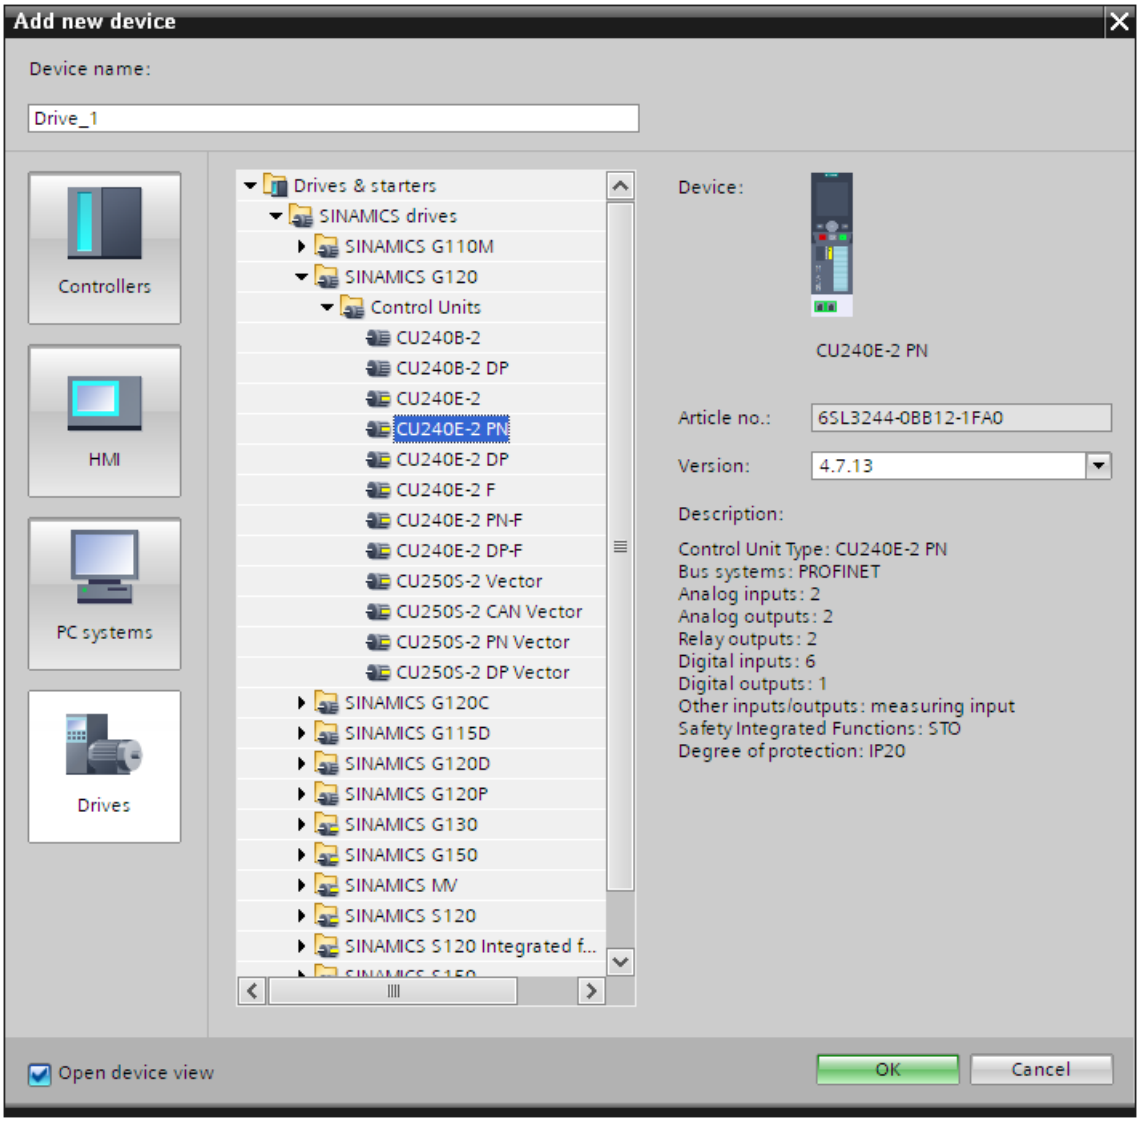

Figure 3-331 Selecting a Startdrive drive

8. Click "OK" to apply the settings and add the Startdrive drive.

Adding a Power Module

To add a Power Module, proceed as follows:

1. Switch to the device view.
2. Switch to the "Hardware Catalog" task card and open the "Power Modules" component.
3. Select the Power Module that you want to use, a PM240 in the example.

4. Drag-and-drop the Power Module onto the drive.
5. Assign the master system. To do this, click "Unassigned" and select the device with which the drive is to be networked.

Result

You have created a Startdrive drive and added the Power Module.

You have networked the drive with the SIMOTION device.

The device view displays a full graphical view of the Startdrive drive, showing all interfaces and properties.

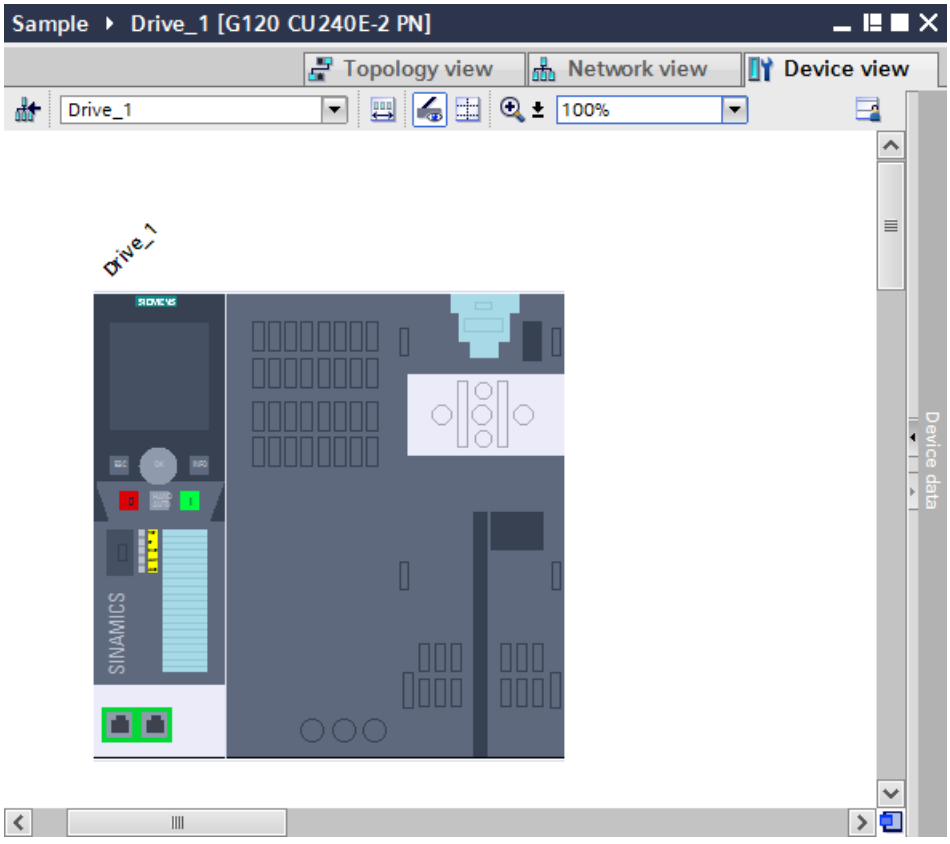

Figure 3-332 Startdrive drive in the device view

The inserted Startdrive drive is visible in the project tree.

As soon as you have inserted the Startdrive drive in the TIA Portal, it will also be visible in SIMOTION SCOUT TIA.

Note

Interconnecting and configuring Startdrive drives

Like GSD drives, Startdrive drives can be interconnected with technology objects in SIMOTION SCOUT TIA. The drives are configured with Startdrive.

Inserting a GSD drive

If you are using a drive that cannot be configured via SIMOTION SCOUT TIA or Startdrive, insert this drive as a GSD drive. Various Siemens drives, such as SINAMICS S150 CU320-2, are available as a GSD drive in the TIA Portal.

Procedure

Inserting a GSD drive and assigning it to a controller

To insert a GSD drive and assign it to a controller, proceed as follows:

1. Add a higher-level controller, e.g. SIMOTION D435-2.
2. Switch to the network view.
3. Switch to the "Hardware Catalog" task card and open the "Other field devices" component.

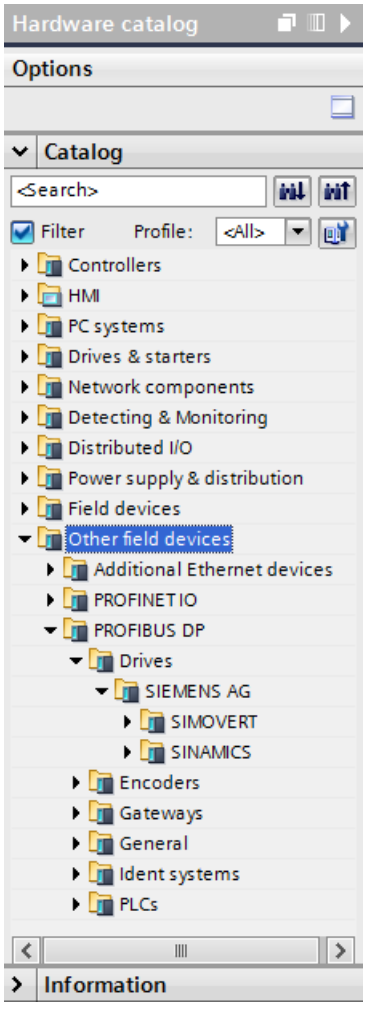

Figure 3-333 Selecting field devices

4. Select the GSD drive in the hardware catalog, SINAMICS GM150 in the example.

5. Drag-and-drop the GSD drive to the "Network view".
6. Assign the master system.
   To do this, click "Unassigned" and select the device with which the GSD drive is to be networked.

Configuring telegrams for the communication

Communication between the controller and the drive is performed via PROFIdrive telegrams. Different telegrams are available, depending on the task.

To add a telegram for the communication between controller and drive, proceed as follows:

1. Select the GSD drive and switch to the device view.
2. Display the device overview.
3. Switch to the "Hardware catalog" task card.
   The telegrams available for this drive are displayed.

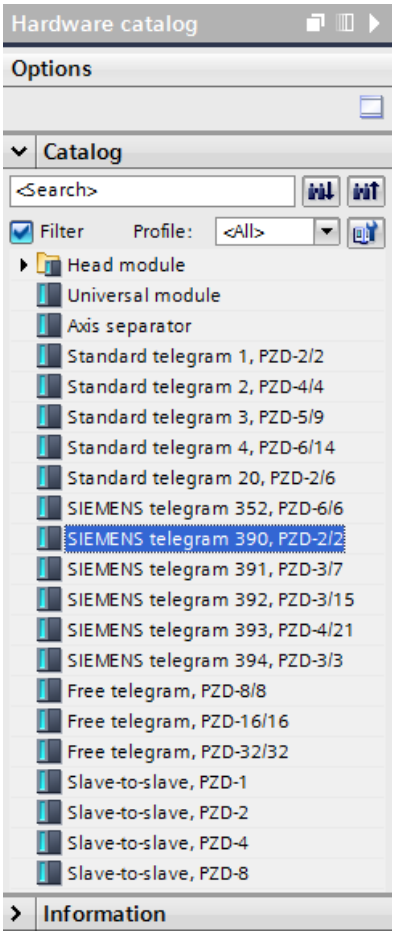

Figure 3-334 Hardware catalog telegrams

4. Select a telegram.
   In the device view, the possible positions for insertion are indicated by blue lines.

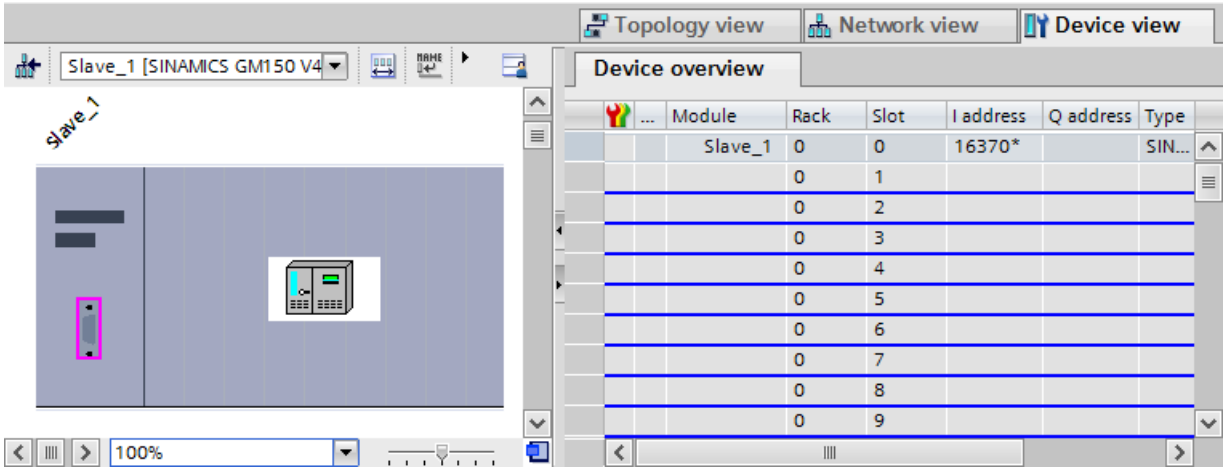

Figure 3-335 Selecting a telegram

5. Drag-and-drop the telegram into the device overview and the desired position.
   The I/O addresses are assigned automatically.
6. If required, adapt the I/O addresses for the Motion Control applications.

Result

You have created a GSD drive and networked it with the SIMOTION device.

You have inserted a telegram for the communication between controller and drive.

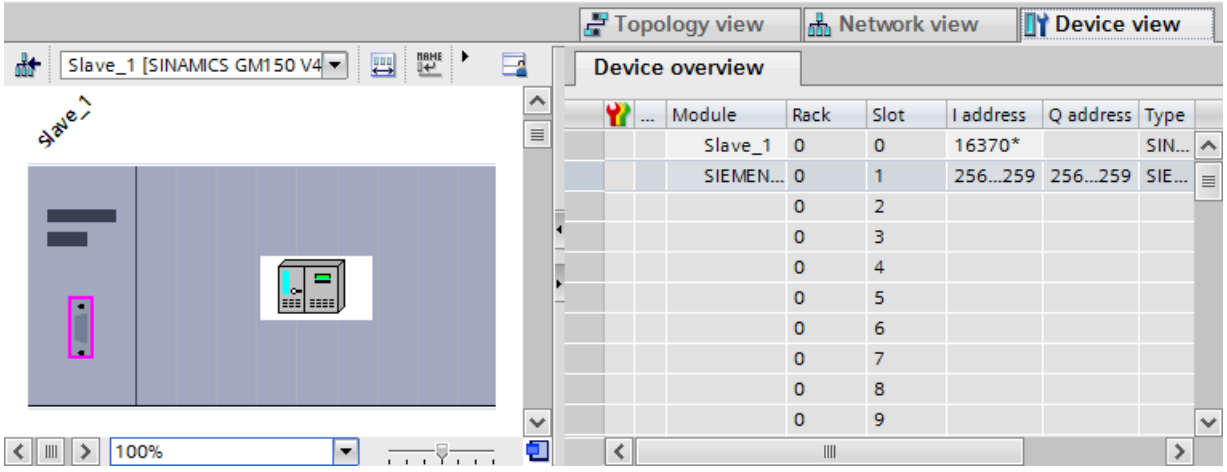

Figure 3-336 Telegram inserted into device overview

As soon as you have inserted the GSD drive in the TIA Portal, it will also be visible in SIMOTION SCOUT TIA.

3.5.5.4 Configuring online access

Online access of the project

Displaying available nodes in the TIA Portal

In the "Online access" folder in the project navigation, you will find all active interfaces at your PG/PC. At each interface icon, you receive information about the current status. You can view the available nodes and use the context menu to show and change the properties of an interface.

Procedure

To display the available nodes on a single interface of the PG/PC, proceed as follows:

1. Open the "Online access" folder in the project navigation.
2. To make all objects ordered below the interface visible, click the arrow at the left next to the "Online access".
3. Double-click "Update accessible nodes" below the interface.
   All nodes that can be accessed via this interface are displayed in the project navigation.

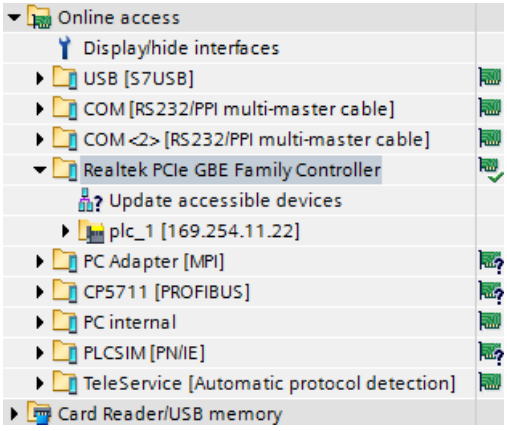

Figure 3-337 Accessible nodes

Setting up the PG/PC communication

Note

You assign the PG/PC interface in the TIA Portal.

Communication between the SIMOTION device and the PG/PC requires a conditioner card (for PROFIBUS) or an Ethernet interface. You configure, parameterize, program and test using the PG/PC.

The following options to assign the PG/PC interface are available:

- "Connect online" function
  The function is available until the PG/PC interface has been successfully set up.
- "Online & diagnostics" function
- "Online access" function

Assign PG/PC interface

The following procedure describes the process for the Ethernet interface type by using the "Online access" function.

To assign the interfaces, proceed as follows:

1. Navigate to the appropriate interface in the project tree at "Online access".
2. Select the "Properties..." command in the context menu.

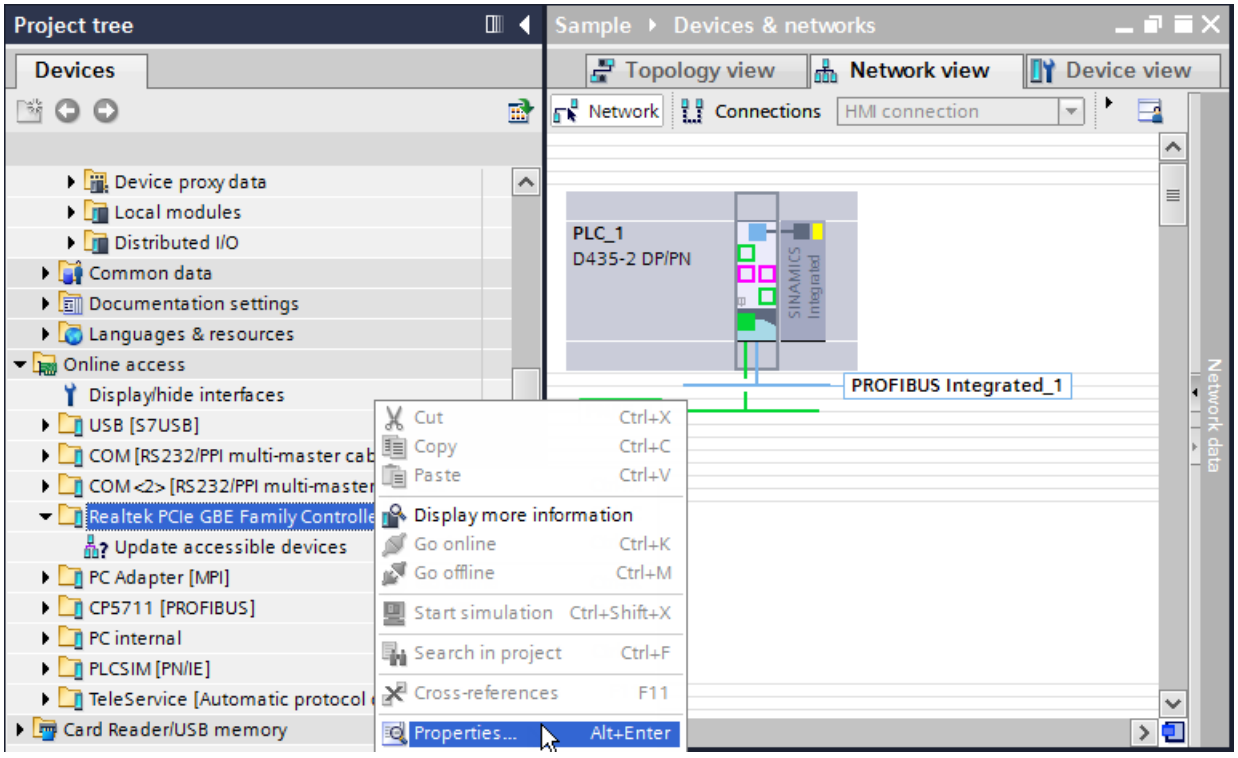

Figure 3-338 Online access properties

3. In the next step, select the subnet and apply the setting with "OK".

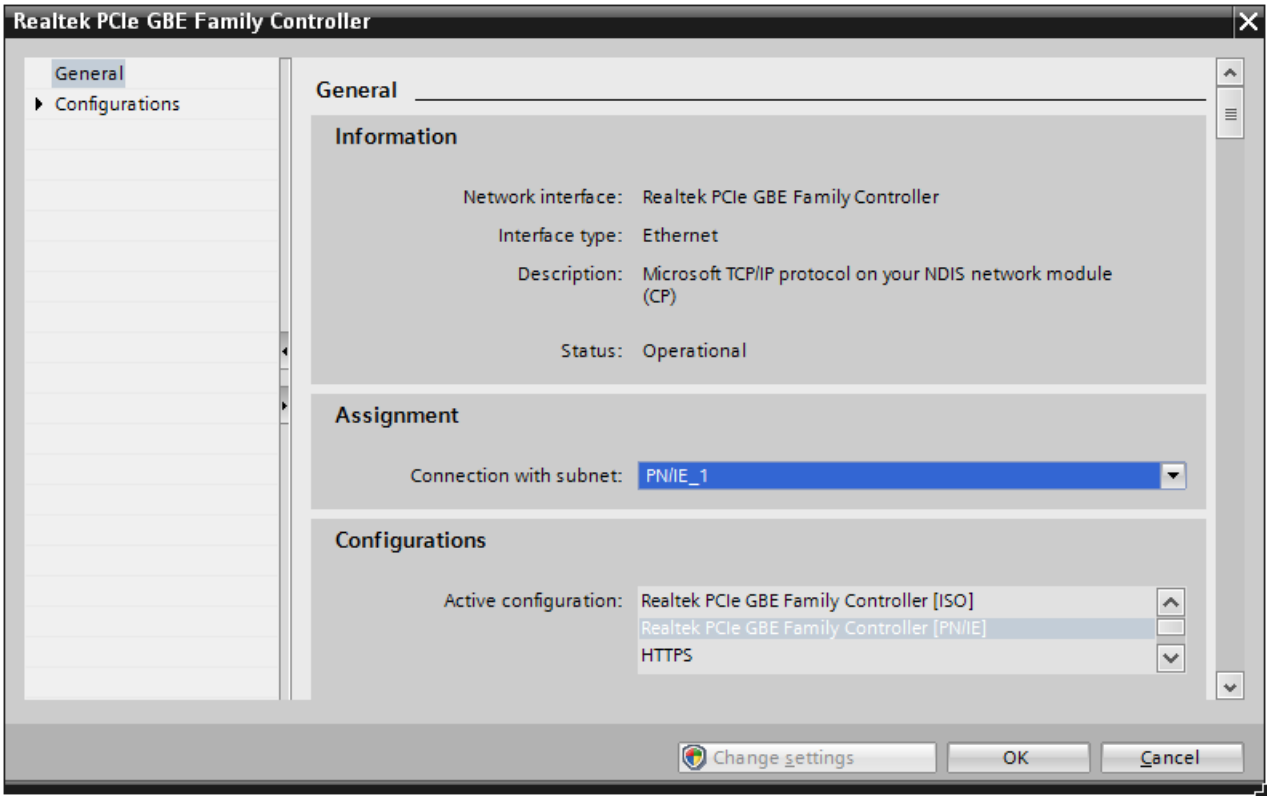

Figure 3-339 Assigning a subnet

Adding an IP address in the subnet

If the SIMOTION device and the PG/PC are not in the same subnet, add a suitable IP address from the subnet of the device to the PG/PC.

To automatically add an IP address in the subnet, proceed as follows:

1. Click Go online in the toolbar.
   The "Connect online" dialog opens.
2. Click "Start search" to search for accessible devices.

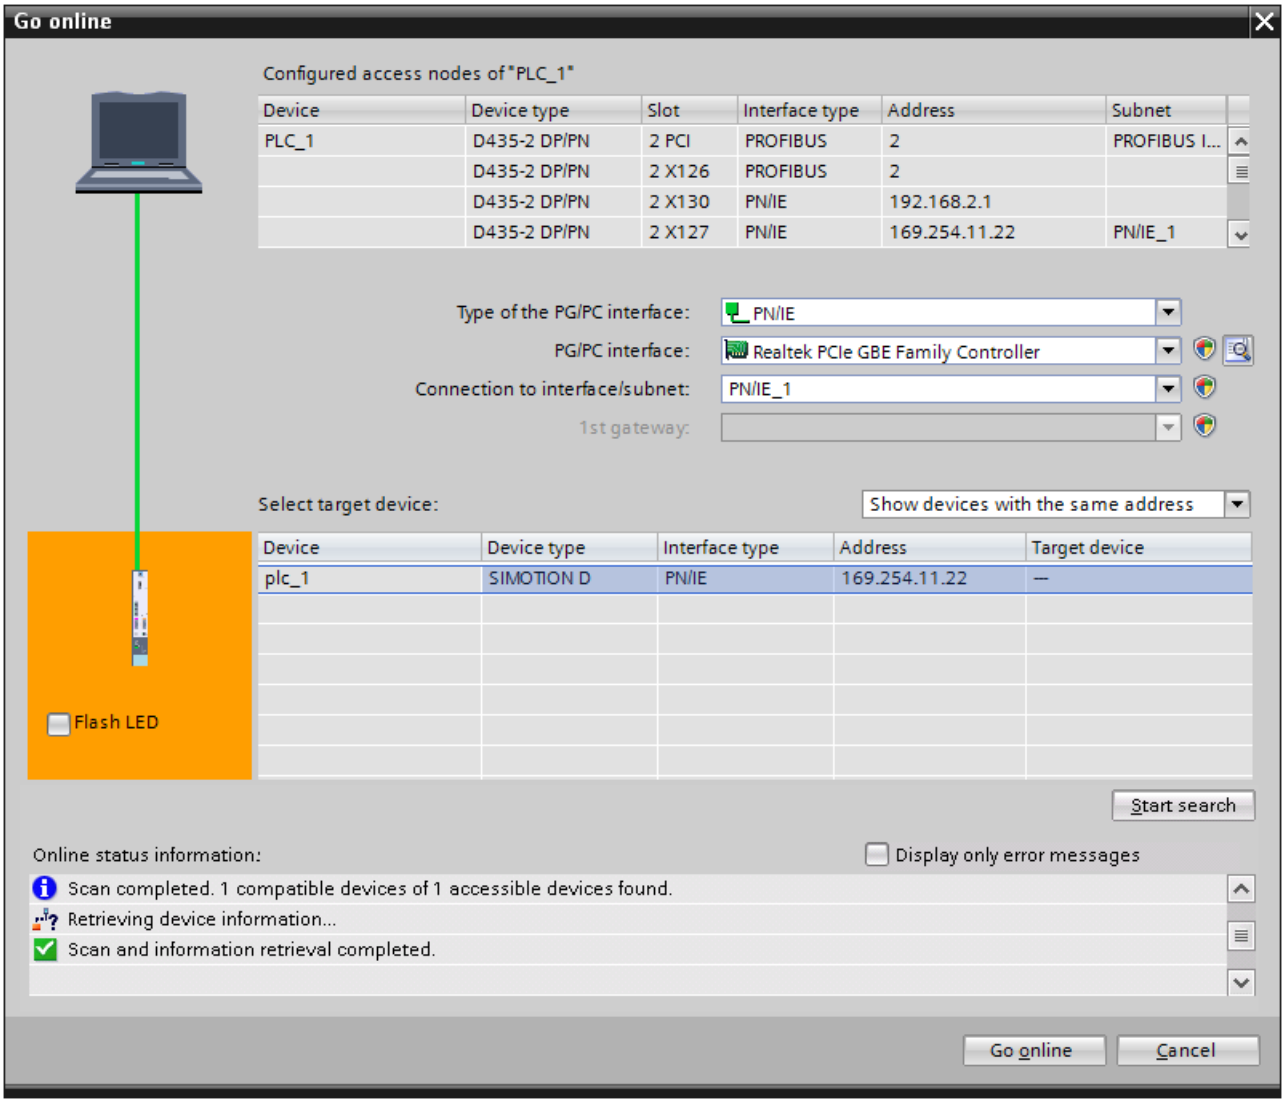

Figure 3-340 Connect online - select a device

3. Click "Connect" in order to establish a connection to the device located by the search.

4. If the SIMOTION device and the PG/PC are not in the same subnet, a message is displayed offering you the option of temporarily assigning a suitable IP address from the subnet of the device.

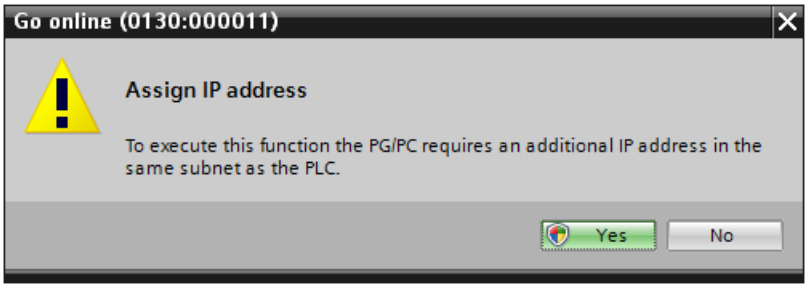

Figure 3-341 Assigning an IP address

5. Confirm with "Yes".

Figure 3-342 IP address assigned

6. To use the connection path specified in the settings as default for the online access, click "Yes".

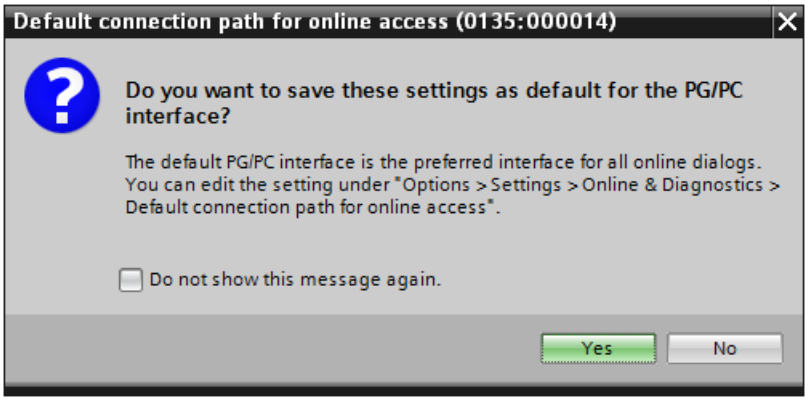

Figure 3-343 Default connection path

Result

- You have assigned the PG/PC interface.
- The TIA Portal has assigned an IP address within a project.
- The online connection has been established.
  The title bar of the project navigation is orange colored.

Displaying and deleting temporary IP addresses

You can display and also delete all temporarily assigned addresses.

To display and delete temporary IP addresses, proceed as follows:

1. Navigate in the project navigator at "Online access" to the appropriate interface.
2. Select "Properties" in the context menu.
3. At Configuration, select the "IE-PG access" entry.

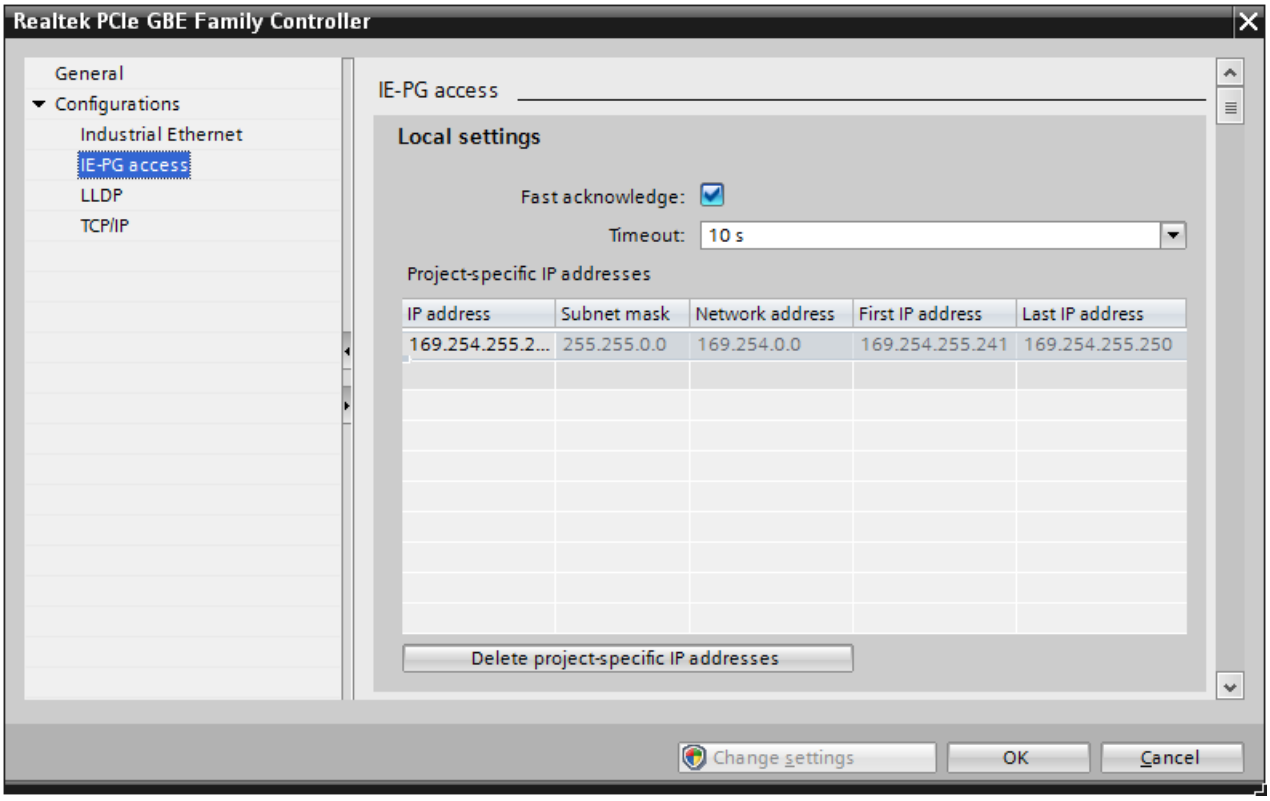

Figure 3-344 Displaying and deleting temporary IP addresses

Compiling the project and downloading the hardware configuration to the SIMOTION device

Note

Downloading the hardware configuration

Before you continue configuring in the SIMOTION SCOUT TIA, download the hardware configuration in the TIA Portal to the SIMOTION device.

Downloading to the SIMOTION device from the TIA Portal is necessary, for example, if you want to change the device names of the IP address. In addition, the loading in the TIA Portal results in the routing information being loaded.

Requirement

The online connection to the SIMOTION device is disconnected.

Procedure

To compile the hardware configuration and download to the SIMOTION device, proceed as follows:

1. Select the SIMOTION device and select "Compile > Hardware (only changes)" in the context menu.

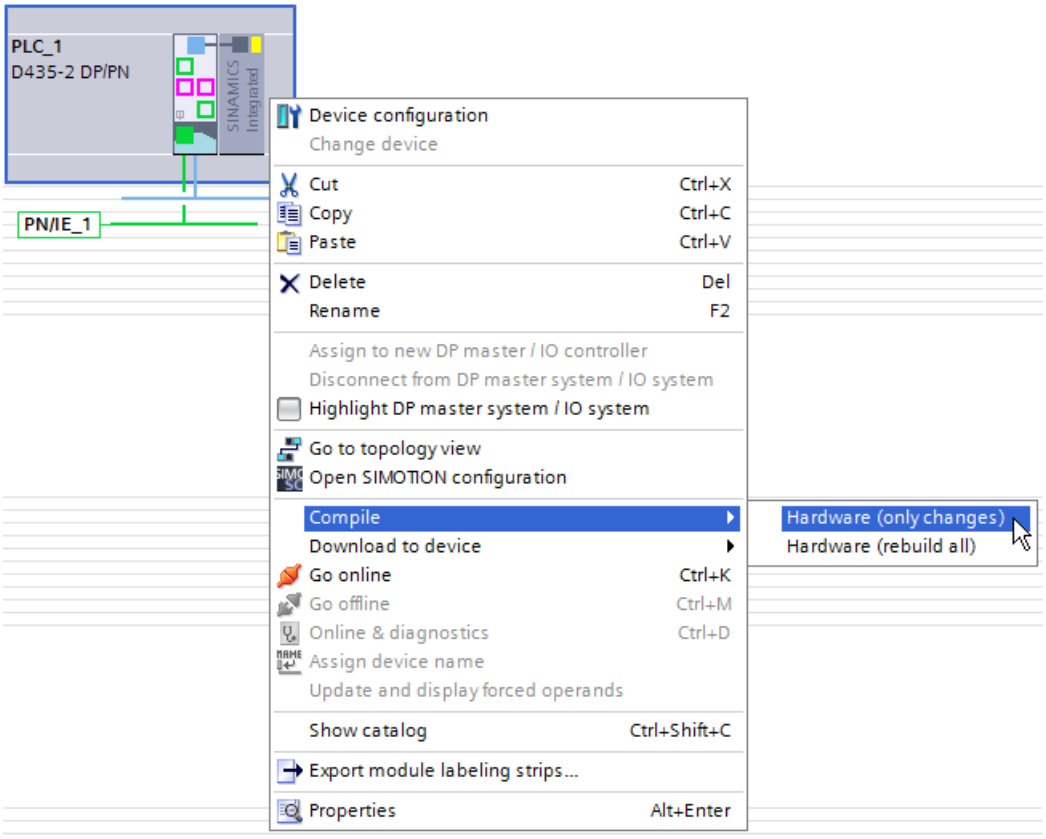

Figure 3-345 Compile hardware

2. Select the SIMOTION device and select "Load to device > Hardware configuration" in the context menu.

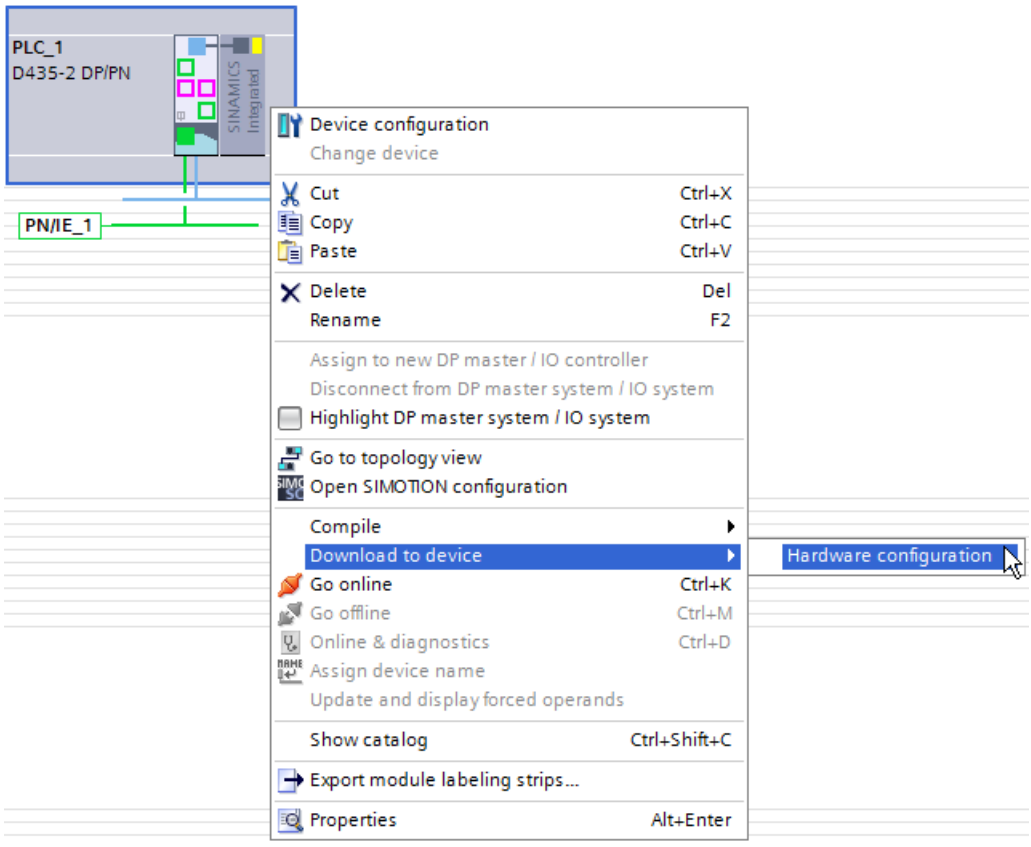

Figure 3-346 Load hardware

– If you have already established an online connection, the "Load Preview" dialog opens. In this dialog, messages are displayed and actions required for loading suggested.
– If you have not yet established any online connection, the "Advanced Load" dialog opens and you must first select the interfaces with which the online connection to the device should be established.

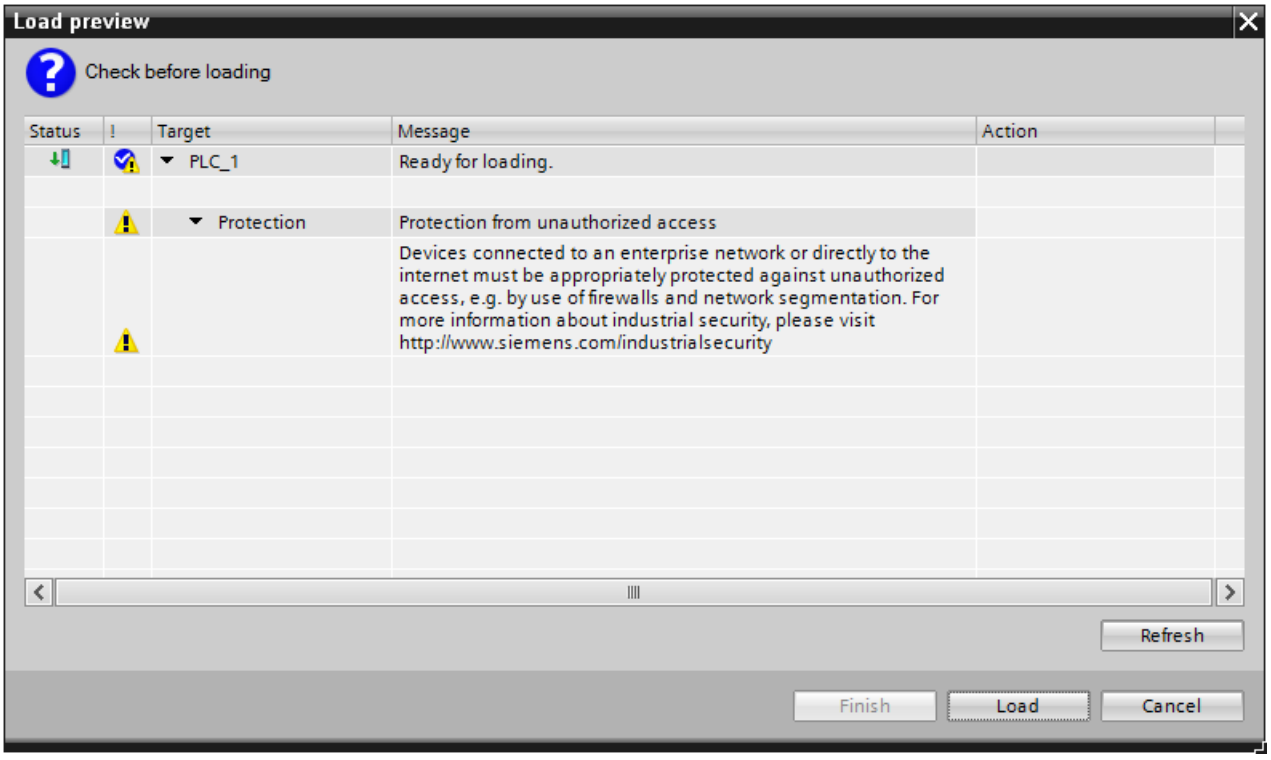

Figure 3-347 Loading the preview

3. Click "Load".

Result

You have compiled the current hardware configuration and loaded it to the target device.

Additional references

You will find a detailed description of how to set up the Ethernet interfaces in SIMOTION SCOUT TIA in the online help "SIMOTION SCOUT TIA Getting Started".

For detailed information about the configuration of the online access, refer to the information system of the TIA Portal "Configuring online access".

3.5.5.5 Diagnostics and functions

Overview

The following device diagnostics functions are available, for example, via the online and diagnostics view:

- Display diagnostics status of a module
- Read out diagnostics buffer of a CPU
- Assign an IP address to a PROFINET IO device

- Determine and set the time of a CPU
- Assign PROFINET device name
- Reset the parameters of the PROFINET interface

Calling up the online and diagnostics view

To call up the online and diagnostics view, proceed as follows:

1. Open the device view.
2. Select the module to be diagnosed.
3. Select "Online> Online & diagnostics" from the main menu or select "Online & diagnostics" in the context menu.

Result

The online and diagnostics view of the module to be diagnosed is started.

Note

Establish the online connection

If no online connection is available when starting the online and diagnostics view, no online information can be displayed. The corresponding display fields remain empty.

Structure of the online and diagnostics view

Via the "Online access" group it is displayed if there is currently an online connection to the associated target or not. Furthermore, you can also establish or cancel an online connection.

The "Diagnostics" folder contains several diagnostic groups for the selected module.

The "Functions" folder contains several groups in which you can change the settings on the selected module, or output commands to the module.

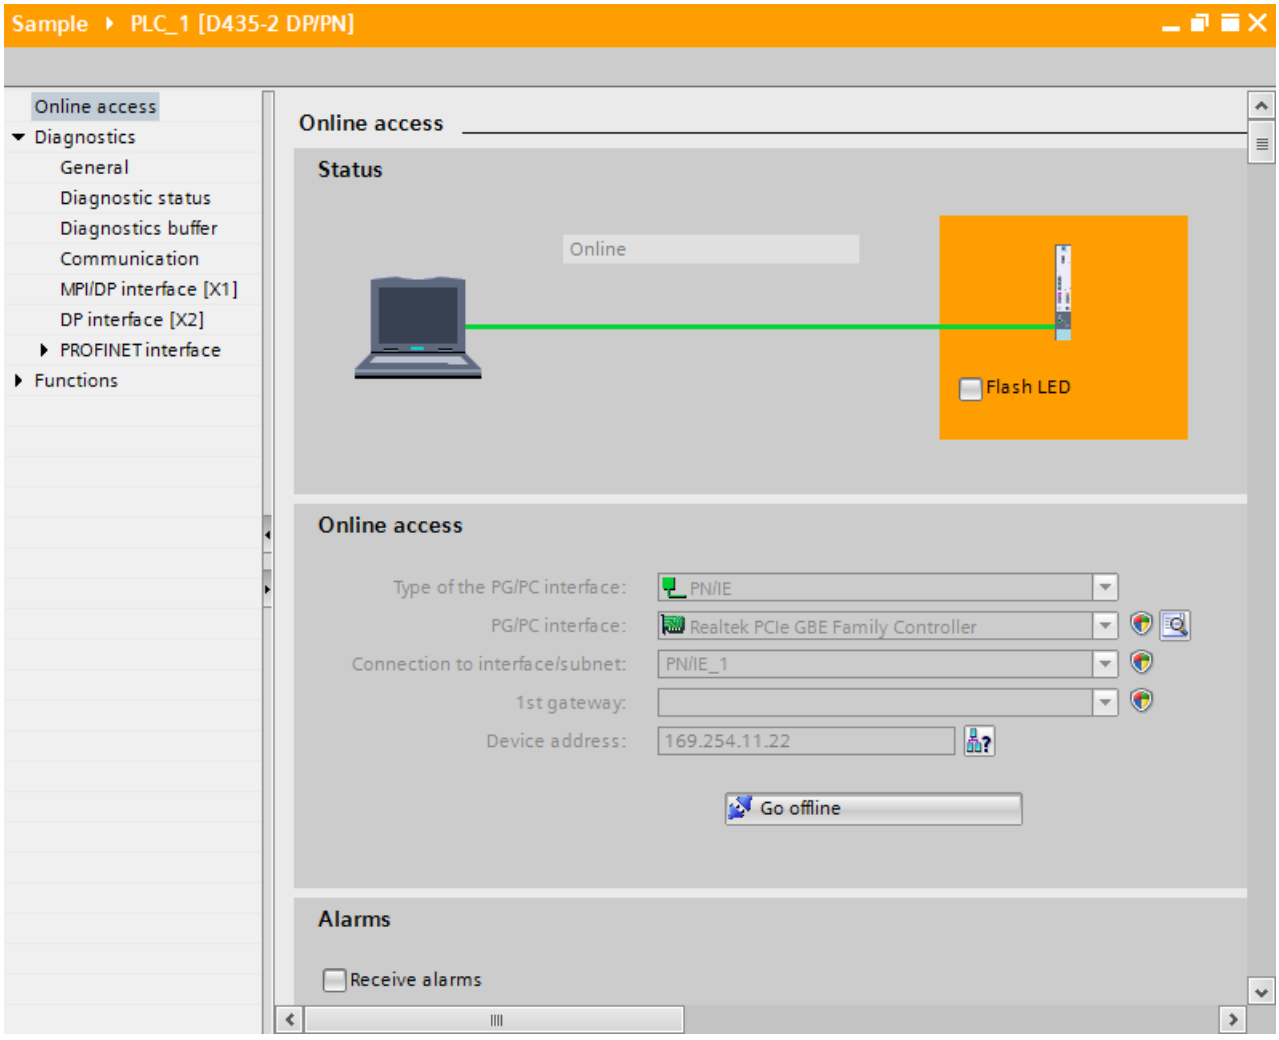

Figure 3-348 Online and diagnostics view

Diagnostics

General

The "General" group shows the general characteristics and system-relevant information of a module.

The following areas are displayed:

Module	The "Module" area contains information such as short designation, article number, firmware, hardware, rack and slot.
Module information	The "Module information" area contains information such as device name, module name, plant ID and location designation.
Manufacturer information	The "Manufacturer information" area contains information, such as manufacturer description, serial number, copyright and profile details.

Diagnostics status

The "Diagnostics status" group displays the status of the module from the perspective of the CPU.

Diagnostics buffer

The diagnostics buffer is used as a log file for the diagnostic events that have occurred on the CPU and its associated modules. The diagnostic results are entered in the order in which they occurred, with the most recent event shown at the top.

The following areas are displayed:

Events	Activate the "CPU time stamp considers local PG/PC time" option if you want the diagnostics buffer entries to be displayed with the time that is calculated using the following formula: Displayed time = module time + time zone offset of your PG/PC. It is assumed that the module time is identical with UTC. Use this setting if you want to see the local time of your PG/PC as the time-of-day in the diagnostics buffer entries of the module. If you activate or deactivate the checkbox, the time information of the diagnostics buffer entries is immediately adjusted. The events with consecutive number, date and time, and short description of the event are listed in the events table. If you click the "Freeze display" button, the current display of the diagnostics buffer entries will be frozen. If there is a quick succession of diagnostic events, this lets you examine the entries without a hurry. The CPU continues to enter events in the diagnostics buffer. Click "Cancel freezing" to update the diagnostics buffer entries again.
Event details	Detailed information such as the consecutive number of the event in the diagnostics buffer, event ID, description of the event with event-related additional details, time stamp, and information as to whether it is an incoming or outgoing event is displayed in the "Events" area. If you click the "Help for event" button, the selected event will be explained in greater detail and, if applicable, remedies are suggested. If you click the "Open in editor" button, the referenced block is opened in the offline view at the programming instruction causing the error if reference is made in the diagnostic event to a relative address of a block. This allows you to check the source code of the block at the specified location and, if necessary, change and subsequently load it back into the CPU. If the diagnostic event was triggered by a module, the "Open in editor" function opens the device view of the module concerned. Click "Save as..." if you want to save the contents of the diagnostics buffer in a text file.
Settings	In the "Settings" area, you can configure how the events should be displayed.

Communication

The following areas are displayed:

Connection resources, maximum number	Specifies the maximum number of available connection resources of the module. In each case, a certain number of available connection resources is reserved for PG, OP communication, S7 communication, and S7 basic communication. However, you can create additional PG or OP connections; the number of unassigned connection resources is then reduced accordingly.
Cycle load through communication	The CPU's cycle time can be extended due to communication processes. These communication processes include, for example: • Data transfer to another CPU • Loading of blocks is triggered via a programming device (PG) The duration of these communication processes can be controlled to a certain extent by means of the CPU parameter "Cycle load through communication". Via the parameter "Cycle load through communication", you indicate the percentage of total CPU processing power that is to be available to the communication processes.

Displaying interfaces and interface properties of a module

The interfaces and interface properties of a module can be found in the following groups:

- MPI/DP interface
- DP interface
- PROFINET interface

Additional references

Detailed information about diagnostic functions can be found in the information system of the TIA Portal at "Diagnose hardware".

Functions

Assigning an IP address

If the IP address of a device is located in a different subnet than the IP address of the network card, you must first assign the network card an additional IP address with the same subnet address as that of the device. Only then is communication between the device and the PG/PC possible.

Select "Connect online", for example, in order to automatically assign a temporary address in the same subnet to the PG/PC. A prompt is displayed automatically if the current IP address of the PG/PC is not already located in the correct subnet.

A temporarily assigned IP address is valid until the next restart of the PG/PC or until it is manually deleted.

Setting the time-of-day

In the "Set time-of-day" folder, you can determine and change the time of a CPU. This is only possible if there is an existing online connection.

The following areas are displayed:

PG/PC time:	Here the set time zone, the current date, and the current time-of-day of your PG/PC is displayed.
Module time	The "Module information" area contains information such as device name, module name, plant ID and location designation. This displays the current date and time values that were read from the module (e.g. CPU) and converted to local time. If the "Import from PG/PC" checkbox is activated, clicking on the button "Apply" triggers transfer of the date and the PG/PC time-to-day converted to UTC time) to the module. If the "Import from PG/PC" checkbox is deactivated, you can specify the date and time-of-day for the internal clock of the module. After clicking the "Apply" button, the date and time-of-day of day (converted to UTC time) will be transferred to the module.
Time system	In the "Time system" area, the following factors are considered for the time-of-day and synchronization: • **Resolution**: Specifies the accuracy of the calculation and output of the time-of-day. • **Real-time clock**: Indicator whether the CPU has a real-time clock: "available" when yes; "not available" when no. • **Correction factor**: Parameterized correction factor for the real-time clock of the module. The daily deviation of the clock is corrected using the correction factor. Synchronization can be achieved through synchronization mechanisms between the clocks of various sub-systems. The time synchronization settings are made during module parameterization. The integrated real-time clock - if present - can synchronize the clocks of other modules (master) or can be synchronized by the clocks of other nodes (slave), or it does not participate in the synchronization. Synchronization can be performed in the AS or MPI.

Assigning a PROFINET device name

Before an IO device can be addressed by an IO controller, it must have a device name. In the case of PROFINET, this method was chosen because names are easier to handle than complex IP addresses.

The assignment of a device name for a PROFINET IO device can be compared with setting the PROFIBUS address of a DP slave.

In its delivery state, an IO device does not have a device name. An IO device can only be addressed by an IO controller, for example, for the transfer of project engineering data (including the IP address) during startup or for user data exchange in cyclic operation, after it has been assigned a device name with the PG/PC.

Additional references

Detailed information about diagnostic functions can be found in the information system of the TIA Portal at "Diagnose hardware".

3.5.6 Configuring communication

3.5.6.1 Devices, networks and communication services in the TIA Portal

Configure and parametrize communication

Editing devices and networks

In the TIA Portal, you edit devices and networks in the hardware and network editor. For a detailed description, refer to the corresponding section in the information system of the TIA Portal at "Editing devices and networks". Note that modules can be fully parameterized only if they are assigned to a CPU. Therefore, PROFIBUS or PROFINET modules need to be networked first, so that they form a master system or IO system.

Only then, for example, can the addresses of the components be edited.

In this section, only the settings relevant to SIMOTION are listed below:

- PROFIBUS Integrated on SIMOTION D
- SIMOTION on PROFIBUS DP
- SIMOTION and PROFINET IO
- SIMOTION drives on PROFIBUS DP
- SIMOTION drives on PROFINET IO

Note

SIMOTION communications

The theoretical principles of the communication for SIMOTION are contained in the *Motion Control Communication* Manual.

Representation in the user interface

Devices and networks are shown in the device view and the network view.

Device view

In the device view, the device is illustrated with all interfaces. Additional modules can also be added, e.g. communication boards.

In the device overview, the parameters of the individual interfaces are shown in tabular form.

If you select an interface or the whole device, you will see the corresponding parameters displayed in tabs in the Inspector window.

Network view

In the network view, you perform the following tasks:

- Configure and parametrize devices
- Network devices with each other

For SIMOTION devices, this means they are interconnected with each other, with drives, SIMATIC modules or PN IO devices (e.g. ET200SP, third-party devices) in the network view.

In the network overview, the parameters of the modules are shown in tabular form.

If you select a device or the bus, you will see the corresponding parameters displayed in tabs in the Inspector window.

Configuring telegrams

Telegrams are generally configured in SIMOTION SCOUT TIA. Telegrams are configured in the TIA Portal for drives and other hardware that have been inserted, for example, via GSD. In SIMOTION SCOUT TIA, you specify the telegrams or allow specification of the telegrams by the symbolic assignment. The telegrams configured for the respective drive objects are displayed in the device overview of the device in the TIA Portal.

Device overview

Module	Rack	Slot	I address	Q address	Type	Order no.
Drive unit_1	Rack_0	0	16369*		S120 CU 320-2 PN	6SL3 040-1MA01
PROFINET interface_1	Rack_0	0 X1	16368*		PROFINET-Interface	
Drive_1	Rack_0	1			Drive object	
Module access point_1	Rack_0	1 1	16365*		Module access point	
SIEMENS telegram 105	Rack_0	1 2	288...307	288...307	SIEMENS telegram 105, PZD-1...	
	Rack_0	1 3				
	Rack_0	1 4

	Rack_0	3 3				

Figure 3-349 View telegrams

Note

Handling telegrams

Deleting telegrams in the TIA Portal can result in synchronization errors between SCOUT TIA and the TIA Portal.

- Avoid deleting telegrams in the TIA Portal.

Move the slots in the TIA Portal device overview

- The moving of individual slots in the TIA Portal device overview can cause problems when saving and compiling or during the telegram alignment. The "Value outside permissible range" message appears. For this reason, do not move any slots in the device overview.

Telegram configuration and symbolic assignment

Introduction

The communication and also the communication roles of PROFINET IO controllers / IO devices or master-slave relationships for PROFIBUS DP are based on the use of telegrams. The telegrams and necessary interconnections can be automatically created during configuration in SIMOTION SCOUT TIA via the symbolic assignment. This in turn is a requirement for the automatic setting of the communication relationships in the TIA Portal.

Symbolic assignment in SIMOTION SCOUT TIA

SIMOTION SCOUT TIA supports the symbolic assignment on SINAMICS drive objects (DOs, Drive Objects) during the configuration of technology objects (TOs) and I/Os. This simplifies the configuration of the technological relationships, including communication between IO controllers and IO devices (e.g. drives) for PROFINET IO or master and slave for PROFIBUS DP.

After the configuration of the hardware in the TIA Portal (devices created, ports interconnected), you should configure the drives and technology objects (axes) in SIMOTION SCOUT TIA. Because of the selected functions for the configuration of the drives and technology objects, the required telegrams are determined. They are used as basis for the communications configuring in the TIA Portal. If a telegram configuration exists, the TIA Portal makes the required settings automatically, e.g. the Sync-Master and Sync-Slave synchronization roles are preassigned automatically and a synchronous mode set. Note this for further actions.

Note

Before communications are configured in the TIA Portal, the drive and axis should be configured with active symbolic assignment in SIMOTION SCOUT TIA.

For further information about the symbolic assignment, see the *SIMOTION Runtime Basic Functions* Function Manual.

Time-of-day synchronization via NTP

Introduction

To ensure that all components throughout the system have the same time of day, they must be synchronized to a time of day and one component must be the time generator for all the others. One possibility is to synchronize the time of day via an NTP server.

For NTP, the device sends time of day queries in regular time intervals to the NTP server in the subnet. A router must be used if the NTP server is located outside the subnet. The most accurate time of day is determined based on the responses and used to synchronize the station time of day. NTP has the advantage that the synchronization is also performed over subnet limits.

NTP time-of-day synchronization properties

- The NTP server is configured at the PN/IE interface of the controller. The PN interface via which communication with the time-of-day server actually takes place is determined on the basis of the IP address configured in the TCP/IP stack.
  - X7 with C240
  - X130 with D4x5
  - X127 with D410
  - X1 with P320-4
- Up to four servers can be configured as time generator.
- NTP does not support any automatic adjustment between summer and winter time.
- Time zones cannot be set. UTC (Universal Time Coordinated) is always transferred. It is identical with GMT (Greenwich Mean Time).

Configuring NTP in SIMOTION SCOUT

Introduction

The NTP time-of-day synchronization of a SIMOTION CPU can be configured in the TIA Portal.

Procedure

How to configure the NTP time synchronization:

1. In the device view, click the PN/IE interface (e.g. for D4x5 X130).
2. In the Inspector window, select "Properties > General" and click "Time-of-day synchronization".
3. Activate the "Activate time-of-day synchronization via NTP server" checkbox.

4. Enter the IP addresses for as many as four NTP servers. A router must be used when the IP address lies outside the subnet of the SIMOTION controller.
5. Select the refresh interval.

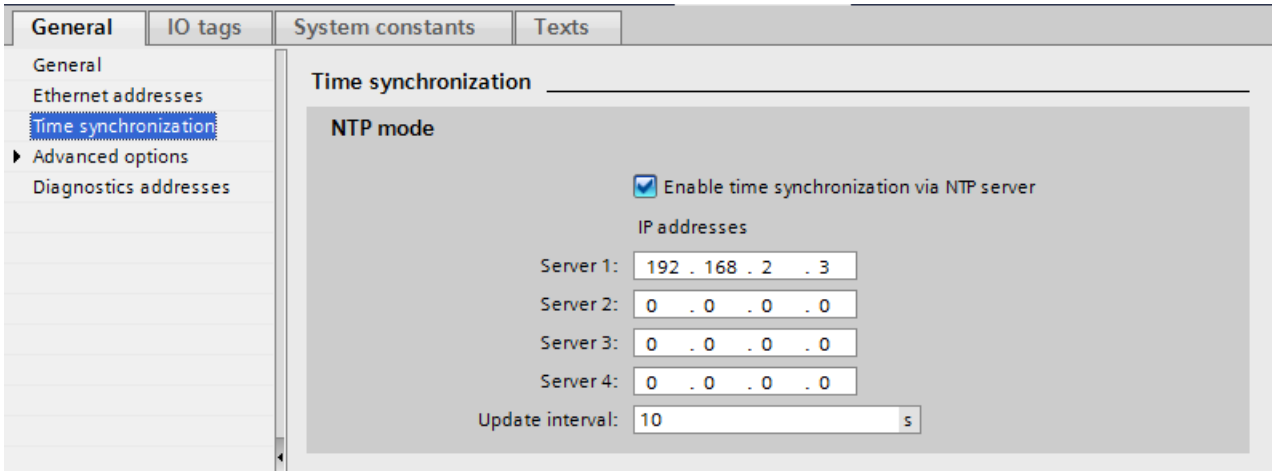

Figure 3-350 Time-of-day synchronization via the NTP protocol in the TIA Portal

TCP expert settings

You set the TCP expert settings for SIMOTION controllers in the TIA Portal at "Properties > General". With these settings, you configure the behavior of the host (SIMOTION) for TCP/IP connections. TCP is a connection-oriented protocol, the sender receives a receive confirmation via the reception of the sent data.

Set the times for the timeout so that the sender does not have to wait continuously for a receive confirmation when there is a connection abort. You can set these and the number of new send attempts here. Only change these values when the communication is frequently faulted due to timeouts. This can be the case with slow communication connections with high latency:

The following settings are required:

- Connection timeout [ms]
  Within this period, the sender waits for a receive conformation from the recipient.
- Max. retransmission timeout [ms]
  After this time has expired, a retransmission is started until the connection timeout or the maximum number of retransmissions is reached.
- Max. number of retransmissions
  Maximum number of attempts for a retransmission. If the maximum number is exceeded, there is no retransmission attempt.

3.5.6.2 PROFINET IO

Device settings on the PROFINET IO

Introduction

This section briefly explains the basic concepts and properties of PROFINET IO.

PROFINET IO

PROFINET, as an Ethernet-based automation standard specified by PROFIBUS International (PI - PROFIBUS & PROFINET International), defines a manufacturer-independent communication, automation and engineering model.

PROFINET IO systems

A PROFINET IO system consists of a PROFINET IO controller and its assigned PROFINET IO devices. The PROFINET IO controller is a controller (e.g. SIMOTION D4x5-2 DP/PN) that controls the automation task. A PROFINET IO device is a device (e.g. SINAMICS S120) controlled and monitored by an IO controller.

RT classes and isochronous mode

PROFINET offers two transmission protocols that are adapted to the requirements of automation. These are PROFINET IO with RT and PROFINET IO with IRT. For typical motion control applications, an isochronous application with IRT is required. As well as synchronizing the transmission network, IRT enables the application (e.g. SIMOTION position controller and interpolator) to be synchronized in the devices (isochronous application).

Addressing of PROFINET IO devices

In addition to the MAC and the IP address, PROFINET also uses a device name (NameOfStation) to identify PROFINET devices.

Creating a PROFINET subsystem

To create a new PROFINET subsystem, proceed as follows:

1. Right-click the PN interface at which you want to create a subsystem.
2. Select "Create subnet" if you want to create a new subnet.
3. Select "Assign subnet" if you want to assign an existing subnet to the PN interface.

Editing an IP address

To set an IP address, proceed as follows:

1. In the network view / device view, select the interface whose IP address you want to edit.
2. In the Inspector window, select the "Properties" tab and click the "General" tab.
3. Select "Ethernet addresses".
   You will now see the IP address and subnet mask below the "IP protocol".

   Note

   Make sure that all IP addresses and subnet masks are in the same area.

4. On this tab, you can select the subnet assigned to the interface with "Interface networked with".

Assigning device names

Before an IO device can be addressed by an IO controller, it must have a device name. In the case of PROFINET, this method was chosen because names are easier to handle than complex IP addresses.

The PROFINET device name must conform to the DNS naming conventions. Further information is available in the online help of the TIA Portal with the "Address and naming convention for PROFINET devices" keyword.

To change the device name, proceed as follows:

1. In the network view / device view, select the interface whose device name you want to edit.
2. In the Inspector window, select the "Properties" tab and click the "General" tab.
3. Select "Ethernet addresses".
   You now see at "PROFINET" the setting options of the device name.
4. Change the device name or select "Automatically generate PROFINET device name" for automatic generation.

Note

Converted device names

The TIA Portal supports PROFINET device names that do not conform with the DNS name conventions. A "converted name" is generated from the non-conform PROFINET device name. This is the device name that is actually loaded to the device. The PROFINET device name is converted only when it does not conform to the IEC 61158-6-10 rules. The PROFINET device name and the converted name are displayed for the properties of the PN interface. You cannot change the converted name; it is generated automatically.

Additional references

You will find detailed information and SIMOTION-specific settings and parameters described in detail in the *SIMOTION Communication* Function Manual.

Brief introduction communication configuration SIMOTION controller with SIMOTION drive via PROFINET IO

SIMOTION controller with PROFINET IO drive

Introduction

This section explains how to get started quickly with communication configuration of a PROFINET IO system using the examples of a SIMOTION D455-2 DP/PN with a SINAMICS S120 CU320-2 PN drive.

Configuration example	Description
SIMOTION D455-2 DP/PN IO controller	Sync master in the sync domain (IRT) Servo isochronous mode of the subnet
IO device SINAMICS S120 CU320-2 PN	Sync slave in the sync domain (IRT) IO device isochronous mode with the servo cycle

Note

For the following steps, symbolic assignment must have been activated in SIMOTION SCOUT TIA and the drive and axis must have been configured before communication configuration.

Additional references

Detailed information about the basic theoretical principles is contained in the *SIMOTION Communication* System Manual or in the information system for the TIA Portal.

General overview of the configuration sequence

To configure an isochronous PROFINET IO system, proceed as follows:

1. Insert a SIMOTION D4x5-2 DP/PN (PROFINET IO controller) and a SINAMICS S120 CU320-2 PN (PROFINET IO device) (Inserting devices (Page 685)).
2. Configure a PROFINET IO system (Inserting a subnet (Page 686)).
3. Interconnect the topology. This is necessary if you are using PROFINET IO with IRT (Interconnecting topology (Page 688)).
4. Switch to SIMOTION SCOUT TIA and configure the drive and the telegrams (Telegram configuration (Page 688)).
5. Switch to the TIA Portal. All necessary settings for communication configuration are performed automatically (Communication configuration (Page 690)).

Result

The PROFINET IO system is fully configured. Further operating steps are only required if you want to make changes to the default settings.

A detailed description of the individual steps is given in the next sections.

Inserting SIMOTION D455-2 DP/PN and SINAMICS S120 CU320-2 PN

Requirement

You have created a new project in the TIA Portal.

Inserting a device and drive

1. Drag a SIMOTION D455-2 DP/PN (S120) from the folder "Controller > SIMOTION" in the hardware catalog and drop it into the network view. The IP address and the PROFINET device name are assigned automatically. You can leave the default settings unchanged or adjust them accordingly.
2. Drag a SINAMICS S120 CU320-2 PN from the folder "Controller > SIMOTION > SIMOTION drives > SINAMICS S120" in the hardware catalog and drop it into the network view. The IP address and the PROFINET device name are assigned automatically. You can leave the default settings unchanged or adjust them accordingly.

After inserting the hardware, the network view is represented as follows. The drive device is shown as "Not assigned".

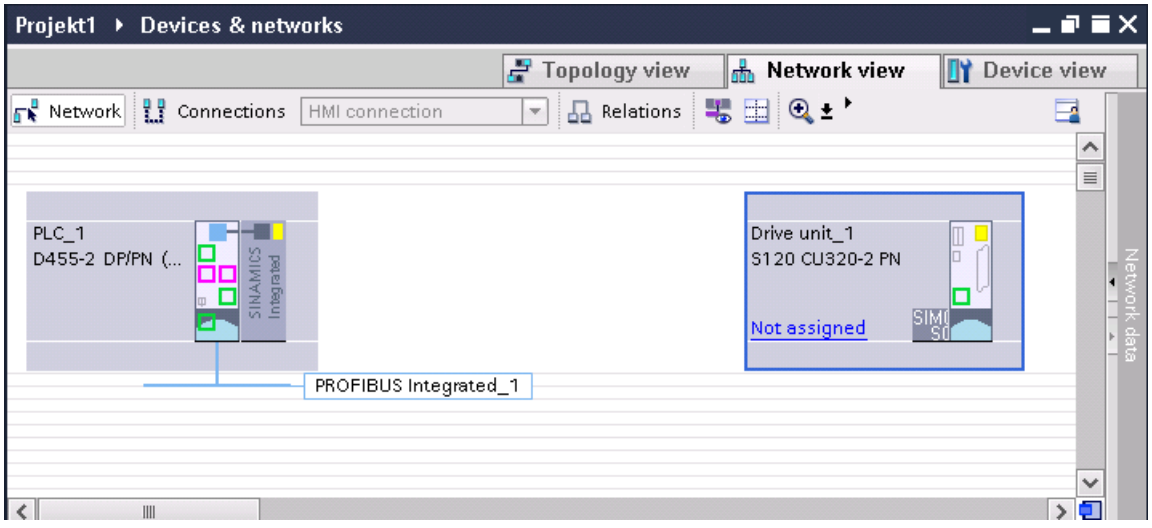

Figure 3-351 SIMOTION D455-2 DP/PN and SINAMICS S120 CU320-2 PN in the network view

In the next step, you will create a PROFINET IO system.

Creating a PROFINET IO system

Introduction

After inserting the hardware, it must first be assigned to a subnet. Unassigned devices are displayed as "Not assigned". Nodes of a subnet form a PROFINET IO system. A sync domain is also needed for synchronizing PROFINET IO devices. The sync domain ensures that all nodes are synchronized. When a subnet is created, a new sync domain is also created.

Creating a sync domain

To assign the devices to a sync domain, proceed as follows:

1. In the network view, click the "Not assigned" link on the SINAMICS S120 CU320-2 PN. All IO controllers in the project are displayed.

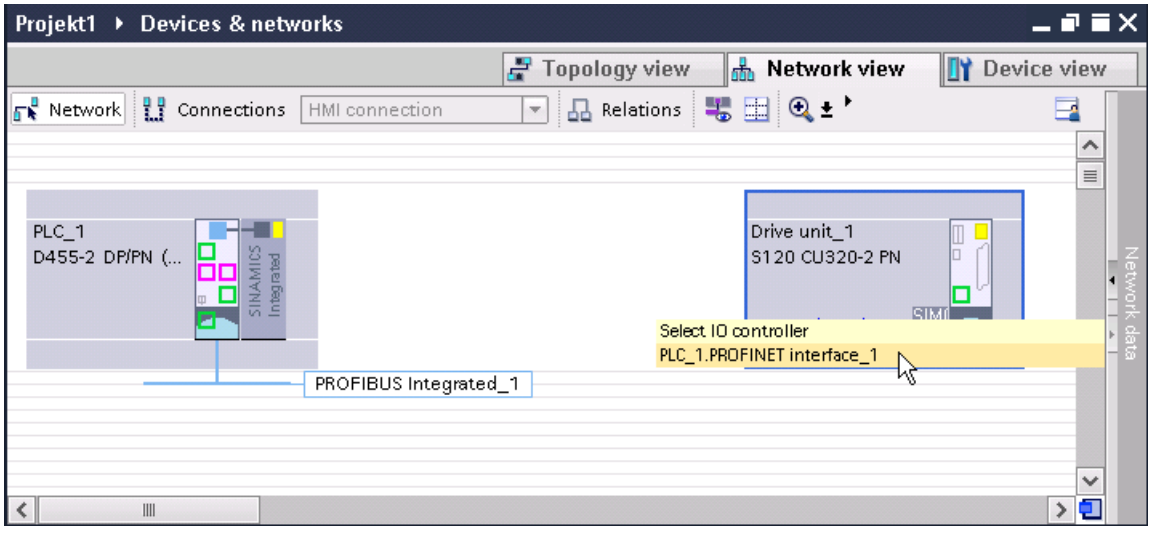

Figure 3-352 Assigning an IO device to an IO controller

2. Click the displayed PROFINET device name of the SIMOTION D455-2 DP/PN to connect it to the SINAMICS S120 CU320-2 PN IO device. A PROFINET IO system and a sync domain with the two nodes is automatically created.
   If you assign another IO device to the IO system of the IO controller, the IO device will automatically be assigned to the sync domain of the IO controller.

After you have assigned the drive unit, a sync domain ① and a PROFINET IO system ② will be created automatically. The IO controller is created as a sync master and the drive unit is created as an IO device without synchronization ③. The RT class and the synchronization role of the drive unit is automatically generated when the drive and the axis are configured in SIMOTION SCOUT TIA.

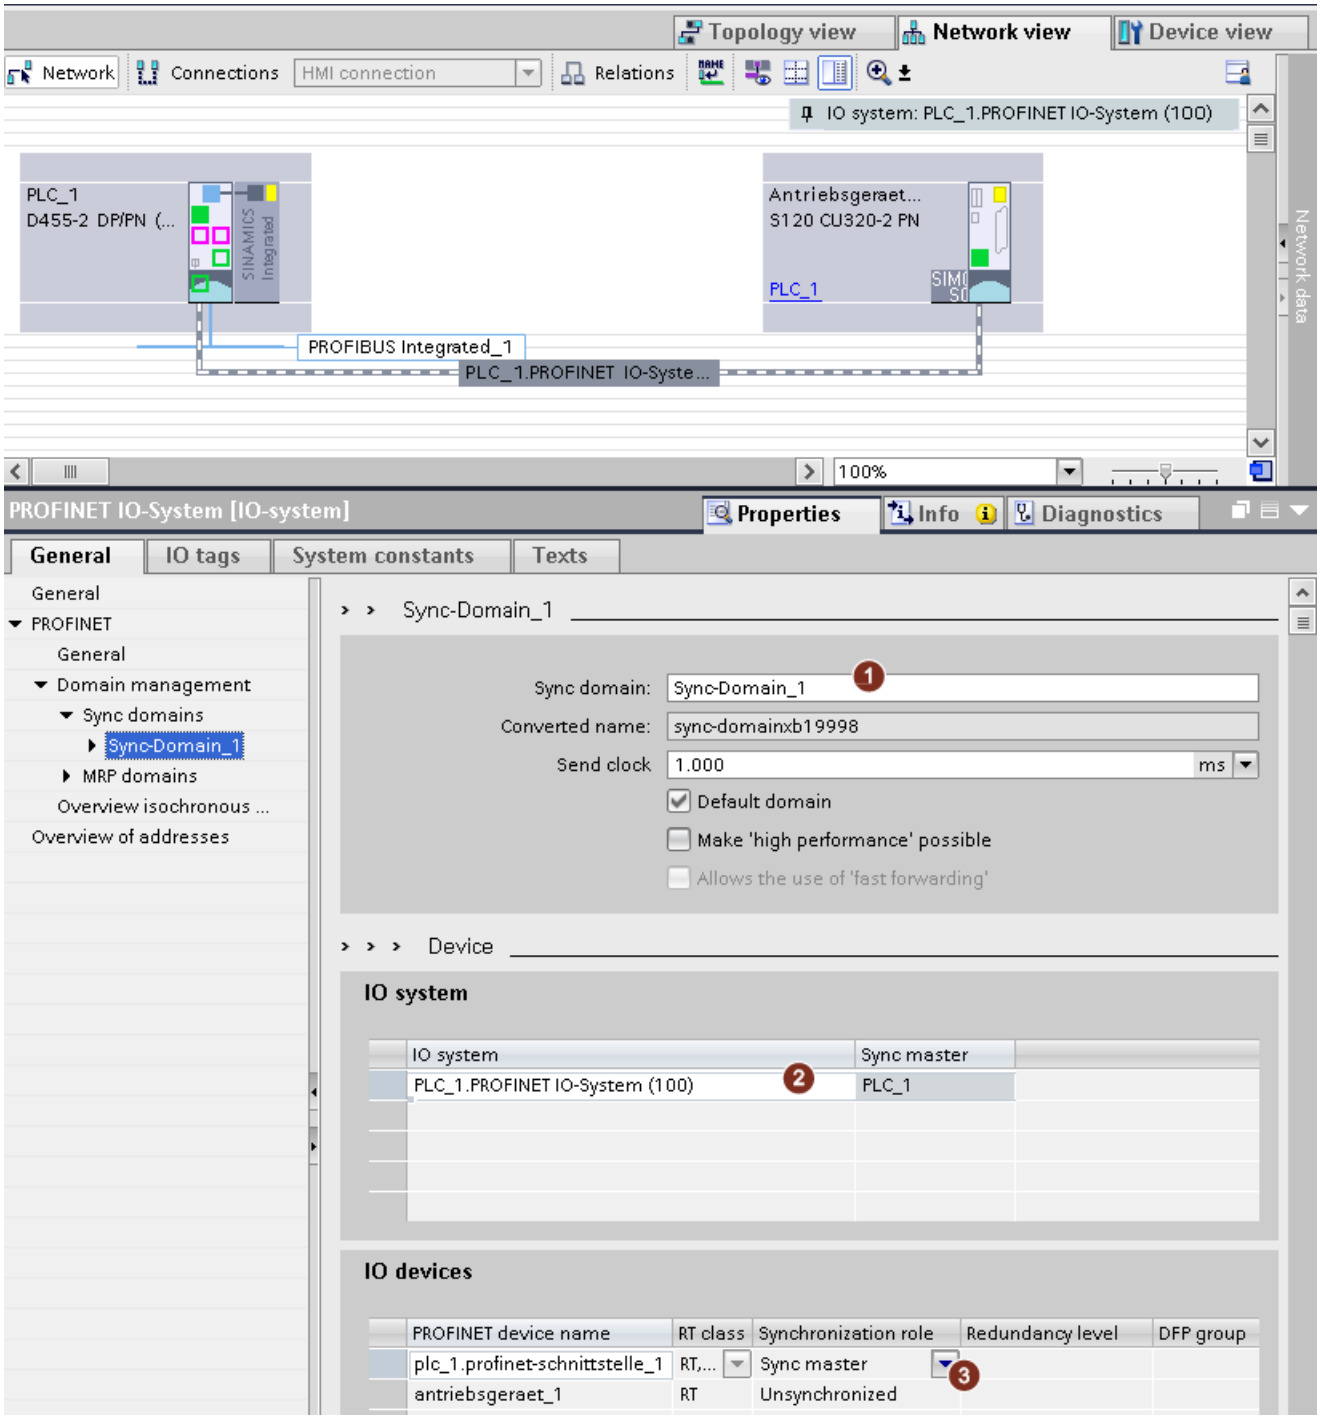

Figure 3-353 Sync domain and PROFINET IO system

The topology is interconnected in the next step.

Interconnecting the topology

Introduction

A requirement for isochronous IRT is the topology configuration. In the example, a connection from the port of the IO controller (SIMOTION D455-2 DP/PN) to the port of the IO device (SINAMICS S120 CU320-2 PN) must be configured. The configuration is performed in the topology view.

Configuring the topology

1. Switch to the "Topology view" tab.
2. Click the port of SIMOTION D455-2 DP/PN. The topmost port (X150 P1) is used in the example.
3. Hold down the left mouse button and draw a connection to the port of the SINAMICS S120 CU320-2 PN. The topmost port (X150 P1) is used in the example.

The connection between the ports is created.

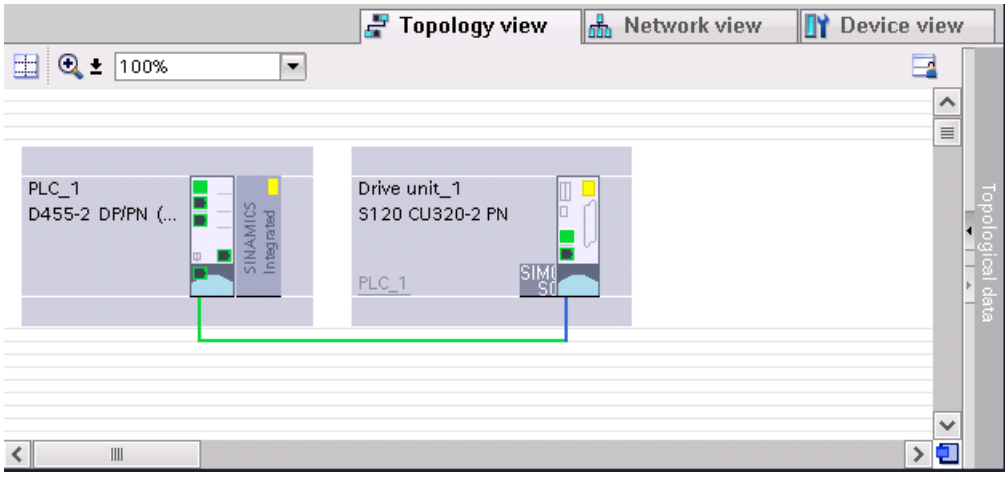

Figure 3-354 Configuration of the topology in the topology view

After this step, configuration in the TIA Portal is complete. The next steps are performed in SIMOTION SCOUT TIA.

Configuration of technology and telegrams in SIMOTION SCOUT TIA

Introduction

After you have inserted the hardware in the TIA Portal and configured the topology, switch to the SIMOTION SCOUT TIA to configure the drive and the axis (technology). This step is necessary for automatic communication configuration. With configuration of an axis on the drive, the TIA Portal automatically configures communication, e.g. the drive as a sync slave that is isochronous with the servo cycle.

Procedure

Note

You will find the precise procedure for configuration of the drive and the axis in the "SIMOTION SCOUT TIA" Configuration Manual in the Motion Control parameterization/programming section.

1. Open SIMOTION SCOUT TIA.
2. Configure the drive. In the example, a SINAMICS S120 CU320-2 PN.
3. Create an axis and assign it to the drive in the axis wizard.
   If only one axis and one drive are present in the project, the correct assignment is automatically displayed.

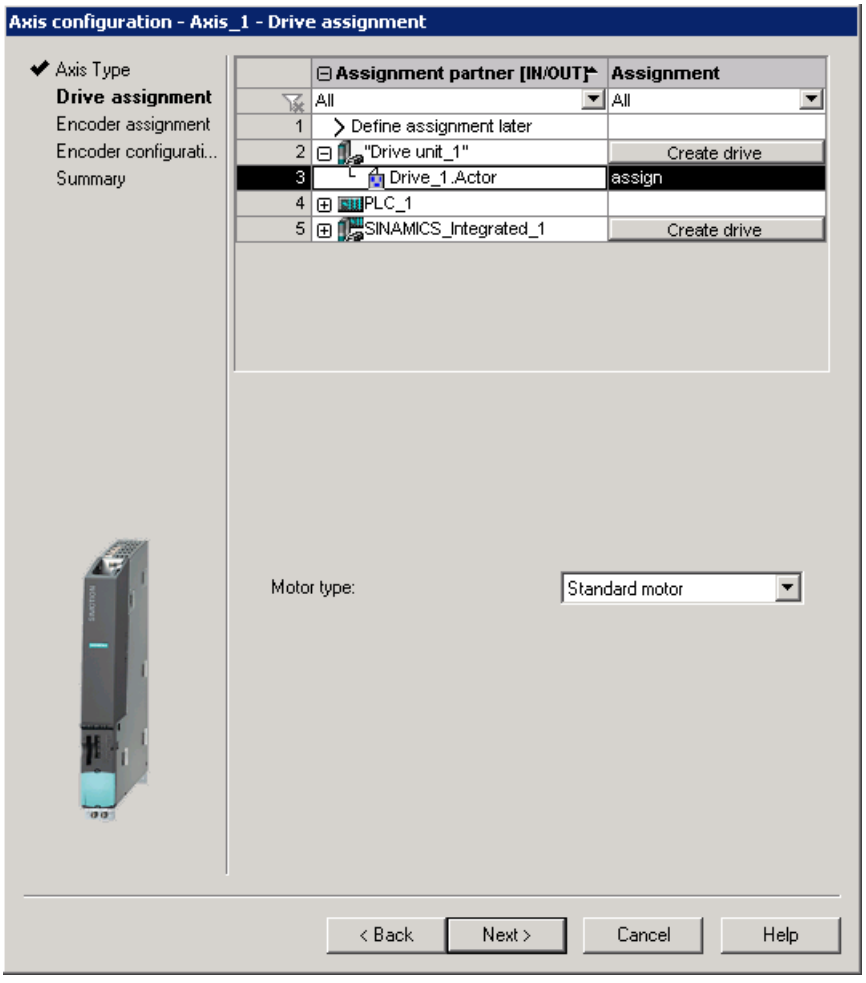

Figure 3-355 Axes are assigned to the drive during configuration

4. "Save and compile" in SIMOTION SCOUT TIA. During active symbolic assignment, the technological relationships and the telegrams are configured in the SIMOTION SCOUT TIA automatically.
5. Open the telegram configuration below the drive unit to view the configured telegrams.

Result

The telegrams and addresses have been synchronized with the TIA Portal. With the "Telegram configuration" entry below the drive unit, you can switch to the telegram overview in which blue checkmarks are now shown.

Configuration in SIMOTION SCOUT TIA has now been completed. The communication configuration has therefore been created automatically in the TIA Portal.

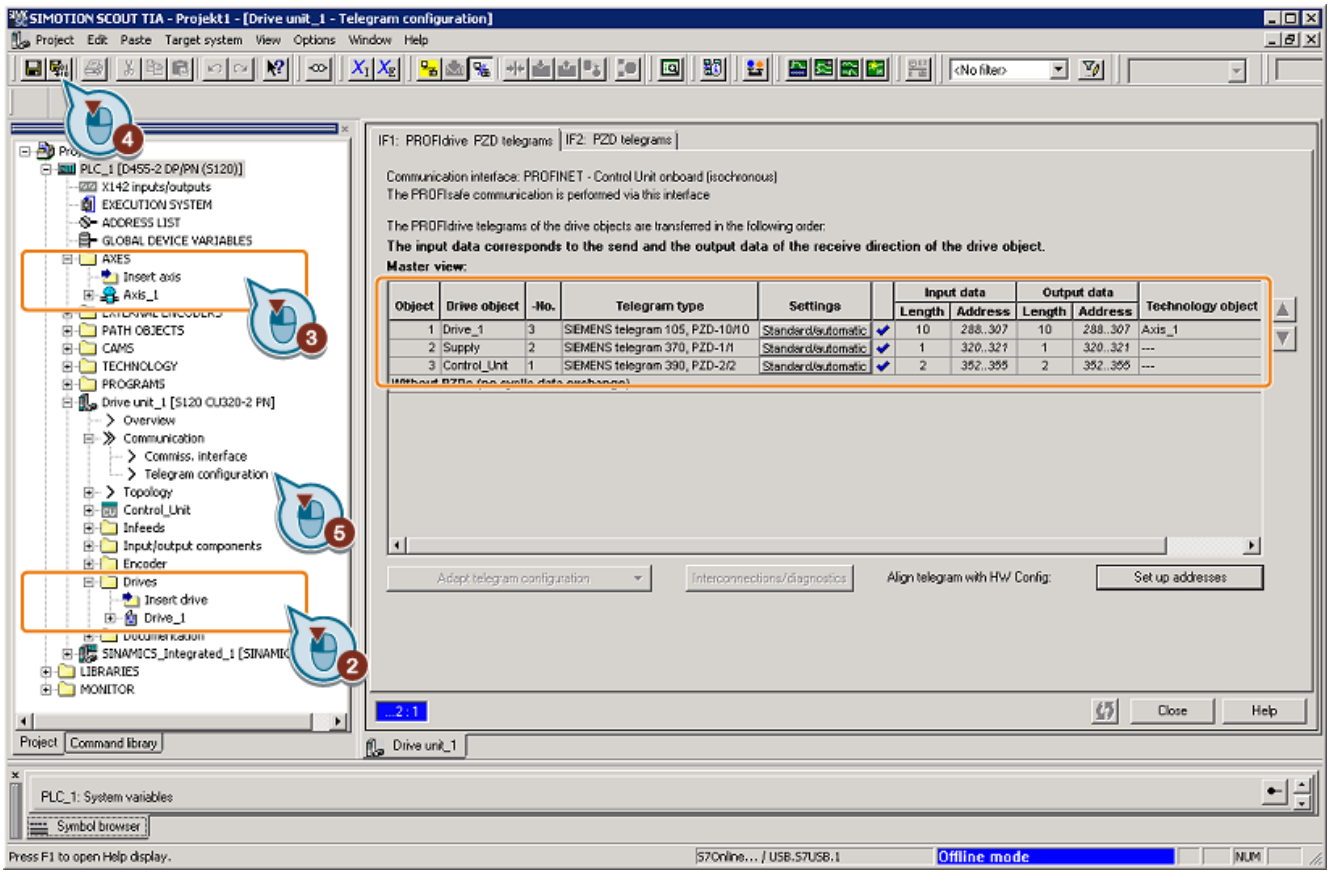

Figure 3-356 Drive and axis configuration in the SIMOTION SCOUT TIA

Automatic communication configuration in the TIA Portal

Introduction

After synchronization of the telegrams of SIMOTION SCOUT TIA to the TIA Portal, the communication configuration will automatically be adapted in the TIA Portal. All necessary communication settings required because of the technology configuration in SIMOTION SCOUT TIA have been adapted automatically. You can check the automated settings below. The communication configuration has now been completed.

Checking for automatic communication configuration

In the table, you can see the necessary communication configuration settings. You can check them.

Configuration example	Description
SIMOTION D455-2 DP/PN IO controller	Sync master in the sync domain (IRT) ① Servo isochronous mode of the subnet ③
IO device SINAMICS S120 CU320-2 PN	Sync slave in the sync domain (IRT) ② IO device isochronous mode with the servo cycle ④

Checking sync domain, sync master, sync slave ①②

1. Select the PROFINET IO system in the network view.
2. Select the sync domain in the secondary navigation "PROFINET > Domain management > Sync domains" on the "General" tab. You can check the settings there.

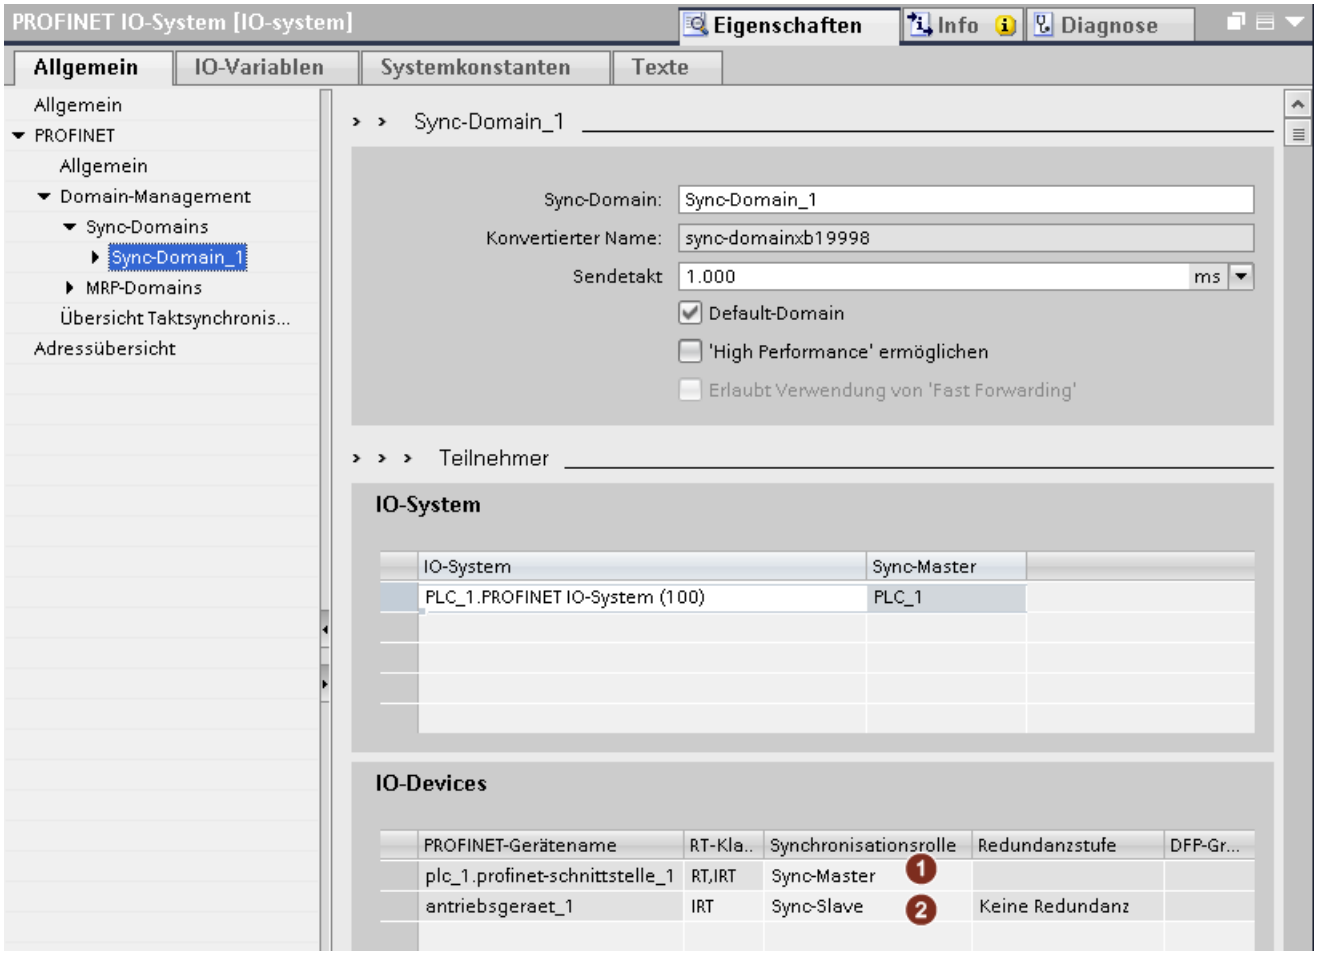

Figure 3-357 Checking sync domain, sync master, sync slave

Servo isochronous mode of the subnet ③

1. Select the PROFINET IO system in the network view and click the "Overview isochronous mode" entry on the "General" tab of the Inspector window. You can check the settings there.

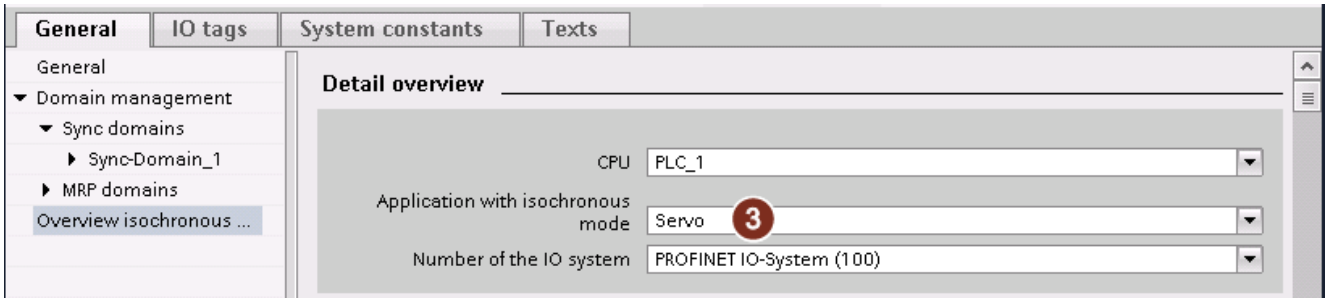

Figure 3-358 Isochronous mode of the subnet

IO device (sync slave) isochronous with the servo cycle ④

1. In the network view, select the PN interface of the IO device and click the "isochronous mode" entry on the "General" tab of the Inspector window. You can check the settings there. The isochronous telegram of the drive is shown in the detailed view.

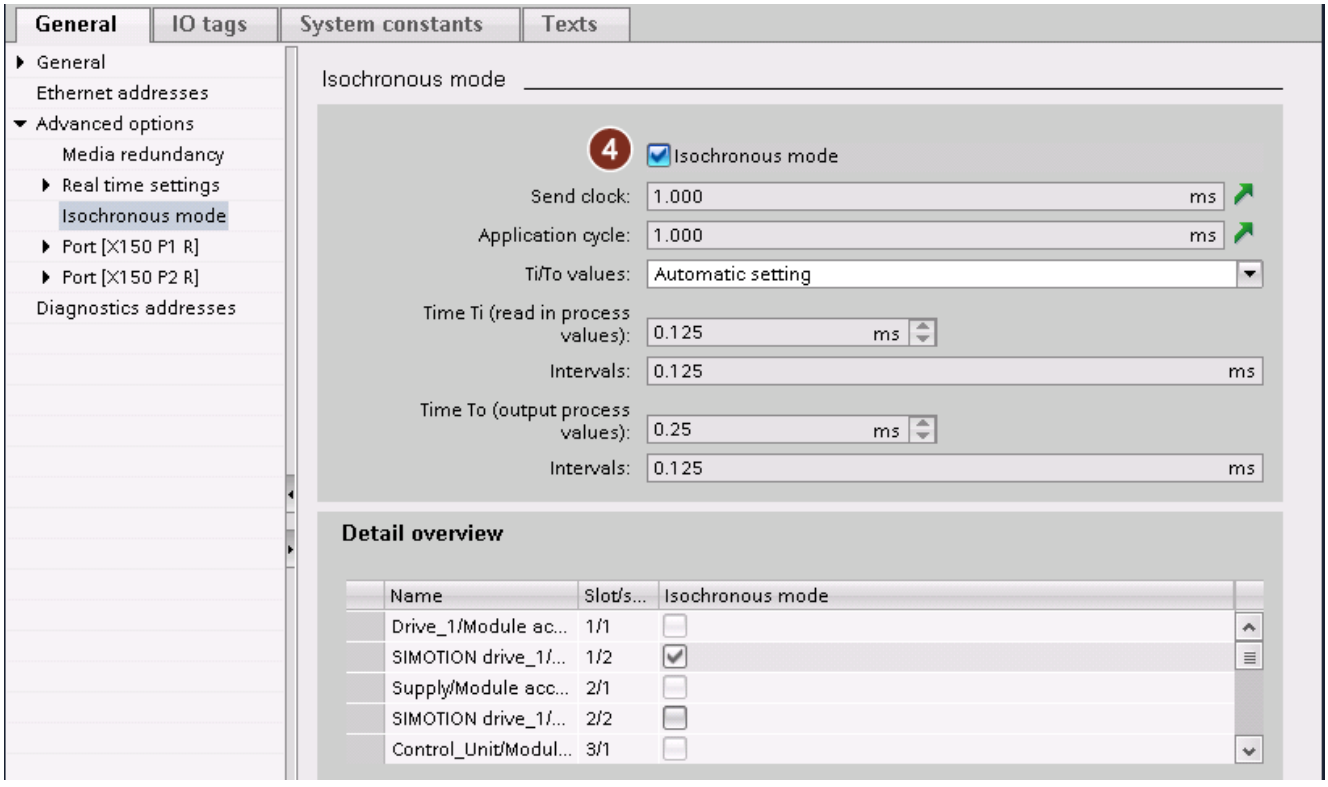

Figure 3-359 Isochronous mode of the PROFINET IO device in the servo cycle

If you would like to change the preset values, e.g. the send cycle, you will find more detailed explanations in the following sections.

Sync domain, topology, and isochronous mode

IO device (drive) on PROFINET IO

Introduction

A SIMOTION device should be connected with an IO device via PROFINET, in our example, a drive device. You have already inserted a SIMOTION device with integrated PROFINET interface into your project.

Section "Inserting a SIMOTION device (Page 643)" describes inserting a SIMOTION device in detail.

Note

Drive devices that are not networked or assigned to an IO controller are not displayed in SIMOTION SCOUT TIA.

Inserting and editing drives

To operate a drive as an IO device, proceed as follows:

1. Select a SIMOTION drive in the hardware catalog at "Controller> SIMOTION> SIMOTION drives" and drag it into the network view.
2. Click the link on the unassigned device in the network view (in the example, a SINAMICS S120).
   All possible IO controllers in the project are displayed.

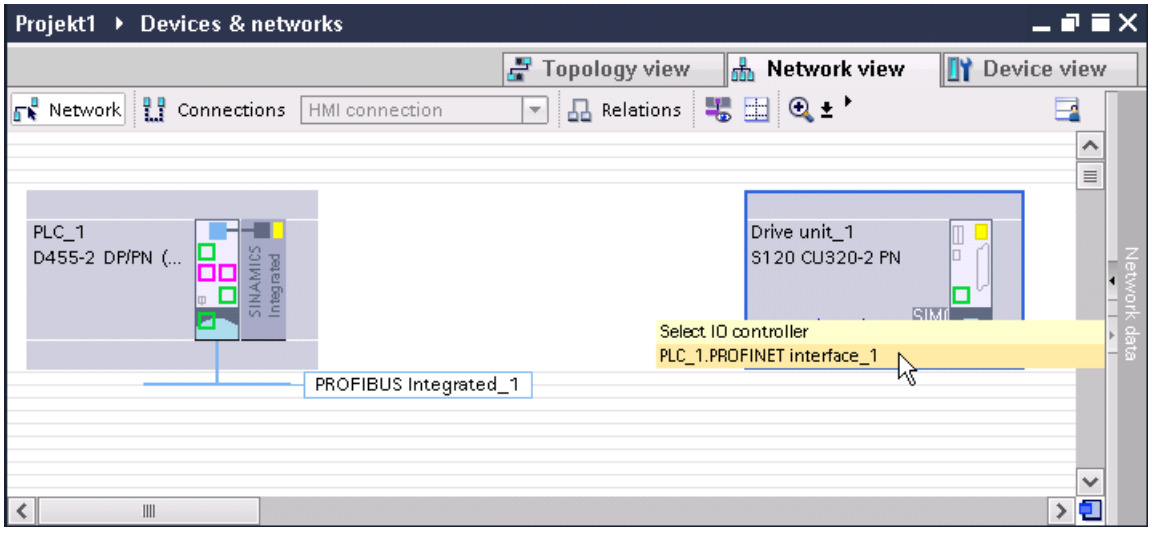

Figure 3-360 Assigning an IO device to an IO controller

3. Assign the drive to a SIMOTION controller. A PROFINET IO system and a sync domain with the two nodes are created automatically. If you assign another IO device to the IO system of the IO controller, the IO device is assigned automatically to the sync domain of the IO controller.

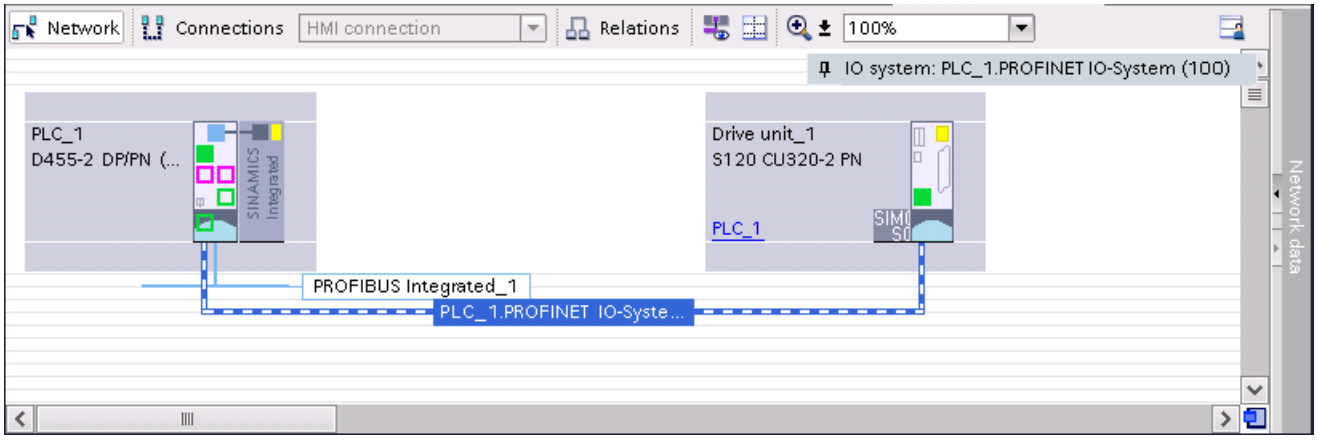

Figure 3-361 SINAMICS drive device on SIMOTION D4x5-2 via PROFINET

Note

You need a telegram for the communication between a SIMOTION controller and a drive. Telegrams are configured in SIMOTION SCOUT TIA. This requires that you configure the drive and the axis in SIMOTION SCOUT TIA. If "Symbolic assignment" is activated, the required telegrams are configured automatically for saving and compiling.

After inserting the IO device, you can configure the sync domain and the isochronous mode of the IO device. Isochronous mode is required for typical motion control applications.

Configure sync domains and send clock (Page 695)

Configure sync domains and send clock

Configuring sync domains

A sync domain is needed for synchronizing PROFINET IO devices. The sync domain ensures that all nodes that belong to it are synchronized. After being inserted, the nodes of the sync domain are not synchronized.

After inserting a SINAMICS CPU and a SINAMICS S120 drive device, they must first be assigned to a subnet. Unassigned devices are displayed as "Not assigned".

To configure the sync domain, proceed as follows:

1. Select the PROFINET IO system in the network view.
2. In the Inspector window, click the "General" tab and select "Domain management > Sync domain > Sync domain_1". You can set the parameters in the tab.
3. You can set a new name at "Sync domain". It is converted automatically to a conformant name that is displayed at "Converted name".
4. Select the sync master (in the example, SIMOTION D445-2 DP/PN) and select the RT class for the IO device (in the example, SINAMICS S120). When you select IRT, the synchronization role of the IO device is set automatically to sync slave.
5. Select the "send cycle" for the sync domain.

   Note

   You can set the send cycle only when you have configured the synchronization role and the RT class at "IO devices".

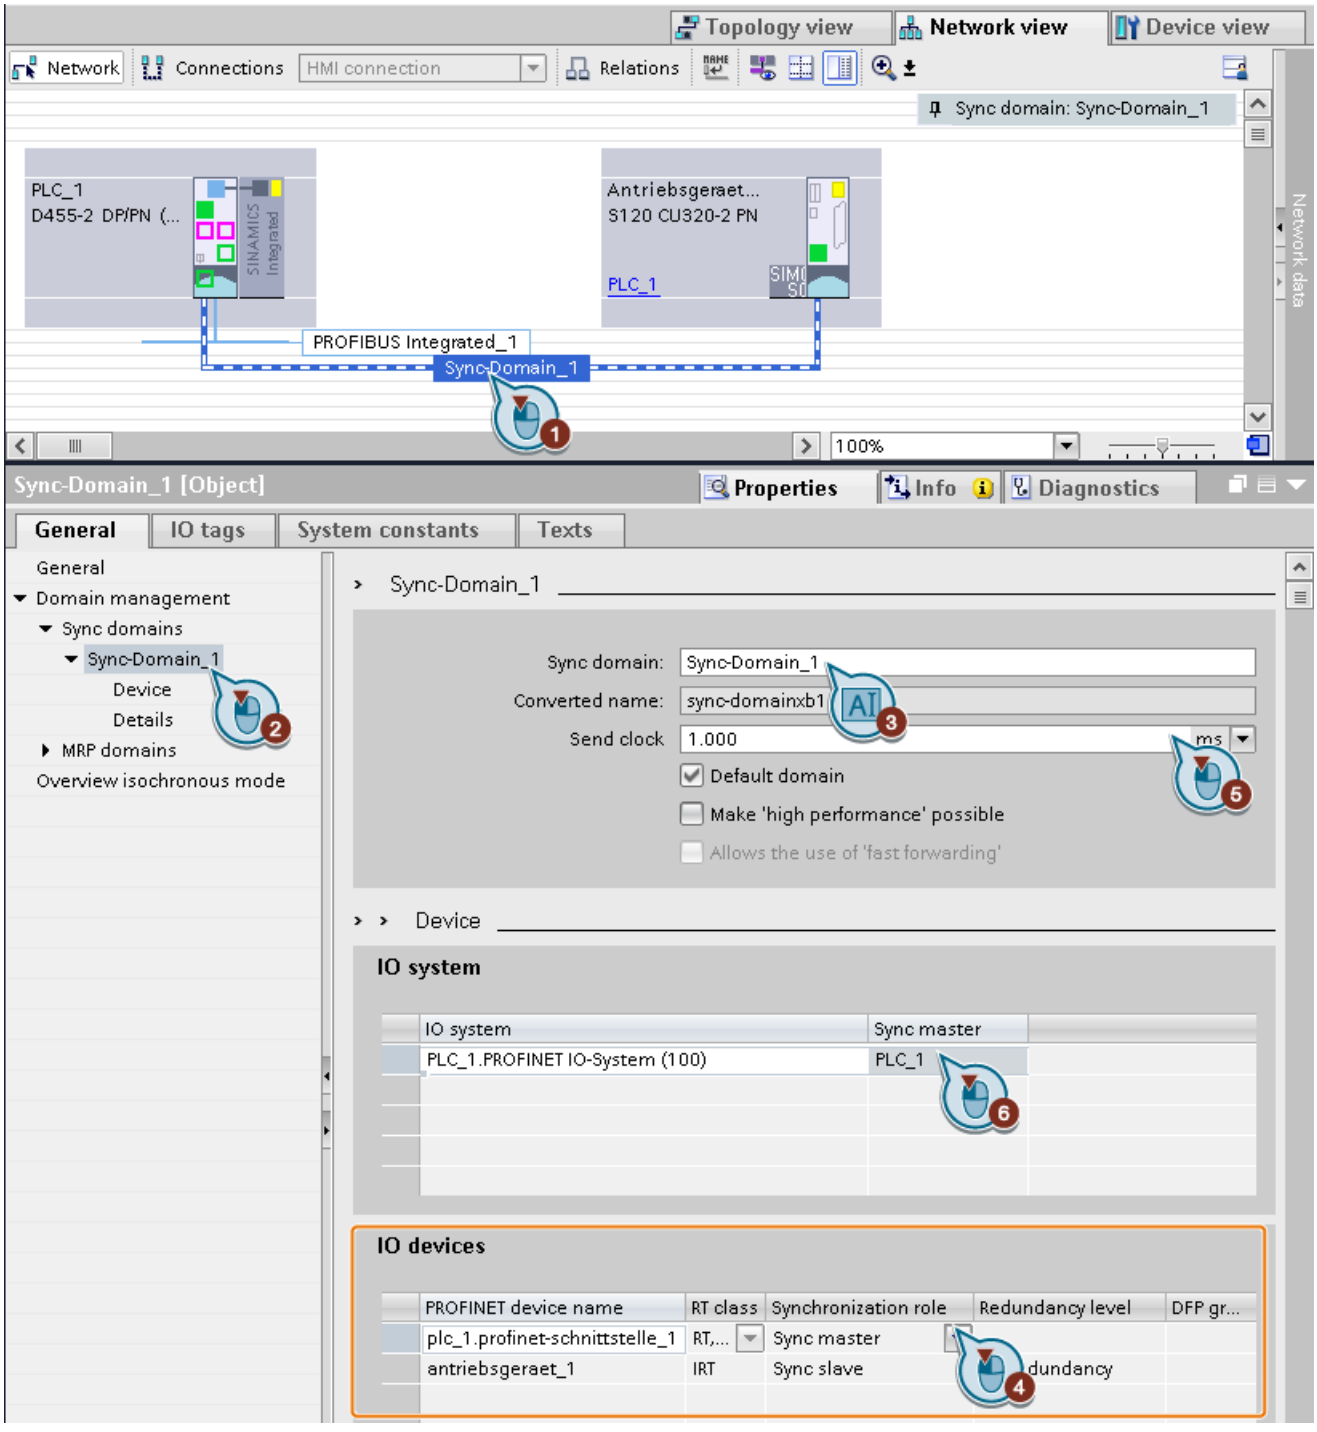

Figure 3-362 Configuring the sync domain

Explanation of the parameters

Parameter	Description
③ Sync domain	Name of the sync domain. This name is converted automatically if it does not conform with the DNS conventions.
④ IO devices	Here, you can see a list of the IO devices of the sync domain. You can select the following parameters for the nodes: • RT class: Select either RT (Real Time) or IRT (Isochronous Real Time). • Synchronization role: Choose between sync master, redundant sync master or sync slave. The synchronization role is displayed as "unsynchronized" by default, e.g. for devices in RT networks. Information about the RT classes and synchronization roles is provided in the SIMOTION SCOUT Communication Function Manual.
⑤ Send cycle	Select the send cycle for the sync domain here.
⑥ Node	The nodes of the PROFINET IO system are listed here.

See also

IO device (drive) on PROFINET IO (Page 693)

Set up the sync master and sync slave.

Requirement

You have performed the following configured steps:

- IO controller and IO device configured with RT
- Port interconnections are configured

Note

The sync master and sync slave are automatically configured in the TIA Portal if you have configured the drive and axis as well as saved and compiled the project in SIMOTION SCOUT TIA. You will find further information and a description of the configuring in SIMOTION SCOUT TIA in Section Isochronous mode (Page 702).

Configuring the sync master

To configure a sync master, proceed as follows:

1. Select the PROFINET interface of the sync master in the network view.
   The interface settings are displayed in the Inspector window.
2. Click "Extended options > Real-time settings > Synchronization" on the "General" tab.
3. Select the "Sync master" entry at "Synchronization role".

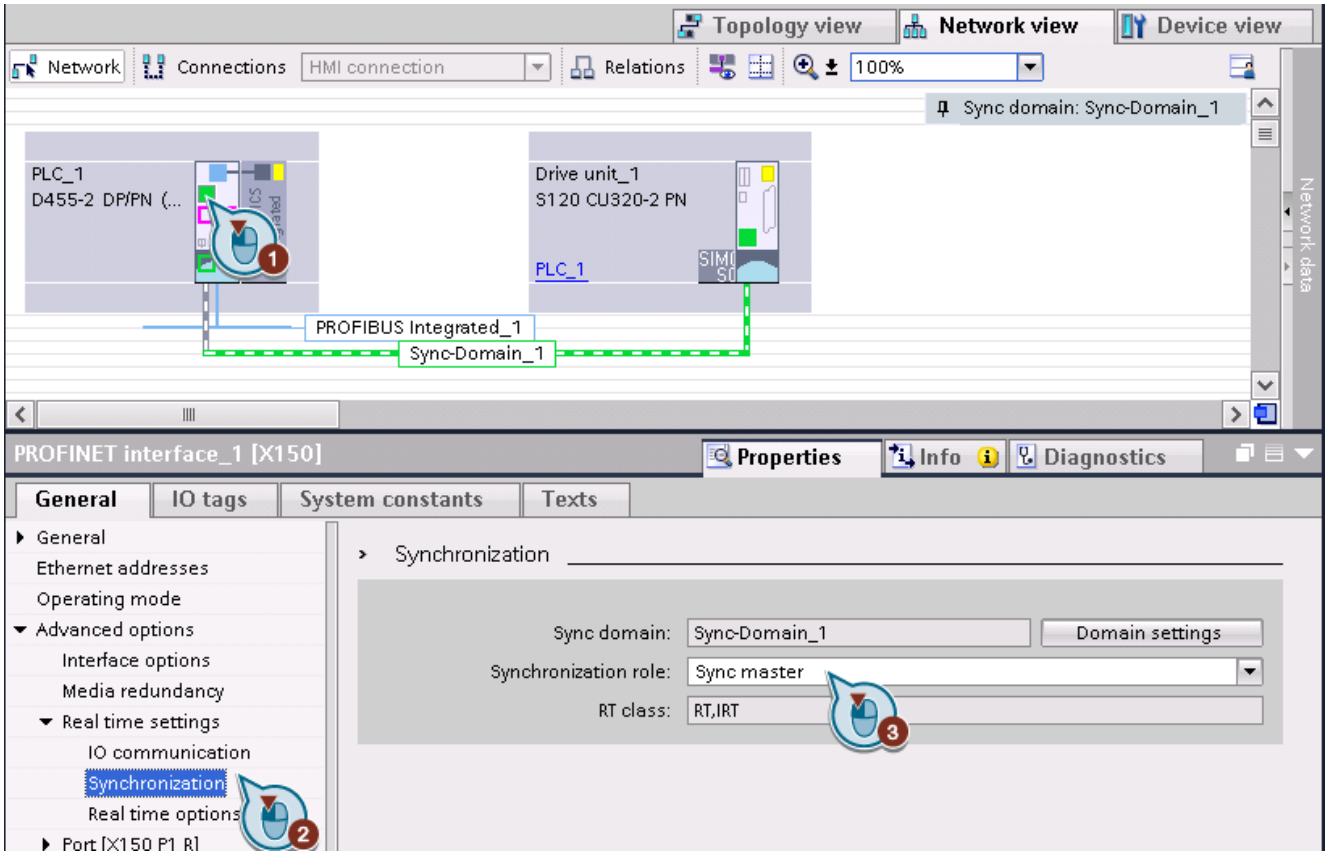

Figure 3-363 Configuring the sync master

Configuring the IO device as a sync slave

To configure a device within a PROFINET IO system as a sync slave, proceed as follows:

1. Select the PROFINET interface for the sync slave in the network view.
   The interface settings are displayed in the Inspector window.
2. Click "Extended options > Real-time settings > Synchronization" on the "General" tab.
3. Select "IRT" as RT class. In the example, the "sync slave" entry is selected automatically as "synchronization role".

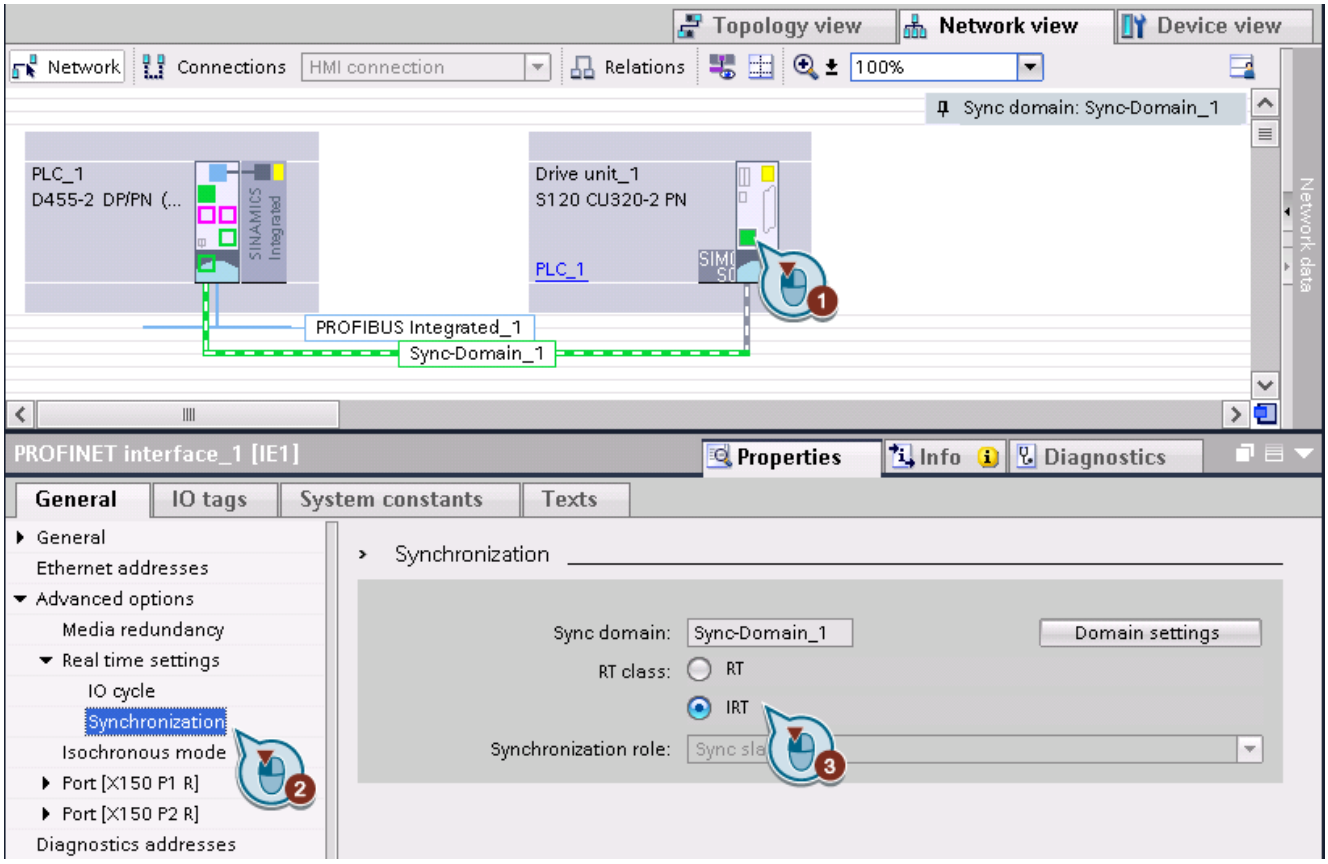

Figure 3-364 IO device as a sync slave

Configure isochronous IO device (Page 701)

Configuring the topology, interconnecting ports

Interconnecting ports

A requirement for IRT is that the topology is configured and settings made to determine which device is to be connected via which port to which other devices.

There are two options for defining the properties of the cables between the ports of the switches:

- Using the topology view
- Using the object properties

Use the topology view

With the topology view you have an overview of all ports in the project and can interconnect them centrally.

To configure the topology, proceed as follows:

1. Click the "Topology view" tab.
   You can perform the following in the topology view:
   - Interconnect ports
   - Modify the properties of the interconnection
   - Insert passive components
   - Arrange for an offline/online comparison to be displayed in online mode
2. If you hover the mouse over the ports, port names are displayed in the tooltip. In the Inspector window, the properties for each selected port/ device are displayed.
3. Click on the source port and drag-and-drop the connection to the target port.
   The topology view then shows the connection between the two ports.

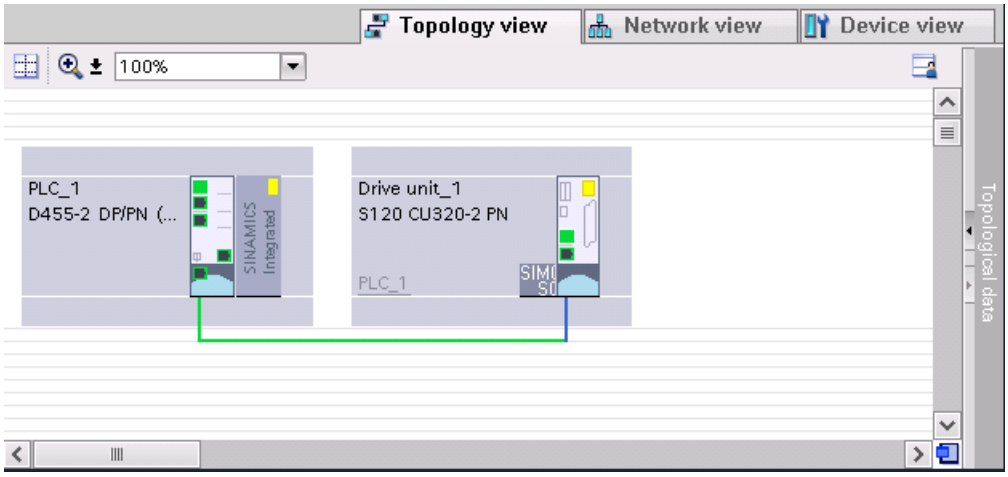

Figure 3-365 Topology view

Port interconnection via the properties

After selecting a device or an interface, you see the entries for the ports in the Inspector window under "PROFINET PN/IO interface > Extended options" in the "General" tab.

1. Select the interface, whose ports you want to edit, from the Inspector window.
2. Select the interface you wish to interconnect.
3. Select the "Port interconnection" entry.
   The "Local port" and "Partner port" dialogs open.
4. Open the "Partner port" drop-down menu.
   All devices with their PROFINET interfaces are shown.
5. Below the respective interface, select the port you want to connect to the selected port.
   Ports that you cannot interconnect are marked in red. Ports that are already occupied are not displayed.
   The connection between the ports is displayed in the topology view.
6. If necessary, edit the other parameters of the port.

Additional references

For more information on this topic, refer to the Online Help of the TIA Portal.

Configure isochronous IO device

Configuring isochronous mode for IO devices

The drive and controller together form a sync domain. For motion control applications of the PROFINET IO system, you must parameterize the IRT operating mode (for isochronous drives) and the PROFINET settings. Isochronous mode for the application on the bus is only possible for PROFINET IO with IRT. In the case of PROFINET IO with IRT, a sync master generates a synchronization telegram to which all sync slaves synchronize themselves. To use isochronous mode, you must configure it for the IO device.

The PROFINET IO system is isochronous with the servo clock. If you want to use the Servo_fast clock, you must select it under "Isochronous mode" on the IO controller.

Note

Isochronous mode only applies if isochronous submodules are configured in the IO device so that the IO controller has isochronous IO submodules. Otherwise, the Save and compile in the TIA Portal will be terminated with an error message.

To configure isochronous mode in the TIA Portal, you should therefore have already configured the drive and an axis in the SIMOTION SCOUT TIA. In this case, the necessary telegrams and isochronous submodules will be generated on Save and compile (symbolic assignment in SIMOTION SCOUT TIA). This is precondition for configuring the isochronous mode in the TIA Portal. After the configuration in the SIMOTION SCOUT TIA, isochronous mode is usually preset.

To configure isochronous mode, proceed as follows:

1. Select the IO device in the network view and click the PN interface.
   The interface properties are displayed in the Inspector window.
2. Click "Extended options > Isochronous mode" on the "General" tab.
3. Activate the "isochronous mode" option.
4. In the "detailed overview", the drive objects with the appropriate telegrams are displayed. The objects and telegrams must have been configured previously in SIMOTION SCOUT TIA. The telegrams are parameterized automatically during the symbolic assignment.
5. If necessary, activate the "isochronous mode" option besides the drive object with the appropriate telegram. This setting cannot be changed for telegrams for which isochronous mode is essential (e.g. telegram 105). In the example, telegram 105 is created automatically during symbolic assignment in SIMOTION SCOUT TIA.

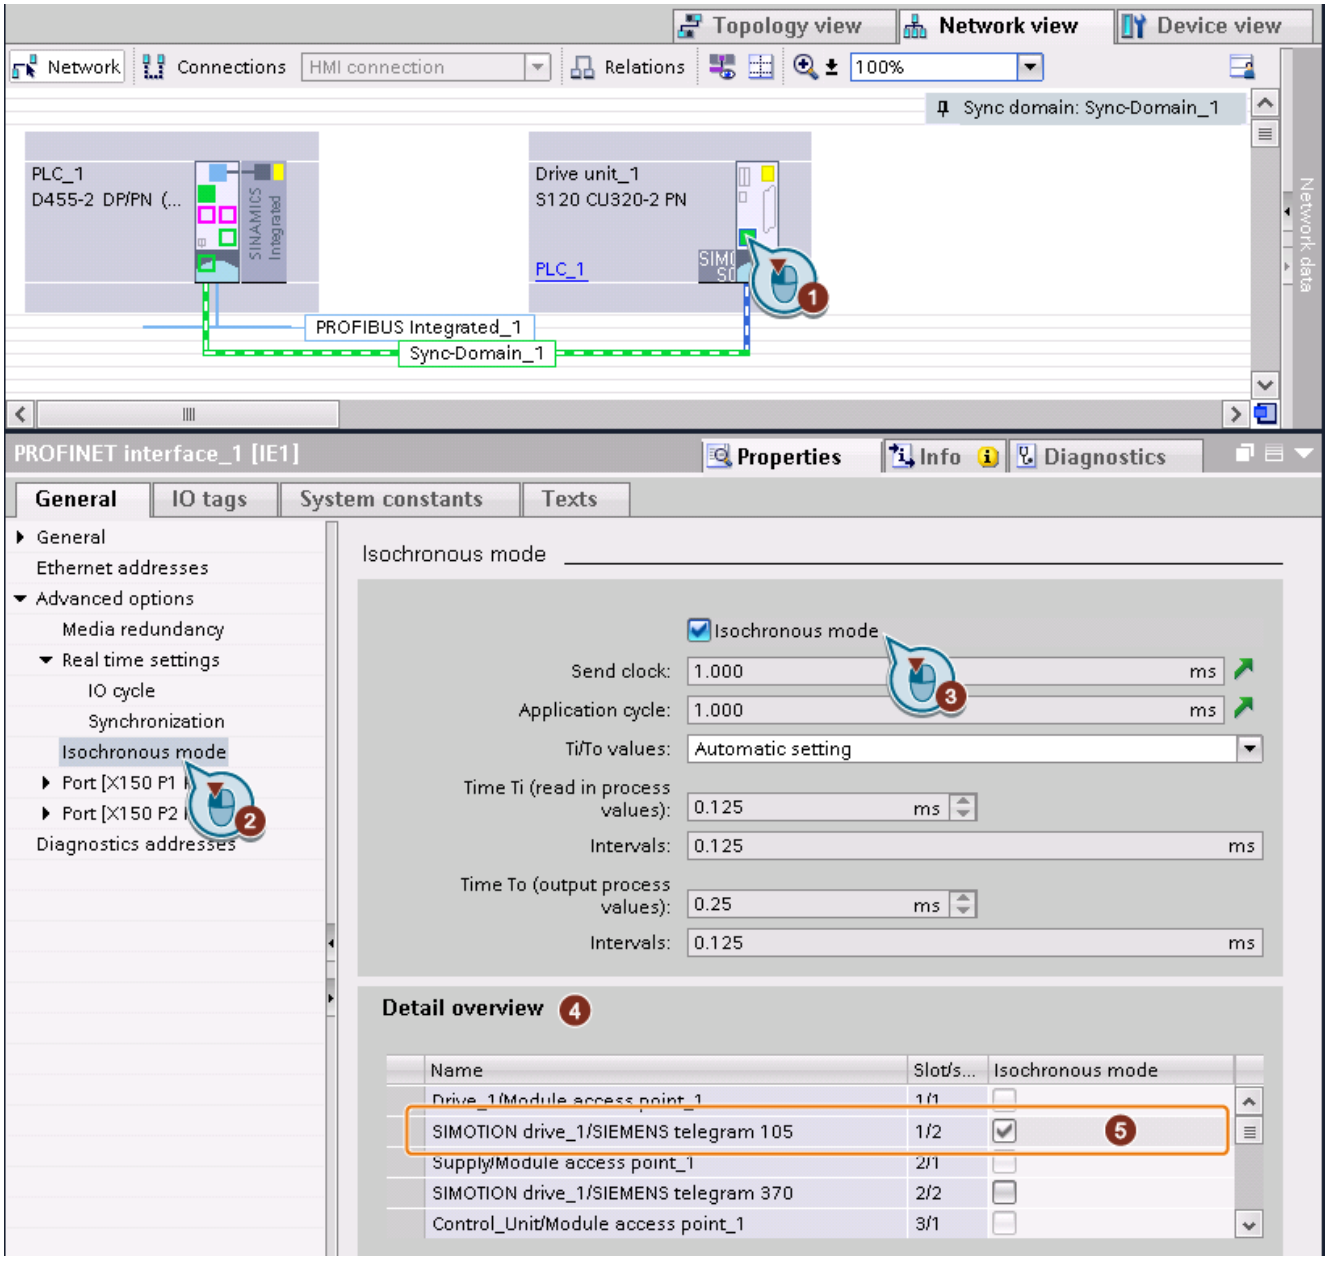

Figure 3-366 Configure isochronous IO device

Parameterizing isochronous mode

Isochronous mode can be individually activated or deactivated for each IO device or module in the IO device. You will find a more detailed description of the possible settings for isochronous mode in the following table.

Parameter	Description
Isochronous mode	Activate this option if you want to operate the drive (IO device) in isochronous mode with the PROFINET IO.
Send clock	Shows the send cycle clock of the PROFINET IO system. Click the link to edit the setting.
Application cycle	Shows the application cycle (multiple of the data cycle).
Ti/To values	Three settings are possible for the Ti/To values: • Automatic: Ti/To is automatically calculated. • Manual: Ti/To can be edited. • Task: Ti/To values are transferred to the OB. Ti, To: can only be edited if "manual" is set. Ti_{Min}/Ti_{Max}: minimum or maximum time for Ti. To_{Min}/To_{Max}: minimum or maximum time for To. Interval: defined interval for Ti/To values.
Time Ti (actual value)	Specifies at what time Ti, the actual value will be read in before the cycle starts.
Intervals	Indicates in which interval the value will be read in. The value should not be changed.
Time To (setpoint)	Specifies at what time To, the setpoint will be read out after the end of the cycle.
Interval	Indicates in which interval the value will be read in. The value should not be changed.

Isochronous mode with servo cycle clock (Page 703)

Isochronous mode with Servo_fast cycle clock (Page 705)

Isochronous mode with servo cycle clock

Isochronous mode with the servo clock

For isochronous mode, the drive unit (IO device) must be synchronized with the PROFINET IO clock. You make these settings on the PN interface of the drive unit. In the previous chapter, you have already configured this. You can check isochronous mode in the IO controller.

Displaying isochronous mode in the TIA Portal

To display isochronous mode for a PROFINET IO system or DP master system, proceed as follows: A PROFINET IO system is shown in the example.

1. Select the device (interfaces) in the network view.
   The interface settings are displayed in the Inspector window.
2. Select "General > Isochronous mode" in the Inspector window.
   The TIA Portal initializes the settings automatically in accordance with their configuration; the settings cannot be changed.
   The application cycle is calculated and is derived from the settings in the TIA Portal and SIMOTION SCOUT TIA.

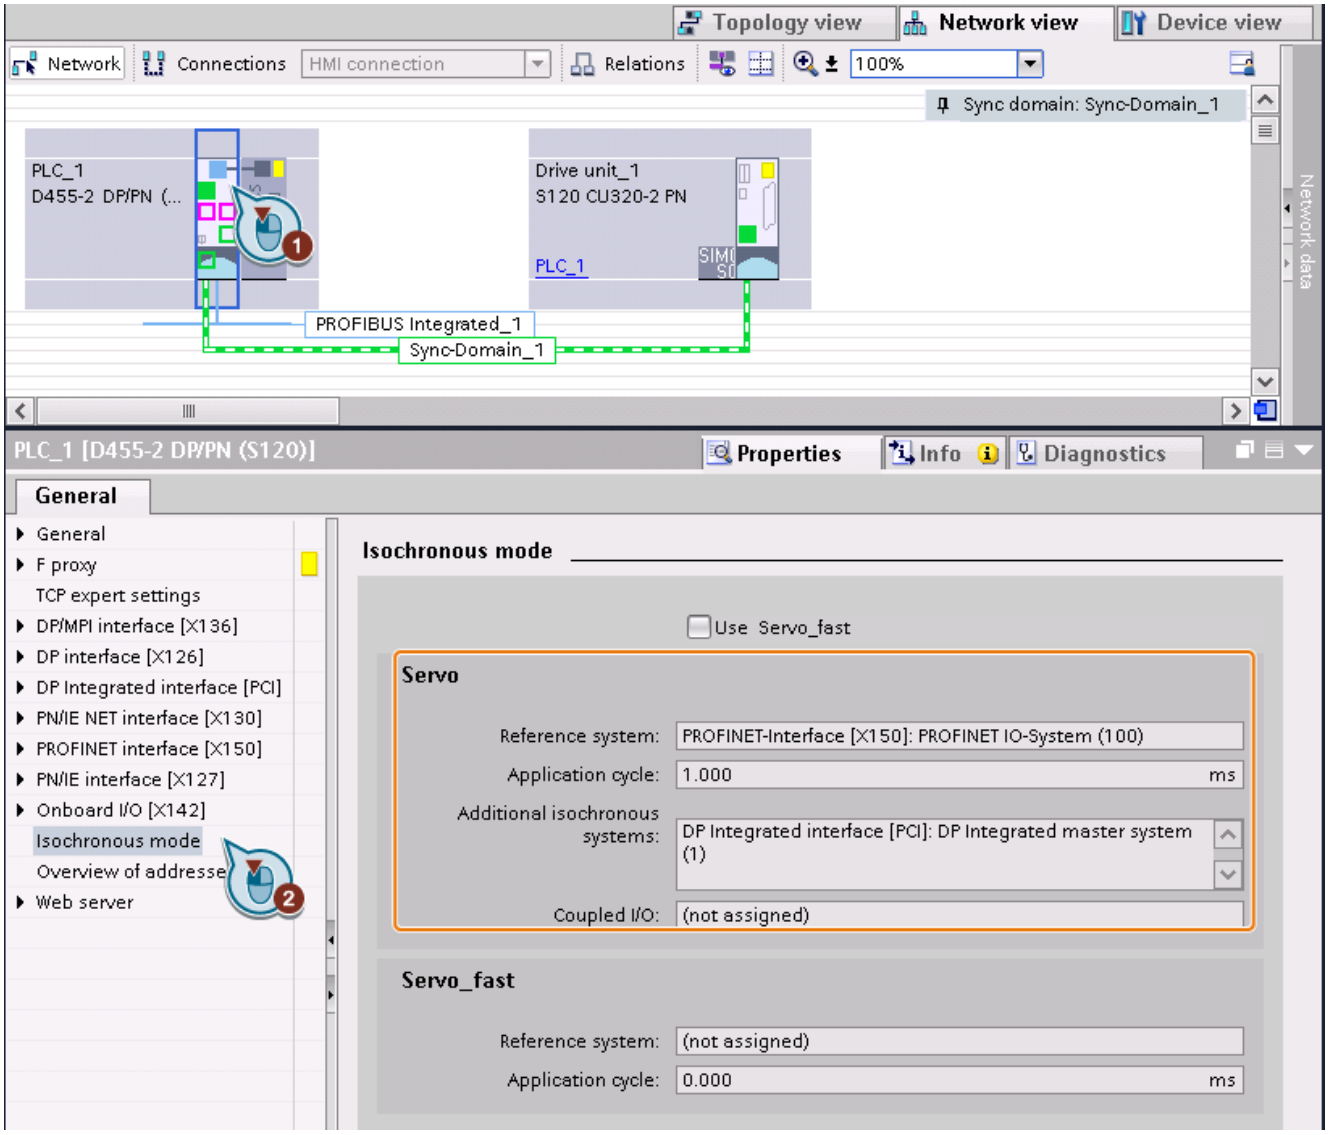

Figure 3-367 Setting the servo

The following parameters are displayed:

Parameter	Description
Reference system	Displays the reference system for the servo cycle in the following form: "Type of interface [interface name]: Master/IO system (number of master/ IO systems)". In the example, the reference system (clock generator) is the PN interface X150.
Application cycle	Shows the application cycle. The application cycle corresponds to the servo clock and can be set in SIMOTION SCOUT TIA. 1. Right-click the controller in the project navigator and perform "Set system cycle clocks." 2. Select an appropriate value in the "Factor" column.
Other isochronous systems	Displays the other (DP) master systems that are operated in isochronous mode.
Coupled IO	Displays the IO system on the [X1400] with the isochronously operated drive unit as the coupled I/O.

See also

Isochronous mode with Servo_fast cycle clock (Page 705)

Isochronous mode with Servo_fast cycle clock

Configuring Servo_fast

Servo_fast is configured like the Servo. That means the IO devices must be operated isochronously and the application of Servo_fast must be activated explicitly at the IO controller.

Note

Servo_fast is only supported by SIMOTION D435-2 DP/PN, D445-2 DP/PN and D455-2 DP/PN. The requirements and constraints that apply to the Servo_fast can be found in the "SIMOTION SCOUT Communication" Function Manual.

For detailed information, read the descriptions of the servo settings:

Configure isochronous IO device (Page 701).

In the following example, a SIMOTION D455-2 DP/PN with two SINAMICS S120 CU310-2 PN drive devices is configured. The drives operate isochnronously. The drive device at the integrated PN interface (X150) should be operated isochronous with the Servo_fast; the drive device on the CBE30-2 (X1400) should be operated isochronous with the servo.

To configure Servo_fast, proceed as follows:

1. Select the device in the network view.
   The interface settings are displayed in the Inspector window.
2. In the Inspector window, select the "Properties > General" tab and click "Isochronous mode".

3. Activate the "Use Servo_fast" option.
   The settings are "read-only" and are filled according to the configuration. The application cycle is calculated and is derived from the settings in the TIA Portal and SIMOTION SCOUT TIA. The reference systems in this example for Servo and Servo_fast are X1400 CBE30-2 interface and X150 PN Integrated, respectively.

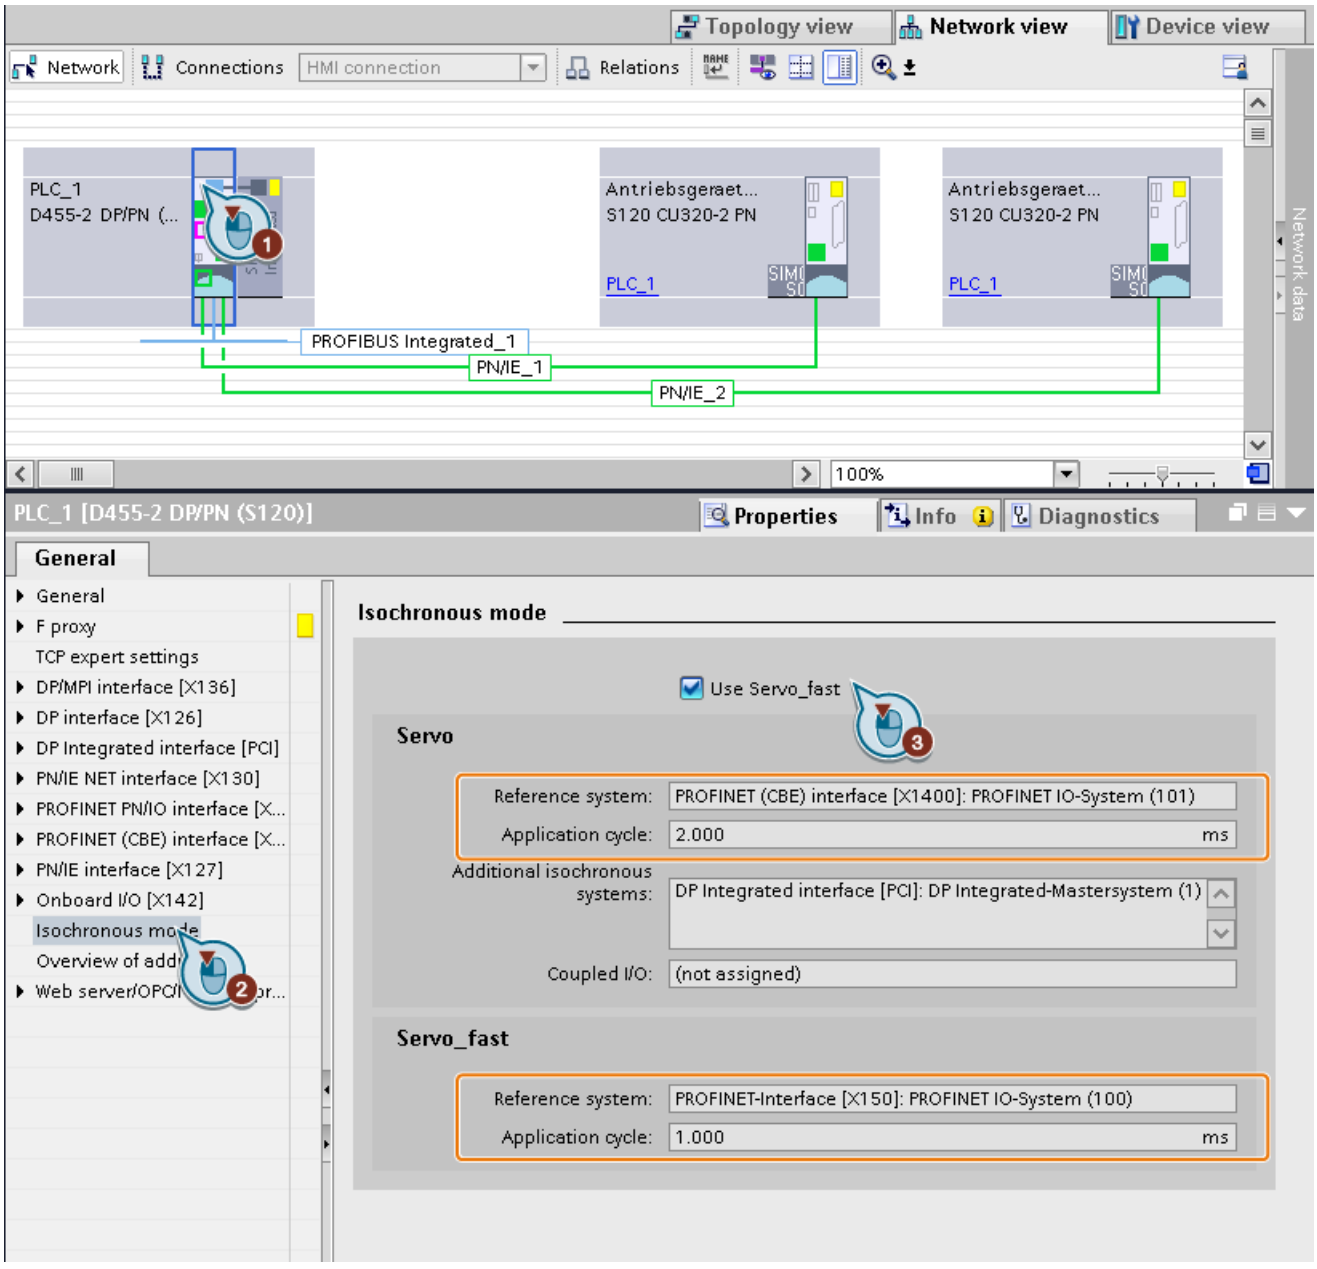

Figure 3-368 Assign Servo_fast

4. The application cycle corresponds to the servo cycle and can be set in SIMOTION SCOUT TIA. Switch to SIMOTION SCOUT TIA, right-click the controller and select "Set system cycles" in the context menu. In the opened dialog, select an appropriate value in the "Factor" column. In the example, Servo_fast is set to 1 ms and Servo to 2 ms.

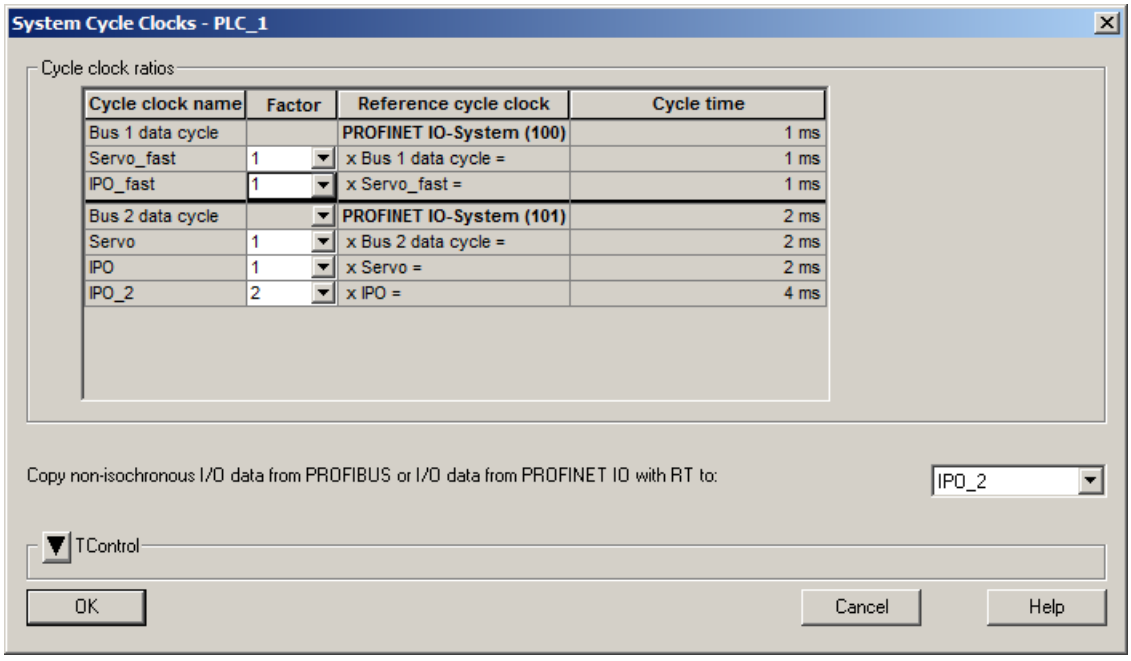

Figure 3-369 Setting system cycles for SIMOTION SCOUT TIA

5. Switch to the TIA Portal. There you can check the isochronous mode, the send cycle and the application cycle for the IO devices. A send cycle has been entered as 1 ms (i.e. synchronously to the Servo_fast cycle) at the IO device at the integrated PN interface (X150).

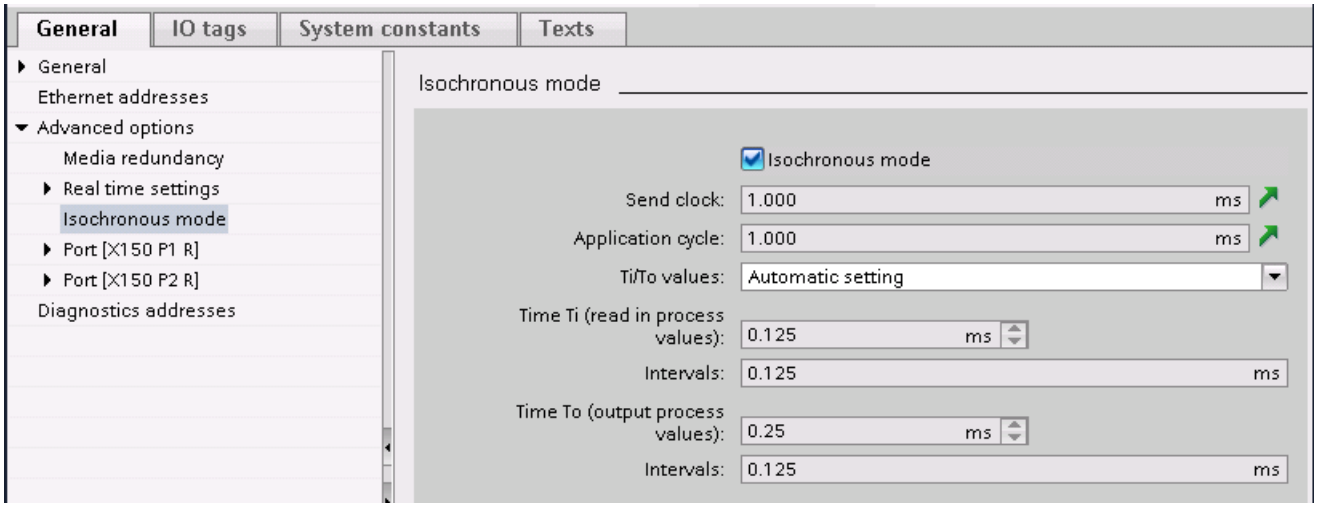

Figure 3-370 IO device configured isochronous to the Servo_fast

6. At the IO device at the PN interface of the CBE30-2, the send cycle has been entered with 2 ms, which means synchronously to the servo cycle.

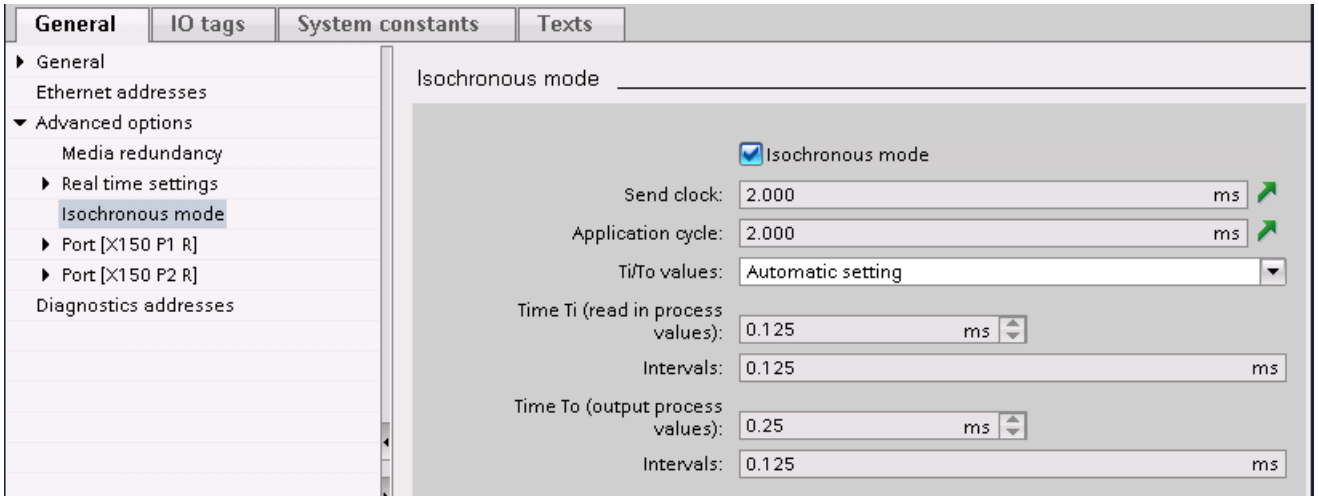

Figure 3-371 IO device configured isochronous to the servo

IO controller as IO device (I-Device)

Configuring I devices

I-Device description

The "I-Device" (intelligent IO device) functionality of a controller enables exchange of data with an IO controller. Here the I-Device is connected as an IO device to a higher-level IO controller. Communication can be established in both directions (bidirectional) via I/O areas using the I-Device functionality. This function also allows both controllers to operate in separate projects. When operating as an I-Device, a SIMOTION device can be used for data exchange with a SIMATIC station, for example.

Additional references

You will find detailed information in the information system of the TIA Portal under the keyword "I-Device" and in the "SIMOTION SCOUT Communication" Function Manual.

I-Device properties

With SIMOTION, the I-Device is available for PROFINET IO with RT and IRT. The restrictions that exist for operation as IRT or RT are contained in the following table.

Table 3-42 RT and IRT I-Device combination options with SIMOTION

SIMOTION functions	**Possible additional functions**			
	RT I-Device	RT controller	IRT I-Device	IRT controller
RT I-Device	-	X	-	X
RT controller	X	-	X*	X*
IRT I-Device	-	X	-	-
IRT controller	X	X	-	-

*Either an IRT I-Device or an IRT controller

Configuring I-Device

In the following example, a SIMOTION D455-2 DP/PN with isochronous SINAMICS S120 operates as I-Device on a SIMATIC S7 CPU 1516-F. If you want to operate a device as an I-Device, you must first activate the "IO device" operating mode.

In order to create an I-Device, proceed as follows:

1. In the network view, select the SIMOTION controller and the interface over which the I-Device is to be operated. In the example, X150.
2. In the Inspector window, select the "Properties > General" tab and click "Operating mode".
3. Activate the "IO device" option.

4. Assign the controller to which the I-Device is to be assigned at "Assigned IO controller".

Note

If the I-Device is to be used in another project, select "not assigned". To be able to use the I-Device, you must export the GSD and reinstall it. In the hardware catalog, this is displayed at "Other field devices" in a subfolder.

5. Activate the "Parameterization of the PN interface by higher-level IO controller" option if the interfaces of the I-Device and its ports are to be configured by the controller. This is the case if the I-Device is to be operated with IRT.
   If the I-Device is to be operated isochronously with IRT, you must also activate the "Operate in isochronous mode" option. This option is only available when the "Parameterization of the PN interface by the higher-level IO controller" option has been activated. If isochronous operation of the I-Device is not possible (e.g. already configured as IRT controller), you cannot activate the "Operate in isochronous mode" option.

Note

If you operate the I-Device with a lower-level IO system, the PROFINET interface (e.g. port parameter) of the I-Device cannot be parameterized by the higher-level IO controller.

Note

Restriction to configuring an isochronous IRT I-Device

Configuring an isochronous IRT I-Device in a single project in the TIA Portal is not supported. When an isochronous IRT I-Device is configured, the configuration must be divided between two projects.

This restriction also applies to migrated SIMOTION SCOUT projects. The SIMOTION SCOUT project must be divided between two projects before it is migrated.

This restriction does not apply to RT I-Devices.

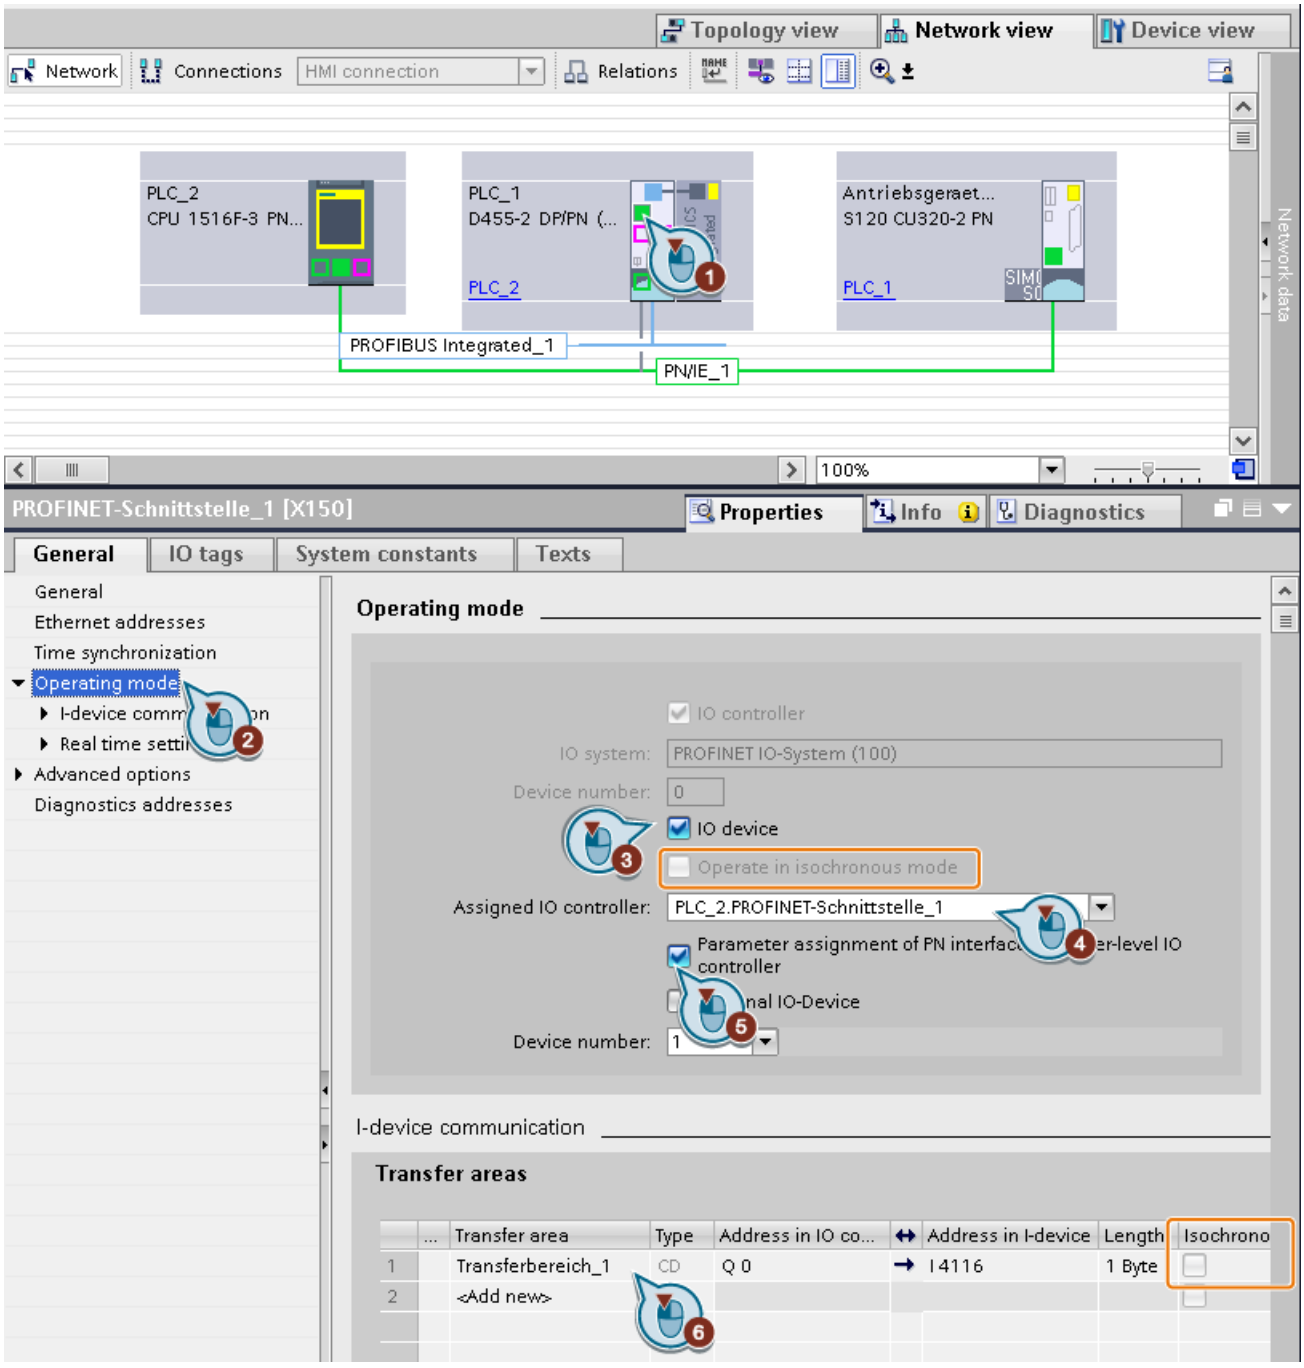

Figure 3-372 Setting the I-Device

6. Once the "IO device" option has been activated for the controller, you can define the transfer area. It is necessary to define a transfer area for the data exchange.

Parameter		Description
⑥ Transfer areas		Transfer areas are the peripheral areas over which the I-Device communicates data with the higher-level IO controller.
	Add new	Add a transfer area. A name is created automatically for the transfer area, the addresses are assigned in the IO controller and I-Device, and the length of the transfer area is set. You can still edit the following data:
	Type	Select the "Type" CD (Controller Device communication relationship).
	TransferArea_x	After you have created a transfer area, "Details of the transfer area" are displayed, where you can view the settings and change them, if necessary.
Diagnostic address of the communication		Here, you see the diagnostic addresses for each module and its ports/interfaces.
Export the device description file (GSD)		If you use the I-Device in another project or if the I-Device is used in another engineering system, then configure the higher-level IO controller and the I-Device as described here, in principle. Click the "Export" button after configuration of the transfer areas to create a GSD file from the I-Device. This GSD file is the representative of the I-Device configured in the other project.

Exporting and installing an I-Device

You can also export an I-Device as a GSD file and then install it in the TIA Portal. With this functionality, you can insert the I-Device in other projects via the hardware catalog.

1. In the "Operating mode" window, select the "not assigned" entry at "Assigned IO controller".
2. Configure the transfer area.
3. The next step is to export the GSD (generic station description). Click the "Export" button in the same window in the field "Export generic station description (GSD)".
4. In the dialog that opens, enter a name and description and specify the export path.
5. Confirm with "Export". The GSD file will be stored in the specified folder.
6. Select "Options" > "Install GSD file" in the menu.
7. Navigate to the storage location of the exported GSD file and select it in the window that opens.
8. Click "Install". The GSD file will be installed. In the hardware catalog, the I-Device is displayed at "Other field devices" in a subfolder.
9. With a drag-and-drop operation, you can, for example, insert the I-Device into another project.

Real-time settings on IO devices and I devices

Real-time settings for IO devices

The real-time settings are displayed when you set the "IO device" operating mode. Accordingly, these settings are also available for I-Devices:

1. Mark the SIMOTION CPU and select the "Real-time settings" for the PN interface in the "Properties" tab in the Inspector window.
   The table shows the possible options.

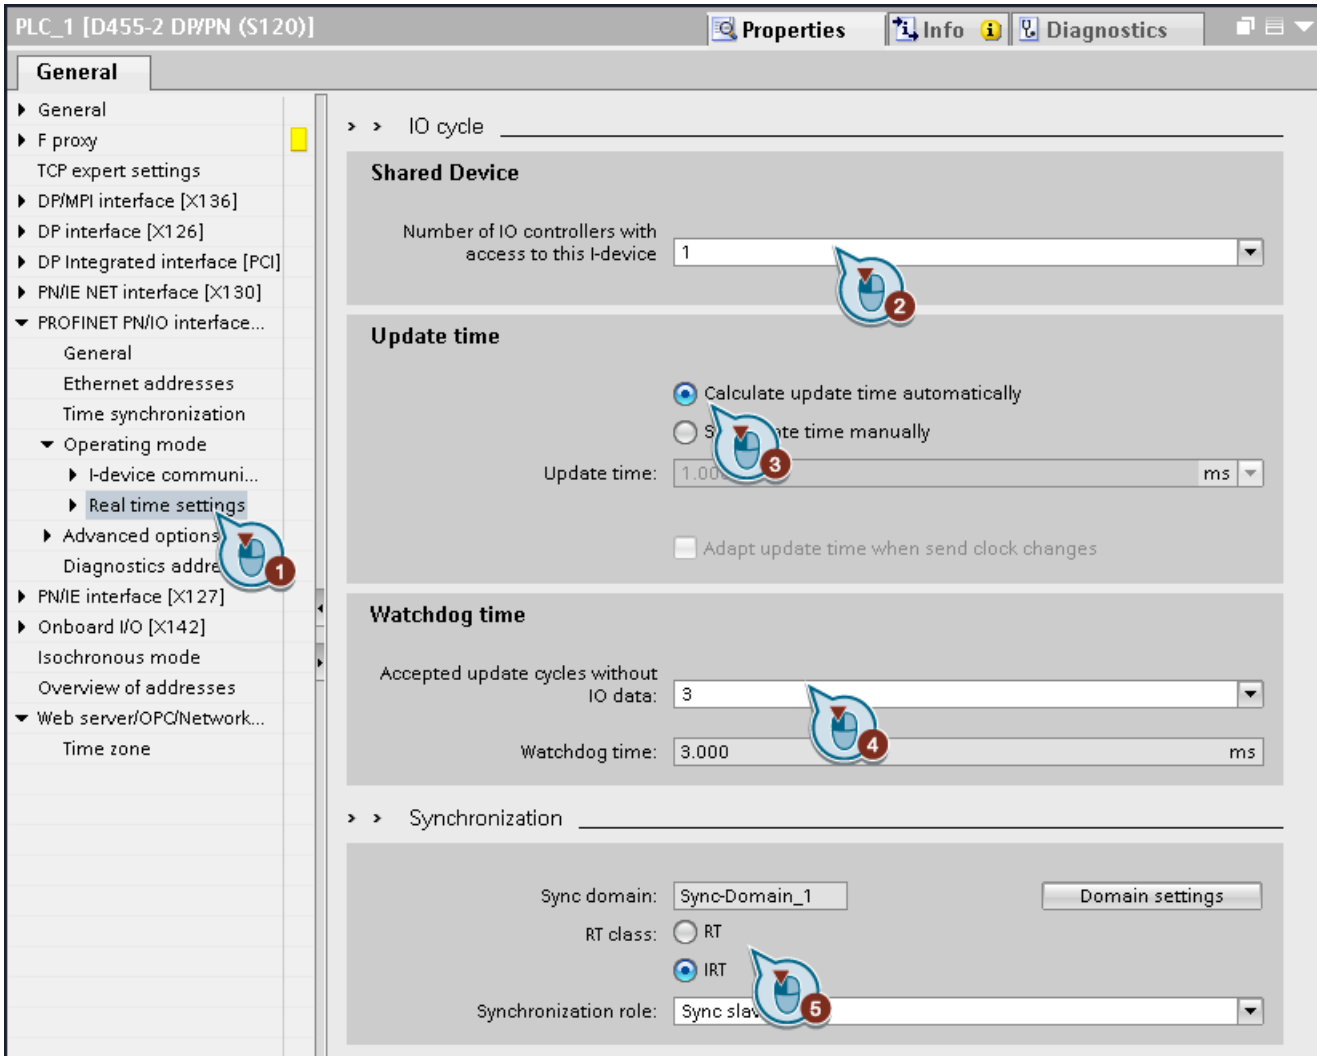

Figure 3-373 Real-time settings on the I-Device / IO device

You can set the following parameters:

Parameter		Description
② Shared device		From the drop-down menu, select the number of IO controllers to have access to this I-Device (only possible if you have configured an I-Device). **Note:** A SIMOTION I-Device can be operated only on **one** IO controller. As shared I-Device is not possible. A number > 1 causes an error message during the compilation.
③ Update time		Within this time interval an IO device / IO controller in the PROFINET IO system is supplied with new data by the IO controller / IO device. The update time can be configured separately for each IO device and determines the interval at which data is sent from the IO controller to the IO device (outputs) as well as from the IO device to the IO controller (inputs).
	Automatic	Automatically calculates the update time for each IO device of the PROFINET IO system, taking into account the data volume and the send cycle set.
	Adjustable	Activate the option to enter the update time manually. However, this can lead to errors if the bandwidth is not sufficient, or for example, too many nodes are configured.
	Adjust the update time when changing the send cycle	Automatically adjusts the update time.
④ Response monitoring time		If the IO device is not supplied with input or output data (IO data) by the IO controller within the response monitoring time, it switches to the safe state.
	Accepted update cycles without IO data	Enter here the number of cycles in which the IO device may be without data from the IO controller.
	Response monitoring time	Displays the current response monitoring time.
⑤ Synchronization		Can only be edited if the "Parameterization of the PN interface by the higher-level IO controller" option has been activated.
	Sync domain	Displays the name of the assigned sync domain. Click the "Domain setting" to edit the sync domain.
	RT class	Select the current RT class here. The following are available: • RT; for the cyclic data transmission • IRT; for isochronous real-time data transmission **Note:** The I-Device can operate only in IRT mode when IO devices connected to the I-Device operate only in RT mode.
	Synchronization role	Indicates the synchronization role the IO device has. The following are possible: • Unsynchronized • Sync master • Sync slave

See also

IO device (drive) on PROFINET IO (Page 693)

Direct data exchange via PROFINET IO

Direct data exchange

Direct data exchange between two SIMOTION controllers

IO data areas can be exchanged cyclically via IRT between two or more SIMOTION controllers. This is also referred to as controller-controller data exchange broadcast. Controller-controller data exchange broadcast is possible only between SIMOTION controllers via PROFINET IO with IRT. The following requirements must be met:

- The controllers are interconnected to the subnet.
- The topology is configured (ports interconnected).
- The PN-IO system is configured.
- The synchronization roles are assigned.
- The devices are in a single sync domain.

Procedure

To configure controller-controller data exchange broadcast, proceed as follows:

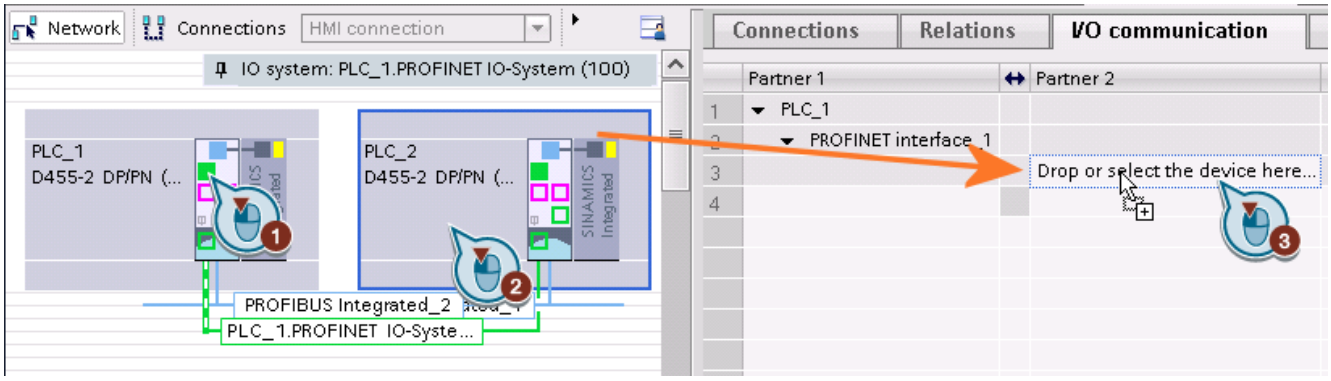

Figure 3-374 Drag-and-drop direct data exchange

1. Call the network view and click the "I/O communication" tab in the foreground below "Network data".
2. At the transmitter module, select the interface that you want to use for direct data exchange. At "I/O communication", the modules that are configured in this subnet are displayed.
3. Drag-and-drop the receiver module onto the transmitter interface.
   The module is displayed with the corresponding direction of communication.
4. Repeat the operation to configure the reverse direction of communication.
5. Select the "receiver module" to configure it as a transmitter and drag the "transmitter module" onto the interface in the "I/O communication".
   The two configured communication paths are now displayed.

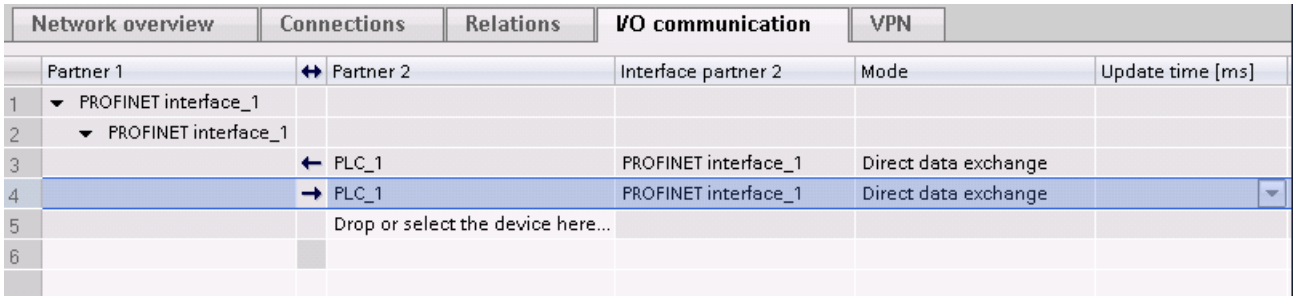

Figure 3-375 I/O communication

Configure transfer areas

It is necessary to define transfer areas for direct data exchange. Once you have selected the interface in the "I/O communication", the "Direct data exchange" area is displayed below the "General" tab in the Inspector window.

To configure a transfer area, proceed as follows:

1. On the "General" tab, click the "Add new..." entry in the "Transfer areas" table.
   The transfer area is created and displayed with the given data.
2. Repeat the process to create the transfer area for the reverse direction.

Note

The transfer areas must be configured both in the transmit and the receive direction (bidirectional data communication).

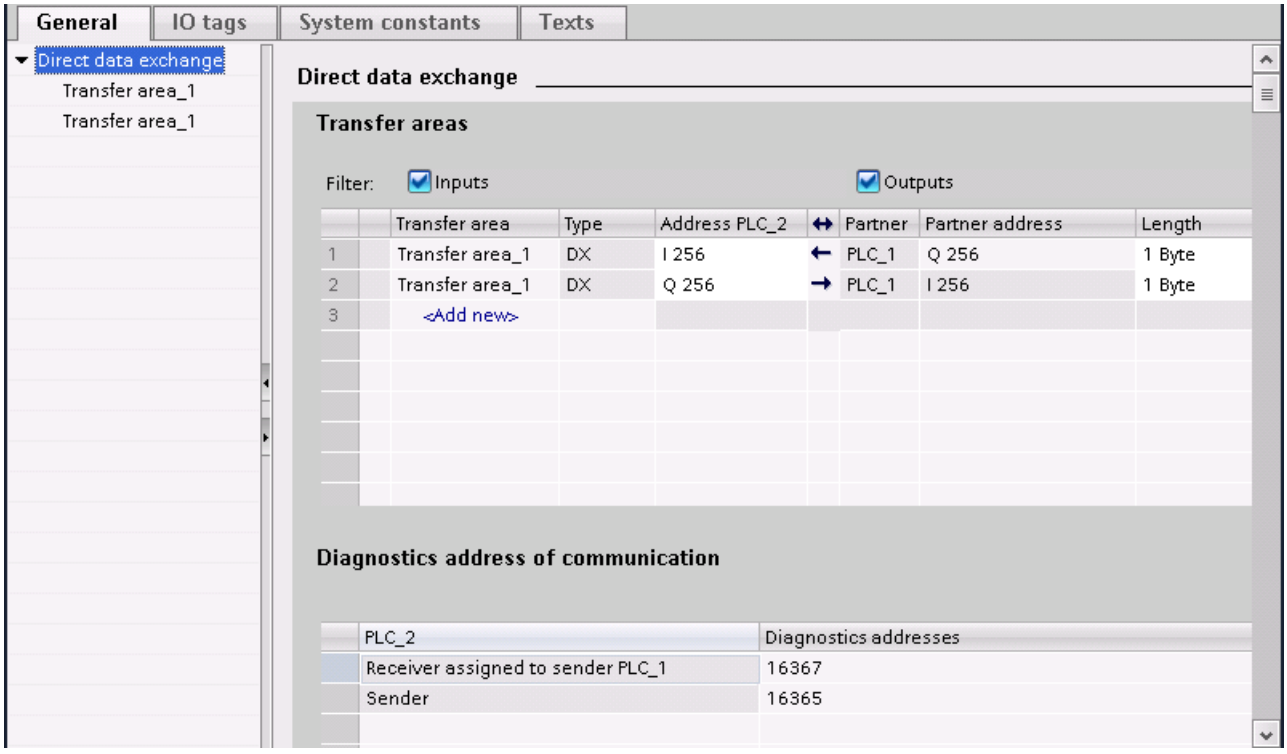

Figure 3-376 Configure transfer areas

3. In order to parameterize the transfer areas further, click the "Transfer area 1", ... "Transfer area x" entries in the secondary navigation.
   The corresponding parameters are displayed for each transfer area.

The diagnostic addresses for transmitter and receiver are illustrated at "Diagnostic address of communication".

If you want to configure direct data exchange for additional controllers, add them to the subnet, and perform the configuration similarly.

Type of transfer areas

In the TIA Portal, different types of communication (PROFIBUS, PROFINET) can be configured. Depending on this configuration, different short codes are shown for the transfer area type.

- PROFINET IO
  For Direct Data Exchange, "DX" is displayed as the type in the TIA Portal. For synchronous and distributed synchronism configurations that are generated automatically by SIMOTION SCOUT TIA, "M-DX" is displayed as the type. M-DX means Motion Control with Direct Data Exchange.

Set up the sync master and sync slave. (Page 697)

Configuring the redundancy second sync master

Configuring the redundant sync master

There are machines/plants that consist of two submachines / plant units. For such machines/ plants (complete systems), it can be necessary that both submachines / plant units (subsystems) must be able to be operated synchronously, alone (separated) and in the complete system. This requires that a sync master is defined/configured on each subsystem. Only one sync master is permitted in the complete system. Consequently, a sync master is configured on one subsystem and a redundant sync master is configured on the other subsystem.

If the complete system is operated combined, either the sync master or the redundant sync master handles the synchronization of the complete system (depending on the switch-on sequence; for simultaneous switch-on, the sync master).

Example of a redundant sync master

In the following example, simple topology is configured with a redundant sync master. The project contains two SIMOTION D455-2 DP/PNs and one SINAMICS S120 CU320-2 PN. One SIMOTION D455-2 DP/PN is configured as the sync master (PLC_2) and the other as the redundant sync master (PLC_1). On the redundant sync master, the SINAMICS S120 is connected in isochronous mode via PROFINET.

For configuration of the sync master and sync slave, refer to Section Communication configuration SIMOTION controller with SIMOTION drive (Page 684).

To configure a redundant sync master, proceed as follows:

1. Select the PROFINET interface in the network view.
   The interface settings are displayed in the Inspector window.
2. Click "Synchronization" at "Real-time settings".

3. Select the "Redundant sync master" entry.

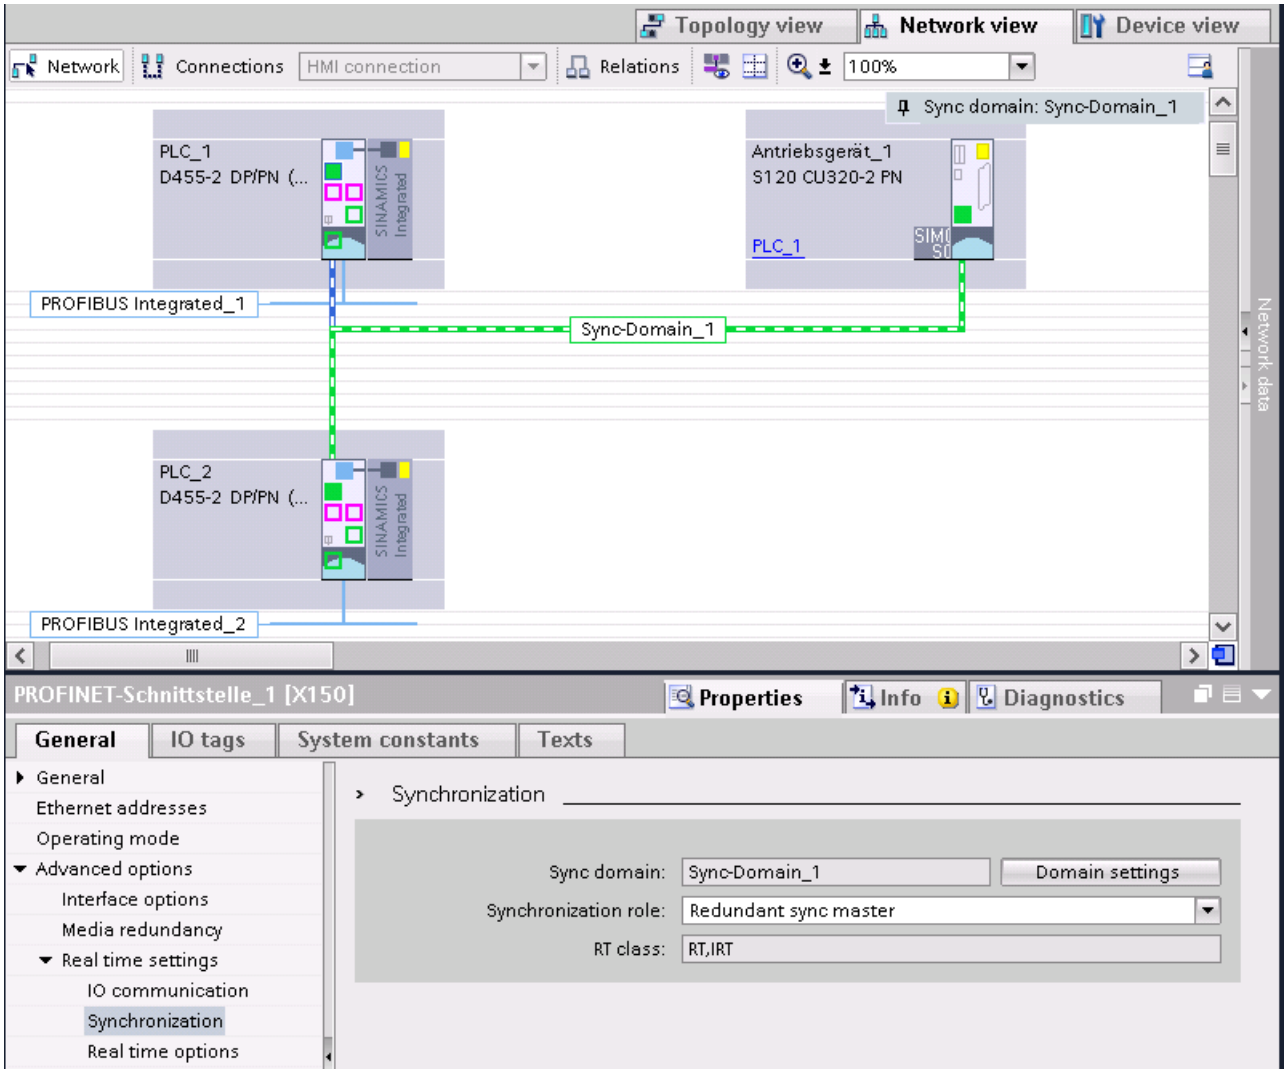

Figure 3-377 Redundant sync master

4. Switch to the topology view.
5. Interconnect the ports of the two SIMOTION controllers.

Note

In the topology view, the redundant sync master should be between the sync master and the sync slaves.

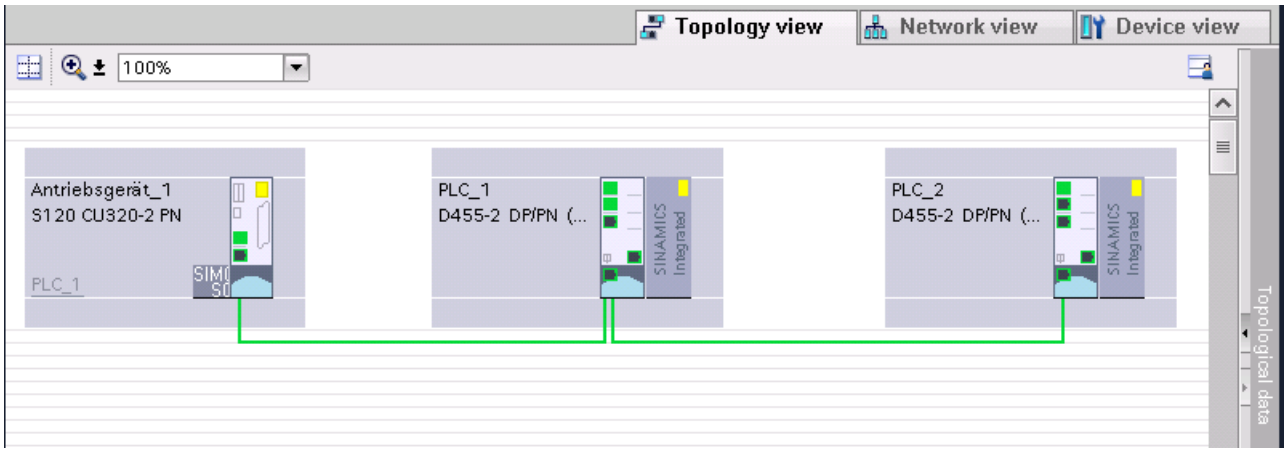

Figure 3-378 Topology view with redundant sync master

Media redundancy (MRP and MRPD)

Configuring MRP media redundancy

Configuring MRP (PROFINET RT)

It is possible to establish redundant networks via the so-called Media Redundancy Protocol (MRP). Redundant transmission links (ring topology) ensure that an alternative communication path is made available when a transmission link fails. The PROFINET devices that are part of this redundant network form an MRP domain. The Redundancy Manager coordinates the communication. All other members in the MRP ring are so-called redundancy clients, e.g. SINAMICS S120 drives.

Only devices with MRP-capable ports may be inserted in an MRP ring. In SIMOTION controllers, the ring ports are marked R. In MRP, no IRT communication can be configured, i.e. no PROFINET interface is set to "sync master" or "sync slave".

Additional references

You will find detailed information in the information system of the TIA Portal under the keyword "Media redundancy" and in the "SIMOTION SCOUT Communication" Function Manual.

Requirements

1. Generate a ring via the port interconnections in the topology view. If no rules are violated, a MRP domain is automatically created.
2. Check the media redundancy roles, e.g. who assumes the role of the "Redundancy Manager".
3. Select the device and click "Properties" in the Inspector window and then the "General" tab. You edit the parameters at the "Media redundancy" entry.

Port interconnection ring topology for MRP

In the topology view, you must configure the port interconnection of the manager with the clients to create a ring. In the example, a SCALANCE X-200 IRT as the redundancy manager, a SIMOTION D435-2 DP/PN, and a SINAMICS S120 CU310-2 PN as clients are configured.

1. Open the topology view.
2. Interconnect the individual ports of the devices. The interconnected ports must be ring ports. They are marked with an R.
3. Connect the two end points of the line topology with each other in order to close the ring, e.g. the redundancy manager with a redundancy client.

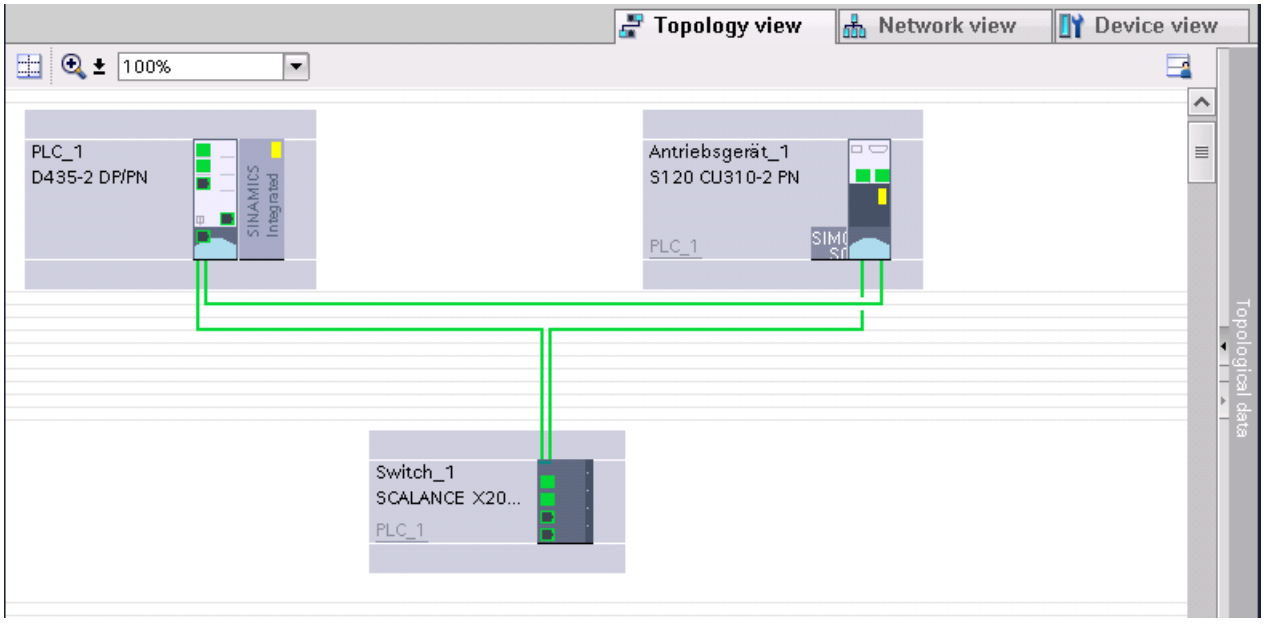

Figure 3-379 Port interconnection of a ring topology

MRP parameters

You can set the following parameters for media redundancy:

Parameter	Description
MRP domain	Shows the MRP domain that is assigned to the device. The assignment is made at Domain Management, see below.
Media redundancy role	Please select here the role the device is to perform in the ring: • Manager (Auto) if the device is to assume the manager role. The device must be able to fulfill this role. • Client if the device is part of the MRP ring. • Not node within the ring if the unit is not to participate in the MRP.
Ring port 1	Displays the interconnection of ring port 1.
Ring port 2	Displays the interconnection of ring port 2.
Diagnostic alarms (in the manager only)	Activate the option if you want to display diagnostic alarms.
Alternative redundancy (in the manager only)	Select this option if the properties of the media redundancy are parameterized by alternative mechanisms or tools.
Domain settings	Click this button to edit the domain settings. Then switch to the "Properties > General" tab of the PROFINET system. There, you can edit the settings for sync domains and MRP domains, see also Configure sync domains and send clock (Page 695).

In the following example, you see the media redundancy settings of a SIMOTION D435-2 DP/PN, which is configured as a client in the ring. The SCALANCE X-200 IRT is configured as a manager and the SINAMICS S120 CU310-2 PN as a further client.

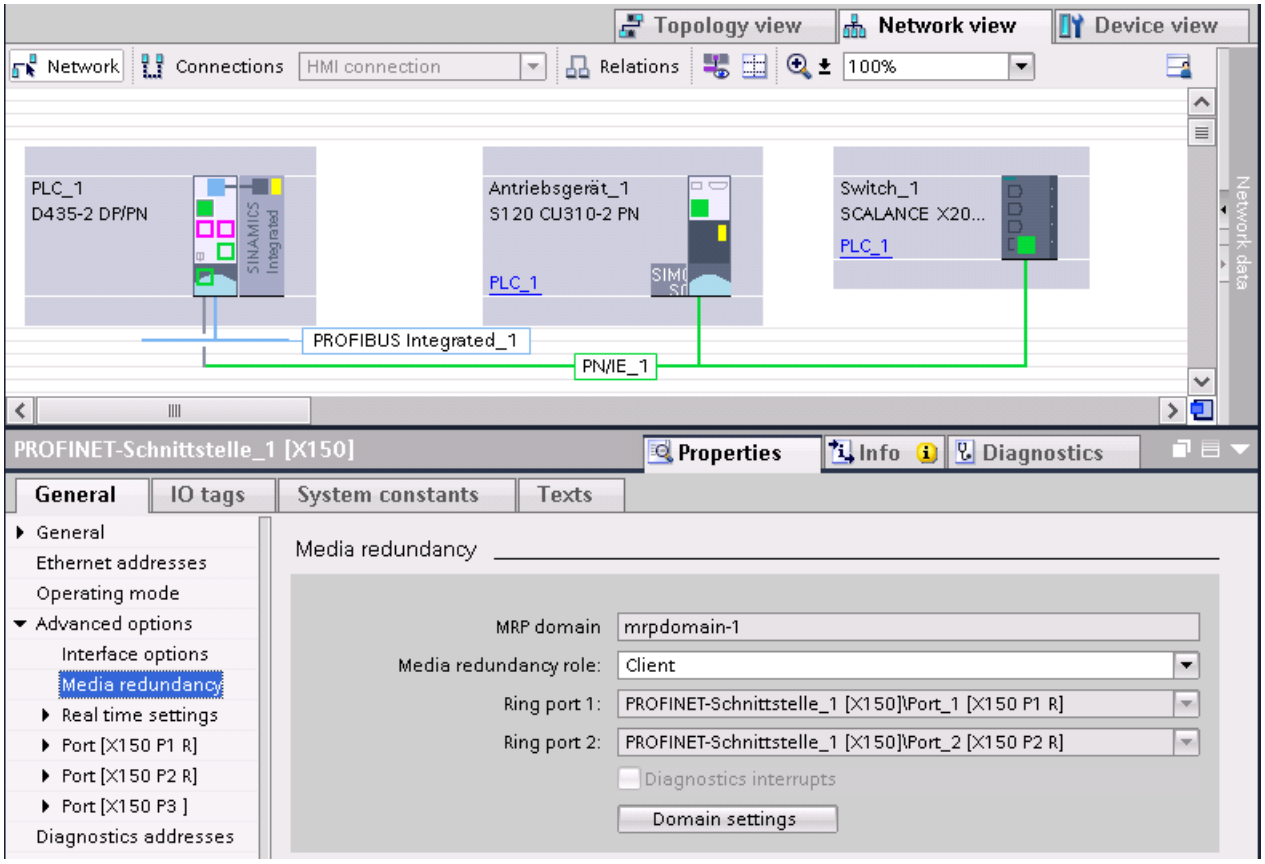

Figure 3-380 Media redundancy settings of a SIMOTION D435-2 DP/PN as redundancy client

Configuring the MRP domain

MRP domain

All devices that want to participate in the MRP must be part of an MRP domain. The ring topology can be accessed via the corresponding port interconnection.

Configuring the MRP domains

To configure the nodes of an MRP domain, proceed as follows:

1. Select the PROFINET IO system in the network view.
2. In the Inspector window, select the "General" tab and click the "MRP domain" entry.

The following parameters can be edited:

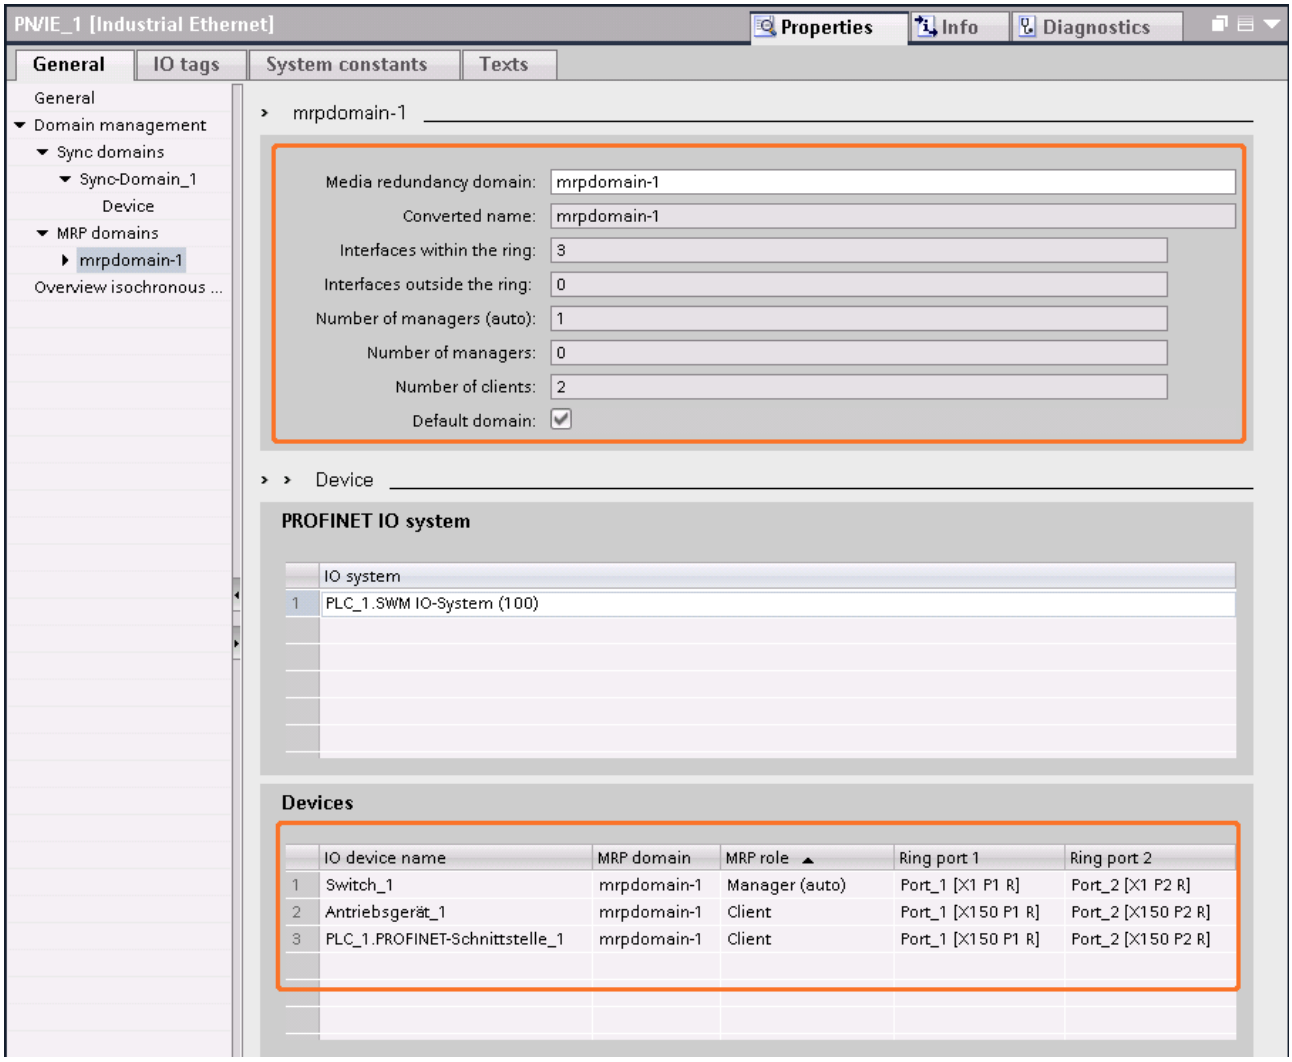

Figure 3-381 Configure MRP domain

Parameter		Description
MRP domains		
	Media redundancy domain	Displays the MRP domain to which the device is assigned.
	Converted name	Displays the converted name of the MRP domain.
	Interfaces within the ring	Displays the number of PROFINET interfaces that are located within the ring.
	Interfaces outside of the ring	Displays the number of PROFINET interfaces that are located outside of the ring.
	Number of managers	Displays the number of Redundancy Managers.
	Number of clients	Displays the number of Redundancy Clients.
	Default domain	Indicates whether the displayed MRP domain is the default domain.
PROFINET IO System		
	IO system	Displays the IO systems that are part of the MRP domain.
Devices		
	IO device name	Lists the device names of the PROFINET IO system nodes.

Parameter		Description
	MRP domain	Drop-down menu to select the MRP domain
	MRP role	Drop-down menu to select the role of the device in the MRP domain: • Not node within the ring • Client; is a redundancy client within the ring • Master; is a redundancy master within the ring
	Ring port 1	Drop-down menu to select the port through which the device is connected to the ring.
	Ring port 2	Drop-down menu to select the second port through which the device is connected to the ring.

Configuring MRPD media redundancy for IRT

Configuring MRPD (PROFINET IRT)

MRPD (Media Redundancy for Planned Duplication) is a method for smooth media redundancy with PROFINET IRT. MRPD also requires MRP.

The combination of MRP with MRPD provides bumpless PROFINET operation for short cycle times in the event of a fault in the ring. MRPD is based on IRT and ensures bumpless operation by the transmitter sending the cyclic data in both directions which the recipient then receives twice. The first received telegram is used by the recipient. The second telegram is discarded automatically. If the ring is interrupted at one location (e.g. through the failure of a ring node), receipt of the cyclic data via the problem-free side of the ring is still guaranteed.

Note

Bumpless media redundancy MRPD always requires the activation of MRP in the individual rings.

Requirements for media redundancy with MRPD

- All nodes in the ring must support MRPD.
- IRT must be configured for all components.
- All nodes in the ring must be configured as node.
- Devices not contained in the ring must assume the MRP role "Not node of the ring".

Configure MRPD and redundancy level

MRPD does not need to be activated explicitly. The function is available automatically once all MRPD requirements are satisfied. If MRPD is available, the redundancy level is displayed for each IO device. The redundancy level specifies the extent to which the real-time communication is affected in the event of a network interruption between an IO device and its IO controller.

In the following example, a SCALANCE X-200 IRT as the redundancy manager, a SIMOTION D455-2 DP/PN and a SINAMICS S120 CU320-2 PN as clients are configured. MRPD is set automatically when all nodes satisfy the requirements. For active MRPD, the "Redundancy level" column with the associated value is displayed for the IO devices.

Displaying the redundancy level

1. Select the PROFINET IO system in the topology view.
2. In the Inspector window, select "Properties > General" and open the "Nodes" of the sync domain in the secondary navigation. The redundancy level is displayed in the "IO devices" table.

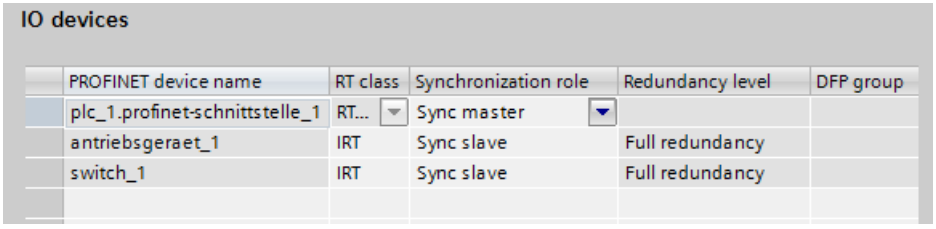

Figure 3-382 Redundancy level for available MRPD in the ring

Series machine projects (modular machine)

Series machine projects

Introduction

Series machine projects (basis for modular machine projects) are designed to help you configure and commission flexible automation solutions for series or modular machines.

A hardware configuration comprising an IO controller and any number of connected IO devices represents a "PROFINET IO system master". This master is a "maximum configuration" and a template from which various options can be derived for a variety of series machines with, for example, different design variants of the IO system.

SIMOTION SCOUT TIA provides you with a range of functions that will support you as you configure a master project from which you can derive modular machine instances.

Characteristics

- You can derive different variants (instances) from a project with maximum configuration.
- An IO system can be integrated using simple tools into an existing on-site network.

Functions for series machine projects

- Addresstailoring (reusable IO systems) Adaptation of IP addresses and device names on-site using simple tools.
- Machinetailoring (configuration control for IO systems) Vary the number of on-site IO devices

Additional references for TIA Portal

Additional information and application examples on the subject of Configuration control with SIMATIC S7 (https://support.industry.siemens.com/cs/ww/en/view/29430270) can be found in the Service & Support Portal.

Assigning device name and IP address via user program / DCP

Introduction

With the SIMOTION system functions, the IP addresses and the device names of the PN IE interfaces and the PN IO interfaces can be assigned from the user program or the DCP (Discovery and Configuration Protocol). An additional reboot is no longer necessary for the PN interfaces. This mechanism allows the IP addresses and device names to be adjusted without making changes to the project. The IP settings can be changed locally, in particular for series machines.

System functions

New system functions have been introduced as of SIMOTION V4.4 for assigning the IP address and device name.

- _setPnNameOfStation
- _getPnNameOfStation
- _getPnPortNeighbour (only PN IO interfaces)
- _setPnIpConfig
- _getPnIpConfig

Assigning the device name based on the MAC address (V5.2)

As of SIMOTION SCOUT V5.2, the device name can also be assigned based on the MAC address. The PN devices are named with the system function _assignNameOfStationToDevice().

Note

A detailed description of the system functions can be found in the online help of SIMOTION SCOUT TIA, in the *SIMOTION System Functions/Variables Devices* List Manual, and in the *SIMOTION Communication System Manual*.

Permit adaption of IP addresses and device names directly on the device

Introduction

The IP address and the device name can be assigned via a user program. The hardware must consider this during the configuration.

Procedure

1. Select in the network view or device view of the hardware and network editor of STEP 7, the PROFINET interface of an IO controller.
2. Navigate in the Inspector window to "Ethernet addresses".
3. Select the "Permit adaptation of the IP address directly on the device" option in the "IP protocol" area.
4. Activate the "Permit adaptation of the PROFINET device name directly on the device" checkbox in the "PROFINET" area.

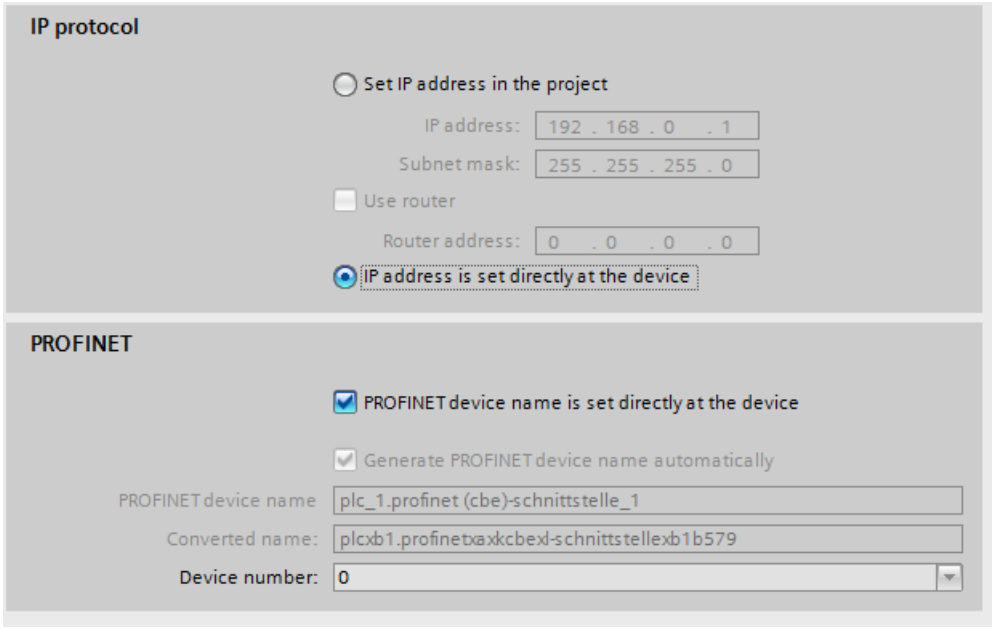

Figure 3-383 Permit assignment of device names and IP addresses differently (e.g. user program)

The IP address and the device name for the commissioning can be assigned via the user program or, for example, also via the PST (Primary Setup Tool) or PRONETA.

Permit overwriting the PN device name

Introduction

Previously, a topological naming of an IO device was possible only when the IO device did not have any device name (NameOfStation). To change existing device names of IO devices, they had to be reset. Only then could the devices be renamed by the IO controller. As of SIMOTION V4.5, overwriting a device name can be activated without reset for the hardware configuration. This option, for example, makes it easier for you to replace a device during automatic commissioning.

⚠ CAUTION

Unstable error states during partial commissioning

The activated option can cause the system to reach an unstable error state in the case, for example, of a wiring error, and wiring errors are difficult to diagnose.

After the wiring has been rectified, you must manually delete, for example, the device names of the IO devices to ensure that the names are correctly assigned.

⚠ WARNING

Incorrect PROFINET device names from the configuration due to incorrectly connected devices

Depending on the I/O connected, malfunctions may pose a danger to life or risk of serious injury or property damage if PROFINET device names are entered incorrectly because the device connections are incorrect.

To eliminate any risks, always check when a device is replaced whether the appropriate replacement device is connected and the port interconnection matches the configured set topology!

Principle

With activated "Permit overwriting the PROFINET device name" option, the IO controller (CPU) can overwrite the PROFINET device names of the IO devices in the IO system.

Note

The "Permit overwriting the PROFINET device name" option must be activated for address tailoring and is set automatically when "Reusable IO system" is selected.

Procedure

To change the "Permit overwriting the PROFINET device name" option, proceed as follows:

1. Select in the network view or in the device view the PROFINET interface or the CPU for which the option is to be changed.
2. Select the "Extended options" area, "Interface options" section.
3. Change the option.

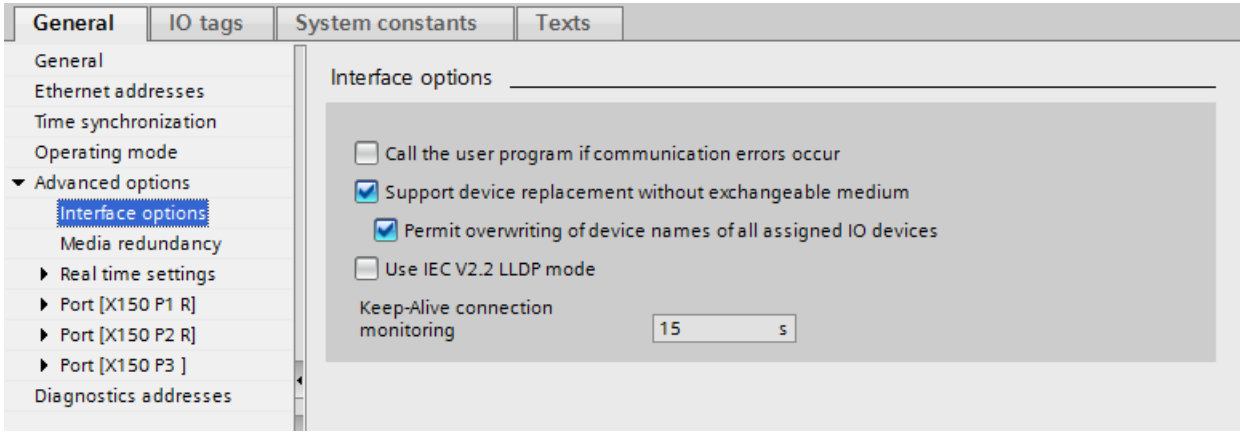

Figure 3-384 Permit overwriting the PROFINET device name

Reusable IO systems - Addresstailoring

Introduction

The Addresstailoring function assigns the IP address and NameOfStation for IO controllers and IO devices via system functions at commissioning time. This feature allows a machine consisting of an IO controller and IO devices to be supplied with IP addresses and NameOfStation, and permits multiple instances of the machine to be commissioned on a single physical Ethernet without the engineering system.

There is only one project (configuration and programs). It can be loaded onto machines of the same type without change. To integrate the machine in an existing network infrastructure, only limited customization is required for the on-site commissioning (IP address, NameOfStation). The user program assigns the IP address and the NameOfStation during the first controller startup.

Note

Addresstailoring can be configured only for SIMOTION SCOUT TIA.

Example of an automation solution

The following figure shows how an automation solution with a reusable IO system is loaded into various automation systems and one of these is then adapted on-site to the existing network infrastructure.

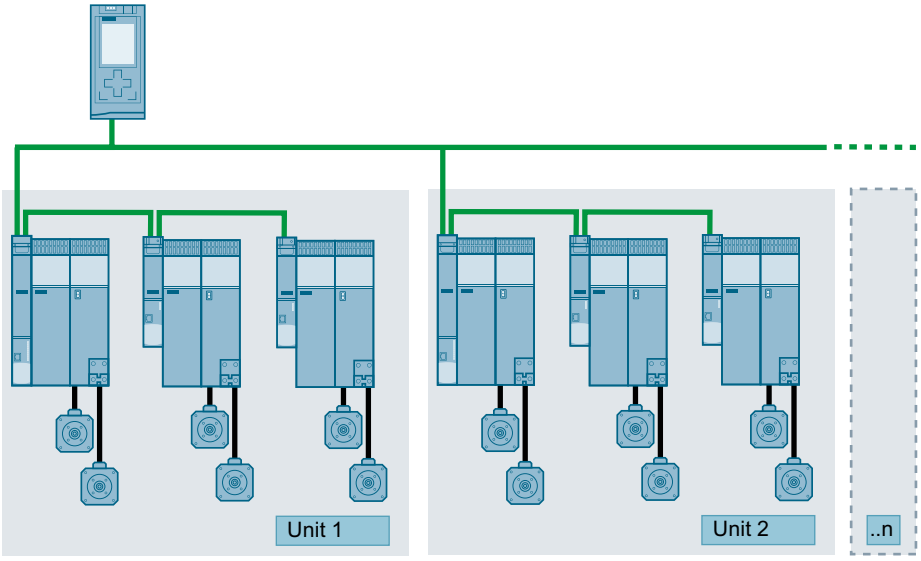

Figure 3-385 Addresstailoring: Series machine with the same units with a different name and IP address

Rules

The following rules apply to a reusable IO system:

- A series machine project consists of an IO controller and the associated IO devices. Consequently, configure only one CPU as IO controller and the associated IO devices in the series machine project.
- No IO device may be configured as shared device.
- If IRT is configured, all IO devices must belong to the same sync domain and the sync domain must not contain any further IO devices.

Alternatively to Addresstailoring via two PN interfaces

In the SIMOTION environment, under some circumstances, rather than using Addresstailoring, the same functionality can also be achieved by using the two PN interfaces. One PN interface is configured as I device and connected with the higher-level controller. The second PN interface is the IO controller for the IO devices. In this case, a second PN interface (e.g. CBE30-2) is required.

In the previously described configuration, the IO devices are located within a local network and so can have the same NameOfStation and IP address in all instances.

Additional references

Further information can be found in the *Basic Functions for Modular Machines Function Manual* and in the *online help for the TIA Portal*.

Configuring the project for Addresstailoring

Introduction

The Addresstailoring function ensures that all devices in the physical network are assigned a unique IP address and NameOfStation. This must be configured in the project for the IO controller and for the IO devices.

Procedure

The configuration of a series machine is described in the following using a SIMOTION D CPU as an example.

Configure a series machine project with Addresstailoring as follows

1. Create a project.
2. Configure the SIMOTION CPU as IO controller.
3. Configure the required IO devices (e.g. SINAMICS S120) and assign the IO devices to the PROFINET IO controller.
4. Configure the port interconnections between the devices.
5. Select the IO system so that you can edit the properties in the Inspector window.
6. Activate the "Reusable IO system" checkbox in the "General" area of the inspector window.

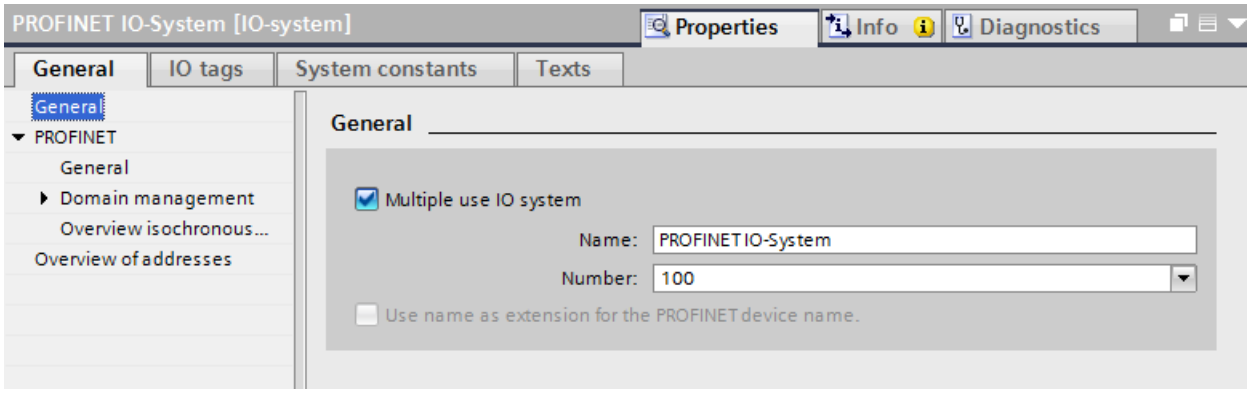

Figure 3-386 Configuring a reusable IO system (Addresstailoring)

Result in the TIA Portal

The following settings are made automatically through the configuration in the TIA Portal.

- The device name of the IO controller (CPU) in the series machine project is set to "Permit adaptation of the PROFINET device name directly on the device". At first, the IO controller (CPU) does not have a PROFINET device name.
- The IP protocol of the IO controller (CPU) is set to "Permit adaptation of the IP address directly on the device". At first, the CPU does not have an IP address.

- The "Enable device replacement without exchangeable medium" option is activated automatically. This option enables an automatic commissioning. A commissioning engineer does not have to assign device names on site to the IO devices. Based on the target topology and other settings, the IO controller assigns the device name and the IP address to the IO devices during startup.
- The device name of the IO devices is set to "Automatically generate PROFINET device name" (from the configured name of the IO device).
- The IP protocol for the IO devices is set to "Permit adaptation of the IP address by the IO controller". At first, the IO devices do not have an IP address. If an IO device is not a typical distributed I/O system (e.g. ET 200 system), but rather another device, e.g. an HMI device, then change the option to "Permit adaptation of the IP address directly on the device", see below.
- The device numbers for the IO devices are assigned automatically and used locally to make the IP address unique.

In order that the IO controller can adapt the device names later at the operator, the "Permit overwriting of the PROFINET device name" option must be activated (CPU parameters, property of the PROFINET interface, Ethernet addresses area). This option is deactivated per default.

Local commissioning

During the plant startup, the IP address and the NameOfStation are assigned to the IO devices. IP address and name are generated according to the following rules:

- IP address: Sum of the IP address of the IO controller and the station number of the IO device
- NameOfStation: <Configured name of the IO device from the series machine project>.<Name of the associated IO controller set on the device>

Diagnostics

If an error occurs during startup, e.g. incorrect IP address or NameOfStation is too long, an error message is entered in the diagnostic buffer.

Configuration control for IO systems - Machinetailoring

Introduction

The configuration control for IO systems (Machinetailoring) allows several specific instances or configurations of the series machine to be generated from a single series machine project. The configuration of an IO system can vary flexibly for a specific application provided the real configuration can be derived from the configured configuration. The configured configuration (series machine project) so forms the superset of all derivable real configurations.

You can activate or deactivate a PROFINET IO system (IO devices, I devices) in a specific system. Different variants can be operated from a configured maximum configuration of an IO system. You prepare for a series machine project a modular system consisting of IO devices that can be adapted flexibly for the wide range of configurations via the configuration control.

Machinetailoring allows the following customizations to be made on-site (without engineering system):

- Variation of the number of associated modules (IO devices). This is also possible with restrictions with IRT (IRT node as leaf for the IRT node part in a line).

Note

Machinetailoring can be configured only for SIMOTION SCOUT TIA.

PROFINET IRT

Machinetailoring is possible for PROFINET IRT only when minor adaptations need to be made to the IRT devices of the master machine. Minor adaptation means that IRT IO devices are only bridged or individual branches and leaves are removed.

Example of an automation solution

The following figure shows an example from a series machine project how an instance can be created with a different number of IO devices. The IO devices in the middle and at the end can be optional.

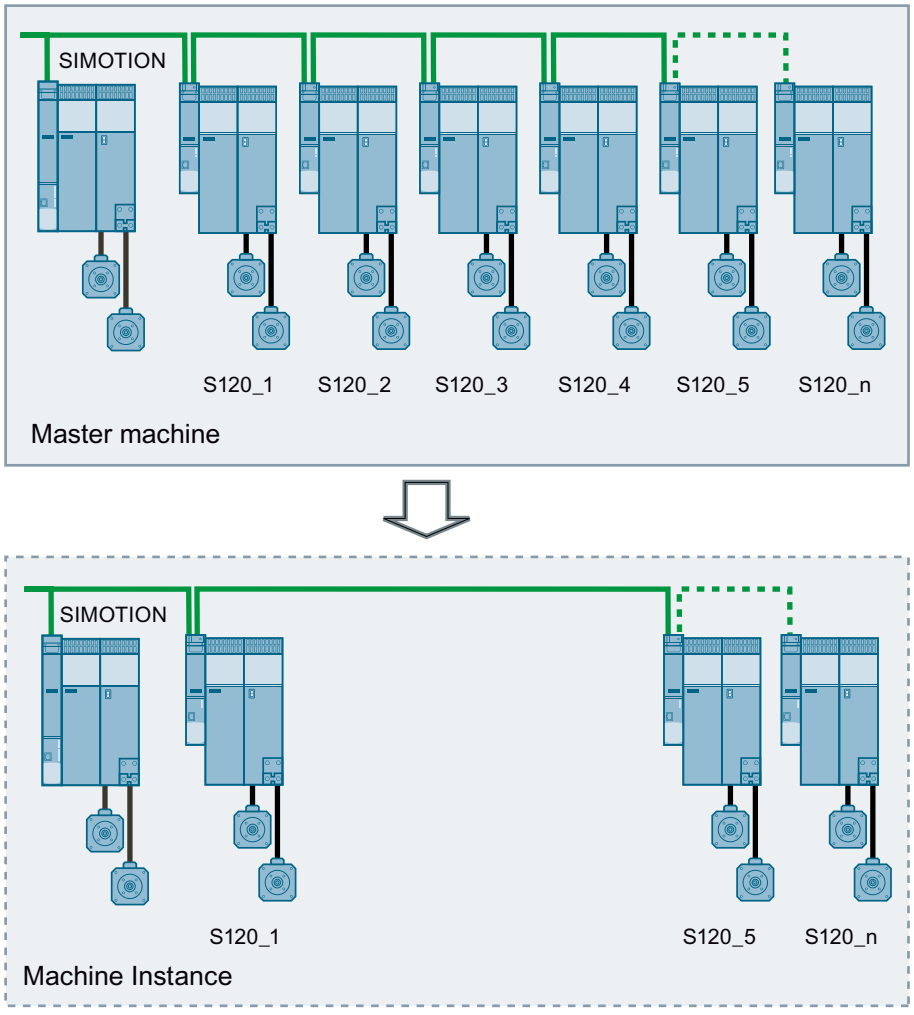

Figure 3-387 Instance of the machine with a different number of IO devices

Restrictions

- The number of optional IO devices in series is limited.
- The data exchange between IO controllers (controller-controller slave-to-slave communication) is possible only from the user program.
- Because it cannot be guaranteed that the optional IO devices actually exist in the machine instance, data exchange between IO devices is not meaningful.

Additional references

Further information can be found in the *Basic Functions for Modular Machines Function Manual* and in the *online help for the TIA Portal*.

Configuring with optional IO devices

Principle

In the project, configure the maximum configuration of the series machines. The supplied machines contain all or individual IO devices of the maximum configuration. The user program transfers a parameterized data set for configuring the supplied machines. After the reconfiguration, the optional IO devices are activated.

Requirement

You must observe the following for the configuration of the optional IO devices:

IO controller

- No special settings need to be made on the IO controller.
- The IO controller must be assigned a subnet.

IO devices

- The deployed interface modules have a PROFINET interface.
- The distributed peripheral stations are assigned the same subnet as the IO controller.
- The topology of the IO devices is defined.

Configuring the optional IO devices

For the configuration, settings must be made on the IO devices that should be optional.

1. Open the "Devices & networks" overview.
2. Double-click the IO device in the project navigator. The selected IO device is displayed in the device view.
3. Click the PROFINET interface of the IO device. Open the "Advanced options".
4. Activate the "Optional IO device" checkbox for "Interface options" in the Inspector window.
5. Repeat the steps for all optional IO devices.

SIMOTION controller as intelligent IO device (I device) on a higher-level IO controller

If you operate a SIMOTION controller as I device together with optional IO devices, you must take the following into account during the configuration of the SIMOTION I device. The parameterization for the PN interface of the SIMOTION I device must be performed as for a "normal" IO device by the higher-level controller.

Note

Parameterization by the higher-level controller

In order that the "Optional IO device" function can be activated, all IO devices and I devices in the PROFINET IO system must be parameterized by the higher-level IO controller, irrespective of whether they are used optionally. This means that "Parameter assignment of PN interface by higher-level PN controller" must be configured for all I devices.

To configure the SIMOTION I device:

1. Activate the following options for the operating mode of the I device.
   - IO device
   - Operate isochronously
   - Parameterization of the PN interface higher-level PN controller
2. Save and compile the hardware.
3. Export the SIMOTION I device.
4. You can now connect the SIMOTION I device as intelligent IO device to the higher-level controller.

SIMOTION variant management function block

The IO devices to be activated are specified with a data set. A function block transfers this to the IO controller, which activates the IO devices accordingly. The function block and the associated documentation (SIMOTION variant management) with the detailed procedure are available as download in the Service & Support Portal (https://support.industry.siemens.com/cs/ww/en/view/109747768).

Performance upgrade - low send cycle clocks

Optimized data transfer / 125 µs PROFINET send clock

PROFINET V2.3 Performance Upgrade

All SIMOTION Control Units support PROFINET in accordance with the PROFINET International specification PN V2.3. The optional **Performance Upgrade** functionality that provides extended functional scope is available for SIMOTION D455-2 DP/PN.

- Minimum PROFINET send cycle clock 125 µs (Fast Send Clock)
- Optimization of data transfer (e.g. by Dynamic Frame Packing - DFP (Page 740))

- Fast forwarding
- Fragmentation

Note

Validity

The PROFINET Performance Upgrade (Fast Send Clock 125 µs and Dynamics Frame Packing) is only approved for SIMOTION SCOUT TIA.

Note

You will find further information on this on the web site of the PI Organization (http://www.profibus.com) and the following technical specifications:

- Technical Specification for PROFINET, Version 2.3 – Date: October 2010, Order No.: 2.722
- Application Layer services for distributed I/O and distributed automation, Technical Specification for PROFINET, Version 2.3 – Date: October 2010, Order No.: 2.712

With optimized data transfer, the following options are possible:

- More devices can be operated with the same cycle time.
- The cycle time can be reduced for the same number of devices.

Requirements

General conditions for using the 125 µs send cycle:

- The 125 µs send cycle is supported only by the onboard PROFINET interface X150 in conjunction with Servo_fast / IPO_fast.
- Only one port can be used on X150; the other two ports must therefore be deactivated in the interface properties of X150 (the ports cannot be used for TCP/IP or UDP communication either).
- X150 can only be used as a PROFINET IO controller (not as an I-Device).
- No MRP/MRPD media redundancy (only one port is available on X150).
- Use of STEP 7 V14, V14; for other operating conditions, see also *Readme* for SIMOTION SCOUT V4.5.

Note

Quantity structures in the case of very short send cycles

When very short send cycles (125 µs, 250 µs) are used in a configuration with a large number of PROFINET devices, SIMOTION will be operating close to its upper performance limits. It is not possible to reliably predict all the restrictions applicable to the configuring of such systems. Only during runtime will it be possible to identify overload situations. Overload conditions will be indicated by appropriate messages (cycle violation, inconsistent data transmission). When you are using these very short cycle times, you should therefore restrict the number of devices to the absolute minimum necessary.

Components that can be used

The 125 µs send cycle is only supported by selected PROFINET nodes (e.g. by the ET 200SP I/O system). No SCALANCE switches are currently available for the 125 µs send cycle.

- SIMOTION D455-2 DP/PN as of V4.5

Note

For the PROFINET nodes that support a send cycle of 125 µs and the general conditions that have to be met, see the relevant product documentation.

Dynamic Frame Packing - DFP

Description

For PROFINET V2.2, a separate Ethernet frame is used for each IO device for the cyclic transfer of the IO data. This leads to a large overhead due to the Ethernet header, especially in the case of IO devices with a small amount of IO data.

With the PN V2.3 Performance Upgrade, SIMOTION D455-2 DP/PN supports Dynamic Frame Packing (DFP) via the onboard PROFINET interface X150. With Dynamic Frame Packing, the cyclic data of multiple IO devices is summarized in one Ethernet frame. DFP significantly reduces the bandwidth required to exchange the cyclic data, especially in the case of IO devices with a small amount of IO data. This makes it possible to either operate more IO devices with the same cycle time or to reduce the cycle time in order to achieve a shorter response time.

In the outbound direction (from the IO controller to the last IO device), the Ethernet frame is automatically reduced. This is achieved by having each device remove its own data from the telegram when forwarding. In the inbound direction (from the last IO device to the IO controller), each IO device adds its own data to the Ethernet frame.

Dynamic Frame Packing is used automatically when send cycles < 250 µs are set and the requirements (see "Requirements" section) are met.

The figure below shows examples of how package groups can be formed. The IO devices (IO-D) with red backgrounds are automatically grouped into package groups.

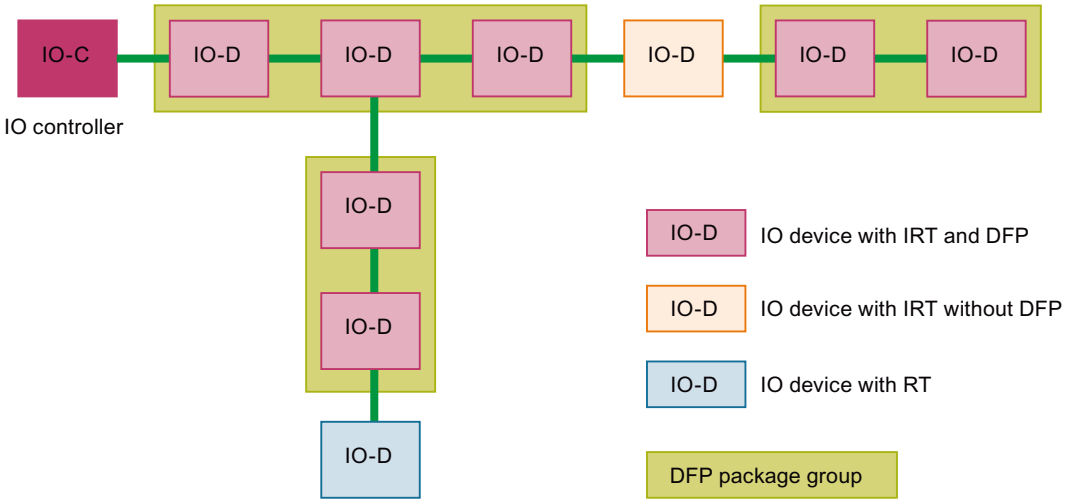

Figure 3-388 Example of DFP package group formation

Requirements

DFP can only be used with the following restrictions:

- DFP can be used only on the onboard PROFINET interface X150 of the SIMOTION D455-2 DP/PN and on the ET200SP High Speed IO-Devices.
- DFP is supported by SIMOTION only as an IO controller. The SIMOTION I-Device does not support DFP.
- A DFP device can be used as a shared device by a second IO controller. Whereby the shared device restrictions apply. One IO controller communicates with DFP via IRT; the other via RT.
- In the case of MRPD, the DFP devices must be present in a spur line. IO devices in the ring are not supported.
- IO devices that do not support DFP terminate a package group; i.e. the grouped IO devices must form a line with no gaps.
- A maximum of 63 IO devices can be packed in one group.
- The size of a package frame is limited to 128 bytes in the outbound direction and 256 bytes in the inbound direction.

Configuring IRT with Performance Upgrade

Introduction

To use PN V2.3 Performance Upgrade on the SIMOTION CPU with SIMOTION SCOUT TIA, you must activate this option on the sync domain.

Activating High Performance and increasing the bandwidth

To use send cycles < 250 µs and other Performance Upgrade functions, proceed as follows:

1. Deactivate all ports (except for port 1) of the SIMOTION D455-2 DP/PN.
2. Select the PROFINET IO system in the network view.
3. In the Inspector window, select the "Properties > General" tab.
4. Select "Domain-Management" in the navigation and then the appropriate sync domain.
5. Select the send cycle 0.125 ms.
6. Activate "Permit High Performance" and "Fast Forwarding" optionally.

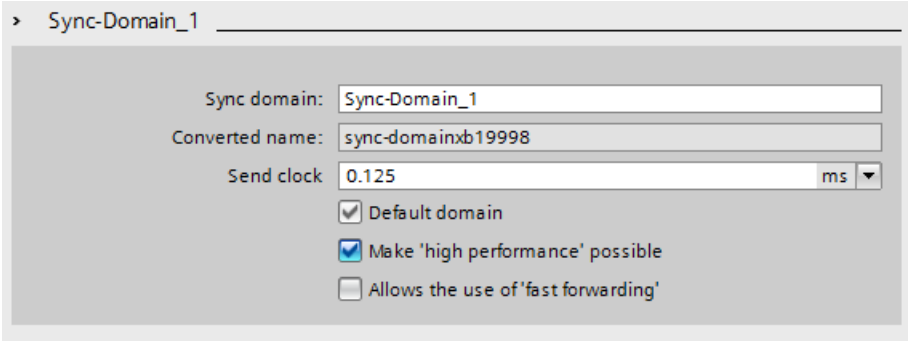

Figure 3-389 Activating High Performance for SIMOTION

7. Click "Details" in the navigation below the sync domain.
8. Select "Maximum 90% cyclical IO data..." for the bandwidth use.

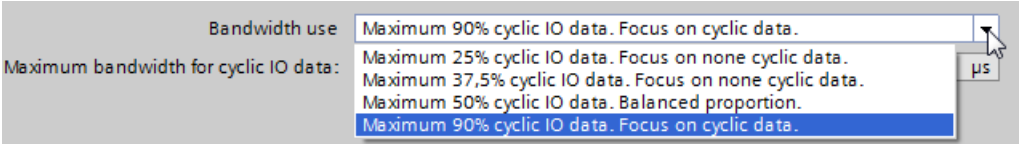

Figure 3-390 Increasing the bandwidth for cyclical IO data

3.5.6.3 Using PROFIsafe

PROFIsafe for SIMOTION

Description

The drive-based safety functions in the drive can be controlled either by using safe terminals directly on the drive or from a fail-safe control (F control) via PROFIBUS/PROFINET.

The control signals for the drive-based safety functions, as well as the feedback relating to the safety function status, are safety-oriented and must be transferred via a communication channel that is secured by means of the PROFIsafe protocol.

Mechanisms with PROFIsafe

Basically, the PROFIsafe communication can be performed via PROFINET and also via PROFIBUS. The following mechanisms are available for PROFINET and PROFIBUS:

- PROFINET I device F-proxy
  - I device directly on the F-host (a project for F-CPU and SIMOTION CPU)
  - I device as GSDML file coupled to F-host (two projects)
  - Shared I device (like I device as GSDML file, the I device is also "shared")
- PROFINET Shared Device
- PROFIBUS slave-to-slave communication
  - I slave to slave

For all the mechanisms, the fail-safe data is managed by the F-CPU and the motion control data by the SIMOTION controller. The required properties of the PROFIsafe communication are set in the F-parameters during the hardware configuration.

Note

Mixed operation in a PROFIsafe configuration is **not** possible with **one** Control Unit. If, for example, in the case of a SINAMICS drive, the safety configuration for one axis is carried out via F-Proxy and those of the other axes are configured via Shared Device, this configuration will be rejected with a consistency error during compilation. The F-Proxy variants are recommended for the PROFIsafe configuration.

Supported number of F-Proxy submodules

A maximum of 128 I device submodules are supported. Of these, up to 64 submodules can be used for Safety by default. The other 64 submodules are available for standard IOs. The maximum number of 64 F-Proxy submodules can be configured **independently** of the PROFIsafe telegram for all SIMOTION CPUs.

Up to 128 F-Proxy submodules supported (as of SIMOTION V4.5)

As of firmware version 4.5, a maximum of 128 F-Proxy submodules, and thus a maximum of 128 safety axes, can be configured for the SIMOTION D455-2. The maximum number of F-Proxy submodules **depends** on the configured PROFIsafe telegram.

In the following tables, the input/output data, as well as the maximum number of F-Proxy submodules, are shown depending on the PROFIsafe telegram and the SIMOTION CPU.

SINAMICS PROFIsafe telegrams

PROFIsafe telegram	F-Proxy submodules SIMOTION D455-2	F-Proxy submodules SIMOTION CPU (other)	Single telegram Input	Single telegram Output	Single telegram Total
30	128	64	6	6	12
31	128	64	8	8	16

PROFIsafe telegram	F-Proxy submodules SIMOTION D455-2	F-Proxy submodules SIMOTION CPU (other)	Single telegram Input	Single telegram Output	Single telegram Total
901	89	64	14	10	24
902	79	64	16	10	26
903	89	64	14	10	24

Configuring more than 64 F-Proxy submodules

The following must be taken into account when configuring more than 64 F-Proxy submodules:

- A SIMOTION I device supports a maximum of 128 subslots. If, for example, 128 subslots are assigned to F-Proxy axes, no further user data can be configured on the I device interface (see table above).
- A SIMOTION I device supports a maximum of 1440 bytes of user data (including IOPS/CS user data qualifier). Depending on the selected safety telegram and the number of F-Proxy axes, only limited (or no) space is available for user data in the I device.

F proxy with SIMOTION

F-Proxy description

SIMOTION features integrated F-Proxy functionality for the purpose of PROFIsafe connection of drives that are controlled by SIMOTION but are in a different communication domain than the F-CPU, for example. The F-Proxy functionality enables transparent routing of safety telegrams from the SIMOTION I-Device interface to the respective SIMOTION controller interface on which the drive is configured. Despite the SIMOTION routing function, PROFIsafe communication between the F-CPU and drive is secure, as the PROFIsafe drivers at the end points (F-CPU, drive) securely monitor communication.

In order to use F-Proxy functionality, the two paths of communication - from the F-CPU to SIMOTION and from SIMOTION to the drive - need to be configured separately.

The following drive connections can be used on the SIMOTION controller for the F-Proxy:

- Drive on SINAMICS_Integrated (SIMOTION D)
- Drive on PROFIBUS DP
- Drive on PROFINET IO Onboard PN interface
- Drive on PROFINET IO CBE30-2 PN interface

Properties of the I-Device F-Proxy

- The F-Proxy submodules on the SIMOTION controller are RT and can be operated non-isochronously.
- The PROFIsafe standard telegrams 30 and 31 and the PROFIsafe SIEMENS telegrams 901, 902 and 903 are supported.

Additional references

Detailed information about the F-Proxy can also be found in the *SIMOTION Communication* Function Manual.

Note

Connection between SIMOTION and F-CPU only via PROFINET IO

With the TIA Portal, you can interconnect F-Proxy slots between the SIMOTION controllers and the F-CPU only via PROFINET IO. A so-called PROFIBUS I slave F-Proxy is not supported.

Basic procedure for an F-Proxy configuration

The F-Proxy configuration is performed in the TIA Portal and in SIMOTION SCOUT TIA:

- Creating the device (F-CPU, SIMOTION controller, drives) in the TIA Portal
- Networking the devices and creating the topology in the TIA Portal
- Creating and configuring the drives, axes, and configuration of PROFIsafe in the drive in SIMOTION SCOUT TIA
- Changing the operating mode of the PN interface of the SIMOTION controller to IO device (I-Device) in the TIA Portal
- Interconnecting the F-CPU with the drive units via the PN interface that functions as I-Device in the TIA Portal

A configuration example (Page 746) is described in detail in the next section.

F-Proxy settings on the SIMOTION controller

If you want to run a SIMOTION controller as F-Proxy, you must perform the following steps:

1. Change the operating mode for the SIMOTION device to IO device and select whether the F-CPU is in the same or in another project.
2. In the Inspector window below "General", select the "F-Proxy" entry.
3. Configure the interconnections of the F-Proxy.

Checking project-wide PROFIsafe addresses (Page 757)

Configuration example for I device F-Proxy

Introduction

This section describes a configuration example for an I-Device F-Proxy. The configuration is largely identical for all drives at the SIMOTION controller. The difference is essentially whether the F-CPU is in the same or in another project. As an example, the configuration is shown in the same project.

Controllers and drives used

- SIMOTION D455-2 DP/PN (Motion Control) [PLC_1]
- SINAMICS S120 CU320-2 PN
- SIMATIC S7-300 CPU317F-2 PN/DP (F-CPU) [PLC_2]

Requirement

- Project created in the TIA Portal.
- Controllers and drives inserted.
- PROFINET IO system configured with SIMOTION D455-2 DP/PN and SINAMICS S120 CU320-2 PN.
- Ports are interconnected.
- Drive and the axis are configured in SIMOTION SCOUT TIA.

Also note Section Brief introduction to SIMOTION control and SINAMICS drive via PROFINET IO (Page 684).

Configuring PROFIsafe in SIMOTION SCOUT TIA

1. In the project navigator in SIMOTION SCOUT TIA below the drive, click "Functions > Safety Integrated".
   The window for safety configuration opens in the working area.
2. Select a PROFIsafe function such as "Extended functions via PROFIsafe".
   You can view the "PROFIsafe address" in the window "Configuration PROFIsafe". 0001H is used in this example.

   Note

   The PROFIsafe address for the safety configuration is the F-destination address for the later configuration of the F-Proxy. These **must** be identical. You enter the F-destination address in the interconnection table when interconnecting the F-Proxy.

   The F-destination address must be configured at three places and must be identical:

   - in the drive (PROFIsafe-address)
     As of V5.2, you can apply in the drive the PROFIsafe address (F-destination address) configured in the TIA Portal.
   - at the F-Proxy interconnection
   - at the exported I-Device if the F-CPU is in another project

   Observe the procedure for checking PROFIsafe addresses in the project in section Checking project-wide PROFIsafe addresses (Page 757).
3. Activate Safety Integrated for the axis. Double-click "Configuration" below the axis in the project navigator. The window opens in the working area.
4. In the "Functions" field, click the "Change..." button and select the "Standard (support of the entire safety functionality via DSDB)" option in the "SINAMICS Safety Integrated" tab.
5. After configuration, you have to select the PROFIsafe telegram. In the SIMOTION SCOUT TIA project navigator, below the drive unit double-click "<Drive unit_xx"> - Communication > Telegram configuration".
   The telegram configuration is opened in the working area.
6. Mark the appropriate drive in the tab "IF1: PROFIdrive PZD telegram" in the telegram overview, and in the bottom part of the window at "Adapt telegram configuration", select the entry "Add PROFIsafe".
   The PROFIsafe telegram is inserted. Dependent on the drive, you can select from several telegrams. The PROFIsafe standard telegram 30 is inserted by standard. You can change this.

Figure 3-391 Adding the PROFIsafe telegram on the drive

7. Save and compile the project.

8. Click "Set up address" to run an address alignment between SIMOTION SCOUT TIA and TIA Portal. A successful alignment is indicated with a blue checkmark. For the drive, telegrams are indicated with red checkmarks, since during the alignment the process data was extended due to the automatic telegram extension. This is for information purposes only. Configuration in SIMOTION SCOUT TIA is completed by saving.

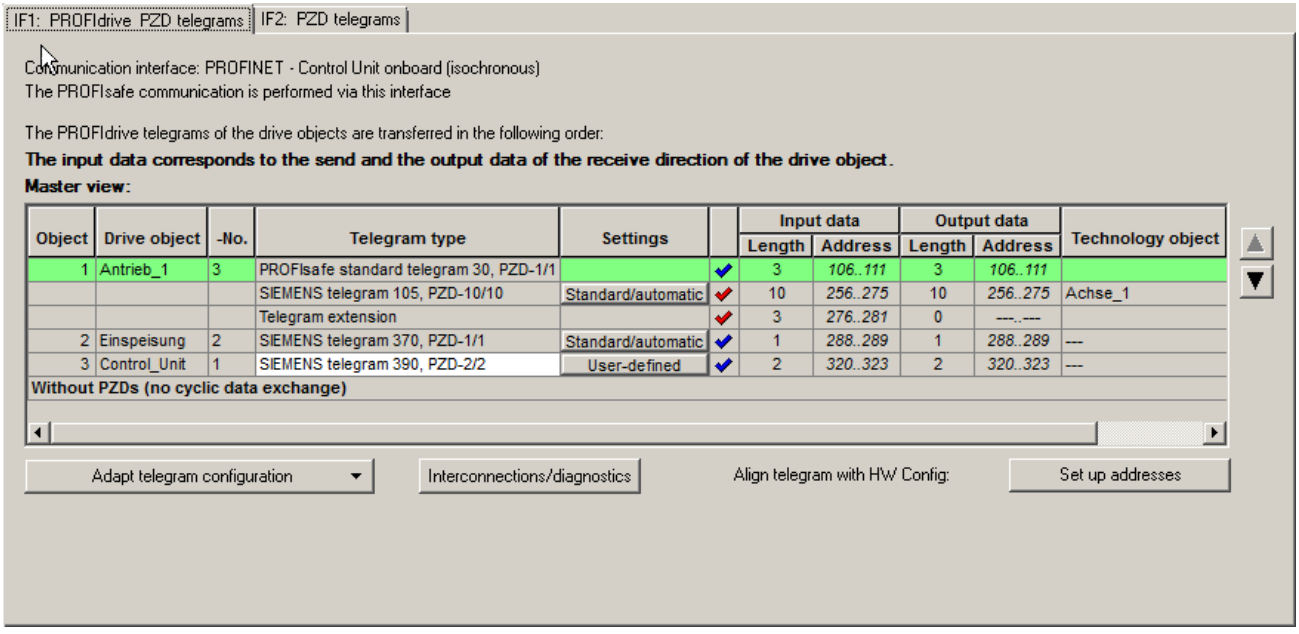

Figure 3-392 Telegram configuration for drive with PROFIsafe

9. Switch to the TIA Portal and create the I-Device.

Creating an I-Device in the TIA Portal

1. In the network view, select the SIMOTION controller and the interface via which the I-Device is to be operated. In the example, X150.
2. In the Inspector window, select "Properties > General" and click "Operating mode".
3. Activate the "IO device" option.

4. Assign the controller to which the I-Device is to be assigned at "Assigned IO controller". In this case, the F-CPU. A subnet is automatically inserted between the F-CPU and the SIMOTION controller.

   Note

   From that point on, the configuration is different if the F-CPU is in another project. "Not assigned" is selected as IO controller and the transfer area is defined and the F-Proxy is configured. A GSD file of the I-Device is then created.

5. Define the transfer area.
   You configure the F-Proxy in the next step.

   Note

   Transfer areas

   In the transfer area, the automatically created fail-safe I/O transfer areas are **not** displayed.

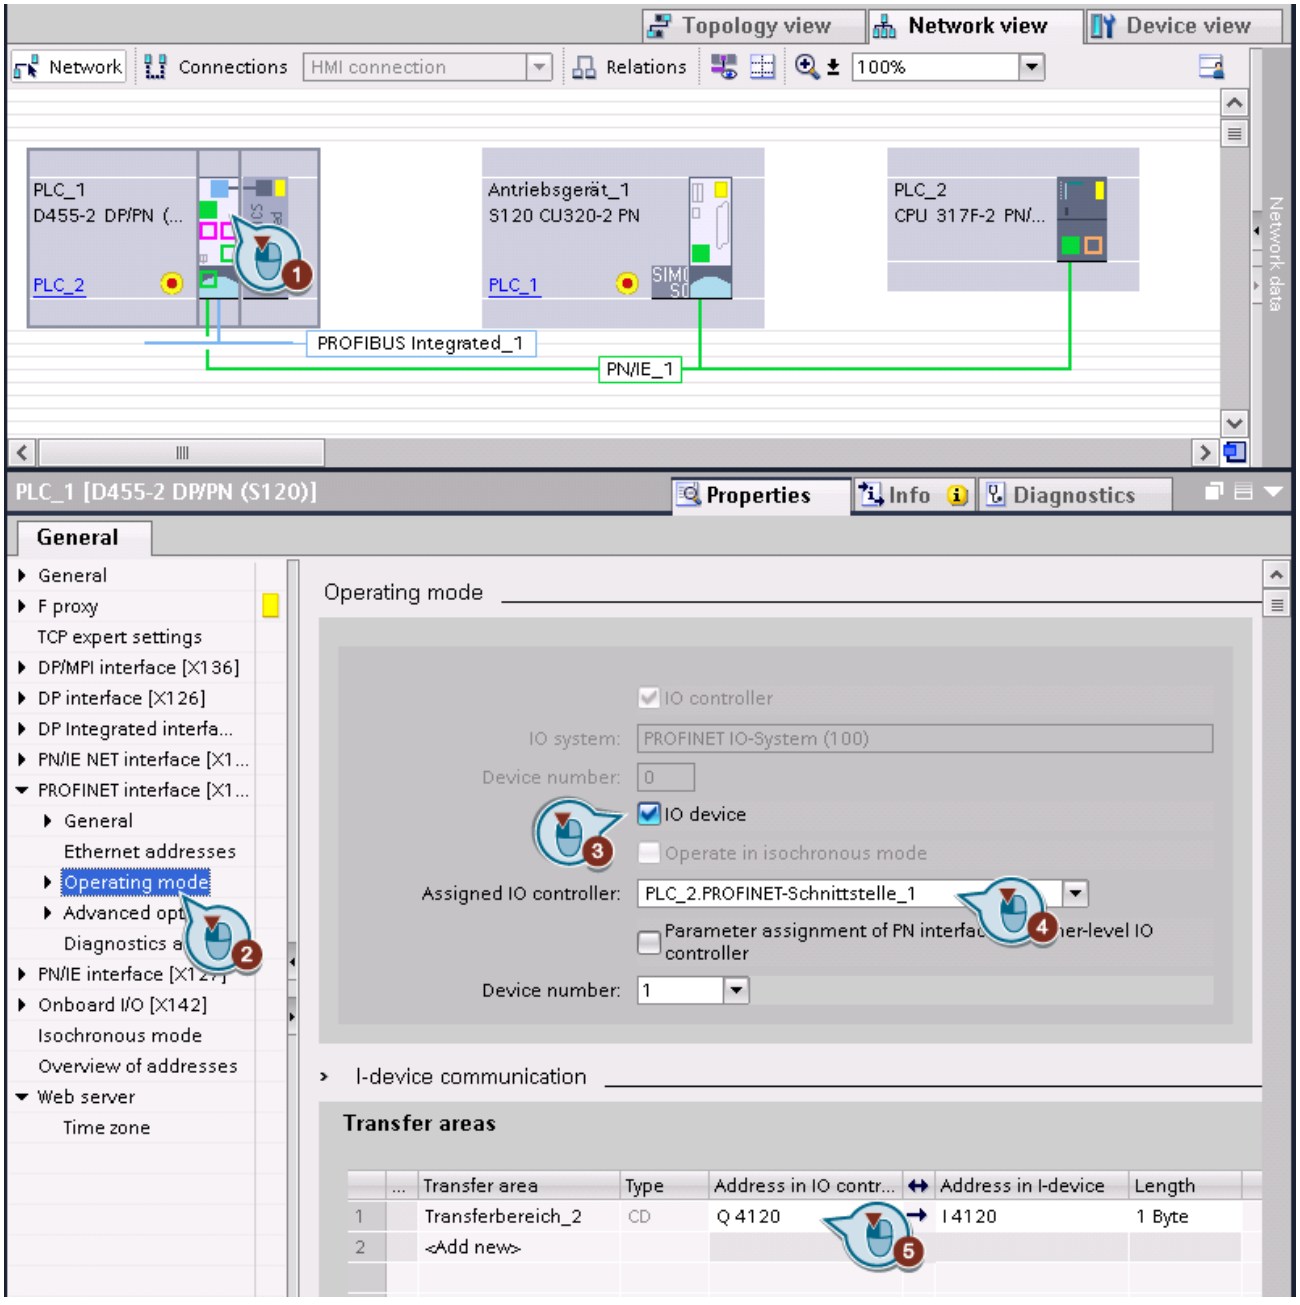

Figure 3-393 Creating an I-Device for I-Device F-Proxy

Configuring F-Proxy in the TIA Portal

1. Click the SIMOTION controller in the network view.
2. Click "F-Proxy" on the "General" tab. The F-Proxy interconnection is opened.
3. In the column "F-CPU", select the IO controller for PROFIsafe monitoring. All controllers in the project are displayed. Choose "PLC_2.PROFINET_Interface_1" in the example.

4. If the F-CPU is already interconnected with the SIMOTION controller, the PN interface used is automatically entered into the column "F-Proxy interface". If there is no interconnection yet, you can select the PN interface of the SIMOTION controller here.
5. An address is specified in the "F-destination address" column. This address must be identical with the PROFIsafe address of the drive in SIMOTION SCOUT TIA. Check if these addresses are identical and change them. Address 0001H is used in this example. Click the field to change the address. This will finish the configuration.
   More information about the interconnection table can be found in Section Editing F-Proxy settings (Page 753).

Note

The F-destination address must be assigned for each drive. If you have configured further drives at the SIMOTION controller, they are shown in the table and are configured identically. You must also enter the specific F-destination addresses of the safety configuration here for each drive.

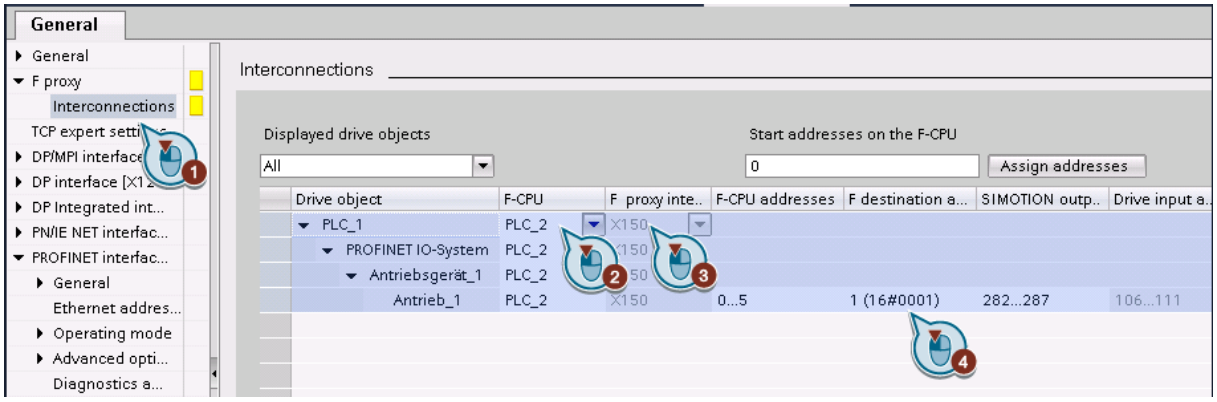

Figure 3-394 Configuring interconnections for F-Proxy

F-CPU in another project

If the F-CPU exists in another project, you must pay attention to some points.

1. When configuring the I-Device, select the entry "Not assigned" at "Assigned IO controller" and then configure the I-Device as described above.
2. Configure the interconnection of the F-Proxy. For the F-CPU, select "F-CPU in another project" and then configure the further parameters of the F-Proxy as described above.

3. Change back to the "Operating Mode" window. Now export the I-Device as device description file (GSD). The procedure is described in Section Configuring an I-Device (Page 709).

Note

Configuring an F-Proxy prior to the I-Device export

Before you create the I-Device, you must have finished the F-Proxy interconnections. If changes are made to the F-Proxy interconnection (e.g. other F-destination addresses), you must export the I-Device again.

4. You may insert the installed I-Device with a drag-and-drop operation into the other project with the F-CPU and connect it to the subnet of the F-CPU.

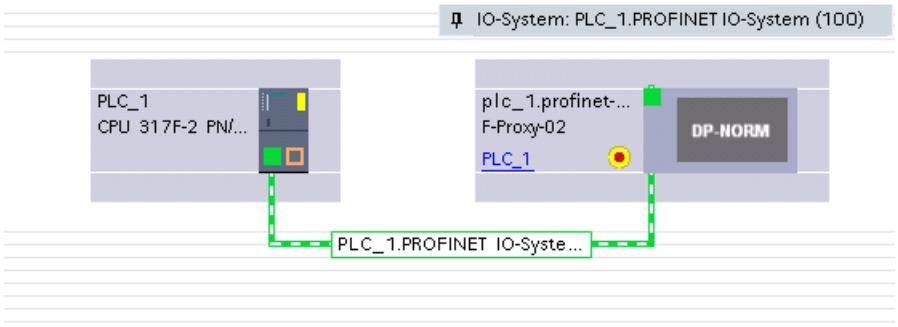

Figure 3-395 F-CPU in another project with I-Device F-Proxy on the subnet

Automatic transfer of the F-destination addresses

Accept F-destination address (V5.2 and higher)

All axes are configured and commissioned during initial commissioning of a machine. Next the PROFIsafe telegrams are added in the telegram configuration of SIMOTION SCOUT or Starter. As soon as the telegram is used for the F-Proxy it can no longer be changed. The logical address is specified during "Save and compile" with symbolic assignment.

After the slot for the PROFIsafe telegram has been accepted in HW Config, the PROFIsafe telegram also receives its F-destination address. Up to V5.2, this address had to be entered manually for all drives with PROFIsafe while commissioning Safety Integrated. To avoid incorrect entries, the "Accept F-destination address" button is available during Safety commissioning as of V5.2 and higher.

F-destination address during Safety Integrated commissioning

You apply the F-destination address for PROFIsafe during drive commissioning.

1. In the SIMOTION SCOUT project navigator, click on "Functions > Safety Integrated" below the drive. The Safety configuration window opens in the work area. PROFIsafe is configured as Safety function.
2. Click the "PROFIsafe configuration" button.
3. You can view the "F_Dest_add" in the "PROFIsafe configuration" window.

4. Click "<" to accept the F-destination address as PROFIsafe address.

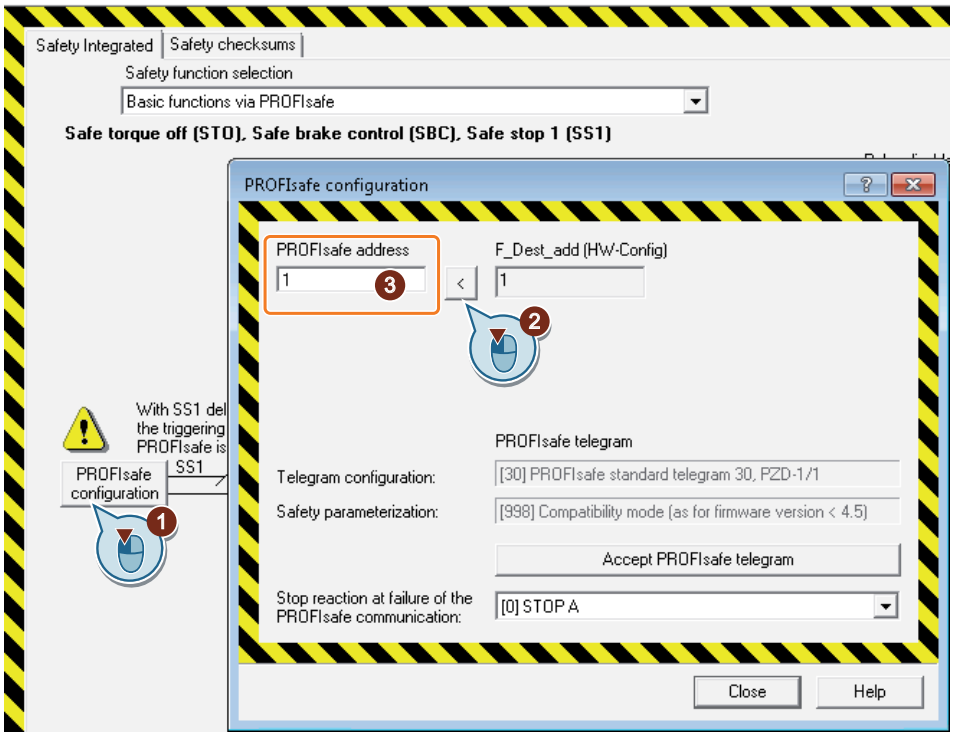

Figure 3-396 Accepting the F-destination address as PROFIsafe address

5. Click "Close" to confirm.

Scripting

The "Accept F-destination address" function can also be programmed via scripting. To do so, program the following scripting commands.

- GetFDestAdressFromHWCN
- SetUpAddresses

Editing F-Proxy settings

Working with the F-Proxy interconnection table

With an interconnection table, you interconnect all drives (also termed drive objects or DOs) with a F-CPU. The drives must be connected to the SIMOTION controller and a PROFIsafe telegram must be set up.

The table is hierarchically organized. If you change a setting (F-CPU, F-Proxy interface) on a higher-level entry, the new setting will be propagated to all lower-level objects.

- To edit the settings below a SIMOTION controller, edit the settings at the controller level to interconnect all the interfaces and drive objects below it.
- If you only want to interconnect the drive objects of one particular bus system, edit the relevant entry of the interface to interconnect all the drive objects below it.
- If you only want to configure a particular drive object, change the settings on this drive object only.

In the first example figure, for example, the F-CPU with the name PLC_2 is used for all drive objects.

In the following figures, you can see an example of an F-proxy interconnection with an F-CPU in the same project and an F-CPU in another project. You will find the explanations of the numerals in the table. In the interconnection table, you can edit only the field with a light-blue background.

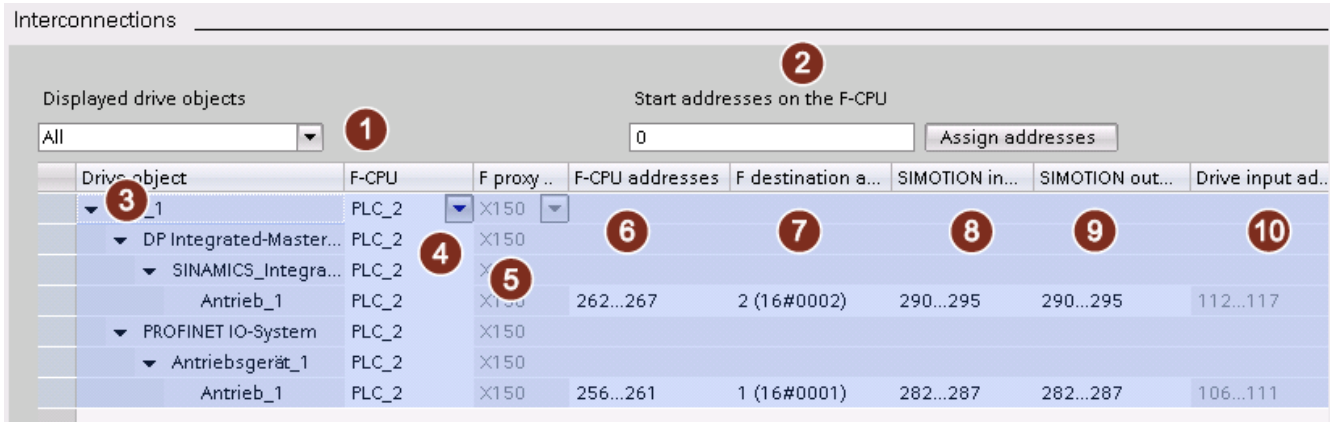

Figure 3-397 F-proxy interconnection table with two drive objects and F-CPU in the same project

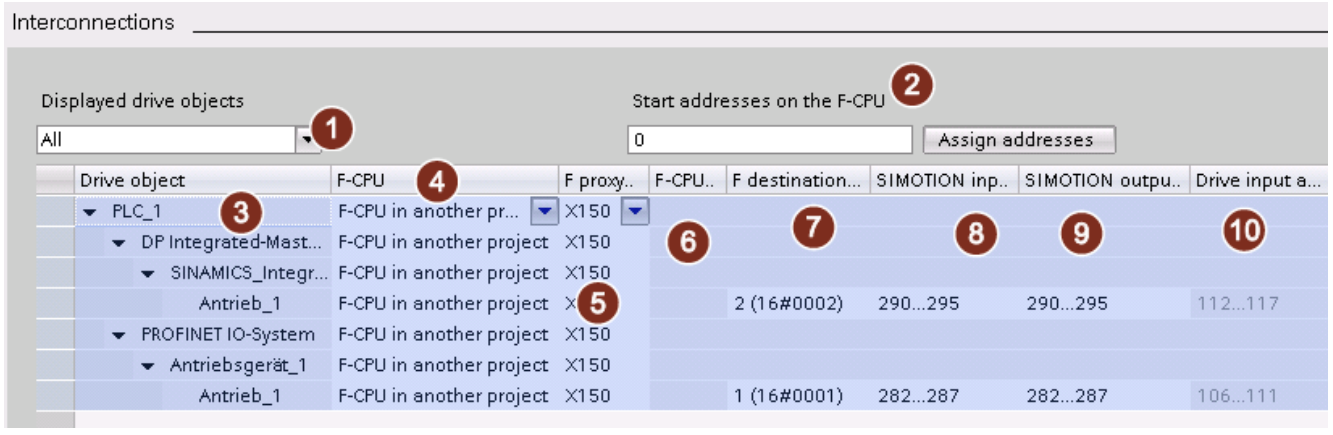

Figure 3-398 F-proxy interconnection table with two drive objects and F-CPU in another project

Explanations of the interconnection table

Parameter	Description
Displayed drive objects ①	At "Displayed drive objects", you can filter the display of the drive objects. You can have only the interconnected or only the non-interconnected objects displayed.
Start address in the F-CPU ②	Enter a start address as the basis for address assignment in the F-CPU here. If no drive object has yet been interconnected with the F-CPU, this button is not active.
Drive object ③ (not editable)	The drive objects are displayed sorted hierarchically below the controller and interface.
F-CPU ④	Select the F-CPU with which interconnection of the SIMOTION controller is to be performed via the F-proxy. • All F-CPUs connected to the SIMOTION controller are listed (F-CPU in the same project) In the example, the SIMOTION controller (PLC_1) is interconnected to the F-CPU (PLC_2). • F-CPU in another project • None With this selection, existing interconnections will be deleted.
F-proxy interface ⑤	Here, you can select the PN interface of the SIMOTION controller via which interconnection with the F-CPU is performed. All PN interfaces that are in I-Device mode are displayed (X150, X1400). In the example, it is the X150 interface. If the F-CPU is in the same project and is already interconnected with the SIMOTION controller, the interface will be entered automatically.
F-CPU addresses ⑥	Address of the drive objects in the IO controller of the F-CPU. On the first drive object, the start address is used that was entered at "Start address in the F-CPU".
F-destination address ⑦	You enter the F-destination address here. This is preset to a default value. The F-destination address is identical to the PROFIsafe address in the drive.
Input address ⑧	Enter the input address of the I-Device here (SIMOTION controller).
Output address ⑨	Enter the output address of the I-Device here (SIMOTION controller).
Drive input address ⑩ (not editable)	The logical address of the PROFIsafe telegram of the drive object is displayed here. You can change this address in SIMOTION SCOUT TIA.

Configuring a table

When you right-click the table header, a shortcut menu opens.

1. Select "Display/hide" if you wish to configure the displayed columns. Please note that some of the columns including, for example, F-CPU address are required for programming the F-CPU application.
2. "Show all columns" if you require the entire table.

F-CPU in another project

If the fail-safe module is located in another project, for example, after migrating a project, select the entry "F-CPU in another project" for the F-CPU.

For this setting, at least one PN interface of the SIMOTION controller must be configured as an I-Device and no F-CPU must be present in the project. When you have made all the parameter settings, you must export the I-Device with a GSD export and then install it and reinsert and interconnect it in the F-CPU.

Filtering the display

With the "Displayed drive objects" filter, you can filter displayed drive objects, for example, for the following application scenarios:

- You want to interconnect additional drive objects subsequently.
- You have a project with a large number of drive objects.
- For checking whether all drive objects have been interconnected.

The entries that do not correspond to the filter criterion are hidden.

Start address of the F-CPU

The start address defines an address range in the F-CPU. All components are then clearly listed within the address band.

1. Enter a start address as the basis for address assignment in the F-CPU here.
   If no drive object has yet been interconnected with the F-CPU, this button is not active.
2. First enter the start address.
3. The make the interconnection.
   When you then interconnect the object, the addresses will be assigned from the starting value in ascending order.

If you want to change the address range after having made an interconnection, enter a new start address and click "Assign address".
The addresses are automatically moved into the address range.

Deleting components

If you delete an F-CPU, for example, all interconnections and transfer areas will be deleted.

Changing CRC backed-up data of a PROFIsafe telegram

Improved configuring/commissioning of drives with safety technology

For plants and machines with comprehensive safety technology, it must be possible to detect changes to safety-related data quickly and precisely. Each safety element usually has safety features, e.g. CRC (Cyclic Redundancy Check) backed-up data. For machines with 128 safety axes, for example, large data storage areas such as F-parameters are protected for the PROFIsafe telegrams. This means changed data must be displayed in a clearly structured manner. As of V5.2 and higher, the F-Proxy Interconnections table is extended by the **CRC change** column.

CRC change in the F-Proxy Interconnections table

Each change of CRC backed-up data of a PROFIsafe telegram is recorded. When the signature of the F-parameters (Failsafe_F_Par_CRC/F-parameter signature with addresses) is changed, this is indicated visually for the F-Proxy in the Interconnections table. If there is no CRC change, the column remains empty. CRC changes are displayed by a symbol for the respective safety axis. Check the respective F-parameters of the safety axis when a change is detected.

The detected difference only serves as information. The generation of online data is not prevented.

Working with the CRC change

1. Save and compile the modified project. A check is performed during compiling to see whether a CRC change exists.
2. If changes are detected, the comment "Unconfirmed CRC changes present" is displayed in the "Info > Compile" detailed view.
3. Click on the "Go to" column in the information row to jump to the Interconnections table with the detected CRC changes.
4. Check the displayed changes.

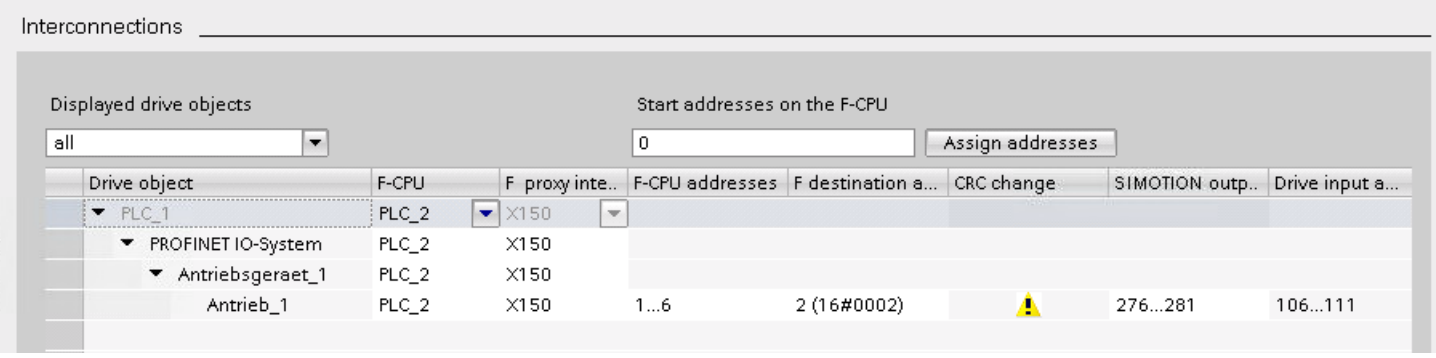

Figure 3-399 CRC change detected at safety axes

5. By using the filter selection "With CRC changes" for "Displayed drive objects", only the rows with changed CRC data are displayed.
6. At the bottom of the Interconnections table, click on the "Confirm CRC changes" button. The markings at the changed safety axes are deleted.

Checking project-wide PROFIsafe addresses

Unique PROFIsafe address

To ensure reliable communication, unique PROFIsafe addresses are required throughout the CPU and the network.

For this reason, you need to carefully check the settings of the PROFIsafe addresses.

⚠ WARNING

Unique PROFIsafe addresses

You must ensure the unique assignment of the PROFIsafe address throughout the network and the CPU.

- The fail-safe I/O of PROFIsafe address type 1 is uniquely addressed by its F-destination address.
- The F-destination address of the fail-safe I/O (drive units in this case) must be unique for all the fail-safe I/Os throughout the network and the CPU (system-wide). The fail-safe I/O of PROFIsafe address type 2, e.g. modules of the ET 200SP type, must also be taken into account.
- Note also the corresponding documentation in the TIA Portal online help in section "SIMATIC Safety - Configuration and programming".
  (*SDR001*)

1. Make sure that the following parameters are set for each drive:
   – Parameter p9610 in the parameter view = "F address" (F_Dest_Add) in the Inspector window under "Cyclic data exchange".
   Or
   – Parameter p9610 in the function view in dialog "F-DI / F-DO PROFIsafe" = F address (F_Dest_Add) in the Inspector window under "Cyclic data exchange".
2. Check the messages in the Inspector window while the control safety program is being compiled (compile CPU in the project tree). An error will be displayed for any address that is not unique:

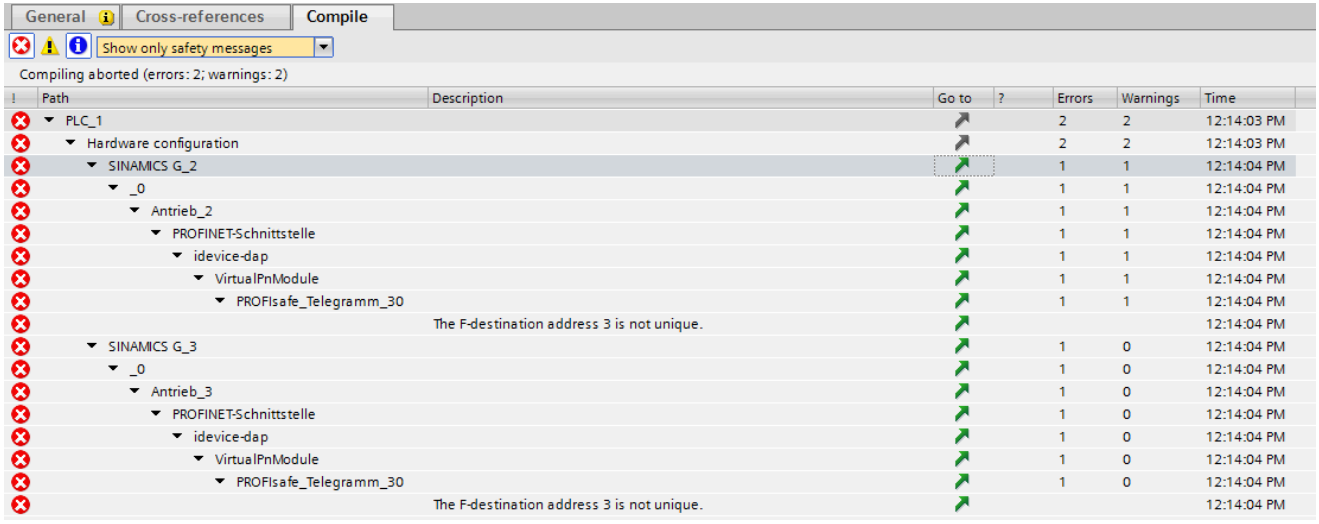

Figure 3-400 Compiler error message "F destination address is not unique"

Navigate into the telegram configuring screen of the affected device and assign a different PROFIsafe address.

3. Check the safety printout of the PLC you are using.
   Create the printout by right clicking on "Safety Administration" to call the context menu and then select "Print".
   All of the relevant data is listed in the printout. Below you can see an example for a drive that is networked as an IO device; the PROFIsafe address is displayed under "F-destination" address.

Note

Error-free hardware and software compilation

Error-free hardware and software compilation is the prerequisite for the creation of the safety printout for acceptance purposes. Only then is it assured that all consistency checks have been performed and therefore the safety printout created for a consistent project.

PROFINET-Schnittstelle : PROFINET IO-System PN/IE_1 idevice-dap

Compare this PROFIsafe address with the values of all other nodes and make sure that the addresses are unique.

Typical PROFIsafe topologies

Overview of topologies

This topic shows examples of topologies in which SIMOTION PROFIsafe is used.

1. F-CPU in another project (GSDML export)

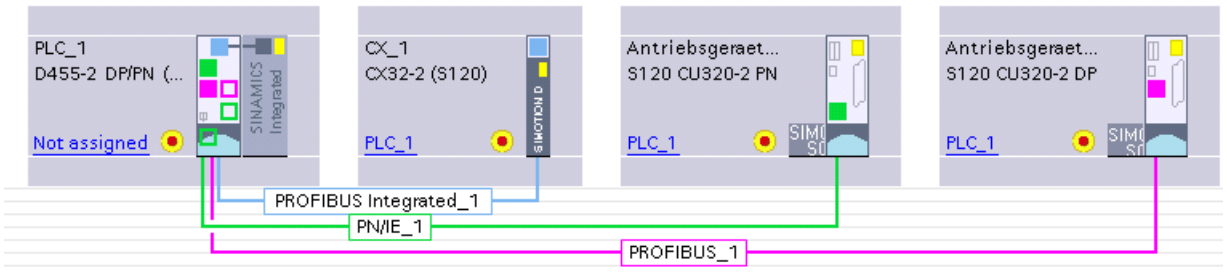

Figure 3-402 F-CPU in another project

2. F-CPU with SIMOTION via PROFINET as an I-Device (F-Proxy)

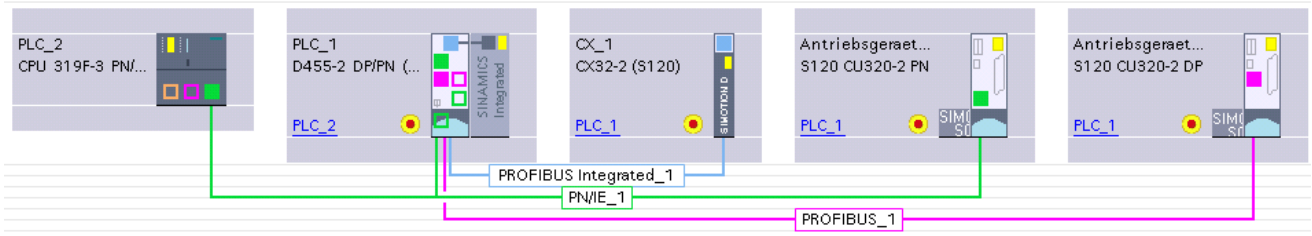

Figure 3-403 F-CPU with SIMOTION via PROFINET as an I-Device

Check of F-destination addresses

3. F-CPU with SIMOTION via PROFINET as an IO device (GSDML import)

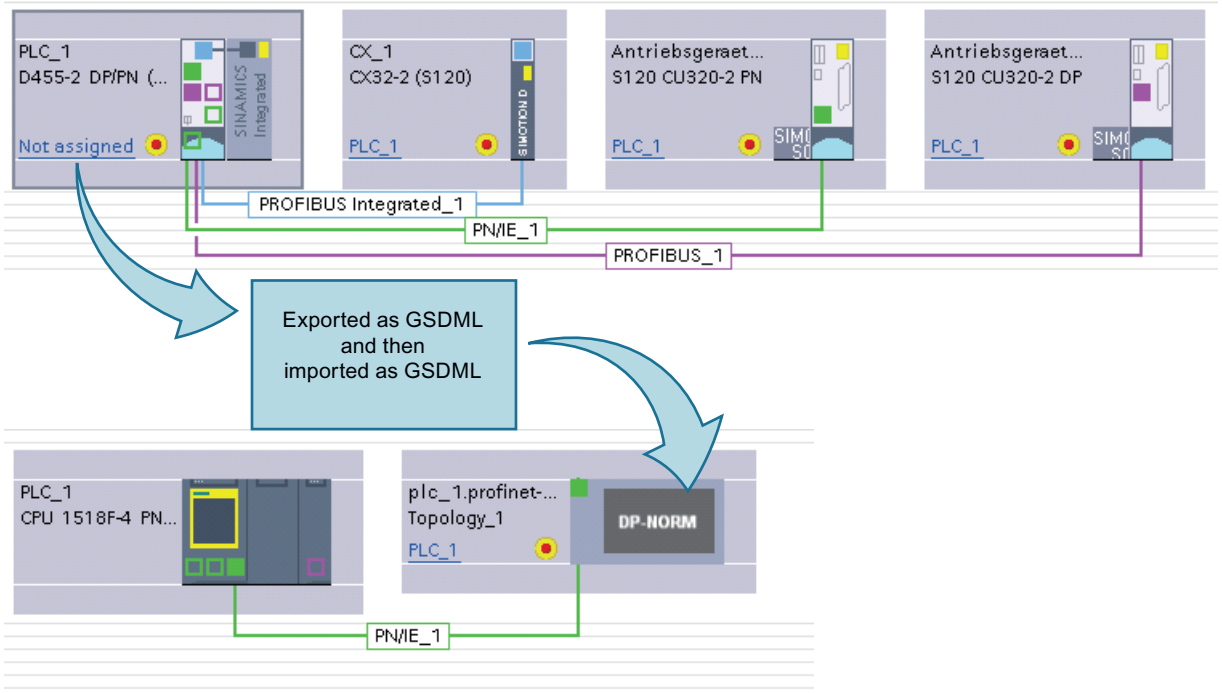

Figure 3-404 F-CPU with SIMOTION via PROFINET as an IO device

4. F-CPU with SINAMICS via PROFIBUS as a DP slave (F-DX-Mod)

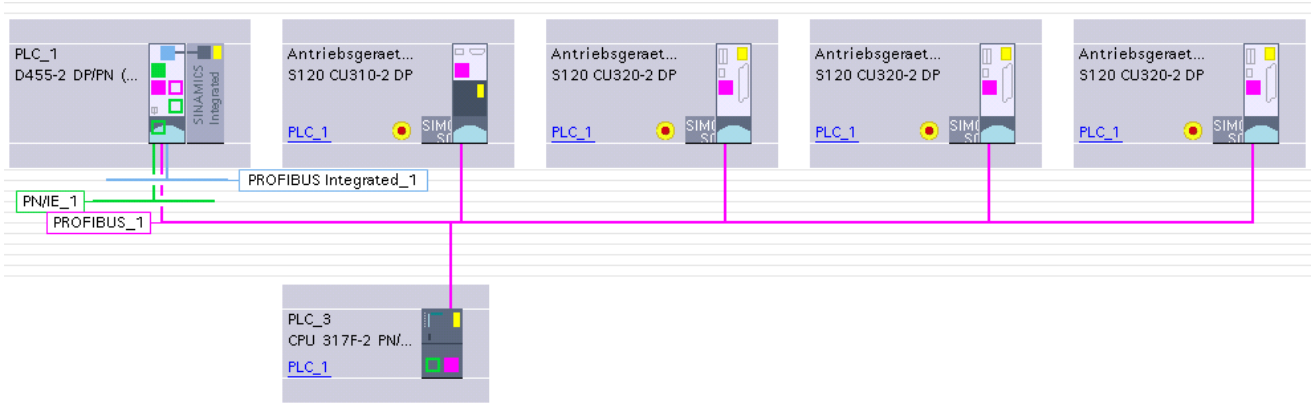

Figure 3-405 F-CPU with SINAMICS via PROFIBUS as a DP slave

5. F-CPU with SIMOTION as shared IO device via PROFINET (GSDML import)

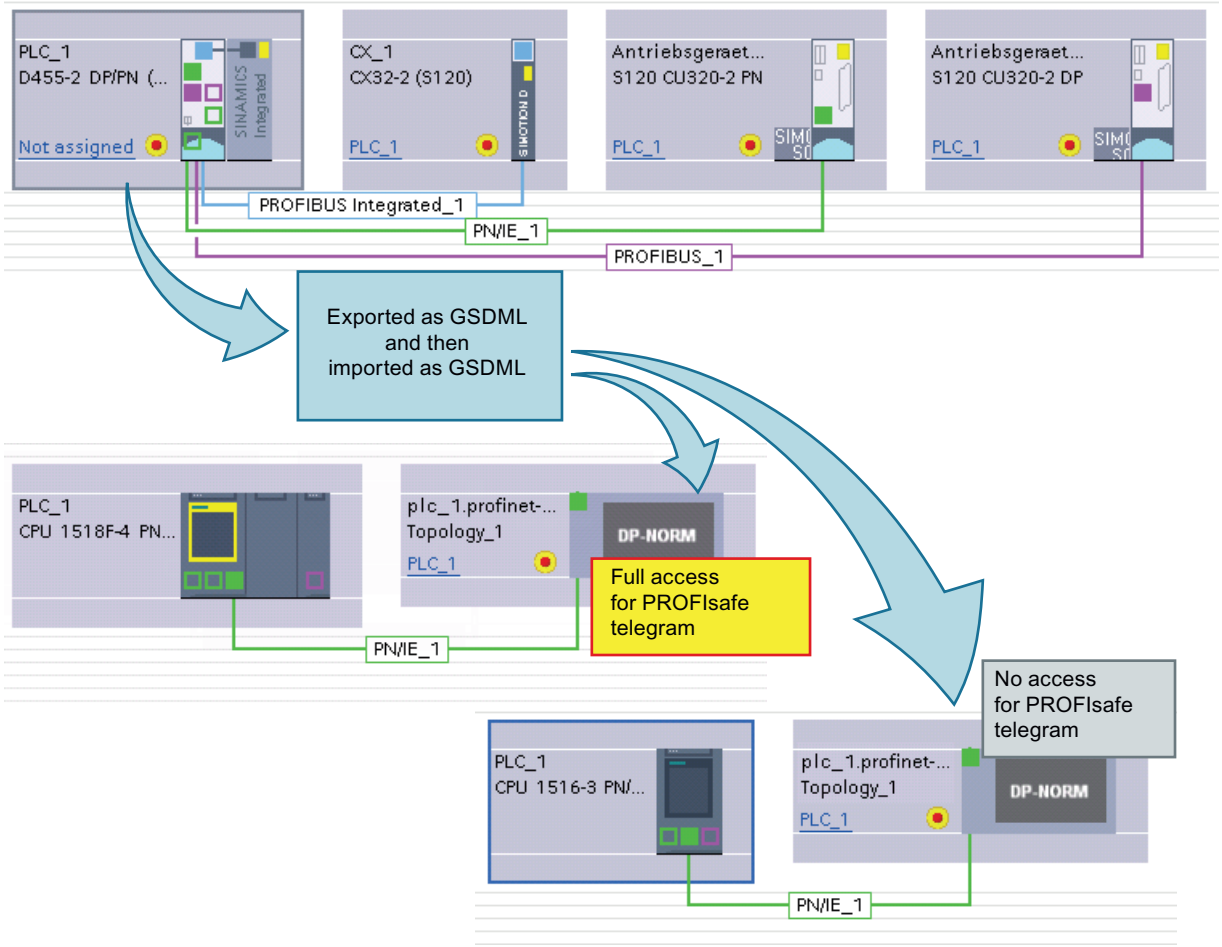

Figure 3-406 F-CPU with SIMOTION as shared device via PROFINET

Unique PROFIsafe addresses

You must check the uniqueness of the PROFIsafe addresses for all nodes in every topology. Typical points to be considered with respect to the topologies illustrated are described in the table.

Topology	F-destination address (F_Dest_Add)
Re 2:	Compare this F-destination address with the values of all other nodes and make sure that the addresses are unique. The nodes in the area between the F-CPU and the coupled SIMOTION CPU must be checked.
Re 3:	Compare this F-destination address with the values of all other nodes and make sure that the addresses are unique. The nodes in the F-CPU area must be checked. The nodes of the SIMOTION CPU in the imported project (topology 1) must also be checked.
Re 4 and 5:	Compare this F-destination address with the values of all other nodes and make sure that the addresses are unique. The nodes in the F-CPU area must be checked.

Shared Device and PROFIsafe

Shared Device and PROFIsafe

Description

With the Shared Device functionality, you can configure access to an IO device with several IO controllers using PROFINET. This enables channels/modules to be flexibly assigned to different IO controllers. This option is available for inputs and outputs. Access to the submodules of the Shared Device is divided between the individual IO controllers. Each submodule of the Shared Device can be assigned exclusively to one IO controller.

You can use this mechanism to access the fail-safe data of a drive configured below a SIMOTION CPU via the F-CPU, for example.

Note

When configuring PROFIsafe, it is recommended that you use the I-Device F-Proxy functionality instead of the Shared Device. The configuration as Shared Device is only relevant when the F-Proxy functionality cannot be used because of the number of axes.

Schematic diagram of Shared Device

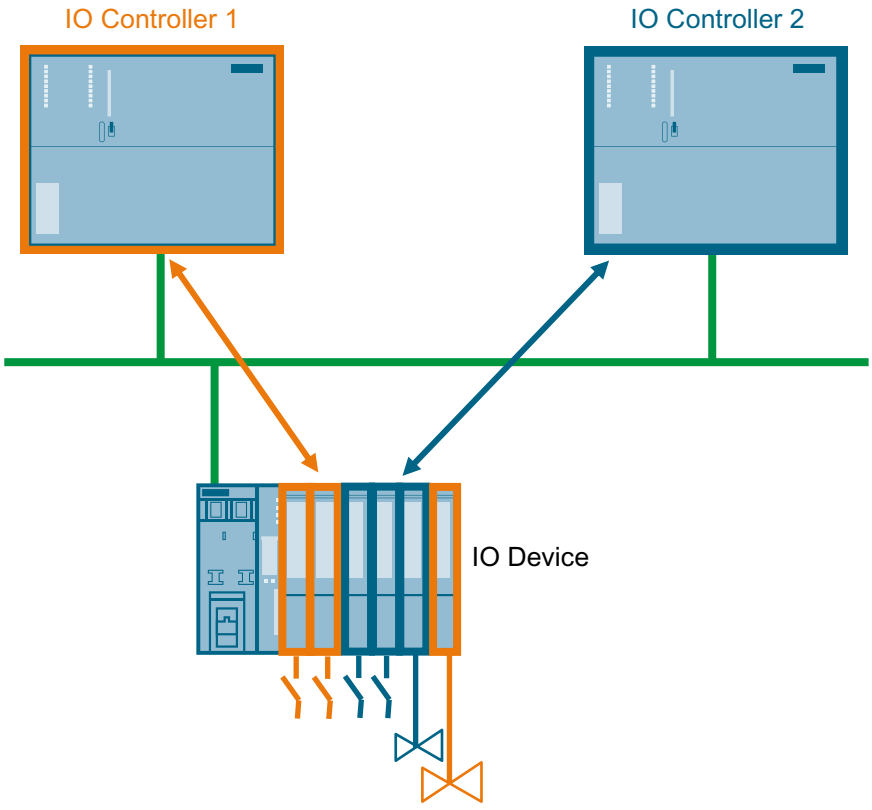

Figure 3-407 Schematic diagram of Shared Device

SINAMICS G120 shared by SIMOTION and F-CPU

Introduction

SINAMICS G120 as Shared Device only supports a fixed division of the subslots between the two sharing IO controllers. The Shared Device functionality is available only for the SINAMICS G120 GSD drives.

The following rule applies:

- Only the safety subslots are assigned to a second IO controller as F-CPU.
- All other subslots are assigned to the automation CPU, i.e. SIMOTION.

Note

The F-Proxy for SINAMICS G120 is**not** supported via GSD and Startdrive.

Configuring

A SINAMICS G120 can only be configured as Shared Device via GSDML. The configuration via GSD is performed in the same way as for a SINAMICS S120. The drive commissioning must be performed separately.

- SINAMICS G120 as GSD drive on SIMOTION CPU (project 1)
- SINAMICS G120 as GSD drive on SIMATIC F-CPU (project 2)
- Drive configuration and SINAMICS G120 commissioning in Startdrive (project 3)

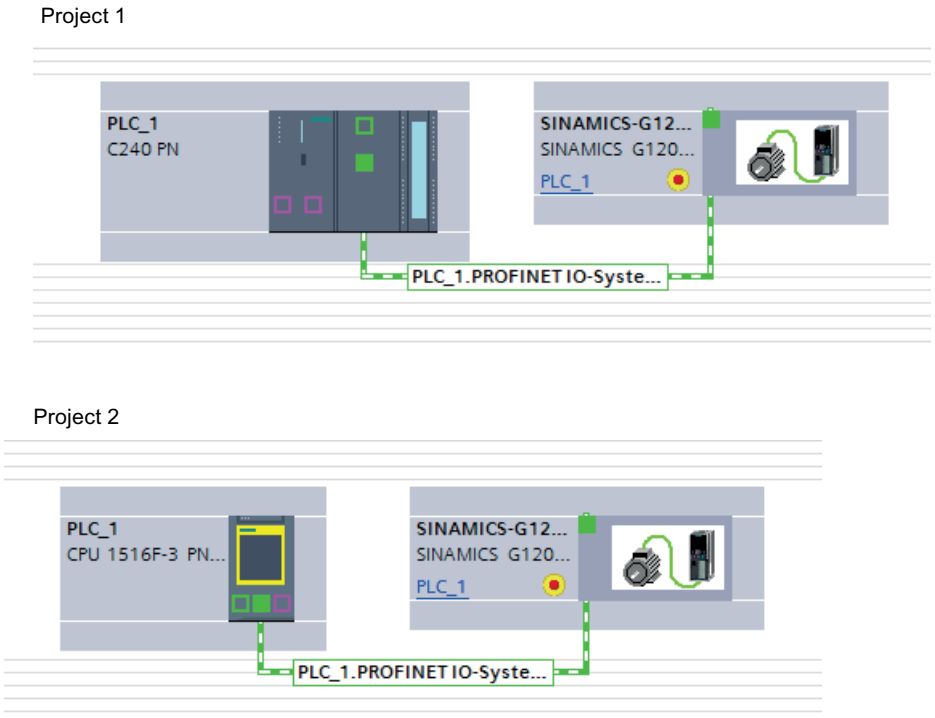

Figure 3-408 Two projects with SINAMICS G120 shared between SIMOTION CPU and F-CPU

Procedure

In the following example, you configure a project with a SIMOTION C240 PN with SINAMICS G120 CU240E-2 PN and a second project with a SIMATIC CPU 1516F-3 PN/DP, which accesses the fail-safe data of the shared SINAMICS G120. You perform the drive commissioning in Startdrive in a third project.

Creating project 1 with SIMOTION CPU and SINAMICS G120

1. Create a new project with a SIMOTION CPU.
2. Insert the SINAMICS G120 CU240E-2 PN (V4.7) IO device via the GSD file. You can find the GSD file in the hardware catalog at "Further field devices > PROFINET IO > Drives > SIEMENS AG > SINAMICS".
3. Assign the IO device to the controller.
4. You must adapt the SINAMICS G120 modules that are to be shared in the device overview.

5. Insert the modules and submodules from the hardware catalog using drag-and-drop. Only the safety modules have to be configured.
   - PROFIsafe telegram (PROFIsafe telegram 30 in the example)
   - SIEMENS telegram (SIEMENS telegram 352 in the example)

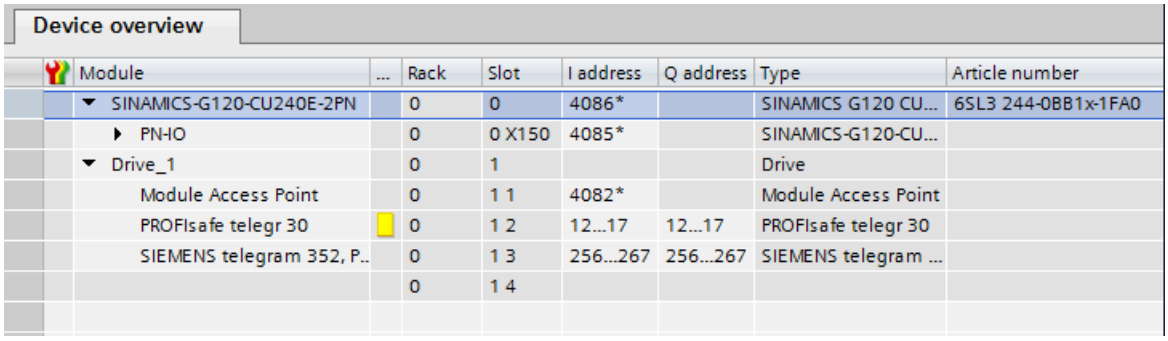

Figure 3-409 SINAMICS G120 inserted via GSD, Shared Device PROFIsafe modules via F-CPU

6. The following parameters and addresses must be identical in all three projects:
   - I/O addresses of the PROFIsafe telegram and the F-parameters (F-source/F-destination address).
   - The device name (also the converted device name) and the IP address.
7. Save the project.

Creating project 2 with F-CPU and SINAMICS G120 via GSD

1. Create a new project with an F-CPU, e.g. SIMATIC CPU 1516F-4 PN/DP.
2. Insert the SINAMICS G120 IO device and proceed as described above in project 1 as of step 3.

Creating project 3 with SINAMICS G120 (Startdrive must be installed)

1. Create a new project with a SINAMICS G120 CU240E-2 PN in the TIA Portal.
2. Run through the drive commissioning in Startdrive and configure the drive and PROFIsafe.
3. To use the SINAMICS G120 as Shared Device, parameter p8929 of the Control Unit must be set to "(2) Automation and safety".
4. Continue as described above in project 1 as of step 6.

Configuring access to the modules of the SINAMICS G120 (Shared Device)

1. Open project 1.
2. Click the SINAMICS G120 drive unit in the network view.
3. In the Inspector window, navigate to the "PROFINET interface > Extended options > Real-time settings > I/O cycle" area.
4. Select the number of project-external IO controllers at "Shared Device" (one in the example).
5. Select "Properties > General > Shared Device" in the Inspector window.

6. Configure the F-CPU access to the safety module. To do this, select the value "---" in the "Access" column in the "PROFIsafe telegram" row. In this way, another controller (the F-CPU in this case) can access these modules.

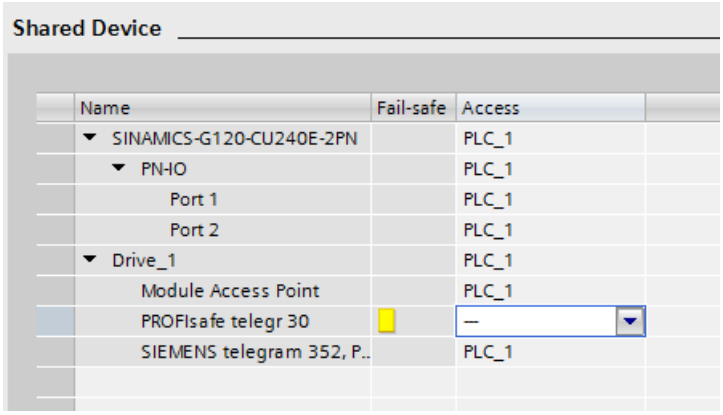

Figure 3-410 SINAMICS G120 Shared Device, automation assigned to the SIMOTION CPU

Note

If you select the "---" option, you cannot change the associated parameters for the PROFINET interface and the ports. They are read-only. Parameters of the PROFINET interface and port parameters can only be edited in the project in which the PROFINET interface is assigned to the local CPU. Irrespective of this, the ports can be connected in both projects.

7. Open project 2.
8. In the Inspector window, navigate to the "PROFINET interface > Extended options > Real-time settings > I/O cycle" area.
9. Select the number of project-external IO controllers at "Shared Device" (one in the example). Select "Properties > General > Shared Device" in the Inspector window.
10. Configure the access to the safety module with the F-CPU in the same project. To do this, select the value "PLC_1" in the "Access" column in the "PROFIsafe telegram" row for the local CPU. All other modules are set to the value "---".

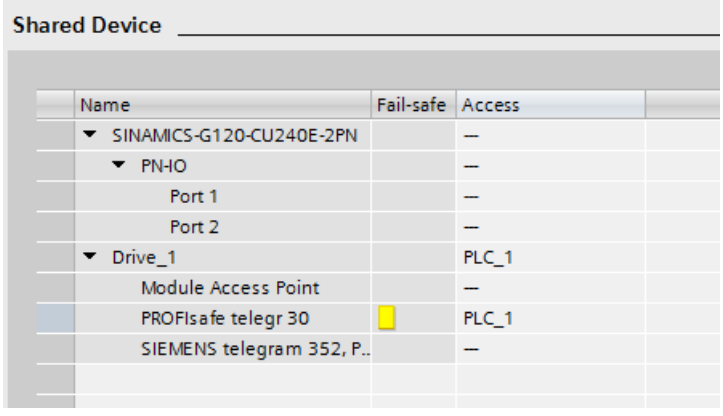

Figure 3-411 SINAMICS G120 Shared Device, PROFIsafe modules assigned to the F-CPU

11. Check whether the same IP address parameters and device names have been set for the Shared Device in all projects and that the modules have not been assigned twice. Only one IO controller may have access to a module.
12. Save all projects.

ET200SP as a shared device on SIMOTION CPU

Introduction

The SIMATIC ET200SP can be operated as Shared Device on SIMOTION controllers as of V4.5. The SIMATIC ET200SP is integrated as IO device, as GSD or via the hardware catalog (MDD). Two higher-level IO controllers share the submodules of the SIMATIC ET200SP. A typical application is a SIMOTION CPU as automation CPU and an F-CPU for the safety application.

Note

Isochronous mode and MRPD are only supported by SIMATIC ET200SP HS.

Applications

In principle, there are three typical applications for the SIMATIC ET200SP as Shared Device with two higher-level controllers.

1. SIMOTION CPU not isochronous and F-CPU
2. SIMOTION CPU isochronous and F-CPU (variation of application 1)
3. SIMOTION CPU isochronous and second CPU not isochronous (e.g. SIMOTION or SIMATIC)

Applications 1 and 2:SIMOTION CPU not isochronous or isochronous and F-CPU

The application is configured in two separate projects.

- SIMATIC ET200SP HS or SIMATIC ET200SP HF as Shared Device
- SIMOTION CPU (CPU 1)
  Accesses the standard modules of the ET200SP station via PROFINET with IRT for isochronous applications.
  Variant:
  SIMOTION accesses the standard modules of the ET200SP via PROFINET RT for non-isochronous applications.
- SIMATIC F-CPU (CPU 2)
  Accesses the safety modules of the ET200SP via PROFINET RT and the safety telegrams of the integrated drives of SIMOTION via the I-Device F-Proxy of SIMOTION.

Support of MSI and MSO

The modules/submodules are logical copies of real IO modules. Isochronous operation is not supported in MSI/MSO mode.

Schematic diagram

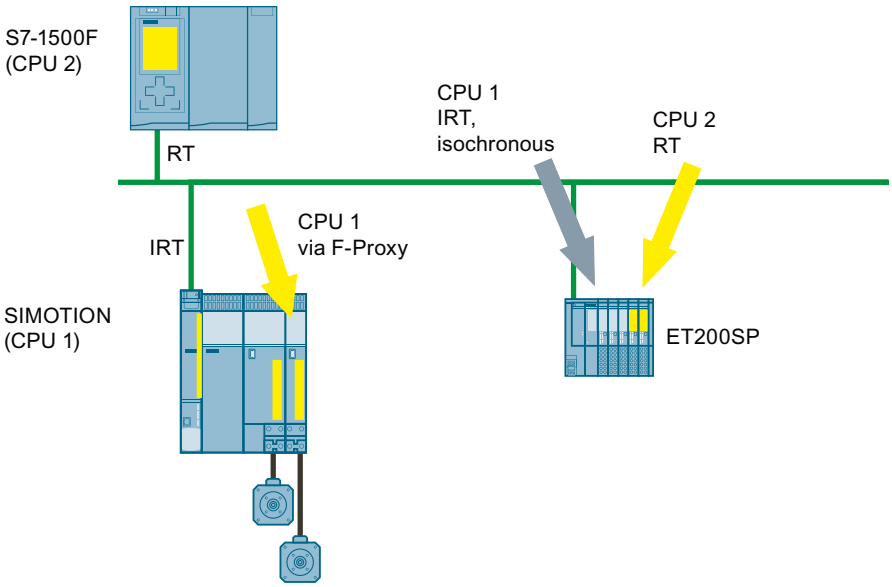

Figure 3-412 SIMATIC ET200SP as Shared Device between SIMOTION CPU IRT isochronous and F-CPU RT (application 2)

Application 3:SIMOTION CPU isochronous and second CPU not isochronous (e.g. SIMOTION or SIMATIC)

The application is configured in two separate projects.

- SIMATIC ET200SP HS as Shared Device
- SIMOTION CPU (CPU 1)
  Accesses the standard modules of the ET200SP station via PROFINET with IRT for isochronous applications.
- SIMOTION or SIMATIC CPU (CPU 2) accesses the non-safety modules via PROFINET RT for non-isochronous applications.
  SIMOTION accesses the standard modules of the ET200SP via PROFINET RT for non-isochronous applications. CPU 2 can also be any SIMATIC CPU, e.g. S7-1500.

Supported modules

Modules can each be DI, DQ, AI, AQ. The modules/submodules are logical copies of real IO modules. Isochronous operation is not supported in MSI/MSO mode.

Schematic diagram

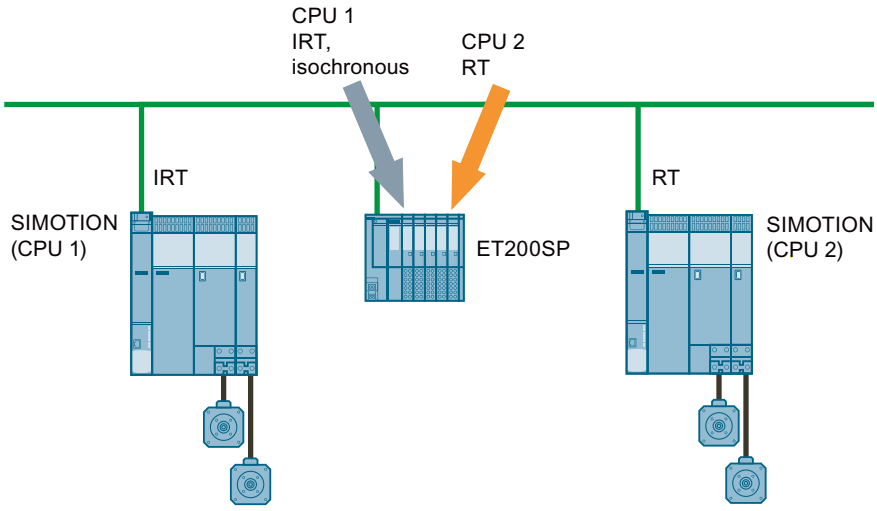

Figure 3-413 SIMATIC ET200SP as Shared Device between SIMOTION CPU IRT isochronous and second SIMOTION/SIMATIC CPU RT

Configuration example of SIMOTION CPU isochronous and F-CPU (application 2)

In the following example, an ET200SP HS isochronous is shared with a SIMOTION CPU and an F-CPU. The F-CPU accesses the PROFIsafe modules via RT.

Table 3-43 Hardware used

Project 1	Project 2
• SIMATIC S71516F-3 PN/DP • ET200SP HS (shared): IM 155-6 PN HS with the following modules DQ 8x24 VDC HF DI 8x24 VDC / 0.5 A HF F-DQ 4x24 VDC / 2 A PM HF F-DI 8x24 VDC HF	• SIMOTION D455-2 PN/DP • ET200SP HS (shared copied): IM 155-6 PN HS with the following modules DQ 8x24 VDC HF DI 8x24 VDC / 0.5 A HF F-DQ 4x24 VDC / 2 A PM HF F-DI 8x24 VDC HF

Configuring project 1 with F-CPU

1. Create a new project 1 in the TIA Portal with the F-CPU and an ET200SP HS with the modules described above.
2. Configure the PN subnet. The ET200SP HS is operated in RT mode.
3. Click the ET200SP HS station in the network view.
4. In the Inspector window, navigate to the "PROFINET interface > Extended options > Real-time settings > I/O cycle" area.
5. Select the number of project-external IO controllers at "Shared Device" (one in the example).
6. Select "Properties > General > Shared Device" in the Inspector window.

7. Configure the F-CPU access to the safety module. To do this, select the value "---" for all modules that are to have access through the SIMOTION CPU from another project. The F-DI and F-DQ modules remain assigned to the F-CPU.
8. Save and compile the project.

Configuring project 2 with SIMOTION CPU

1. Create a new project 2 in a new instance of the TIA Portal with the SIMOTION CPU.
2. Configure the SIMOTION CPU with the appropriate integrated drives and PROFIsafe.
3. Switch to project 1, click the ET200SP HS in the network view and select "Copy" in the shortcut menu.
4. Insert the copied ET200SP HS station in project 2 and assign it to the SIMOTION CPU. The IP address and the device name must be identical and in the same subnet.
5. Click the inserted ET200SP HS station in the network view.
6. In the Inspector window, navigate to the "PROFINET interface > Extended options > Real-time settings > I/O cycle" area.
7. Select the number of project-external IO controllers at "Shared Device" (one in the example).
8. Select "Properties > General > Shared Device" in the Inspector window.
9. Configure the access of the SIMOTION CPU to the modules. The F-DI and F-DQ modules are assigned to the F-CPU and are assigned the value "---". Assign the other modules to the SIMOTION CPU, e.g. value "PLC_1".
10. Configure the SIMOTION CPU as master and the ET200SP HS station as slave in the IRT isochronous mode to the servo.
11. Switch to the device view of the inserted ET200SP HS station and select "Servo" as process image for the DI and DQ modules for the I/O addresses.

    Note

    An ON delay must not be activated for the inputs of the modules that are to be operated in isochronous mode. "Servo" must be selected as process image for the I/O addresses of the isochronous modules.

12. Save and compile the project.

Note

Supplementary condition for ET200SP as a shared device

The PROFINET send cycle must be identical in both projects (sync domains of the controllers). The first higher-level controller operates the SIMATIC ET200SP in IRT isochronous mode, e.g. with a send cycle of 2 ms. The second higher-level controller which has shared access to the SIMATIC ET200SP in RT mode must also operate in a 2 ms send cycle. Only if the two controllers have the same send cycle can the ET200SP establish a connection with both of them. If they have different send cycles, the shared device randomly establishes contact with one controller and cannot be accessed by the other controller.

Shared I-Device and PROFIsafe

Shared I-Device and PROFIsafe

Description

An I-Device can be operated on two higher-level IO controllers as an IO device. This functionality is known as shared I-Device.

It provides the following application areas:

- One of the higher-level controllers works as the "Automation CPU" and uses the SIMOTION I-Device as an isochronous I-Device in the IRT operating mode.
- The other higher-level IO controller works as the "Safety CPU" and uses the submodules configured as the F-Proxy in the RT operating mode.

This means that an I-Device can communicate with two higher-level controllers as an IO device. At the same time, higher-level controllers can access certain modules, e.g. an F-CPU can access the F-Proxy submodules, using Shared Device.

The configuration is performed in three projects. The two higher-level IO controllers are configured in two projects and the SIMOTION CPU in an extra project. The SIMOTION CPU is connected to the higher-level IO controllers via GSD. Only two higher-level IO controllers are supported.

Schematic diagram

The schematic diagram below shows two IO controllers which share the submodules on the I-Device of a third IO controller.

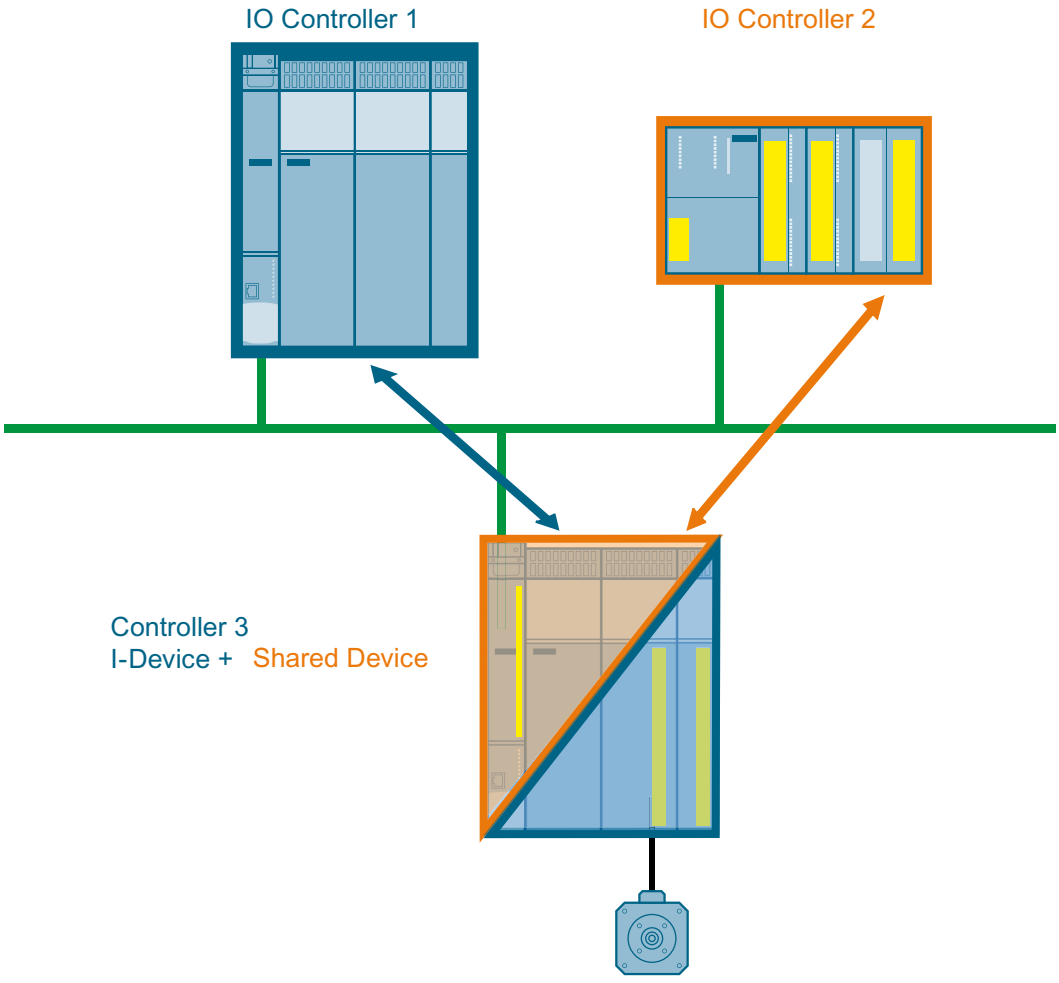

Figure 3-414 I-Device as Shared Device

Note

In this configuration, only the submodules that are used by the "Automation CPU" are configured as isochronous (IRT).

Applications

In principle, there are five typical applications for the SIMOTION CPU as shared I-Device with two higher-level controllers.

1. Shared I-Device via RT (or IRT not isochronous) - RT
   - SIMOTION CPU is a shared I-Device on PN Integrated or CBE30-2
   - Automation CPU 1 SIMATIC (RT or IRT not isochronous)
   - Automation CPU 2 SIMATIC (RT)
2. Shared I-Device via IRT isochronous
   - SIMOTION CPU is a shared I-Device on PN Integrated or CBE30-2
   - Automation CPU 1 SIMOTION (IRT isochronous)
   - Automation CPU 2 SIMOTION (RT)
3. Shared I-Device via RT (or IRT not isochronous) - PROFIsafe
   - SIMOTION CPU is a shared I-Device on PN Integrated or CBE30-2
   - Automation CPU 1 SIMATIC (RT or IRT not isochronous)
   - F-CPU SIMATIC (RT)
4. Shared I-Device via IRT isochronous - PROFIsafe
   - SIMOTION CPU is a shared I-Device on PN Integrated or CBE30-2
   - Automation CPU 1 SIMOTION (IRT isochronous)
   - F-CPU SIMATIC (RT)
5. Shared I-Device via PROFIsafe - PROFIsafe
   - SIMOTION CPU is a shared I-Device on PN Integrated or CBE30-2
   - F-CPU 1 SIMATIC (RT)
   - F-CPU 2 SIMATIC (RT)

Configuration example of a shared I-Device and PROFIsafe

Configuration example

In the following example, a SIMATIC S7-1500 is used as automation CPU and an S7-15xxF for safety for the central machine logic. The SIMOTION CPU performs the motion control task and is coupled to the automation CPU and the F-CPU via PROFINET RT as shared I-Device. The F-CPU accesses the SIMOTION drives via F-Proxy. The configuration must be performed in three projects.

Extended application

Several SIMOTION CPUs can be used as shared I-Device as extended application The SIMOTION CPUs work in a synchronized group using direct data exchange. The shared I-Devices are all PROFINET RT.

In the following example, only one SIMOTION CPU is configured as shared I-Device.

Schematic diagram

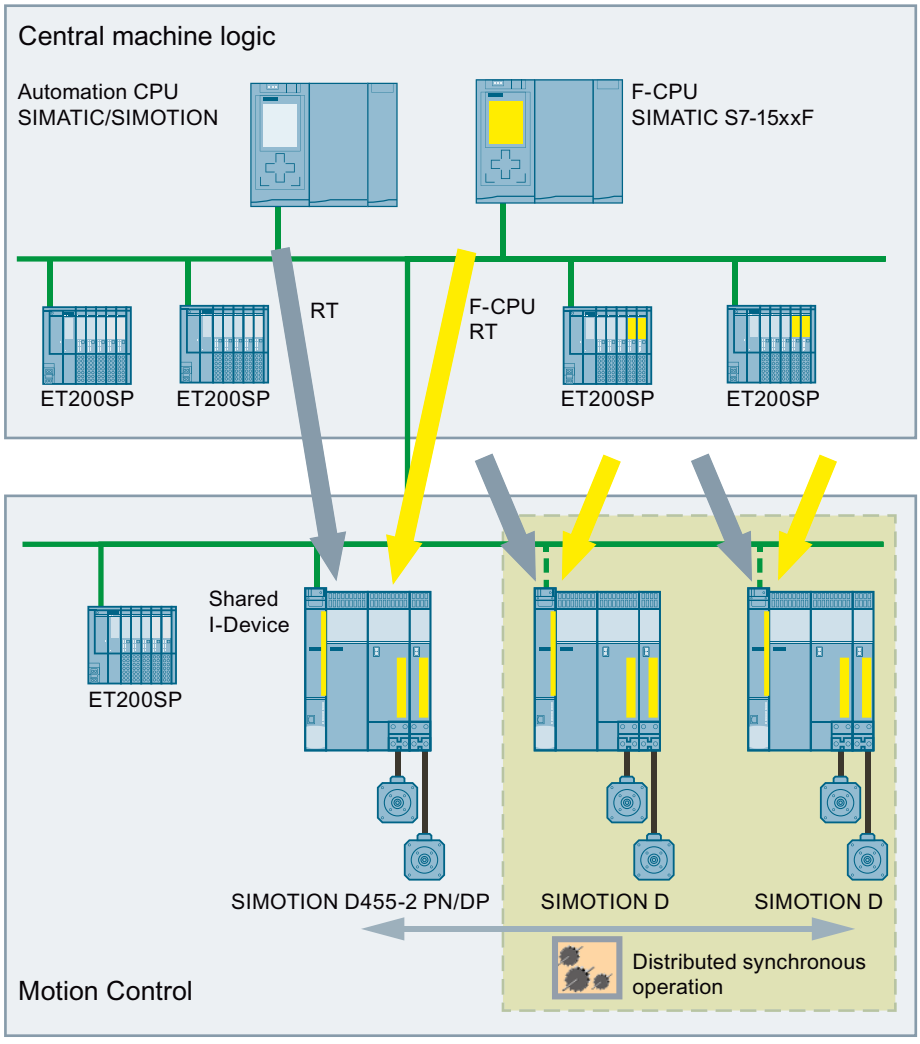

Figure 3-415 Two higher-level SIMATIC IO controllers access the SIMOTION CPU via shared I-Device (RT). Optionally, also additional SIMOTION CPUs in synchronous operation.

Hardware used in the projects

Project 1 (I-Device)	Project 2 (automation CPU)	Project 3 (F-CPU)
• SIMOTION D455-2 PN/DP • SINAMICS S120 on the PROFIBUS Integrated axis assigned with Safety Integrated	• SIMATIC S7-1516-3 PN/DP • SIMOTION I-Device via PROFINET RT	• SIMATIC S7-1516F-3 PN/DP • SIMOTION I-Device via PROFINET RT

Project 1: Configuring the SIMOTION CPU, drive and PROFIsafe

In project 1 you configure the SIMOTION CPU and create the SIMOTION I-Device.

1. Create a new project in the TIA Portal with a SIMOTION D455-2 PN/DP.
2. In SIMOTION SCOUT TIA, configure the drive on the SINAMICS Integrated and insert an axis, and assign it to the drive.
3. Configure PROFIsafe:
   - Activate "Safety via PROFIsafe" on the drive.
   - Activate the functions of the SINAMICS Safety Integrated axis.
   - Insert a PROFIsafe telegram during the telegram configuration of the SINAMICS Integrated.
4. Save and compile the project in SIMOTION SCOUT TIA. The addresses are set up.
5. Switch to the TIA Portal and in the network view click the PN interface of the SIMOTION CPU in order to configure the operating mode as I-Device.
6. In the Inspector window, switch to "Properties > General > Ethernet addresses".
7. Assign a unique "IP address" and a unique "PROFINET device name".
8. In the Inspector window, click "Operating mode".
   - Activate "IO-Device".
   - Add the transfer areas.
   - Select the number of IO controllers that are to have access to the I-Device ("Operating mode > Real-time settings > IO cycle", "Shared Device" section).
9. Click the SIMOTION CPU in the network view and select the "F-Proxy" section on the "General" tab in the Inspector window.
   - Enter the "Start address" of the F-CPU.
   - Select "F-CPU in another project".
   - Select the "F-Proxy interface" X150.
10. Save the project.
11. In the Inspector window, switch to "Properties > General > Operating mode > I-Device communication" tab.
12. Click "Export" in the "Export device description file (GSD)" section, select the designation and path and export the GSD file.
13. You must install the exported GSD in the TIA Portal. Select "Options > Manage device description file GSD" in the menu, navigate to the storage path and install the GSD file. The I-Device is displayed at "Other field devices" in the "PROFINET IO > PLCs & CPs" subfolder in the hardware catalog.

Note

The IP address and the device name must be identical for the SIMOTION CPU and the I-Device. Check that the parameters are identical in other projects in which you use the I-Device because with Shared Device, it is the same device.

Project 2: Coupling SIMOTION as shared I-Device to the automation CPU

In project 2, you couple the SIMOTION I-Device to the automation CPU and assign the modules to the IO controller.

1. Create a new project in the TIA Portal with a SIMATIC S7-1516-3 PN/DP and configure the CPU.
2. Insert the I-Device from the hardware catalog (hardware catalog: Other field devices > PROFINET IO > PLCs & CPs).
3. Assign the IO controller to the I-Device.
4. In the properties of the I-Device, select the "Shared Device" area. All transfer areas and the PROFINET interface are assigned the local IO controller (PLC_1) in the table.
5. Specify the transfer areas to which the automation CPU should not have access. Select the entry "---" for these areas. These transfer areas are intended for the F-CPU.
6. Save the project.

Project 3: Coupling SIMOTION as shared I-Device to the F-CPU

In project 3, you couple the SIMOTION I-Device to the F-CPU and assign the modules to the IO controller.

1. Create a new project in the TIA Portal with a SIMATIC S7-1516F-3 PN/DP and configure the CPU.
2. Insert the I-Device from the hardware catalog (hardware catalog: Other field devices > PROFINET IO > PLCs & CPs) or copy the I-Device from project 2 and insert it in the network view.
3. Assign the IO controller to the I-Device.
4. In the properties of the I-Device, select the "Shared Device" area. All transfer areas and the PROFINET interface are assigned the local IO controller (PLC_1) in the table.
5. Specify the transfer areas to which the F-CPU CPU should not have access. Select the entry "---" for these areas. For the safety module,. select "PLC_1".
6. Save the project.

Compiling and loading

You only have to compile the configurations for the IO controller and load them in succession to the CPUs. Errors in the configuration and consistency errors are not detected during the compilation. They can cause communication and access errors.

PROFIsafe via PROFIBUS with failsafe direct data exchange

Introduction

This section describes a configuration example for fail-safe slave-to-slave communication. During fail-safe slave-to-slave communication, the SIMOTION CPU is the DP master. The SIMATIC F-CPU is the I slave on PROFIBUS DP and controls fail-safe communication, e.g. with a CU320 of the SINAMICS S120.

Controllers and drives used

- SIMOTON D410-2 DP (motion control)
- SINAMICS S120 CU320-2 DP
- SIMATIC S7-300 CPU317F-2 PN/DP (F-CPU)

Requirements

- Project created in the TIA Portal
- Controllers and drives inserted in TIA Portal
- PROFIBUS DP system with SIMOTION D410-2 DP, SINAMICS S120 CU320-2 DP, and SIMATIC S7-300 CPU317F-2 PN/DP configured in the TIA Portal

Configuring fail-safe slave-to-slave communication

1. In network view, create an F-CPU, a SIMOTION D410 controller, and a SINAMICS S120 in accordance with the hardware installed. The devices are located in the same PROFIBUS DP subnet.

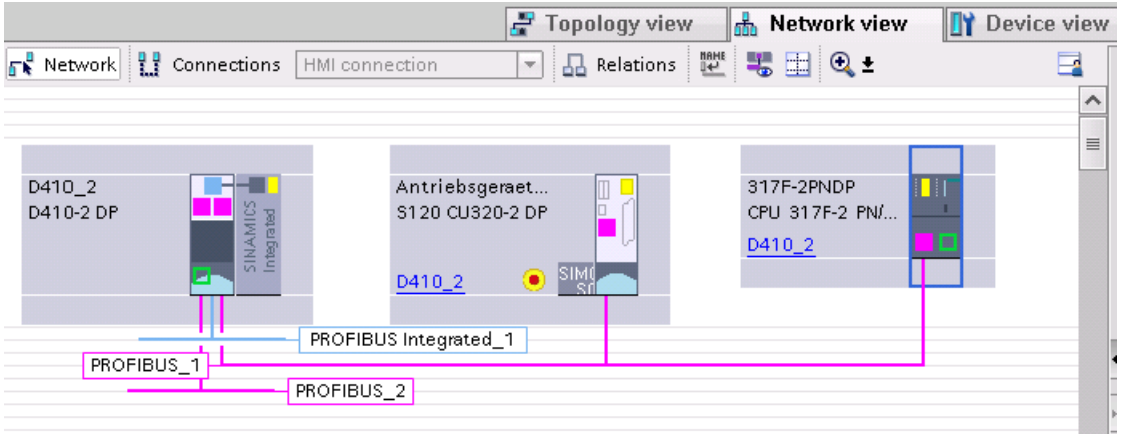

Figure 3-416 Configuration example of fail-safe slave-to-slave communication on the PROFIBUS DP

2. You configure the SIMOTION CPU as a DP master and the SINAMICS S120 as a DP slave, which is isochronously synchronized to the constant DP cycle.

3. You configure the SIMATIC F-CPU as an I slave and enter at least one transfer area per transfer direction.

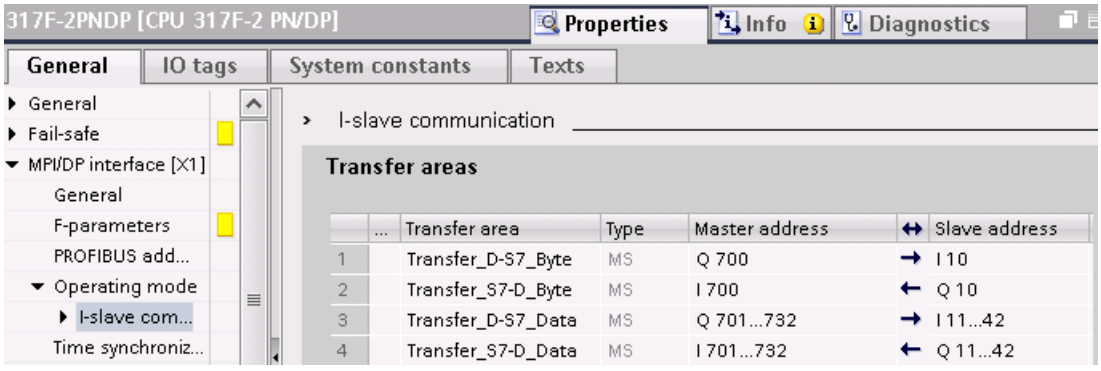

Figure 3-417 I slave communication transfer areas

4. Configure the SINAMICS drive unit (safety configuration) in SIMOTION SCOUT TIA in accordance with your hardware configuration.
5. Then insert a new TO axis in SIMOTION SCOUT TIA and run through the axis wizard. In the wizard, interconnect the axis to the corresponding drive object of the S120 and a corresponding telegram will automatically be created (symbolic assignment).
6. Save and compile the project in SIMOTION SCOUT TIA.
7. Create a PROFIsafe slot in SIMOTION SCOUT TIA in the configuration of the SINAMICS drive unit.
   For this, on tab "IF1: PROFIdrive PZD telegrams", select the drive object that will communicate with the SIMATIC F-CPU via PROFIsafe. Click the "Adapt telegram configuration" button and select "Add PROFIsafe". In the example, a PROFIsafe telegram 901 is configured.

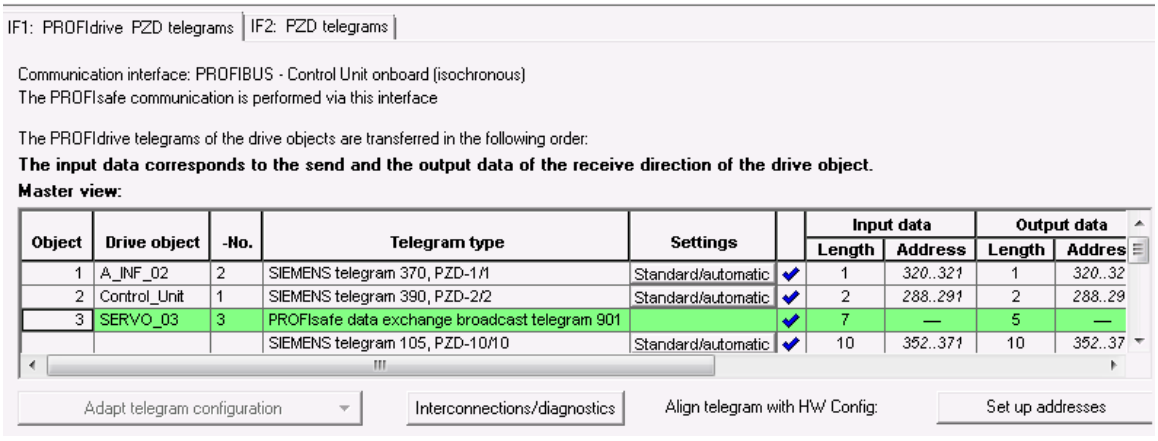

Figure 3-418 Adding a PROFIsafe telegram

8. Transfer the new PROFIsafe slot by clicking the "Set up address" button.
9. Switch to the TIA Portal and in the network view click SIMATIC F-CPU.
10. At the network data, select the "I/O communication" tab. You can show the network data on the right-hand side of the network view.

11. On the transmitter module (SIMATIC F-CPU), select the interface that you want to use for direct data exchange. At "I/O communication", the modules that are configured in this subnet are displayed. Click the SINAMICS drive unit. It is inserted for slave-to-slave communication.

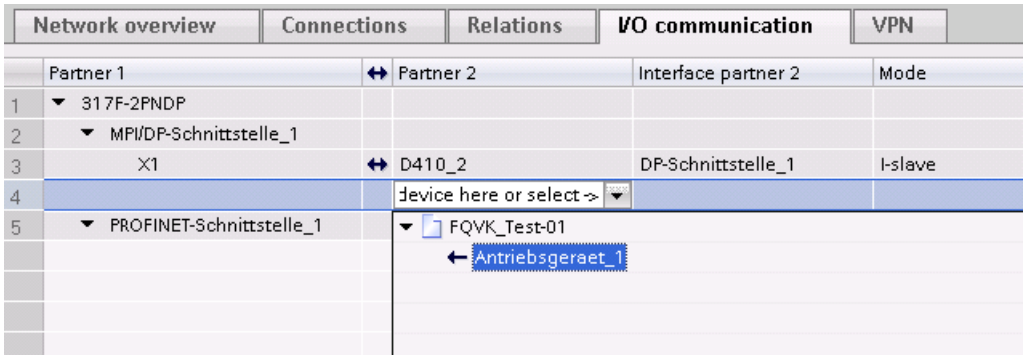

Figure 3-419 Setting up slave-to-slave communication in the TIA Portal

12. On the "I/O communication" tab, click the inserted drive unit. In the "Inspector window", go to the "Properties" tab and then "General" to add a transfer area for fail-safe slave-to-slave communication.

13. Click "<Add new>" and then insert a transfer area of type "F-DX-Mode" and adapt the addresses accordingly.

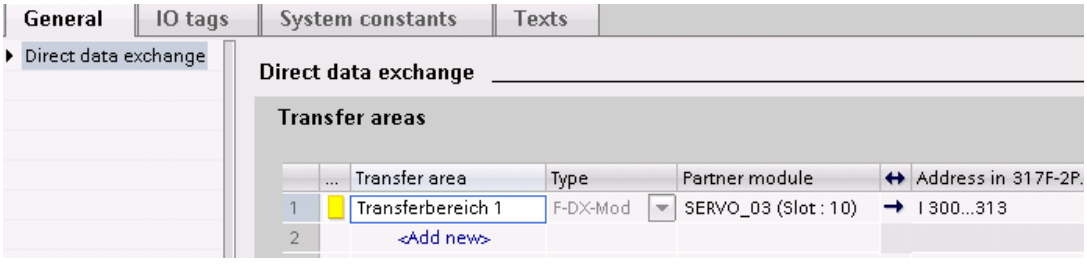

Figure 3-420 Adding a transfer area F-DX-Mode in the TIA Portal

14. Save and compile the project in the TIA Portal. Fail-safe slave-to-slave communication is configured.

3.5.6.4 Configuring onboard IO X142

SIMOTION D4x5-2 I/Os (terminal X142)

The I/Os of terminal X142 are permanently assigned to the SIMOTION D4x5-2. The configuration is performed in the device view of the TIA Portal. The digital I/Os on the X142 connector are provided for the connection of sensors and actuators.

The following types of digital inputs/outputs are available:

- Digital inputs (DI)
- Bidirectional digital I/Os (DI/DO, IN/OUT)

Bidirectional digital I/Os can be configured individually as digital inputs or outputs. Assignment of the I/Os to functions can be parameterized as required. Special functions (e.g. input of measuring input and cam output) can also be assigned to the I/Os.

Note

If you want to interconnect a measuring input or an output cam to the terminals X142 in the SIMOTION SCOUT TIA, you can select all of the I/Os (measuring inputs / output cams) configured here.

You can set the following parameters:

Table 3-44 Channels 0-7

Field/button		Meaning/instruction
IN/OUT X142		Inputs/outputs (IN/OUT 0-7) of the X142
Inverter		Button for the inversion
Function		
	DI	Digital input
	DO	Digital output
	Output cam	Output for output cam
	Measuring input	Input for measuring input
IN filter time		
	Filter time	The selection list has the values 1 µs and 125 µs and is available only for the function "DI" and "measuring input".
Logical addr.		PI, PQ for output cams and measuring inputs The displayed logical address of a channel is only required when symbolic assignments are not used.

Table 3-45 Digital inputs and outputs

Field/button	Meaning/instruction
Input addresses	
Start address	Enter the start address of the digital inputs here.
End address	The end address is determined by the length.
Output addresses	
Start address	Enter the start address of the digital outputs here.
End address	The end address is determined by the length.

Configuration of the D4x5-2 I/Os (terminal X142)

The following figure shows an example interconnection to DI, DO, measuring input, and output cam.

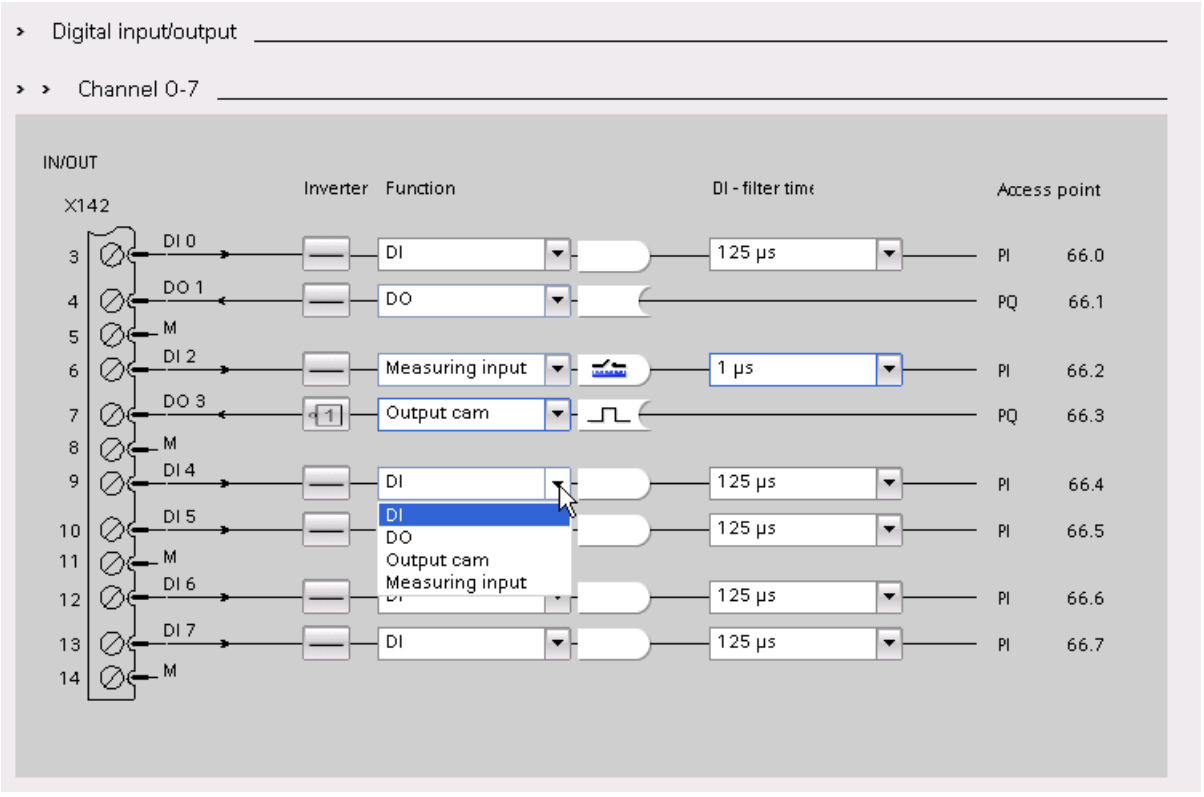

Figure 3-421 Configuration of the D4x5-2 I/Os (terminal X142)

In the SIMOTION SCOUT TIA, you can interconnect the technology object to the configured I/Os of the X142 in the configuration of the technology objects measuring inputs or output cams. In the example, the input X142.6 with the measuring input.

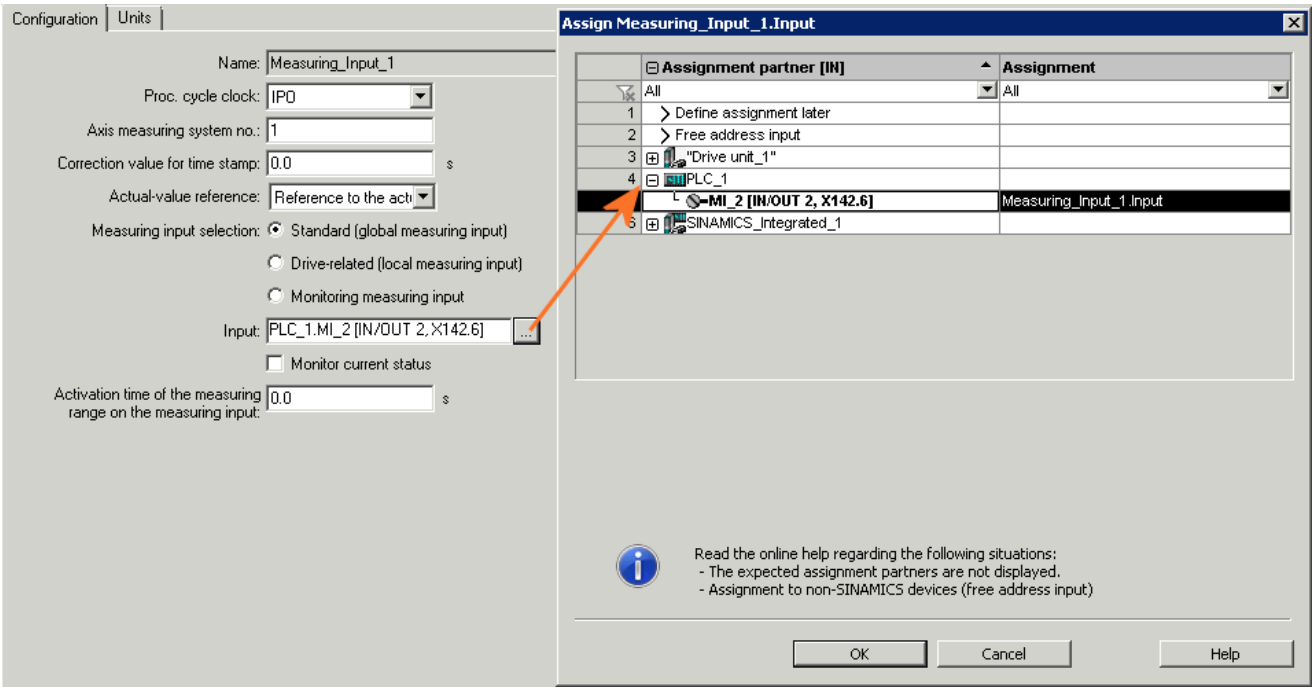

Figure 3-422 Configuring a measuring input at the input X142

3.5.6.5 PROFIBUS DP

Settings on the PROFIBUS

Parameterize PROFIBUS DP

PROFIBUS DP is used for communication between the SIMOTION controller and other devices such as drives or other SIMOTION or SIMATIC controllers. Via DRIVE-CLiQ, you can connect additional modules (CX32-2) to the PROFIBUS Integrated.

For the settings that are possible for the different devices, refer to the documentation of the devices that you use.

Creating a PROFIBUS subnet or master system

To create a new PROFIBUS subnet or a DP master system, proceed as follows:

1. Right-click the interface at which you want to create a system.
2. Select "Create subnet" if you want to create a PROFIBUS subnet at this interface.
3. Select "Assign subnet" if you want to assign an existing subnet to the interface.
4. Select "Create master system" if your device is to act as a DP master.

PROFIBUS address

In general, the PROFIBUS address of the interface is assigned automatically.

Reserve PROFIBUS address "0" for a service PG and "1" for a service HMI device which are connected to the subnet as required.

For service purposes, it is recommended reserving the address "2" for a SIMOTION module. This prevents occurrence of duplicate addresses when a SIMOTION D4x5-2 is installed in the subnet using default settings (for example, when replacing a SIMOTION D4x5-2). You should therefore assign addresses greater than "2" to additional units on the subnet.

The PROFIBUS address set in the TIA Portal must match the address that is set on the device.

You edit The PROFIBUS address either in the device view or in the network view:

- In the device view or network view by selecting the device and then clicking the "PROFIBUS address" entry below the "Inspector window > General > <Interface>". There, set the PROFIBUS address in the "Address" drop-down menu.
- In the device view or network view by directly selecting the interface and then clicking the "PROFIBUS address" entry below the "Inspector window > General". There, set the PROFIBUS address in the "Address" drop-down menu.

Operating mode

To create a DP master system, you need a DP master and at least one DP slave. Once you connect a DP master with a DP slave, a master-slave coupling occurs.

You can change the operating mode subsequently:

1. To do this, select the device in the network view.
2. Change to the Inspector window and call the respective interface from the "Operating mode".
3. Activate the option you want to use for your device.

PROFIBUS Integrated

The PROFIBUS Integrated is operated only equidistantly. You can view the settings by clicking the bus in the network view and the "General" tab in the Inspector window under "Properties".

In order to parameterize the isochronous cycle for the PROFIBUS Integrated, proceed as follows:

1. Select the PROFIBUS Integrated in the network view.
2. Select the "General" tab in the Inspector window and click "Equidistance" to display the parameters for the equidistant PROFIBUS.
   The "Activate equidistant bus cycle" setting is permanently selected and cannot be edited.

The other parameters are set to default settings and can be edited.

Drives on PROFIBUS DP (Page 787)

Cycles with SINAMICS_Integrated (<500 µs)

Introduction

As of SIMOTION SCOUT/SIMOTION SCOUT TIA V4.5, SINAMICS_Integrated for drives on SIMOTION D4x5-2 can use bus cycles of less than 500 µs. It supports cycles between 250 µs and 375 µs. SINAMICS_Integrated remains assigned to the servo cycle. Servo_fast is not supported.

Supplementary conditions

The supplementary conditions for deployment of cycles < 500 µs are listed below.

PROFIBUS and Servo_fast

- External PROFIBUS interfaces cannot be used isochronously
- Since a factor of 4 between Servo and Servo_fast is prescribed for cycles of ≤ 250 µs, Servo_fast with 125 µs cannot be used in parallel to SINAMICS_Integrated with 250 µs.
- Because the Servo cycle must be a multiple of the Servo_fast cycle, Servo_fast cannot be used:
  - Servo_fast > 250 µs: N = 2, 4, 8, 16, 32, ...
  - Servo_fast ≤ 250 µs: N = 4, 8, 16, 32, ...

Number of axes

With regard to utilization, SINAMICS_Integrated is subject to the same restrictions as those applicable to an external SINAMICS drive.

If the SINAMICS_Integrated is operated with a DP Integrated cycle clock of 250 µs or 375 µs, the resultant utilization is higher in comparison to a cycle clock of ≥ 500 µs. Depending on the utilization situation (e.g. by deployed ALMs, CXs, TMs), this can result in a reduction in the number of axes (e.g. from six to five servo drives).

The higher utilization can result in a reduction of the quantity structure for vector and V/f-controlled drives.

CBE30

CBE30 supports a minimum send cycle of 500 µs. The SINAMICS_Integrated can only be operated with 250 µs if no isochronous communication is configured for the CBE30. If the CBE30 operates isochronously (assignment to the Servo), the Servo has a minimum cycle of 500 µs.

Setting the equidistant PROFIBUS

Configuring the equidistance

The PROFIBUS properties of "isochronicity" and "equidistance" form the basis for synchronized editing cycles.

Equidistance ensures exactly the same interval for bus cycles. The "Constant bus cycle time" function ensures that the DP master always starts the PROFIBUS DP bus cycle within a constant time interval. Therefore, the connected slaves also obtain their data from the master in exactly constant time intervals. This is also called "clock of the bus cycle."

Equidistance is the requirement for isochronous operation. For instructions on setting isochronicity, refer to Drives on PROFIBUS DP (Page 787).

Equidistant PROFIBUS

In order to perform the settings for the PROFIBUS, select the bus in the network view.

1. In the Inspector window, select the "Properties > General" tab and click "Equidistance".
2. Parameterize the bus settings there.

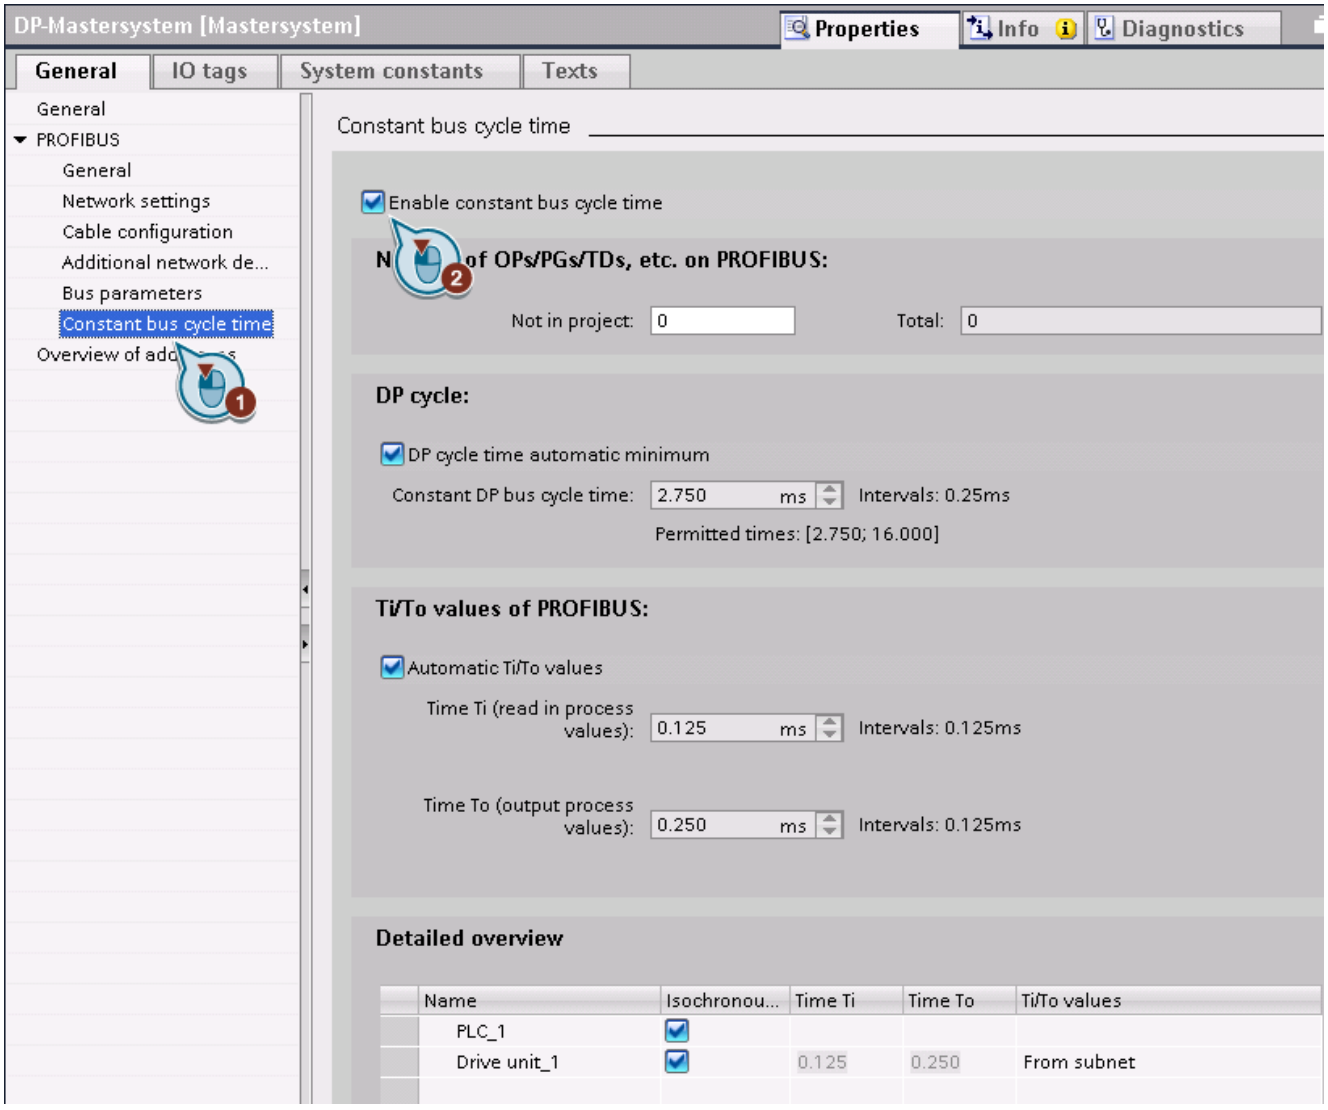

Figure 3-423 Configuring the equidistant PROFIBUS

Parameter		Description
Activate the equidistant bus cycle		Activate this option if you want to operate the bus isochronously.
DP cycle		
	DP cycle time automatically minimal	Activate this option if you want to assign the values automatically with the minimum value.
	Equidistant DP cycle	The equidistant DP cycle in which the master exchanges data with all slaves is set here.
Ti/To values of the PROFIBUS		
	Ti/To values automatic	Activate this option if you want to assign the values automatically.
	Time Ti (read in process values)	Specifies at what time Ti before the start of the "DP cycle", the actual position value (process value) is recorded.
	Time To (output process values)	Specifies at what time To after the start of the "DP cycle" the controller transfers the setpoint (e.g. speed setpoint).

Detailed overview

For an overview of the current settings and nodes on the equidistant PROFIBUS DP, select the "Properties > General" tab in the Inspector window and click "Equidistance". The "Details view" is located in the lower area of the "Equidistance" tab.

Drives on PROFIBUS DP

Settings on PROFIBUS DP

Drives are normally operated on the PROFIBUS DP as slave on a higher-level controller. There is also the possibility of operating the bus equidistantly and isochronously.

For an isochronous mode, you have to click the "Activate equidistant bus cycle" option on the bus, see also Settings on the PROFIBUS (Page 783).

More settings on the drive (DP slave) are necessary for an isochronous PROFIBUS.

For detailed information, refer to the information system of the TIA Portal under "Isochronous" and "Equidistant" operation.

Drive units that are not networked or are assigned to a DP master are not displayed in SIMOTION SCOUT TIA.

Set the isochronization on the drive

1. Click the interface of the drive in the network view.
2. In the "General" inspector window, select "Isochronization."
3. Activate the "Synchronize DP slave to constant DP cycle" option.

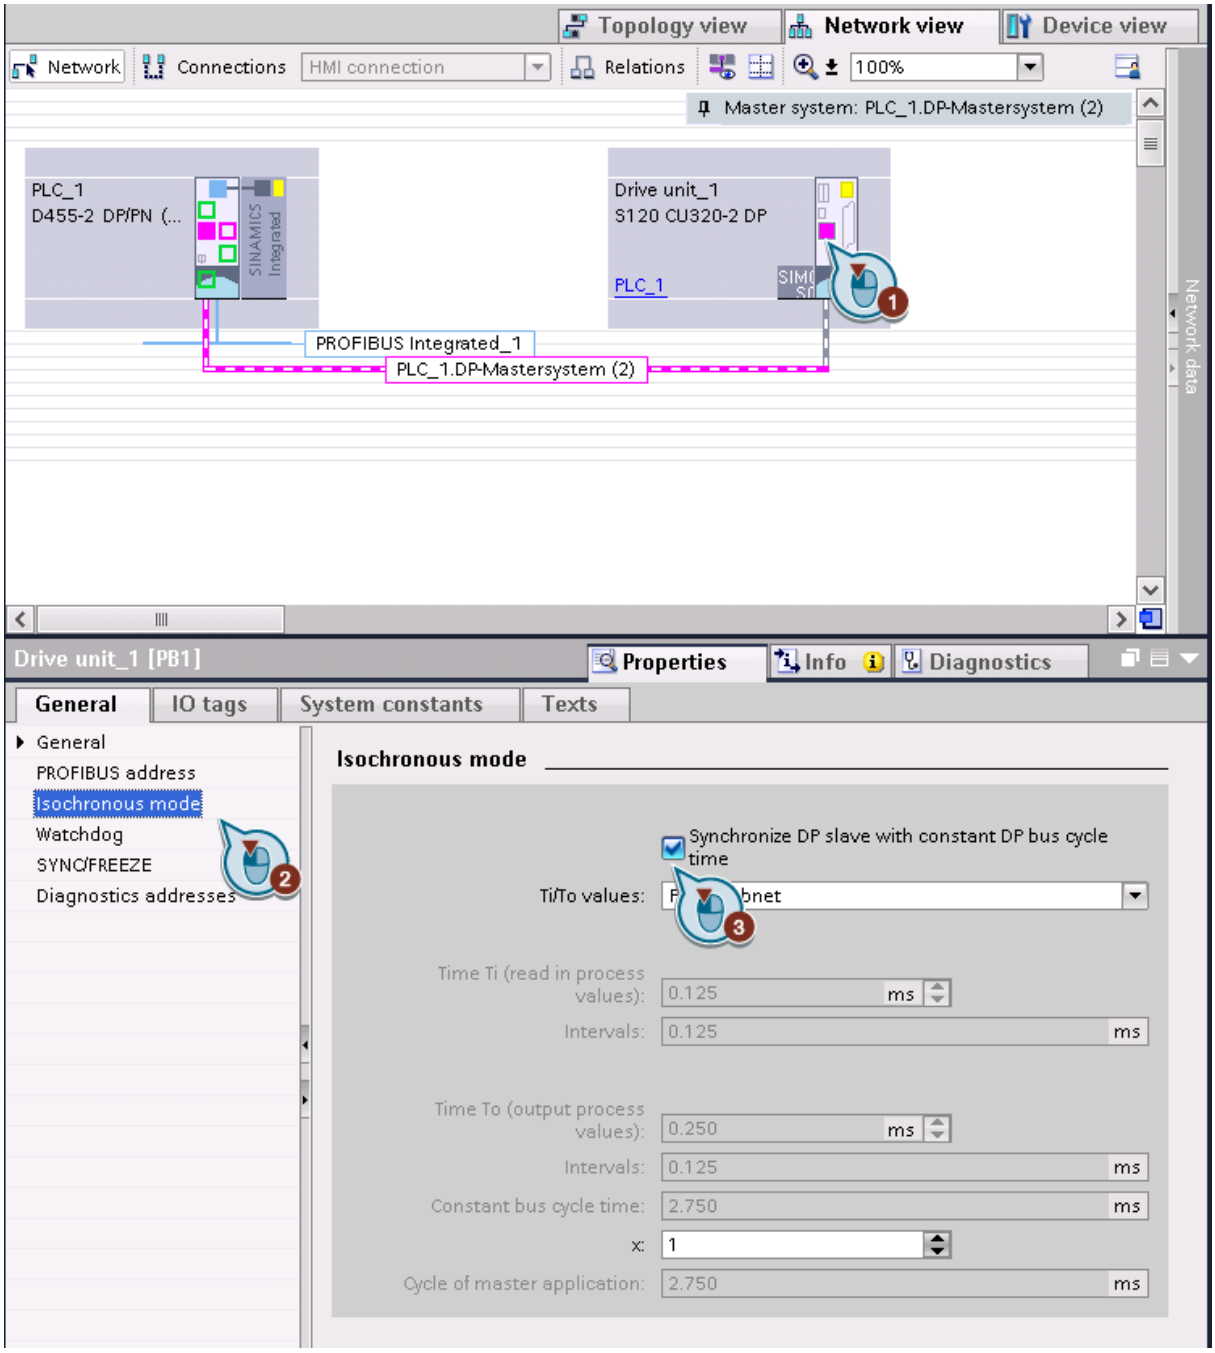

Figure 3-424 Isochronous drives on PROFIBUS DP

The following settings can be made:

Parameter	Description
Synchronize the DP slave to equidistant DP cycle	Activate this option if you want to synchronize the drive (DP slave) to the equidistant DP cycle.
Ti/To values	From the drop-down menu, select whether you want to enter the Ti/To values manually or obtain them from the subnet. The values for Ti/To are then set the same for all DP slaves.

Parameter	Description
Time Ti (read in process values)	Specifies at what time Ti before the start of the "DP cycle", the process value (actual position value) is recorded. If several drives operate as group, the same value for all axes should be entered here.
Grid	Indicates in which field the value is read.
Time To (output process values)	Specifies at what time To after the start of the "DP cycle" the controller transfers the process value (e.g. speed setpoint). If several drives operate as group, the same value for all axes should be entered here.
Grid	Indicates in which field the value is read.
Equidistant DP cycle	Displays the calculated cycle time in the equidistant PROFIBUS.
x	Factor which is multiplied by the cycle time.
Cycle of the master application	Enter the master application cycle here. The cycle describes the reduction ratio between the DP cycle and the cycle of a higher-level controller, e.g. the servo cycle of a SIMOTION controller.

Direct data exchange via PROFIBUS DP

Configuring direct data exchange between two controllers

Master-slave communication is possible between two SIMOTION controllers via PROFIBUS DP using direct data exchange.

You can find more information in the information system of the TIA Portal under "Direct data exchange."

One module is the DP master, the other module is the I slave. This makes, for example, distributed synchronous operation on two modules possible.

Procedure

To configure communication for this topology, proceed as follows:

1. Insert two SIMOTION modules in the TIA Portal.
2. Create a DP master system. Preferably, you should create the system on the module that is to be the DP master and drag the PROFIBUS DP onto the second module.
3. In the network view, select a module which is to be the master.
4. In the inspector window on the "General" tab under the interface used under operating mode, select the option "DP Master."
5. In the network view, select a module which is to be the I slave.
6. In the Inspector window on the "General" tab under the interface used, select the item "Operating mode".
7. Select the "DP Slave" option.
   The direct data exchange is automatically created and displayed under I/O communication.

8. In the "Assigned DP master" dropdown list, select the controller with the interface being used. Additional parameters are listed under "I-Slave communication":

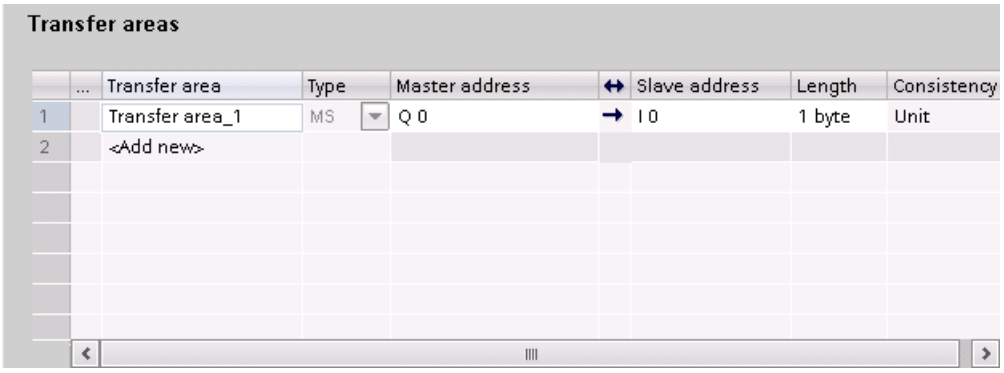

Figure 3-425 Transfer area

9. Under "Transfer areas" click "Add new". A new transfer area is created.
10. Select type "MS" (Master - Slave).
    The addresses are entered automatically.
11. In the "Transfer direction" column, click the arrow to reverse the communication direction.
    This activates data transfer from the "sender" (master) to the "receiver" (I-Slave) and vice versa.

Type of transfer areas

In the TIA Portal, different types of communication (PROFIBUS, PROFINET) can be configured. Depending on this configuration, different short codes are displayed as the transfer area type.

- PROFIBUS DP
  In master I-slave communication, "MS" is displayed as the type. For synchronous and distributed synchronism configurations that are generated automatically by SIMOTION SCOUT TIA, "M-MS" is displayed as the type. M-MS means motion control with master I-slave communication.

3.5.7 Configuring an HMI connection

3.5.7.1 Supported HMI panels

An overview of the HMI panels supported with SIMOTION SCOUT TIA can be found in the Internet at: Compatibility list (https://support.industry.siemens.com/cs/ww/en/view/18857317).

3.5.7.2 Adding an HMI

Note

You can only add an HMI device in the TIA Portal.

An HMI device can communicate with a SIMOTION device via the PROFINET, Ethernet and PROFIBUS bus systems. The SIMOTION device and the HMI operator panel can exchange information about variables for technology objects, system variables and global user variables.

Procedure

To add an HMI, proceed as follows:

1. In the network view, browse to the "Hardware Catalog" task card and open the "HMI" component.
2. Open the folder of the panel type, "SIMATIC Comfort Panel" in the example.
3. In the folder for the display size, select the installed panel, "15" Display > TP1500 Comfort" in the example.
4. Drag the HMI panel into the network view of your project.

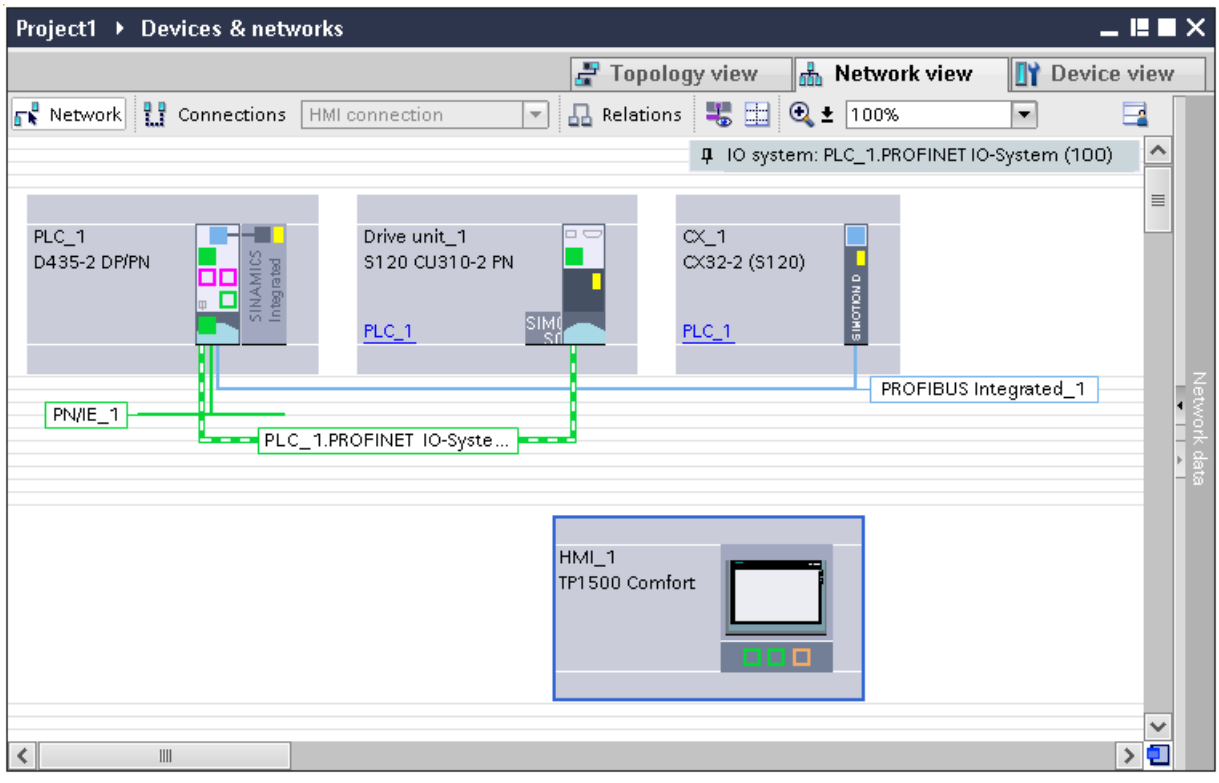

Figure 3-426 HMI in the network view

Result

The inserted HMI is visible in the project navigator.

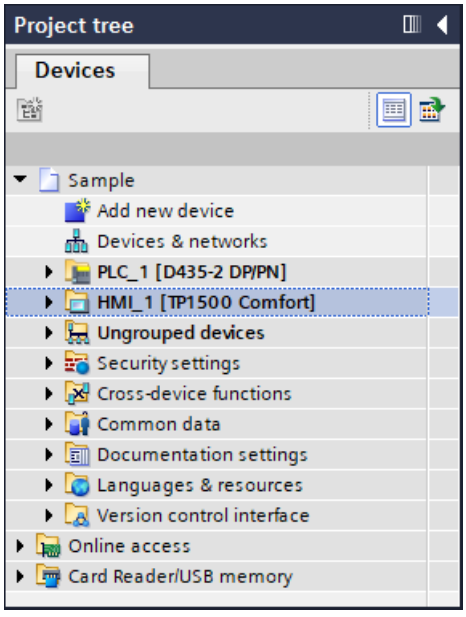

Figure 3-427 HMI in the project navigator

3.5.7.3 Synchronizing SIMOTION variables and messages

So that they can be displayed on an HMI, the variables and messages of SIMOTION SCOUT TIA must be transferred to the TIA Portal.

Procedure

To determine when the variables and messages will be transferred, proceed as follows:

1. Switch to SIMOTION SCOUT TIA.
2. Select "Options > Settings" in the menu.
3. Switch to the "WinCC" tab and select when the data is to be synchronized, e.g. "Automatically with Save and compile".
4. Save and compile your project.

Result

The variables have been transferred to the TIA Portal and can be called there in the project navigation below the SIMOTION device with the "SIMOTION variables > Show all variables" entry.

Note

SIMOTION variables

The following SIMOTION variables are visible after synchronization in the TIA Portal:

- System variables of the technology objects and of the SIMOTION device
- Configuration data of the technology objects
- Global device variables
- Global unit variables
- I/O variables

User-defined data types are also available in the TIA Portal.

The messages (user alarms and alarms of the technology objects) have been transferred to the TIA Portal and are available there for the message configuration for the HMI.

Note

SIMOTION messages

The following messages are also available in the TIA Portal after transfer and/or synchronization:

- Alarm_S messages (TIA Portal text lists are supported)
- TO alarms (separate alarm class in the TIA Portal)
- User-defined diagnostic buffer entries
- System-side diagnostic buffer entries

The display language for the entire project including message texts is set in the project navigation of the TIA Portal at "Languages & Resources".

Additional references

You will find detailed information on creating and compiling message texts in Section "Message configuration" in the SIMOTION SCOUT TIA Online Help.

See also

Using tags (Page 847)

3.5.7.4 Creating an HMI connection

To make this connection, the SIMOTION device and the HMI device must have been created in HWCN. The HMI device must support SIMOTION CPUs.

There are two ways of establishing the communications connection between the SIMOTION CPU and the HMI device:

- The communications connection is configured manually in the network view.
- The communications connection is generated automatically when a SIMOTION variable is used in an HMI image.

Configuring an HMI connection manually

To configure the HMI connection manually, proceed as follows:

1. Switch to the network view.
2. Click Connections and select "HMI connection" in the drop-down list.
   The connection option is then highlighted in color.

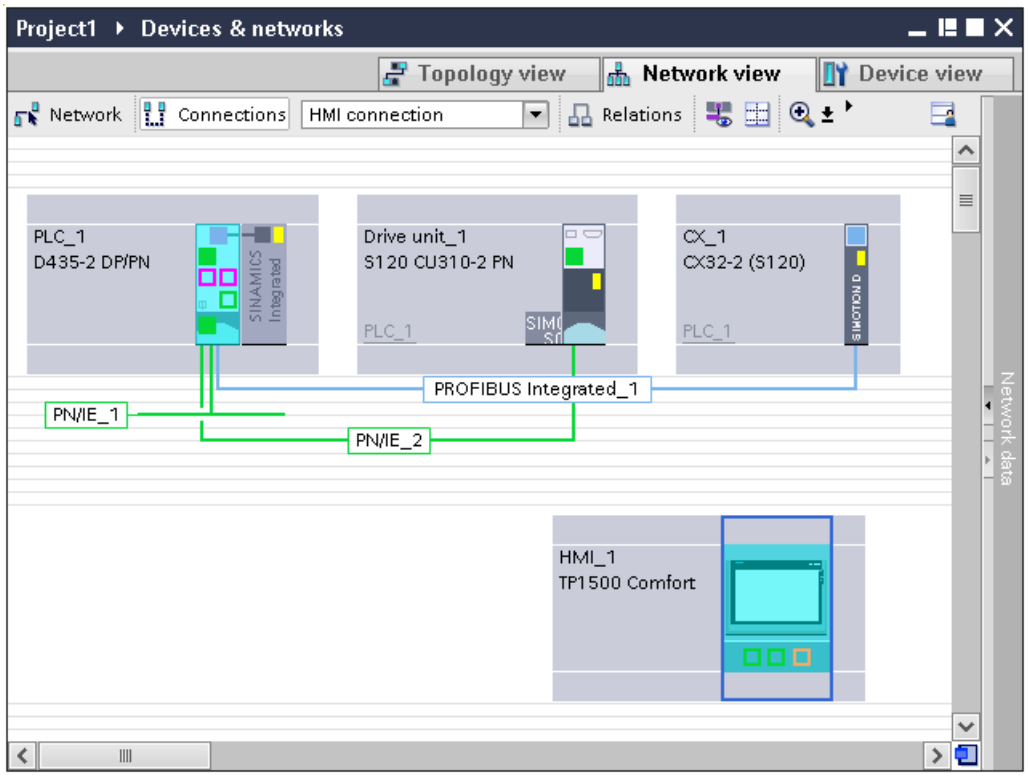

Figure 3-428 Displaying an HMI connection

3. Move a connection from the HMI device to the SIMOTION device with a drag-and-drop operation.

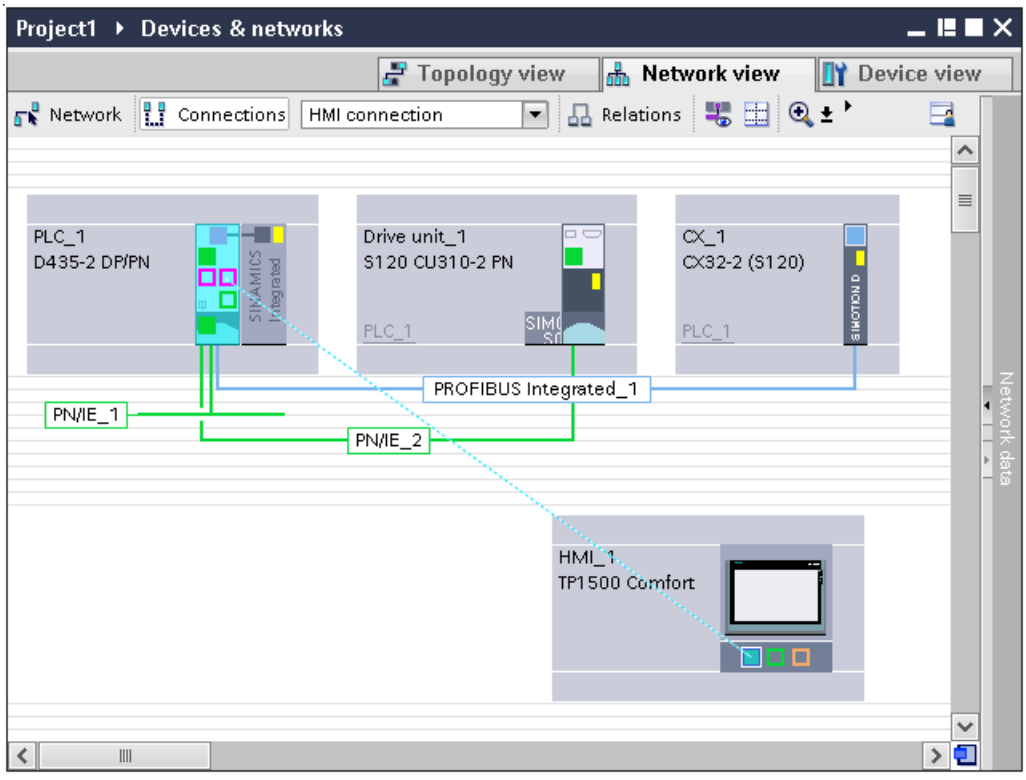

Figure 3-429 Configuring an HMI connection

The parameters of this connection are displayed in the "Properties" tab of the inspector window.

You can specify the connection subsequently here and/or create a suitable connection path to the partner via "Find connection path".

Result

The HMI connection has been established.

You can connect parameters in the "Connections" editor.

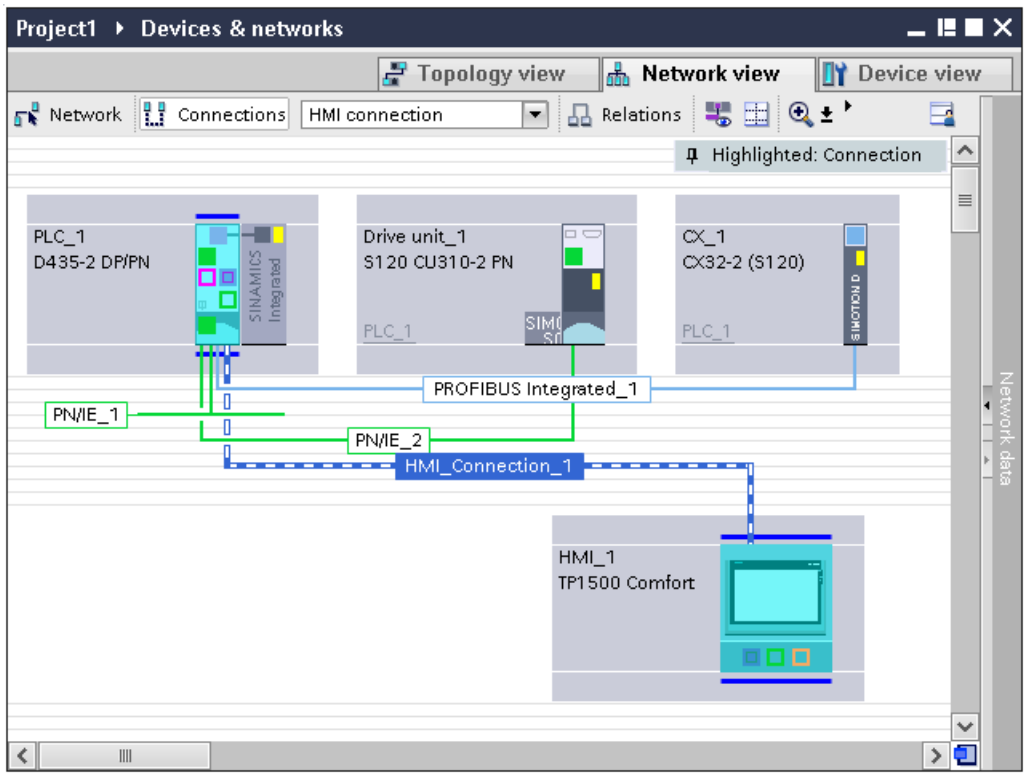

Figure 3-430 HMI connection created

Generating an HMI connection using variables

To generate the HMI connection using variables, proceed as follows:

Creating an HMI screen

1. In the TIA Portal, browse to the HMI in the project navigator.
2. Click "Images" and double-click "Insert new image".

Adding I/O fields

1. In the "Tools" window, select the desired element.

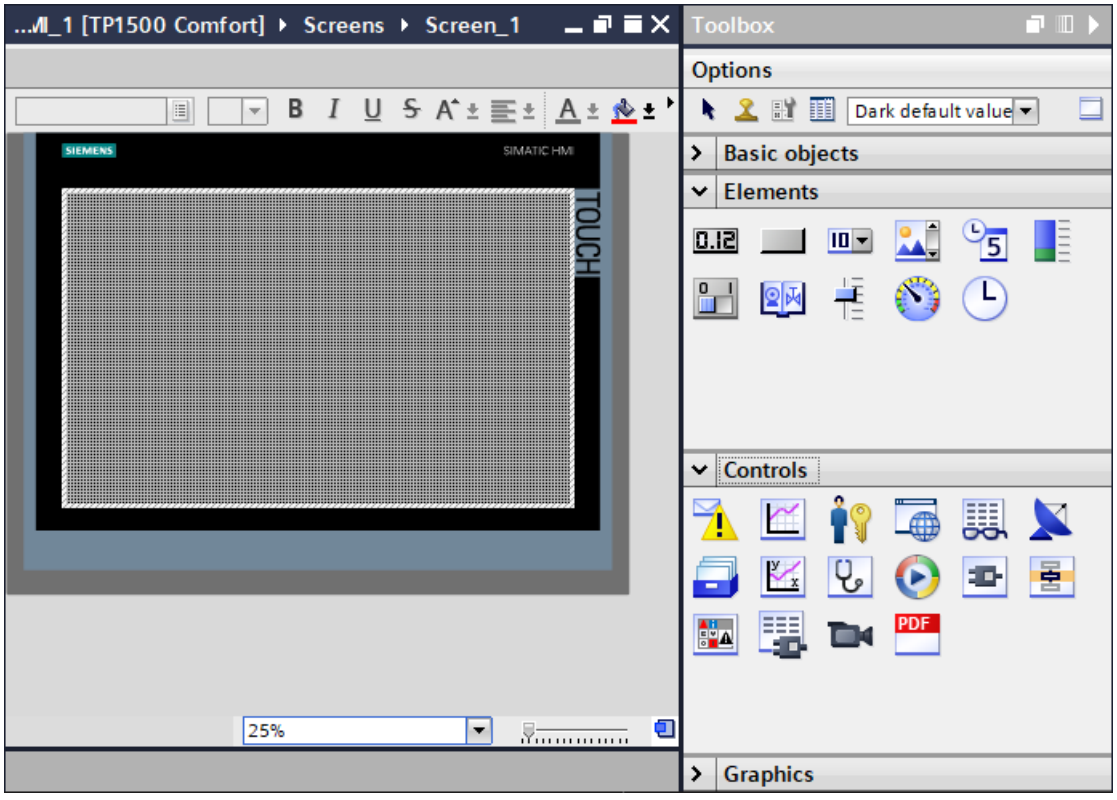

Figure 3-431 Selecting an element

2. Drag the element to the approximate position on the screen at which you want it to appear later.
3. Select the element and switch to the properties window.
4. In the navigation, select the entry "General".
   In this area, you can configure the connection of the process variables and settings to the mode and displayed format.
5. Drag the variable from the project navigator to the properties window onto the "Variables" entry.

Result

The system automatically creates an HMI variable assignment.

You can see the assignment of the connections in the network view of the device configuration.

3.5.7.5 Testing the connection

To test the created connection with the HMI device in the TIA Portal, proceed as follows:

1. Configure an alarm window on the HMI device.
   To do this, select the object "Alarm control" under "Controls".
2. Define "Alarm buffer" as display setting.
3. Compile the project.
4. Load the project to the controller and to the HMI device.
5. Switch the controller's operating mode to RUN.

Result

Buildup of the connection is displayed in the alarm window.

3.5.8 Motion Control parameterization/programming in SIMOTION SCOUT TIA

3.5.8.1 Start SIMOTION SCOUT TIA

Note

You can only start SIMOTION SCOUT TIA from the TIA Portal.

After you have created the project in the TIA Portal and you have configured the hardware and communication, start SIMOTION SCOUT TIA to configure the technology.

Procedure

You can start SIMOTION SCOUT TIA in the following ways:

In the portal view

1. Click the "Motion & Technology" function.
2. Click the "Open SIMOTION configuration" entry in the secondary navigation.

In the project view

1. Start SIMOTION SCOUT TIA via the "Project > Open SIMOTION configuration" menu.
   Or double-click the "SIMOTION configuration" menu entry below the SIMOTION device in the project navigation.

Note

Disconnecting the online connection to the TIA Portal

You should not go online simultaneously in the TIA Portal and SIMOTION SCOUT TIA.

Always disconnect the online connection in the TIA Portal before going online with SIMOTION SCOUT TIA. You need to do this so that programs can be compiled in SIMOTION SCOUT TIA.

Making basic settings

In SIMOTION SCOUT TIA, you can make various basic settings via the "Options > Settings..." menu.

To make the settings, proceed as follows:

1. In the "Options" menu, select the "Settings..." command.
   The "Settings" dialog opens.
2. Switch to the desired tab.
3. Make the settings.
4. Confirm with "OK".

Additional references

You will find detailed information on the individual tabs and settings in the SIMOTION SCOUT TIA Online Help.

3.5.8.2 Going online/offline with SIMOTION SCOUT TIA

Selecting the access point and target devices

Online access points

You have two access points for the communication of SIMOTION SCOUT TIA with controllers and drive units.

- The properties of the access point **S7ONLINE** are defined in the TIA Portal. With this access point, you go online via the interface that you have configured in the TIA Portal. The settings in SIMOTION SCOUT TIA are not used and are not effective.
  The settings for this access point are taken from the TIA Portal.

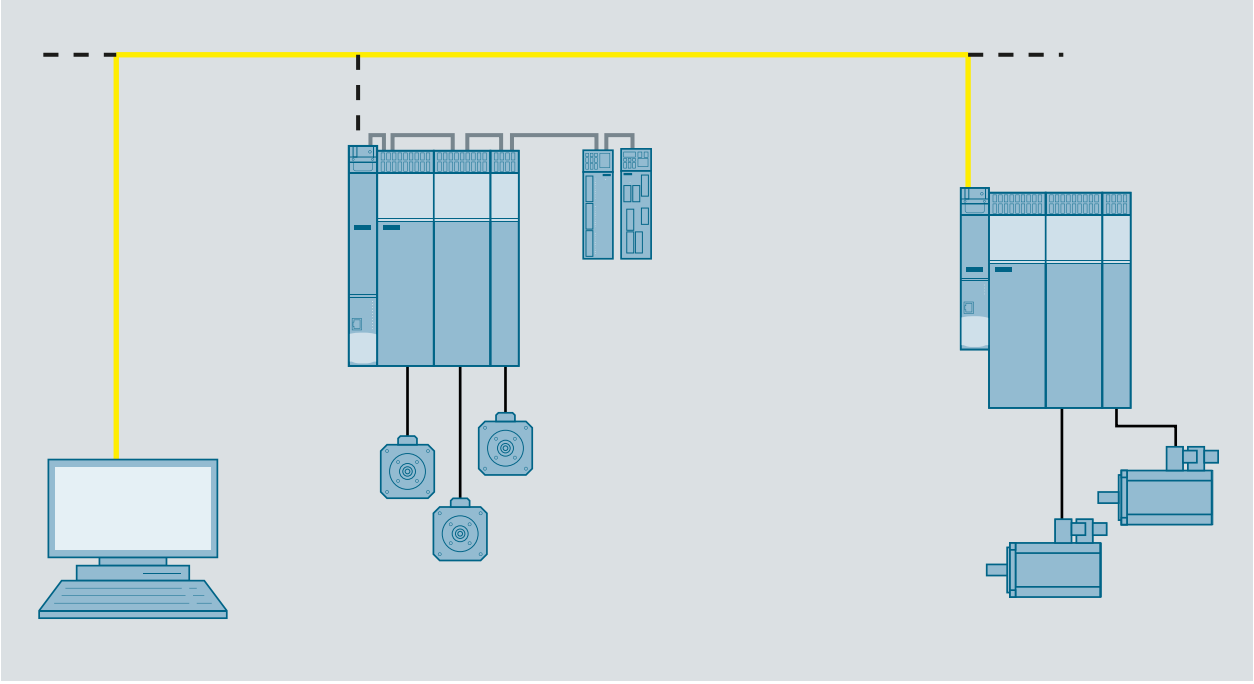

Figure 3-432 S7ONLINE

- The **DEVICE (STARTER, SCOUT)** access point provides the option of connecting SIMOTION SCOUT TIA (either in parallel or alternatively to S7ONLINE) directly to a device, e.g. via the Ethernet interface. In this way, you can communicate quickly, without changing the project settings, with the device either via the system network or via a separate connection in order, for example, to adapt the parameterization or read out the diagnostics information. The DEVICE access point does not exist in the TIA Portal. Thus, the settings for this access point can be configured only in SIMOTION SCOUT TIA.

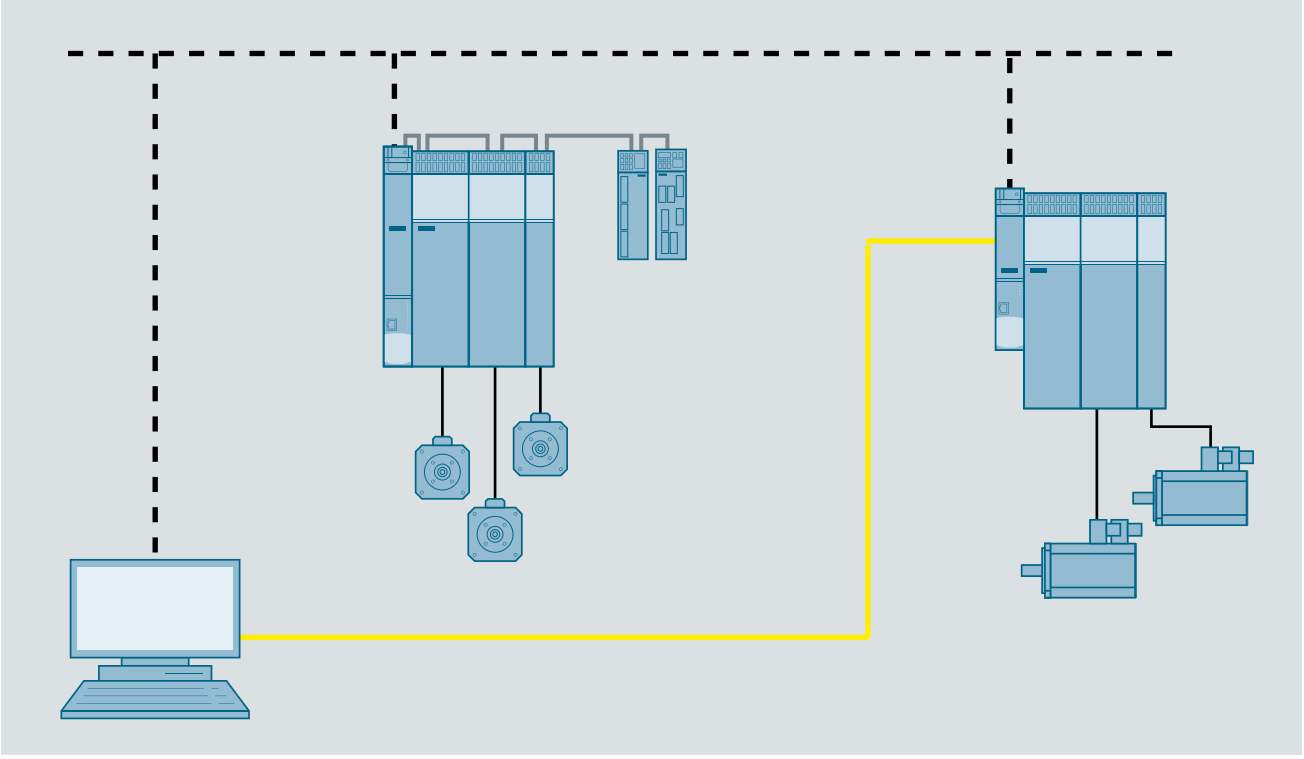

Figure 3-433 DEVICE

It is therefore possible to configure both access points for a device and to go online via these points.

See also

Select target devices (Page 805)

Available nodes

The function "Accessible nodes" in SIMOTION SCOUT TIA enables you to identify devices in a network and go online with them.

Note

The search for accessible nodes assumes that no online connection with an opened project exists.

Displaying accessible nodes

Proceed as follows to identify accessible nodes:

1. Select "Project > Accessible nodes" in the menu.
   All the devices found in the network are listed in the working area below the folder "Accessible Nodes". Type information is also displayed for the devices.

Assigning interface parameterization to an access point

To create a connection between the access point, the interface parameterization, and the interface, proceed as follows:

1. Click the "PG/PC..." button to open the "Set PG/PC Interface" dialog.
2. At "Access point of the application", select the DEVICE access point to which you assign the interface parameterization.
3. Select one of the interface parameterizations to assign it to the access point, modify its properties, copy it, or delete it.
4. Click "OK" to accept the settings.
5. In the working area, click "Update" to restart the search for accessible nodes.

Note

The settings in SIMOTION SCOUT TIA are only accepted for the access point DEVICE. The access point S7ONLINE must be configured in the TIA Portal.

Searching for accessible nodes via the IP address

With TCP/IP interface parameterization you can search for nodes via the IP address. Enter the IP address in the "IP address of the sought node:" field.

For the automatic detection of accessible nodes via a PG/PC interface with TCP/IP, the nodes must be connected to the same physical Ethernet subnet as the PG/PC. Once a device is downstream of an IP router and so located in another physical Ethernet subnet, this device will no longer be automatically detected in "Accessible nodes".

You can also enter an IP address and check whether it is possible to access a node downstream of an IP router with the configuration currently set on the Ethernet adapter located in the PG/PC (IP address / subnet mask).

Displaying additional information

To display additional information about identified devices, proceed as follows:

1. Right-click on a device or drive unit and select, for example, one of the following options from the shortcut menu:
   - "Device Diagnostics"
   - "Operating state..."
   - "Licenses"
   - "Edit Ethernet Node..."
   - "Flashing"

See also

Setting the access point on the PG/PC (Page 804)

Select target devices (Page 805)

Setting the access point on the PG/PC

Note

The data for the PG/PC interface can only be changed when the interface is not online. If several instances of SIMOTION SCOUT TIA have been started, an online connection can only be established from one of the instances. An attempt to go online simultaneously from several SIMOTION SCOUT TIA applications to different CPUs results in errors.

Using S7ONLINE

SIMOTION SCOUT TIA takes the settings for the S7ONLINE access point from the TIA Portal. At "Online accesses", select the following settings:

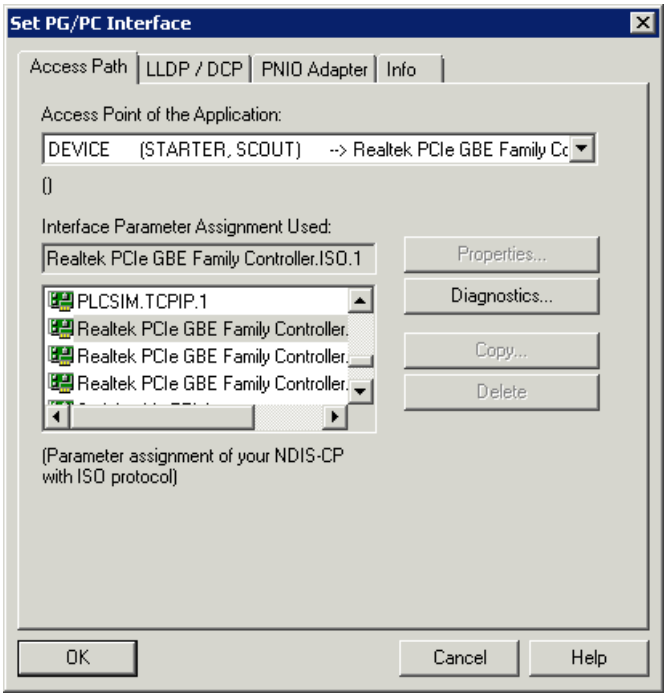
1. PG/PC interface type
2. PG/PC interface
3. Connection with interface/subnet
4. "1st gateway"
5. Device address

The settings for S7ONLINE in the "Set PG/PC Interface" dialog box are not applied.

Setting the DEVICE access point

Proceed as follows to set the DEVICE access point:

1. Select "Options > Set device access interface..." in the menu.
   The "Set PG/PC Interface" dialog box opens.
2. Select the DEVICE access point at "Access point of the application":



3. At "Interface parameterization in use", select the interface with which you want to go online via the selected access point.
4. Confirm your selection with OK.

Select target devices

With the target device selection, you specify whether an online connection to this device will be established and which access point will be used when you perform "Connect to selected target devices".

Procedure

To select a target device, proceed as follows:

1. Select "Target system -> Select target devices ..." in the menu.
   The "Target Device Selection" dialog opens.

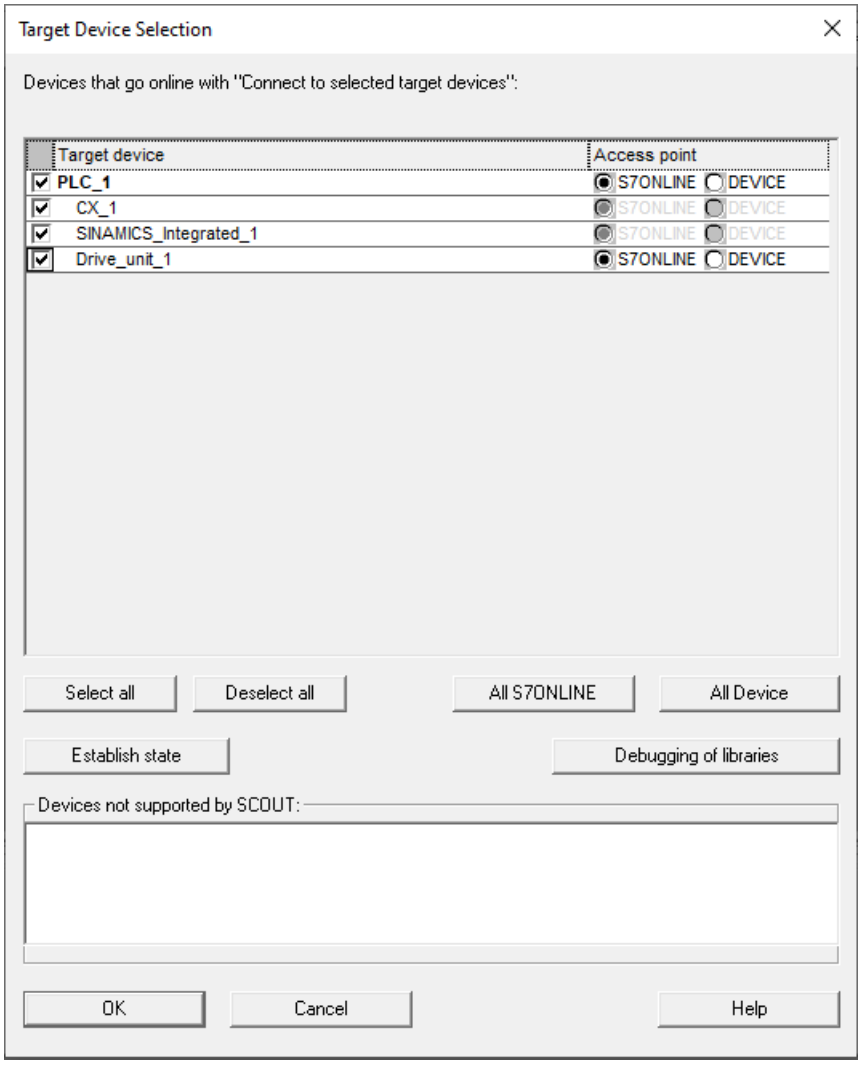


Figure 3-434 Selecting target devices and access points

2. Activate the checkbox for the respective device.
3. Click the "Establish state" button.

- Establish a connection to a device that was deselected when going online and that has been subsequently selected.
- Separate a connection to a device that was selected when going online and that has been subsequently deselected.

Save project and compile changes

Overview

Note

You can only "save a project and compile changes" in SIMOTION SCOUT TIA.

"Save project" in SIMOTION SCOUT TIA automatically performs a "Save project" in the TIA Portal.

Always cancel the online connection in the TIA Portal before you perform "Save and compile project" in SIMOTION SCOUT TIA.

To download a project to the target system, it must first be saved and compiled into an executable code. Only the compiled code can be downloaded to the target system and executed.

By default, "Save and compile" is performed automatically for a download if the appropriate option is activated under "Options > Settings..." in the "Download" tab.

Save project

With "Save project", the project is saved to the hard disk. The changes are accepted into the project. No further processes (such as compilation or consistency checking) are triggered for the project.

Procedure

To save a project, proceed as follows:

1. Select "Project > Save" in the menu.

Save project and compile changes

"Save project and compile changes" searches through the entire project for changes. If a source is found which has been changed or has no compilation results, this and any linked sources are compiled and saved (e.g. during an FB call). Therefore only the changes are compiled.

Procedure

To save and compile a project, proceed as follows:

1. Select "Project > Save and compile changes" in the menu.
   Or click the "Save project and compile changes" button in the toolbar.

The compilation run is logged in the detail view of the workbench. Information, warning and compilation errors are shown there in plain text.

Saving projects and recompiling all

With "Save and recompile all", all sources of the entire project are recompiled. The command is suitable if you are quite sure that all the old data from older versions should be removed and replaced with new compilation results. The function comprises the following steps:

- Project-wide deletion of all compilation results
- Recompilation of all objects

Procedure

To save and recompile data, proceed as follows:

1. Select the "Project > Save and recompile all" menu command.

The compilation run is logged in the detail view of the workbench. Information, warnings and compilation errors are shown there in plain text.

Check consistency

Overview

Use "Check consistency" to check the current configuration and parameterization of the project for formal errors in the data.

This allows you to determine that the programmed configuration is consistent with the defined hardware configuration.

Procedure

To check the consistency of a project, proceed as follows:

1. Select "Project > Check consistency" in the menu.

The results of the consistency check are logged in the detail view of the workbench in the "Compile/check output" tab.

Connect to selected target devices

Overview

Use the "Connect to selected target devices" function to go online with the device connected to the PG/PC. You can send and receive data.

Requirements

- You have created a subnet for the PG/PC interface in the TIA Portal.
- You have assigned the PG/PC interface to the subnet in the TIA Portal (see also Setting up the PG/PC communication (Page 661)).

- In the TIA Portal, you have loaded the hardware configuration into the SIMOTION device (see also Setting up the PG/PC communication (Page 661)).
- You have disconnected the online connection in the TIA Portal.

Establishing an online connection

To establish an online connection, proceed as follows:

1. Select "Project > Connect to selected target devices" in the menu.
   Or click the "Connect to selected target devices" button in the toolbar.
   The "Target Device Selection" dialog opens.
2. In this dialog, check the settings of the target device selection and the access points and confirm with "OK".
   Devices not selected in this dialog but still online will not be disconnected from the target system.

Establishing a selective online connection

To establish a selective online connection, proceed as follows:

1. Select a CPU or a drive in the project navigator.
2. Perform "Connect target device" in the context menu to establish a specific connection to this drive.

Result

- The connection will be established and the project checked for consistency.
- The footer area indicates that the system is online.
- The detail view shows the drives control panel.
- In the project navigator, the status of the online connection is indicated in a color by the connector icons.

Consistency display (connector icons)

Each element in the project navigator has its characteristic icon. In online mode, the icons are highlighted in color or additional icons (connector icons) are displayed which are characteristic for the PG/PC to target system connection.

The following table provides an overview of the meaning of the various icons.

Icon	Description
	The SINAMICS drive unit / element of a drive unit (DO) is in online mode. There is an inconsistency in terms of the data contents (parameter values) of the drive unit / element. SINAMICS drive unit / element of a drive unit (DO) is in online mode. There is an inconsistency in terms of the data contents (parameter values) of the drive unit / element. Possible reasons for the inconsistency: • At least one parameter value differs between the project data and the actual values in the target system. • Sequential parameterization: After a parameter assignment has been downloaded, sequential parameterization may be required once data has been received in the drive. In this case, you must perform an upload for alignment purposes. Note: • If the inconsistency is displayed by means of the icon in the project navigator, you can display the inconsistency in detail using the object comparison. Depending on the result, you can then decide whether or not an upload or download is necessary. • If this icon is displayed, it may be that, depending on the mechanism used, the parameters of a DO that are marked with this icon will be marked as "equal" in the object comparison. The object comparison is based on a direct comparison of all the values for the element and, therefore, provides the correct difference.
	The component (drive object) is in online mode. The component is physically present in the RAM of the drive unit or project data in the main memory of the PG/PC is identical with the project data of the component present in the RAM.
	The component (drive object) is not in online mode. The component is not physically present in the RAM of the drive unit or the connection to the target device is broken.

Icon	Description
	The device was not selected during the change to online mode. There is no connection to this device.
	Device/element is in online mode. There is an inconsistency between the project data of the device/element in the PG/PCs and the actual values of the device/element in the target system. • Possible reasons for the inconsistency – SIMOTION CPUs/TOs/Units: – Configuration data of a technology object changed / technology objects added – Change in a program source, in a global device variable, or in the address list – Change to the default value of a system variable • Possible reasons for the inconsistency – drive unit / DO, e.g. due to: – Change in the name of a DO – Change in the type of drive object (DO) from SERVO -> VECTOR – Selection/deselection of different function modules – Addition/removal of DDS/CDS – Addition of a DCC chart to a drive object (DO) Structural changes have been made to the DO. If this inconsistency is present, integrated online diagnostics cannot be performed on the device/element. Remedy: In the event of this inconsistency, save the project and reload the new project data to the target system. Note: If an inconsistency is displayed by means of the icon in the project navigator, you can display the inconsistency in detail using the object comparison.

No connection could be established to SINAMICS Integrated/drive units

1. Check the messages in the output window.
2. Perform a project download to load the project data to the device and establish a connection. Select "Project > Download to target system" in the menu.

You will find more information in Section Loading data to the target system (Page 814).

Note

You must make sure that you go online via the selected interfaces. If, for example, you have configured the incorrect interface for the S7ONLINE access point, you will not go online. Therefore, if required, check the settings made there.

Additional references

You will find more information in Section "Set interface" of the SIMOTION SCOUT TIA Online Help.

Problems when going online

Not possible to connect to target system

If you cannot go offline with the project despite proceeding as described above, check the following settings:

- Network connections (TIA Portal)
- PG/PC interface access point S7ONLINE (TIA Portal)
- Access point Device (SIMOTION SCOUT TIA)
- Bus address of the devices or IP address (TIA Portal)
- Firmware version of the device (SIMOTION SCOUT TIA)

Subsequently we describe the procedures that are particularly easy to implement.

You have the choice of communicating with the controller via PROFINET/Ethernet or PROFIBUS. These options also provide maximum flexibility in the choice of a teleservice connection (teleservice via PROFINET/Ethernet or PROFIBUS). This access method, which is specified once, enables you to use routing to access other controllers and drives connected to the SIMOTION controller via PROFINET/Ethernet or PROFIBUS.

You can also access the SIMOTION controller via existing routing connections to other controllers, without there being a direct connection between the PG and the SIMOTION controller.

However, these options require that an online access is specified during the initial commissioning. This description explains the procedure for the initial commissioning (or when changing the access settings). When this configuration has been performed correctly and completed, going online then is practically only at the touch of a button.

Only procedures that always and safely result in success are described here. Depending on the initial situation, a different procedure is also possible with sufficient knowledge.

PG/PC interface (access point S7ONLINE) configured in the TIA Portal?

Were you online with the TIA Portal and have you configured the PG/PC interface?

Before you can go online with the SIMOTION SCOUT TIA, you must configure the interface on which you want to go online. Perform this step in the TIA Portal.

Possible sources of error include:

- You are still online with the TIA Portal. Disconnect the online connection.
- You have not assigned the controller to any subnet. Instructions for assigning the controller to a subnet are described in the SCOUT TIA Online help in the TIA Portal.
- IP address and subnet screen of the PG/PC and the controller are not on the same subnet. Adapt the IP address / subnet of the PG/PC in the Windows Control Panel or automatically assign a temporary IP address via the TIA Portal. Associated information is contained in the SCOUT TIA online help in the TIA Portal.
- In the TIA Portal, check with which interface you attempt to go online at "Online & diagnostics".

Before going online with the controller, you must clarify the following questions:

Is the project to be loaded (or consistent project) already on the controller and have no changes been made to the interface settings?

In this case, activate the interface configured in the project and go online in SIMOTION SCOUT TIA using the  button, "Connect to selected target devices". The devices to which a connection is established can be seen under "Target system > Select target devices...".

Have the interface settings been changed?

When do changes have to be made to the interface settings?

- An overall reset has been performed on the controller (MRES).
- The controller has been replaced.
- The project is to be loaded to a new (or unknown) controller.
- Interface settings have been changed in the project (different PROFIBUS baud rate selected; access addresses changed).

Requirement: You have a completed HW configuration and a project that can be downloaded.

Do I require an online connection to all devices/components present in the project?

In online operation, SIMOTION SCOUT TIA tries to perform online operation with all hardware components contained in the project. This means that the time needed for going online increases. We recommend that you make settings for SIMOTION SCOUT TIA so that online operation is made only with those components currently needed. The setting can be found with "Target system > Select target devices..." in the menu. The selection and deselection of the devices in the online state can be made from the "Online connection" context menu on the device.

This procedure is also advantageous for SIMOTION D when configuration of the SINAMICS Integrated is complete. Without completely going offline with all hardware components, the connection may simply be deselected on the object SINAMICS_Integrated via the context menu.

See also

Setting up the PG/PC communication (Page 661)

Troubleshooting

If you still cannot go online with the project despite proceeding as described above, check the settings of CX32-2.

To be able to go online on a CX32-2, at least the hardware configuration (HWCN) must be loaded to the D4x5-2 and the CX32-2 connected without errors via the configured DRIVE-CLiQ ports on the D4x5-2.

Online access to the drives is not possible if HWCN is not loaded at the time you initially connect to the target system.

Loading data to the target system

Overview

Note

Loading data to the target system can only be done in SIMOTION SCOUT TIA.

You have to download the project data that you have created with SIMOTION SCOUT TIA to the target system.

The target system can contain several CPUs, e.g. SIMOTION controllers or drives. The project data contains the programs (e.g. MCC) that you have created and compiled, the hardware configuration and the technology packages that you have created and parameterized.

You must download a project to the target system if you have made the following changes:

- You have created or changed programs.
- You have changed definitions of global variables or symbolic I/O variables.
- You have made changes in the execution system.
- You have inserted or changed technology objects.
- In the TIA Portal, you have loaded the hardware configuration of a SIMOTION controller with the "Upload device as new station (hardware and software)..." function into a project.

Requirements

The following conditions must be met before the project can be downloaded to the target system:

- All ports (cables) must be plugged in and the interfaces configured
- All source codes are compiled without errors.
- The project is consistent.
- SIMOTION SCOUT TIA is in online mode.

Responses in the event of an error

The download is canceled in response to a fault: Information can be found in the "Target system output" tab.

Download variants

You can either load the entire project to the target system or perform a download for a specific device:

- Download a project to the target system (all target devices)
- Download CPU / drive unit to target device
- Download a program subset and single units (sources) to the target device

Additional references

You will find detailed information on downloading in the SIMOTION Runtime Basic Functions Function Manual and in the SIMOTION SCOUT TIA Online Help at "Downloading data to the target device".

See also

Load project to the target system (Page 815)

Load CPU / drive unit to target device (Page 817)

Downloading a program subset and single units (sources) to the target device (Page 819)

Load project to the target system

Note

You can only perform a project download in the STOP operating state and for all target devices with which you are ONLINE.

Procedure

To load a project to the target system, proceed as follows:

1. Select "Project -> Download to target system" in the menu or click the "Download project to target system" button in the toolbar.
   The "Download to Target System" dialog opens.

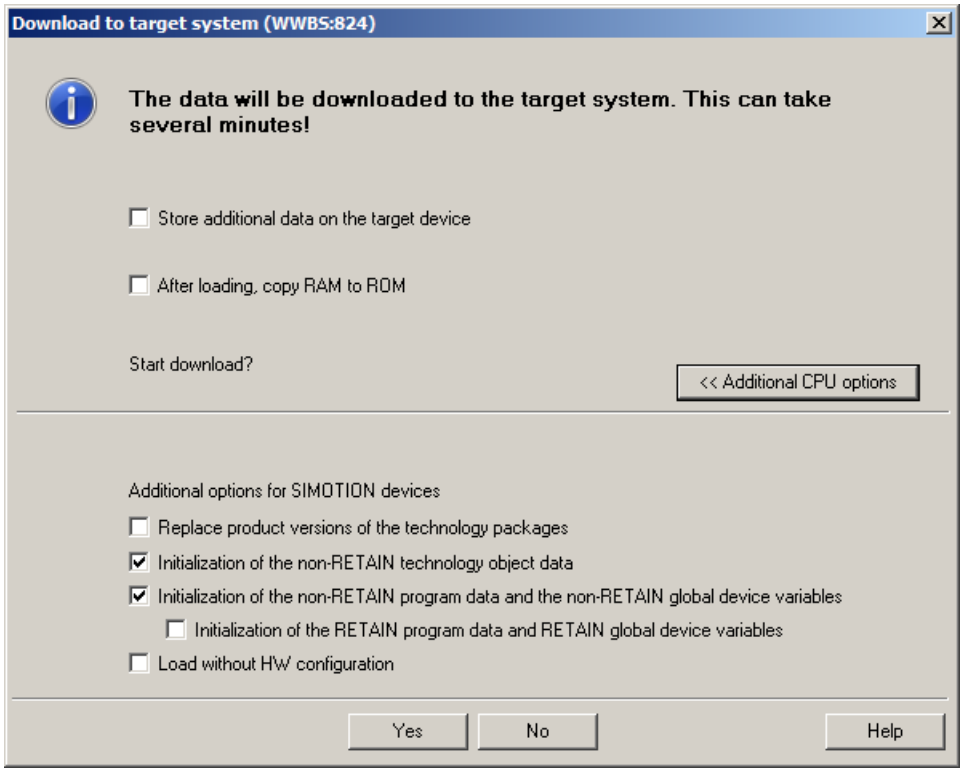

Figure 3-435 Download to target system

   Optionally activate the following options, depending on the device:

   – Store additional data on the target device
   – Copy RAM to ROM after download

2. Click the "Additional CPU options" button to display the following options:
   – "Replace product versions of the technology packages"; this loads the technology packages selected in the "Select Technology Packages" dialog to the target system.
   – "Initialization of the non-RETAIN technology object data"; only non-RETAIN data can be initialized for TOs. This does not affect the program data (variable values).
   – "Initialization of the non-RETAIN program data and the non-RETAIN global device variables"
     The "RETAIN program data and the RETAIN global device variables" can also be initialized. This does not affect the technology object data. The global device variables are initialized together with the settings for the program data (variable values) - only works in STOP mode.
   – Load without HW configuration

3. Select additional options when required.
4. Click "Yes" to start the download.

Note

Global download settings

You make the global presetting in SIMOTION SCOUT TIA under "Options > Settings... > Download".

Note

Default names in the station manager and offline project for SIMOTION P

Note that the default names in SIMOTION SCOUT in the station manager and the offline project must match.

If you have performed a download from SIMOTION SCOUT TIA and then want to start a download from SIMOTION SCOUT, make sure that the default names in the station manager and the offline project match.

Result

The project data has been loaded to the target device and an online connection established.

If the connection was successful, the connector icons are highlighted in green.

Load CPU / drive unit to target device

In addition to a project download, you can also selectively load data to each CPU / drive unit. The standard procedure is the download in STOP operating state. However, under certain circumstances you can also perform a download in RUN operating state.

Procedure

Proceed as follows to load selective data to a CPU / drive unit:

1. First select the device to which you want to load the data in the project navigator. The device must be online.
2. Click the "Download CPU / drive unit to target device" button.
   Or right-click the device in the project navigator and select "Target device > Download..." in the context menu.
   The "Download" dialog opens. The contents depend on the device for which you want to download data.

Loading the CPU to the target device

A download can be performed for the entire CPU (without drive unit) but also separately for individual related download units.

- Download CPU without drive unit
- Download all technology objects of the CPU
- Download all programs of the CPU

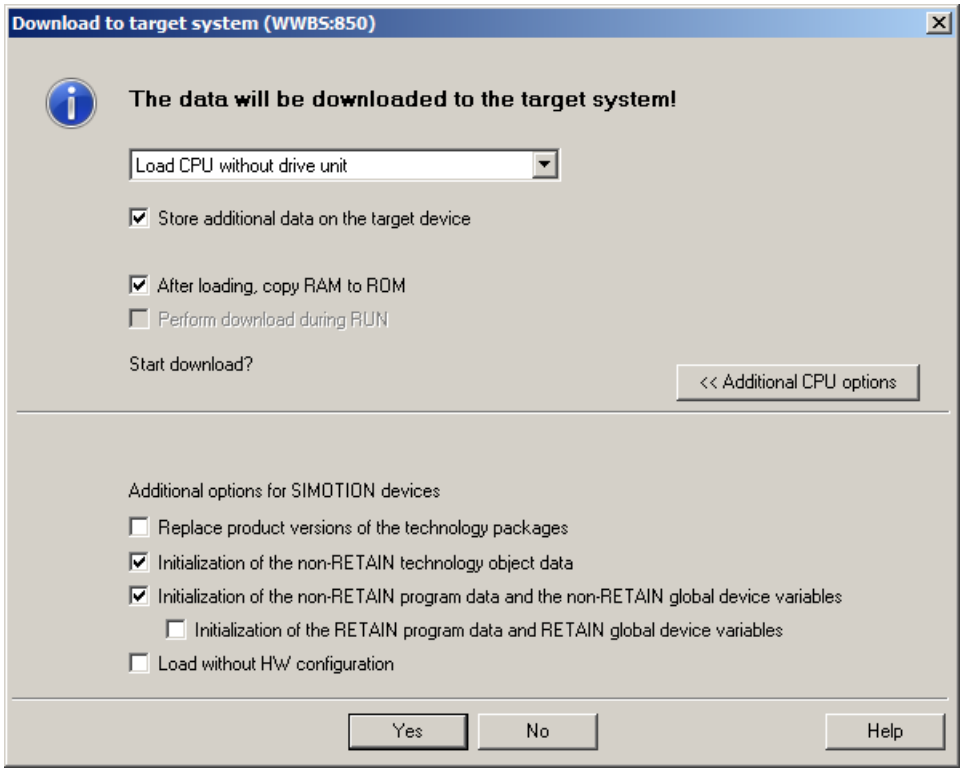

Figure 3-436 Download to CPU / drive unit

You can select the following options:

- "Store additional data on the target device"; you can use this option to store additional data, e.g. program sources, on the target device.
- "After loading, copy RAM to ROM"
- "Perform download during RUN"; enables a download to be performed in RUN operating state.

Click "Additional CPU options" to display the following options:

- "Replace product versions of the technology packages"
- "Initialization of the non-RETAIN technology object data"
- "Initialization of the non-RETAIN program data and the non-RETAIN global device variables"
- "Load without HW configuration"

Downloading the drive to the target device

For drives, you can only download the drive data (parameterization, etc.) to the drive unit.

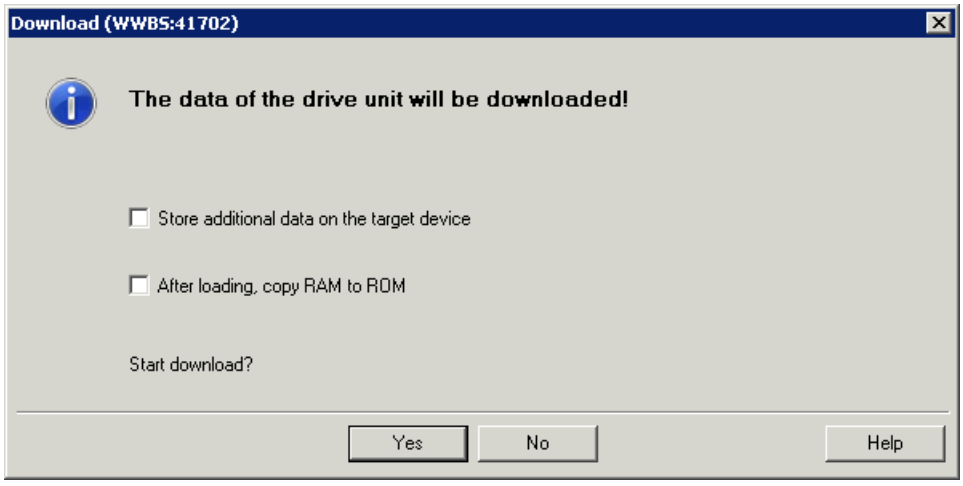

Figure 3-437 Download to drive unit

By default, the download is performed in STOP. After a successful download, the CPU can be restored to its previous state.

You can select the following options:

- "Store additional data on the target device"; you can use this option to store additional data, e.g. program sources, on the target device.
- "After loading, copy RAM to ROM"; copies RAM to ROM to the selected device once the download is complete.

Additional references

You will find detailed information on downloading in the SIMOTION Runtime Basic Functions Function Manual and in the SIMOTION SCOUT TIA Online Help at "Downloading data to the target device".

Downloading a program subset and single units (sources) to the target device

Download of selected units

You can load single or multiple units to the SIMOTION device in the RUN and STOP operating states and in this way specifically load only a selected subset of programs.

This enables, for example, two users who are connected online to the target device at the same time with SIMOTION SCOUT TIA to download separate program subsets independently.

To load selected units to the target device, proceed as follows:

1. In the project navigator, right-click the unit and select the "Download" command in the context menu.

Additional references

You will find detailed information on downloading in the SIMOTION Runtime Basic Functions Function Manual and in the SIMOTION SCOUT TIA Online Help at "Downloading data to the target device".

Loading data from the target device

Load to PG

With Load to PG, the SIMOTION SCOUT TIA data is loaded from the target device to the PG/PC. In this way, SIMOTION SCOUT TIA data can be loaded from the target device to the existing SIMOTION SCOUT TIA offline project on the PG/PC.

Load the CPU / drive unit to the PG

- Select this option if you want to load all the project data from the target device to the PG. Note the information in the dialog.
- Select the "Save before loading to PG" option if you want to save the project on your PG before loading.
- Select the "Overwrite available libraries" option if you want to overwrite the libraries of the project available locally on your PG.

Only load configuration data to PG

- Select the "Only load configuration data to PG" option if you want to load the current configuration data present in the target device to the PG.

Transfer current data to RAM

If you want to load the current data present in the current data memory of the target device to the RAM before Load to PG, activate the "Transfer current data to RAM" option. If you do not transfer the current data to the RAM, it is not loaded to the PG.

When "Load to PG" is executed, adapted values for configuration are detected and "Transfer current data to RAM" is also automatically preselected.

Load to PG via project comparison (object granular)

With the project comparison functionality, you can also load the data for individual objects to the PG.

Additional references

You will find detailed information in Section "Loading data from the target device" of the SIMOTION SCOUT TIA Online Help.

Detailed information on the project comparison can be found in the SIMOTION SCOUT TIA Online Help and in the SIMOTION Project Comparison Function Manual.

See also

Device upload (Page 947)

Load to file system

Select "Edit > Load to file system..." to save data for a device to a memory card/CF card directly via a card adapter on the PC. Alternatively, the device data can also be saved locally on a hard disk in order to copy it to a memory card / CF card at a later point in time. First delete the USER directory on the card as otherwise inconsistencies can occur. The directory structure of the versions of the hard disk and CF card may not be the same and data will not be overwritten.

Note

Kernel version and device type

A project is always created for exactly one kernel version and one device type and will only run on the relevant SIMOTION device if this exact kernel version and this device type are available. If this is not the case, the SIMOTION device remains in the STOP operating state.

Note

Saving only possible in offline mode

To be able to load data into the file system, SIMOTION SCOUT TIA must be in OFFLINE mode and the device must be selected in the project navigator.
When the project data is saved, an executable project results.

Additional references

Detailed information can be found in the SIMOTION SCOUT TIA Online Help.

Disconnect from target system

Use "Disconnect from target system" to switch to offline mode. The device is disconnected from the PC/PG.

Disconnecting from the target system

To disconnect the connection to the target system, proceed as follows:

1. Select "Project > Disconnect from target system".
   Or click the "Disconnect from target system" button in the toolbar.

Result

The connection is interrupted and SIMOTION SCOUT TIA goes into offline mode.

Disconnecting a device

To disconnect a device selectively, proceed as follows:

1. In the project navigator, select the drive that you want to disconnect.
2. Select "Disconnect target device" in the context menu.

Result

The drive goes offline.

If this is the last drive that was online, SIMOTION SCOUT TIA goes into offline mode.

3.5.8.3 Selecting technology packages

The technology packages (e.g. TP CAM, TP PATH) for SIMOTION are available for installation in various versions.

You can only use the functions of the technology objects selected if the technology objects are available in the target system.

You can select the technology packages and their versions (as well as the service packs and hotfix versions) for each SIMOTION device.

In the "Select Technology Packages" dialog, you can adopt a more selective approach when choosing the technology packages you want to use. To open this window,

Procedure

To select technology packages, proceed as follows:

1. Select a SIMOTION device in the project navigator.
2. Select "Select technology packages..." in the context menu.
   The "Select Technology Packages" dialog opens.

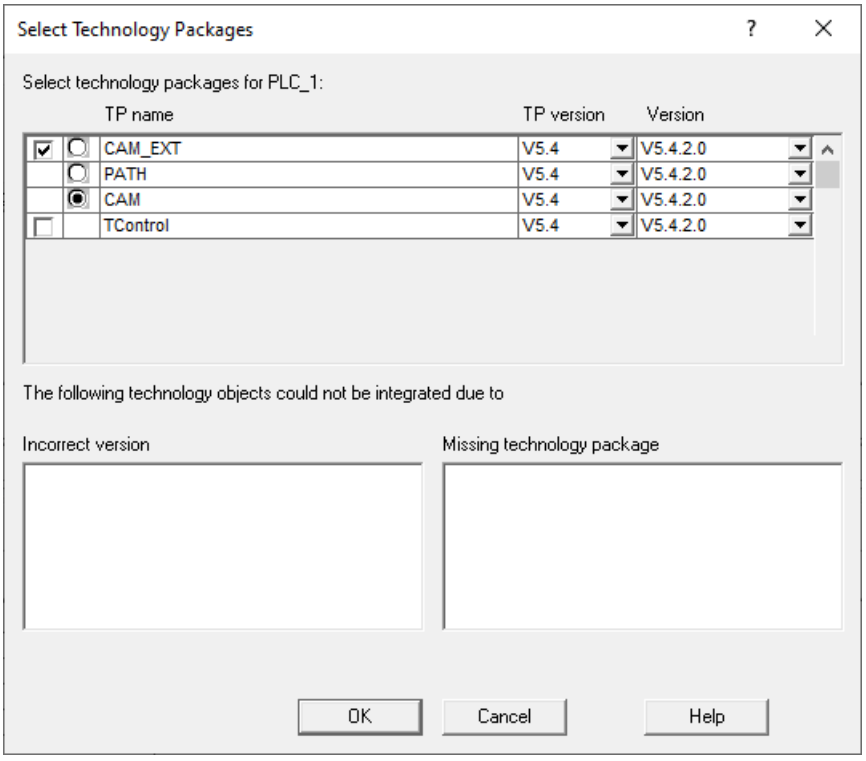

Figure 3-438 Selecting technology packages

3. Select the technology package, version and product version.
4. Confirm with "OK".

Note

Device diagnostics can provide information on which technology package product version has been loaded to a CPU.

Loading technology packages to the target device

Technology packages are only loaded to the target device if no technology package has been loaded previously. If a technology package version changes, the technology package must be explicitly reloaded to the target device.

To download a changed technology package to the target system, proceed as follows:

1. In the "Project" menu, select the "Download to target system" command.
   The "Download to Target System" dialog opens.
2. Click the "Additional CPU options" button.
3. Activate the "Replace product versions of the technology packages" option.
4. Confirm with "OK".

Additional references

You will find detailed information on downloading in the SIMOTION Runtime Basic Functions Function Manual and in the SIMOTION SCOUT TIA Online Help at "Downloading data to the target device".

3.5.8.4 Commissioning the drives

Overview

Note

Creating a SIMOTION drive

You configure a SIMOTION drive in SIMOTION SCOUT TIA. A SIMOTION drive in the current version of SIMOTION SCOUT TIA is a drive of the SINAMICS S120 type (interconnection via PROFINET or PROFIBUS) interconnected with a SIMOTION CPU. You will find the SIMOTION drives you can insert explicitly in Section Supported devices (Page 584). These SIMOTION drives can be configured and parameterized only under these conditions (interconnection with SIMOTION CPU).

You can configure the drive both in offline and online modes.

After configuring the drive, you can test the drive with the drive control panel.

Configure drives online

Requirements:

- You have created a drive in the project.
- The project has been downloaded to the target system.
- SIMOTION SCOUT TIA is in online mode.
- The drive is not being used by a current project (TO axis linked to this drive) in the RUN state.

Procedure

To configure drives automatically, proceed as follows:

1. In the project navigator, navigate to the SINAMICS drive and double-click "Automatic configuration".

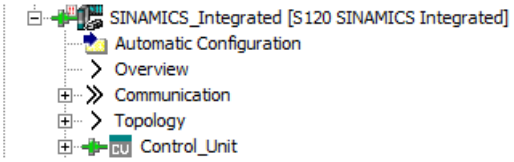

Figure 3-439 Starting automatic configuration

The "Configuration" dialog opens.

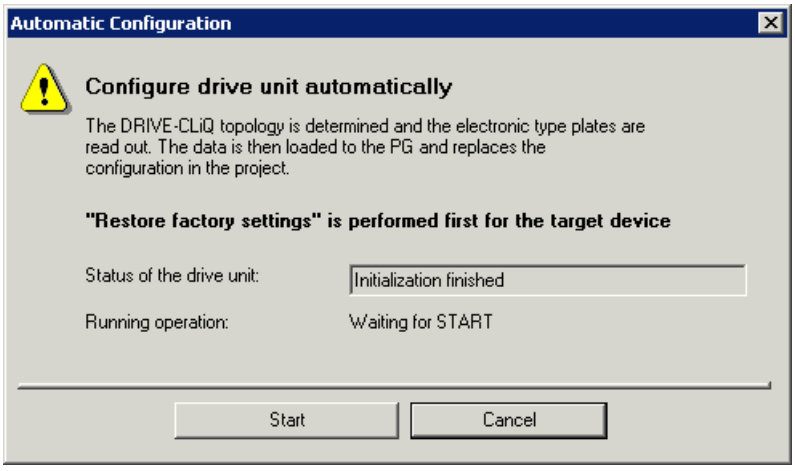

Figure 3-440 "Automatic Configuration" dialog

2. Click the "Start" button and reset the device configuration in the following "Restore Factory Settings" dialog.
   The confirmation prompt appears if the drive unit is not in the "First commissioning" state.

3. In the "Automatic Commissioning" dialog, you can specify whether you are using a drive object of the type "servo" or "vector". Confirm your selection with "Create". Automatic configuration is started.

   Note

   Firmware update

   If the firmware version on the DRIVE-CLiQ components is different to that on the CF card, a firmware update is performed automatically at this position.

   In this case, proceed as follows:

   - Wait for the procedure to finish. This can take several minutes.
   - Go offline.
   - Switch the power supply to the SIMOTION device off and on again.

   As soon as automatic commissioning has finished, SIMOTION SCOUT TIA carries out an upload. With this upload, the configuration data of the component is uploaded to the SIMOTION SCOUT TIA project.

4. Close automatic configuration and select "Stay ONLINE" to test the drive with the drive control panel.

Result

The drive is displayed in the "Drives" folder in the project navigator.

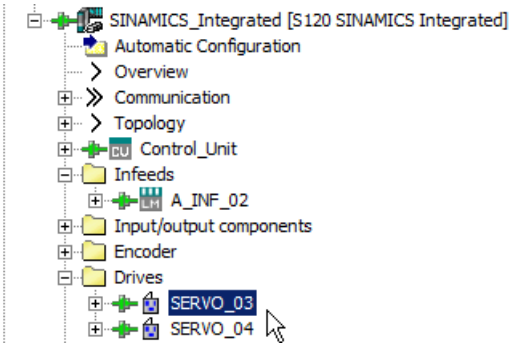

Figure 3-441 Drives inserted

Infeed

- If an infeed with DRIVE-CLiQ connection has already been created, the ready signal of the infeed (r0863.0) is automatically interconnected with "Infeed operation, p0864" of the drive when drives are inserted (only applies to drives that are attached to the same drive unit as the infeed).
- If you are using an infeed without a DRIVE-CLiQ interface, e.g. a Smart Line Module, you must wire the ready signal of the infeed via terminals, see Section Configuring the infeed (Page 831).

Configure a drive offline

The drive is configured in offline mode in two steps:

1. Insert a drive into the project.
2. Configure the drive with the Wizard.

Procedure

To insert a drive, proceed as follows:

1. In the project navigator, navigate to the drive unit and double-click "Configure drive unit".

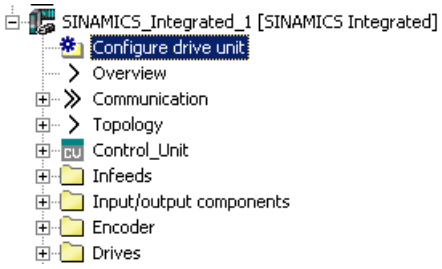

Figure 3-442 Configuring a drive unit

The "Configuration - Option Module" dialog opens.

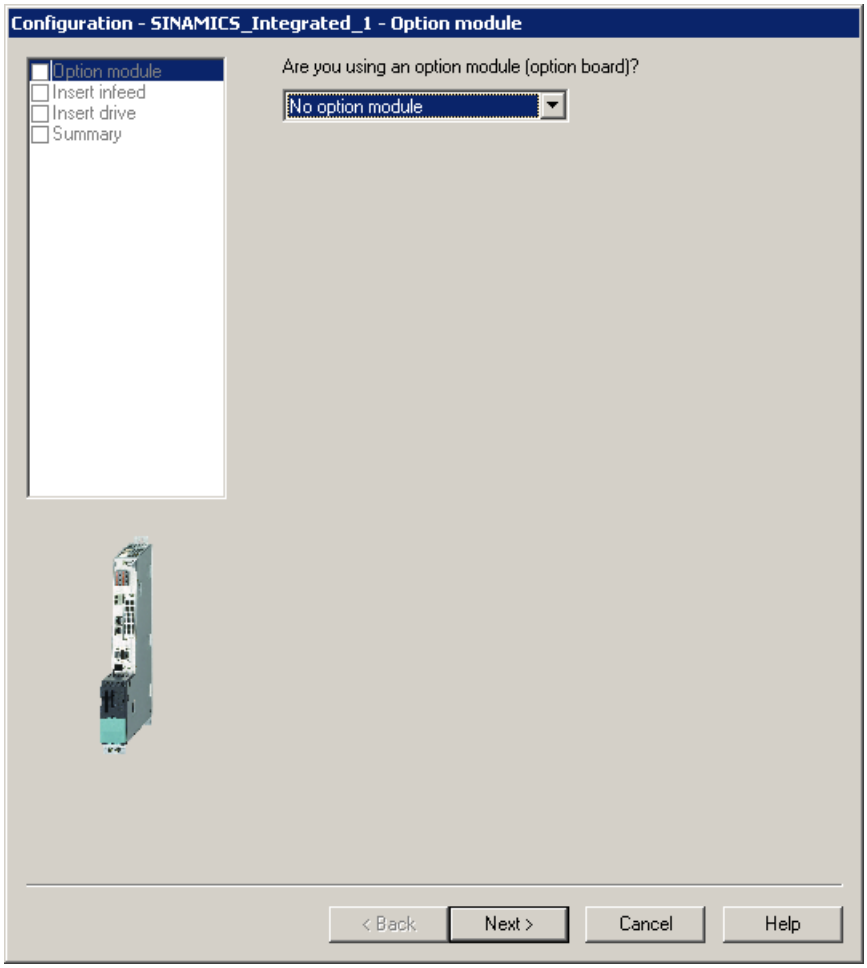

Figure 3-443 Option module configuration

2. Select the option module used at "Option module" when required. Confirm with "Next>".

3. At "Insert infeed", select whether you want to use an infeed with or without DRIVE CLiQ interface.
   - If you are using an infeed with DRIVE-CLiQ interface, the ready signal of the infeed is interconnected automatically.
   - If you are using an infeed without a DRIVE-CLiQ interface, e.g. a Smart Line Module, you must wire the ready signal of the infeed via terminals, see Section Configuring the infeed (Page 831).
4. At "Insert drive," confirm with "YES" that you would like to create a drive. Click "Continue>". The "Configuration - Drive Properties" dialog opens.

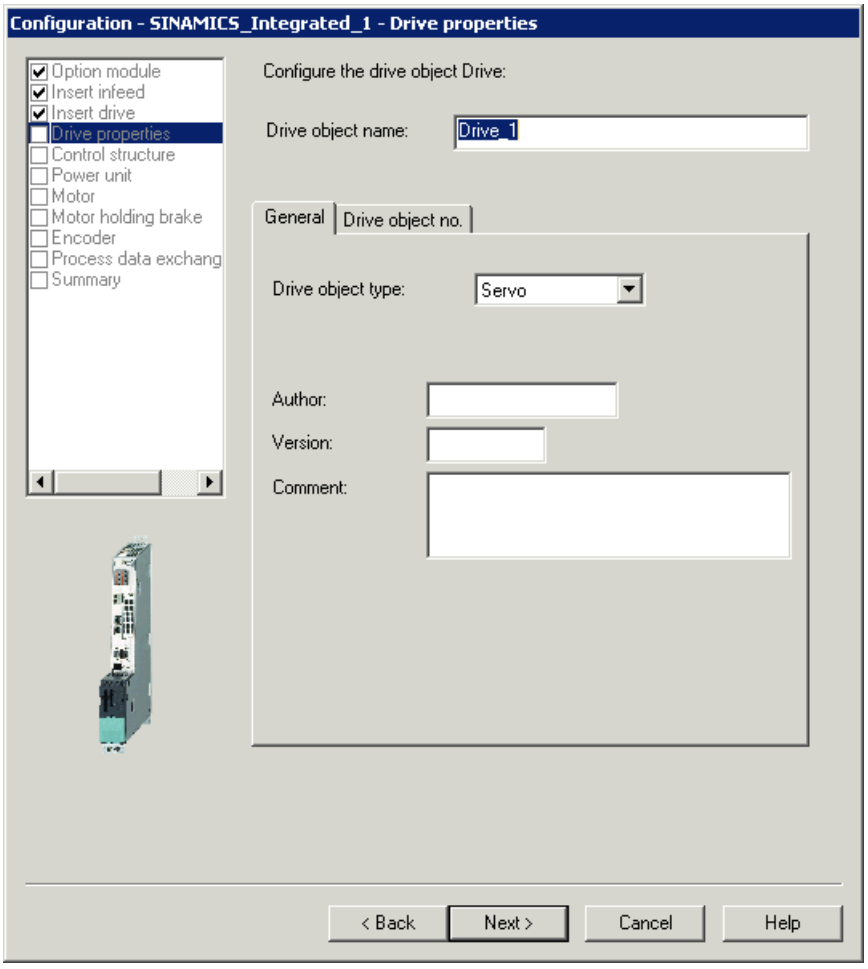

Figure 3-444 Configuring drive properties

5. Assign a name for the drive. Optionally, you can enter Author, Version, and Comment.
6. Confirm with "Next>".
7. At "Control structure", specify the control mode and the function modules depending on the operating mode (servo or vector). Confirm with "Next>".
8. At "Power unit", select the required power unit. Further narrow down your selection of possible power units by using the prescribed filter criteria supply voltage, cooling method, type. Confirm with "Next>".

9. If you are using an infeed without a DRIVE-CLiQ interface, you must manually interconnect the ready signal of the infeed in the next step "Power unit BICO". In the example, parameter p0864 is set to 1 (high) to simplify matters.
   From the perspective of the drive, the infeed is thus always ready, regardless of its actual state of readiness.
10. At "Motor", define the motor for the SINAMICS drive. Confirm with "Next>".
11. At "Motor holding brake", you can configure the motor holding brake of the selected motor. Depending on the motor, different parameters are displayed. Confirm with "Next>".
12. At "Encoder", specify the encoder that you want to use. This step is skipped if you selected speed control without encoder as the control type. Confirm with "Next>".
13. Adopt the preset option at "Process data exchange" and confirm with "Next>". The telegram configuration is done automatically.
14. Once you have worked through all the steps of the configuration, the configured configuration is displayed once again for you to confirm.
    Close the dialog with "Finish".

Result

The drive is displayed in the "Drives" folder in the project navigator.

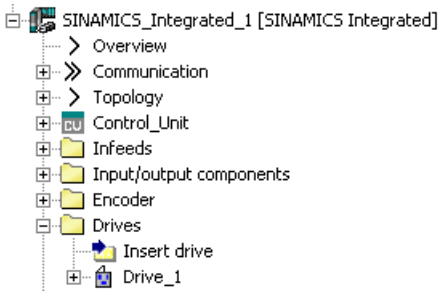

Figure 3-445 Drive inserted

Change configuration

To change the configuration of a drive that has already been configured, proceed as follows:

1. Open in the project navigator the folder of the drive whose configuration you want to change.
2. Double-click "Configuration".
3. Click "Configure DDS" or "Wizard", depending on the drive, to start the drive wizard.

Download the drive configuration to the target system

Save and compile the changes and load the drive configuration to the target system to be able test the drive function with the control panel in the next step.

Additional references

You will find detailed information in Section "Configure SINAMICS drives" of the SIMOTION SCOUT TIA Online Help.
Further information on the interconnection of the ready signal can be found in Section Configuring the infeed (Page 831).

Configuring the infeed

Configuring an infeed without a DRIVE-CLiQ interface

An infeed without DRIVE-CLiQ interface provides the ready signal (p0863.0) via an output terminal. In the project, you specify on which input (r0722) of SINAMICS Integrated the signal is active. The drive supplied by the infeed uses the signal as a ready signal (p0864).

Note

Infeed ready

A drive on SINAMICS Integrated of a SIMOTION D can only be moved if the infeed is ready.

Interconnecting the ready signal of the infeed

Requirements

- You have configured a drive.
- SIMOTION SCOUT TIA is in online mode.

Procedure

In the next step, in order to wire the ready signal of the infeed (terminal "DO: Ready" of the infeed) with the DI 0 of the D4x5-2, proceed as follows in case you have not already established the interconnection during processing using the drive wizard:

1. Navigate in the project navigator to the "Drives" folder and double-click "Configuration" below the drive.

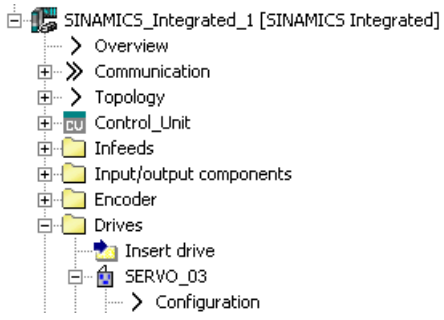

Figure 3-446 Configuring a drive

2. Click the "Configure DDS" button with a yellow background in the working area.

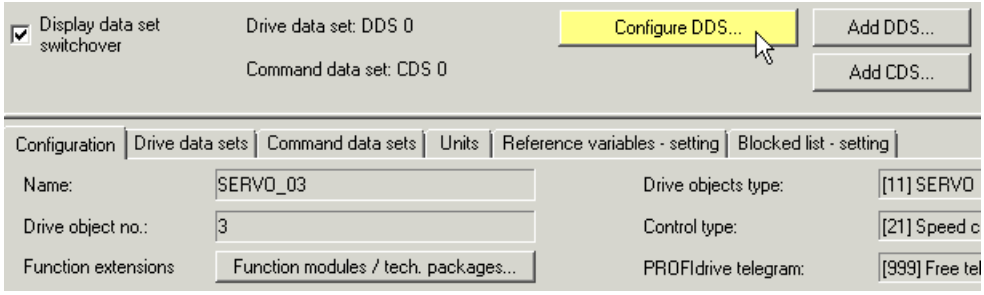

Figure 3-447 Configuring DDS

The drive wizard opens.

3. Click "Next" in the drive wizard until you reach the "Configuration - SINAMICS_Integrated - BICO Power Unit" dialog.
4. In the input field "p0864", select the digital input (e.g. DI 0) to which the ready signal of the infeed is wired.

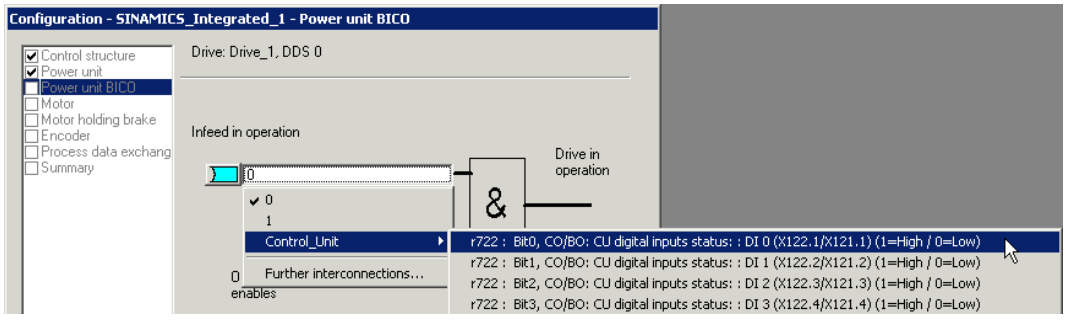

Figure 3-448 BICO interconnection

5. Click "Next". Run through all other dialogs without change until the final "Summary" dialog.
6. Click "Finish".
Thus, the configuration is finished.

See also

Configure a drive offline (Page 827)

Configure drives online (Page 824)

Testing the drive with the drive control panel

Drive control panel

The drive control panel is used to control and monitor individual drives. With the drive control panel, you can traverse drives and can:

- Test each part of the system individually before the drives are traversed in a coordinated manner by means of a program.
- Test in a fault situation whether the individual drives can be traversed by the drive control panel at all, or whether there are already problems here.

⚠ WARNING

This software may be used only when the associated safety instructions are observed! The non-observance can cause injury to persons or damage to material!

The function is released exclusively for commissioning, diagnostic and service purposes. The function should generally only be used by authorized technicians. The safety shutdowns from the higher-level control have no effect.

The **Stop with preconfigured braking ramp** function is not guaranteed in all operating states. Therefore, there must be an EMERGENCY STOP circuit in the hardware. The appropriate measures must be taken by the user.

Requirements

- You have created and fully configured a drive in the project.
- You have stored and compiled the project. The project is consistent.
- SIMOTION SCOUT TIA is in online mode.
- The project with the drive parameterization has been loaded to the target system.

Opening the drive control panel

To open the drive control panel, proceed as follows:

1. In the project navigator, navigate to the drive unit and open the "Drives" folder.
2. Open the "Commissioning" entry and double-click "Control panel".
   The drive control panel opens in the detail view.

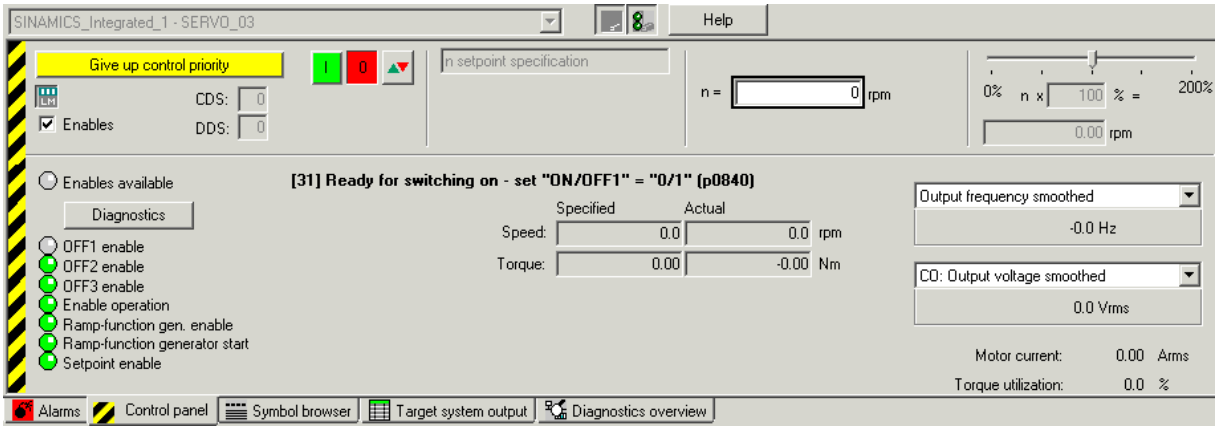

Figure 3-449 Drive control panel

Using the drive control panel

Assuming control priority

To assume control priority, proceed as follows:

1. Click the button to show the control area to test the motor speed specified at "n=".
2. Click the button to show the diagnostics area to display and evaluate defined parameters. You can determine the status of the required enables with the "Diagnostics" button.
3. In the selection list, select the drive that you want to control or monitor using the PG/PC, "SINAMICS_Integrated_1 - SERVO_03" in the example.
4. Specify the parameters that you want to display in the selection lists on the bottom right-hand side of the diagnostics area. The values are displayed below.

5. Select "Assume control priority" to establish the connection to the PG/PC. The "Assume Control Priority" dialog opens.

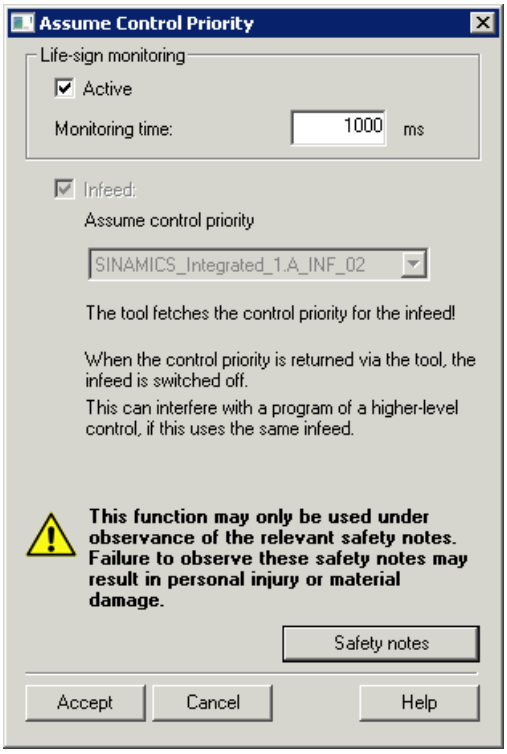

Figure 3-450 Assuming control priority

6. Consider the following infeed options for the type of connection you are using.
   - If you are using an infeed with a DRIVE-CLiQ interface, select the infeed for which the control priority is to be assumed at "Infeed" in the "Assume Control Priority" dialog. Activate the "Infeed" option if the infeed control priority is to be assumed and activated.
   - If you are using an infeed without a DRIVE-CLiQ interface, you will have to interconnect the "Infeed operation" signal (drive parameter p0864) yourself. In this case, the dialog does not contain any fields for selecting infeed.
   - If the signal of the "Closed-loop control operation" infeed is already BICO interconnected with the drive, the infeed is permanently specified. No selection is possible in the dialog, the fields are grayed out.
7. Read the safety instructions and confirm these with "Accept".

The PG/PC has the control priority; the label of the button has changed to "Return control priority".

Note

Stopping the drive

You can also stop the drive at any time by pressing the SPACEBAR.

Activating the infeed

To switch on the infeed, proceed as follows:

1. Click the button for more information.

Activating enables

To activate the enables, proceed as follows:

1. Activate the "Enables" option to enable the drive.
   The ON and OFF buttons and are activated and the enable states are indicated by the LEDs.
   Click the "Diagnostics" button to show any missing enables.

Testing the drive

To test the drive, proceed as follows:

1. Enter a speed setpoint in the "n=" field.
2. Use the slider to set the current speed **setpoint** in relation to the maximum speed **setpoint (100%)**.
3. Click the green switch to start the drive.
   Or click the switch to control the drive in jog mode. The motion continues as long as you keep the switch pressed.
   In the diagnostics area you can monitor the set speed/torque as well as the actual speed/ torque.

Exiting the drive control panel

To exit the drive control panel, proceed as follows:

1. Click the red button to stop the drive.
2. Deactivate the "Enables" option.
   The LEDs are grayed out.
3. Deactivate the infeed. To do this, click "Infeed on/off".
4. Click the "Return control priority" button to return the control priority of the control panel.
5. On the menu bar, select "Project > Disconnect from target system" to switch to offline mode.

Result

The drive can be operated. The drive configuration is complete.

3.5.8.5 Creating and testing an axis

TO axis technology object

Note

You create the technology object (TO) axis in SIMOTION SCOUT TIA.

You can create the axis both in offline and online mode.

Technology objects represent the respective real objects, e.g. a position axis, in the controller.

The technology object axis offers the user a technological view of the drive and the encoder (actuator and sensor) and provides technological functions, such as communication with the drive, actual value processing, position control and positioning functionality. It executes control and motion commands and indicates states and actual values.

Requirements

If you want to insert a real axis, you require a functional drive.

If you want to insert a virtual axis, you do not require a functional drive.

Note

Virtual axis

All axis types can also be virtual axes, i.e. they do not control real drives but are used as auxiliary axes, e.g. as a leading axis for several following axes (line shaft).

Axis technologies

You can use the following axis technologies:

- Speed-controlled axis
  Motion control is performed using a speed specification without position control.
- Positioning axis
  Motions are position-controlled.
- Synchronous axis
  The synchronous axis creates a grouping of the following axis and synchronous object.
- Path axis
  The path axis type can be interconnected with a path object.
  The path object can be used to calculate and traverse a linear, circular or polynomial path in the 2D/3D coordinate system for at least two path axes and up to three path axes.

Axis wizard

SIMOTION SCOUT TIA provides the Axis wizard for the creation of a new axis. Using the wizard, you interconnect the TO axis with a drive.

Note

Axis wizard - restriction

The wizard can only be run through once.

Subsequent changes to the axis configuration are possible in the corresponding dialogs of the TO axis.

Configuring Axes

Procedure

To insert an axis with the axis wizard and to interconnect with drive and encoder, proceed as follows:

1. Navigate to the folder in the project navigator "AXES" and open it by double-clicking.
2. Select "Insert axis".
   The "Insert Axis" dialog opens.

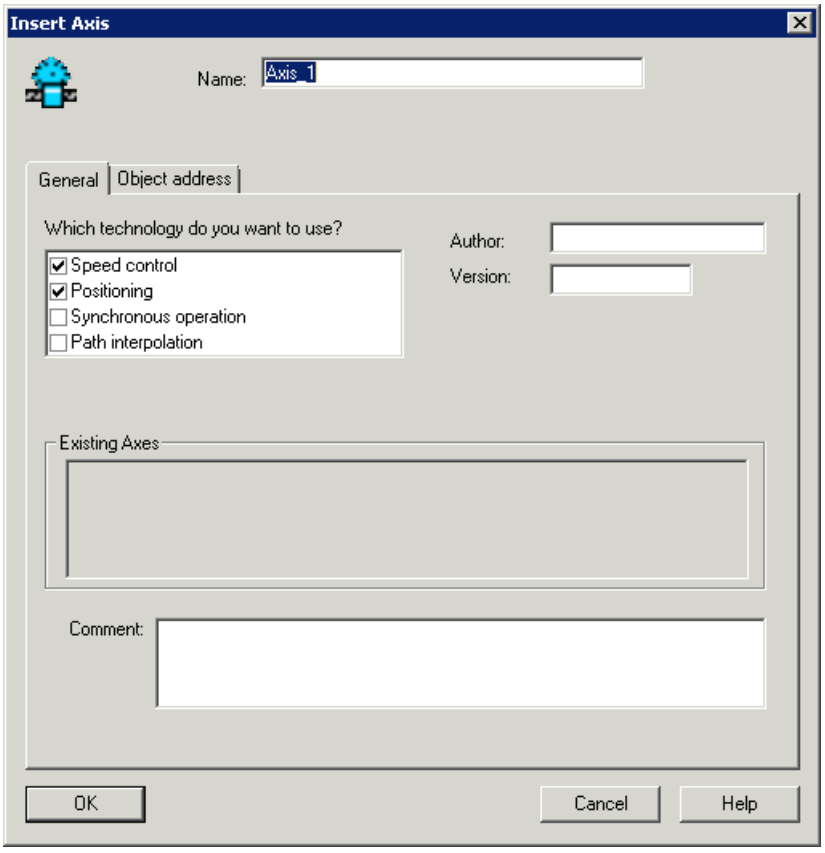

Figure 3-451 Creating an axis

3. Name the axis and select the axis technology that you want to use.
   Note here that the "Positioning" technology always requires the "Speed control" technology. Thus, this technology cannot be deactivated.

4. Click "OK" to exit the dialog.
   The "Axis Configuration - Axis Type" dialog opens.

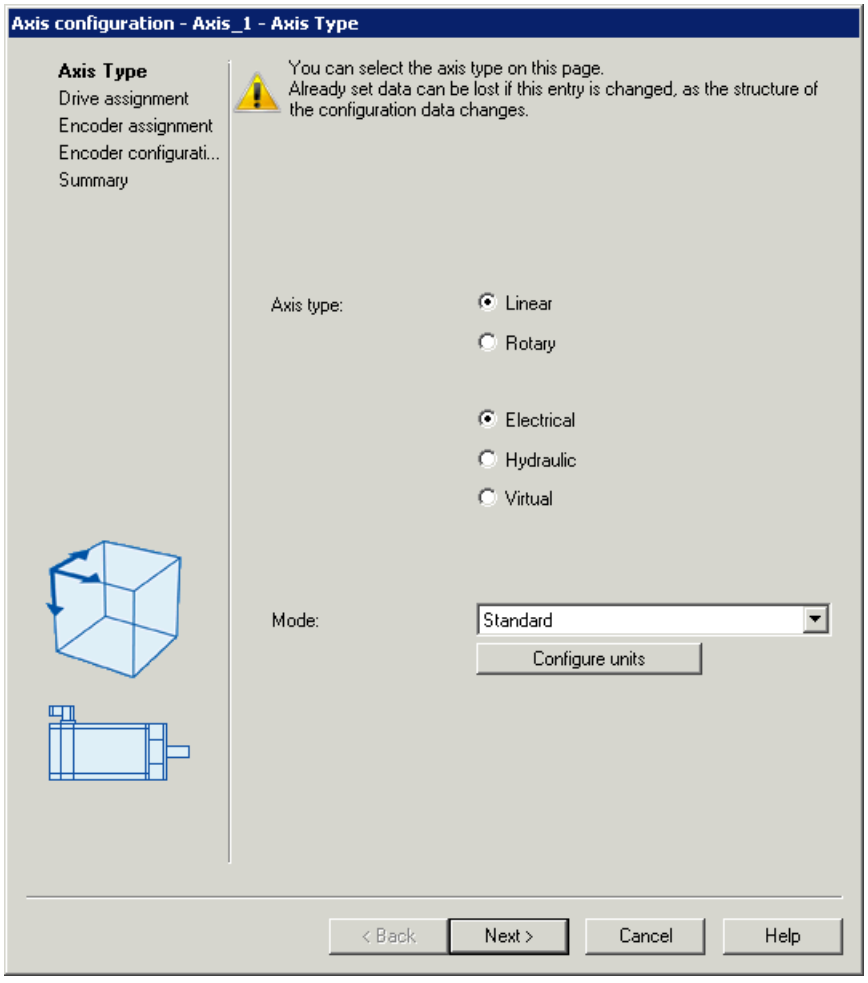

Figure 3-452 Axis configuration - defining the axis type

5. Select the axis type, and specify it. Select the mode for electric axes or hydraulic axes and confirm with "Next>".
   The "Axis Configuration - Drive Assignment" dialog opens.

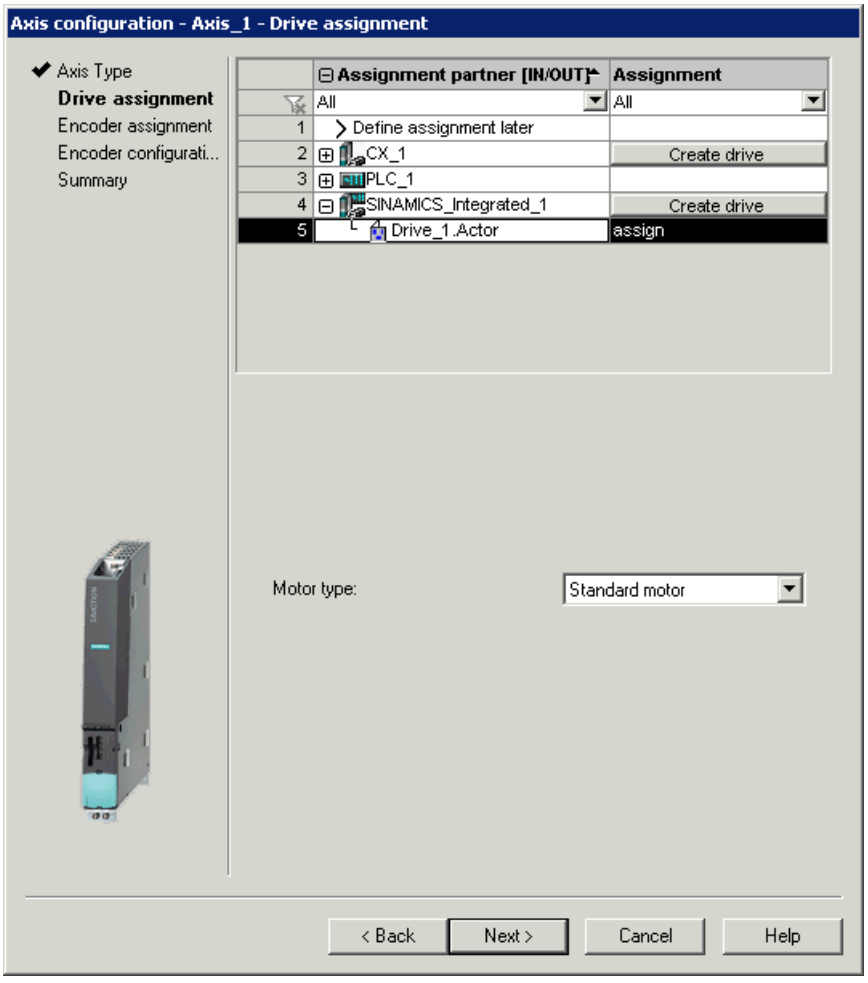

Figure 3-453 Axis configuration - Drive assignment

6. Depending on the selected axis type, with an electric axis you assign the drive which you have configured previously in the "Drive assignment" step.
   Several drives are configured in the example: "Drive_unit_1" (CU310-2), "CX_1" (CX32-2) and "SINAMICS_Integrated_1" (SIMOTION D SINAMICS Integrated).

   Note

   As an alternative to assigning the axis to an already configured drive, the axis wizard offers two further selection options:

   - Define the axis/drive assignment later:
     The axis is to be created and not assigned to a drive until later. Programming and simulation of the axis are also possible here.
   - Create drive:
     The drive wizard can be called up from the axis wizard (offline configuring). The axis can thus be created in one step along with the drive, and assigned to the drive.

   The alternative approaches are not being considered at this point.

   With an hydraulic axis, you configure the output for a Q-valve in the step "Configuration of Q-output"; the Q-valve represents the actuator for a volume flow.
   Confirm with "Next>".
7. Specify the encoder to be used by the axis or the active axis data set in the "Encoder assignment" step.
   Confirm with "Next>".
8. Specify the parameters for the encoder used in the "Encoder configuration". Only the encoder type has to be specified when using the symbolic assignment.
9. Once you have worked through all the steps of the configuration of a TO axis, the configured configuration is displayed once again for you to confirm.
   Close the dialog with "Finish".

Result

The axis is displayed in the "AXES" folder of the project navigator.

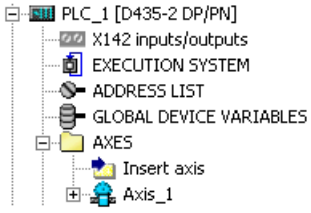

Figure 3-454 Axis created

Automatic settings of the engineering system

The engineering system automatically defines the PROFIdrive axis telegrams required for communication with the drive, as well as the addresses used.

In the same way, telegrams are extended and interconnections automatically created in the drive, depending on the selected TO technology (e.g. SINAMICS Safety Integrated).

Drive and encoder data, as well as reference variables, maximum variables, torque limits, and granularity in torque reduction of the SINAMICS S120 are accepted automatically for the configuration of the SIMOTION technology objects "TO axis" and "TO externalEncoder". This data no longer has to be entered in SIMOTION.

Loading the axis configuration to the target system

Save and compile the changes and download the axis configuration to the target system in order to be able to test the function of the axis in the next configuration step.

Additional references

For detailed information, refer to the section "Configuring the axis and external encoder" in the SIMOTION SCOUT TIA Online Help.

Testing the axis with the axis control panel

Using the axis control panel you can control and monitor individual axes.

You can perform the following tasks with the axis control panel:

- Test axes before you traverse them via a program.
- Testing as to whether you can move the axis using the axis control panel if a fault is detected.
- Set/remove axis enable.

Requirements

- You have created, configured and connected an axis to the drive.
- SIMOTION SCOUT TIA is in online mode.
- You have loaded the project to the target system.

Opening the axis control panel

To open the axis control panel, proceed as follows:

1. Open the "AXES" folder in the project navigator.
2. Double-click the "Control panel" entry below the axis to be tested.

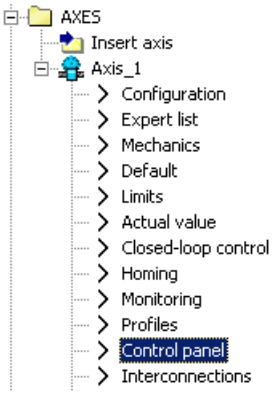

Figure 3-455 Select axis control panel

The axis control panel opens in the detail view.

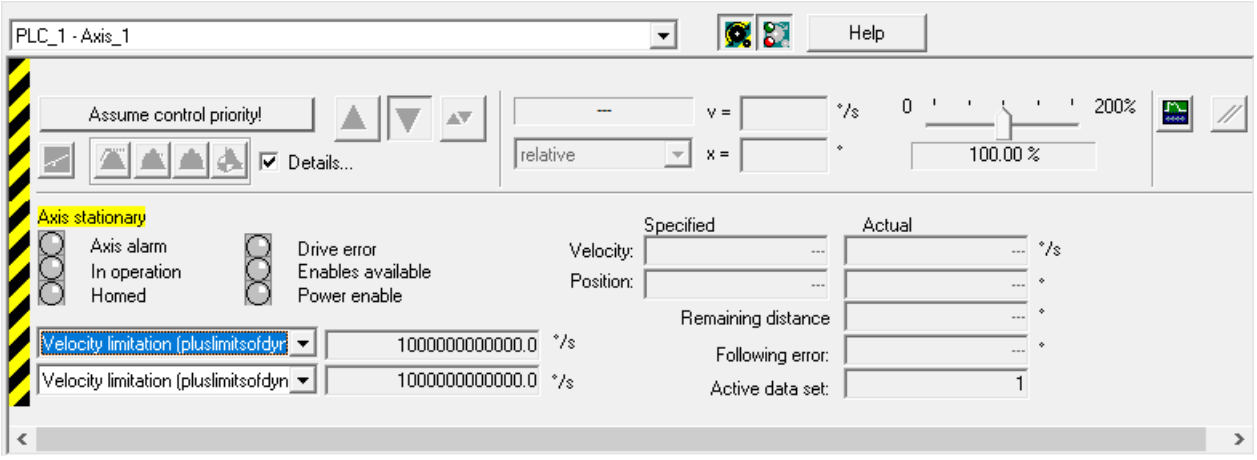

Figure 3-456 Axis control panel

Using the axis control panel

⚠ WARNING

Activate sign-of-life monitoring

Use the axis control panel in control mode only with activated sign-of-life monitoring and a suitably short monitoring time! Otherwise, if problems occur in the communication link between the control PC and the device, the axis may start moving in an uncontrollable manner.

Assume control priority

To assume control priority, proceed as follows:

1. Show the control area by clicking the button in order to test, for example, programmed traversing motions in this mode.
2. Show the diagnostic area by clicking the button in order to test traversing motions that are caused by the motion commands sent to the axis in this mode.
3. Select the axis that you want to traverse and monitor from the selection list, PLC_1 - Axis_1 in the example.
4. Specify the parameters you want to display in the lower left side of the Diagnostics area using the selection lists. The corresponding values are shown next to them.
5. Select "Assume control priority" to establish the connection to the PG/PC.
   The "Assume Control Priority" dialog opens.

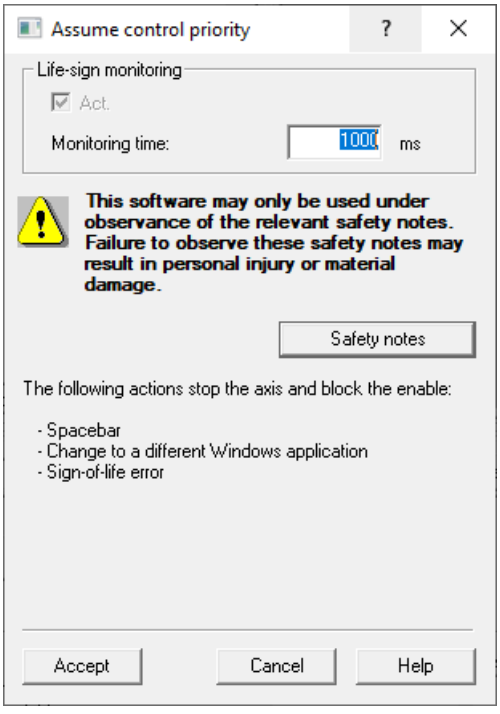

Figure 3-457 Assume control priority

6. Read the safety instructions and confirm these with "Accept".

The PG/PC has the control priority; the label of the button has changed to "Return control priority".

Note

Stopping the axis

By pressing the SPACEBAR, you can stop the axis at any time.

Activating enables

To activate the enables, proceed as follows:

1. Click the "Set/remove enables" button to enable the axis.
2. Confirm the dialog "Switch axis enable" with "OK".
   The LEDs indicate the status of the enables.

Specifying motion commands for axis

1. Specify motion commands for the axis.
   The following functions are available:

Button	Meaning/function
	Speed default This command specifies that the axis is started speed-controlled. Specify a speed setpoint to which the axis can be ramped up via a velocity profile. The command is possible for all axis types; position and following axes are operated speed-controlled.
	Start axis position-controlled This command specifies that the axis is started position-controlled. Specify a speed setpoint to which the axis can be ramped up via a velocity profile. The command is possible for position and following axes.
	Position axis With this command, you specify positioning of the axis (positioning or synchronous axis) at a specific position. The position value entered can be absolute or relative. Modulo axes can also be positioned via the shortest path. The programmed position must be within the software limit switches.
	Home axis With an absolute measuring system, homing is only required once during commissioning. When this is completed, the position value will be known when the machine is switched on. In the case of an incremental measuring system, the machine must be homed every time it is switched on.

Start axis motion

To start the axis motion, proceed as follows:

1. Click the switch to start the motion command parameterized last.
   Or click the switch to start the "Speed specification" or "Start axis position-controlled" motion commands in jog mode.
   The motion continues as long as the right-hand mouse button is pressed.

Exit axis control panel

To exit the axis control panel, proceed as follows:

1. To stop the system, click the switch.
2. Deactivate the "Set/remove releases" button.

3. Confirm the "Remove Axis Enable" dialog with "OK".

Note
Acknowledging alarms

If you want to traverse the axis again, acknowledge all alarms in the "Alarms" window.

4. Click "Give up control priority" to return the control priority to the control panel.
5. On the menu bar, select "Project > Disconnect from target system" to switch to offline mode.

Result

The axis can be traversed. Axis configuration is complete.

Potential problems

The axis cannot be traversed.

If the axis cannot be traversed using the axis control panel, test to see if you can traverse the drive using the drive control panel.

- If you cannot traverse the drive using the drive control panel, there is a problem with the drive.
- If you can traverse the drive with the drive control panel, there is a communication problem. Check the drive.

Testing the drive with the drive control panel (Page 833)

3.5.8.6 Program SIMOTION application

Using tags

Variable types

Variables are used to structure programs. They are wild cards in a program and can assume values.

In SIMOTION, different types of variables are distinguished:

- **System variables**
  Each SIMOTION device and technology object has specific system variables. You can access system variables within the SIMOTION device from all programs.
- **I/O variables**
  An I/O variable is a symbolic variable name that is assigned to an I/O address of the SIMOTION device or to the I/O. Thus, direct access to the peripherals is possible.
  I/O variables are valid for all devices. All programs of the SIMOTION device have access to them.
- **Global device variables, unit variables and local variables** are user-defined variables with limited scope:
  These global device variables can be accessed from all parts of the user program. They can also be accessed from HMI devices.
  Unit variables can be accessed by all programs, function blocks and functions defined within the same source, e.g. ST source, MCC source, LAD/FBD source.
  A source is a logic unit that you can create in your project and that can contain programs, functions and function blocks.
  Local variables can only be accessed within the program, the function or function block in which they are defined.
  If variables have been defined in the interface section of a source, they can be accessed by other sources and external components, e.g. HMI systems.

Creating global device variables

Note

Global device variables can only be created in offline mode.

To create global device variables, proceed as follows:

1. Click the "GLOBAL DEVICE VARIABLES" element in the project navigator below the SIMOTION device.
   The "Global device variables" table is displayed in the symbol browser.
2. In the "Name" column, click the first empty cell and enter the variable name, "g_bo_start" in the example.
   Press the RETURN or TAB key. The input focus jumps to the "Data type" field. Alternatively, you can click on the field to move the input focus to it.
3. Enter the data type in the "Data type" field, "BOOL" in the example.
4. Press <RETURN> to confirm.
   The variable is created and available in the project. In the symbol browser, a new line is opened for input.

5. Create other global device variables in the same way, "g_bo_ready" in the example.

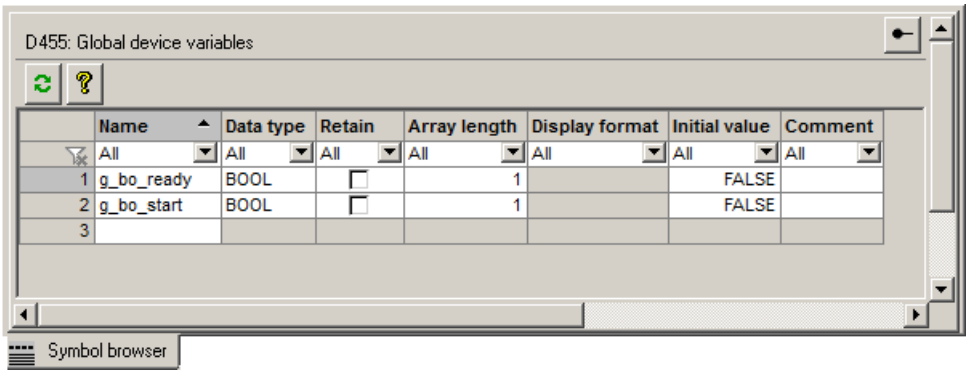

Figure 3-458 Creating global device variables

6. Select "Project > Save and compile changes" in the menu to accept the expansions in the project.

Creating I/O variables

Note

I/O variables can only be created in offline mode.

To create I/O variables, proceed as follows:

1. Double-click the "ADDRESS LIST" element below the SIMOTION device in the project navigator.
   In the detail view, the "Address list" tab opens.
2. Click on the first free cell in the "Name" column. Enter a name for the variable.
3. Press the <RETURN> or <TAB> key. The cursor moves to the "I/O address" field.
4. Select the "IN" entry for input variables or "OUT" for output variables in the I/O address column.
5. Click the three dots in the "Assign" column to open the "Assignment" dialog.
6. In the "Assignment" dialog, select the required variable and select the "Assign" entry in the "Assignment" column.
7. Confirm the dialog with "OK".
8. Select "Project > Save and compile changes" in the menu to accept the expansions in the project.

Note

Steps 4, 5, 6 and 7 only apply for devices that support symbolic assignment (e.g. CU320-2).

Additional references

You will find detailed information on the creation of variables in the SIMOTION SCOUT TIA Online Help and the relevant Programming and Operating Manuals.

Use MCC

Overview

Program creation steps

Creation of an MCC program encompasses the following steps:

1. Creating the MCC unit.
2. Creating the MCC chart in the MCC unit.
3. Inserting MCC commands in the MCC chart and parameterizing the commands.

Creating the MCC unit

Procedure

To insert an MCC unit, proceed as follows:

1. In the project navigator, below the SIMOTION device, open the "PROGRAMS" folder.
2. Double-click "Insert MCC unit".
   The "Insert MCC Unit" dialog opens.

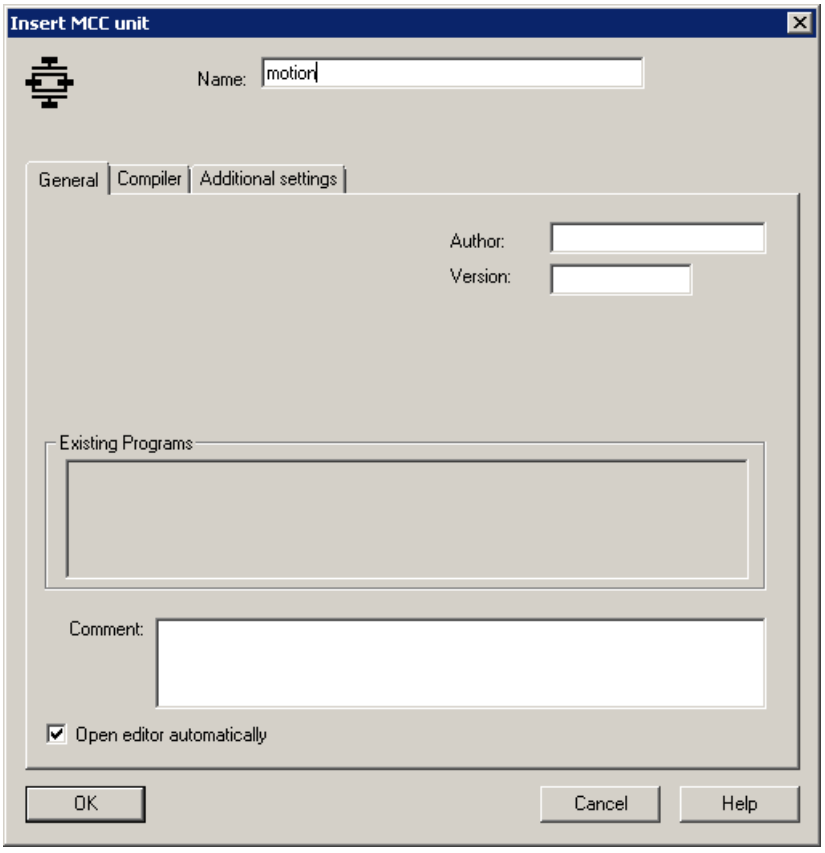

Figure 3-459 Inserting an MCC unit

3. Assign a name, "motion" in the example.
4. Go to the "Compiler" tab. For diagnostics purposes, activate the "Permit program status" and "Permit single step" options. In this way, you can monitor program execution later in online mode.
5. Confirm with "OK".

Result

The MCC unit is created.

- The unit appears in the project navigator below the "PROGRAMS" branch.
- The declaration table of the source file opens in the working area of the workbench. The variables declared there apply within the MCC unit and can be linked in other units.

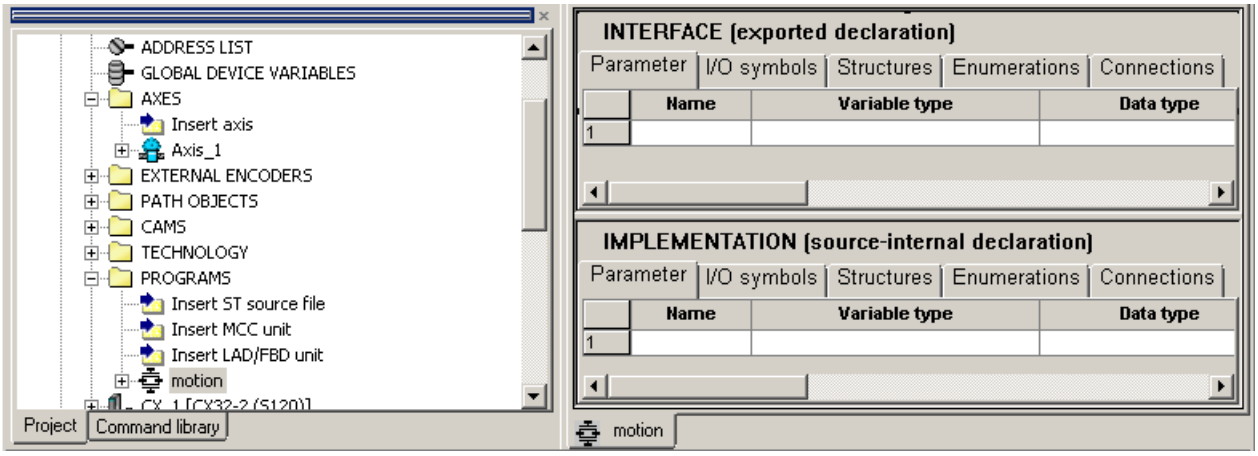

Figure 3-460 MCC unit "motion" inserted

Creating an MCC chart

Procedure

To insert an MCC chart, proceed as follows:

1. In the project navigator, below the SIMOTION device, open the "PROGRAMS" folder.
2. In the "PROGRAMS" folder, open the MCC unit, "motion" in the example.

3. Double-click "Insert MCC chart".
   The "Insert MCC Chart" dialog opens.

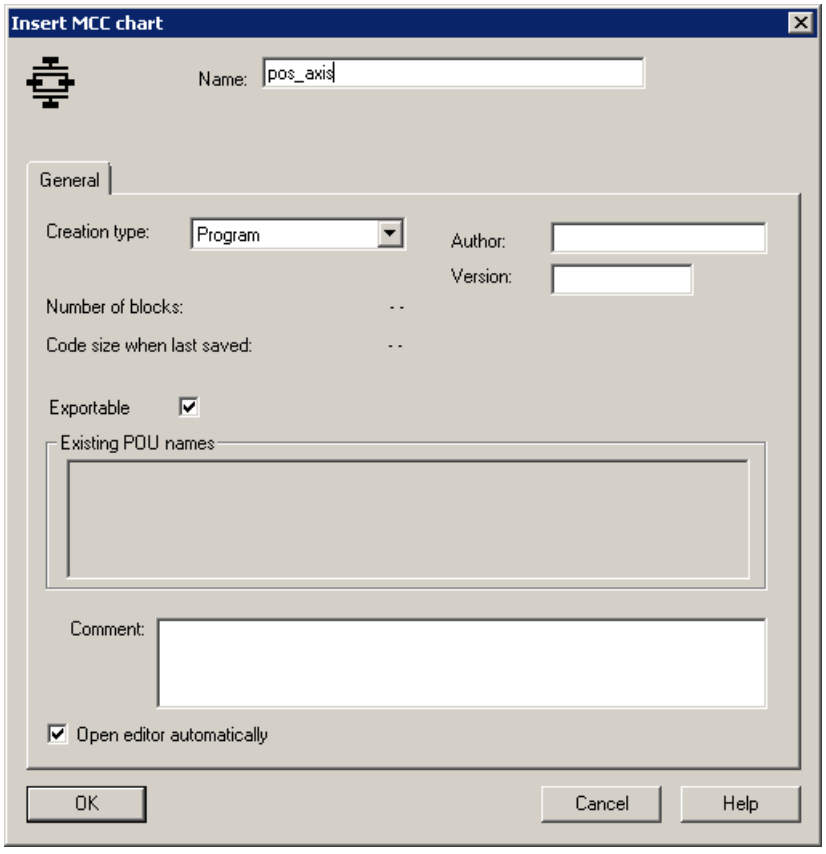

Figure 3-461 Inserting an MCC chart

4. Assign a name, "pos_axis" in the example.
5. For the creation type, select "Program".
6. Confirm with "OK".

Result

The MCC chart is created in the project.

- The created MCC chart "pos_axis" appears in the PROGRAMS folder below the "motion" unit.
- The MCC editor is opened in the working area of the workbench. The start and end nodes are already pre-defined. You can start MCC programming.

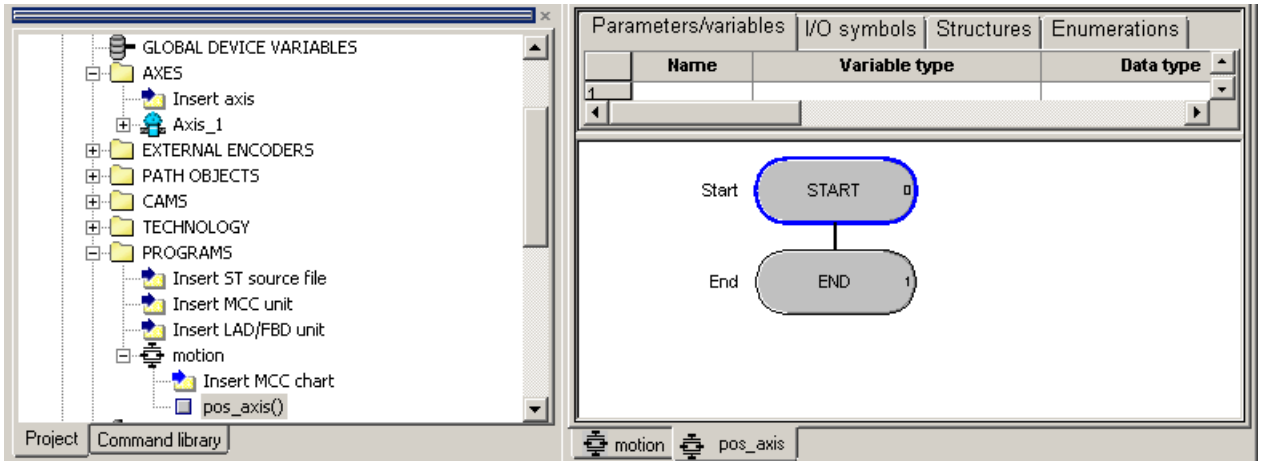

Figure 3-462 MCC chart "pos_axis" inserted

Using MCC command blocks

Every newly created MCC chart already contains a start and an end node.

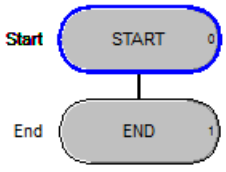

Figure 3-463 MCC chart, start/end nodes

You insert the MCC command blocks between these. The commands are processed in the direction from the start to the end node.

The MCC commands are available to you via:

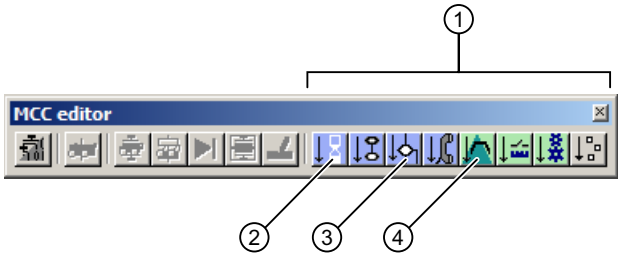
- "MCC editor" toolbar
- "MCC chart > Paste" menu command
- Context menu of the command block

Using the MCC editor toolbar

Open the toolbar

The "MCC editor" toolbar is displayed in the workbench as soon as you open an MCC chart.

The commands are arranged into command groups.



① Command groups
② Basic commands
③ Program structures
④ Single axis commands

Note

Displaying the MCC toolbar

If you do not see the toolbar, check that the display is switched on: Open the "View > Toolbars" menu. Select the checkbox for "MCC editor" in the "Toolbars" window.

Opening the command group

Move the cursor across the colored buttons of the toolbar to display the command groups.

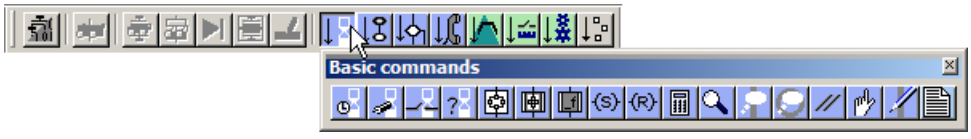


Figure 3-464 Opening the command group

Keeping command groups open or closed continuously

Click the window title of a command group to keep the command group open continuously.

Select "Hide" in the context menu of a command group to close the command group.

Placing the command group as required

Drag the toolbar or the command groups of the toolbar with the mouse to any location on the workbench.

Docking the toolbar

Drag the toolbar or the command groups of the toolbar with the mouse to the edge areas of the workbench to dock them there.

Showing a tooltip for the command

Hold the mouse pointer briefly over a command button. The designation of the command is shown.

Inserting MCC editor commands in the MCC chart

In order to insert an MCC editor command in the created MCC chart, proceed as follows:

1. In the active MCC chart, click the connecting line between two commands, or click the command after which the new command is to be inserted.
   The connecting line or the border line of the command button is marked blue. The marking flashes.
2. On the "MCC editor" toolbar, select the command group.
3. Click the desired command in the command group.

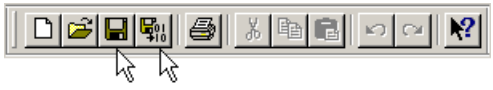
Result

The command was inserted into the chart and can now be parameterized.

Backing up the MCC program

To back up the MCC programs, proceed as follows:

1. On the toolbar, click the "Save project" or "Save project and compile changes" button.



Alternatively you can click the "Accept and compile" command in the MCC editor toolbar.

This command compiles the currently selected program as well as all other programs of the same unit.
However, the command does not save the changes.
You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

Additional references

For further information, refer to the SIMOTION MCC Motion Control Chart Programming and Operating Manual.

The "Getting Started section of the SIMOTION SCOUT TIA" Online Help contains a detailed description of a sample configuration.

Use LAD/FBD

Overview

Program creation steps

Creation of a LAD/FBD program encompasses the following steps:

1. Creating an LAD/FBD unit.
2. Creating an LAD/FBD program in the LAD/FBD unit.
3. Inserting LAD/FBD commands in the LAD/FBD program and parameterizing the commands.
4. Saving and compiling the LAD/FBD program.

Create LAD/FBD unit

Procedure

In order to set up an LAD/FBD unit, proceed as follows:

1. In the project navigator, below the SIMOTION device, open the "PROGRAMS" folder.
2. Double-click "Insert LAD/FBD unit".
   The "Insert LAD/FBD Unit" dialog opens.

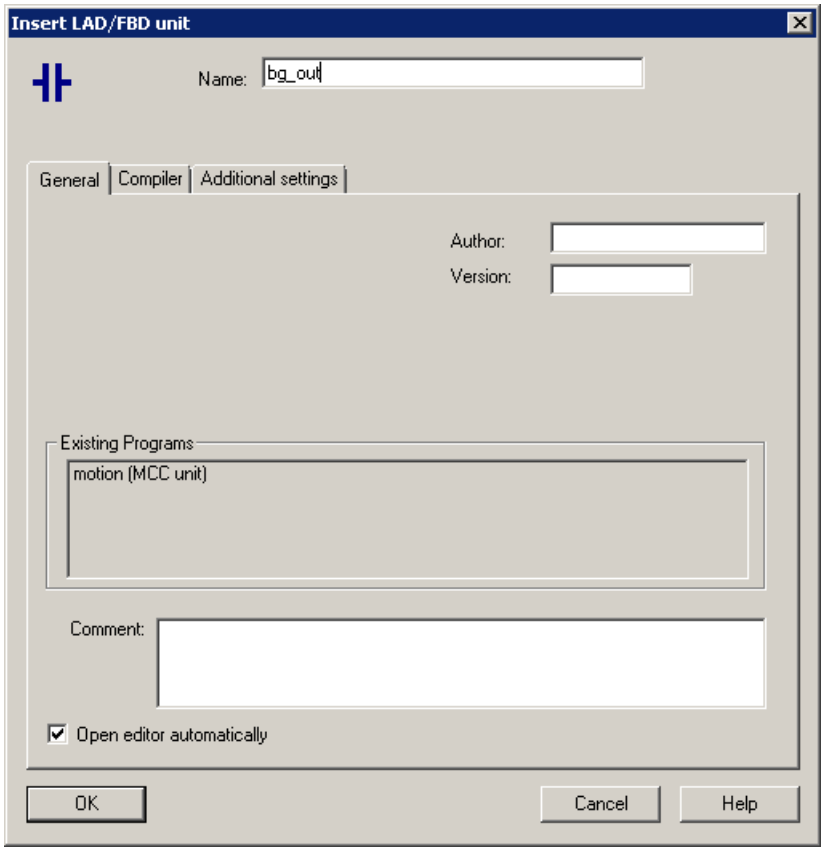


Figure 3-465 Inserting the LAD/FBD unit

3. Assign a name, "pos_axis" in the example.
4. Switch to the Compiler tab.
5. Activate the "Permit program status" option for diagnostics purposes. In this way, you can monitor program execution later in online mode.
6. Confirm with "OK".

Result

The LAD/FBD unit is created.

- The LAD/FBD unit "bg_out" appears in the "PROGRAMS" folder.
- The declaration table of the source file opens in the working area of the workbench. The variables declared there apply within the LAD/FBD unit and can be linked in other units.

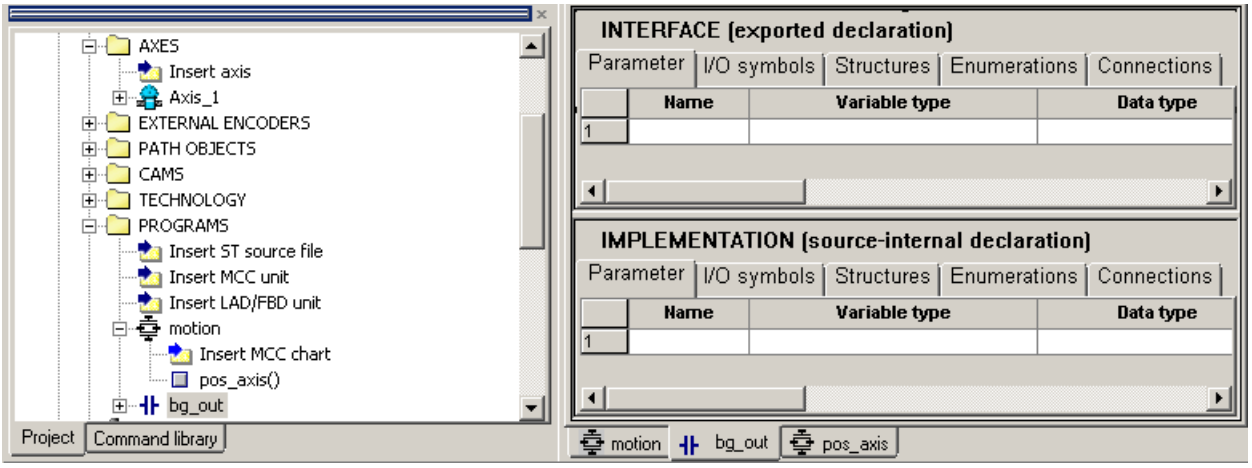

Figure 3-466 LAD/FBD unit "bg_out" inserted

Create LAD/FBD program

Procedure

In order to set up an LAD/FBD program, proceed as follows:

1. In the project navigator, below the SIMOTION device, open the "PROGRAMS" folder.
2. Open the LAD/FBD unit "bg_out" in the "PROGRAMS" folder.

3. Double-click "Insert LAD/FBD program".
   The "Insert LAD/FBD Program" dialog opens.

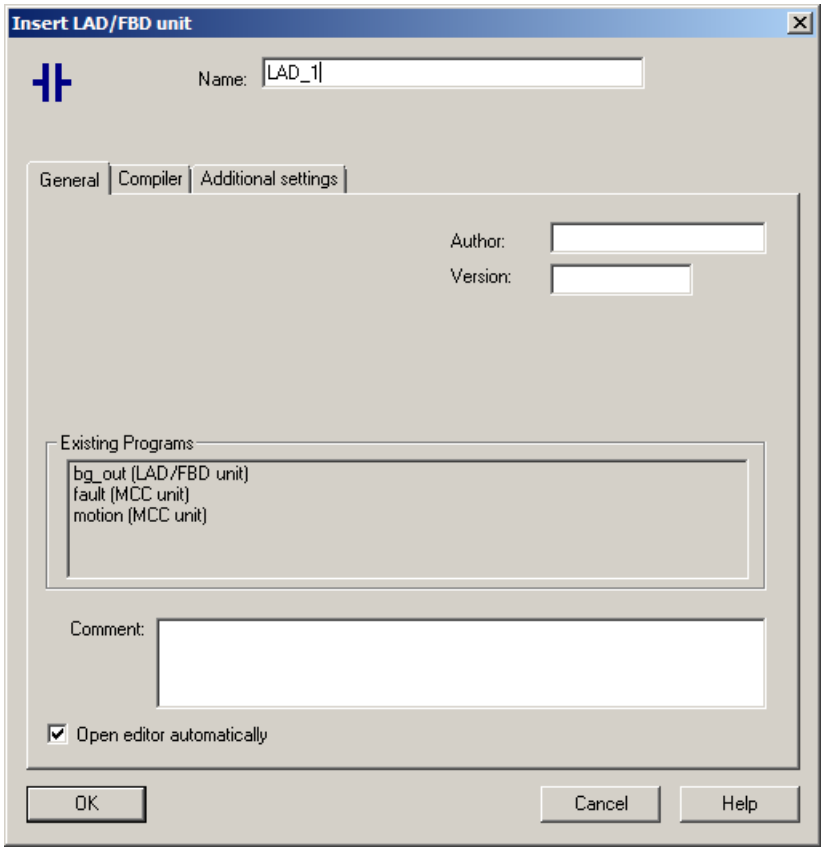

Figure 3-467 Inserting the LAD/FBD program

4. Assign a name, "LAD_1" in the example. The name must be unique throughout the project.
5. For the creation type, select "Program".
6. Confirm with "OK".

Result

The LAD/FBD program "LAD_1" is created in the project.

- The LAD/FBD program appears in the "PROGRAMS" folder.
- The LAD/FBD editor is opened in the working area of the workbench. You can start programming.

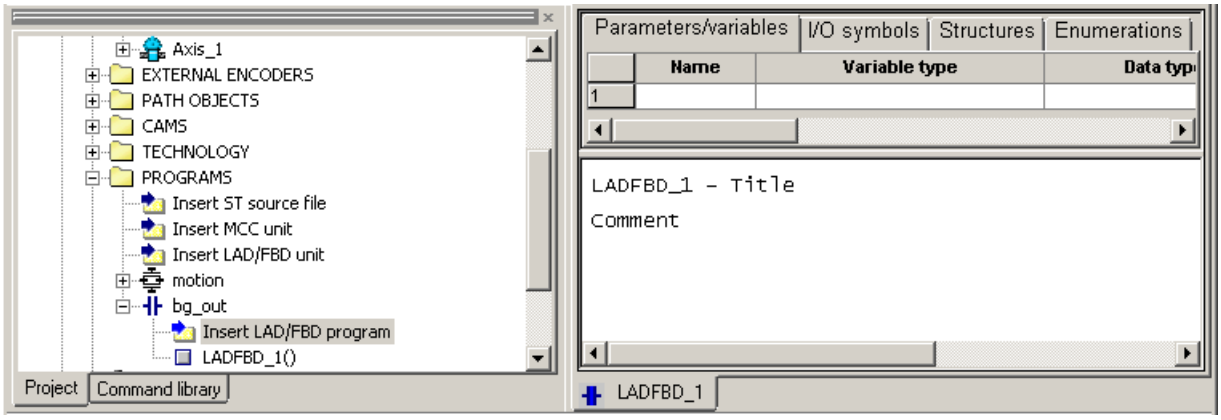

Figure 3-468 LAD/FBD program "LAD_1" inserted

Using the LAD/FBD toolbar

Opening the LAD/FBD toolbar

The LAD/FBD toolbar becomes visible in the workbench as soon as you open an LAD/FBD program.

Move the cursor across the active buttons of the toolbar to display the functions.

Note

Displaying the LAD/FBD toolbar

If you do not see the toolbar, check if the display is switched on: Open the "View > Toolbars" menu. In the "Toolbars" window, activate the "LAD/FBD toolbar" checkbox.

Switching the programming language

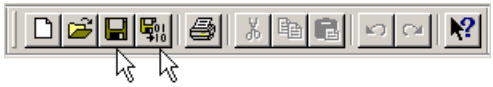
SIMOTION SCOUT TIA allows simple switching between ladder logic and function block diagram. The LAD/FBD editor contains the command "LAD/FBD program > Switch to FBD" or "Switch to LAD".

Backing up the LAD/FBD program

Procedure

In order to back up an LAD/FBD program, proceed as follows:

1. On the toolbar, click the "Save project" or "Save project and compile changes" button.



Alternatively you can click the "Accept and compile" command in the LAD/FBD toolbar.

This command compiles the currently selected program as well as all other programs of the same unit.
However, the command does not save the changes.
You thus have the option of accepting changes to a program into the project without having to save or compile the entire project again.

Additional references

For further information, refer to the Online Help and SIMOTION LAD/FBD Programming and Operating Manual.

The "Getting Started section of the SIMOTION SCOUT TIA" Online Help contains a detailed description of a sample configuration.

Using ST

Overview

Program creation steps

The creation of an ST program encompasses the following steps:

1. Creating an ST source file.
2. Saving and compiling the ST program.
3. Executing the ST program.

Note

Template for example unit

An extensively annotated *template for example unit* is also available in the online help.

Creating an ST source file

Procedure

To create an ST source file, proceed as follows:

1. In the project navigator, below the SIMOTION device, open the "PROGRAMS" folder.
2. Double-click Insert ST source file.
   The "Insert ST Source File" dialog opens.

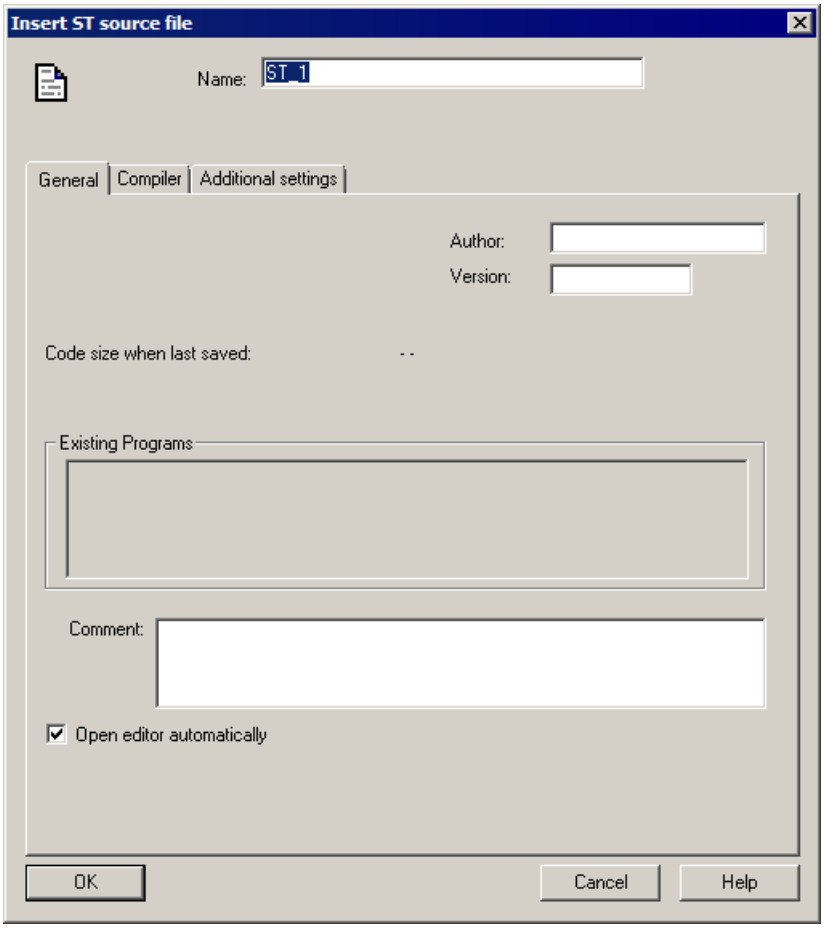


Figure 3-469 Inserting an ST source file

3. Assign a name, "ST_1" in the example.
4. Confirm with "OK".

Result

The ST source file has been created.

- The unit appears in the project navigator below the "PROGRAMS" branch.
- The declaration table of the source file opens in the working area of the workbench.

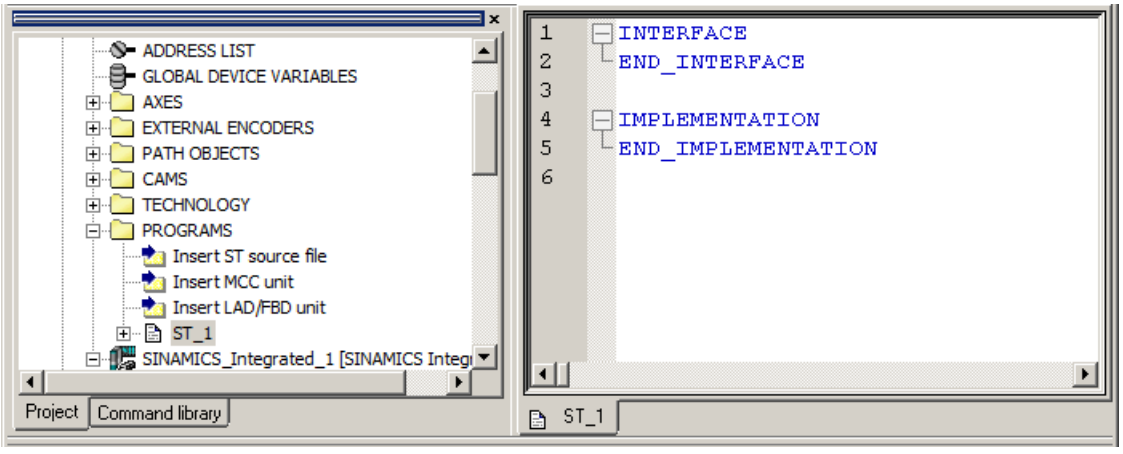

Figure 3-470 ST source file "ST_1" inserted

Using the Snippet Editor

With the Snippet Editor, you can create your own snippets for frequently used code blocks. You assign a keyword to the code block and insert the code block into your ST program by calling the keyword.

To call the Snippet Editor, click in the active work area of your ST source and select "View > Snippet Editor" in the context menu.

Additional references

Detailed information on the Snippet Editor can be found in the SIMOTION SCOUT TIA online help, section "Code Snippets".

Using the ST toolbar

Using the ST toolbar

The ST toolbar is displayed in the workbench as soon as you have created an ST source file.

Move the cursor across the buttons of the toolbar to display the functions.

Backing up the ST program

Procedure

To back up an ST program, proceed as follows:

1. Save the entire project.
   Select the "Save" command in the "Project" menu.
2. Click the "Accept and compile" button in the toolbar to run and test the program.

Executing the ST program.

Before you can execute the sample program, you must assign it to an execution level or a task. When you have done this, you can establish the connection to the target system, download the program to the target system, and then start it.

Additional references

Detailed information can be found in the SIMOTION SCOUT TIA Online Help and in the SIMOTION ST Structured Text Programming and Operating Manual.

The "Getting Started section of the SIMOTION SCOUT TIA" Online Help contains a detailed description of a sample configuration.

Using libraries

In SIMOTION SCOUT TIA, you can create general functions or standard functions as a library and use them in ST source files, LAD/FBD programs or MCC charts for programming.

You can create user and standard libraries for user-defined data types, unit variables, functions (FC) and function blocks (FB).

You create libraries in the project navigator in the "LIBRARIES" folder. You store the ST source files/ LAD/FBD programs/MCC charts for the library below the library. A library's individual ST source files, LAD/FBD programs or MCC charts can be protected against unauthorized opening, reading and modification via the know-how protection for programs.

Inserting libraries

To insert a library, proceed as follows:

1. Open the "LIBRARIES" folder in the project navigator.
2. Double-click "Insert library".
   The "Insert library" dialog opens.

3. Enter the name of the library.

   Note

   Long library names

   If the library name is longer than 9 characters, the name may be shortened depending on the set column width. A tooltip shows the full library name.

   For example, a user has assigned the name "myVeryVeryLongLibName_1". "myV ... e_1" is shown.

   If there is only a small number of libraries, the displayed name can be longer, depending on the window size.

   CPU names can also be long, so their display mode is limited in the same way as the library names, except that the displayed length is 15 characters. The full name is displayed via a tooltip here also.

4. Go to the "Technology packages" tab and select the device and the technology package. You can select specific technology packages for each device.
5. Switch to the "Compiler" tab and enable the current settings for the library. This setting applies to all ST source files of this library. The current settings overwrite the global settings.
6. Confirm with "OK". The library is created.
7. To create the ST source files/LAD programs/MCC charts of the library, double click on "Insert ST source file"/"Insert MCC unit"/"Insert LAD/FBD unit" under the folder of the created library You can also insert ST, MCC or LAD/FBD source files from the "PROGRAMS" folder into the library by copying or drag-and-drop, or import them via a selective export from another project.

Using libraries

To use libraries, follow these steps:

1. For MCC charts and LAD/FBD programs, select the connection type "Library" in the "Connections" tab in the active work area of the source. Select the name of the library. For ST source files, integrate the libraries via the USELIB command.

A library is always specifically created for one SIMOTION device and one technology package. These settings are taken into consideration during compilation and the library can only be run on this set device with the selected technology package. If the library is also to be capable of being run with other devices or technology packages, you have to change the library's properties accordingly and perform the compilation again. When changing the technology package, you must make sure that the system functions used in the library are also to be found in the technology package. If there are any errors, they will be displayed during compilation.

Debugging libraries

Debugging a library is only possible if it is connected to a device. You can link libraries to CPUs to define the context in the editors so that the files are available from the corresponding CPU via "Diagnostics".

Proceed as follows to connect the library with a CPU and select it:

1. Select the "LIBRARIES" folder in the project navigator.
2. Right-click and select "Debugging by target device..." in the context menu.
   Only the CPUs available online are displayed.
   CPUs that are already connected are marked with a checkmark.

   Note

   A library can only be connected with one CPU at any time

   Please note that a library can only be connected with one CPU at any time.

   To disconnect a device, click on the CPU again.

3. Set the connection.
   The libraries are connected.

   Note

   The same CPU can be connected with multiple libraries

   You can connect multiple libraries to the same CPU.

Additional references

Detailed information on the topic of libraries can be found in the SIMOTION SCOUT TIA online help, section "Libraries".

Searching in variables and programs

In the open project, you can search all the project data for variables or any text.

If you select a variable search, you can also search within the sources. All global and local variables at the declaration and use points are recognized.

Global search

To start the search, proceed as follows:

1. In the "Edit" menu, select the "Search in the project..." command.
   The "Search in the Project" dialog opens.

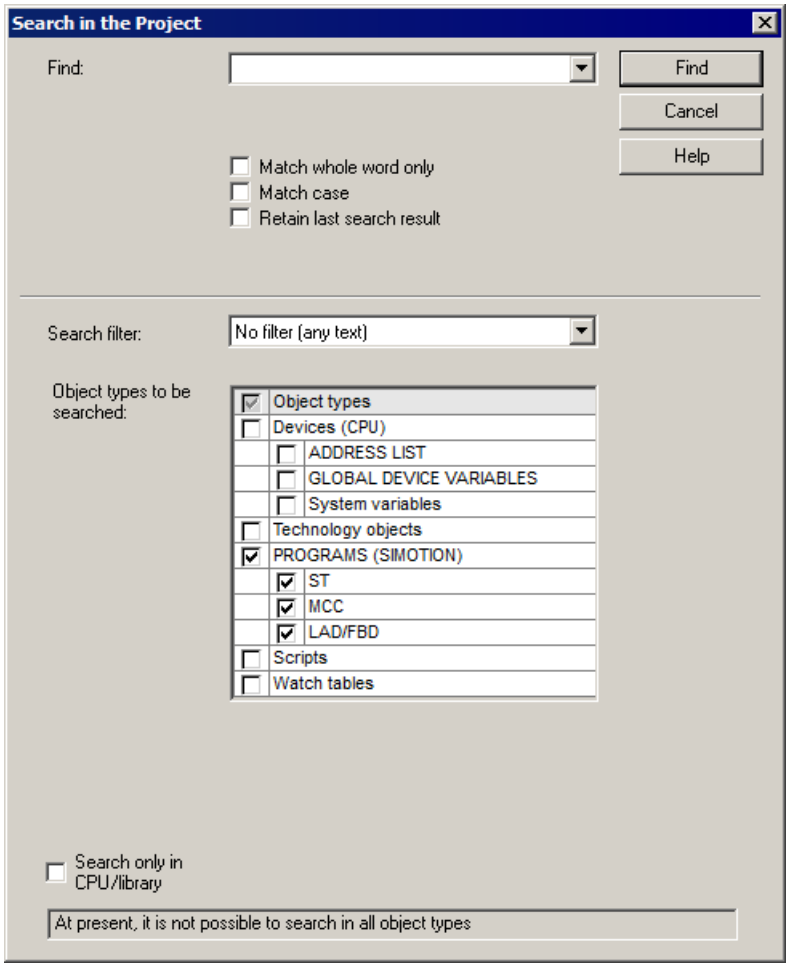

Figure 3-471 Search in the project

2. Enter the search text and specify additional criteria for the search.
3. Start the search by clicking "Find".

Result

The search results are displayed in the detail view in the "Search result" tab.

Local search

You can search locally for a specific text in the various editors and the declaration tables.

To start the local search, proceed as follows:

1. Open the appropriate editor, e.g. for a program or created global device variable.
   The focus in on the editor window.
2. In the "Edit" menu, select the "Search..." command.
   The "Search" dialog opens.
3. Enter the search text.
4. To start the search, click "Find next".

Result

The result of the search is highlighted in the editor window.

3.5.8.7 Configure execution system

Execution levels define the chronological sequence of tasks in the execution system. A level can contain several tasks. The tasks provide the framework for program execution. A task may comprise several programs. By assigning the created programs to the tasks, you can, for example, define the priority, the time frame or order in which the programs are to be executed.

Assigning programs to tasks

To assign programs to tasks in the execution system, proceed as follows:

1. In the project tree, under the SIMOTION device, double-click "EXECUTION SYSTEM". The "EXECUTION SYSTEM" window opens in the working area.
2. Assign the required program to the preferred task. In the sample MCC program, "motion.pos_axis" and "MotionTask_1" task.
   – Select the "ExecutionLevels > OperationLevels > MotionTasks > MotionTask_1" branch in the tree of the execution system.

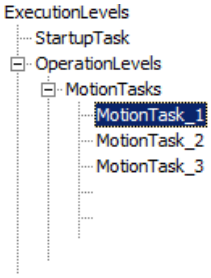

Figure 3-472 Execution system, tree view of the execution levels and tasks

The "MotionTasks" window opens on the right of the working area. On the "Program assignment" tab, under "Programs," the programs "pos_axis" and "KOP_1" and the programs of the source "fault" are visible.

– Select the MCC program "motion.pos_axis" and click the ">>" button. The program is displayed under "Programs used". Thus, the "MotionTask_1" task is assigned.

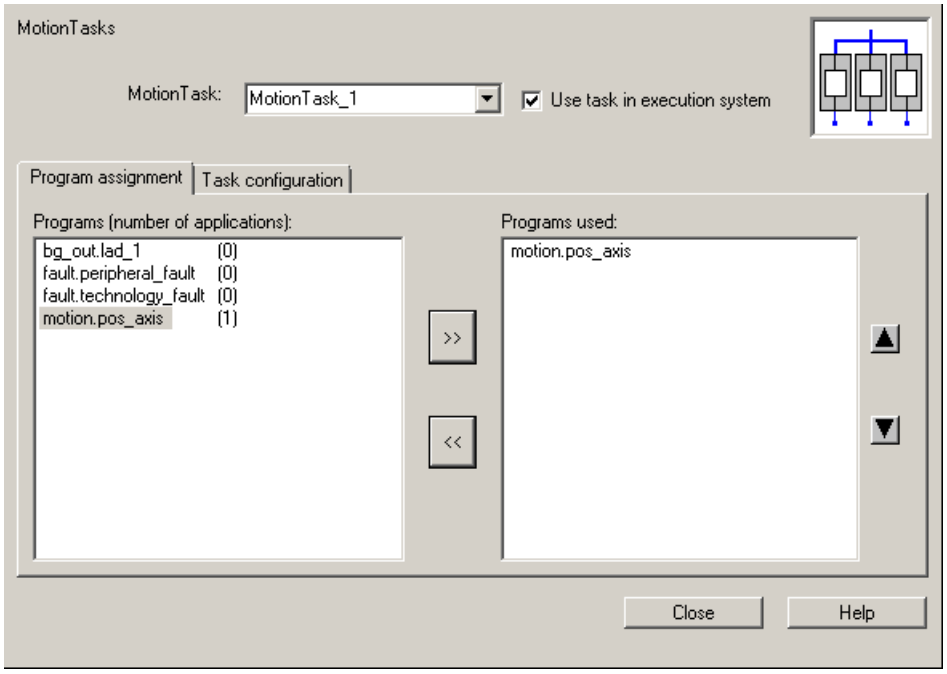

Figure 3-473 Execution system, MotionTasks window

The assignment is visible in the tree of the execution system. The "motion.pos_axis" program appears below the "MotionTask_1" branch.

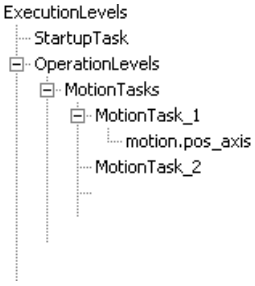

Figure 3-474 Execution system, MotionTask_1 with assigned pos_axis program

– In the "Task configuration" tab, activate the "Activation after StartupTask" option. This executes the MCC program immediately after the SIMOTION device is started. If this option is not activated, the program must be started explicitly by the call from another program that is assigned to the StartupTask or another active task.

3. Assign the LAD program "bg_out.kop_1" to the task "BackgroundTask":

   – In the tree of the execution system, select the branch "ExecutionLevels > OperationLevels > BackgroundTask". Assign the LAD program "bg_out.kop_1" to this task.

4. Assign the fault handling routines:
   - In the tree of the execution system, select the branch "ExecutionLevels > OperationLevels > SystemInterruptTasks > TechnologicalFaultTask". Assign the MCC program "fault.technology_fault" to this task.
   - In the tree of the execution system, select the "ExecutionLevels > OperationLevels > SystemInterruptTasks > PeripheralFaultTask" branch. Assign the MCC program "fault.peripheral_fault" to this task.
5. Click the "Close" button. Confirm with "Yes" if you are prompted to save.

Result

The execution system is configured.

Loading the configured execution system to the target system

Save and compile the changes, go online and load the configured execution system into the target system.

3.5.8.8 Controlling the target system

RUN and STOP operating states

Operating states

In the SIMOTION SCOUT TIA dialog "Control Operating State", you can switch a SIMOTION CPU to the RUN or STOP state.

RUN operating state

SIMOTION executes the user program and the associated system services:

- Reading process image of inputs
- Execution of the user programs assigned to the execution system
- Writing process image of outputs

The technology packages are active in this state. They can execute commands from the user program.

STOP operating state

SIMOTION does not process a user program.

- It is possible to load a complete user program.
- All system services (communication, etc.) are active.

- The I/O modules are in the safe state (this means, for example, digital outputs are "LOW" and analog outputs are de-energized or at zero current).
- The technology packages are inactive, i.e. all releases are deleted. No axis motions can be executed.

Additional references

Detailed information about operating states can be found in the section "SIMOTION device: Operating state**"** in the SIMOTION SCOUT TIA Online Help.

Control operating mode

⚠ WARNING

Danger to life through unexpected machine movement

If the operating state is not switched under controlled conditions, this may endanger the safety of personnel and the machine.

- Observe the safety regulations before you control a SIMOTION device via the mode selector switch in SIMOTION SCOUT TIA.

Switching SIMOTION devices to the RUN or STOP operating state

To control the operating state, proceed as follows:

1. Select "Target system -> Control operating state..." in the menu to open the "Control Operating State" dialog.
   Or click on the "Control operating state" icon in the toolbar.

   

   The call is possible if at least one CPU of the project is in online mode.
2. Click the assigned button to select the desired "RUN" or "STOP" operating state for the displayed devices in the "Control Operating State" dialog.
   The "State" field indicates whether the operating state change was performed.

Control Operating State dialog

The dialog shows the operating state of all configured CPUs. The display can be filtered. The change of operating state is possible per device, or for several devices simultaneously.

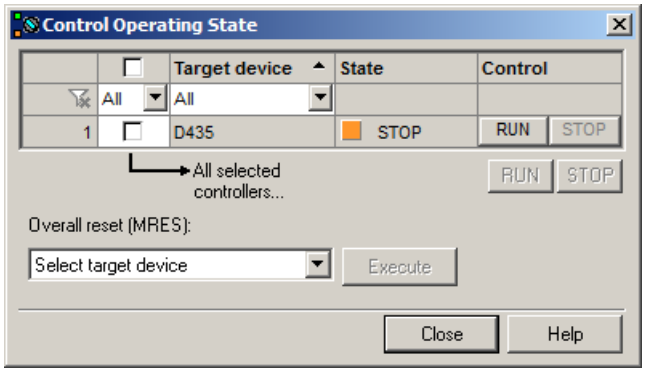

Figure 3-475 STOP operating state

Note

"Control Operating State" dialog with all configured devices

As of Version 4.4, the "Control Operating State" dialog represents all configured SIMOTION devices. The previous dialog had to be opened individually for each CPU.

Overall reset is possible in the dialog as before. You will find additional information about overall reset in the section Overall reset (Page 880).

The SIMOTION P State tool is retained unchanged.

Listed devices

The "Target device" column shows the names of the CPUs available in the project. The order corresponds to the order of the CPUs in the project navigator.

Offline/online distinction

If a CPU is in offline mode, the name of the CPU and all other assigned elements are grayed out in the table line.

The checkbox is always open for input.

Filter

The list of the CPUs can be filtered according to the following criteria:

- Selection by checkbox
- Name, or part of the name, of the CPU
- CPU in online mode

Filtering the display with the checkbox

The display can be restricted to CPUs that are activated in the checkbox column. The field in the header of the checkbox column provides a choice of the following filter values.

Table 3-46 Filter values in the checkbox column

Filter value	Filter result
All	All CPUs are displayed, irrespective of whether a check mark is set or not.
Set	Only CPUs with a set check mark are displayed.
Not set	Only CPUs without a set check mark are displayed.

If the dialog is called from the context menu of a CPU, this CPU is automatically preselected ("Context menu > Target device > Operating state").

All CPUs can be selected or deselected with the checkbox in the header.

Filtering the display by operating state or CPU name

The selection field in the header of the "Target device" column offers the following filter values:

Table 3-47 **Filter values in the Target device column**

Filter value	Filter result
All	All CPUs are displayed, regardless of whether they are in online or offline mode
Online	Only CPUs that are in online mode are displayed.
User-definable	The field can be edited, thus enabling filtering according to parts of names. Up to five user-defined filters remain for selection.

Operating states

State column: Shows the state of the CPUs in text form and via static LEDs.

Table 3-48 Operating states of a SIMOTION device

Operating state		Description
Text	**LED**	
STOP	(orange)	• Technology objects inactive (enables deleted, no axis motion) • User program is not executed • Loading a user program is possible • All system services are active (communication, etc.) • All analog and digital outputs set to "0" • The I/O modules (signal modules) are in the safe state (SIMOTION D)
STOP U	(orange/white)	• Technology objects active • Technology objects can execute jobs for test and commissioning functions • Otherwise identical to STOP operating state • STOP U means stop user program • User program is not executed
RUN	(green)	• Technology objects active • Execution of the user programs assigned to the execution system • Loading a user program is possible • The process image of the inputs and outputs is read or written
STOP	(orange/white)	• All tasks shut down, operating system stopped, real-time clock continues to run
STARTUP	(orange/white)	• The display only appears if the state persists longer than 1 second, or in the event of a fault
SERVICE	(orange/white)	• Display, e.g. if master control has been fetched by the axis control panel
SHUTDOWN	(orange/white)	• Display appears only if the state persists for longer than 1 second
(empty)	(empty)	• CPU is in offline mode

Control operating state

A CPU can be switched to the designated operating state with the RUN and STOP switches. The switching options are dependent on the position of the mode selector switch on the SIMOTION device. The setting on the device takes priority.

Table 3-49 Switching options of the software switch dependent on the position of the mode selector switch on the SIMOTION device.

Mode selector switch position of the SIMOTION device	Switching option in the SCOUT "Control Operating State" dialog
STOP	STOP
STOP U	STOP
RUN	RUN, STOP
MRES	STOP

Note

Manual switching to the "STOP U" operating state is no longer possible.

As of V4.4, manual switching to the "STOP U" operating state is no longer possible in the "Control Operating State" dialog of SCOUT.

If a CPU is in offline mode, both the RUN and STOP buttons are deactivated.

Simultaneous control of several CPUs

CPUs that are in online mode and that are selected in the filter column can be switched simultaneously to the RUN or STOP operating state. To do so, click the RUN or STOP switch below the list.

Observe that the switches only switch the CPUs that are visible in the dialog. For this reason, verify the effect of the name filter in the "Target device" column.

Error messages

A CPU that can no longer assume the required state is indicated in color. The "State" cell changes to red or yellow/orange.

- Red: Error
- Yellow/orange: Note

A single click on the corresponding cell causes an error text or information text to appear in a roll-out tip.

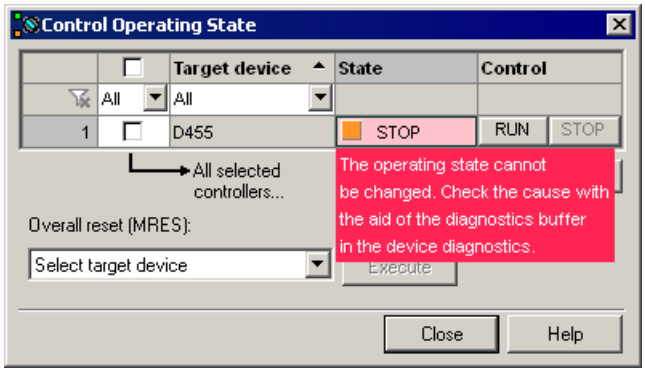

Figure 3-476 Roll-out tip with error message

Priority of the mode selector switch on the SIMOTION device

The setting of the operating state on the SIMOTION device has priority. SIMOTION SCOUT TIA can switch a SIMOTION device to the RUN operating mode only if the mode selector on the device is set to "0" or "RUN".

- **SIMOTION D**
  You can find the mode selector switch of the D410-2 and D4x5-2 in the lower area of the front behind the blanking cover.

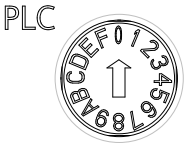

Figure 3-477 D410-2 and D4x5-2, mode selector switch, switch position 0 (RUN)

- **SIMOTION P**
  The LEDs, mode selector switch and CF card handling indicators, which are implemented as hardware on other SIMOTION platforms, are visualized on the screen for SIMOTION P.
  The display is performed via the *SIMOTION P State* application.
  The following figures show *SIMOTION P State* in the started state, using the SIMOTION P320-4 as an example.

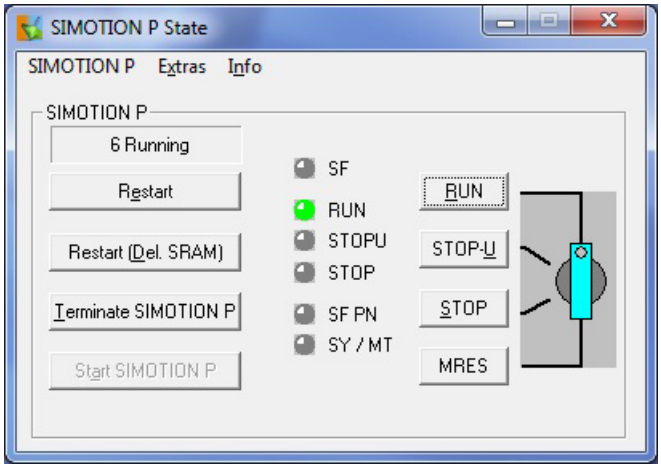

Figure 3-478 SIMOTION P State - state display

- **SIMOTION C**

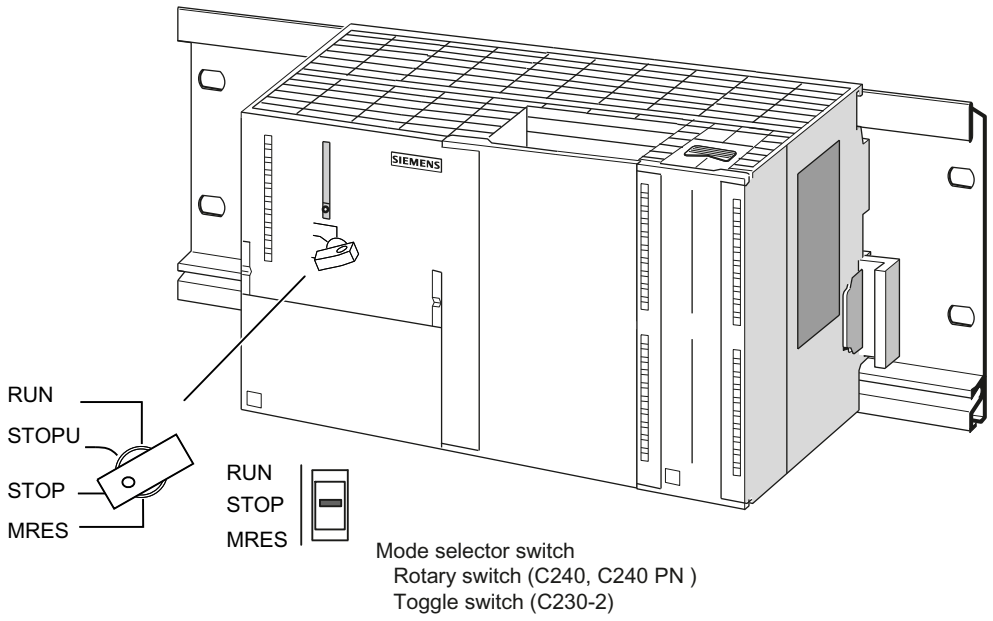

Figure 3-479 SIMOTION C module front

Overall reset

Requirement

The SIMOTION device for which overall reset is to be performed must be online.

Procedure

To execute an overall reset, proceed as follows:

1. Select "Target system -> Control operating state" in the menu to open the "Control Operating State" dialog.
   Or click "Control operating state" in the toolbar.

   The call is possible if at least one CPU of the project is in online mode.
2. Switch the SIMOTION device for which an overall reset is to be performed to the "STOP" operating state in the "Control Operating State" dialog.
3. Select the SIMOTION device under "Overall reset (MRES)". Click the "Execute" button. Confirm the command by clicking "Yes".

Result

The memory reset will now be performed.

Control operating mode (Page 873)

3.5.8.9 Know-how protection

Know-how protection

The know-how protection in SIMOTION SCOUT TIA prevents unauthorized viewing and editing of your programs or parameters directly in the drive unit. A distinction is made between the following two know-how protection types:

- Know-how protection for programs
- Know-how protection for drive units (as of SINAMICS V4.5)

Note

Write protection for drive units

In addition to the know-how protection, write protection can be set up for drive units.

See also

Know-how protection for programs (Page 882)

Know-how protection for drive units (Page 885)

Write protection for drive unit (Page 888)

Know-how protection for programs

The know-how protection protects the programs and libraries in your project. Unauthorized viewing and editing of your programs is prevented when the know-how protection is activated.

Note

If a program is copied using copy and paste, the copied program also remains locked. A program retains its know-how protection even when it is imported or exported.

Setting up a password

By specifying a login and password, the know-how protection is activated for the program. The programs included in the project are visible to the user in the project navigator, but the programs are locked. Only by entering the password can you remove the lock and open the program for editing.

Procedure

To set up a password, proceed as follows:

1. Select "Project > Know-how protection for programs > Edit default login..." in the menu. The "Edit Default Login" dialog opens.

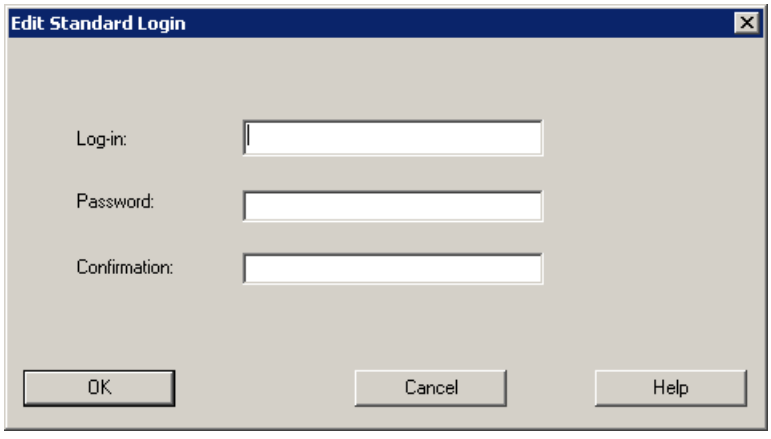

Figure 3-480 Setting up know-how protection password

2. Select the login and specify a password.

Note

The set default login remains valid for the whole project until it is deleted or SIMOTION SCOUT TIA is closed.

Configuring know-how protection

To configure the password security level, proceed as follows:

1. Select "Project > Know-how protection > Configure..." in the menu.
   The "Configure Know-how Protection for Programs" dialog opens.

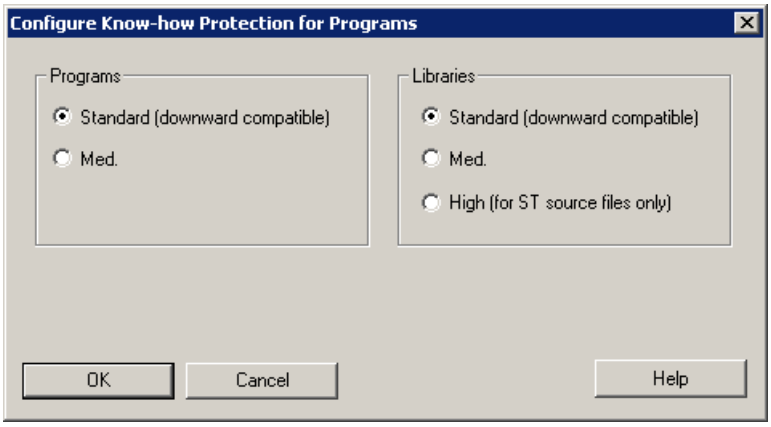

Figure 3-481 Configuring know-how protection

2. Select the required security level for programs and libraries.

Additional references

For detailed information, refer to Section "Know-how protection" in the SIMOTION SCOUT TIA Online Help.

Activating/ deactivating know-how protection

Activate know-how protection

Proceed as follows to activate know-how protection for programs:

1. Open the project and, in the project navigator, select the "PROGRAMS" folder or a program, depending on whether you want to set know-how protection for all programs or for selected individual programs.
2. Right-click to open the context menu and select "Know-how protection > Set".

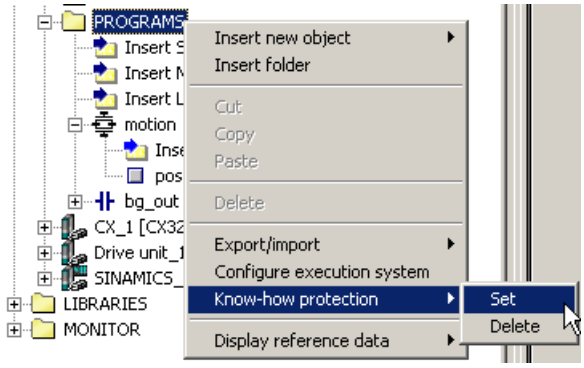

Figure 3-482 Set know-how protection

Result

The selected programs are protected and then locked. Protected programs are identified in the project navigator symbolically by a lock.

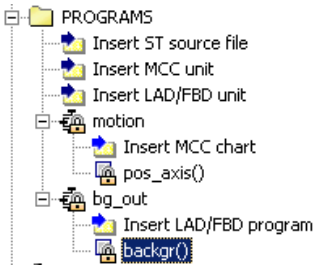

Figure 3-483 Result: Programs are protected

Only by entering the password can you remove the lock and open the program.

Deactivating know-how protection

Proceed as follows to deactivate know-how protection for programs:

1. Open the project and, in the project tree, select the "PROGRAMS" folder or the program, depending on whether you want to deactivate the know-how protection for all or only for specific programs.
2. Right-click to open the context menu and select "Know-how protection > Delete".

Result

The know-how protection for all programs or for the selected individual programs will be deleted.

Search in know-how-protected sources

If you have set know-how protection on sources, these are no longer included in the search. A search is only possible if you open the source in the appropriate editor or if you remove know-how protection again.

Note

Setting know-how protection for all programs

In ST source files, MCC charts and LAD/FBD programs, you can protect all programs in one action by setting the know-how protection directly in the "PROGRAMS" folder.

Know-how protection for drive units

The Drive unit know-how protection only applies online and is used to protect intellectual property, in particular, the know-how of machine manufacturers, against unauthorized use or reproduction of their products.

Activating know-how protection for a drive unit

Proceed as follows to activate the know-how protection for the drive unit:

1. Open the project, and in the project navigator, select the drive unit to which you want to apply know-how protection.
2. Right-click to open the context menu and select "Know-how protection for drive unit > Activate ...".
   The "Activate Know-how Protection for Drive Unit" dialog opens.

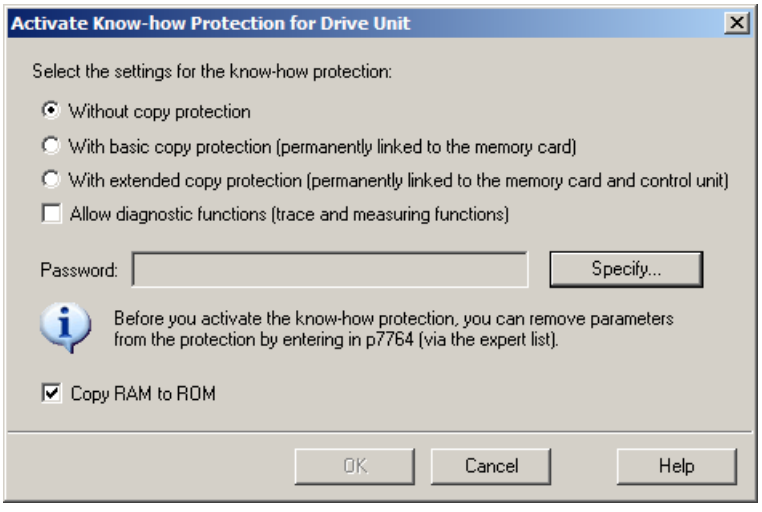

Figure 3-484 Know-how protection for drive unit

3. Specify whether the know-how protection should be set with or without copy protection.

4. Activate "Copy RAM to ROM" if the know-how protection is to be maintained permanently.
5. To set a password, click the "Set" button.
   The "Know-how Protection for Drive Unit - Define Password" dialog opens.
6. Define a password.
7. Confirm with "OK" to close the dialog.
8. Confirm with "OK" to activate the know-how protection for the drive unit.

Deactivating know-how protection for a drive unit

Proceed as follows to deactivate the know-how protection for the drive unit:

1. Open the project, and in the project navigator, select the drive unit whose know-how protection you want to deactivate.
2. Right-click to open the context menu and select "Know-how protection for drive unit > Deactivate ...".
   The "Deactivate Know-how Protection for Drive Unit" dialog opens.

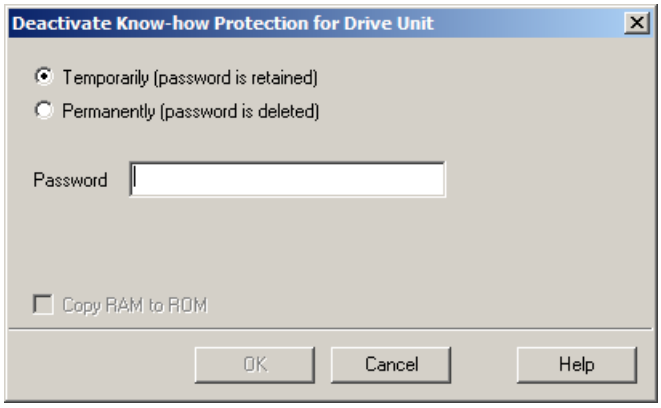

Figure 3-485 Deactivating know-how protection for a drive unit

3. Specify whether the know-how protection should be temporarily deactivated or whether the know-how protection should be deleted permanently.
   For temporary deactivation, you can activate the know-how protection via the context menu. Copying from RAM to ROM is not possible here.
4. Enter the password and confirm with "OK".

Additional references

For detailed information, refer to Section "Know-how protection" in the SIMOTION SCOUT TIA Online Help.

3.5.8.10 Access protection for technology objects

Overview

With the access protection for technology objects, you can protect important configuration data of the machine, e.g. axis settings, cams, coupling types, controller settings, etc., from unauthorized access.

With enabled access protection, the following actions can only be performed after input of a password:

- Uploading data from the controller
- Reading out data with the Web server
- Reading/analyzing data from a CF card

Note

Protect memory card from unauthorized access

It makes sense to extend the security measure and ensure that unauthorized persons have no access to the memory card.

Note

Longer controller ramp-up times

Please note that ramp-up may take longer for controllers with enabled access protection.

Managing access protection

Access protection is based on SIMOTION IT and is managed via SIMOTION IT.

You set up access protection via "Manage Config > SIMOTION IT > Access Control".

We distinguish between the following applications:

1. No access protection is set up yet.
   Set up access protection via "Manage Config > SIMOTION IT > Access Control" and assign a password.
2. Access protection is already set up. You as user are authorized to access the configuration data and have logged in successfully.
   In this mode, you can remove access protection, change the password for access protection, or enable access protection.
3. Access protection is set up and active. You have not yet logged in with a password.
   On the login page, enter your login data with password to log in.

When access protection is enabled and without login with password, the following functions are blocked:

- IT-Diag
- FTP (even when enabled in HW Config)

- OPC UA (even when enabled in HW Config)
- Upload of SIMOTION SCOUT TIA

Additional references

You can find detailed information on access protection in the "SIMOTION IT Diagnostics and Configuration" Diagnostics Manual and in the SIMOTION SCOUT TIA online help.

3.5.8.11 Write protection for drive unit

Drive unit with activated write protection

As of SINAMICS V4.5 there is a write protection for drive units. You can only activate/deactivate this write protection in online mode.

The write protection applies only online and is used for protection against accidental changes by the user. When write protection is set, p parameters can be read, but not written.

Activate/deactivate the write protection via the "Write protection for drive unit" context menu of the drive unit or via parameter p7761 of the expert list. A password is not required to activate/deactivate the write protection. You can query the status of the write protection via parameter r7760.0 in the expert list (value = 0 means that the write protection is not set).

Note

Permanent write protection

If you want to activate the write protection permanently, execute the "Copy RAM to ROM" function.

Features for drive units with activated write protection

Note the following restrictions for activated write protection of drive units:

- The write protection for drive unit always applies to the device, not to individual drive objects.
- Write protection only applies online.
- All r parameters can still be read and are visible as usual.
- All p parameters can be read, but not written. p parameters are displayed hatched.
- Parameters with the WRITE_NO_LOCK attribute can be written despite the write protection.

The following functions are available even when write protection is activated for the drive units:

- Restoring factory settings
- Upload
- Acknowledging alarms
- Control panel

- Trace
- Function generator
- Measuring functions
- Reading out the diagnostic buffer

Note
Restoring factory settings

You can restore the factory settings via the expert list (parameters p9, p976).

The following functions are not available when write protection for drive unit is activated:

- Download
- Automatic controller setting
- Stationary/rotating measurement
- Delete fault buffer (p952 must not be defined as an exception parameter)
- Delete drive unit completely or individual components thereof
- Rename drive unit

Activating/deactivating write protection for drive unit

Activate write protection

Proceed as follows to activate the Drive unit write protection:

1. Connect to the target device online.
2. Select the drive unit to which write protection is to be applied in the project navigator.
3. Right-click the drive unit and select "Drive unit write protection > Activate" in the context menu.

Result

Write protection has been activated.

Copy RAM to ROM

You can select whether the write protection for drive unit is to be set permanently by activating "Copy RAM to ROM".

Deactivating write protection

Proceed as follows to deactivate the Drive unit write protection:

1. Connect to the target device online.
2. In the project tree, select the drive unit, whose write protection you want to remove.
3. Right-click the drive unit and select "Drive unit write protection > Deactivate" in the context menu.

Result

Write protection has been deactivated.

Note

Activating/deactivating write protection in the expert list

You can activate and deactivate the Drive unit write protection also directly in the expert list via the parameter p7761. No password is required to modify the parameter p7761. Similarly, you can activate and deactivate the Drive unit write protection via script.

Additional references

For detailed information, refer to Section "Drive unit write protection" in the SIMOTION SCOUT TIA Online Help.

3.5.8.12 Configuring multilingual messages

Multilingual messages and comments can be configured with the "Language-dependent texts" function. This is necessary, for example, if you want to output multilingual user-defined Alarm_S messages or diagnostic buffer entries.

Procedure

To configure multilingual messages, proceed as follows:

1. Select "Project > Language-dependent texts..." in the menu.
   The "Select Language" dialog box opens.
2. At "Relevant text sources", select the source for which you want to configure multilingual texts, e.g. Alarm_S.
3. Add the languages for which you want to configure texts in the selected text source. To do so, click the (>) arrow key to transfer the languages from the "Other languages" field to the "Languages in the project" field.
   Dual-language messages, for example, German and English, are then in the "Languages in the project" field.

4. Set the current configuring language. To do so, select the language in the "Languages in the project" field and click the arrow-down key (v). The selected language is displayed as "Current language".
   The language-dependent texts for the selected text source are now configured in this language setting.
5. Confirm with "OK".
6. Select "Project -> Messages > Configuration" in the menu.
   The "Message Configuration" dialog box opens.
7. Check the language set at "Configuration language".
   The message texts and remarks are displayed in the language in which they were originally configured. These texts must then be translated into the new configuration language.
8. Double-click the messages for which you want to enter texts in the new configuration language.
   The "Edit Message" dialog box opens.
9. Enter the new message text and remarks in the changed language.
   The symbol name must not be changed in foreign language messages, as this symbol name is used for programming.
   Only the message text and remarks are language-dependent.
10. Confirm with "OK".
    The modified message text is entered in the Message configuration table.

Exporting and importing text sources for translation

Using the "Language-dependent texts... > Export" function, you can export the language-dependent texts within the same project for translation, and then import them again.

Proceed as follows to export text sources:

1. Select "Project > Language-dependent texts..." in the menu.
   The "Select Language" dialog box opens.
2. At "Affected text sources", select the source that you want to export for translation, e.g. Alarm_S.
3. Click the "Export..." button.
4. Navigate to the target directory and assign a file name.
5. Confirm the selection with "Save".
   A *.txt text file has been imported that contains placeholders for all languages defined in the project.

Proceed as follows to import the translated text sources again:

1. Select "Project > Language-dependent texts..." in the menu.
   The "Select Language" dialog box opens.
2. Click the "Import..." button.
3. Navigate to the translated text file.

4. Click "Open".
   The translated text source has been imported and is available in the project in the respective configuration language.
5. Select "Project > Save and compile changes" in the menu to save the changes.

Additional references

Detailed information can be found in Section "Message configuration" and in Section "Exporting/ importing language-dependent texts" in the SIMOTION SCOUT TIA online help.

Observe in particular the constraints applying to the use of language-dependent texts described in the online help under "Notes on language-dependent texts".

3.5.8.13 Exporting OPC data

Overview

The OPC interface (**O**LE for **P**rocess **C**ontrol) is the specification of a common, manufacturer independent software interface based on OLE (**O**bject **L**inking and **E**mbedding). It has been designed as an industry standard by leading automation companies with the support of the Microsoft Corporation.

Up to now, applications that accessed process data depended on manufacturer-specific interfaces. With the standardized OPC interface, you can now access process data uniformly via the OPC interface when using, for example, operator control and monitoring software.

For OPC data export, the following symbols are exported in the symbol file:

- System variables of the device and the technology objects
- Global device user variables
- Symbolic input and output variables
- Interface variables of user programs (ST source file, MCC, LAD/FBD)

Note

In the interface area of a program, a maximum of 64 KB data can be addressed for operator control and monitoring. Data beyond this area get lost during the export.

In addition, the following data can be exported for OPC Alarm/Event:

- Configured alarms (Alarm_S/Q)
- Alarms from technology objects (technology object alarms)
- All messages/alarms of the diagnostics buffer

The data is saved as an XML file in the selected target directory (OPC_AE.xml).

Exporting OPC data

Procedure

Proceed as follows to export the OPC data:

1. In SIMOTION SCOUT TIA, select "Options > Export OPC data..." in the menu.
   The "Setting the Data for Export" dialog opens.

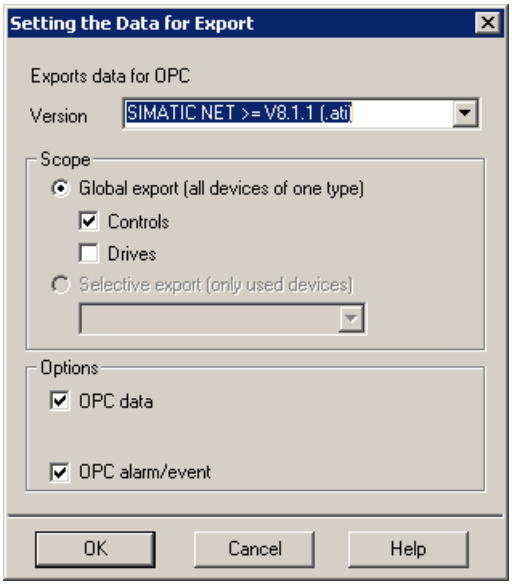

Figure 3-486 Exporting OPC data

2. Select the intended use of the data to be exported and confirm with OK.
   The "Exporting OPC data" dialog opens.
3. Select a target directory and confirm with "OK".
4. If several interfaces with different bus addresses are available on the device, also select the protocol, e.g. PROFIBUS or TCP/IP, and the interface for the export. The "Parameterize Interfaces" dialog opens. If the interfaces possess the same bus addresses or only one is being used, this dialog will not be displayed. Select the interface and protocol and confirm with "OK". An interface must be selected for all SIMOTION devices in the project. Repeat this step when required.
   The export is started. A successful export is displayed in the "Export OPC data status display" tab in the detail view.
5. If the SIMOTION devices are distributed across multiple subnets and you want to address a SIMOTION device with a SIMATIC OPC server via a router, you must configure this router again in a window after the file export in SIMOTION SCOUT TIA. If you do not want to use a router, confirm the dialog with "No".
   The following information is displayed in the "OPC Routing Information for HMI Devices" dialog:
   - All configured networks
   - All SIMOTION devices contained in the project
6. First select the subnet (location) of the OPC server.

7. Select the network station and then the first router for each network station to be addressed via the OPC server in the displayed window.
8. Confirm with "OK".

Setting the data to be exported

Note

OPC data can only be exported if a project is open. The export is possible both in offline and online mode.

Note

Default export setting

The latest version is set as default for the OPC export. As of SIMATIC Net V8.1.1 the OPC server can use the format "*.ati" and as of SIMOTION SCOUT TIA V4.4.

The data to be exported is selected in this window.

The following parameters can be selected:

Field/button	Meaning/note
Exports data for SIMATIC NET OPC	
SIMATIC NET versions	Select the SIMATIC NET version for which the export data is to be used. Different versions are not fully compatible. The SIMATIC NET >= V8.1.1 (.ati) Export is the fastest export version. The symbol file to be exported is first configured in the main memory and then exported. For this operation, you require sufficient main memory for the number of symbols. Before the export is started, the maximum number of symbols that can be exported is displayed. Check first whether the maximum possible number of symbols is greater than the number of symbols in your export.
Scope	
Global export	Under "Global export", activate the data (control data, drive data) that you want to export. All the required variables of the controller (SIMOTION CPU) are exported with the control data. Only drive data of drives of the SINAMICS family can be exported. Whereby the drive must be inserted below a SIMOTION CPU. The export of data of single drives and drives below a SIMATIC CPU is not possible.
Selective export	Activate "Selective export" if you only want to export certain variables. You must first have compiled these variables in watch tables in SIMOTION SCOUT TIA. In the selection list, you can then select the watch table whose variables are to be exported. A selective export is only possible when you have inserted watch tables in the project. You can create watch tables in the project tree by clicking "Insert watch table" in the "MONITORING" folder. The drive parameters are copied to the watch table using the expert list of the associated drive object.
Options	

Field/button	Meaning/note
OPC data	Activate OPC data if the symbol names and variable names are to be exported from the current SIMOTION project. If the option is deactivated, no data is exported.
Arrays with single elements	Activate the option if the arrays' single elements are to be exported with them. If the option is deactivated, only the first address of the array is exported and the data export can be shortened and the data volume reduced.
OPC alarm/event	Activate OPC alarm/event if you want to export the configured alarms and alarm texts. All existing languages of the alarms are exported to the file. If the option is deactivated, no alarms are exported.

OPC export - OPC data

The target directory is defined in the "Project Export" window.

You can set the following parameters:

Field/button	Meaning/note
Export settings	
Enter a target directory for the export	To select a target directory for the files to be exported, proceed as follows: 1. Click Browse to the right of the text field. A window opens. 2. Specify a target directory. 3. Confirm with "Open". Your selection is displayed in the text box.
Project path	The path of the currently opened project is displayed here. The symbol name of the current project is exported as a file or files.

Exporting OPC data, ati export (main memory)

SIMATIC NET >= V8.1.1 (.ati) export

The SIMATIC NET >= V8.1.1 (.ati) export is faster than the old versions of the OPC export. However, it requires more main memory as the symbol file must be configured in the main memory. For this operation, you require sufficient main memory for the number of symbols.

Therefore, at the start of the export, a calculation is made as to how many symbols can be exported with the available main memory. Check first whether the maximum possible number of symbols is greater than the number of symbols in your export. If the calculated number is not sufficient for the export of the project data, then you still have to use the other export versions, e.g. SIMATIC NET V7.x/V8.0.

Assigning the connection parameters

Assign the parameters for the connection in this window.

The following parameters can be selected:

Field/button	Meaning/note
Device	The device for which you must select the protocol and the interface is displayed here. You must specify the interface settings for each device in the project. You must specify these settings in this window depending on the number of devices.
Connection name	With V4.3, it is possible to use device names that do not satisfy the ST conventions. If the name of the device violates these conventions, a name valid for the OPC export is displayed at "Connection name". The following is modified in the name: • Invalid characters are replaced by a "_". • If the first character is not a letter, an "A" is set as prefix. • A number (_<n>) is added at the end, if not already available, so that the connection name is unique. You can rename the name modified in this way. Since the connection name and the device name may be different, the device/connection assignment is also exported in a file (OPC_device_connection.dat).
Protocol	Selects the transmission protocol for the SIMOTION device. **PROFIBUS** Protocol for PROFIBUS **TCP/IP** Protocol for Ethernet
Interface	Use "Interface" to select the interface for the symbol names to be exported. The SIMOTION device is addressed via this interface from the HMI software. Each symbol name must be uniquely assignable to a hardware address (bus address). This assignment is set via the "Interface" selection. **Notice** : If the interface is parameterized for isochronous bus cycle, then it must not be used for an OP.

OPC routing information (routers)

If the SIMOTION devices are distributed across multiple subnets and you want to address a SIMOTION device with a SIMATIC OPC server via a router, you must configure this router again in a dialog after the file export in SIMOTION SCOUT TIA.

In the "OPC routing information for HMI devices" dialog, the following is displayed:

- All configured networks
- All SIMOTION devices contained in the project

First select a location of the OPC server and then the first router for each node to be addressed via the OPC server.

Several projects interconnected

To communicate with the SIMOTION devices in a network interconnection through several projects, the SIMATIC NET OPC server must be forwarded the following files and items of information:

- "OPC Alarm/Event" files, which may originate from several SIMOTION SCOUT TIA projects
- Time zones
- Router

An auxiliary program, "SIMOTION OPC File Manager", enables you to configure this data for the SIMATIC NET OPC server.

Exporting OPC data, status display

The status is displayed in the "Export OPC data status display" tab in the detail view during the export.

The following information can be displayed during export:

Information displayed	Meaning/note
Error messages	Error messages are displayed in plain text if export fails. The following errors are possible: • 64k overshoot. • Export file with symbol names already exists and is being used by another application.
Location and name of the exported data	Displays the storage location of the exported files after the symbol names have been successfully exported.

3.5.8.14 Licensing of the runtime components

Licensing of the runtime components

Overview for the licensing

Licensing of the technology functions

Functions can be licensed using the following software options:

- Motion control technology functions
  The licensing is performed axis-specifically for:
  - POS; use of the technology functions for positioning axis
  - GEAR; use of the technology functions for following axis and path axis
  - CAM; use of the technology functions for cam axis

The GEAR technology function contains the POS technology function, while the CAM technology function contains the POS and GEAR technology functions.

The MultiAxes package permits a simple licensing of the Motion Control technology functions. It contains the license for the unlimited use of the POS/GEAR/CAM technology function on a SIMOTION device, e.g. a D4x5-2.

- TControl technology function
  The TControl technology package functions are licensed on a channel-specific basis in packages of eight temperature channels.

Note

For SIMOTION C, D and P, licenses for Runtime software can also be ordered as pre-installed software (via order code / Z option) on the memory card.

Additional references

You will find information on further licensed technology functions and detailed information on licensing the runtime software and the order data under:

- SIMOTION, SINAMICS S120 & SIMOTICS, equipment for production machines, PM 21 catalog
- PM 21 catalog, section titled SIMOTION runtime software
- Configurator for SIMOTION Runtime licenses in the Industry Mall (http://mall.industry.siemens.com)

Licenses and license key

Depending on the type and number of runtime components used in the project, licenses must be acquired as part of the licensing procedure for SIMOTION. The licenses required for a SIMOTION device are assigned to a license key. This license key is stored on the storage medium of the SIMOTION device during the licensing procedure.

There are two ways of ordering licenses:

- Preinstalled licenses
  The license key is already stored on the card.
- Ordered licenses (Certificate of License)
  These licenses must be assigned to the storage medium using the Web License Manager. The Web License Manager can be found on the Internet under:
  Web License Manager (http://www.siemens.com/automation/license).

  Note

  Web License Manager login

  You can find the required login data, e.g. license number and the delivery note number, on the license sticker on the software.

  The license key is transferred to the hardware with SIMOTION SCOUT TIA.

You require the following information to obtain the license key:

- The serial number of the SIMOTION device memory medium
  You can obtain the serial number from the memory medium or have it displayed online in the SIMOTION SCOUT TIA (licensing wizard).
- The serial number of the CoL (Certificate of License)
  You have this number on paper.

Table 3-50 The serial number on the SIMOTION hardware assigned to the SIMOTION device

SIMOTION device	Hardware serial number of the module
SIMOTION C2xx	SIMOTION Micro Memory card
SIMOTION D	SIMOTION Compact Flash card
SIMOTION P	You can find this information on the rating plate of the SIMOTION P, starting with SVP...

License keys can be generated separately from the licensing.

Note

Archiving the licensing data

When the SIMOTION memory card is deleted or formatted, the licensing data is also deleted. Archive the licensing data in order to be able to transfer it again to the memory medium in such a case. If the data is not backed up, you have to perform the licensing again. You can display the entered license key in the Web License Manager.

You will find additional information in Section License key delete protection (Page 902).

Determining licensing requirements

License requirement

Determine your license requirement only if you have completed the configuration, and before you load it into the target device! Before you begin, the project must have been saved and compiled.

If you have not acquired any licenses yet, under-licensing is displayed.

You can determine the licenses in the following ways:

- **Offline mode** with open project
  The required licenses are displayed.
- **Online mode** with open project
  A comparison of the required and actual licenses is displayed.
- **Online mode** without project
  The actual licenses of the selected SIMOTION device are displayed.

Procedure

To determine the license requirement, proceed as follows:

1. Select the SIMOTION device in the project tree.
2. Select "Licenses" in the context menu.
   The required licenses for the project or a comparison of required and actual licenses are displayed.
3. You can close the window with "X" or continue with "Perform licensing...".

The license check, i.e. the inspection of the license key, is carried out in the target system. Possible responses in the case of under-licensing can be found in Section Underlicensing (Page 902).

Memory cards can be purchased with integrated runtime licenses, which do not require separate licensing.

Note

A license which has already had a license key allocated can no longer be taken.

It is possible, however, to add licenses to an already generated license key.

Display the available licenses of the SIMOTION device

Displaying via accessible nodes

You can use the list of "Accessible nodes" to determine the specific licenses that have already been assigned to the SIMOTION device. You can access the data of the SIMOTION device directly.

Note

This step is not necessary if the required and actual licenses are displayed within a project.

Requirements

- SIMOTION SCOUT TIA has been started.
- SIMOTION SCOUT TIA is in offline mode.

Procedure

To display the licenses assigned to the SIMOTION device, proceed as follows:

1. Select the menu "Project" > "Accessible nodes" menu.
   The list of accessible nodes is displayed in the working area.
2. Select the relevant SIMOTION device.
3. Select the "Licenses" command in the context menu.
   The "Licenses" dialog opens. The actual licenses of the selected SIMOTION device are displayed.
4. You can close the window with "X" or continue with "Perform licensing...".

Performing the licensing

If there are no pre-installed licenses, you can acquire the licenses you need and then generate the license key required.

Requirements

Licensing is subject to the following requirements:

- The configuration has been completed.
- The project has been saved and compiled.
- The required licenses have been determined.
- The license key has been determined or the serial numbers of the memory medium and the CoL are available.
- SIMOTION SCOUT TIA is in online mode.

Procedure

To perform the licensing, proceed as follows:

1. Select the relevant SIMOTION device in SIMOTION SCOUT TIA.
2. Select the "Licenses" command in the context menu.
3. In the "Licenses" dialog, click "Perform licensing...".
   If the "Use wizard" option is activated, a wizard guides you through the licensing procedure.
   If the option is not activated, the window for expert licensing opens. You can enter the license key there without running through the wizard.
   If you have not yet generated the license key, the wizard gives you the option of switching to the Web tool to generate a license key. Then return to the wizard.
4. If you have an online connection, continue with item 5.
   Otherwise, you can establish an online connection with "Online" in the (Step 2 of 3) window.
5. Enter the license key in the (Step 3 of 3) window.
6. Click the "Finish" button.
   The wizard closes. Licensing is complete.

Note

The license key is written to the retentive memory when the project data is transferred to the target system.

Changing the license key

Through changes in the project, such as through the inclusion of an additional axis, the license key for the project can lose its validity. This is why under-licensing is displayed when the project is downloaded and the SF LED flashes at 0.5 Hz.

After you have determined the actual requirement and purchased the necessary licenses, generate the license key again. Now replace the license key already entered with the newly generated one.

Licensing during hardware replacement

For the replacement of licensed SIMOTION components (MMC, CF, etc.), the associated license key must be assigned to the new SIMOTION component. In this case, contact the Customer Support for assistance.

License key delete protection

The license key is stored in the "KEYS" directory on the SIMOTION Memory Card.

When the controller starts up for the first time, the license key will be saved in the boot sector of the card and from this time is protected from being lost.

Deleting the license key in the boot sector through user operation is not possible, also not by formatting the card or by using the "Write boot sector..." function.

If the license key is no longer present on the card, it will be written again during startup from the boot sector to the "KEYS" directory. This means that the system will repair any deletion on the "Key" file.

The license key can be changed at any time, e.g. through relicensing. At the next startup, the license key will be saved again in the boot sector.

Underlicensing

If SIMOTION SCOUT TIA detects the presence of under-licensing during license verification, an entry is made in the diagnostics buffer. The verification is repeated every hour, and an entry is made in the diagnostics buffer each time under-licensing is detected.

The following information can be read from the diagnostics buffer entry:

- Number of required licenses
- Number of actual licenses
- Operating mode

As an additional warning signal, the SF LED flashes at 0.5 Hz as long as under-licensing is present on the system. Underlicensing will only be displayed if no acknowledgeable technological event is pending, as the same SF LED is used to indicate this as well.

Determining licensing requirements (Page 899)

3.5.9 Service and diagnostics

3.5.9.1 Diagnostic functions in SIMOTION SCOUT TIA

There are extensive diagnostic options in the online mode within the SIMOTION SCOUT TIA for the operation of SIMOTION devices. These diagnostic options are summarized in the diagnostics overview:

- The diagnostics overview is a tab in the detail view and is available by default in the online mode. You can call up detailed displays from here.
- An "Alarms" tab is also available in the detail view. This provides a tabular overview of
  - Technological alarms (from technology objects)
  - Alarm_S messages (from user programs)
    The alarms can be acknowledged either individually or all together.
- The "Address list" tab in the detail area offers extended functions in terms of I/O diagnostics and hardware availability.
- With the device diagnostics, you determine extensive diagnostic information (e.g. diagnostics buffer, system utilization, task status, etc.).
- You can record signal charts with the trace tool. The values of system variables can be recorded during runtime for diagnostic purposes.
- Program testing and debugging, e.g. modify variable, program status, breakpoints.
- Back up diagnostic data including non-volatile data (retain data) to CompactFlash card (for SIMOTION D) or MMC (for SIMOTION C).
- Back up the HTML pages, including the current contents for diagnostic purposes, on the CF card or MMC.
- Restore backed up non-volatile data (retain data).
  Further information can be found in the FAQ section on the Utilities & Applications DVD under: FAQs > Engineering > Backing up diagnostic data and non-volatile data.
  SIMOTION IT also offers comprehensive diagnostic options that can be easily accessed via an Internet browser.

Additional references

Detailed information can be found in:

- SIMOTION ST Structured Text Programming and Operating Manual
- SIMOTION MCC Motion Control Chart Programming and Operating Manual
- SIMOTION LAD/FBD Programming and Operating Manual

- SIMOTION SCOUT TIA Online Help

3.5.9.2 Using the diagnostics overview

The diagnostics overview is available as a tab in the detail view when the project is in online mode.

- In the detail view, select the "Diagnostics overview" tab.

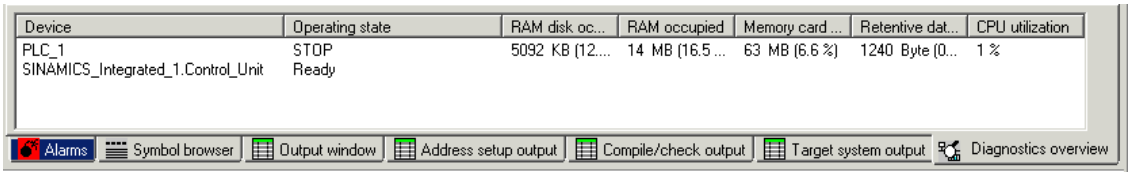

Figure 3-487 Diagnostics overview in the detail view (online mode)

The following are displayed for each accessible SIMOTION device:

- Operating mode
- Memory used (absolute and percentage display)
  RAM disk, RAM, memory card, retentive data
- CPU utilization (percentage display)

The drive units are also displayed. To obtain a detailed display of the individual devices, open the device diagnostics.

3.5.9.3 Device diagnostics

In online mode, the device diagnostics function enables you to obtain a comprehensive display of diagnostics results of the individual SIMOTION devices.

To display the diagnostic results of the individual devices, follow these steps:

1. Select the desired SIMOTION device in the project navigator.
2. Select the "Target system > Device diagnostics" menu.
   Or double-click the SIMOTION device in the Diagnostics overview tab in the detail view.

Note

Device diagnostics for several SIMOTION devices

You may open the device diagnostics for several SIMOTION devices simultaneously. This allows you to compare different devices.

You can also access these device diagnostics via the "Accessible nodes" function.

The "Device Diagnostics" window will open in the working area of the workbench. This window provides you with the following information:

- General information
- Diagnostics buffer
- Task runtimes
- Memory utilization
- System utilization
- Userlog file

- Syslog file
- Alarms

You can work with this information as follows:

- Print:
  Select the "Project > Print" menu.
- Save it as a text file:
  Click "Save".
- Refresh:
  Click "Refresh" or press the <F5> function key.

You can also monitor and change the operating state:

- Click "Control operating state".

General information on the SIMOTION device

To obtain general information on the SIMOTION device, proceed as follows:

- Select the "General" tab in the device diagnostics.

The following information will be displayed:

- Name and system ID of the SIMOTION device
- Operating state of the SIMOTION device
- MAC addresses
- IP addresses
- Subnet mask

- Standard gateway
- Article numbers and designations of the deployed components, e.g. SIMOTION device, Motion Control technology package.

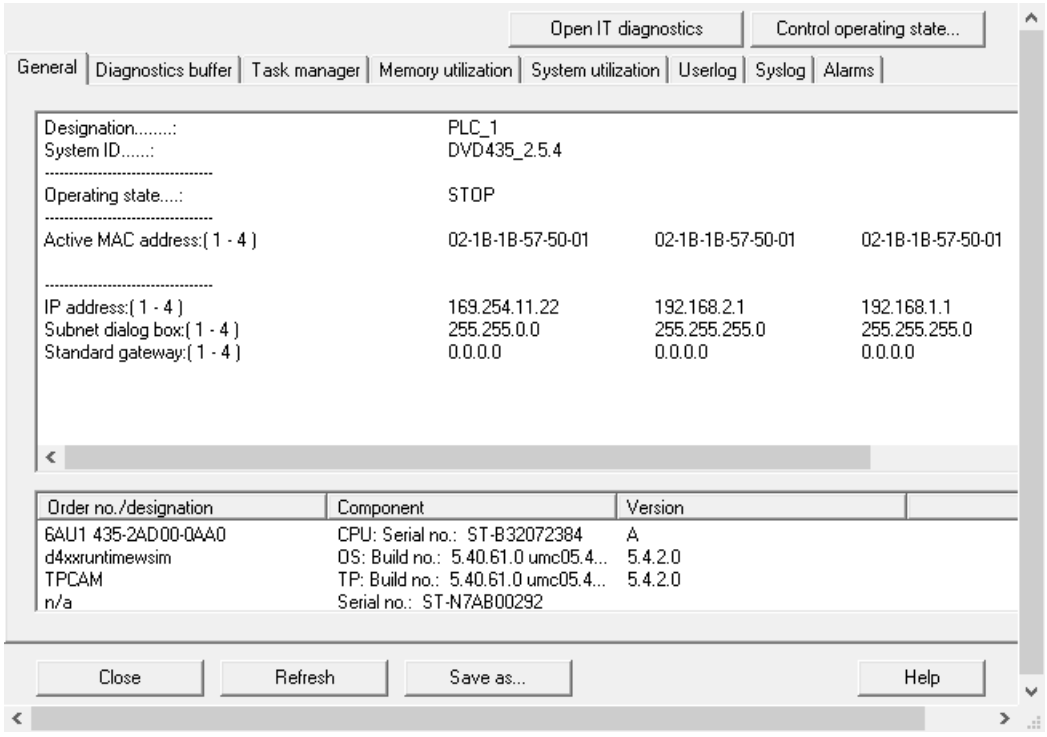

Figure 3-488 Display of general information in the device diagnostics

Diagnostics buffer

The diagnostics buffer is part of the system status list. It is possible to jump to the error position from the diagnostics buffer. It logs important events (e.g. changes in module state) in the order in which they occur. These include the following:

- Faults in a module
- Faults in the process wiring
- System errors in the CPU
- CPU operating state transitions
- User-defined diagnostic events
- Technology object alarms
- Alarm_S messages
- Errors in the user program
- User-defined entries with the _writeAndSendMessage() function
- Compatibility errors, e.g. between the drive software and SIMOTION (SIMOTION D)

To display the diagnostic buffer events, proceed as follows:

1. Select the "Diagnostics buffer" tab in the "Device Diagnostics" dialog.
   The saved events are displayed in tabular form.
2. Select the event for which you want to display more information.
   Detailed information for the selected event is displayed in the lower pane of the window.

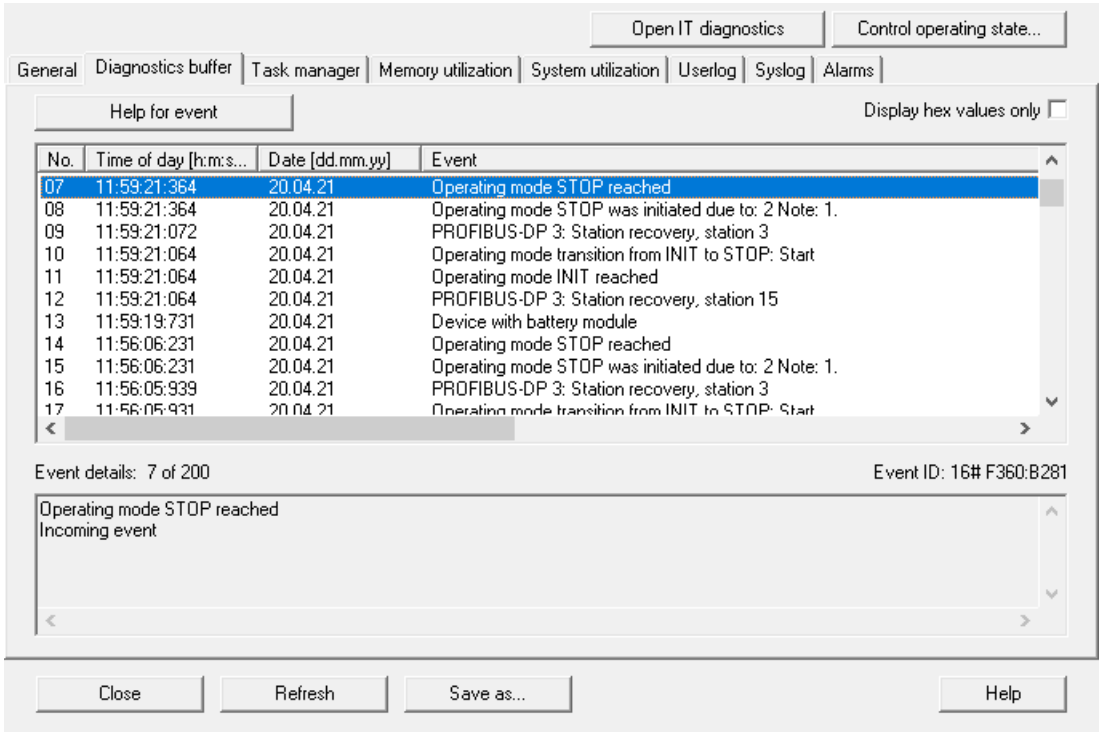

Figure 3-489 Example of the diagnostics buffer display in the device diagnostics

Task Manager

You can display the task runtimes and the status of the tasks set up in the project if you are connected online with the device. The resolution of the displayed task runtimes is performed in the servo cycle clock.

Note

The task runtimes are calculated to the µs and indicate the effective level runtime of the respective task (including the interrupt times). Thus, these correspond to the values of the "effectiveTaskruntime" device variables.

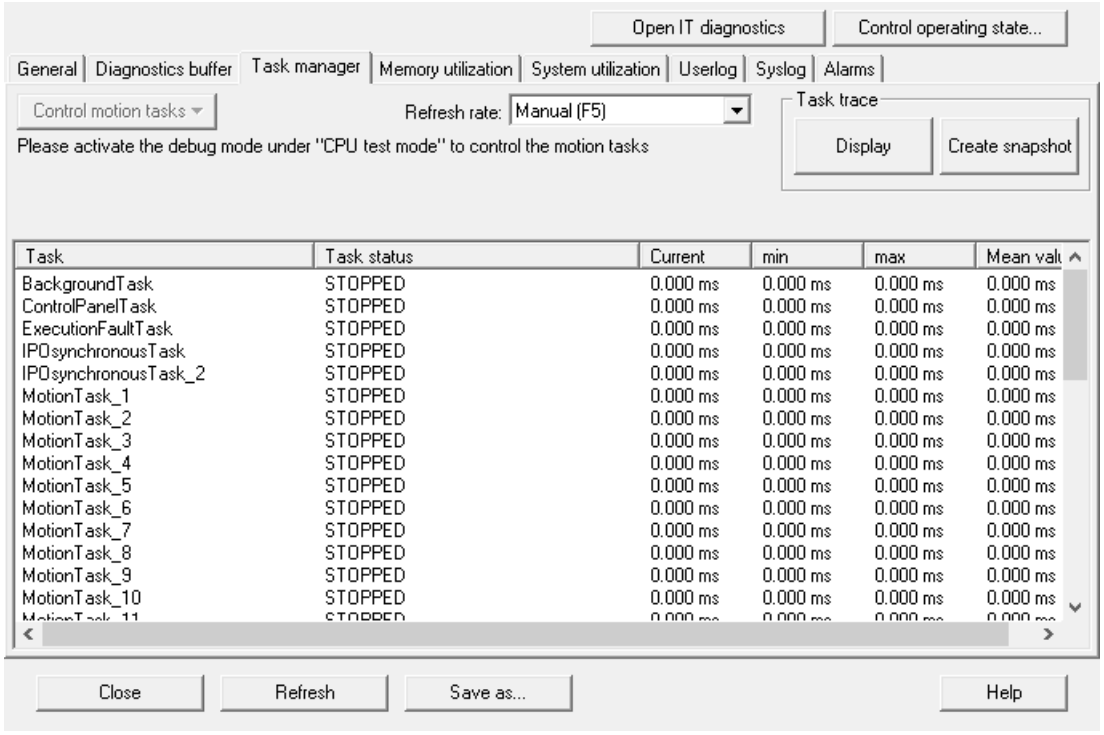

Figure 3-490 Example of the displayed task runtimes in the device diagnostics - STOPPED status

The display is refreshed according to the refresh rate selected. The status and the following values are then displayed:

- Current runtime (current):
  Value of last polling
- Minimum runtime (min.):
  Minimum value since last transition from STOP to RUN
- Maximum runtime (max.):
  Maximum value since last transition from STOP to RUN
- Mean runtime (mean value):
  Value averaged from the last 10 cycles

The runtimes measured include the interruptions by higher-priority tasks.

Meaning of the various status displays:

- RUNNING (TASK_STATE_RUNNING)
  Task running, e.g.:
  - By "_startTask" function
  - As an active cyclic task
- RUNNING_SCHEDULED (TASK_STATE_RUNNING_SCHEDULED)
  Task is interrupted by the system.
  If the task status RUNNING_SCHEDULED remains pending for a long time, it identifies a long running user task, e.g. a programmed endless loop.

- STOP_PENDING (TASK_STATE_STOP_PENDING)
  Task has received signal to stop; it is in a state between RUNNING and STOPPED.
  Actions may be performed until the task has stopped.
- STOPPED (TASK_STATE_STOPPED)
  Task stopped (e.g. via "_resetTask" function), completed or not yet started.
- SUSPENDED (TASK_STATE_SUSPENDED)
  Task suspended by function "_suspendTask".
  Use "_resumeTask" *(name)* to cancel this command. The task then resumes from the point at which it was interrupted.
- WAITING (TASK_STATE_WAITING)
  Task is waiting due to the function "_waitTime" or "WAITFORCONDITION".
- WAITING_FOR_NEXT_CYCLE (TASK_STATE_WAIT_NEXT_CYCLE)
  TimerInterruptTask waiting for start trigger.
- WAITING_FOR_NEXT_INTERRUPT (TASK_STATE_WAIT_NEXT_INTERRUPT)
  SystemInterruptTask or UserInterruptTask is waiting for the triggering event to occur. When an interrupt occurs, the SystemInterruptTasks are started and executed once. Up to eight incoming interrupts can be stored in the buffer. If another interrupt occurs, the buffer overflows and the CPU goes into STOP operating state.
- LOCKED (TASK_STATE_LOCKED)
  Task locked by function "_disableScheduler".
  This status prevents the activation of all user tasks (except the IPOSynchronousTask and IPOSynchronousTask_2) until the "_enableScheduler" command is called. It does not, however, affect system tasks. The time watchdog for cyclic tasks is **not** suspended.

  Note

  This also prevents the activation of the SystemInterruptTasks and UserInterruptTasks.

Controlling MotionTasks

It is possible to control MotionTasks via SIMOTION SCOUT TIA without a user program. Consequently, you can test programs and influence MotionTask sequences in a very specific way. Selected MotionTasks can be stopped, and locked or restarted for the sequence.

This means that programs in MotionTasks can also be downloaded in RUN mode. If you have made changes to sources and want to reload them in RUN mode, an active MotionTask can prevent this. To avoid this problem, you can terminate MotionTasks specifically with SIMOTION SCOUT TIA and then carry out the download in RUN mode.

Additional references

More detailed information on downloading in RUN mode can be found in:

- SIMOTION Runtime Basic Functions Function Manual
- SIMOTION SCOUT Task Trace Function Manual

Checking memory utilization

To display the memory utilization, proceed as follows:

1. Select the "Memory utilization" tab in the device diagnostics.

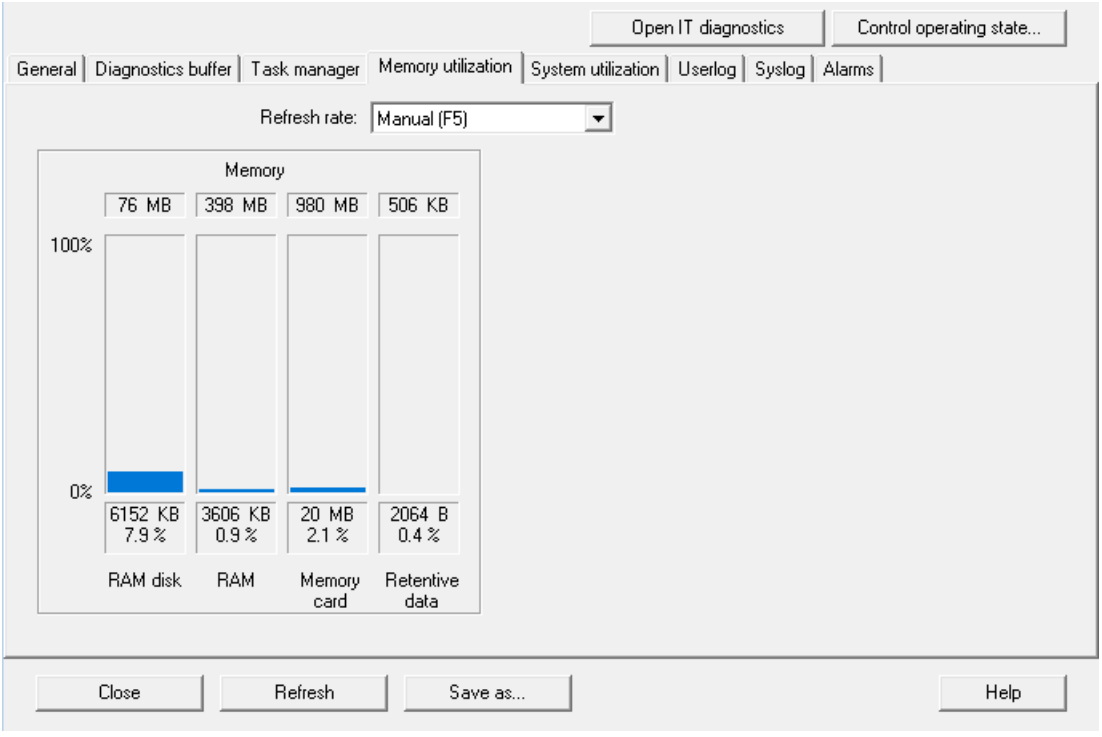

Figure 3-491 Example of the memory utilization display in the device diagnostics

Additional references

More detailed information on this topic can be found in:

- SIMOTION Runtime Basic Functions Function Manual, Section "Overview of the memory in the target device"
- SIMOTION SCOUT TIA Online Help

Checking the system utilization

To display the system utilization, proceed as follows:

- Select the "System utilization" tab in the device diagnostics.

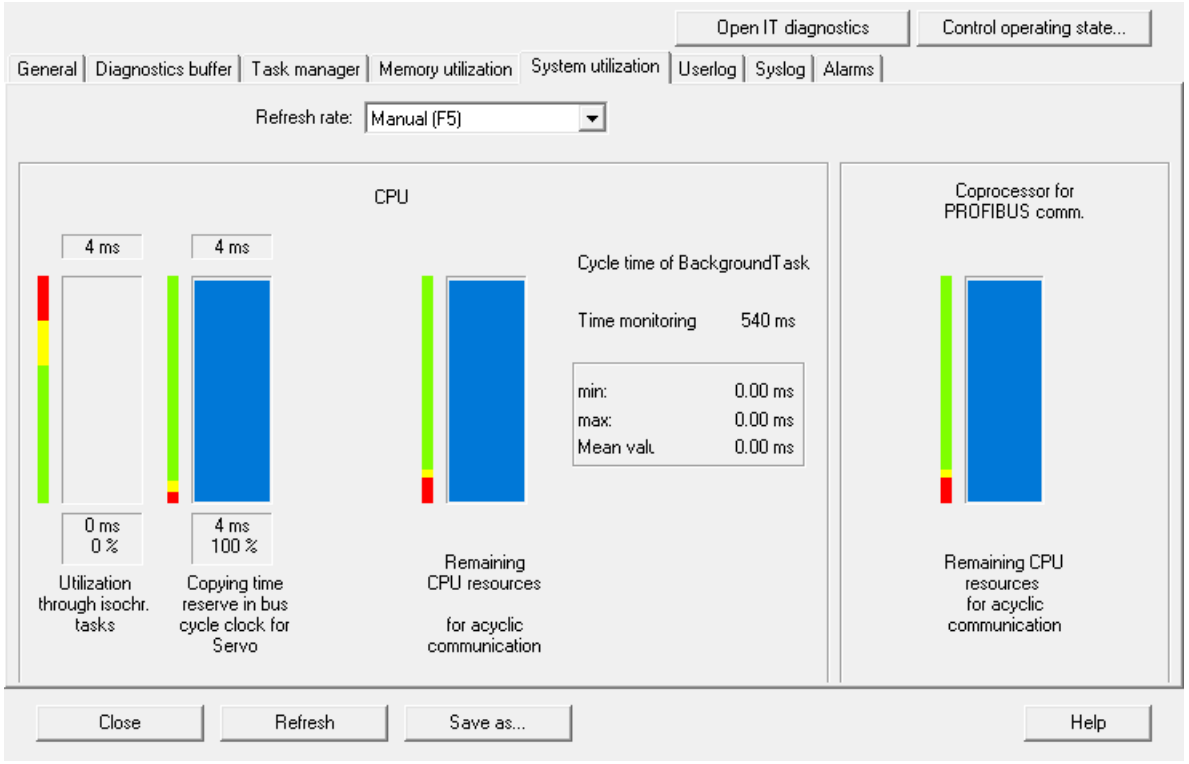

Figure 3-492 Example of the system utilization display in the device diagnostics

Additional references

More detailed information on this topic can be found in:

- SIMOTION Runtime Basic Functions Function Manual, Section "Overview of the memory in the target device"
- SIMOTION SCOUT TIA Online Help

User log file

With the Userlog file, you can store your own texts in the RT system. This is necessary, for example, when changes, which are to be documented, are made in the SIMOTION system on a plant which has already been commissioned.
Changes can be written in the SIMOTION SCOUT TIA. These are loaded to the ROM of the target device. When required, the text strings can be read out again. The text editor for the Userlog file is integrated as a tab in the device diagnostics Snap-in. This function is only available in online mode.

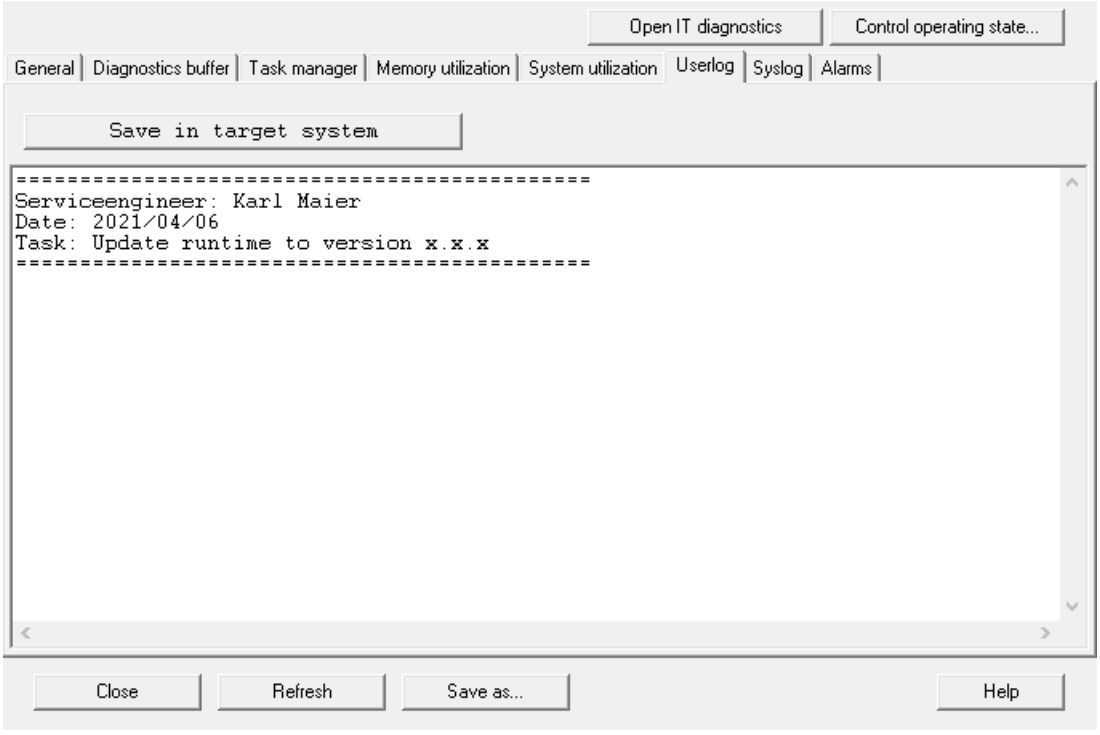

Figure 3-493 Example of the Userlog file display in the device diagnostics

How to work in the Userlog file

- In the Device diagnostics, select the "Userlog" tab.
  The editor is in edit mode, i.e. you can write or delete immediately.
  The system does not add any additional system content, such as date/time.
  Enter the information.
- To save, click "Save as..." The Userlog file is saved as a .txt file.
  All text entries can be changed or deleted at any time.
  Access protection is not available.
- The Userlog file can also be read without the project.
  The online mode is necessary for this.
- The Userlog file remains after "Delete user data".

Syslog file

In addition to the user-defined Userlog file, the SIMOTION device also has a Syslog file. The ROM actions entered therein facilitate a subsequent diagnosis. This function is only available in online mode. The information of the Syslog file can also be read without a project.

The Syslog file logs the following actions:

- RAM2ROM
- Overall reset
- Formatting the card from SIMOTION SCOUT TIA

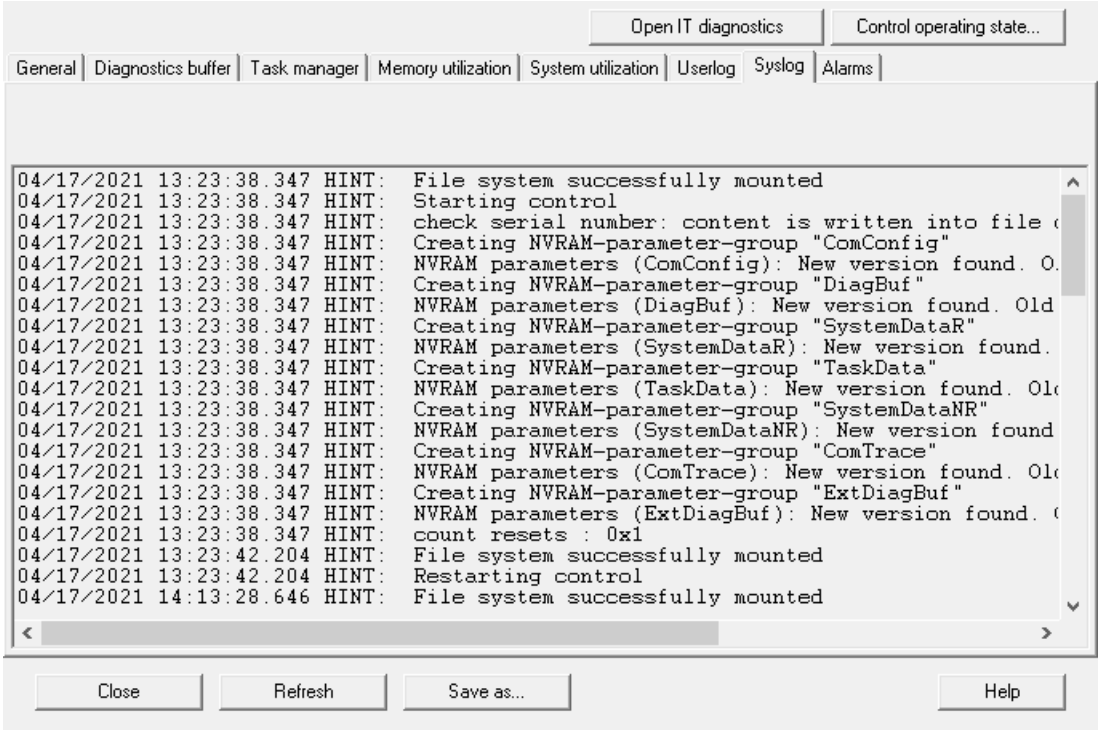

Figure 3-494 Example of the Syslog file display in the device diagnostics

Alarms

In the device diagnostics "Alarms" tab, pending alarms and configured messages are displayed in the same way as in the "Alarms" tab in the detail view.

Note

Alarm_S messages

When configuring Alarm_S messages, observe the specifications for the TIA Portal data type formattings.

Detailed information is contained in the information system of the TIA Portal at "Configuring messages".

Detailed information can be found in the SIMOTION SCOUT TIA Online Help, in the Alarms output window.

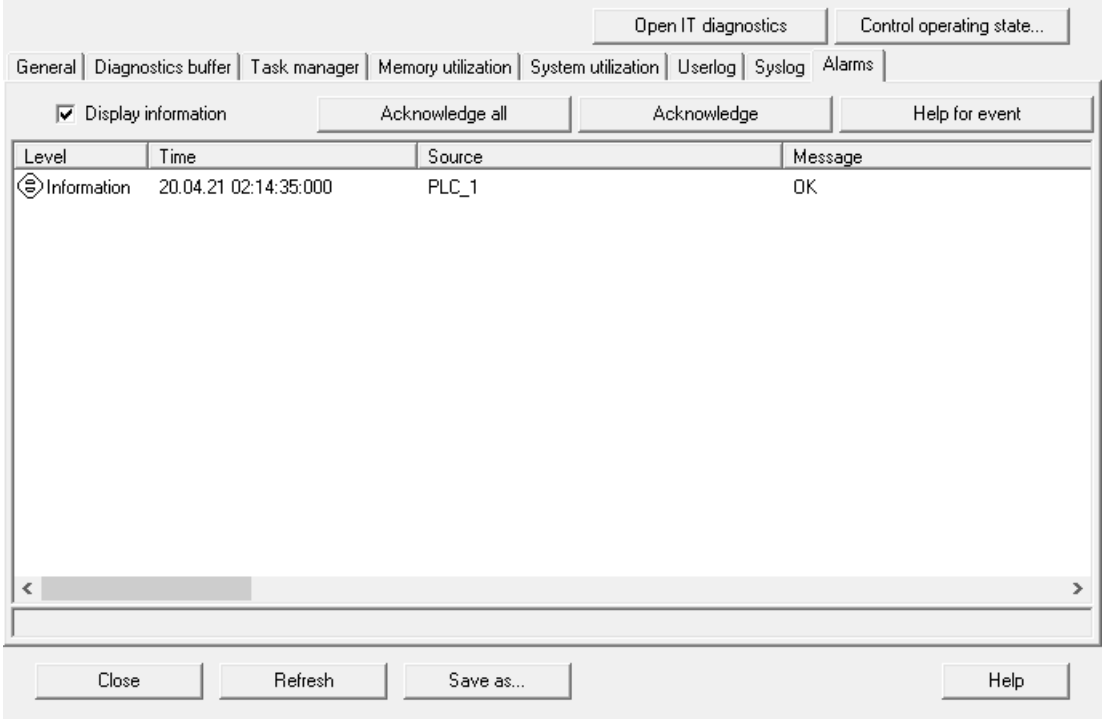

Figure 3-495 Example of the displayed alarms in the device diagnostics

3.5.9.4 Diagnostic functions in the address list

The Address list provides more features for I/O diagnostics. In online mode, the information is displayed in the "Availability" column. Detailed information is available via a tool tip if you move the cursor over the relevant cell.

To open the address list, proceed as follows:

1. Browse to the folder for your device in the project navigator.
2. Double-click the "ADDRESS LIST" item.
   The address list opens in the detailed area.

The following diagnostic information is recorded:

- I/O stations that have failed completely
- Modules have been removed, e.g. for ET200SP
- Deactivated I/O stations
- I/O variables working with substitute values
- I/O stations whose set topology differs from the actual topology
- I/O stations configured to be isochronous are not isochronous
  - Distributed synchronous operation
  - Drive units
  - Isochronous I/O

- Partner device, e.g. I-Device, I-Slave, is in STOP state
- For PROFINET devices: Provider state / consumer state displays errors
  - Controller
  - I/O device
  - Module
  - Submodule

Additional references

Further information can be found in the description of the "_quality()" system function in Section *Detailed status of I/O variables (as of kernel V4.2)* in the SIMOTION ST Structured Text Programming and Operating Manual.

For further information on diagnostics with the address list, please refer to the Online Help.

3.5.9.5 Trace and measuring functions

Trace, measuring function, and automatic controller setting

Overview

SIMOTION SCOUT TIA provides support for the commissioning and optimization of technology objects and user programs. The following functions are available:

- Device trace / function generator
- System trace
- Measuring function
- Automatic controller setting

Calling trace and measuring functions

To call the trace and measuring functions in SIMOTION SCOUT TIA, proceed as follows:

1. Select the SIMOTION device in the project navigator.
2. Select "Target system" in the menu and select the desired function.
   Or click the desired function in the toolbar.

① ② ③ ④

① Device trace / function generator
② System trace
③ Measuring function
④ Automatic controller setting

Device trace / function generator

You can use the device trace to record and evaluate parameters as well as system and program variables.

The device trace for system variables is mainly used to analyze time-synchronous sequences in the real-time system.

An automatic multiple trace is available as of SINAMICS V4.6. It can be used to trigger a recording automatically according to the trigger conditions. The measurement is stored as a YDB file (SIMOTION) or ACX file (SINAMICS) in a ring buffer on the memory card. At least five measurements can be stored in the ring buffer.
You can parameterize the multiple trace on the Trace tab under "Save to device (memory card)".

Program variables can be traced in order to find logical errors in the execution system or in user programs. For this purpose, rather than a time-triggered measuring task, an event-triggered measuring task in the RT system can be used. The event that causes the measurement recording is the execution of a specific code position in the user program by the RT processor. To start recording, a trigger event based on the variable can be selected on the Device trace tab (on a positive edge, a tolerance range or a bit map, for example).

The function generator can be used for test purposes to dynamically generate setpoints with defined shapes (e.g. rectangle, sine) for various system variables. With the aid of the trace, for example, the system response can be recorded in order to optimize the controllers. Two function generators are provided which you can start separately or simultaneously. You can also output the signals of the two function generators to a system variable at the same time. The signals are then superimposed.

System trace

You can use the system trace to record and evaluate parameters, system variables, and program variables from multiple CPUs at the same time. It is essential that the CPUs communicate via PROFINET. An isochronous connection must exist between the CPUs, and the PROFINET Sync Master must be a SIMOTION device.

Function generator, mathematical processing and bit tracks are not available for recording with the system trace.

Measuring function

The measuring function is used for controller optimization.

The SIMOTION measuring functions are used to commission the axis controller without requiring a user program.

With the SINAMICS measuring function, you can directly inhibit the influence of higher-level control loops by means of simple parameterization, and analyze the dynamic response of individual drives. The free measuring function measures and averages several measurement series with parameterizable noise sources without master control. This measuring function is suitable for controller settings and for avoiding whirling resonance with magnetic suspension bearing applications with rotor systems.

Automatic controller setting

The automatic controller setting can be used to configure the speed controller in the drive and the DSC position controller in the controller (SCOUT TIA only) for SINAMICS drive units.

Additional references

Detailed information can be found in the SIMOTION SCOUT TIA Online Help under Diagnostics.

Task Trace

Application area

The SIMOTION Task Trace supports you when troubleshooting in the SIMOTION multitasking environment. The SIMOTION Task Trace records the sequence of individual tasks, identifies user events that you can generate via a program command, and displays these graphically.

Structure of the Task Trace

The SIMOTION Task Trace includes two main components:

- The SIMOTION Task Tracer, which writes the task change and events to a buffer on the target device, and
- The SIMOTION Task Profiler, an application for displaying the recorded data.

Additional references

Detailed information on this topic can be found in:

- Function Manual: Task Trace
- SIMOTION IT Diagnostics and Configuration Diagnostics Manual
- SIMOTION SCOUT TIA Online Help

Trace technology object

With the Trace technology object, you can monitor commands at a technology object and track access to the system variables and configuration data

Overview

In SIMOTION, technology objects can be influenced by configuration data, system variables and commands during runtime. In order to represent the influences on a technology object during runtime through the user program, a TO trace / object trace records the last actions at the technology object in chronological order.

Note

Simultaneous use of the **Trigger through program call** trigger condition for the TO trace and the device trace is not permitted.

If the TO trace and the device trace are active simultaneously, different trigger conditions must be used.

The recording can be read out from the technology object on request and displayed in the ES.

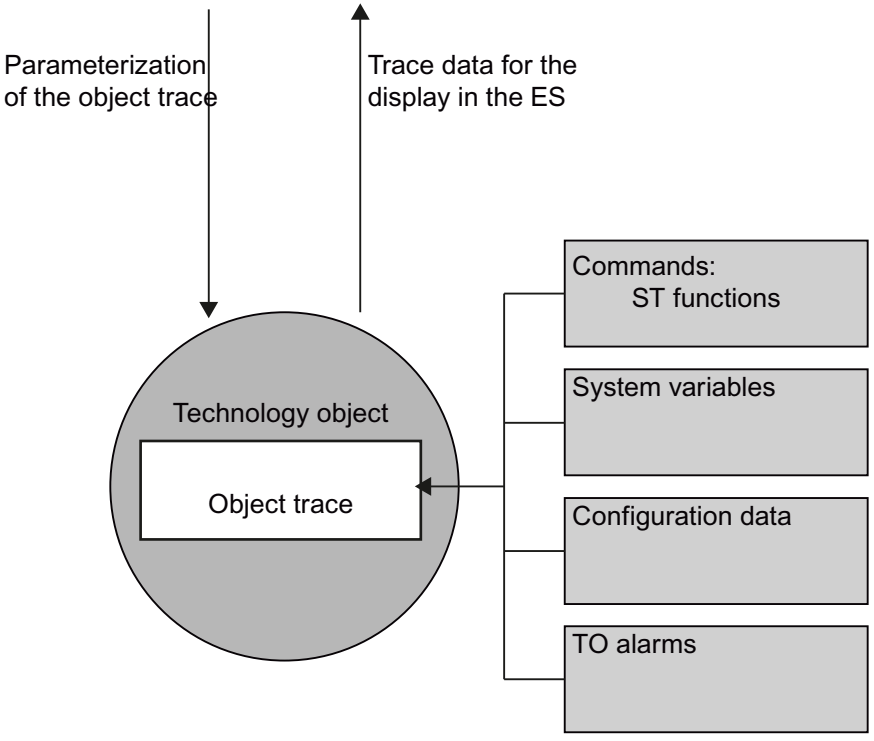

Figure 3-496 Principle of the object trace

The TO trace is used for the diagnostics of technology objects and displays the information and the events that influence a technology object during runtime in tabular form. The TO trace can be configured separately for each technology object.

It records commands and access to configuration data and system variables with their command and error statuses when the TO trace is read out. As of SIMOTION V4.4, alarms of the individual technology objects can also be recorded and an automatic trace is available. It can be used to trigger a recording automatically according to a trigger condition immediately after a restart. You parameterize the automatic trace in the "Settings > Save in the device (memory card)" tab.

The TO trace is displayed in a table/list with a time stamp.

The TO trace is available for the following technology objects:

- Drive axis
- Position axis
- Following axis
- Path interpolation
- Following object
- External encoder
- Measuring input
- Output cam
- Cam track
- Addition object
- Formula object
- Sensor
- Temperature channel
- Fixed gear
- Controller object

Additional references

Additional information on this topic can be found in the SIMOTION Runtime Basic Functions Function Manual.

3.5.9.6 Interconnection overview

The interconnection overview allows you to display all motion input and output interconnections of technology objects (TO) within the project. This overview is displayed in the SIMOTION SCOUT TIA working area in the form of an interconnection tree.

The tree display enables the synchronous operation interconnections to be displayed in cascades. In the interconnection table below, you can see all the TOs interconnected on the input and output sides for the technology object selected in the interconnection tree.

Call the interconnection overview with "Edit > Interconnection overview" in the menu.

Note

Device names with special characters

As of V4.3, it is possible to assign device names that do not comply with the ST naming convention. Names with special characters such as "." are displayed in the interconnection overview in " ".

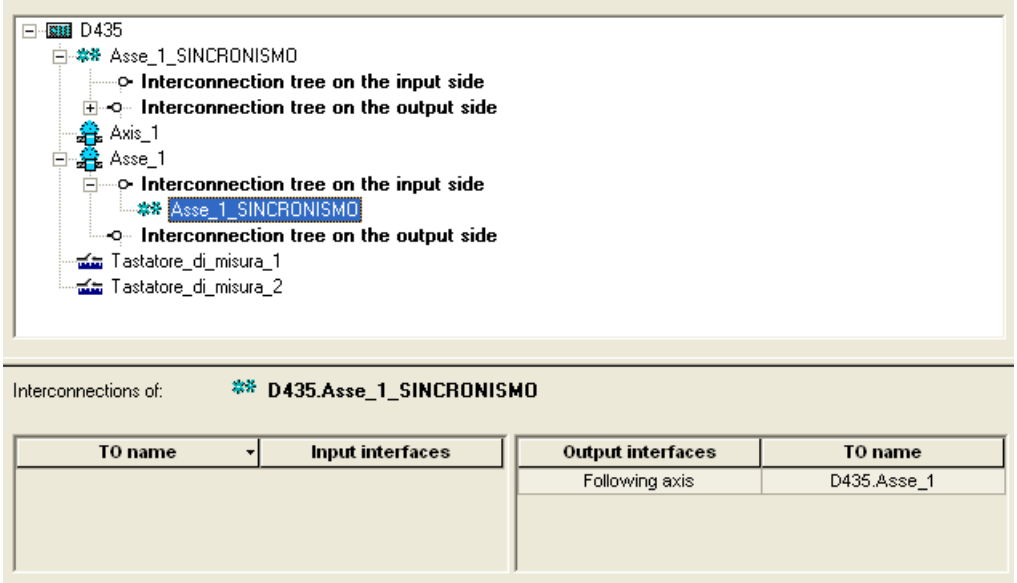

Figure 3-497 Example of an interconnection overview

Additional references

Further information on this topic can be found in:

- SIMOTION Runtime Basic Functions Function Manual
- SIMOTION SCOUT TIA Online Help

3.5.9.7 Service Overview

In online mode, the service overview shows a tabular complete overview of all configured axes in the project. The current state (including values from system variables) is displayed along with fault conditions.

The service overview is called with "Target system > Service overview" in the menu.

Error states are indicated by a red light and an active state by a green light.

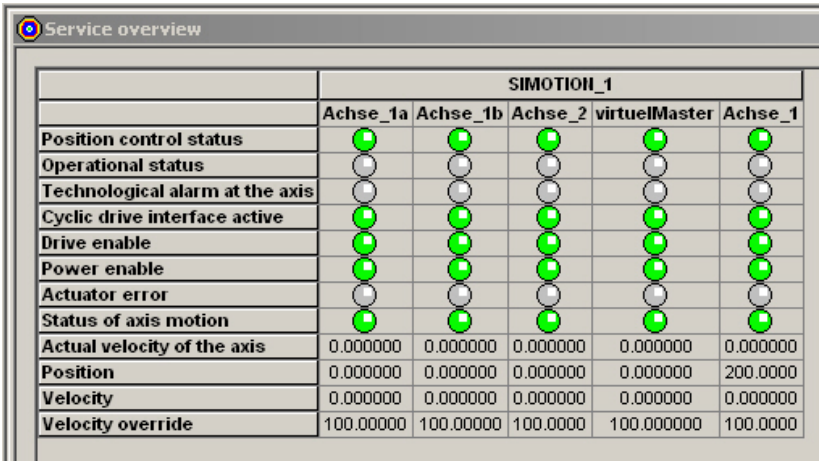

Figure 3-498 Service overview

3.5.9.8 Program testing and debugging

Comprehensive program testing and debugging functions are available in SIMOTION SCOUT TIA.

Overview

Various SIMOTION device operating modes are available for program testing.

To choose the operating mode, select the SIMOTION device and the "Operating mode..." command in the context menu.

Process mode

Program execution on the SIMOTION device is optimized for maximum system performance. The following diagnostic functions are available:

- Monitor variables in the symbol browser or a watch table
- Program status (restricted)
- Trace tool (restricted)

Test mode

The diagnostic functions of the process mode are available to the full extent.

The following diagnostic functions are available:

- Monitor variables in the symbol browser or a watch table
- Program status
- Trace tool

Debug mode

In addition to the functions of the test mode, you can use the following functions:

- Breakpoints
- Controlling MotionTasks

You can only select the debug mode for one SIMOTION device.

Note

Parameterizing the sign-of-life monitoring

Observe the safety information before using debug mode.

You will find detailed information on this topic in the SIMOTION SCOUT TIA online help under "Modes of the SIMOTION devices > Important information about the life-sign monitoring".

Additional references

Please refer to the following documents on this subject:

- SIMOTION ST Structured Text Programming and Operating Manual
- SIMOTION MCC Motion Control Chart Programming and Operating Manual
- SIMOTION LAD/FBD Programming and Operating Manual
- SIMOTION SCOUT TIA Online Help

3.5.9.9 Project comparison

You can use the "Compare..." function to compare objects within the same project or objects from other projects (online or offline).

Objects are devices, programs, technology objects (TOs) or drive objects (DOs) and libraries.

Procedure

To compare objects, proceed as follows:

1. Start the project comparison by clicking the "Object comparison" button .
   The "Select Comparison Partners" dialog opens.
2. Select the projects to be compared.

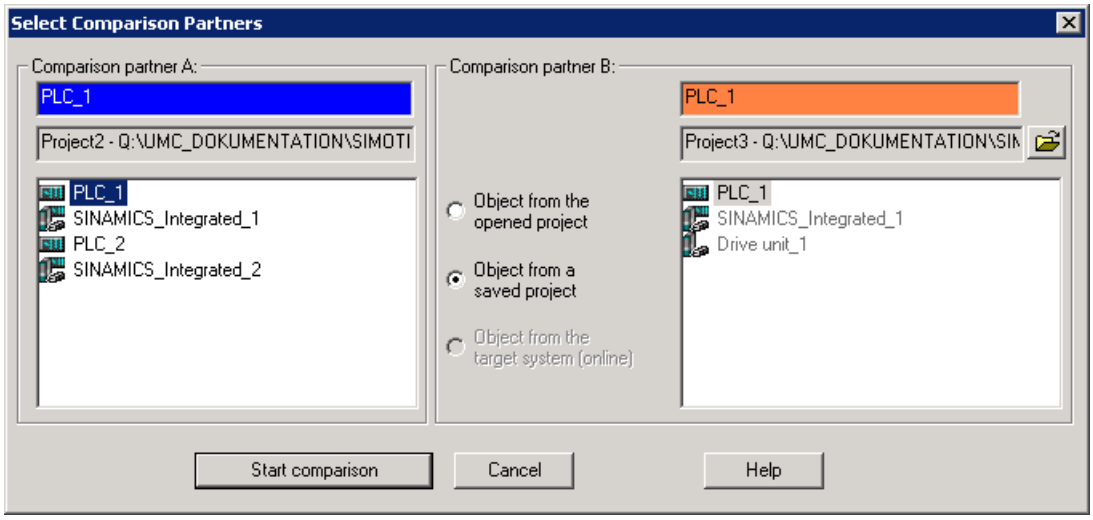

Figure 3-499 "Select Comparison Partners" dialog

3. Click the "Start comparison" button.

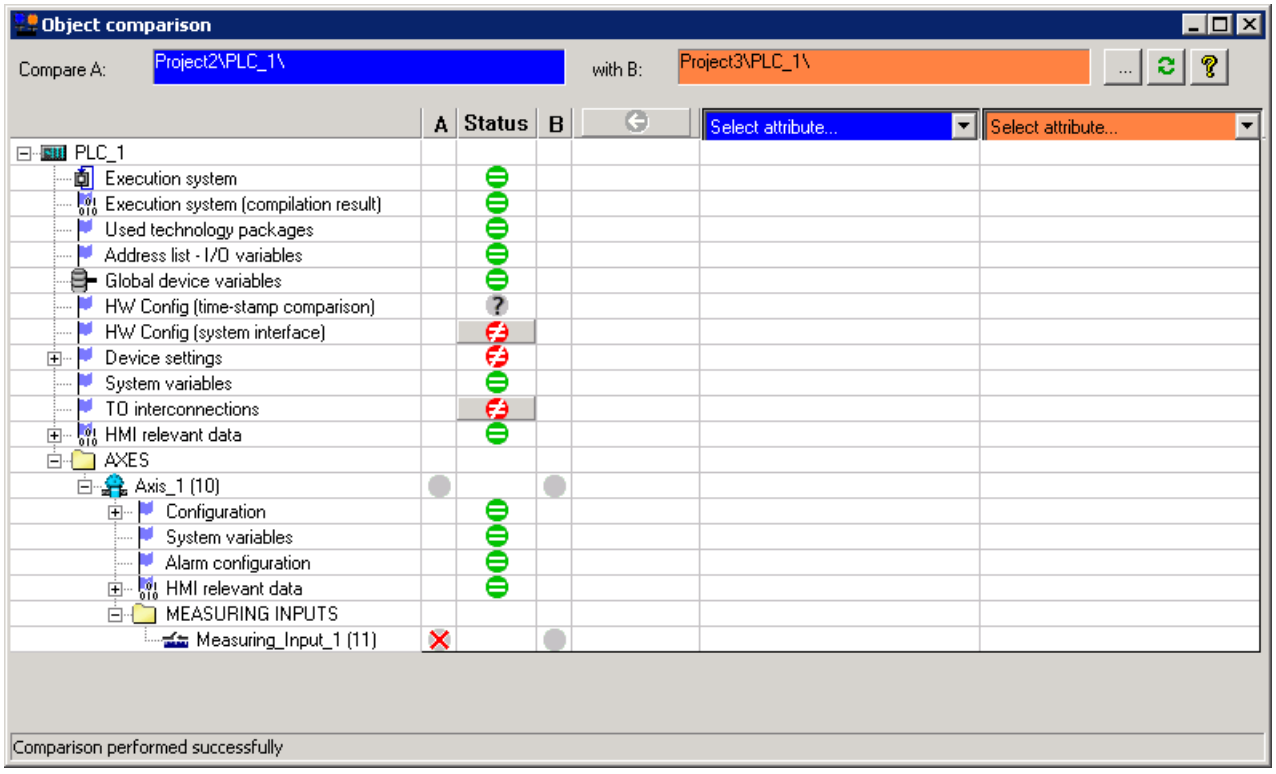

Figure 3-500 Synchronizing project data via the project comparison function

4. Move the mouse over the symbols highlighted in color to display information about the status.

Note

A detailed comparison is only possible if supplementary data (e.g. program sources) has also been downloaded to the target device ("Options > Settings... > Download").

Additional references

Detailed information on the topic can be found in the SIMOTION SCOUT TIA Online Help and in the SIMOTION Project Comparison Function Manual.

3.5.9.10 Version Control Interface

With Version Control Interface (VCI), SIMOTION SCOUT TIA provides the option of tracking and comparing changes to the source files within a version control.

Version Control Interface is characterized by the following features:

- Versioning automatically manages changes for all files that have been added to the version control system (VCS).
- Versioning allows complete traceability of all of the versions of every file, the author of these versions, and complete undoing of all changes from the start of the version control.

Advantages

Via the Version Control Interface of SIMOTION SCOUT TIA, you have the option of connecting any version control system (VCS) in SIMOTION SCOUT TIA.

You exchange data with the VCS via a work directory that you have defined as workspace.

Working with VCI offers the following advantages:

- You can export program sources of the project to a work directory as XML and back them up. You can transfer this data to the VCS as new version.
- You can restore a previous version in the work directory. This can be necessary, for example, when different versions were saved in the VCS via the work directory.
- You can work together in parallel in a team in a traceable manner and merge changes made.

Default settings

Before working with Version Control Interface, you can make the following settings:

- Define a default work directory.
  You can only define the work directory when a project is open. The work directory is assigned to the project.
- Connect the VCS using a configuration script.
  With a configuration script, it is possible to use the script commands in SIMOTION SCOUT TIA via the context menu or the operator controls.

  Note

  Scripts changed without authorization are not executed

  Make sure that unknown, unmanaged and unverified scripts are not called and/or executed with the login information of the user of the Siemens software. SIMOTION SCOUT TIA creates a checksum for every known script and saves it in encrypted form. The validity of the checksum is checked before each execution of a known script is initiated from SIMOTION SCOUT TIA. If the current and saved checksums of the script differ, SIMOTION SCOUT TIA does not execute the relevant script and reports a fault.
  If such an error occurs, make sure that the scripts have not been changed without authorization.

To make the settings for the work directory and/or a configuration script, proceed as follows:

1. Select the "Options > Settings..." menu.
   The "Settings" dialog opens.
2. Switch to the "Version Control" tab and make your settings there.

Starting Version Control Interface in SIMOTION SCOUT TIA

Note

Version Control Interface in offline mode

You can only start Version Control Interface in offline mode.

To start Version Control Interface in SIMOTION SCOUT TIA, proceed as follows:

1. In the toolbar in SIMOTION SCOUT TIA, click on the button  .
   The VCI window opens in the work area.
2. To start the comparison for the current project with the project data from the selected workspace, click the button  .
   If differences are detected between two projects, the status is displayed with an active button. Click the corresponding button to go to comparison mode and view the details.

Additional references

Detailed information on the topic of Version Control Interface in the SIMOTION SCOUT TIA can be found in the SIMOTION SCOUT TIA online help, section "Version Control Interface".

3.5.9.11 Creating a Project Overview by Script

In the Utilities_Applications\src\Scripts\ReportingScripts folder on the product DVD VOL3, you will find sample scripts that allow you to create reports on the following objects of the current SIMOTION project:

- TOs
- Programs, function blocks, functions
- Sources
- Tasks and assigned programs

The script lists the relevant specific objects of the SIMOTION project in an HTML document, arranged in a tabular format. Once generated, the HTML document opens automatically in the Internet Explorer. The information gathered can also be saved from there in HTML or CSV format or as an Excel file.

3.5.9.12 Services and diagnostics without an engineering system

Activating the Web server

SIMOTION devices have an integrated Web server. The Web server supports the display of diagnostics and system data in standard Internet browsers and the carrying out of project/ firmware updates, even in the absence of an engineering system.

As of version V4.5, SIMOTION SCOUT TIA supports the OPC Unified Architecture (UA) communication standard in addition to OPC XML-DA for access to process data.

Note

Protection against unauthorized HTTP requests

To protect the SIMOTION IT Web pages and the Web server, proven techniques have been implemented that prevent unauthorized access to the data.

As of V5.2, Cross Site Request Forgery (CSRF) protects all applications or Web services for which it could be possible to generally impair the status of the Web server and/or of the controller.

You will find detailed information on how CSRF works in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual, section "CSRF protection".

Procedure

To enable the Web server in the TIA Portal, proceed as follows:

1. Select the SIMOTION device in the network view or in the device view.
2. In the Inspector window, select the "Properties" tab and then click the "General" tab.
3. Select "Webserver/OPC/Netzwerkprotokolle"??.
   The Web server is disabled in the basic setting.
4. To display the CPU Web pages, you must activate the corresponding checkbox.

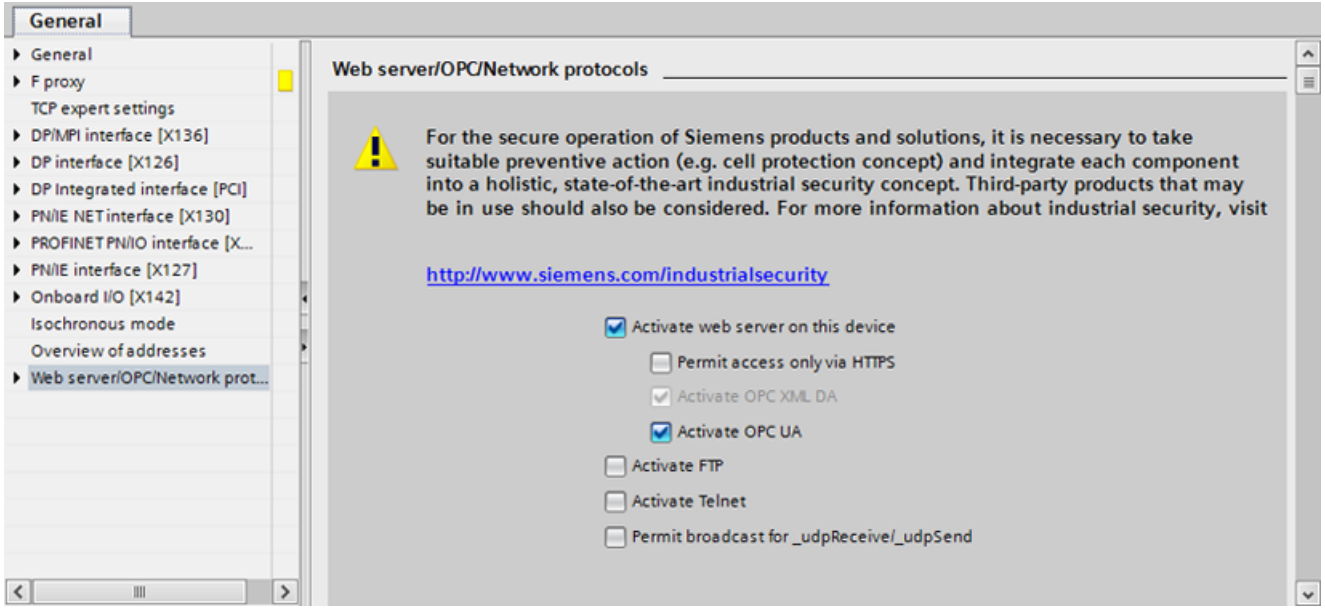

Figure 3-501 Activating the Web server

The Web server is addressed via HTTP/S. FTP and Telnet are only connected to the user administration.

Security concept of HTTP/S, FTP, and Telnet access on the Web server

As of version V4.4, access to the SIMOTION IT Web server is protected by a multi-level security concept.

The security state of the Web server is indicated by the security level on the Website. There are three possible security levels: Low, normal, high.

You will find detailed information on the security concept of the connection via FTP/Telnet in the SIMOTION IT Diagnostics and Configuration Diagnostics Manual, section "Security concept".

Calling HW Config from SIMOTION SCOUT TIA

With SIMOTION SCOUT TIA, you can switch directly to the appropriate tab of the Inspector window in the TIA Portal.

To call HW Config from SIMOTION SCOUT TIA, proceed as follows:

1. Select the SIMOTION device in the project navigator.
2. Select the "Properties..." command in the context menu.
   The "Properties" dialog opens.

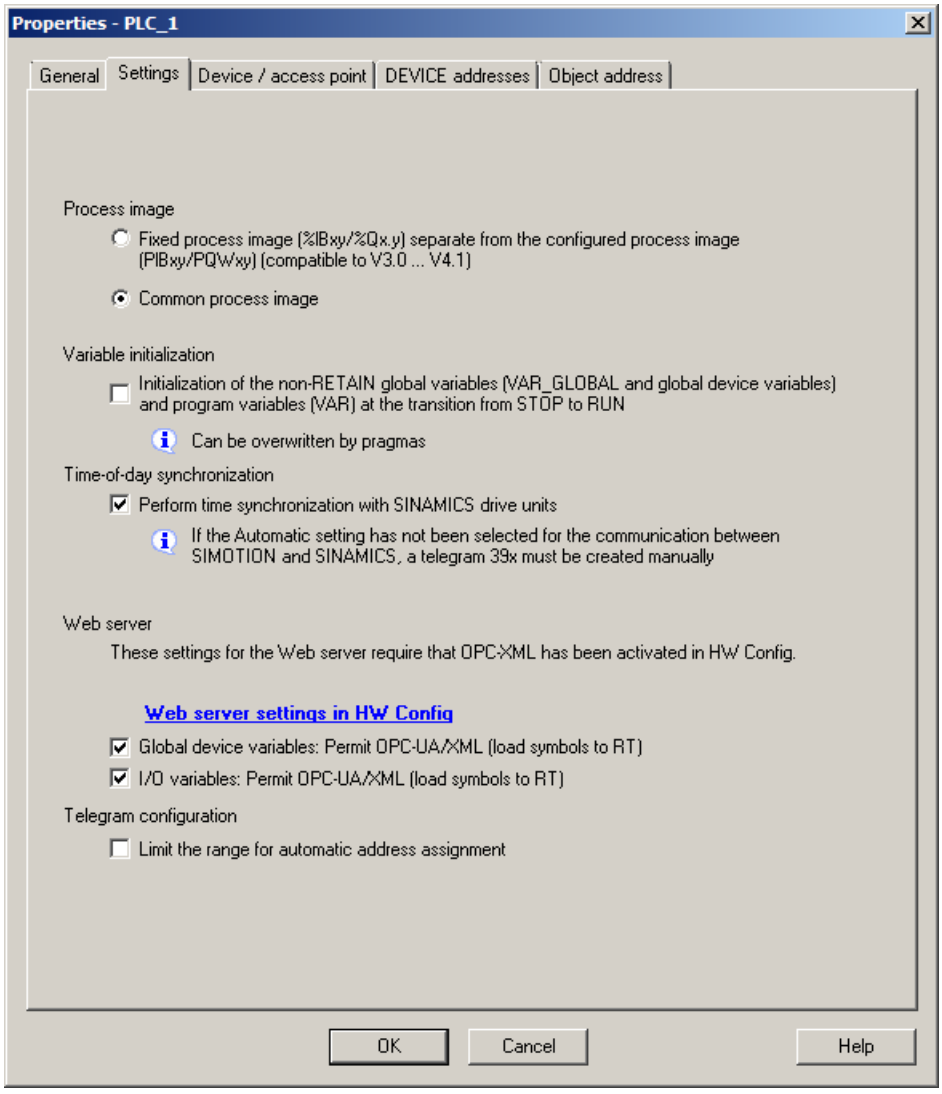

Figure 3-502 Calling HW Config from SIMOTION SCOUT TIA

3. Switch to the "Settings" tab and click the link "Web server settings in HW Config".
   Now you can change the Web server settings in the TIA Portal.

Additional references

Detailed information on this topic can be found in:

- SIMOTION IT Programming and Web Services Programming Manual
- SIMOTION IT Diagnostics and Configuration Diagnostics Manual
- SIMOTION SCOUT TIA Online Help

3.5.10 SIMOTION Runtime Simulation

3.5.10.1 Overview

Note

SIMOTION Runtime Simulation only for SIMOTION devices D4x5-2 as of V5.1

SIMOTION Runtime Simulation (SIMOSIM) is supported for SIMOTION devices D4x5-2 as of V5.1.

With SIMOTION Runtime Simulation, you can test and evaluate the general workflow of a SIMOTION runtime without connected hardware.

The simulation is so ideal for training purposes or, for example, to test and debug programs before they go online on a real module.

The projects are loaded into SIMOTION SCOUT TIA and can be switched retentive with RamToRom. SINAMICS Integrated and external I/Os are not simulated.

As of SIMOTION SCOUT TIA V5.3 you can perform the following simulation tasks with the new PROFIdrive state machine implemented in SIMOSIM:

- Switch the drive selectively to the S1 - S4 states with _enableAxis(BY_STW_BIT)
- Monitor drive enables with STW1 via the system variable on the TO axis
- Monitor status information of the drive with ZSW1 via the system variable on the TO axis

Note

Simulation of SIMOTION devices

Note that not more than one device can be simulated concurrently within a project.

Restrictions

The following functions are not supported:

- CLib
- OA packages
- TPDCBADM, TPTControl, TPdcblib technology packages

Note

Technology package product versions

Note that only those technology packages integrated in the simulation (TPCAM, TPPATH, TPCAM_EXT) are supported.

3.5.10.2 Using SIMOSIM

Requirements

- You have installed SIMOTION SCOUT TIA.
  SIMOSIM is part of the installation up to SIMOTION SCOUT TIA V5.2.
  SIMOSIM will be supplied as a dedicated component in a separate setup as of SIMOTION SCOUT TIA V5.2 SP1 HF2.
- You have activated the "Siemens SIMOSIM Virtual Ethernet Adapter" in the network settings of your PC.
- You have created a project in TIA Portal and use SIMOTION D4x5-2 devices as of V5.1 in your project.
- SIMOTION devices and Siemens SIMOSIM Virtual Ethernet Adapter are contained in the same IP subnet.
- No active online connection to a real SIMOTION device exists.

Starting SIMOSIM in SIMOTION SCOUT TIA

Note

Starting SIMOSIM for side-by-side use of SIMOTION SCOUT and SIMOTION SCOUT TIA

You can start SIMOSIM just once, either in SIMOTION SCOUT or in SIMOTION SCOUT TIA.

To start SIMOSIM and simulation mode in SIMOTION SCOUT TIA, proceed as follows:

1. Switch to SIMOTION SCOUT TIA.
2. In the project navigator, select the device you want to simulate.

3. Click "Start SIMOSIM" in the menu bar.
   The "Start Simulation Mode and SIMOSIM" dialog box opens.

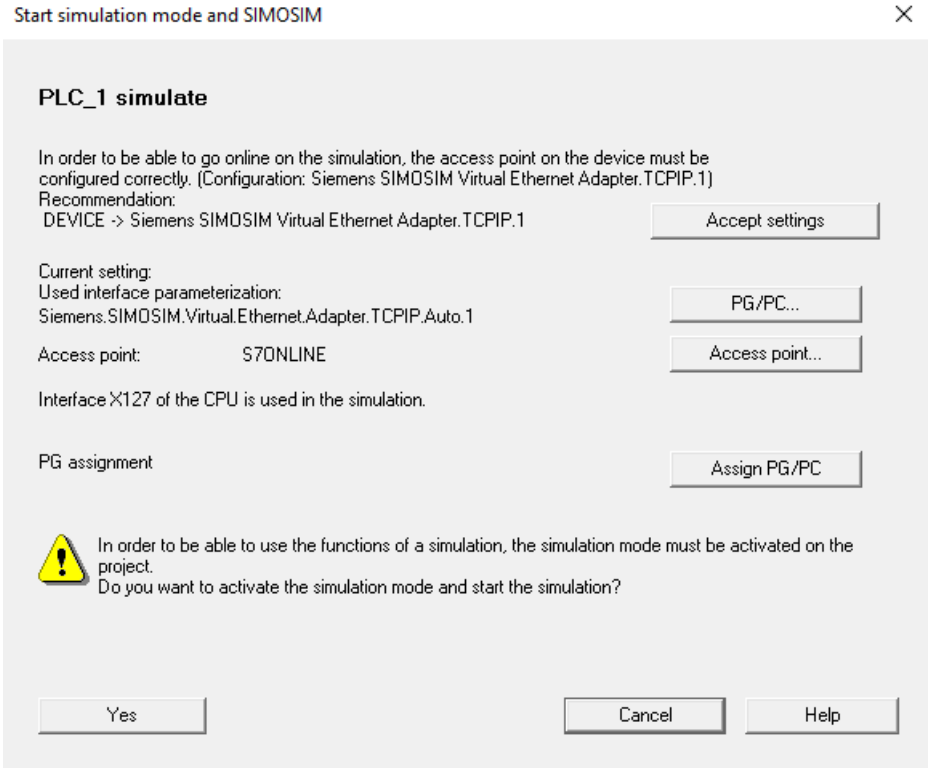

Figure 3-503 Starting simulation mode and SIMOSIM

4. Click "PG/PC...".
   The "Set PG/PC Interface" dialog box opens.

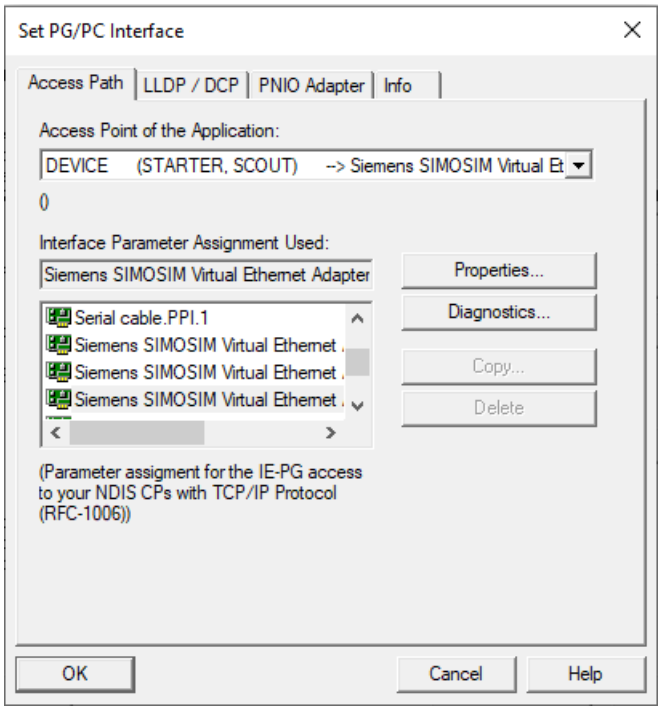

Figure 3-504 Setting the SIMOSIM PG/PC interface

5. Select "DEVICE ->Siemens SIMOSIM Virtual Ethernet Adapter.TCPIP.1" as access point of the application.
   Note the prompt that an online connection via router is no longer possible with this setting and confirm with "OK".
6. Confirm the selected access point with "OK".
   Note the prompt about the changed access path and confirm with OK.

Note

Accepting Siemens SIMOSIM Virtual Ethernet Adapter automatically as setting

To accept Siemens SIMOSIM Virtual Ethernet Adapter automatically as setting, click "Accept settings" in the "Start Simulation Mode and SIMOSIM" dialog box.

7. Click "Access point..." in the "Start simulation mode and SIMOSIM" dialog box.
   The "Properties > Device / access point" dialog box opens.

Figure 3-505 Access point used by SIMOSIM

8. Activate "DEVICE" as used access point.
9. Click "Set DEVICE addresses".
   The "DEVICE addresses" tab appears.

10. Activate X127 as virtual interface.
    You can use online access to the simulation only via interface X127.

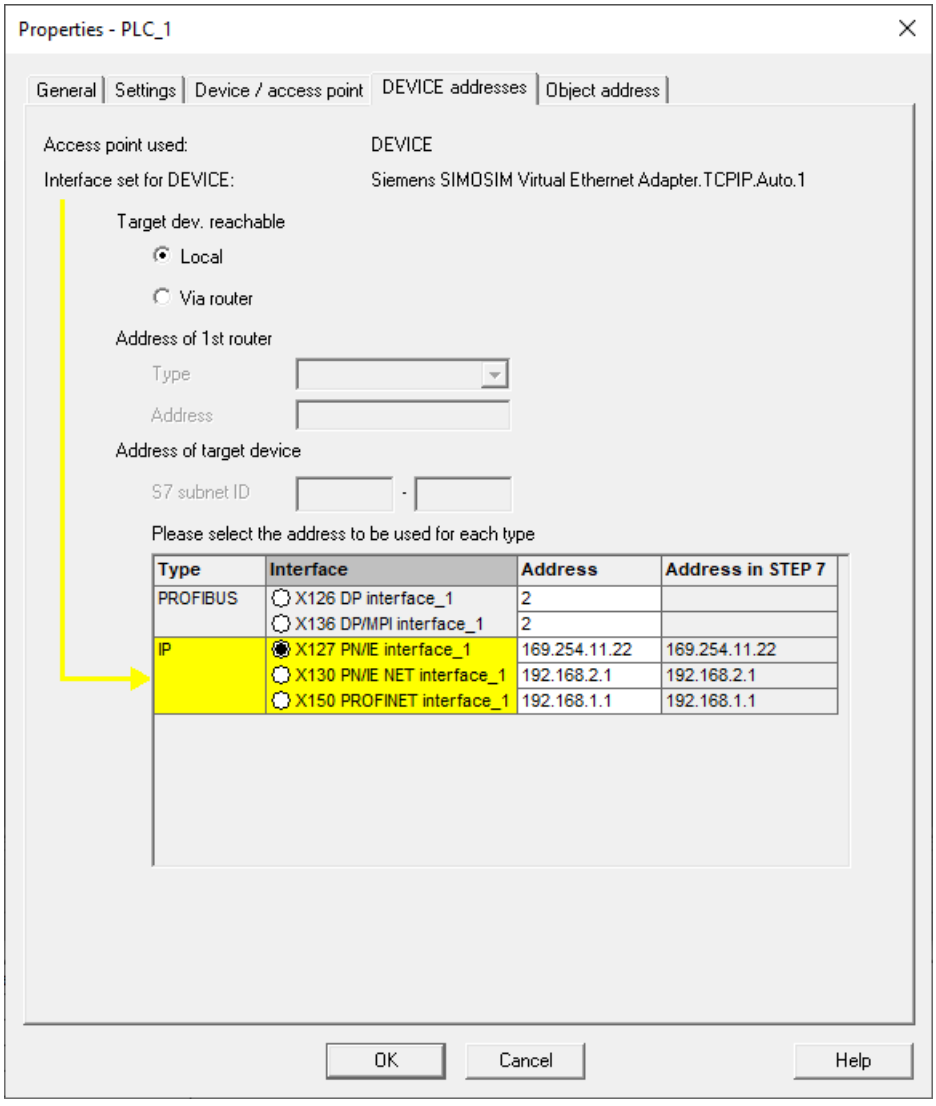

Figure 3-506 Setting the SIMOSIM DEVICE address

11. Click "OK" to confirm the selection.

12. Check your settings for the online interface.

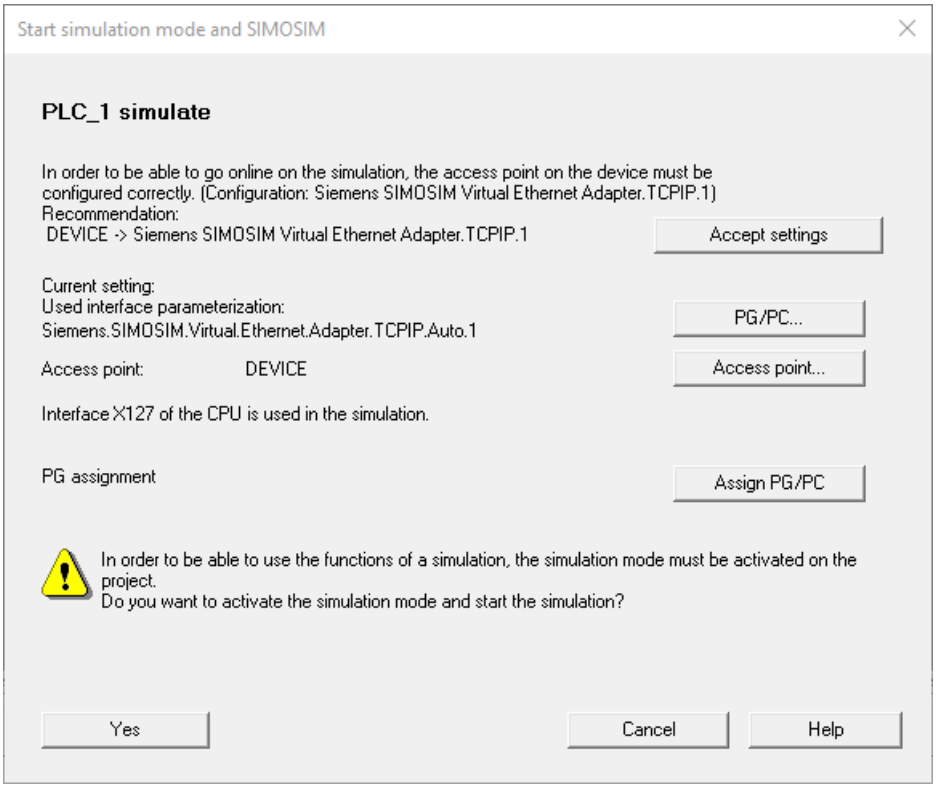

Figure 3-507 Starting simulation mode.

13. To start simulation mode, click "Yes".
Simulation mode is activated, SIMOTION simulation is started and a virtual controller is shown.

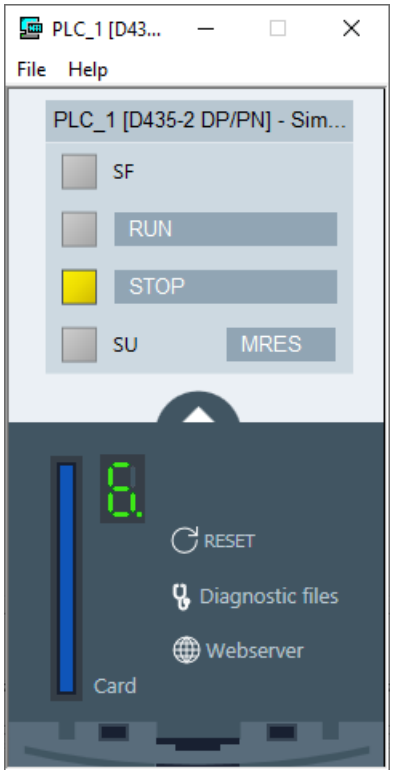

Figure 3-508 Virtual controller

The graphic user interface allows you to:

- Control the CPU operating state
- Open the Web server in the browser window
- Access the diagnostic files
- Reset the controller
- Access data on the memory card

Accessing simulation data

At every start of a new simulation of a device, a directory is created in which the memory image of the device is stored.

The data stored in the NVRAM, RAM disk and CF card can be found in this directory.

To access data in this directory, proceed as follows:

1. Start the SIMOTION simulation.
2. Click the slot of the CF card in the displayed virtual controller.
   The Windows Explorer opens and the directory of the CF card is displayed.
3. To access the memory image of the NVRAM and RAM disk, switch from the CF card to the root directory of the virtual controller in the Windows Explorer.

Note

Check and clear the data memory regularly.

To ensure that no memory bottlenecks occur and that all functions can be used without restrictions, regularly delete the simulation data records from the directory.

To delete data from the simulation directory, proceed as follows:

1. Select "Project -> Delete SIMOSIM data..." in the menu.
   The "Delete SIMOSIM Data" dialog box opens.
2. Select the simulation project whose data you want to delete from the directory.
3. Click "Delete" to start the deletion.

Starting SIMOSIM in simulation mode

To start the simulation in activated simulation mode, proceed as follows:

1. Click  "Start SIMOSIM" in the menu bar.
2. The "Start SIMOSIM" dialog box opens.

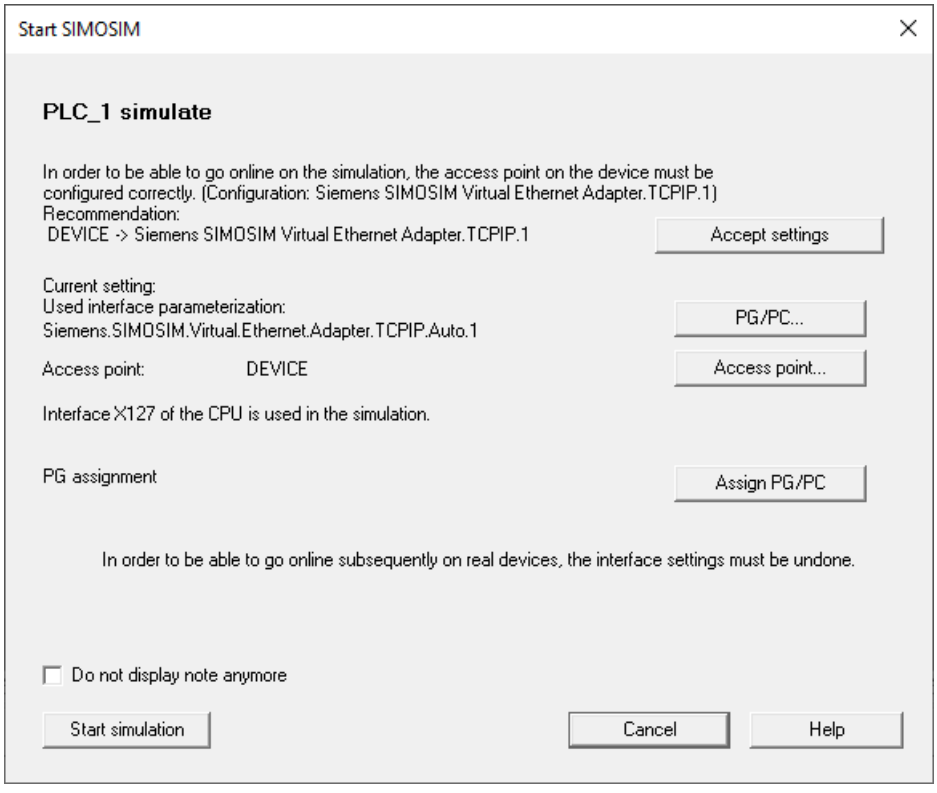

Figure 3-509 Restarting SIMOSIM

3. Click "Start simulation".

Result

Simulation mode and SIMOSIM have been started.

You can now go online with a target device and download your project data into the virtual target system.

You can then simulate programs, axes, etc. You so allow SIMOSIM to write directly to the inputs.

Note

Going online in simulation mode

Note that only one device can go online in simulation mode.

Note

Simulation mode active/inactive

When simulation mode is active, this is color-highlighted in the SIMOTION SCOUT TIA status bar.

To exit simulation mode, close the controller window by clicking the "X" in the upper area of the window. Deactivate the "Use simulation mode" option in the "Project" menu.
The flag in the status bar is reset. Simulation mode is exited.

Note

Emergency stop deactivated in debug mode

Note that in debug mode, no emergency stop is made with the space bar or by switching the application.

Note

SIMOSIM Web server access via HTTPS

Note that the certificates must be created at the first access via HTTPS. This may take some time. Acknowledge any messages that are displayed.

Setting the online access point in the TIA Portal

You now find yourself in SIMOSIM simulation mode.

To set the online access point in the TIA Portal, proceed as follows:

1. Switch to the TIA Portal.
2. Select the "Online > Online & Diagnostics" menu.
   The "Online Accesses" dialog box opens.

3. Select SIMOSIM and X127 as access point

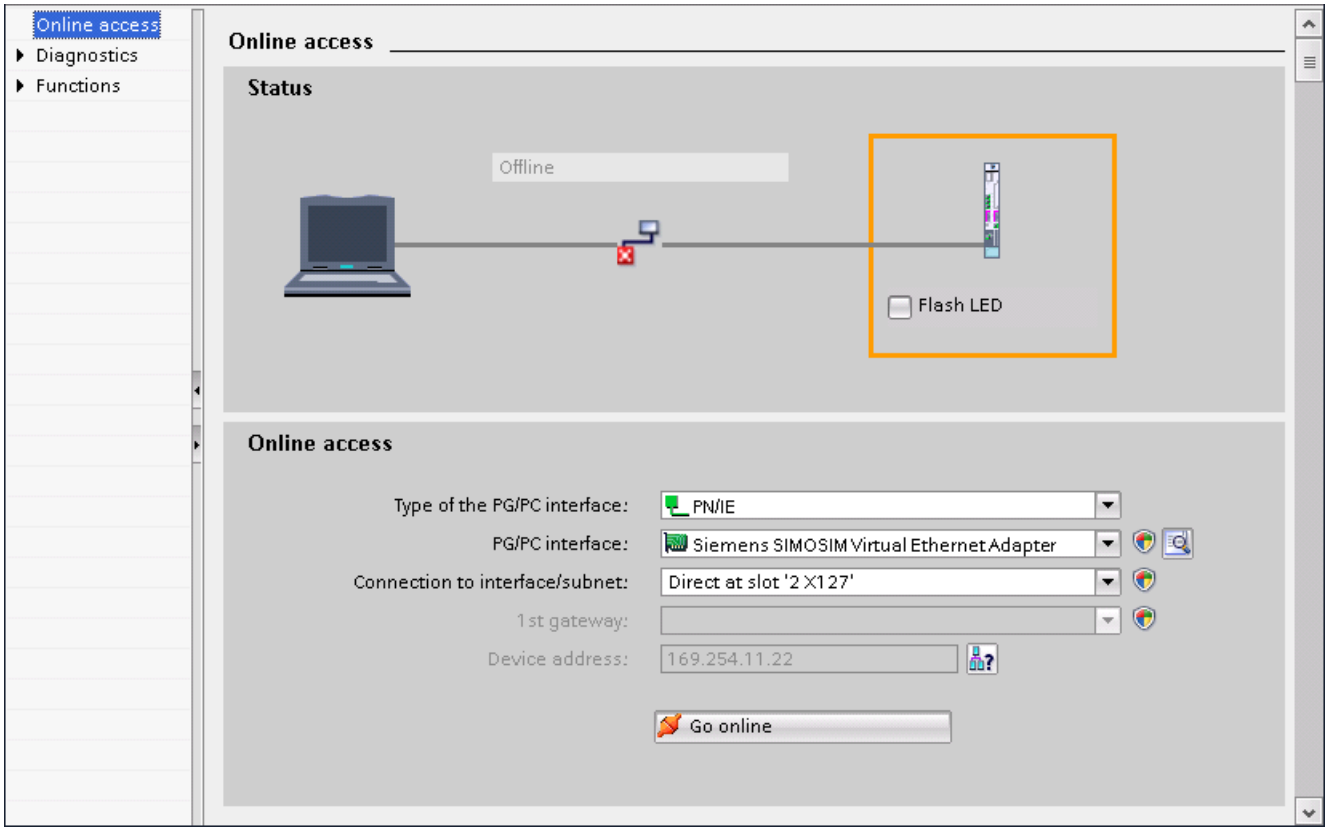

Figure 3-510 Setting the SIMOTION simulation access point

4. Click "Connect online"
   A device is displayed that can be accessed and simulated via the access point.

3.5.11 Multiuser engineering

3.5.11.1 Overview

With Multiuser Engineering, the TIA Portal offers you the possibility, in the context of the Team Engineering functionality, to work together with multiple users and to perform various configuration tasks in a project at the same time (Multiuser Engineering). You can then commission your configuration together using the TIA Portal functionality "Commission Engineering".

This significantly reduces the configuration and commissioning times. You can commission your plant and start to work productively much quicker.

The multiuser engineering in the TIA Portal functions as follows:

- The project management is on a local or an external server.
- Different users work in local sessions, based on the projects managed by the server.

- Users work independently from each other in local sessions.
- Changes from local sessions are transferred by checking into the server project.
- Checked-in changes from other users are displayed and can be applied.

The Multiuser Commissioning in the default synchronous mode in the TIA Portal functions as follows:

- As with commissioning, project management is located either on a local or external server.
- Different users work in local sessions, based on the projects managed by the server.
- Users can work independently from each other in local sessions also during commissioning.
- The changes from the local sessions are first always downloaded to the common CPU and only transferred to the server project after successful download.
- Downloaded changes from other users are displayed and can be conveniently applied.
- The server project is already synchronized on the project server. This means consistent versions of the server project are always downloaded to the CPU. Time-consuming synchronization of different project versions on the CPU therefore becomes obsolete.

The following description of the functionality of Multiuser Engineering in the TIA Portal serves only as a brief insight into team-oriented configuration within the TIA Portal.

Functionalities that go beyond this, e.g. commissioning together at the same time in a team (Multiuser Commissioning) as part of the TIA Portal functionality "Team Engineering", do not form part of this documentation.

Additional references

Detailed information on the concept of Team Engineering in the TIA Portal can be found in the information system of the TIA Portal at "Using Team Engineering".

3.5.11.2 Working with Multiuser Engineering

Requirements

- The TIA project server is installed.
  You can install the TIA project server together with the TIA Portal or standalone via a separate installation process.
  The local project server with limited functionality is installed automatically with the TIA Portal.

  Note

  License required

  To be able to use the project server with extended functionality, for example because you want to use it as external server for long-term cooperation, you need an additional license.

  While you are only using the local project server available with limited functionality, you do not need an additional license for the installed TIA Portal.

- You have created an executable project.

Creating a local session

To be able to work on a server project together with other users in the context of Multiuser Engineering, each user needs to create their own local session.

The respective user can insert their changes in one or more local sessions and then check them into the server project and publish them.

After check-in, the changes from the local session are available again to all users in the server project. They can continue to be used and modified again in subsequent local sessions.

The following steps are required to create a local session:

Configuring the local project server

To configure a local project server, proceed as follows:

1. Select the "Options > Settings > Project server" command in the TIA Portal menu.
2. Double-click on "Local project server" under "Project server" in the table.
   The "Edit server connection" dialog opens.
3. Enter the desired port.
4. Confirm your entries with "OK".

Starting the local project server

Proceed as follows to start the project server:

1. Select the "Project > Project server > Manage server projects..." command in the TIA Portal menu.
   The "Manage server projects" dialog opens.
2. Under "Select server", choose the local project server in the drop-down list. If server projects have already been created, you will see all server projects for the selected server connection listed in the table.
   The "Start local project server" dialog opens.
3. To start the local project server, confirm with "Yes".

Adding the server project

To add a project to the project server, proceed as follows:

1. Select the "Project > Project server > Manage server projects" command in the TIA Portal menu.
2. To add a server project to the server, click "<Add project to server>".
   The "Add project to project server "Local Project Server"" dialog opens.
3. Select the project that you want to make into the server project under "Source path:".
4. Click "Add".

Creating a local session

Follow these steps to create a local instance:

1. Select the "Project > Project server > Manage server projects" command in the TIA Portal menu.
2. Select "Manage server projects" in the dialog and right-click to select "Create new local session" in the context menu.
3. Select the type for the session, check the path for the session and change it if necessary.
   - Select "Multiuser Engineering" if you want to work with multiple users in parallel.
   - Select "Exclusive Engineering" if you want to work exclusively in the local session.
4. Click "Create".

Result

The session folder has been created in the Windows Explorer and the server project created with the file extension "als17".

3.5.11.3 Editing the server project

So that the changes made by different users in separate sessions can be combined and published in the context of Multiuser Engineering, the respective changes from the session or the server project view must be checked in and the server project updated.

Note

Editing objects in SIMOTION SCOUT TIA

The SIMOTION configuration cannot be opened in the session in V17.

To make changes in SIMOTION SCOUT TIA, switch to the server project view in which a temporary local copy of the server project is opened.
During this time, other users cannot open a server project view and check-in changes.

Procedure

Editing objects in the session

To edit a server project in the session, proceed as follows:

1. Select the "Open" command in the "Project" menu.
2. Click "Browse" in the "Open project" dialog.
3. Navigate to the created session and select the file with the extension "als17".
   The selected session opens and the associated toolbar is displayed.

Figure 3-511 Local session toolbar

4. Edit the desired objects in the hardware configuration.
5. Select each changed object. To do this, click the grayed-out flag.
   In the example shown, the HMI variable "HMI_Variable_1" has been marked for check-in with a blue flag.

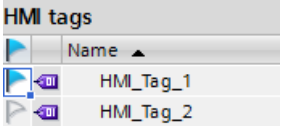

Figure 3-512 Selecting an object

6. To transfer the changes to the local server project, click "Check in" in the local session toolbar.
   All changes pending for check-in are shown in the work area.
7. Click "Start check-in".
   A message may be output prompting you to adjust the options for compiling. You make this setting in the TIA Portal under "Options > Settings > Multiuser".

Note

Changes to objects that cannot be selected

To make changes to objects that cannot be selected, you need to open the server project view.

If you have made changes to objects that cannot be selected in the local sessions, these changes are not applied on check-in.

Editing objects in the server project view

To edit a multiuser server project in the server project view, proceed as follows:

1. Select the "Open" command in the "Project" menu.
2. Click "Browse" in the "Open project" dialog.
3. Navigate to the created session and select the file with the extension "als17".
   The selected session opens and the associated toolbar is displayed.

Figure 3-513 Local session toolbar

4. Change to the server project view. To do so, click in the multiuser toolbar.
   The server project view opens under the session. The session is now in "read-only" mode.
5. Open the SIMOTION configuration in the server project view and make the desired changes.
6. Switch to the TIA Portal and click "Save changes".
7. Enter a meaningful comment for the change history.
8. To close the server project view when required, click .
   The server project view closes. You are now in your local session again.
9. To transfer the changes to the local server project, click "Check in" in the local session toolbar.
   All changes pending for check-in are shown in the work area.
10. Click "Start check-in".
    A message may be output prompting you to adjust the options for compiling.
    You make this setting in the TIA Portal under "Options > Settings > Multiuser".

Result

All changes to objects in the project have been saved and checked in.

1. To synchronize any newer changes from editing of the server project view in the local session, click on "Refresh local session" in the local session toolbar.

Note

Showing the change history

To show the change history to the local session, start the Administration Tool under Windows via "Start > All Programs > Siemens Automation > TIA project server Vxx - Administration".

Add the corresponding server. All server projects assigned to the server are shown in the left-hand area of the tool. You can also display the local sessions for this project via the arrow on the left next to the server project and view the history of the changes made.

3.5.11.4 Comparing project versions in SIMOTION SCOUT TIA

Thanks to the project comparison, device upload and download with supplementary data functions, several users can exchange project data that has been modified via the target device, online. This allows them to synchronize the status of their own SIMOTION project with that of another one, thereby updating it.

The following functions can be performed in parallel operation in SIMOTION SCOUT TIA:

- Reading and controlling of system variables and configuration data
- Execution of measuring functions and axis control panel
- Uploading of configuration data
- Uploading of programs or technology objects and other settings (e.g. execution system)
- Editing and downloading of programs (following prior alignment, if applicable)
- Downloading of individual program sources even when other sources are inconsistent

Loading data to the target system (Page 814)

Loading data from the target device (Page 820)

Device upload (Page 947)

3.5.12 Updating with the Device Update Tool

3.5.12.1 Updating SIMOTION devices

SIMOTION offers a convenient solution for updating SIMOTION devices or SIMOTION projects for machine manufacturers and machine operators.

Updating does not simply refer to an update to a higher version of firmware; rather, in general terms it refers to switching to a defined configuration, e.g. a project update. It is also possible to return (restore) to a previous configuration. Update or restore procedures can easily be performed on SIMOTION devices locally or remotely. The data can be imported to a SIMOTION device via a portable, easy-to-use storage medium or a communication connection.

You can create update or restore data based on the opened project with the Device Update Tool. The data contains all the information required for updating or restoring the data on a SIMOTION device.

This includes:

- SIMOTION project
- Technology packages
- User data
- Firmware

Once the update data has been created, it can either be saved directly to an update medium or stored as an update archive.

Depending on the SIMOTION device, the storage or update medium can be:

- CF/MMC card
- USB memory stick or
- SIMOTION IT DIAG file
- File system (update archive)

Update data can also be imported from the update medium to the SIMOTION device, irrespective of time and place, using the Device Update Tool.

Note

Exiting SIMOTION SCOUT TIA terminates the Device update tool functionality

Note that when exiting SIMOTION SCOUT TIA or closing the project in SIMOTION SCOUT TIA, the functionality of the Device update tool is also terminated.

When required, close the open "Device Update Tool" dialog box with "Cancel".

Additional references

Detailed information can be found in the SIMOTION SCOUT TIA Online Help at "Updating SIMOTION devices" and in the "Updating SIMOTION devices" Operating Instructions.

3.5.13 Device upload

3.5.13.1 Upload functions

As of TIA Portal V14, the hardware configuration of a SIMOTION CPU can be uploaded in the TIA Portal.

Note

Note that the device that you want to upload in the TIA Portal must have been loaded with the TIA Portal (≥V14).

Note

Note that the upload of SIMOTION PC stations is not supported.

The following upload functions are supported:

- Uploading of the hardware configuration in the TIA Portal for a SIMOTION CPU.
- Uploading of the SIMOTION data in SIMOTION SCOUT TIA including the drive data, e.g. for a project comparison, a data adaptation of the configuration data, for multiuser engineering or for debugging.
- Small changes, e.g. in an ST source file.

Alternatively to an upload, you can store the archived project on the CF card.

Additional references

Detailed information on the upload functions in the TIA Portal can be found in the information system of the TIA Portal.

Project comparison (Page 922)

Loading data from the target device (Page 820)

3.5.14 Appendix A

3.5.14.1 Scripting functionality

Automation of sequences with scripts

Overview

You can use the scripting functionality to automate the configuration of devices, such as drive objects (DOs), e.g. SINAMICS drives and SIMOTION technology objects (TOs), such as axes, using an easy-to-learn script language.

Standard scripts can be adapted to special situations occurring during runtime with interactive queries that modify the script processing depending on the query results. This facilitates and speeds up commissioning.

Other application possibilities include the documentation of the settings that have been made and the repetition of complex settings without error.

The implementation basis is VBScript by MICROSOFT, which has been expanded with special objects and methods for SIMOTION SCOUT TIA.

The application of the scripting functionality assumes that you are familiar with script programming.

For scripts and related documents, refer to the installation DVD 3 in the Utilities_Applications\src \Scripts directory.

The selection of documents and scripts you will find there should help you quickly get to grips with scripting in SIMOTION. As well as demonstration-only scripts for studying the code, there are also scripts and script libraries you can actually use yourself.

Restrictions

In the context of SIMOTION SCOUT TIA (TIA Portal), only scripts that influence/use pure SIMOTION SCOUT/SIMOTION SCOUT TIA data/functionalities can be used.

A scripting of the HWCN data/functionalities and project handling of the TIA Portal (framework) is not possible.

The following is explicitly not possible via scripting:

- Creation, deletion, and renaming of objects that have a representation in the TIA Portal (e.g. all SIMOTION devices).
- Creating, deleting, and renaming of projects.
- File system access to TIA Portal projects.
- Utilization of functionality provided by the TIA Portal (framework), e.g. archiving/retrieval.
- Any handling of TIA Portal data.

Additional references

For detailed information, refer to Section "Scripts for sequence automation" in the Online Help.

Scripting with TIA Portal Openness

Introduction

External scripting of the SIMOTION data is only possible in combination with scripting in the TIA Portal. The project and device handling is controlled from the TIA Portal.

To be able to access the valid object model and the Application Program Interface, you must install the *TIA Openness V14.0* option package.

As of STEP 7 or WinCC V13 SP1, the TIA Portal Openness is contained in the scope of delivery of STEP 7 or WinCC in the TIA Portal. You can find the components in the installation files at "Support".

As of TIA Portal V14 SP1, TIA Openness is included in the functional scope of the setup.

Requirement

In order to be able to access a C# project on the SIMOTION application object, the following references must be entered: Siemens.MC.Simotion.Scripting.dll

In order to be able to access the TIA Portal application object, the following references must be entered: Siemens.Engineering.dll and Siemens.Engineering.Hmi.dll

You can find these DLLs in the PublicAPI folder of the TIA Portal installation under "...\Siemens \Automation\Portal V17\PublicAPI\V17".

Set the "Local copy" property of the DLLs to "False".

If no SIMOTION SCOUT is installed on your computer, you must add the reference to the following file in your project: Siemens.MC.Simotion.SideBySide.manifest.

You can find this file in the Bin folder of the TIA Portal installation under "...\Siemens\Automation \Portal V17\Bin".

Establishing version references in the configuration file

To ensure that TIA Portal and SIMOTION SCOUT can operate side by side in the correct version, you must enter the relevant references in the configuration file.

The configuration file "myScript.exe.config" is stored in the same directory as the script and must be transferred together with the script.

An example of how to adapt the configuration file to the TIA Portal V14 version with reference to the installation directories is given below. Adjust this to suit your installation.

```
<?xml version="1.0"?>
<configuration>
 <runtime>
 <assemblyBinding>
```

```
 <dependentAssembly>
 <assemblyIdentity name="Siemens.Engineering" culture="neutral"
publicKeyToken="d29ec89bac048f84"/>
 <codeBase version="14.0.0.0" href="FILE://F:\Program Files
(x86)\Siemens\Automation\Portal V14\PublicAPI
\V14\Siemens.Engineering.dll"/>
 </dependentAssembly>
 <dependentAssembly>
 <assemblyIdentity name="Siemens.Engineering.Hmi" culture="neutral"
publicKeyToken="d29ec89bac048f84"/>
 <codeBase version="14.0.0.0" href="FILE://F:\Program Files
(x86)\Siemens\Automation\Portal V14\PublicAPI
\V14\Siemens.Engineering.Hmi.dll"/>
 </dependentAssembly>
 <dependentAssembly>
 <assemblyIdentity name="Siemens.MC.Simotion.Scripting"
culture="neutral" publicKeyToken="d29ec89bac048f84"/>
 <codeBase version="1.0.0.0" href="FILE://F:\Program Files
(x86)\Siemens\Automation\Portal V14\PublicAPI
\V14\Siemens.MC.Simotion.Scripting.dll"/>
 </dependentAssembly>
 </assemblyBinding>
 </runtime>
</configuration>
```

Use of scripts

The procedure for external scripting of the SIMOTION data via TIA Portal is explained using an example in the following steps.

TIA Portal uses scripts based on .Net. C# is used in the following example.

1. Create the TIA Portal application object:
   ```
   TiaPortal tiaPortal = new TiaPortal();
   ```
2. Open an existing project:
   ```
   ProjectAggregation projects = tiaPortal.Projects;
   string projectPath = @"C:\Demo\AnyCompanyProject.ap14";
   Project tia_proj = projects.Open(projectPath);
   ```

3. Synchronize the hardware configuration data of TIA Portal with the SIMOTION data in SIMOTION SCOUT TIA:
```
Siemens.Engineering.IEngineeringServiceProvider iServProv =
project as Siemens.Engineering.IEngineeringServiceProvider;
Siemens.Engineering.Simotion.SimotionProvider iSimotionProv =
iServProv.GetService<Siemens.Engineering.Simotion.SimotionProvider
>();
System.String strSimotionAppID = iSimotionProv.Initialize();
```
4. Create an application object for the SIMOTION scripting.
```
Type comType = Type.GetTypeFromProgID(strSimAppID);
Siemens.MC.Simotion.Scripting.Application SimApp =
Activator.CreateInstance(comType) as
Siemens.MC.Simotion.Scripting.Application;
```
5. Assign the project path to the SIMOTION application object:
```
SIMOTIONLib.Project SimProj = SimApp.AttachToProject(projectPath);
```
You can now automate configuration sequences, e.g. for drive objects (DOs), with the scripting function in SIMOTION SCOUT TIA.
6. Before you close the TIA Portal project, release the project again in the SIMOTION application object.
```
SimApp.DetachFromProject();
tia_proj.Close();
```

Additional references

Detailed information on scripts in the TIA Portal can be found at:

https://support.industry.siemens.com/cs/ww/en/view/108716692 (https://support.industry.siemens.com/cs/ww/en/view/108716692)

Detailed information on scripts in SIMOTION SCOUT TIA can be found in Section "Scripts for sequence automation" in the online help.

3.6 SIMOTION SCOUT TIA device proxy

Preface

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION V4.5:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

Additional information

Click the following link to find information on the following topics:

- Ordering documentation / overview of documentation
- Additional links to download documents
- Using documentation online (find and search manuals/information)

http://www.siemens.com/motioncontrol/docu

My Documentation Manager

Click the following link for information on how to compile documentation individually on the basis of Siemens content and how to adapt it for the purpose of your own machine documentation:

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT TIA, and in the Service&Support pages in **Product Support**:

http://support.automation.siemens.com

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

http://www.siemens.com/automation/service&support

3.6.1 Fundamental safety instructions

3.6.1.1 General safety instructions

⚠ DANGER

Danger to life due to live parts and other energy sources

Death or serious injury can result when live parts are touched.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, six steps apply when establishing safety:

1. Prepare for shutdown and notify all those who will be affected by the procedure.
2. Disconnect the machine from the supply.
   - Switch off the machine.
   - Wait until the discharge time specified on the warning labels has elapsed.
   - Check that it really is in a no-voltage condition, from phase conductor to phase conductor and phase conductor to protective conductor.
   - Check whether the existing auxiliary supply circuits are de-energized.
   - Ensure that the motors cannot move.
3. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water.
4. Isolate or neutralize all hazardous energy sources by closing switches, grounding or short-circuiting or closing valves, for example.
5. Secure the energy sources against switching on again.
6. Ensure that the correct machine is completely interlocked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Danger to life from hazardous voltage when connecting an unsuitable power supply

Touching live components can result in death or severe injury.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Danger to life from touching live parts on damaged devices

Improper handling of devices can result in damage.

For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Observe the limit values specified in the technical specifications during transport, storage, and operation.
- Do not use damaged devices.

⚠ WARNING

Danger to life through electric shock due to unconnected cable shields

Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the cores of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Danger to life due to electric shock when not grounded

For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Danger to life due to fire spreading if housing is inadequate

Fire and smoke development can cause severe personal injury or material damage.

- Install devices without a protective housing in a metal control cabinet (or protect the device by another equivalent measure) in such a way that contact with fire inside and outside the device is prevented.
- Ensure that smoke can only escape via controlled and monitored paths.

⚠ WARNING

Danger to life from unexpected movement of machines when using mobile wireless devices or mobile phones

Using mobile radios or mobile phones with a transmit power > 1 W closer than approx. 2 m to the components may cause the devices to malfunction, influence the functional safety of machines therefore putting people at risk or causing material damage.

- Switch off wireless devices or mobile phones in the immediate vicinity of the components.

⚠ WARNING

Danger to life due to fire if overheating occurs because of insufficient ventilation clearances

Inadequate ventilation clearances can cause overheating of components followed by fire and smoke development. This can cause death or serious injury. This can also result in increased downtime and reduced service life for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

⚠ WARNING

Danger of an accident occurring due to missing or illegible warning labels

Missing or illegible warning labels can result in accidents involving death or serious injury.

- Check that the warning labels are complete based on the documentation.
- Attach any missing warning labels to the components, in the national language if necessary.
- Replace illegible warning labels.

⚠ WARNING

Danger to life when safety functions are inactive

Safety functions that are inactive or that have not been adjusted accordingly can cause operational faults on machines that could lead to serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

Note

Important safety notices for safety functions

If you want to use safety functions, you must observe the safety notices in the safety manuals.

3.6.1.2 Safety instructions for electromagnetic fields (EMF)

⚠ WARNING

Danger to life from electromagnetic fields

Electromagnetic fields (EMF) are generated by the operation of electrical power equipment such as transformers, converters or motors.

People with pacemakers or implants are at a special risk in the immediate vicinity of these devices/systems.

- Ensure that the persons involved are the necessary distance away (minimum 2 m).

3.6.1.3 Handling electrostatic sensitive devices (ESD)

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Damage through electric fields or electrostatic discharge

Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

3.6.1.4 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. For more information about industrial security, visit http://www.siemens.com/industrialsecurity.

To stay informed about product updates as they occur, sign up for a product-specific newsletter. For more information, visit http://support.automation.siemens.com

⚠ WARNING

Danger as a result of unsafe operating states resulting from software manipulation

Software manipulation (e.g. by viruses, Trojan horses, malware, worms) can cause unsafe operating states to develop in your installation which can lead to death, severe injuries and/or material damage.

- Keep the software up to date.
  Information and newsletters can be found at:
  http://support.automation.siemens.com
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial security concept for the installation or machine.

- Make sure that you include all installed products into the integrated industrial security concept.

3.6.1.5 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

3.6.1.6 Residual risks of power drive systems

When performing the risk assessment for a machine or plant in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or plant constructor must take into account the following residual risks associated with the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance and repairs caused by, for example:
   - Hardware and/or software errors in the sensors, control system, actuators, and cables and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices / mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-rays, ionizing radiation and cosmic radiation
2. Unusually high temperatures, including open flames, as well as emissions of light, noise, particles, gases, etc., can occur inside and outside the components under fault conditions caused by, for example:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

3.6.2 Overview

3.6.2.1 Comfort Panels with SIMOTION SCOUT

Inter Project Engineering (IPE) in the TIA Portal

The TIA Portal makes it possible to carry out the technological and HMI configuration in various projects. For example, one processor can carry out the HMI configuration and a second processor can carry out the technological configuration. In the TIA Portal, this working method is called "Inter Project Engineering".

Note

The "Device Proxy" functionality in the TIA Portal can only be used for SIMOTION when SIMOTION SCOUT TIA V4.4 has been installed.

Using Comfort Panels with SIMOTION SCOUT

Inter Project Engineering is primarily used with SIMOTION to make flexible HMI panels available for SIMOTION SCOUT, SIMATIC STEP 7 V5 and WinCC,which can only be configured in the TIA Portal.

The following application scenarios are relevant to SIMOTION SCOUT:

- Migration of an existing HMI configuration from a SIMOTION SCOUT project.
- Use of panels in SIMOTION SCOUT/WinCC flexible that can only be configured via the TIA Portal, e.g. Comfort Panels.

For this purpose you configure a device proxy in the TIA Portal with which you connect the Comfort Panel for the HMI visualization. The device proxy is a proxy object in the TIA Portal for devices that are not part of the TIA project. Through initialization of the device proxy, the configuration of the SIMOTION controller is simulated in the TIA Portal.

Distributed working with SIMOTION SCOUT TIA

It is also possible to carry out the technological and HMI configuration in various projects for SIMOTION SCOUT TIA via a device proxy.

Procedure for using Comfort Panels with SIMOTION SCOUT

The following steps must be performed in the TIA Portal for the editing:

1. Create a project in the TIA Portal
2. Create a device proxy.
3. Initialize the device proxy, see also Create a device proxy and initialize via a project file (Page 963)
   The project file of the source project must be available and suitable.

4. Create an HMI Panel and establish a connection to the device proxy, see also Configuring Comfort Panels in a SIMOTION SCOUT project (Page 974).
5. Interconnect the HMI tags.

Procedure for "Distributed working with SIMOTION SCOUT TIA"

A controller with the technological configuration is already present.

The following steps must be performed in the TIA Portal for the editing:

1. Create the device proxy data in the TIA Portal.
2. Export the settings in the TIA Portal as an IPE file, see also Creating and configuring device proxy data (Page 968).

In order to create the HMI visualization in a separate project, the following steps must be carried out:

1. Create a project in the TIA Portal
2. Create a device proxy.
3. Initialize the device proxy with the exported IPE file, see also Initialize a device proxy via an IPE file (Page 969)
   The IPE file of the source project must be available and suitable.
4. Create the HMI Panel and establish a connection to the device proxy.
5. Interconnect the HMI tags.

See also

Project with integrated WinCC flexible HMI configuration (Page 976)

Basics of Inter Project Engineering (IPE)/device proxy (Page 960)

3.6.2.2 Basics of Inter Project Engineering (IPE)/device proxy

Introduction to Inter Project Engineering (IPE)

The functionality of Inter Project Engineering, hereinafter referred to as IPE, is used to extract the HMI data in a source project to exchange it using a device proxy. You can then transfer this data to other projects, for visualization in HMI, for example, and use it there for further configuration.

You can exchange the following PLC data between projects via the device proxy for SIMOTION SCOUT:

- Variables
- Messages

The following data is automatically included in the exchange:

- Controller communication interfaces
- Configured communication processors and communication modules

This automatic data exchange ensures that the interfaces and the configured communication are transferred along with the data you selected. This data is required to allow you to continue working consistently and without problems in your target project.

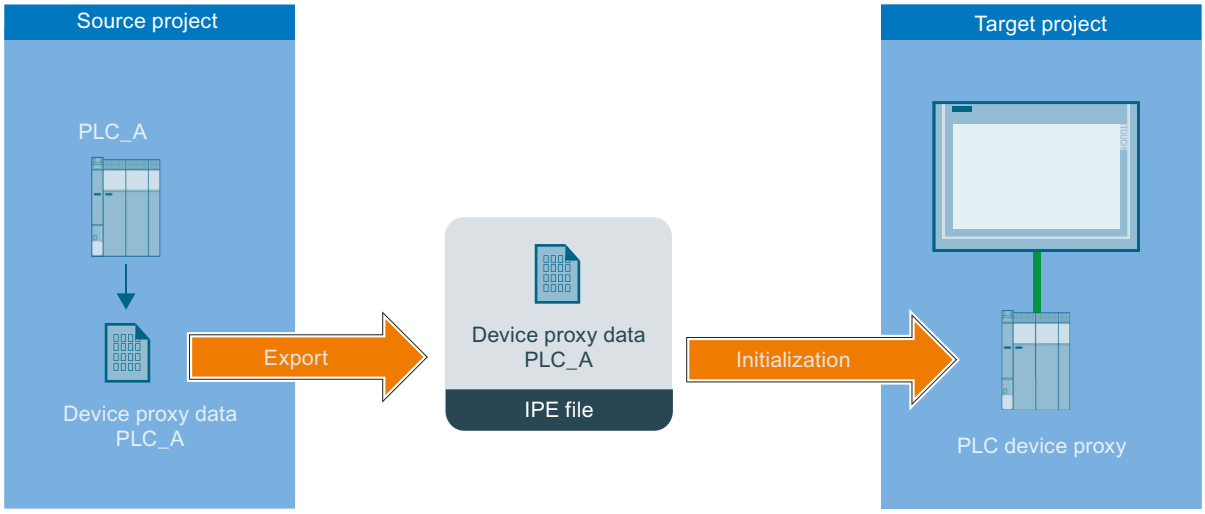
Cross-project data exchange

The following options are available for cross-project data exchange with Inter Project Engineering:

- Exchanging PLC data via a project file
  - for data from SIMOTION SCOUT; the project file may contain several controllers.
- Exchanging PLC data via an IPE file
  - for data from TIA Portal projects V13 or higher; an IPE file must also be generated for each controller.

Exchanging PLC data via a project file

The figure below shows cross-project data exchange via a project file.

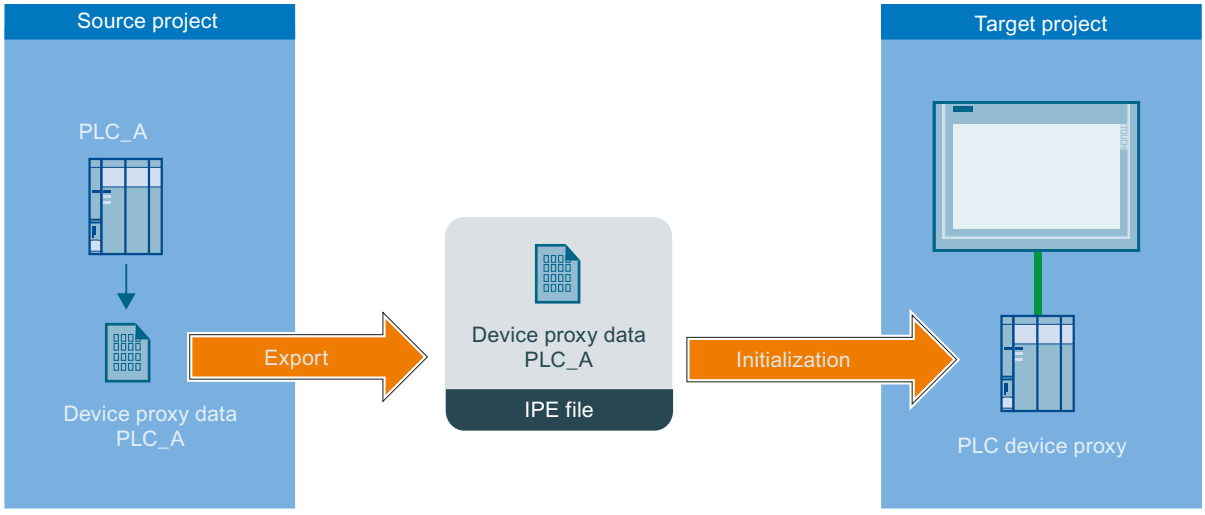


The PLC data from the source project is transferred to the PLC in the target project via a SIMOTION project file (*.mcp).

You can transfer data from STEP7/SIMOTION SCOUT projects that are not integrated in the TIA Portal relating to the HMI visualization conveniently into your current TIA Portal projects and continue to use it there.

Exchanging PLC data via IPE file

The figure below shows cross-project data exchange via an IPE file. Both projects are created in the TIA Portal.



The PLC data from the source project is transferred to the PLC in the target project via the object "Device Proxy Data".

PLC data that is exchanged via an IPE file must originate from TIA Portal projects of V13 or higher. You must generate an IPE file for each controller.

3.6.2.3 Requirements for Inter Project Engineering (IPE) / device proxy

Software and hardware requirements

The following requirements must be met in order for you to use Comfort Panels in SIMOTION SCOUT:

- You have installed TIA Portal as of V13 and the SIMOTION SCOUT TIA V4.4 option package to use Comfort Panels
- You have installed the SIMOTION SCOUT software package as of V4.4 and therefore also SIMATIC STEP 7 V5.5 SP4 (but at least SIMATIC STEP 7 V5.5 SP1).
- You are using a SIMOTION C, P or D module version as of V4.3.
- When Comfort Panels are used, WinCC Comfort, WinCC Advanced or WinCC Professional as of V13 must be installed.
- For the migration of an integrated HMI project, SIMATIC WinCC flexible 2008 SP3 Update 3 must also be installed as a minimum.
- The same firmware version must be installed on all controllers involved.

Functionality of IPE in TIA Portal

- You have installed TIA Portal as of V13 and the SIMOTION SCOUT TIA option package as of V4.4.

Note

Operating systems

The SIMOTION SCOUT and STEP 7 V5.5 software packages are only approved for Windows XP and Windows 7. The TIA Portal is approved for Windows 7 and Windows 8.x. The device proxy for SIMOTION SCOUT is therefore only available to you for Windows 7.

Requirements for IPE and use of Comfort Panels

The requirements for accepting PLC data from projects are as follows:

- You have a project with hardware configuration that is to be transferred to another project.
- You have ensured that the project is consistent before you transfer the PLC data using the device proxy data.

3.6.3 Create and configure device proxy.

3.6.3.1 Initialize a device proxy via a project file

Create a device proxy and initialize via a project file

Introduction

You initialize the device proxy using a project file.

A device proxy must be created for every controller that has a connection to an HMI panel. If the project file contains several controllers, you can select the controller via the "Initialize device proxy" dialog and assign to the device proxy.

Note

PROFIBUS interfaces

Three PROFIBUS interfaces are shown in the network view and device view for SIMOTION D4xx devices, although there are only two interfaces on the devices. The third interface symbolizes the PROFIBUS Integrated. Open the device overview to find out which icon represents the PROFIBUS Integrated interface.

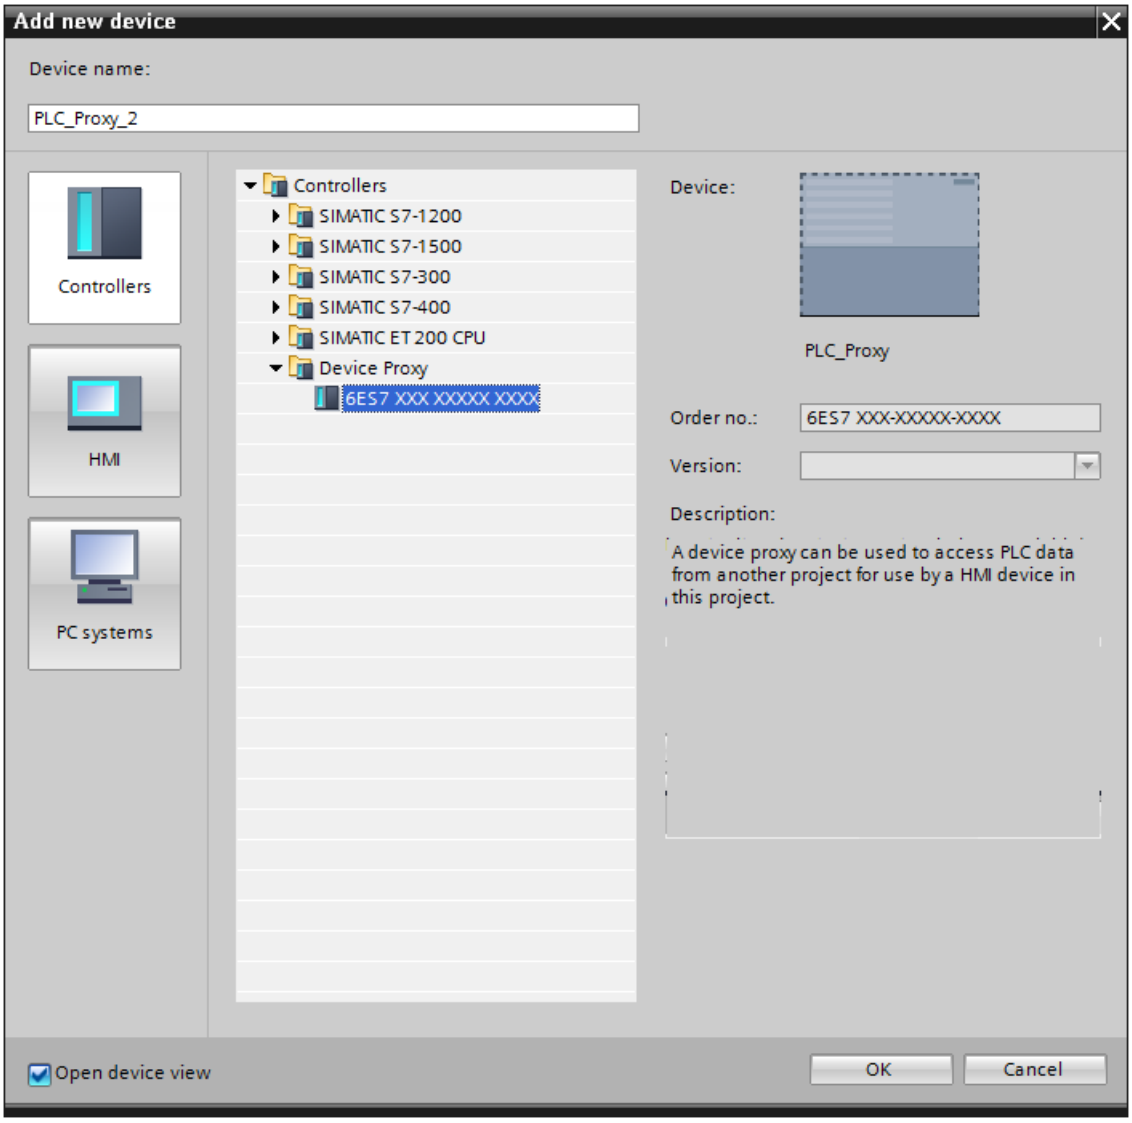
Requirement

One of the following projects exists:

- SIMOTION V4.4 project (*.mcp); you will find the mcp file in the project folder in the "u7" folder.
- TIA Portal V13 Project (*.ap13)

Procedure

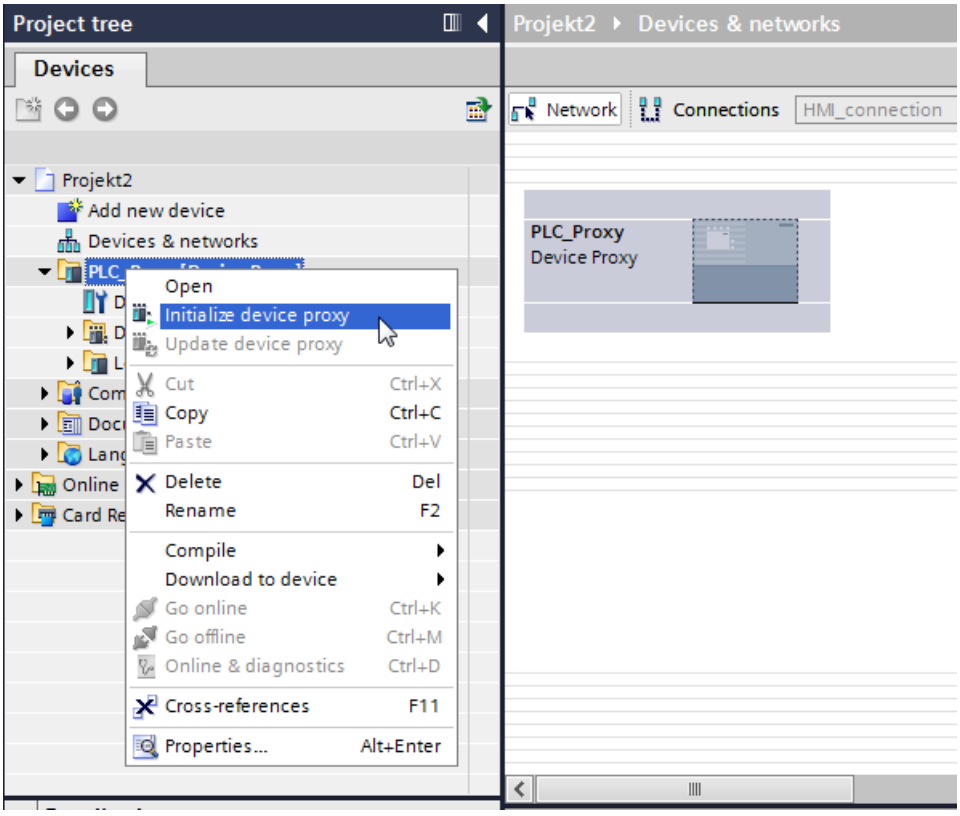
1. Double-click "Add new device" in the project tree.
2. Select the device proxy under "Controller".



A new device is created in the "Devices & Networks" editor.

3. Select the device proxy in net view.

4. Click "Initialize device proxy" in the shortcut menu.



5. In the "Open device proxy data source" dialog box, select from the following entries:
   - "SIMOTION Classic Project (*.mcp)" for initialization via a SIMOTION project file (for editing Comfort Panels)
   - "TIA Project (*.ap13)" for initialization via a TIA Portal project file (only for SIMOTION SCOUT TIA).
6. Select the project file and click "Open".

7. The "Initialize device proxy" dialog box opens.

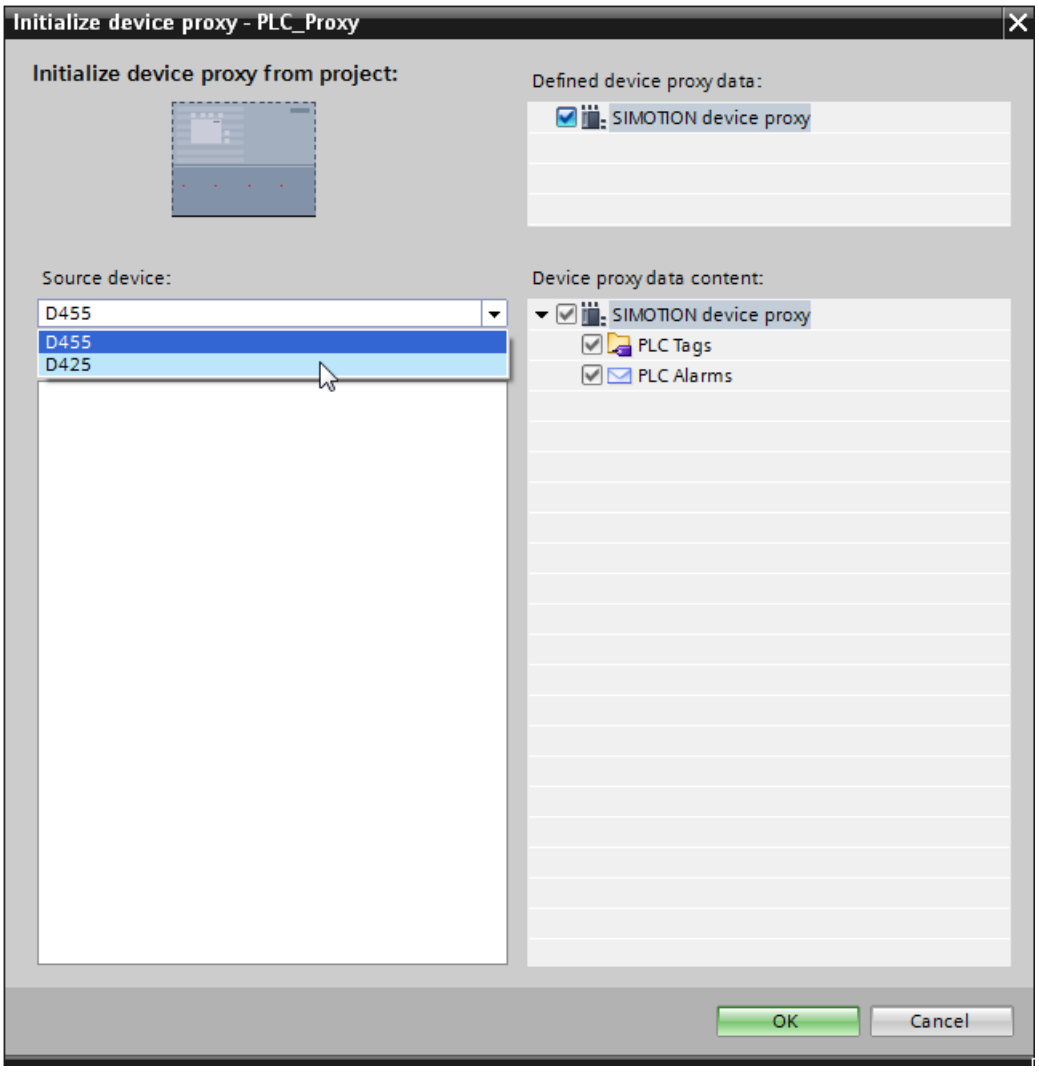


Figure 3-514 Initializing the device proxy

8. Select the source device if several controllers are configured in your project. You cannot change any other settings.
9. Click "OK".

Result

Following initialization, the PLC data from the project file in the selected device proxy data object is stored in the device proxy.

You can now configure an HMI connection with the device proxy and connect PLC tags from the device proxy with HMI tags, for example.

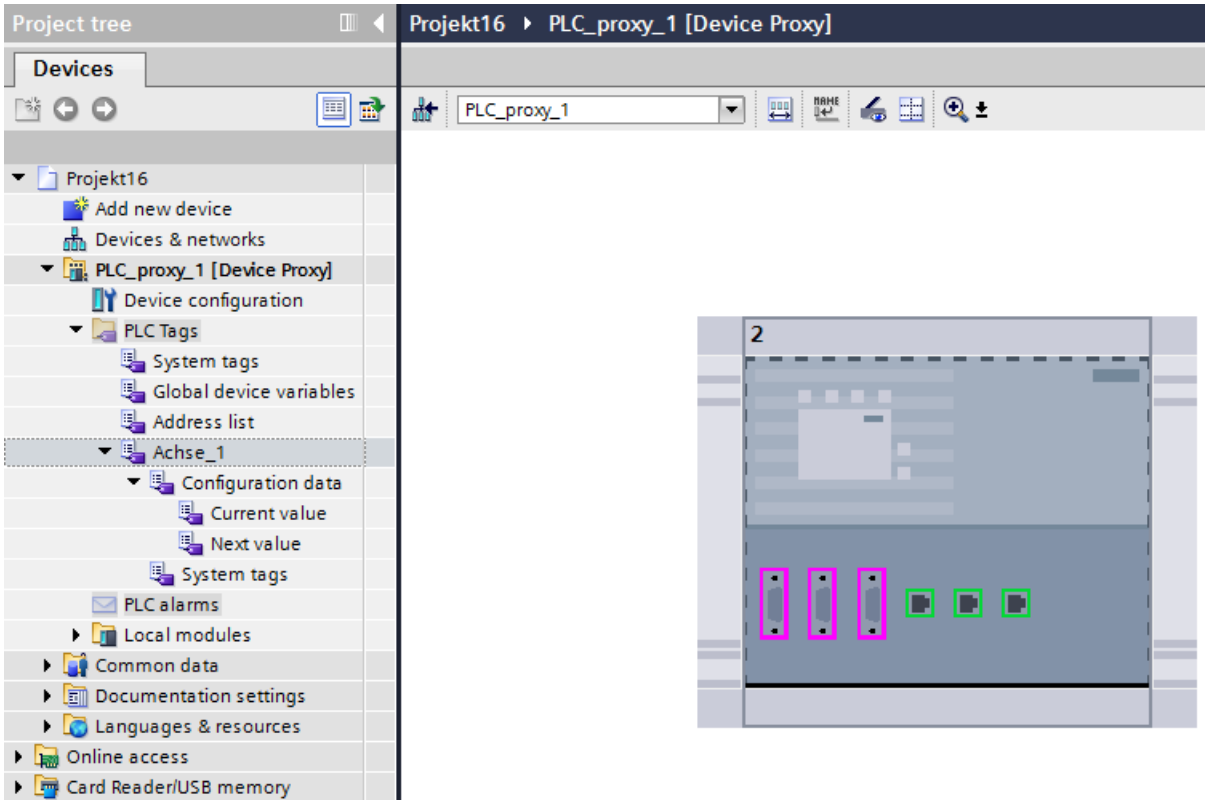

Figure 3-515 Device proxy initialized

See also

Configuring Comfort Panels in a SIMOTION SCOUT project (Page 974)

Updating a device proxy via a project file

Introduction

If changes have been made to the PLC data or the communications configuration in the source project of the device proxy, you can update the device proxy in your TIA Portal project.

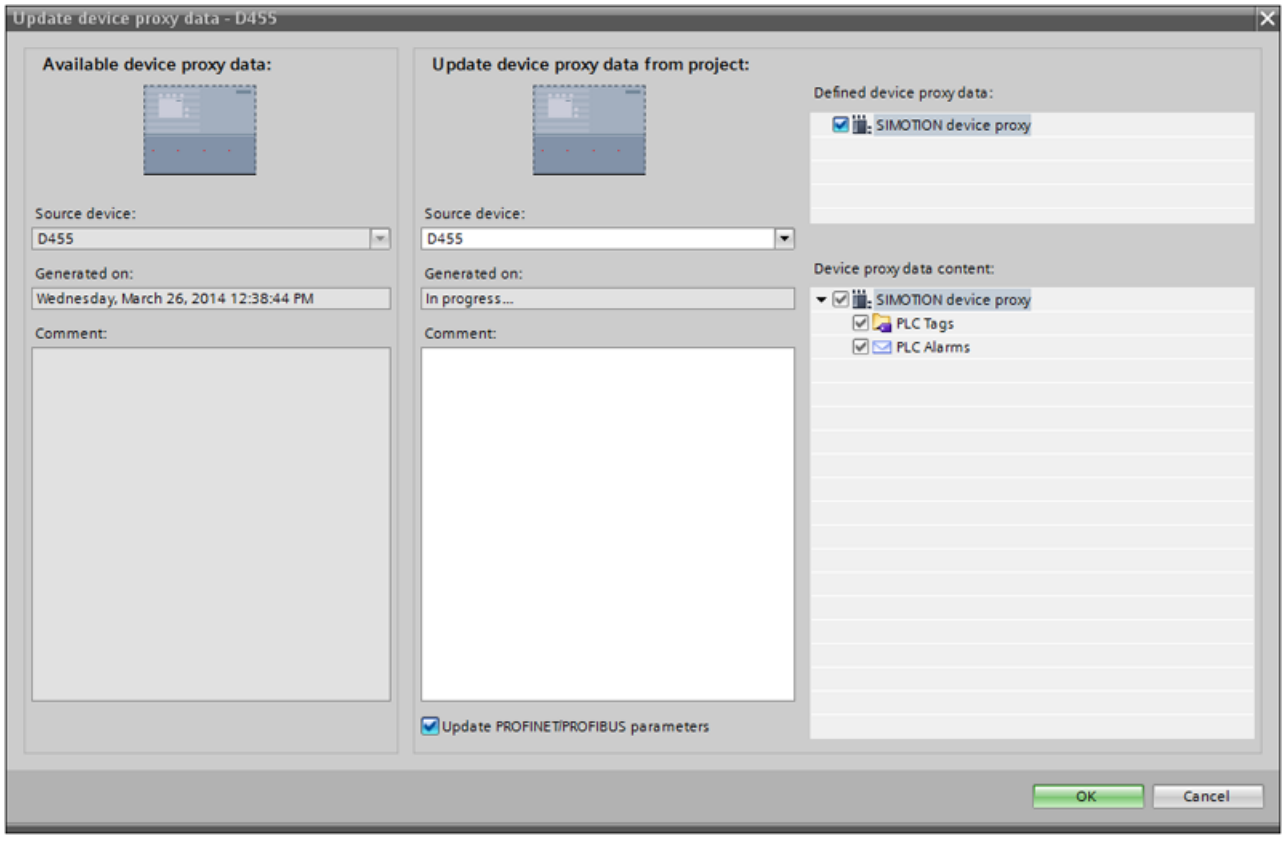
Requirement

- The project file has been generated from the source project of the device proxy.
- A device proxy that has already been initialized is available in the target project.

Procedure

1. Select the device proxy in the project tree.
2. Select the "Update device proxy" entry in the shortcut menu.

3. Select the project file.
   The "Update device proxy" dialog opens.



4. Select a device.
5. Select whether you wish to update the PROFINET or PROFIBUS parameters.
6. Click "OK".

3.6.3.2 Initialize a device proxy via an IPE file

Creating and configuring device proxy data

Creating and editing device proxy data

You need device proxy data to generate an IPE file. With this file you can then replace and transfer configurations in the TIA Portal.

To create device proxy data, follow these steps:

1. Open the "Device Proxy Data" folder below the CPU to which you want to create device proxy data.
2. Double-click the "Add new device proxy data" command.
   A new entry is created.

3. Double-click the entry.
   In the working area, the settings for the device proxy data are now displayed.

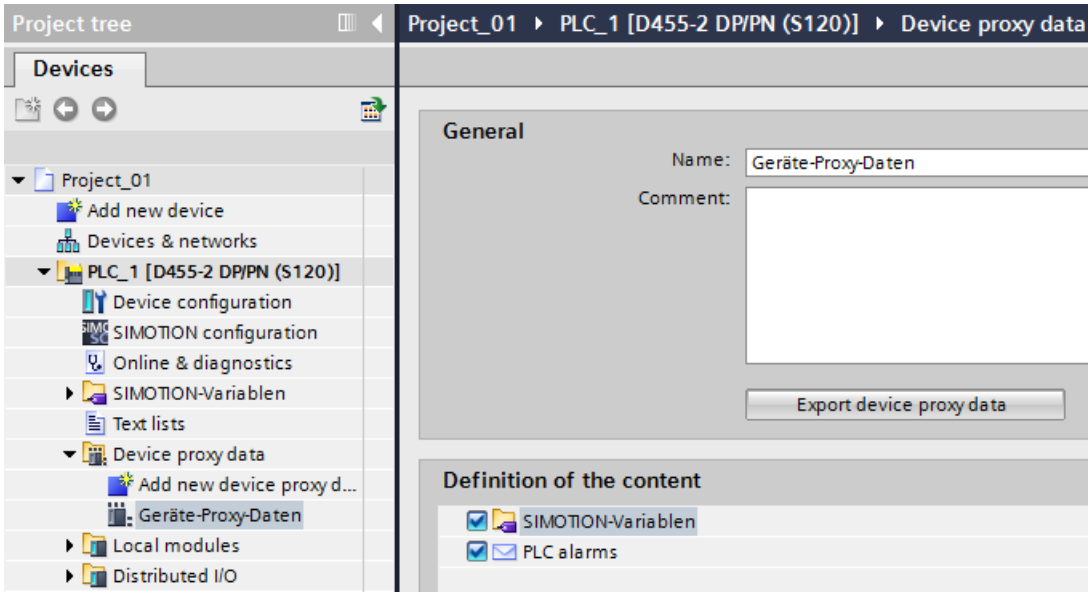


Figure 3-516 Exporting device proxy data

4. Select the content of the data:
   - PLC tags
   - PLC messages
5. Click the "Export proxy data" button to open the "Export device proxy data" dialog box.
6. Enter a meaningful name and click the "Save" button to generate the IPE file.

Initialize a device proxy via an IPE file

Introduction

You initialize device proxy data using a dialog on the device proxy in the TIA Portal.

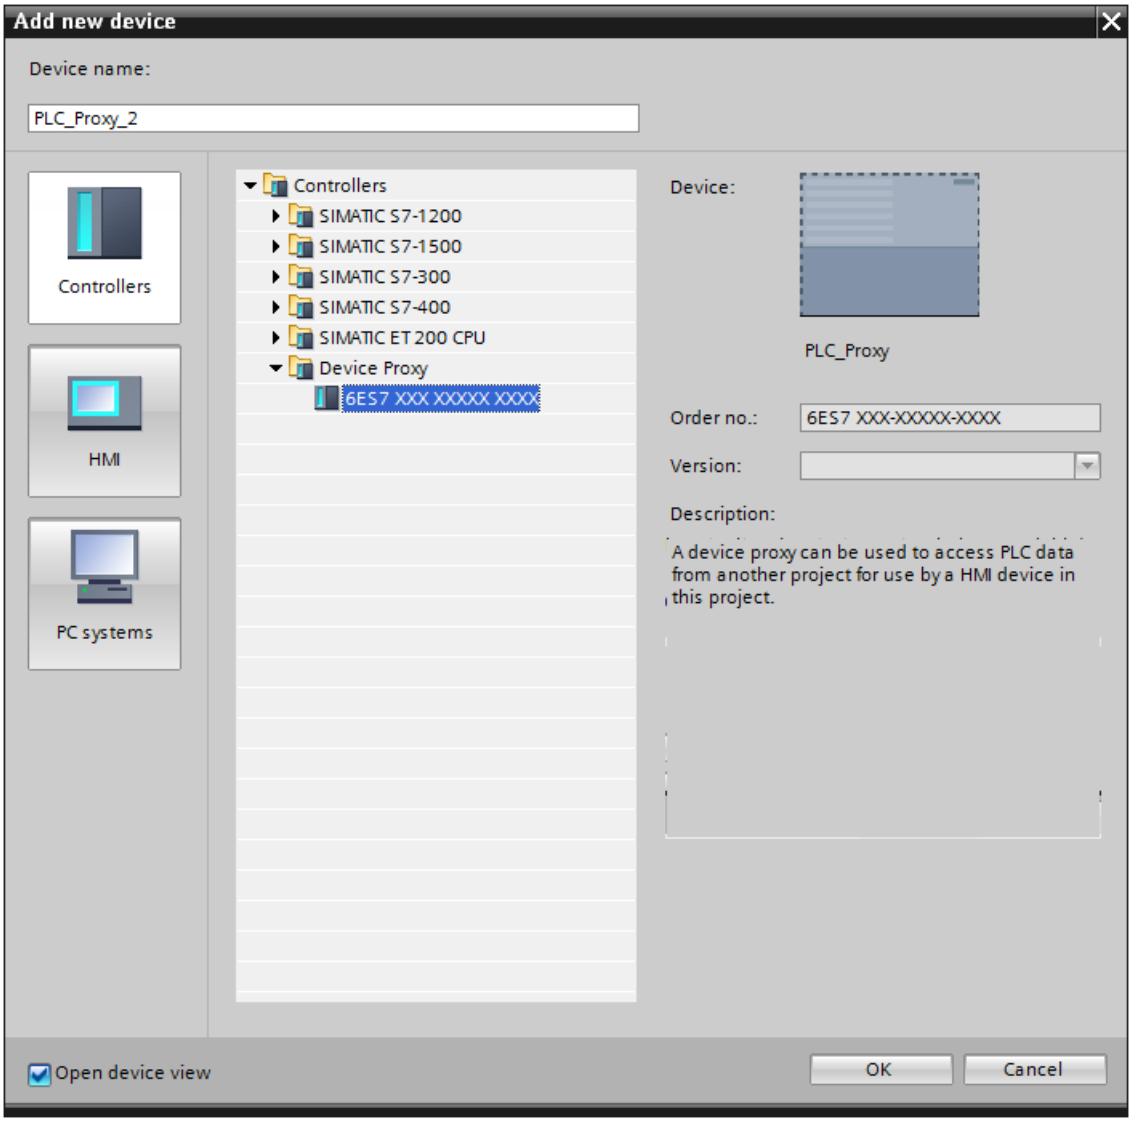
The IPE file contains the device proxy data from the source project.

Requirement

IPE file is available.

Procedure

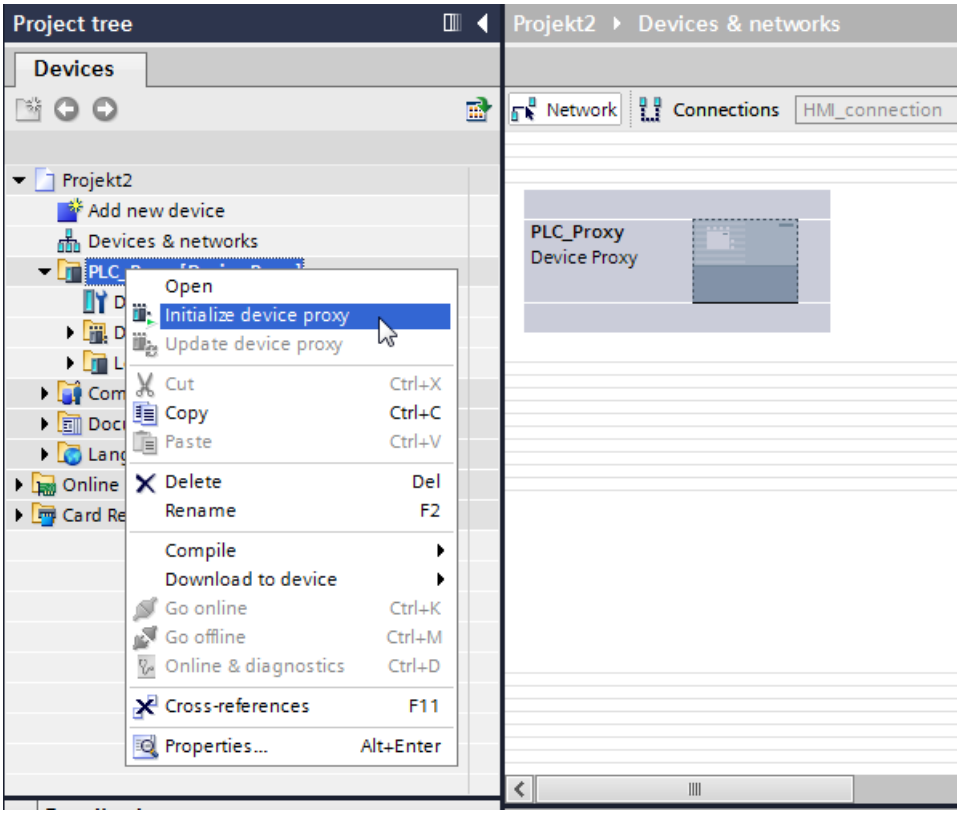
1. Double-click "Add new device" in the project tree.
2. Select the device proxy under "Controller".



A new device is created in the "Devices & Networks" editor.

3. Select the device proxy in net view.

4. Click "Initialize device proxy" in the shortcut menu.



5. Select the IPE file and click the "Open" button.
   The "Initialize device proxy" dialog opens.

   Note

   You cannot select the device proxy data before initialization in the target project.

   All device proxy data included in the IPE file is transferred.

   Click "OK".
   Initialization of the device proxy is started.

Result

Following initialization, all device proxy data from the IPE file is contained in the device proxy.

You can now configure an HMI connection with the device proxy and connect PLC tags from the device proxy with HMI tags, for example.

See also

Create a device proxy and initialize via a project file (Page 963)

Updating a device proxy via an IPE file

Introduction

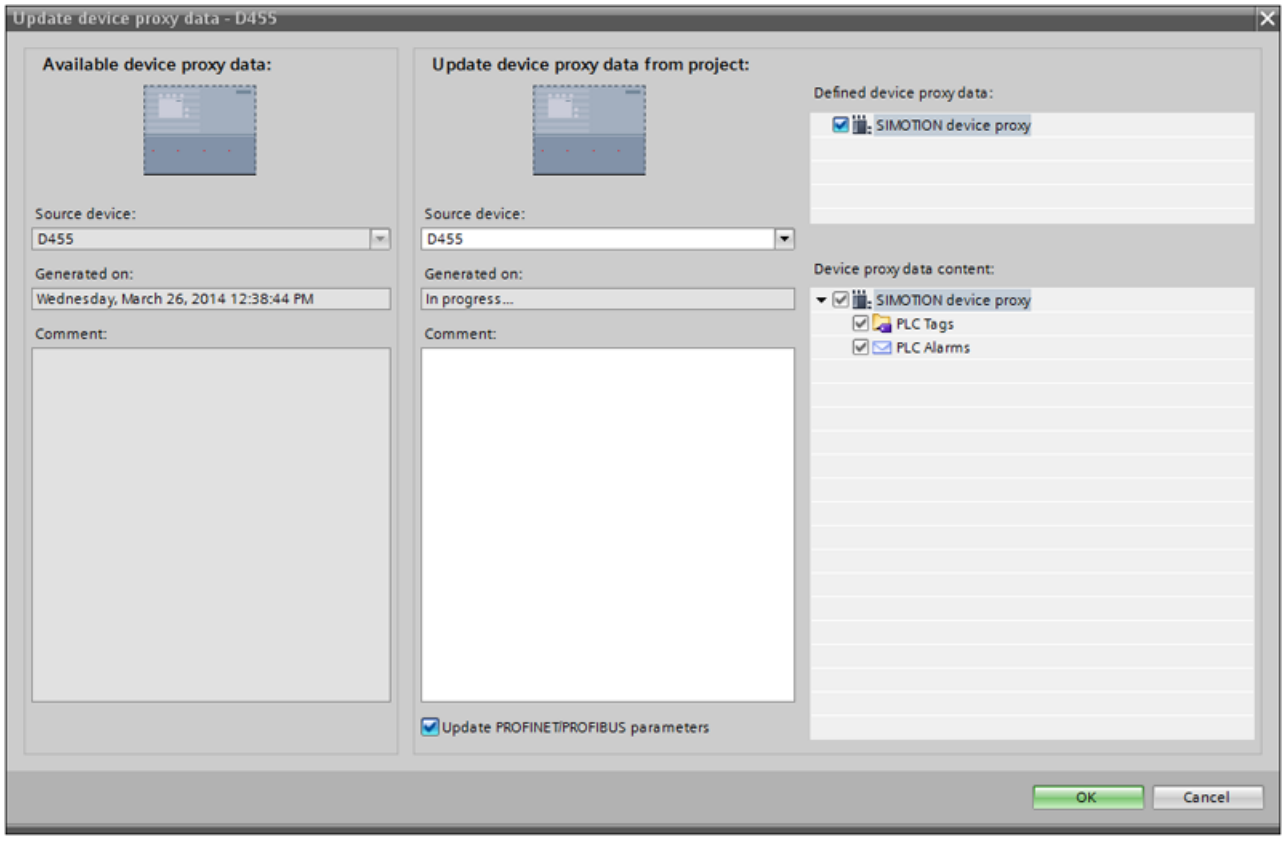
If changes were made to the device proxy data in the device proxy source project, the device proxy data can be updated in the target project.

Requirement

- The new IPE file contains the device proxy data from the source project.
- A device proxy has already been initialized using an IPE file in the target project.

Procedure

1. Select the device proxy in the project tree.
2. Select the "Update device proxy" entry in the shortcut menu.
3. Select the IPE file.



4. Select whether you wish to update the PROFINET/PROFIBUS parameters.
5. Click "OK".

3.6.4 SIMOTION SCOUT with Comfort Panels

3.6.4.1 SIMOTION SCOUT data

Data for the device proxy

With the initialization, the device proxy accepts the data set present in the project file:

- System variables
- Config data
- Global variables
- Message configuration
  The device proxy accepts the message configuration of the source. When you create a new message, you must update the device proxy accordingly.
  TO alarms are also synchronized and created in the TIA Portal.
  Alarm_S messages are created only when they are used in the source project via a message call in a program. If you use the Alarm_S messages only after the initialization, you must update the device proxy.
- Communication configuration
  During the initialization, the settings for the communication interfaces are transferred automatically (e.g. IP address, subnet mask). If you change the settings in the source project, you must update the device proxy.

3.6.4.2 Using Comfort Panels with SIMOTION SCOUT

Using HMI panels

The device proxy is intended for applications in which the automation is still to be configured with SIMOTION SCOUT but the HMI connection made via the TIA Portal.

This is the case, for example, when functions are used in the project that are not available in the TIA Portal (e.g. SIMOTION Drive Control Chart, DCC) and on the other hand HMI panels are being used that are only available in the TIA Portal.

In this case, the automation project remains in SIMOTION SCOUT and only the HMI configuration is carried out in the TIA Portal.

See Requirements for Inter Project Engineering (IPE) / device proxy (Page 962) for an overview of the software requirements.

Note

Comfort Panels are available only for WinCC Comfort, WinCC Advanced and WinCC Professional V13 or higher.

This may result in the following application scenarios:

- You are setting up a new project in SIMOTION SCOUT and using the TIA Portal for HMI configuration.
- You already have a project and would like to reconfigure an HMI in the TIA Portal.
- You already have a project with an HMI configuration and would like to switch to a Comfort Panel.

You generally proceed as follows:

- Configure the SIMOTION components in SIMOTION SCOUT.
- Configure the HMI in the TIA Portal.
- For the SIMOTION part, perform a download from SIMOTION SCOUT.
- For visualization in HMI, perform the download from the TIA Portal.

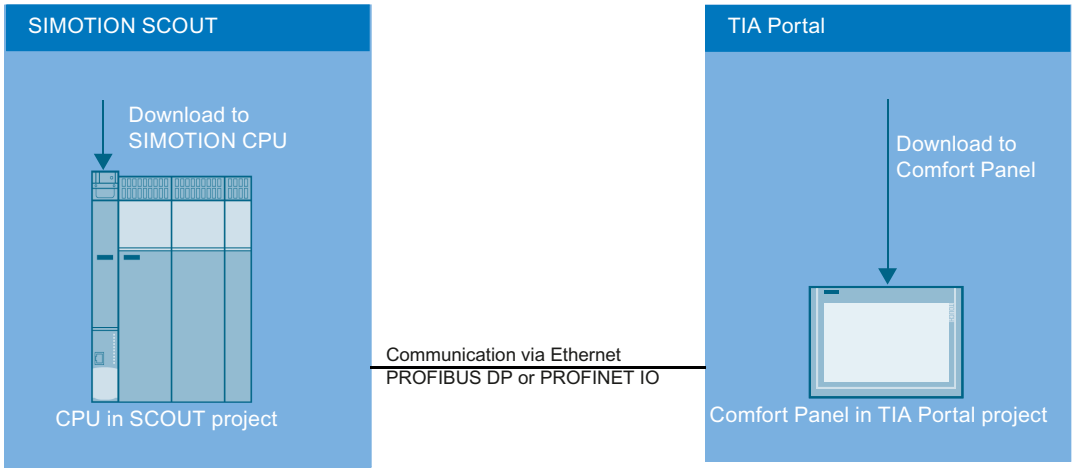


Figure 3-517 SIMOTION SCOUT with Comfort Panel

3.6.4.3 Configuring Comfort Panels in a SIMOTION SCOUT project

Integrating a Comfort Panel via a device proxy

If you use Comfort Panels, you require a connection between the TIA Portal and SIMOTION SCOUT.

If you use an older project, you must first upgrade it to SIMOTION SCOUT V4.4.

Note

PROFIBUS interfaces

Three PROFIBUS interfaces are shown in the network view and device view for SIMOTION D4xx devices, although there are only two interfaces on the devices. The third interface symbolizes the PROFIBUS Integrated. Open the device overview to find out which icon represents the PROFIBUS Integrated interface.

To configure an HMI Panel, proceed as follows:

1. Create a project in SIMOTION SCOUT and add the modules that you need.
2. Configure the communication and the technology.
   – If you have not fully configured the project, you can update the device proxy at a later date (see also Updating a device proxy via a project file (Page 967))
3. Save and compile the project.
4. Open the TIA Portal (as of V13).
5. Create a project and insert a device proxy.
6. Initialize the device proxy using a project file (see also Create a device proxy and initialize via a project file (Page 963)).
7. To do that, in the device view right-click the device proxy and execute "Initialize device proxy". The "Open data source for device proxy" dialog box opens.
8. Select "SIMOTION Project" as the filter for the data source.
9. In the file system, navigate to your project and select the project file.
10. Apply the setting with "Open."

Result

The device proxy has now been initialized with the settings of the SIMOTION module.

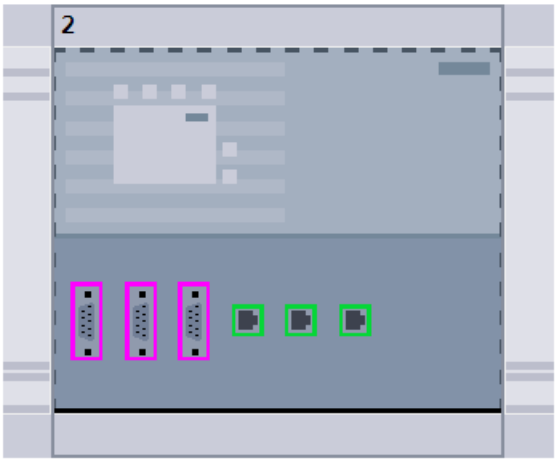

Figure 3-518 Device proxy initialized

Inserting and connecting HMI

Once you have initialized the device proxy, add the HMI and configure the connection.

1. Change to the network view.
2. Select a Comfort Panel in the hardware catalog ("HMI > SIMATIC Comfort Panels").
3. Drag the Comfort Panel into net view.
4. Configure the communication between device proxy and HMI panel in the same way as the SIMOTION SCOUT project:
   – Use the same interfaces and ports (PROFINET only) for the network connection with PROFIBUS or PROFINET as in SIMOTION SCOUT.
5. Change the net view from "interconnect" to "connections", select the "HMI connection" entry in the drop-down list and drag a connection from the device proxy to the HMI panel.
   The connection is created.

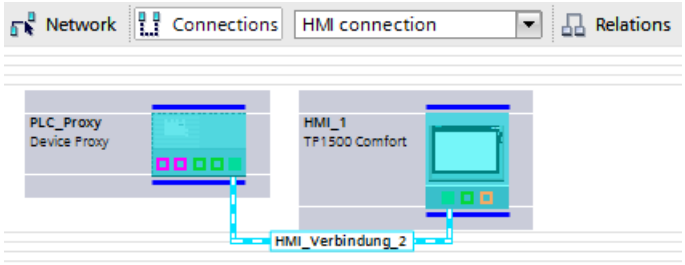

Figure 3-519 Device proxy HMI connection

This connection is an integrated connection and like the connections with SIMOTION devices, it cannot be edited in the WinCC connection editor.

Download

1. Carry out the additional configuration in SIMOTION SCOUT and in the TIA Portal.
2. Load the SIMOTION configuration from SIMOTION SCOUT into the controller.
3. Load the HMI configuration from the TIA Portal into the Comfort Panel.

3.6.4.4 Project with integrated WinCC flexible HMI configuration

Migrating a Classic HMI configuration

If you have a project that contains an HMI configuration, you can migrate this HMI project from WinCC flexible to the TIA Portal. To do this, you must extract the integrated HMI configuration from the SIMOTION SCOUT V4.4 project. This migration can also be used to switch from a panel to a Comfort Panel.

You will find an FAQ in the Internet about extracting the HMI configuration and subsequent migration:

Migrating an integrated project from WinCC flexible to WinCC (TIA Portal) (http://support.automation.siemens.com/WW/view/en/54695062)

After the migration, the project contains the migrated HMI with the old connections.

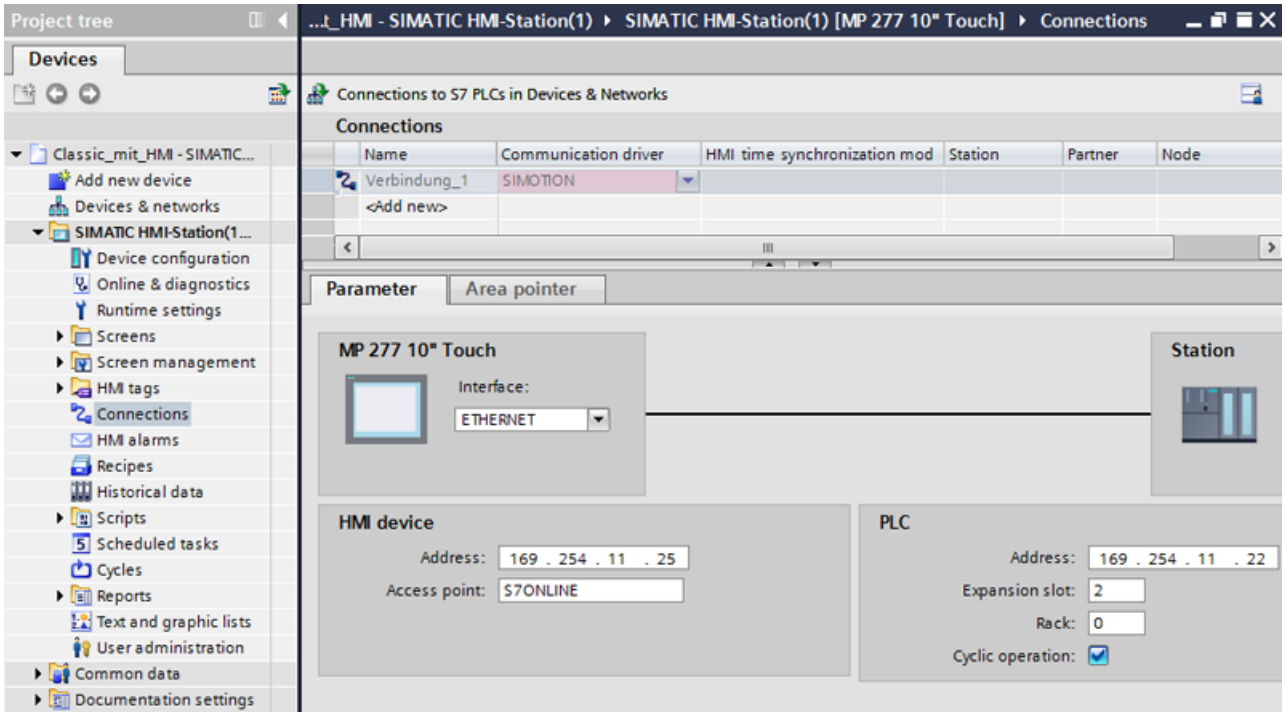

Figure 3-520 HMI migration

You must then perform the following additional steps:

1. Insert a device proxy and initialize it to the Classic project (see also Configuring Comfort Panels in a SIMOTION SCOUT project (Page 974)).
   The Classic project must reference the same HMI tags as the migrated project.
2. If you want to use a Comfort Panel, perform a device replacement.
3. Right-click the panel in the net view and select the "Device / change version" entry.
   The "Replace device" dialog opens.

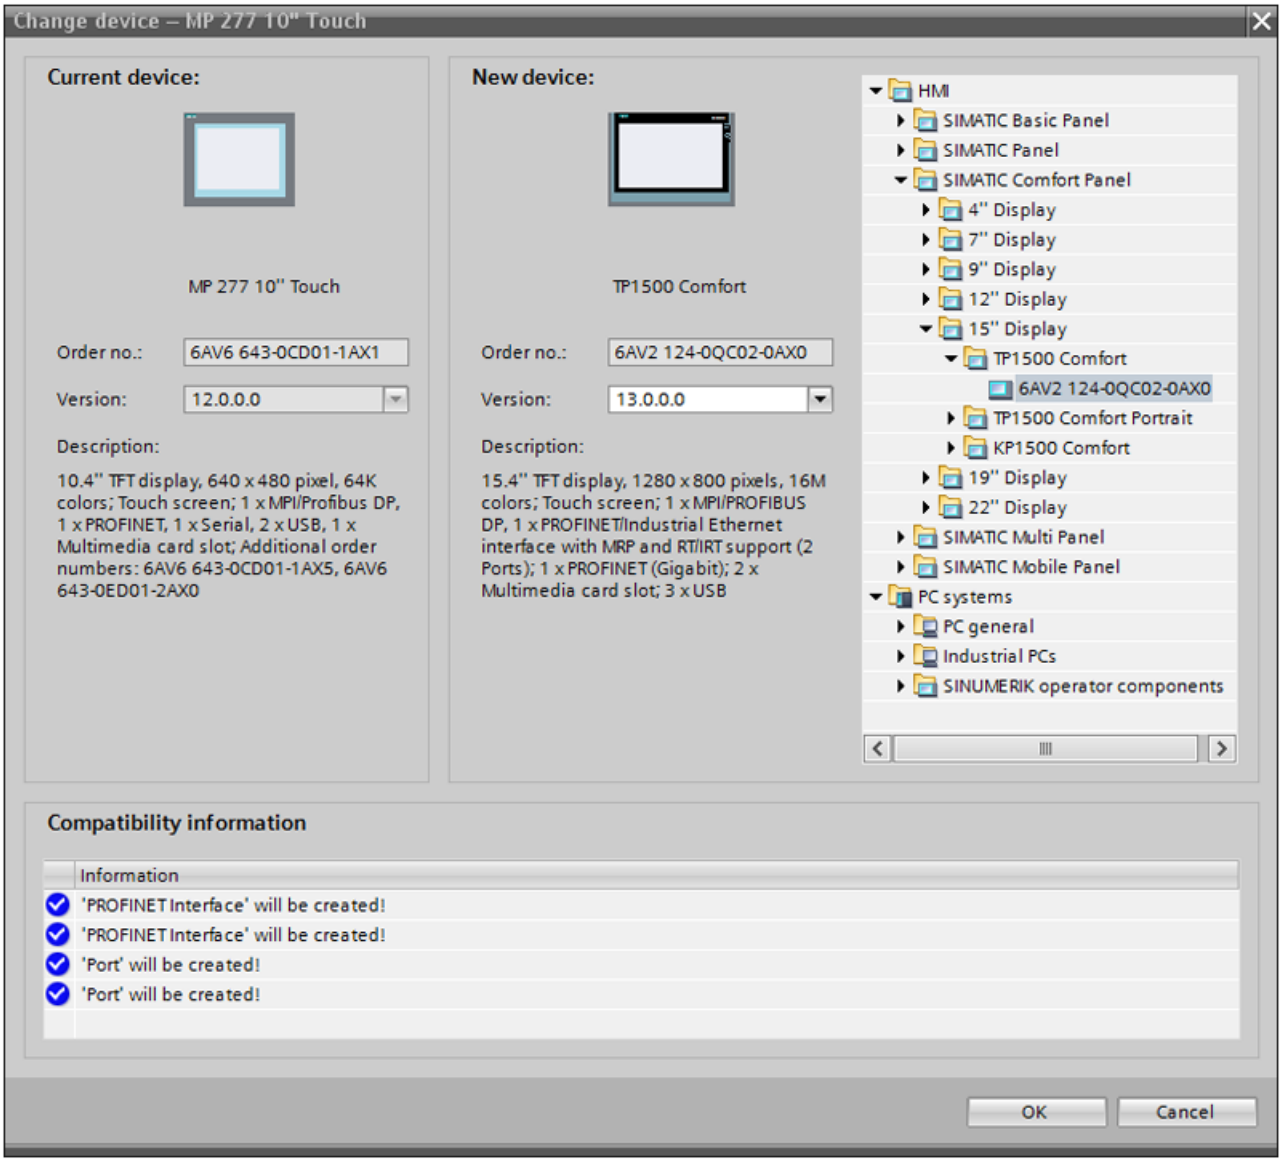

Figure 3-521 Replacing a device

Note

Note the compatibility information.

Establishing a connection and synchronizing HMI tags

1. Establish a connection between the device proxy and the HMI. This connection is an integrated connection and like the connections with SIMOTION devices, it cannot be edited in the WinCC connection editor.
2. Click the "Connections" button and select the device in the net view. Also select "HMI connection" in the drop-down list.
3. Move one device to the other one using drag-and-drop. The TIA Portal creates an HMI connection.

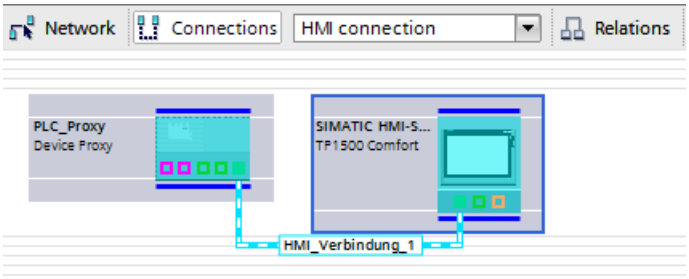

Figure 3-522 HMI device proxy connection

4. Double-click the "Connections" entry under HMI variables in the project navigation. The panel settings are displayed.

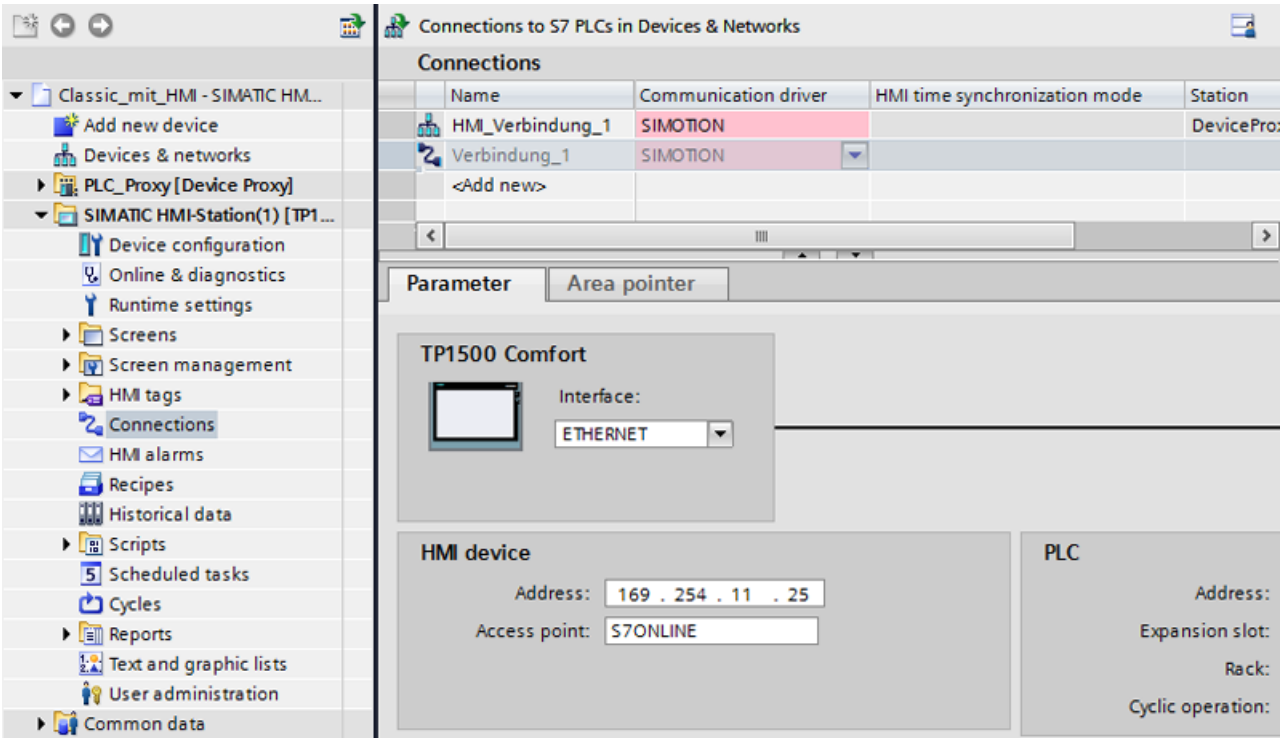

Figure 3-523 Customizing connections

5. Note the name of the old connection (here "Connection_1") and delete this connection. The old connection is invalid after the migration.
6. Change the name of the new connection (between panel and device proxy) by entering the name of the old connection.

7. Perform a comparison of the old HMI variables.
8. Right-click the "HMI variables" entry in the project tree and "Synchronize for comparison with the PLC variable".
   The following dialog opens:

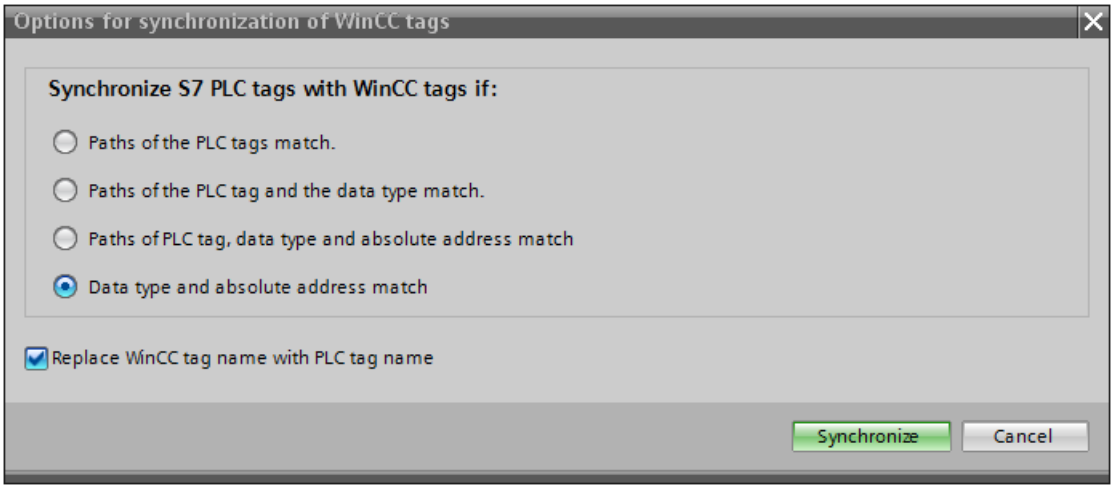

Figure 3-524 Synchronizing PLC variables dialog

9. Activate the "Data type and absolute address match" option. If you have renamed one of the variables, it is possible that it is connected with an incorrect variable. Consequently, renamed variables should be reassigned manually.
   If a variable is incorrectly connected, this error will not occur until during RT communication.
10. Activate the "Replace WinCC variable name with PLC variable name" option.

The project that was used for initializing the device proxy must contain the same set of tags as the old project.

Add new tags after the migration and synchronization, and interconnect them. If you change the source project settings in SIMOTION SCOUT, you must update the device proxy.

3.6.4.5 Using direct keys

Use of panel keys as direct keys

The direct keys are used to directly influence the machine status from the HMI Panel. For example, a direct key can be pressed to stop an axis.

The following files must exist for the configuring:

- For PROFIBUS DP, a GSD file for the panel
- For PROFINET IO, a GSDML file for the panel

Requirement

You already have a project with a device proxy that is connected with a Comfort Panel, and a SIMOTION controller exists.

Configuring in HW Config

As you cannot select the Comfort Panel in the HW Config of SIMOTION SCOUT, you must add the device to the HW Config using GSD import. Only then can you configure the direct keys. The GSD/GSDML files are not currently available; contact SIEMENS Customer Support in this connection.

To configure a Comfort Panel, proceed as follows:

Configuring in HW Config

1. Switch to SIMOTION SCOUT and open HW Config.
2. Perform "Options > Install GSD files".
   The "Install GSD files" dialog box is displayed.
3. Select the GSD/GSDML file, and click "Install" and "Close".
   The file will be installed.
4. Navigate in the hardware catalog, for example to the "PROFINET IO > Further field devices > HMI" entry.
   The installed Comfort Panels are displayed in the folder.
5. Drag the panel to the PROFIBUS master system or to the PROFINET IO subsystem.
   Ensure that the panels have the same bus addresses (PROFIBUS address, IP address, etc.) as the devices configured in the TIA Portal.

The help system of the TIA Portal describes how you complete the configuration of a direct key with WinCC flexible.

Configuring the HMI in the TIA Portal for the use of direct keys

If you intend to use direct keys, you need to take a number of general conditions into account when configuring the Comfort Panel in the TIA Portal. The PROFINET device name and the converted device name of the HMI must be identical. The Comfort Panel must not be configured as an IO device. The configuration must be saved as a GSD/GSDML before the Comfort Panel is exported.

The proxy is set up in the TIA Portal and connected to the panel in the network configuration. The HMI connection has been configured.

Configuration in the TIA Portal

1. Check to make sure that the Comfort Panel is not configured as an IO device. The IO device operating mode must not be activated.

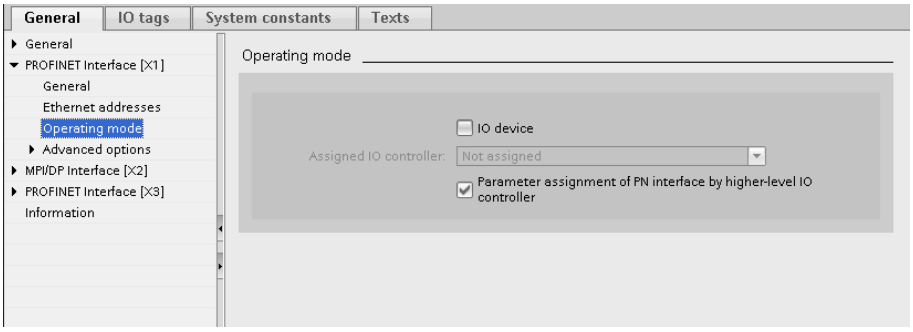

Figure 3-525 HMI operating mode not as IO device

2. Configure the PROFINET device name at the connected interface PNxIO (150) port X1.

3. Enter the device name, e.g. "hmi1_panel". The TIA Portal automatically generates a converted device name. In this example, this is hmi1xbpanel7da2.

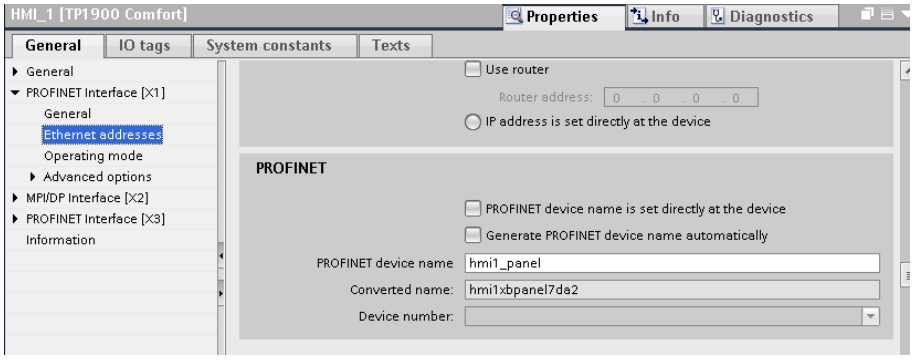

Figure 3-526 Device name of the Comfort Panel with converted device name

4. Copy the converted name into the field labeled "PROFINET device name".

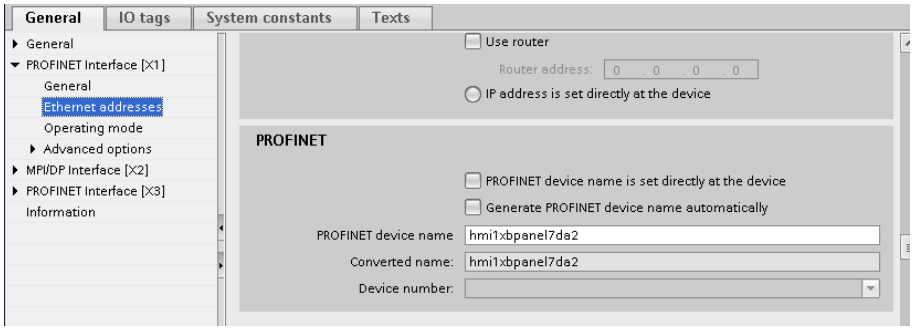

Figure 3-527 Converted name and PROFINET device name are identical

5. All essential configuring steps have now been completed. Continue the configuring process as described in previous chapters.

You can check which device name has been configured by selecting the Startcenter at the fully configured panel.

1. Select the "Startcenter" at the panel.
2. Select "Settings > PROFINET". The PROFINET window appears. The converted name of the panel and the PROFINET device name configured in the TIA Portal must be identical in this window. The name is hmi1xbpanel7da2 in our example.

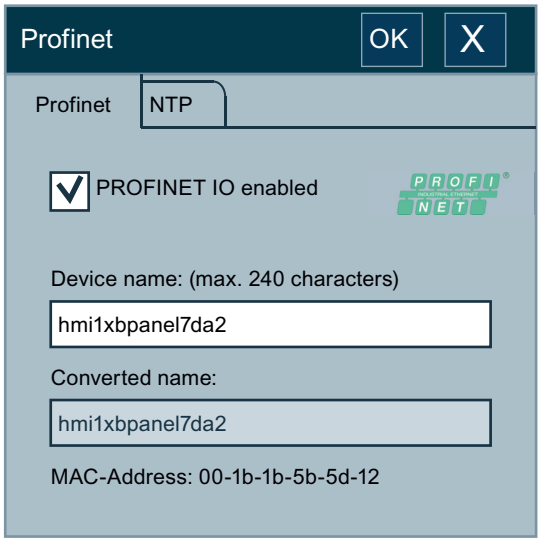

Figure 3-528 Converted name and PROFINET device name at the panel (schematic representation of the Startcenter)

System and Function Descriptions 4

4.1 Basic Functions for Modular Machines

Preface

Preface

This document is part of the **SIMOTION System and Function Descriptions** documentation package.

Scope

This document applies to SIMOTION SCOUT, the engineering system of the SIMOTION product version V5.2 in conjunction with:

- A SIMOTION device with the following versions of the SIMOTION Kernel:
  - V5.2
  - V5.1
  - V4.5
  - V4.4
  - V4.3
  - V4.2
  - V4.1
  - V4.0
  - V3.2
- The relevant version of the following SIMOTION Technology Packages, depending on the kernel:
  - Cam
  - Path (as of kernel V4.1)
  - Cam_ext
  - TControl

Sections in this manual

The following is a list of sections included in this manual along with a description of the information presented in each section.

- **Fundamental safety instructions** (Section 1)
- **Overview of the functionality of modular machines** (Section 2)
  This section provides an overview of the functionalities for modular machines that are automated using SIMOTION and PROFIBUS DP or PROFINET IO.
- **Synchronizing SIMOTION devices with a higher-level bus block cycle** (Section 3)
  This section describes the synchronization of a SIMOTION device and its PROFIBUS DP interfaces with a higher-level bus block cycle.
- **Setting the communication addresses via the user program** (Section 4)
  This section describes the options for changing the communication addresses for PROFIBUS DP, PROFINET IO, and Ethernet via the user program.
- **Activating and deactivating components and technology objects** (Section 5)
  This section describes how to activate or deactivate DP slaves (in PROFIBUS), IO devices (in PROFINET), or technology objects in the user program.
- **Changing the active configuration or the active kernel** (Section 6)
  This section describes how to perform a controlled change of configurations or the SIMOTION Kernel via a user program.
- **Appendix**
  u7mkcnfx.exe Command line application, creating and loading the SCOUT scripting card images, storing configuration files for SIMOTION D4xx devices up to kernel version V4.1.4
- **Index**
  Keyword index for locating information

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.2:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P

- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

4.1.1 Fundamental safety instructions

4.1.1.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Danger to life caused by machine malfunctions caused by incorrect or changed parameterization

Incorrect or changed parameterization can cause malfunctions on machines that can result in injuries or death.

- Protect the parameterization (parameter assignments) against unauthorized access.
- Respond to possible malfunctions by applying suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

4.1.1.2 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

4.1.1.3 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

4.1.2 Overview of the functionality of modular machines

This section provides an overview of which functionalities are offered by the SIMOTION MC system to enable the creation of modular machines with SINAMICS drives, PROFIBUS DP, and PROFINET IO.

The SIMOTION system offers several ways of designing a machine on a modular basis and optimizing the rated conditions:

- The targeted and automated creation of a SIMOTION project in the SIMOTION SCOUT engineering system, for example by:
  - Using ready-made and tested modules such as library components, for example
  - Automating the configuration and parameterization of machine components (e.g. the drives or the components) via so-called scripting.
    This procedure is clearly described in the online help section of the SCOUT engineering system and will not be further explained here.
  - Changing the configuring via the user-friendly SIMOTION easyProject project generator.
    As of version V4.4, it can be called directly from SIMOTION SCOUT.
    Further information is available at:
    On the SIMOTION Utilities & Applications DVD that is supplied free of charge with SIMOTION SCOUT.
    On the Internet (http://w3.siemens.com/mcms/mc-systems/en/automation-systems/mc-system-simotion/motion-control-software/easy-project/Pages/simotion-easy-project.aspx).
    In SIOS (https://support.industry.siemens.com/cs/document/62049135/project-generator-simotion-easyproject?dti=0&lc=en-WW).
- Changing the configuration during user program runtime. This is done via system functions provided by the SIMOTION kernel. An engineering system is not required.
  This procedure is described in detail in this document.
  The procedure for distributed synchronous operation, which can apply to the entire project, is described in the function manual titled *SIMOTION Motion Control Technology Objects Synchronous Operation, Cam*.

4.1.2.1 Synchronizing SIMOTION devices with a higher-level bus cycle clock

SIMOTION devices provide several communication interfaces to which distributed I/O, for example, or other SIMOTION devices can be connected. This enables the synchronous running of axes that are controlled and regulated via the various SIMOTION devices (distributed synchronous operation). For this, the devices must be interconnected via an isochronous communication network (PROFIBUS DP or PROFINET IO) and synchronized with a common bus cycle clock.

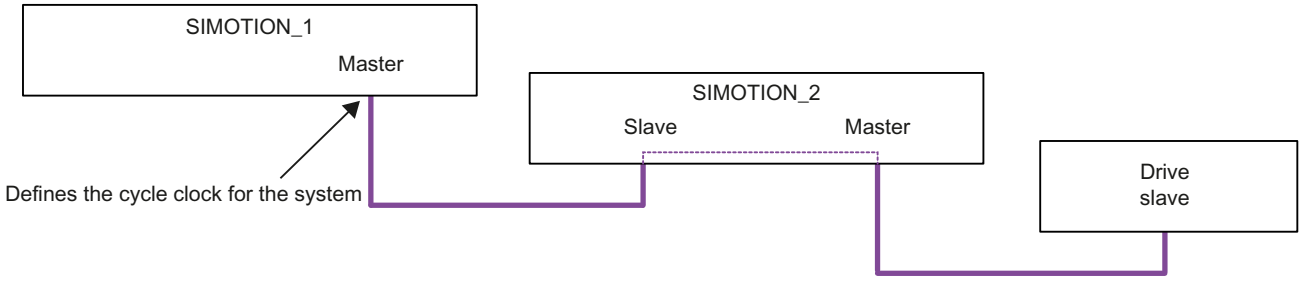

Figure 4-1 Sample configuration for synchronizing a SIMOTION device with an isochronous master

The SIMOTION_1 device delivers a bus cycle clock to the connected subnet via an isochronous communication interface that has been configured as a DP master (in PROFIBUS DP) or as a sync master (in PROFINET IO).

The SIMOTION_2 device should be synchronized with this higher-level bus cycle clock. For this reason, the communication interface reached by the bus cycle clock in the SIMOTION_1 device must be configured as a DP slave (in PROFIBUS DP) or as a sync slave (in PROFINET IO). General information about synchronizing a SIMOTION device with the bus cycle clock (Page 1000) provides an overview of cycle clock generation and synchronization in PROFIBUS DP and PROFINET IO.

Isochronous DP master interfaces in the SIMOTION_2 device can be synchronized with the higher-level bus cycle clock and the cycle clock delivered to lower-level drives. The synchronization behavior of the SIMOTION_2 device depends on whether or not the PROFIBUS DP interfaces have been configured as isochronous DP masters:

- No further isochronous DP master interface available: The synchronization of the device (with the internal cycle clocks) occurs automatically when the higher-level bus cycle clock has been recognized at the corresponding slave interface. See Synchronizing a SIMOTION device without an isochronous DP master interface (Page 1006)
- At least one isochronous DP master interface is available (for example in SIMOTION D). Synchronization of the isochronous DP master interfaces is controlled by the user and occurs when the user calls up a system function. Synchronization of the device varies, depending on whether the higher-level bus cycle clock is fed in via a PROFIBUS DP interface or a PROFINET IO interface. See Synchronization of a SIMOTION device with an isochronous DP master interface (Page 1008)

4.1.2.2 Changing communication addresses via the user program

Nodes are clearly identified within a communication network by means of, for example

- The PROFIBUS address of the interface in PROFIBUS DP
- The device name (NameOfStation) in PROFINET IO
- The IP address of the interface on Ethernet

These communication addresses are set during configuration with the help of the SIMOTION SCOUT engineering software. They can be changed later by a user program and the requirements customized at each respective destination.

Some application examples for this functionality are described in the following.

Application examples for setting the communication address

Base machine with several modules

A machine consists of a base machine (base_machine) with several machine modules (module_1 to module_n). The base machine and all modules are controlled via separate SIMOTION devices. These are interconnected via a communication network. This is shown schematically:

- In the PROFIBUS DP example: A base machine with several identical modules, which communicate via PROFIBUS DP
- In the PROFINET IO example: A base machine with several identical modules, which communicate via PROFINET IO

The same SIMOTION project (i.e. the same SIMOTION devices, drives, technology objects, user programs) is loaded on all machine modules. The user program of each module determines the necessary communication address and sets it up.

Note

As an alternative to changing the communication address of the machine module, you can also activate different configurations (Activating the configuration (Page 998)).

Example of communication via PROFIBUS DP

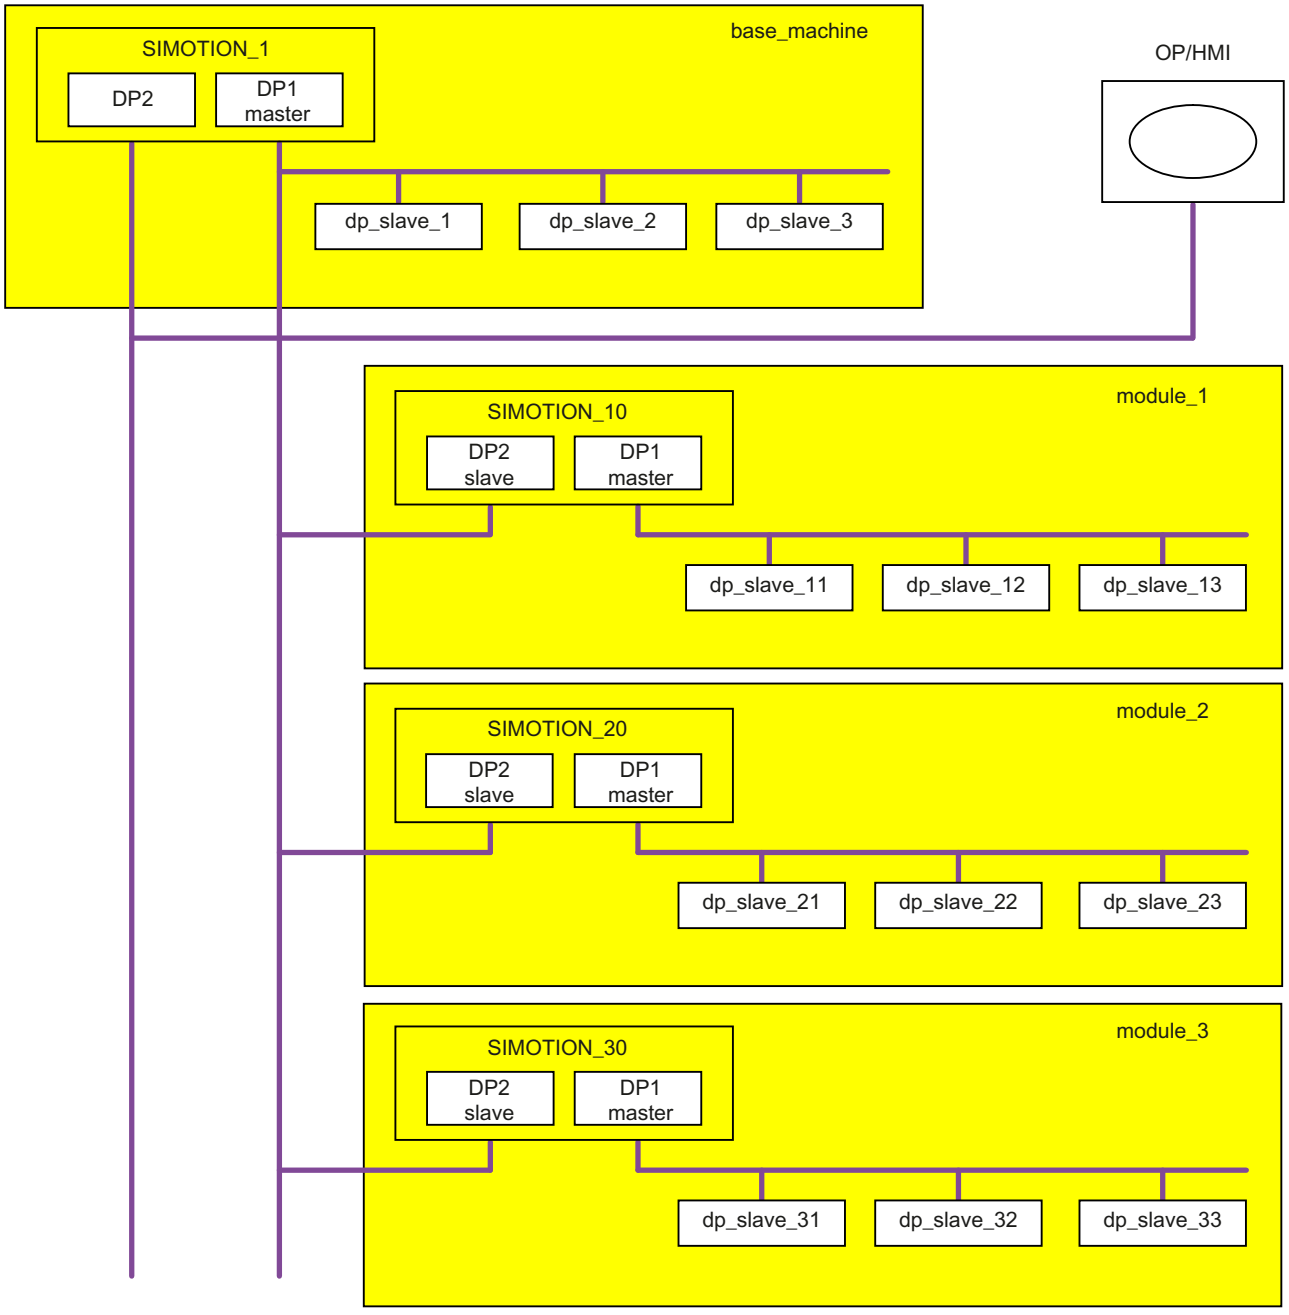

Figure 4-2 Base machine with several identical modules (communication via PROFIBUS DP)

Example of communication via PROFINET IO

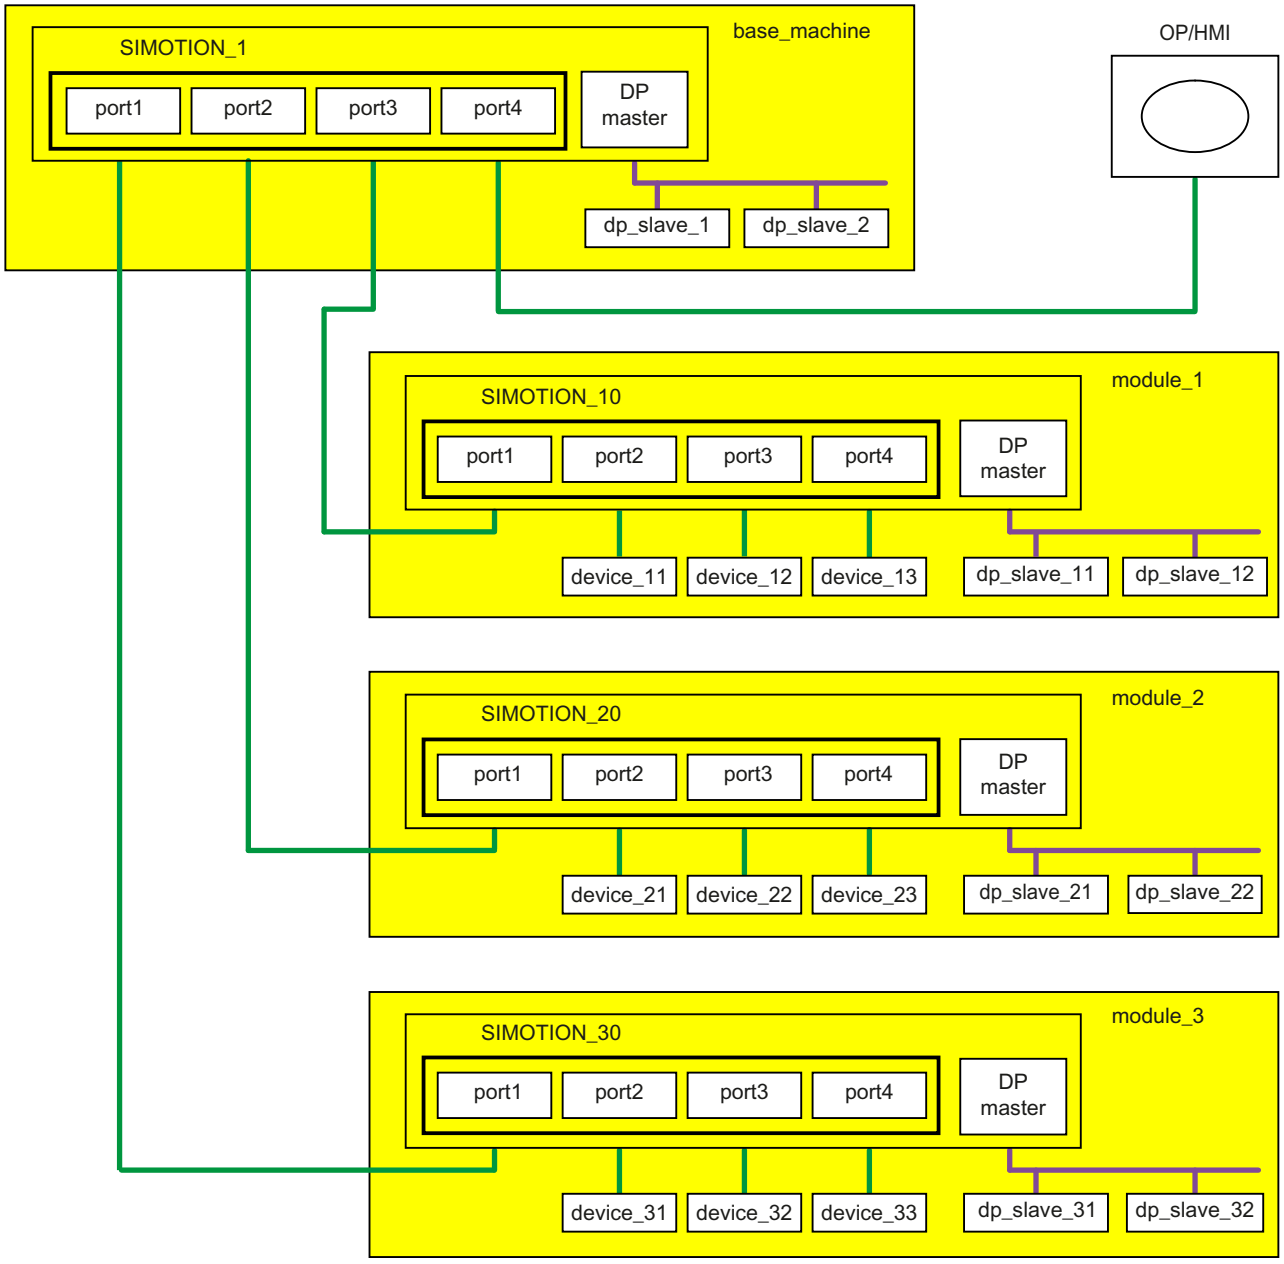

Figure 4-3 Base machine with several identical modules (communication via PROFINET IO)

Replacing a module on the base machine

The user connects a replacement module to the base machine. A standard project with a preset communication address is loaded on the replacement module. The user program of each module determines the necessary communication address and sets it up.

Operating a module on several base machines

A module (with dedicated SIMOTION control) is alternately connected to different base machines (e.g. a transport vehicle travels to different assembly sites and connects there). At each base machine, the module is to be integrated in the respective communication network and contact established with the higher-level control.

A standard project with a preset communication address is loaded on the module. The communication address valid for the network of the respective base machine is set by the user program of the module according to the specifications.

User program for changing the communication address

The user program checks which communication address is to be set for the respective network, e.g. by:

- Reading in and evaluating a slot coding
- Evaluating a program variable (which can be changed, for example, by a user input on the HMI device)

The determined communication address then sets the user program. System functions are provided for this purpose, for example:

- To change the PROFIBUS address of a DP slave (see Setting the PROFIBUS address (Page 1014)):
  - _getActiveDpSlaveAddress
  - _setDpSlaveAddress
  - _activateDpSlaveAddress
- To change the device name (NameOfStation) of an IO device on PROFINET IO (see Setting the device name (NameOfStation) of an IO device on PROFINET IO (Page 1020)):
  As of SIMOTION Kernel version V4.4, the following functions should be used in new projects:
  - _getPnNameOfStation (as of Kernel V4.4, replaces _getActiveNameOfStation)
  - _setPnNameOfStation (as of Kernel V4.4, _setNameOfStation _activateNameOfStation)

  Up to SIMOTION Kernel version V4.3, the following functions should be used:
  - _getActiveNameOfStation
  - _setNameOfStation
  - _activateNameOfStation
- To change the IP address of an Ethernet node (see Setting the IP address (on Ethernet) (Page 1026)):
  As of SIMOTION Kernel version V4.4, the following functions should be used in new projects:
  - _getPnIpConfig (as of Kernel V4.4, replaces _getIpConfig)
  - _setPnIpConfig (as of Kernel V4.4, replaces _setIpConfig)

  Up to SIMOTION Kernel version V4.3, the following functions should be used:
  - _getIpConfig
  - _setIpConfig

4.1.2.3 Operating only parts of a configured maximum configuration

Here, for example, a machine consists of a base machine with several machine modules or several axes. The user configures and programs the base machine with all possible machine modules and axes (maximum configuration). The real machine differs from the configured maximum configuration, e.g.:

- Not all configured machine modules or axes are available (actual structure differs from configured structure)
- Not all machine modules or axes are required in an operation phase.

SIMOTION provides system functions for the following purposes:

- The distributed I/O on PROFIBUS DP or PROFINET IO (e.g. drives or other DP slaves or IO devices) can be activated or deactivated. In addition, the current state of individual or all DP slaves or IO devices can be queried.
- Technology objects (e.g. axes assigned to drives that are not required) can be activated or deactivated.

The computational load of the SIMOTION device can be reduced through specific use of these system functions; the computing capability can be concentrated on the drives or technology objects which are currently required. No bus fault is signaled, even if bus nodes are not available.

Note

Licenses are required for all axes of the maximum configuration.

Fundamental procedures

As an example, different procedures are described for a machine during ramp-up or during production.

- During ramp-up, the user program determines the actual structure of the distributed I/O (e.g. drives, other DP slaves) of the machine. Here, the system function calls _getStateOfAllDpSlaves and evaluates its return value.
  All configured distributed I/O are activated, by default. The user program now deactivates the DP slaves that are not available and the technology objects assigned to the drives.
- During a defined production phase, certain plant units (e.g. machine modules, including drives and axes) are required, while others are not. In accordance with the relevant operator specifications, the user program deactivates plant units which are no longer required (along with the assigned technology objects) and activates the newly added ones.

User program

You can use the following SIMOTION system functionalities in the user program:

- System functions are provided (see Activating and deactivating nodes on the PROFIBUS or PROFINET IO (Page 1031)) to activate or deactivate a bus node (DP slaves or IO devices) and to call up its status; for example:
  - _activateDpSlave
  - _deactivateDpSlave
  - _getStateOfAllDpSlaves or _getStateOfAllDPStations
- Use the parameters of a SINAMICS drive (see Activating and deactivating SINAMICS components (Page 1064)) to activate or deactivate the drive and to query its status.
- System functions are provided (see Activating and deactivating technology objects (Page 1066)) to activate or deactivate a technology object and to query its status; for example:
  - _activateTo
  - _deactivateTo
  - _getStateOfTo

Note

The functions can also be integrated easily into the user program via the library **LMoMa**. This library is included on the DVD "SIMOTION Utilities & Applications". This DVD also contains other useful blocks such as those required to read out the DriveCLiQ topology, for example.

System behavior

The cycle time calculated from the configuration for exchanging data with all distributed I/O on the PROFIBUS DP remains unchanged.

However, a deactivation of the distributed I/O still results in the following advantages:

- The data volume on the PROFIBUS DP to be transferred cyclically is reduced, and the time required within a system cycle clock for communication decreases. The time saved is available for other services on the PROFIBUS (e.g. acyclic services for operator control and monitoring or diagnostics)
- Deactivated technology objects hardly require any computing time. The time saved is available for user tasks
- Alarms of these I/O (e.g. _SC_DIAGNOSTIC_INTERRUPT, _SC_STATION_DISCONNECTED, _SC_STATION_RECONNECTED) are suppressed and no longer evaluated.

4.1.2.4 Activating the configuration or the SIMOTION kernel

The "configuration server" functionality integrated in SIMOTION permits configurations on the memory card to be added to the SIMOTION device. For example, the following applications can be implemented:

- A configuration adapted for each task (e.g. device configuration, technology objects, user program) can be added (see Activating the configuration (Page 998)):
  - By coupling different machine modules (e.g. in different production phases), the required configuration can be automatically determined (using connector coding, for example); this configuration can then be added
  - The memory and computing capability of the SIMOTION device are only used for the configured functionalities
  - Cycle times and cycle clocks (e.g. DP cycle clock, position control cycle clock, IPO cycle clock) can be optimized for each requirement.
- The configurations (e.g. of the user programs) or the SIMOTION kernel can be updated using the user program:
  The user transfers the new configurations and, if necessary, the SIMOTION kernel to the memory card of the SIMOTION device and starts updating via the user program
  (see Activating the configuration (Page 998) and Activating the SIMOTION kernel (Page 999))
- Automatic recognition of the required configuration and its activation during the ramp-up of a SIMOTION device (SelfAdaptingConfiguration) is possible (see Selecting and activating a configuration using an initial configuration (Page 999)).

Activating the configuration

Various machine modules (e.g. DP slaves) are alternately connected to a SIMOTION device (base machine). The data for each arrangement (base machine with connected machine module) is stored as its own configuration on the memory card of the SIMOTION device.

In the example (see figure), a transport device with a SIMOTION control transports a workpiece to various machining stations. The following sequences can be observed here:

1. Drawing a blank from the store and transporting it to the machining station
2. Machining the blank
3. Unloading the semi-finished part at the packing station.

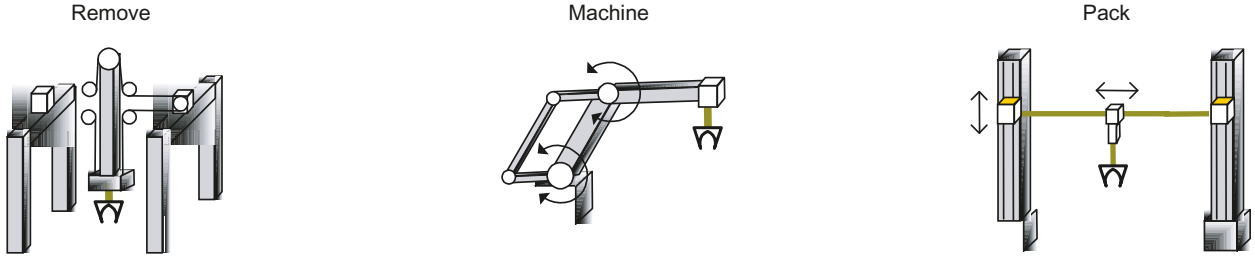

Figure 4-4 Sequences of an automation task

For each machining step, the associated optimized configuration is stored on the memory card of the transport device. After coupling to a machining station, the transport device identifies this, e.g. by evaluating a connector coding, and loads the required configuration using the _activateConfiguration system function. It then completes all work at the station and moves to the next one.

See also Activating a configuration (Page 1078).

Activating the SIMOTION kernel

You can also exchange the active kernel of the SIMOTION device using the user program and, for example, carry out an update to a new version without having to change the memory card of the device. In this regard, you must replace all configurations (configuration data) of the SIMOTION device.

The SIMOTION kernel and the associated configurations (configuration data) are stored on the memory card.

Using the _activateConfiguration system function you can ensure that a new kernel and a configuration are loaded and activated in the user program. The activating configuration can be specified explicitly or determined automatically using an initial configuration.

See also Activating a kernel (Page 1084).

Selecting and activating a configuration using an initial configuration

A SIMOTION device (machine module) is connected to a different SIMOTION device (base machine). After POWER ON, the machine module ramps up, identifies its position at the base machine (e.g. using a connector coding), and automatically loads the required configuration.

For this, the data of all configurations is saved to the memory card of the machine module; the machine module can then pick up this data on the base machine. The initial configuration also stored there will be loaded automatically after POWER ON. This identifies the required configuration (e.g. by using a connector coding) and loads it using the _activateConfiguration system function.

See also Selecting and activating a configuration using an initial configuration (Page 1089).

Procedure

All configurations required for a SIMOTION device (and possibly the SIMOTION kernel to be added) must be stored on the memory card of the SIMOTION device in a prescribed data format. The following section gives a summary of how to create the required data.

1. Configure and program each required configuration as a unique device in the engineering system (e.g. SIMOTION SCOUT).
2. Create the files required for the file system on the memory card of the SIMOTION device.
3. Transfer this card image to the associated memory card.

This process is described in detail in Procedure for creating the card images of configurations (Page 1098).

4.1.3 Synchronizing SIMOTION devices with a higher-level bus cycle clock

4.1.3.1 General information about synchronizing a SIMOTION device with the bus cycle clock

SIMOTION devices provide a range of interfaces for connecting to PROFIBUS DP or PROFINET IO. The devices and their applications (e.g. in ServoSynchronousTask or IPOSynchronousTask) can be operated isochronously to the bus cycle clocks occurring on the interfaces.

The table below provides an overview of the number and type of PROFIBUS DP and PROFINET IO interfaces of the various SIMOTION devices.

Table 4-1 Isochronous PROFIBUS DP and PROFINET IO interfaces of SIMOTION devices

SIMOTION device	PROFIBUS DP interfaces	PROFINET IO interfaces
D410 DP	• 1 interface • 1 internal master interface for SINAMICS Integrated	0 interfaces
D410 PN	• 0 interfaces • 1 internal master interface for SINAMICS Integrated	1 interface (2 ports)
D410-2 DP	• 2 interfaces • 1 internal master interface for SINAMICS Integrated	0 interfaces
D410-2 DP/PN	• 1 interface • 1 internal master interface for SINAMICS Integrated	1 interface (2 ports)
D425 D435 D445 D445-1	• 2 interfaces • 1 internal master interface for SINAMICS Integrated	1 interface optional (CBE30, 4 ports)
D425-2 DP D435-2 DP	• 2 interfaces • 1 internal master interface for SINAMICS Integrated	0 interfaces
D425-2 DP/PN D435-2 DP/PN D445-2 DP/PN D455-2 DP/PN	• 2 interfaces • 1 internal master interface for SINAMICS Integrated	• 1 interface (3 ports) • 1 interface optional (CBE30-2, 4 ports)
C230-2 C240	2 interfaces	0 interfaces
C240 PN	2 interfaces	1 interface (3 ports)
P320-3	0 interfaces	1 interface (3 ports)
P320-4	2 interfaces optional (IsoPROFIBUS board)	1 interface (3 ports)
P350-3	2 interfaces	1 interface optional (MCI-PN board, 4 ports)

The PROFIBUS DP interfaces can be operated as either slave or master, and the PROFINET IO interfaces as either controller and/or device.

The following provides a description of cycle clock generation and the various synchronization mechanisms.

Cycle clock generation and synchronization in PROFIBUS DP

Clock generation in PROFIBUS DP

It is necessary to distinguish between the following cases for clock generation in PROFIBUS DP:

- Precisely one PROFIBUS DP interface is configured as DP slave and is operated isochronously: In this case, this interface supplies the basic cycle clock for the SIMOTION device.
  - If a DP cycle is available at this interface, the SIMOTION device must be synchronized with this cycle clock. The synchronization behavior depends on whether the PROFIBUS DP interfaces of the SIMOTION device have been configured as the isochronous DP master. See the following section, "Synchronization in PROFIBUS DP".
  - If no DP cycle clock is available at this interface (e.g. if the associated DP master fails), a replacement cycle clock of the same size is generated.
- In all other cases (e.g. if no PROFIBUS DP interface has been configured as DP slave, or the interface configured as DP slave is not operated isochronously), the following applies: The basic cycle clock is derived from an internal cycle clock which is determined during configuration (configured basic cycle clock).

The figure below displays the cycle clock generating principle in PROFIBUS DP.

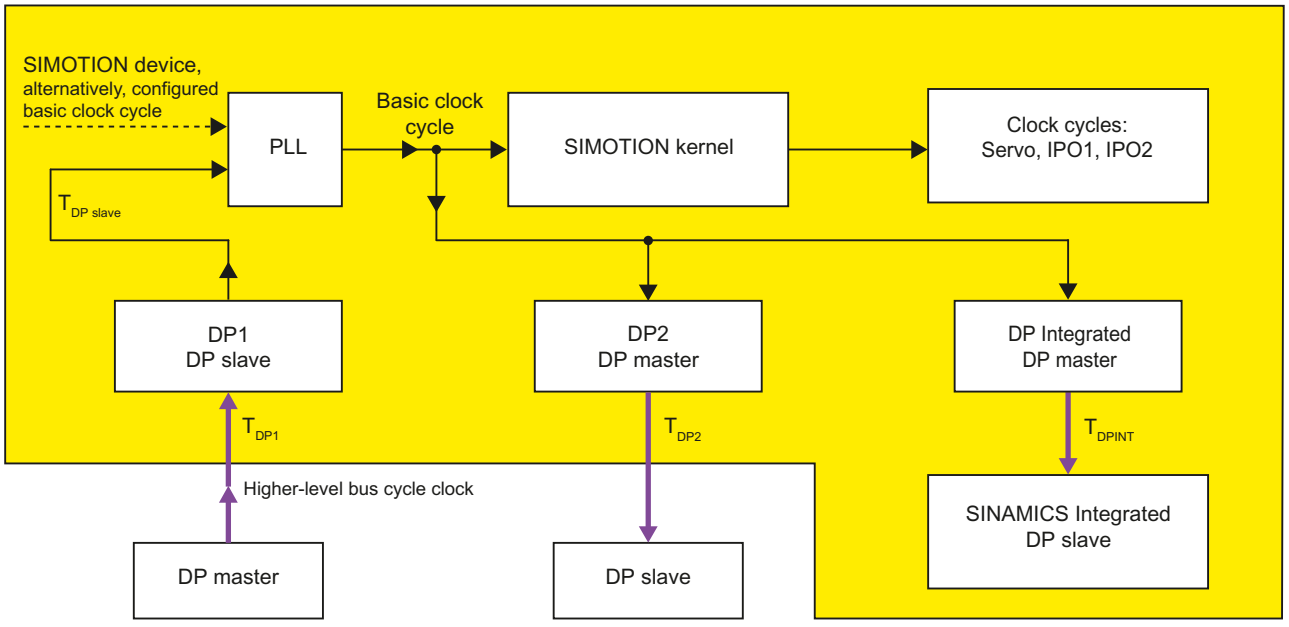

Figure 4-5 Cycle clock generation in a SIMOTION device in PROFIBUS DP

Synchronization in PROFIBUS DP

If the DP slave interface is operated isochronously, the SIMOTION device must be synchronized with the higher-level bus cycle clock. The synchronization behavior depends on whether the PROFIBUS DP interfaces of the SIMOTION device have been configured as the isochronous DP master:

- None of the PROFIBUS DP interfaces have been configured as isochronous DP master for the lower-level drives:
  The device is automatically synchronized with the higher-level bus cycle clock.
  After successful synchronization, the cycle clocks of the device (e.g. Servo, IPO, IPO2) and the programs running in the SynchronousTasks are both synchronous with the higher-level bus cycle clock.
  See: Synchronization of a SIMOTION device without isochronous DP master interface (Page 1006).
- At least one of the PROFIBUS DP interfaces is configured as isochronous DP master for lower-level drives:
  Users must themselves activate synchronization of the device with the higher-level bus cycle clock using the **_synchronizeDpInterfaces** system function (user-controlled synchronization). The user can thereby determine the time of synchronization and take suitable precautions, such as deactivating affected DP slaves, to avoid system failures caused by the synchronization process.
  Only after successful synchronization are the device cycle clocks (e.g. Servo, IPO, IPO2), the programs running in SynchronousTasks, and also the isochronous DP master interfaces all synchronous with the higher-level bus cycle clock.
  See: Synchronization of a SIMOTION device with isochronous DP master interface (Page 1008).

Note

Synchronization without the configured Safety functions

A phase jump occurs during synchronization of an isochronous DP master interface with a higher-level bus cycle clock. This can lead to failures in the connected DP slaves (e.g. SINAMICS drives).

You should, therefore, deactivate the DP slaves concerned and the technology objects assigned to them before synchronizing drives that are already in operation. Once synchronization has been successfully completed, you can reactivate the DP slaves concerned and their assigned technology objects. See Activating and deactivating components and technology objects (Page 1031).

Note

In SIMOTION D devices, the DP Integrated interface is always configured as the isochronous DP master interface.

Therefore, if these devices are connected to a higher-level isochronous master, they must always be synchronized.

Note

Synchronization with the configured Safety functions

Note that if SINAMICS drives with Safety Integrated are connected to the isochronous DP master interface of a SIMOTION device and the actuation is performed via PROFIsafe:

A Safety error in the drive which cannot be acknowledged can be triggered during the synchronization of the SIMOTION device with the higher-level bus cycle clock. This error occurs if the phase jump caused by the synchronization occurs while the Safety functionality in the drive is booting up.

Therefore, the synchronization must not be performed until after Safety Integrated in the drive is ready. In order to achieve this, use the user-controlled synchronization, see synchronization of a SIMOTION device with isochronous DP master interface (Page 1008). Wait with the call of the system function **_synchronizeDPInterfaces** until:

1. The drives have powered up (system variable **cyclicInterface** of the axis = ACTIVE).
   And
2. Safety Integrated in the drives is ready (additional 250 ms = 10 * MAX (p9500)).

Cycle clock generation and synchronization in PROFINET IO

Clock generation in PROFINET IO

The following applies for clock generation in PROFINET IO:

If a PROFINET IO interface is available, the base cycle clock of a SIMOTION device is supplied by this interface providing the interface has been configured as follows:

1. The synchronization type has been set as sync master or sync slave.
2. IRT with the "High Performance" option has been set as the real-time class.

In this configuration, the basic cycle clock is the send cycle clock set at the associated sync domain.

It is necessary to distinguish between the following cases:

- The PROFINET IO interface is configured as a Sync-Master:
  This interface provides the cycle clock for the SIMOTION device including its isochronous PROFIBUS DP interfaces. Synchronization with a higher-level bus cycle clock is not necessary.
- The PROFINET IO interface is configured as a Sync-Slave:
  In this case, this interface supplies the basic cycle clock for the SIMOTION device.
  - If a cycle clock is available at this interface, the SIMOTION device automatically synchronizes itself with this cycle clock.
    If PROFIBUS DP interfaces of the SIMOTION device have been configured as isochronous DP master, their synchronization must be initiated by the user. See the following section, "Synchronization in PROFINET IO".
  - If no cycle clock is available at this interface (e.g. if the associated sync master fails), a replacement cycle clock of the same size is generated.

Note

Only a single cycle clock source is permitted on a SIMOTION device. For this reason:

If a SIMOTION device contains a PROFINET IO interface, a PROFIBUS DP interface can no longer be operated as an isochronous DP slave.

The following figure shows cycle clock generation in PROFINET IO:

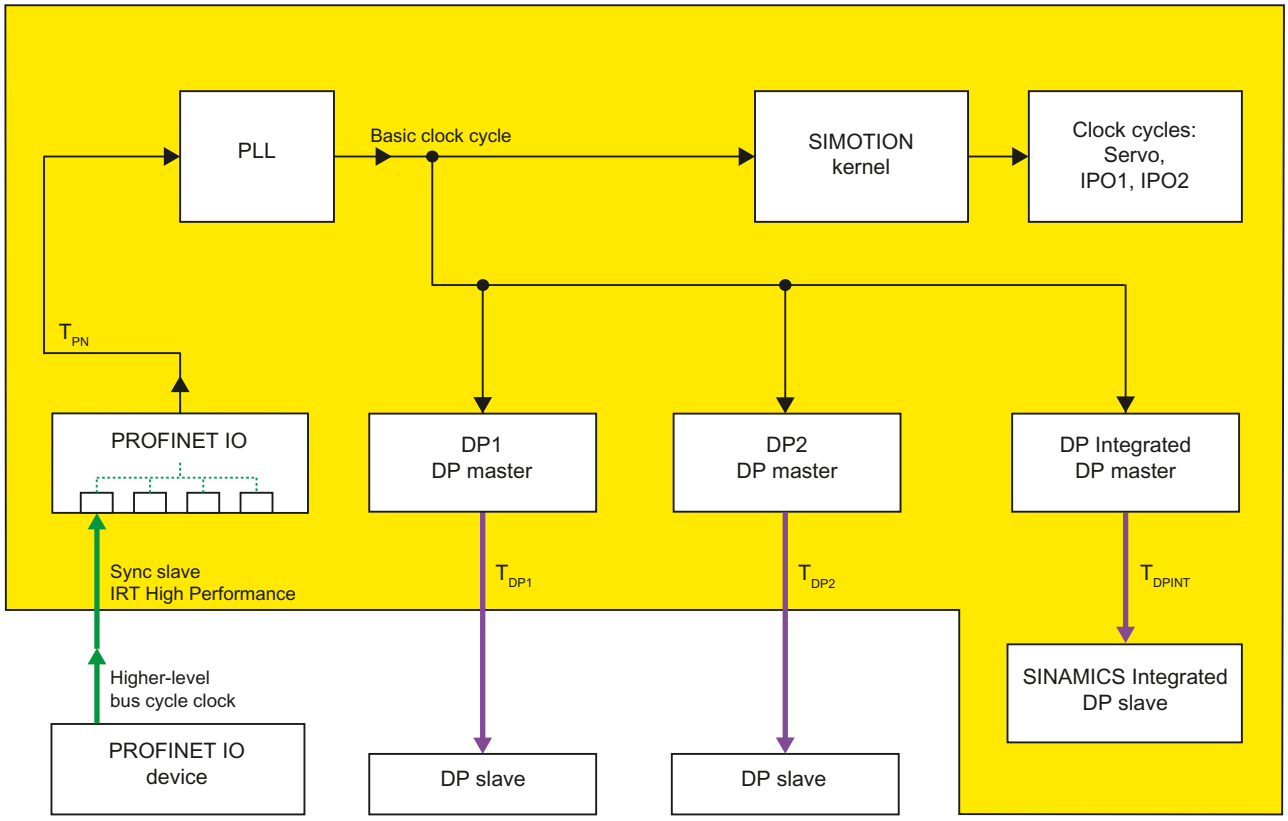

Figure 4-6 Cycle clock generation in a SIMOTION device in PROFINET IO

Synchronization in PROFINET IO

If the PROFINET IO interface has been configured as a Sync-Slave, the SIMOTION device must be synchronized with the higher-level bus cycle clock. The synchronization behavior depends on whether the PROFIBUS DP interfaces of the SIMOTION device have been configured as isochronous DP master:

- None of the PROFIBUS DP interfaces have been configured as isochronous DP master for the lower-level drives:
  The device is automatically synchronized with the higher-level bus cycle clock.
  After successful synchronization, the cycle clocks of the device (e.g. Servo, IPO, IPO2) and the programs running in the SynchronousTasks are both synchronous with the higher-level bus cycle clock.
  See Synchronizing a SIMOTION device without an isochronous DP master interface (Page 1006).
- At least one of the PROFIBUS DP interfaces is configured as isochronous DP master for lower-level drives:
  Synchronization of the device and the isochronous DP master interfaces is different:
  - The device (not including the DP master interfaces) is automatically synchronized with the higher-level bus cycle clock.
    After successful synchronization, the cycle clocks of the device (e.g. Servo, IPO, IPO2) and the programs running in the SynchronousTasks are both synchronous with the higher-level bus cycle clock.
  - Synchronization of the isochronous DP master interfaces with the higher-level bus cycle clock must be activated by the users using the **_synchronizeDpInterfaces** system function. The user can thereby determine the time of synchronization and take suitable precautions, such as deactivating affected DP slaves, to avoid system failures caused by the synchronization process.
    Only after successful synchronization has been completed are the isochronous DP master interfaces synchronous with the higher-level bus cycle clock.
    See Synchronizing a SIMOTION device with an isochronous DP master interface (Page 1008).

Note

A phase jump occurs during synchronization of an isochronous DP master interface with a higher-level bus cycle clock. This can lead to failures in the connected DP slaves (e.g. SINAMICS drives).

You should, therefore, deactivate the DP slaves concerned and the technology objects assigned to them before synchronizing drives that are already in operation. Once synchronization has been successfully completed, you can reactivate the DP slaves concerned and their assigned technology objects. See Activating and deactivating components and technology objects (Page 1031).

Note

In SIMOTION D devices, the DP Integrated interface is always configured as the isochronous DP master interface.

Therefore, if these devices are connected to a higher-level isochronous master, they must always be synchronized.

Note

Note that if SINAMICS drives with Safety Integrated are connected to the isochronous DP master interface of a SIMOTION device and the actuation is performed via PROFIsafe:

A safety error in the drive which cannot be acknowledged can be triggered during the synchronization of the SIMOTION device with the higher-level bus cycle clock. This error occurs if the phase jump caused by the synchronization occurs while the safety functionality in the drive is booting up.

Therefore, the synchronization must not be performed until after Safety Integrated in the drive is ready. In order to achieve this, use the user-controlled synchronization, see synchronization of a SIMOTION device with isochronous DP master interface (Page 1008). Wait with the call of the system function **_synchronizeDPInterfaces** until:

1. The drives have powered up (system variable **cyclicInterface** of the axis = ACTIVE).
   And
2. Safety Integrated in the drives is ready (additional 250 ms = 10 * MAX (p9500)).

4.1.3.2 Synchronizing a SIMOTION device without an isochronous DP master interface

Prerequisites

1. None of the PROFIBUS interfaces in the SIMOTION device have been configured as an isochronous DP master for lower-level drives:
   This is the case e.g. in SIMOTION C230-2, C240 or P350 devices if no lower-level isochronous drives are connected via PROFIBUS DP.
2. An interface receives a higher-level bus cycle clock and is configured accordingly, i.e. as DP slave in PROFIBUS DP or as sync slave in PROFINET IO.

Example configuration

The following example configuration is used:

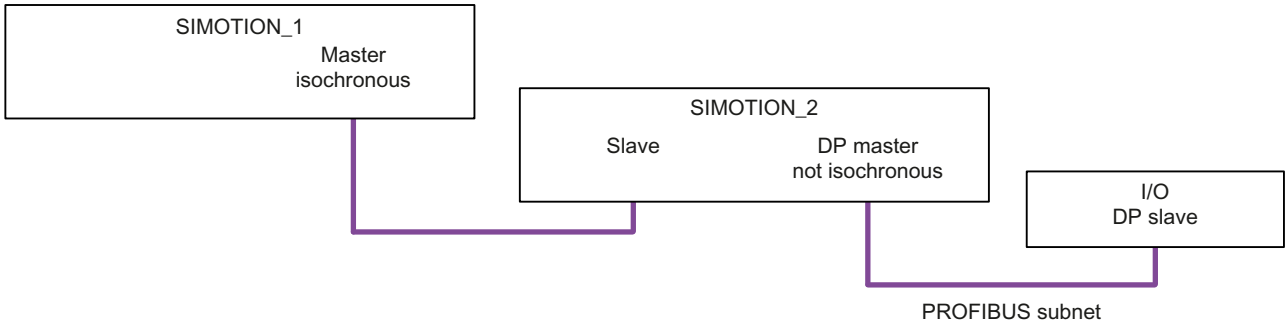

Figure 4-7 Example configuration for synchronizing a SIMOTION device with the higher-level bus cycle clock without an isochronous DP master interface

Synchronization sequence

As soon as a higher-level bus cycle clock is available at the corresponding interface (DP slave in PROFIBUS DP, sync slave in PROFINET IO) of the SIMOTION_2 device, the interface automatically synchronizes itself with the defined bus cycle clock.

Note

Only a single cycle clock source is permitted on a SIMOTION device. For this reason:

If a SIMOTION device contains a PROFINET IO interface, a PROFIBUS DP interface can no longer be operated as an isochronous DP slave.

After successful synchronization, the device cycle clocks (e.g. Servo, IPO, IPO2) and the programs running in the SynchronousTasks are both synchronized with the received bus cycle clock.

Should the bus cycle clock fail, a replacement cycle clock will be generated with the same cycle time.

The current synchronization state is shown in the **stateOfDpSlaveSynchronization** system variable. You can, for example, evaluate the synchronization state in the user program so that in the event of a synchronization failure, execution of program sections that assume synchronization would be prevented.

In addition, you can activate the alarms for initiating the PeripheralFaultTask. To do this, call up the **_enableDpInterfaceSynchronizationMode** system function using the parameter dpInterfaceSyncMode = SLAVE_ALARMMESSAGES_1:

- The _SC_DP_SLAVE_SYNCHRONIZED (= 209) and _SC_DP_SLAVE_NOT_SYNCHRONIZED (= 210) events then initiate the PeripheralFaultTask and can be queried in their TaskStartInfo (TSI#InterruptId).
- The **modeOfDpInterfaceSynchronization** system variable is set to SLAVE_ALARMMESSAGES_1.

See also the status diagram in the figure below.

The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

If the alarms for initiating the PeripheralFaultTask are activated, they must be activated in the execution system and an appropriate program assigned. Otherwise the SIMOTION device enters the STOP operating mode when this event occurs.

Status diagram

For a SIMOTION device without an isochronous DP master interface, the status diagram in the figure below describes:

- Both synchronization states
- The values of the corresponding system variables
- The state transitions and the associated initiated alarms (TDI#InterruptId), provided they are activated.

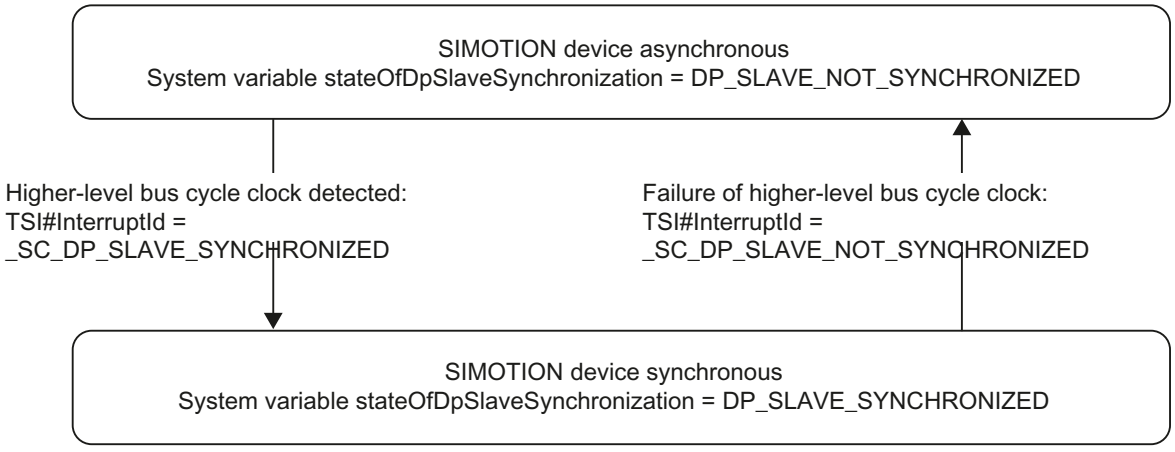

Figure 4-8 Status diagram for synchronization of a SIMOTION device without an isochronous DP master interface

4.1.3.3 Synchronization of a SIMOTION device with an isochronous DP master interface

Prerequisites

1. At least one PROFIBUS interface in the SIMOTION device has been configured as an isochronous DP master.
   This prerequisite is always met with SIMOTION D4xx devices; the interface "DP Integrated" is always configured as an isochronous DP master interface.
2. An interface receives a higher-level bus cycle clock and is configured accordingly, i.e. as a DP slave in PROFIBUS DP or as a sync slave in PROFIBUS IO.
3. The same bus cycle clock must be configured for all isochronously operated interfaces.

Example configuration

The following figures show example configurations for synchronization of a SIMOTION device which has an isochronous DP master interface with a higher-level bus cycle clock. The synchronization behavior depends on whether a PROFIBUS DP subnet or a PROFINET IO subnet supplies the higher-level bus cycle clock.

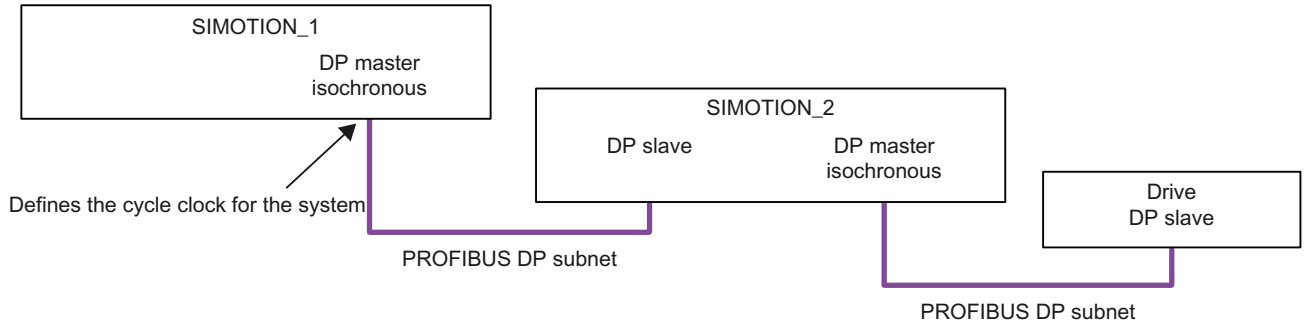

Figure 4-9 Example configuration for synchronization of a SIMOTION device which has an isochronous DP master interface with a higher-level PROFIBUS DP cycle clock

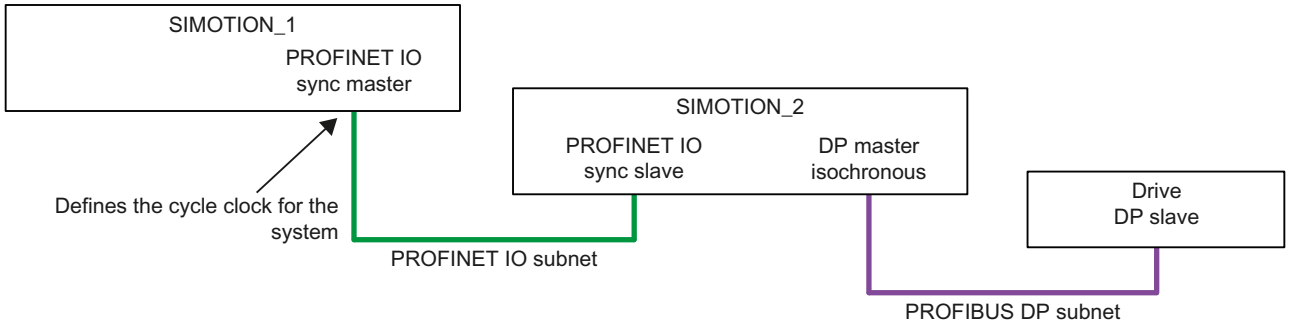

Figure 4-10 Sample configuration for synchronization of a SIMOTION device which has an isochronous DP master interface with a higher-level PROFINET IO cycle clock

Synchronization sequence

Following a configured/programmed system startup, the SIMOTION_2 device with the interface configured as an isochronous DP master (with drives as DP slaves) is to be synchronized with the higher-level bus cycle clock determined by the SIMOTION_1 device.

The interface which receives the higher-level bus cycle clock (DP slave in PROFIBUS DP, sync slave in PROFINET IO) automatically synchronizes itself with the defined bus cycle clock.

Synchronization of the isochronous DP master interface on the SIMOTION_2 device with the higher-level bus cycle clock must be activated by users themselves using a system function. The user can thereby determine the time of synchronization and take suitable precautions, such as deactivating affected DP slaves, to avoid system failures caused by the synchronization process. See following sections: "Procedure for automatic synchronization" and "Procedure for user-controlled synchronization".

Preferably, synchronization should be started while the SIMOTION devices are ramping up (in the StartupTask), before the drives start to move.

Only after successful synchronization has been completed are the isochronous DP master interfaces synchronous with the higher-level bus cycle clock.

For synchronization of the internal cycle clocks of the SIMOTION device and the programs running in the SynchronousTasks, see section: "Synchronization of the cycle clocks of the SIMOTION device".

Synchronization of the cycle clocks of the SIMOTION device

The following differences apply as regards synchronization of the SIMOTION device - which features internal cycle clocks (e.g. Servo, IPO, IPO2) - with the programs running in the SynchronousTasks:

- In PROFIBUS DP:
  Synchronization of the SIMOTION device and synchronization of the isochronous DP master interface run at the same time.
  Therefore, the following applies to both the device cycle clocks (e.g. Servo, IPO, IPO2) and the programs running in SynchronousTasks: Only after successful synchronization of the isochronous DP master interfaces are they synchronous with the higher-level bus cycle clock (see also Cycle clock generation and synchronization in PROFIBUS DP (Page 1001)).
- For PROFINET IO:
  Synchronization of the SIMOTION device with the higher-level bus cycle clock is automatic.
  Therefore, the following applies to both the device cycle clocks (e.g. Servo, IPO, IPO2) and the programs running in SynchronousTasks: They are already synchronous with the received bus cycle clock once successful automatic synchronization of the interface receiving the higher-level bus cycle clock is complete (see also Cycle clock generation and synchronization in PROFINET IO (Page 1003)).

Procedure for automatic synchronization

So that the interface configured as an isochronous DP master in the SIMOTION_2 device automatically synchronizes itself with the higher-level bus cycle clock, you should proceed as follows:

1. If drives (e.g. SINAMICS drives) are already in operation:
   Deactivate the DP slaves concerned and their assigned technology objects (see Activating and deactivating components and technology objects (Page 1031)).
2. Start the automatic synchronization. To do this, call the **_enableDpInterfaceSynchronizationMode** system function using the parameter dpInterfaceSyncMode = AUTOMATIC_INTERFACE_SYNCHRONIZATION.
   - The **modeOfDpInterfaceSynchronization** system variable will be set to AUTOMATIC_INTERFACE_SYNCHRONIZATION.
   - If a higher-level bus cycle clock is recognized at the corresponding interface, the interface configured as an isochronous DP master will be automatically synchronized.
     You can find out about the current synchronization state using the stateOfDpInterfaceSynchronization system variable.
   - The alarm for initiating the PeripheralFaultTask on loss of synchronization is activated.

   The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).
3. Once synchronization has been successfully completed, activate the DP slaves which you previously deactivated and their assigned technology objects (see Activating and deactivating components and technology objects (Page 1031)).
   The synchronized state continues to apply unless it is disrupted, e.g. if the constant bus cycle clock should fail.
   The event _SC_DP_SYNCHRONIZATION_LOST (= 208) initiates the PeripheralFaultTask and can be queried in the associated TaskStartInfo (TSI#InterruptId).

Note

If the alarms for initiating the PeripheralFaultTask are activated, they must be activated in the execution system and an appropriate program assigned. Otherwise the SIMOTION device enters the STOP operating mode when this event occurs.

Note

Preferably, automatic synchronization should be started while the SIMOTION devices are ramping up (in the StartupTask), before the drives start to move.

Procedure for user-controlled synchronization

In order to synchronize the interfaces configured as isochronous DP masters in the SIMOTION_2 device with the higher-level bus cycle clock, you should proceed as follows:

1. First, you must activate the corresponding alarms for initiating the PeripheralFaultTask. To do this, call up the **_enableDpInterfaceSynchronizationMode** system function using the parameter dpInterfaceSyncMode = MASTER_SLAVE_ALARMMESSAGES_1.
   - The events _SC_DP_CLOCK_DETECTED (= 207) and _SC_DP_SYNCHRONIZATION_LOST (= 208) then initiate the PeripheralFaultTask and can be queried in their TaskStartInfo (TSI#InterruptId).
   - The **modeOfDpInterfaceSynchronization** system variable is set to MASTER_SLAVE_ALARMMESSAGES_1.

   The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).
2. If a higher-level bus cycle clock is recognized at the corresponding interface (this event is signaled by TSI#InterruptId = _SC_DP_CLOCK_DETECTED (= 207)), synchronization can be carried out:
   - Deactivate all DP slaves and assigned technology objects that are connected to the isochronous DP master interfaces and in which faults could occur during a phase jump (e.g. SINAMICS drives) (see Activating and deactivating components and technology objects (Page 1031)).
   - Call the **_synchronizeDpInterfaces** system function.
     You can find out about the current synchronization state using the stateOfDpInterfaceSynchronization system variable.
   - Once synchronization has been successfully completed, activate the DP slaves which you previously deactivated and their assigned technology objects (see Activating and deactivating components and technology objects (Page 1031)).

   The synchronized state continues to apply unless it is disrupted, e.g. if the constant bus cycle clock should fail.
   The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

If the alarms for initiating the PeripheralFaultTask are activated, they must be activated in the execution system and an appropriate program assigned. Otherwise the SIMOTION device enters the STOP operating mode when this event occurs.

Status diagram of user-controlled synchronization

The status diagram in the figure below describes the fundamental procedure for synchronizing isochronous DP master interfaces in a SIMOTION device with a higher-level bus cycle clock.

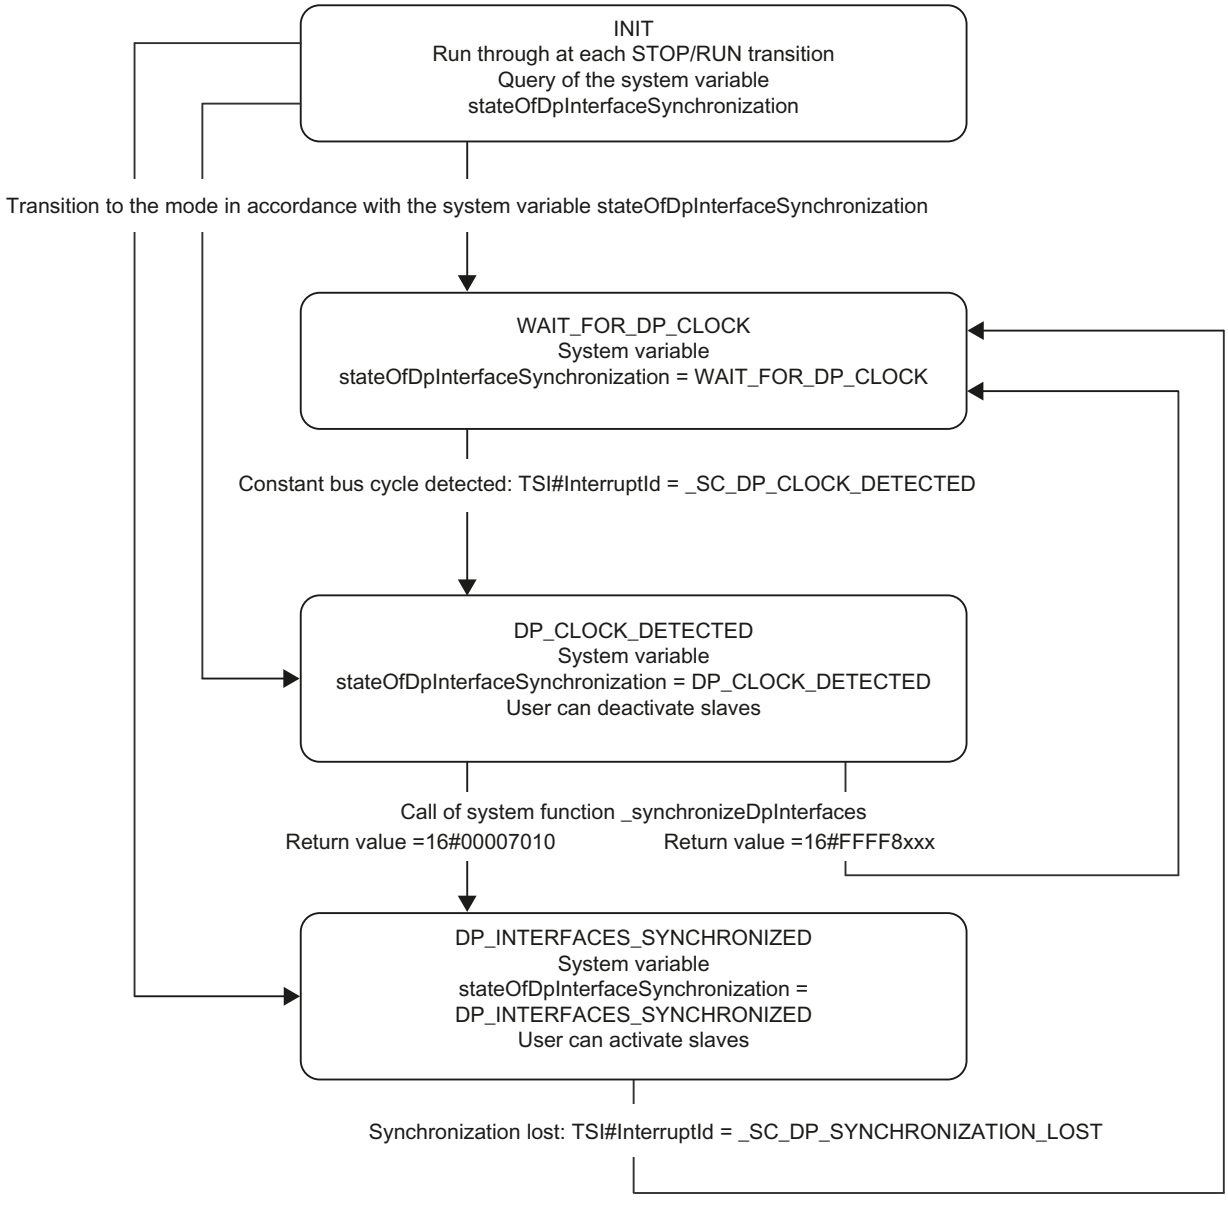

Figure 4-11 Status diagram for user-controlled synchronization of an isochronous DP master interface with a higher-level bus cycle clock

4.1.3.4 Behavior in the STOP and RUN operating modes

The SIMOTION device exhibits the following behavior in the operating modes and in transition between them. Observe this information when configuring/programming synchronization variants in accordance with Synchronizing a SIMOTION device without an isochronous DP master interface (Page 1006) and Synchronization of a SIMOTION device with an isochronous DP master interface (Page 1008).

Behavior in the STOP operating mode

If the interfaces of a SIMOTION device are not consecutively synchronized, the input cycle clock is monitored and a signal generated that leads to the _SC_DP_CLOCK_DETECTED event in the RUN operating mode.

If the interfaces are consecutively synchronized, the synchronicity and the input cycle clock are monitored. If the input cycle clock fails, a signal will be generated that results in the _SC_DP_SYNCHRONIZATION_LOST event in the RUN operating mode.

The state of the DP slaves does not change. An activated slave remains activated and a deactivated slave remains deactivated.

Behavior during the transition from STOP operating mode to RUN operating mode

The system variables are updated.

Processing of the user program will be delayed until, for example, any internal processing of the system functions _activateDpSlave, _deactivateDpSlave, or _getStateOfDpSlave (see Activating and deactivating nodes on the PROFIBUS or PROFINET IO (Page 1031)) which is still running has been completed. There is no separate time monitoring.

Behavior in the RUN operating mode

In the RUN operating mode, the events result in the PeripheralFaultTask being started with the associated TSI#InterruptId. System functions can be called up in the user program or in the PeripheralFaultTask.

The user can use the stateOfDpInterfaceSynchronization system variable and the _getStateOfDpSlave or _getStateOfAllDpStations system function to determine the current system state and restart its application.

Behavior during the transition from RUN operating mode to STOP operating mode

The transition can be made at any time. It is possible that slaves may have been started already or even deactivated. Interfaces can be synchronous or asynchronous.

All called system functions end in a defined state:

- The _synchronizeDpInterfaces system function will be cancelled.
- The system functions _activateDpSlave, _deactivateDpSlave, and _getStateOfDpSlave will undergo further internal processing.

4.1.4 Setting the communication addresses via the user program

Nodes are clearly identified within a communication network by means of, for example:

- The PROFIBUS address of the interface in PROFIBUS DP
- The device name (NameOfStation) in PROFINET IO
- The IP address of the interface on Ethernet

These communication addresses are set during configuration with the help of the engineering software (e.g. SIMOTION SCOUT). They can be changed later by a user program and customized according to requirements.

The address to be set can be determined in the user program in various ways, e.g.:

- Reading in and evaluating a slot coding
- Evaluating a program variable (which can be changed, for example, by a user input on the HMI device)

Note

In a communication network where PROFIsafe is also used, communication addresses may not be changed in the user program.

Note

You will find additional information on PROFIBUS and PROFINET in the SIMOTION Communication System Manual.

Note

The freely available and SIEMENS-supported PRONETA tool can be used to set and configure the PROFINET communication addresses. Associated information and the download are available:

- on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14506/cert).
- in SIOS (https://support.industry.siemens.com/cs/document/67460624/proneta-2-3-0-26-commissioning-and-diagnostics-tool-for-profinet?dti=0&lc=en-WW).

4.1.4.1 Setting the PROFIBUS address

Using system functions, the user program can set and activate the required address (node number) for the SIMOTION device on PROFIBUS DP. The activation initiates a restart of the SIMOTION device.

It is only possible to change the address at the interface when this is set to the DP slave operating mode.

Note

After changing the configured address, it is no longer possible to route via this interface into other devices or interfaces (see "Routing in the communication network" in the section titled System behavior (Page 1017)).

If it must still be possible to route via this interface into other devices or interfaces, use the "Activating a configuration" (Page 1078) functionality instead. The PROFIBUS interface for the configuration to be activated must be configured with the desired address.

System functions

- **_getActiveDpSlaveAddress**
  This function is used to determine the active DP address (node number) of a DP interface on a SIMOTION device.
- **_setDpSlaveAddress**
  This function is used to set a new DP address (node number) for a DP interface on a SIMOTION device.
- **_activateDpSlaveAddress**
  This function is used to activate the DP address (node number) for a DP interface on a SIMOTION device.
  This function initiates a restart of the SIMOTION device.

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

You specify the DP interface of the SIMOTION device via its project-wide, unique, logical, diagnostics address. This diagnostics address is obtained, e.g. in HW Config, via the object properties of the interface (Addresses tab).

Example for reading, setting, and activating the DP slave address

```
// Variable declaration
VAR
    // Diagnostics address of the PROFIBUS interface
    logAddrDpAdapter : DINT := 1023;
    // PROFIBUS address of the local slot
    locDpSlaveAddress : SINT := 4;
    // Variables for the return values
    retDpSlaveAddress : structRetDpSlaveAddress;
    locRetVal : DINT;
    neededSetDpAddress : DINT := 0;
END_VAR

// Read active DP slave address
retDpSlaveAddress := _getActiveDpSlaveAddress (
    logicalAddressCommunicationAdapter := logAddrDpAdapter
    // Diagnostics address of the PROFIBUS interface
    );

IF (0 = retDpSlaveAddress.functionResult) THEN
    // Check if new DP slave address is necessary
    IF (retDpSlaveAddress.dpSlaveAddress <> locDpSlaveAddress) THEN
        // Need to set new DP slave address
        neededSetDpAddress := 1;
    ELSE
        ; //User-defined error response
    END_IF;
END_IF;

IF (1 = neededSetDpAddress) THEN
    // Set new DP slave address
    locRetVal := _setDpSlaveAddress (
        logicalAddressCommunicationAdapter := logAddrDpAdapter,
        // Diagnostics address of the PROFIBUS interface
        dpSlaveAddress := locDpSlaveAddress
        // PROFIBUS address of the local slot
        );
    IF (0 = locRetVal) THEN
        locRetVal := _activateDpSlaveAddress (
            logicalAddressCommunicationAdapter := logAddrDpAdapter
            // Diagnostics address of the PROFIBUS interface
            );
    ELSE
        ; // User-defined error response
    END_IF;
END_IF;
```

System behavior

Configuring the DP slave interface

The following should be noted when configuring the SIMOTION device interface that has been configured as a DP slave:

The configured quantity structure of the data to be exchanged must be identical in both the DP slave and the higher-level DP master.

Only then can the interface function as a DP slave to the higher-level DP master.

Routing in the communication network

The specific routing information is stored in each device corresponding to the communication addresses configured there. When the address is changed, the appropriate routing information no longer remains in the device.

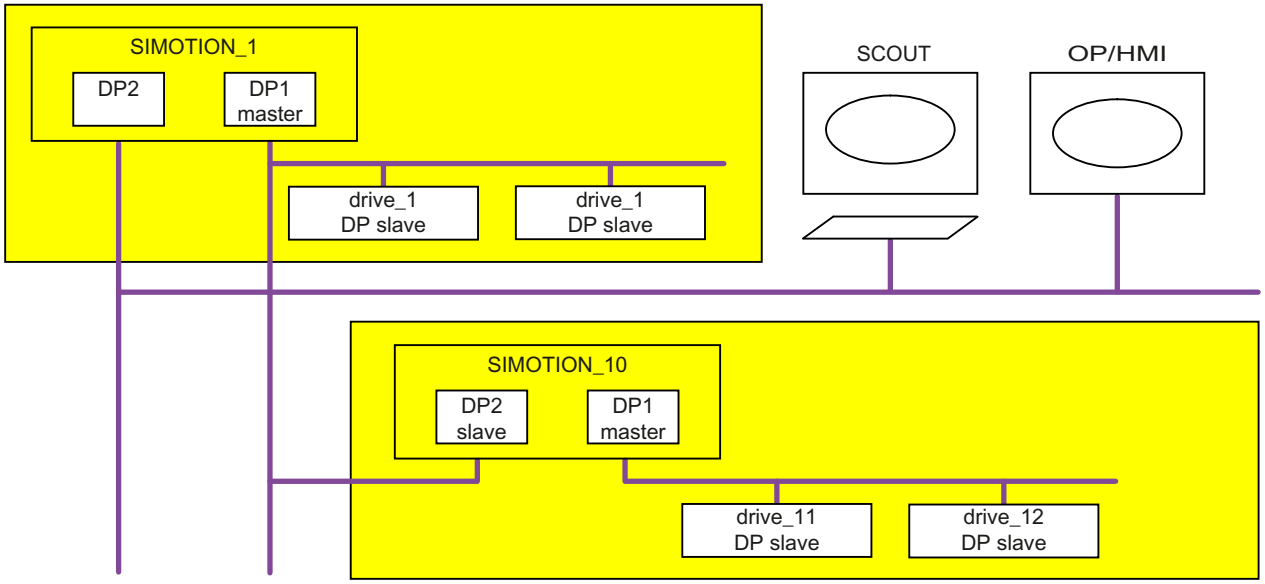

Figure 4-12 Example: Routing in the communication network

In SIMOTION_10, the DP slave address of the DP2 interface is changed in the user program. Routing from the OP or SCOUT via SIMOTION_1 (DP2/DP1) to SIMOTION_10 (DP2/DP1) and to the drives (drive_11, drive_12, etc.) is then no longer possible. No further control, loading, or monitoring actions are possible from the SCOUT.

Communication networks with PROFIsafe

In a communication network where PROFIsafe is also used, communication addresses may not be changed in the user program.

4.1.4.2 Topology detection in PROFINET IO

In PROFINET IO, one port belonging to a node is connected to exactly one port belonging to another node. A SIMOTION device cyclically identifies the connected neighbors for all the local ports, regardless of the configured transfer procedure.

Note

No topology detection is possible in PROFIBUS DP due to the other existing bus topology.

The result for each local port can be read out using the following system functions.

- As of SIMOTION Kernel version V4.4, the following function should be used in new projects: **_getPnPortNeighbour** (as of Kernel V4.4, replaces _getPnInterfacePortNeighbour)
- Up to SIMOTION Kernel version V4.3, the following function should be used: **_getPnInterfacePortNeighbour**

As a result, you receive the following data on the connected neighbor node, which allows for clear identification of this node:

- The device name (NameOfStation) of the connected interface of the PROFINET IO node.
- The number of the connected port (value range 1 to 255)
- The number of the slot (detection of the PROFINET IO interface) containing the connected port (value field 0 to 65535)

Exceptions:

- If no PROFINET IO node is connected to the local port, you receive the following return value:
  - As a device name: An empty string
  - And as a number for the port and the slot: 16#FFFFFFFF in each case
- If the connected PROFINET IO node only contains a single PROFINET IO interface, 16#FFFFFFFF will be returned as the number of the slot.
- If the connected PROFINET IO node has not yet been assigned a device name (NameOfStation), the return value for the device name will comprise:
  - PROFINET IO node is not a SIMOTION device: The hardware address (MAC address) will be returned. The MAC address will be shown in the usual notation xx:xx:xx:xx:xx:xx, where x is a hexadecimal number [0 to 9, A to F].
  - PROFINET IO node is a SIMOTION device: A character string containing the device type and the MAC address hexadecimal numbers will be returned, e.g. SIMOTION-D-08-00-06-73-6C-E6.

The syntax of these system functions is described in detail in the List Manual (reference list) of the SIMOTION devices and in the online help (see index).

For information about the syntax of the device name (NameOfStation), see Setting the device name (NameOfStation) of an IO device on PROFINET IO (Page 1020).

An example of the _getPnPortNeighbour system function is contained in Section "System functions" for setting the device name (Page 1021).

The figure below displays an example for a topology in PROFINET IO. Topology detection is carried out on the SIMOTION devices for various ports using the _getPnPortNeighbour or _getPnInterfacePortNeighbour system function. The result is given in the table.

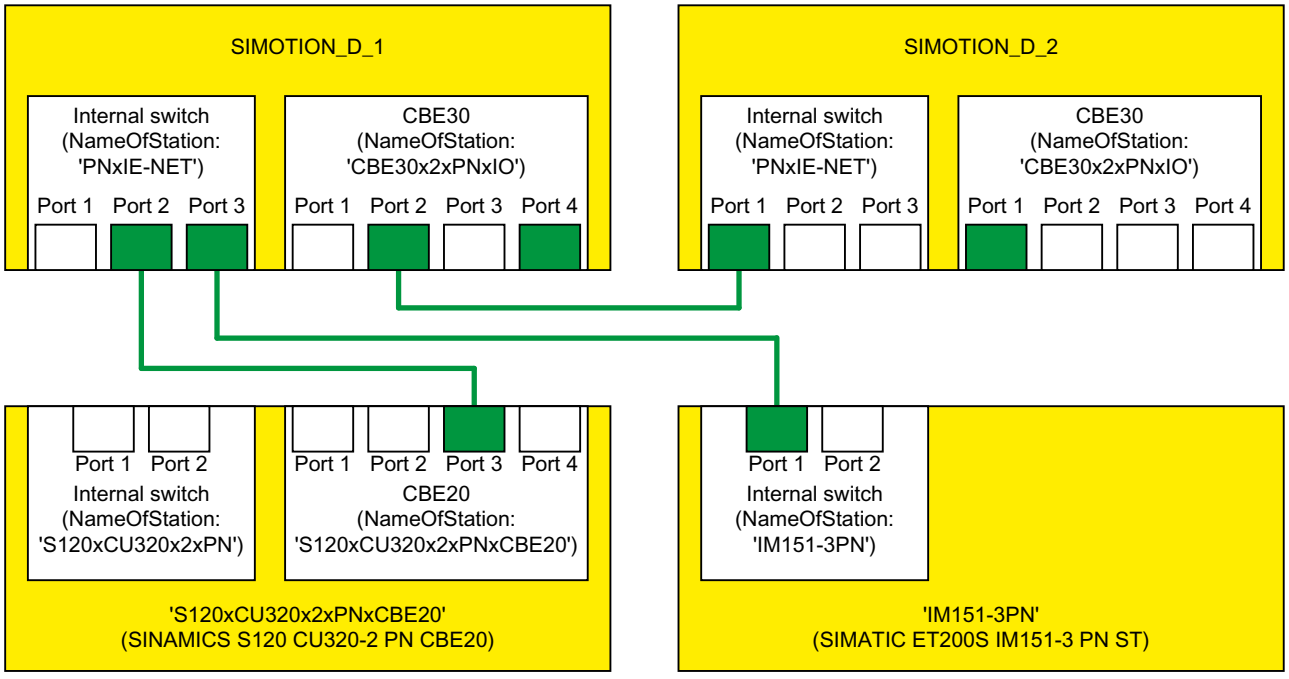

Figure 4-13 Example of a topology with PROFINET IO

Table 4-2 Topology detection (call up of the _getPnPortNeighbour or _getPnInterfacePortNeighbour function) for the topology example in the previous figure

Topology detection for device (interface, port)	Result of the topology detection (components of the return value)			
	functionResult	nameOfStation	pnPortNumber	pnSlotNumber
SIMOTION_D_1 (internal switch, port 2)	0	'S120xCU320x2xPNxCBE30'	3	0
SIMOTION_D_1 (internal switch, port 3)	0	'IM151-3PN'	1	0
SIMOTION_D_1 (CBE30, port 2)	0	'PNxIE-NET'	1	0
SIMOTION_D_1 (CBE30, port 4)	16#FFFF80A2 [1]	' '	-1	-1
SIMOTION_D_2 (internal switch, port 1)	0	'CBE30x2xPNxIO'	2	0
SIMOTION_D_2 (CBE30, port 1)	16#FFFF80A2 [1]	' '	-1	-1

[1] Only with the _getPnPortNeighbour function. The following applies with the _getPnInterfacePortNeighbour function: functionResult = 0.

4.1.4.3 Setting the device name (NameOfStation) of an IO device on PROFINET IO

The user program can change and activate the device name (NameOfStation) for the SIMOTION device on the PROFINET IO using system functions. Activation with the system function _activateNameOfStation initiates a restart of the SIMOTION device.

Note

After changing the configured device name (NameOfStation), the following should be noted:

- It is no longer possible to route via this interface into other devices or interfaces (see *Routing in the communication network* in chapter System behavior (Page 1017)).
- Controller-controller data exchange broadcast is no longer possible.

If these functionalities are still required, follow Activating a configuration (Page 1078) instead. The desired device name (NameOfStation) must be configured for the configuration to be activated.

Syntax of the device name (NameOfStation)

The device name (NameOfStation) must adhere to the following conventions:

- Permissible length: 1 to 127 characters
- Organization using periods "." into several labels is permissible; length of a single label: 1 to 63 characters.
- Characters permitted within a label:
  - Letters "A" to "Z" and "a" to "z".
  - Numbers "0" to "9" (not at the beginning of the label).
  - Special character hyphen "-" (not at the beginning or end of a label).
  - Other special characters (such as umlauts, blank spaces, brackets, underscores) are not permitted.
- The following designations are not permitted for device names:
  - Identifiers that start with "port-xyz-" (x, y, z = 0 ... 9).
  - Identifiers of the form n.n.n.n (n = 0 ... 999).

Note

Device names which do not satisfy the general rules for identifiers (i.e. containing hyphens or periods) must be enclosed in double inverted commas (", ASCII code $22) for use in SIMOTION SCOUT (e.g. in the programming languages).

System functions

As of SIMOTION Kernel version V4.4, the following functions should be used in new projects:

- **_getPnNameOfStation** (as of Kernel V4.4)
  You can use this function to determine the active device name (NameOfStation) of a PROFINET IO interface on the SIMOTION device.
  If the PROFINET IO interface has not yet been assigned a device name (NameOfStation), a character string containing the device type and the hexadecimal numbers of the MAC address will be returned, e.g. SIMOTION-D-08-00-06-73-6C-E6.
- **_setPnNameOfStation** (as of Kernel V4.4)
  You can use this function to set a new device name (NameOfStation) for a PROFINET IO interface on the SIMOTION device and activate this name.

Up to SIMOTION Kernel version V4.3, the following functions should be used:

- **_getActiveNameOfStation**
  You can use this function to determine the active device name (NameOfStation) of a PROFINET IO interface on the SIMOTION device.
  If the PROFINET IO interface has not yet been assigned a device name (NameOfStation), a character string containing the device type and the hexadecimal numbers of the MAC address will be returned, e.g. SIMOTION-D-08-00-06-73-6C-E6
  As of SIMOTION Kernel version V4.4, the _getPnNameOfStation function should be used in new projects:
- **_setNameOfStation**
  You can use this function to set a new device name (NameOfStation) for a PROFINET IO interface on the SIMOTION device.
  As of SIMOTION Kernel version V4.4, the _setPnNameOfStation function should be used in new projects:
- **_activateNameOfStation**
  This function activates all of the device names (NameOfStation) of the PROFINET IO interfaces previously set by the system function _setNameOfStation and initiates a restart of the SIMOTION device.
  As of SIMOTION Kernel version V4.4, this function is integrated in _setPnNameOfStation.

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

For information about synchronizing the PROFINET IO interface, see Cycle clock generation and synchronization in PROFINET IO (Page 1003).

Examples

The following examples demonstrate the reading and setting of the device name.

Example with _getPnPortNeighbour, _getPnNameOfStation, _setPnNameOfStation (as of V4.4, asynchronous call)

```
// Program bgrName is assigned to a cyclic task.
// (e.g. BackgroundTask)
INTERFACE
  VAR_GLOBAL CONSTANT
    // D4x5-2 diagnostics address X150 -----------

    END_CASE;
  END_PROGRAM
END_IMPLEMENTATION
```

Example with _getActiveNameOfStation, _setNameOfStation, _activateNameOfStation (up to V4.3, synchronous call)

```
// Program assigned to a MotionTask
// Variable declaration
VAR
    // Diagnostics address of the PROFINET IO interface
    logAddrPnAdapter : DINT := 1023;
    // Device name of the PROFINET IO interface
    locNameOfStation : STRING[240];
    // Variables for the return values
    retNameOfStation : StructRetDeviceNameOfStation;
    locRetVal : DINT;
    neededSetNameOfStation : DINT := 0;
    locCommandId : CommandIdType;
END_VAR
```

Example with _getActiveNameOfStation, _setNameOfStation, _activateNameOfStation (up to V4.3, synchronous call)

```
// Read active device name
retNameOfStation := _getActiveNameOfStation (
    logicalAddressPnInterface := logAddrPnAdapter,
    // Diagnostics address of the PROFINET IO interface
    requestMode := REQUEST_TRUE,
    // Function will be executed
    commandId := locCommandId,
    nextCommand := WHEN_COMMAND_DONE
    // Synchronous call; wait until the function has terminated
    );
IF (0 = retNameOfStation.functionResult) THEN
    // Check if new device name is necessary
    IF (retNameOfStation.nameOfStation <> locNameOfStation) THEN
        // Need to create a new device name
        neededSetNameOfStation := 1;
    ELSE
        ; // User-defined error response
    END_IF;
END_IF;
IF (1 = neededSetNameOfStation) THEN
    // Set new device name
    locRetVal := _setNameOfStation (
        logicalAddressPnInterface := logAddrPnAdapter,
        // Diagnostics address of the PROFINET IO interface
        nameOfStation := locNameOfStation,
        // Device name of the PROFINET IO interface
        requestMode := REQUEST_TRUE,
        // Function will be executed
        commandId := locCommandId,
        nextCommand := WHEN_COMMAND_DONE
        // Synchronous call
        );
    IF (0 = locRetVal) THEN
        locRetVal := _activateNameOfStation (
            logicalAddressPnInterface := logAddrPnAdapter
            // Diagnostics address of the PROFIBUS interface
            );
    ELSE
        ; // User-defined error response
    END_IF;
END_IF;
```

System behavior

Configuring the PROFINET IO interface

The following should be noted when configuring the PROFINET IO interface of the SIMOTION device (IO device): The configured quantity structure of the data to be exchanged must be identical in both the IO device and the higher-level IO controller.

Only then can this interface function as an IO device to the higher-level IO controller.

Routing in the communication network

The specific routing information is stored in each device corresponding to the communication addresses configured there. After the device name (NameOfStation) has been changed, no further appropriate routing information remains in the device.

Data exchange broadcast

Controller-controller data exchange broadcast is no longer possible. The data exchange broadcast partner can no longer be found after the device name (NameOfStation) has been changed.

Communication networks with PROFIsafe

In a communication network where PROFIsafe is also used, the device names (NameOfStation) may not be changed in the user program.

4.1.4.4 Setting the IP address (on Ethernet)

The IP configurations (IP address, subnet mask, gateway address) can be read in, set, or changed using the system functions _setIpConfig and _getIpConfig. SIMOTION remains in the RUN operating mode.

System functions

As of SIMOTION Kernel version V4.4, the following functions should be used in new projects:

- **_getPnIpConfig** (as of Kernel V4.4)
  You can use this function to determine the IP configuration of an Ethernet interface which you can specify via the logical diagnostics address of the port.
- **_setPnIpConfig** (as of Kernel V4.4)
  You can use this function to set the IP configuration of an Ethernet interface which you can specify via the logical diagnostics address of the port.

Up to SIMOTION Kernel version V4.3, the following functions should be used:

- **_getIpConfig**
  You can use this function to determine the IP configuration of an Ethernet interface; you can specify the interface by inputting the corresponding enumeration value (IE_01, IE_02).
- **_setIpConfig**
  You can use this function to set the IP configuration of an Ethernet interface; you can specify the interface by inputting the corresponding enumeration value (IE_01, IE_02).

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

The factory settings of the IP configurations (e.g. default IP address) vary from one SIMOTION device to the next. Please check the relevant value in the Commissioning and Hardware Installation Manual or in the Operating Instructions of the respective SIMOTION device.

Examples

The following examples demonstrate the setting of an IP address.

Example with _getPnIpConfig and _setPnIpConfig (as of V4.4, asynchronous call)

```

            END_CASE;
    ELSE
            ; // Error handling
    END_CASE;
  END_PROGRAM
END_IMPLEMENTATION
```

Example with _getIpConfig and _setIpConfig (up to V4.3)

```
// Variable declaration
VAR
    ipRead : ARRAY [1..2] OF StructRetIpConfig;
    setIpAddress : ARRAY [0..5] OF USINT;
    setIpSubnet  : ARRAY [0..5] OF USINT;
    setIpGateway : ARRAY [0..5] OF USINT;
    retUdint : UDINT;
    (* IP address of the configuration will be read from the input with address 0. *)
    ip_conf_id AT %IB0 : USINT;
END_VAR
// Read the current data of the Ethernet interfaces
ipRead[1] := _getIpConfig (
    ethernetInterface:= IE_01    );
ipRead[2] := _getIpConfig (
    ethernetInterface:= IE_02    );
```

Example with _getIpConfig and _setIpConfig (up to V4.3)

```
// Change of the Ethernet interface IE_01.
// Check whether a change is necessary.
IF ( ip_conf_id <> ipRead[1].ipAddress[3] ) THEN
    // Make the data to be changed available
    setIpAddress := ipRead[1].ipAddress;
    setIpAddress[3] := ip_conf_id;
    setIpSubnet := ipRead[1].subnetMask;
    setIpGateway := ipRead[1].gatewayAddress;
    (* Check whether the two Ethernet interfaces are different after the subnet masks have
been changed: *)
    IF ( ipRead[2].subnetMask <> setIpSubnet ) THEN
        // Set the data of the Ethernet interface IE_01
        retUdint := _setIpConfig (
            ethernetInterface := IE_01,
            ipAddress := setIpAddress,
            subnetMask := setIpSubnet,
            gatewayAddress := setIpGateway
            );
    ELSE
        ; // No change, error response.
          // Also change interface IE_02, if necessary.
    END_IF;
END_IF;
```

4.1.4.5 Automatic address assignment with PROFINET IO systems (address tailoring)

The address tailoring function can be used to assign an IP address and a NameOfStation to IO controllers and IO devices by means of system functions at the commissioning stage. This feature allows a machine consisting of an IO controller and IO devices to be supplied with IP addresses and NameOfStation, and permits multiple instances of the machine to be commissioned on a single physical Ethernet without the engineering system.

There is only one project (configuration and programs). It can be loaded onto machines of the same type without change. To integrate the machine into an existing network infrastructure, only limited customization is required during on-site commissioning (IP address, NameOfStation). The user program assigns the IP address and the NameOfStation during the first controller startup.

Note

Address tailoring can be configured only for SIMOTION SCOUT TIA.

You can find further information about the following subjects in the SIMOTION SCOUT TIA Configuration Manual and in the online help:

- Reusable IO systems - Address tailoring
- Configuring the project for address tailoring

4.1.5 Activating and deactivating components and technology objects

This section describes how PROFIBUS DP slaves and technology objects are activated and deactivated.

4.1.5.1 Activating and deactivating nodes on the PROFIBUS or PROFINET IO

The user has configured and programmed a maximum configuration. The user program deactivates bus nodes that are not available or not required in order to achieve the following:

- The cyclic load (data exchange) between the DP master and the DP slaves (PROFIBUS) or the controller and the IO device (PROFINET IO) is reduced.
- The processing of alarms is suppressed for deactivated nodes.
- No bus fault is signaled for PROFIBUS or PROFINET IO nodes which are not available.
- DP slaves (drives) re-synchronize with the DP cycle clock.

The user program can also activate further nodes that are required, for example, in another production phase.

Note

If the DP slave or the IO device is integrated in PROFIsafe communication (e.g. SINAMICS with SINAMICS Safety Integrated Extended Functions): Deactivation of a bus node will result in PROFIsafe errors with corresponding responses in the failsafe control (F-CPU). If necessary, the control will shut down all other PROFIsafe nodes.

System functions

- _activateDpSlave (Page 1032)
- _deactivateDpSlave (Page 1032)
- _getStateOfSingleDpSlave (Page 1040)
- _getStateOfAllDpSlaves (Page 1040)
- _getStateOfAllDPStations (Page 1040)
- _getStateOfDpSlave (Page 1039)
- _getLogDiagnosticAddressFromDpStationAddress (Page 1041)
- _getDpStationAddressFromLogDiagnosticAddress (Page 1041)
- _getGeoAddressFromLogAddress (Page 1041)

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

Technology objects are often assigned to the distributed I/O (DP slave, IO device); therefore, please note the information in Procedure for deactivating and activating components (Page 1075).

System functions for activating and deactivating bus nodes

The example below shows a machine design consisting of a central unit and several machine modules, each with several drives that communicate over PROFIBUS.

- **Central unit (SIMOTION_1)**
  The PROFIBUS DP1 interface for the central unit is configured as a DP master for the subnet dp_subnet_1. Machine modules 10 and 20 are connected to this subnet.
- **Machine module 10 (SIMOTION_10)**
  The PROFIBUS DP2 interface for the machine module is configured as a DP slave for the subnet dp_subnet_1.
  The PROFIBUS DP1 interface for the machine module is configured as a DP master for the subnet dp_subnet_10. The drives are connected as DP slaves to this subnet.
- **Machine module 20 (SIMOTION_20)**
  The PROFIBUS DP2 interface for the machine module is configured as a DP slave for the subnet dp_subnet_1.
  The PROFIBUS DP1 interface for the machine module is configured as a DP master for the subnet dp_subnet_20. The drives are connected as DP slaves to this subnet.

This example can also be applied to PROFINET IO in comparable form.

Example structure of a modular machine

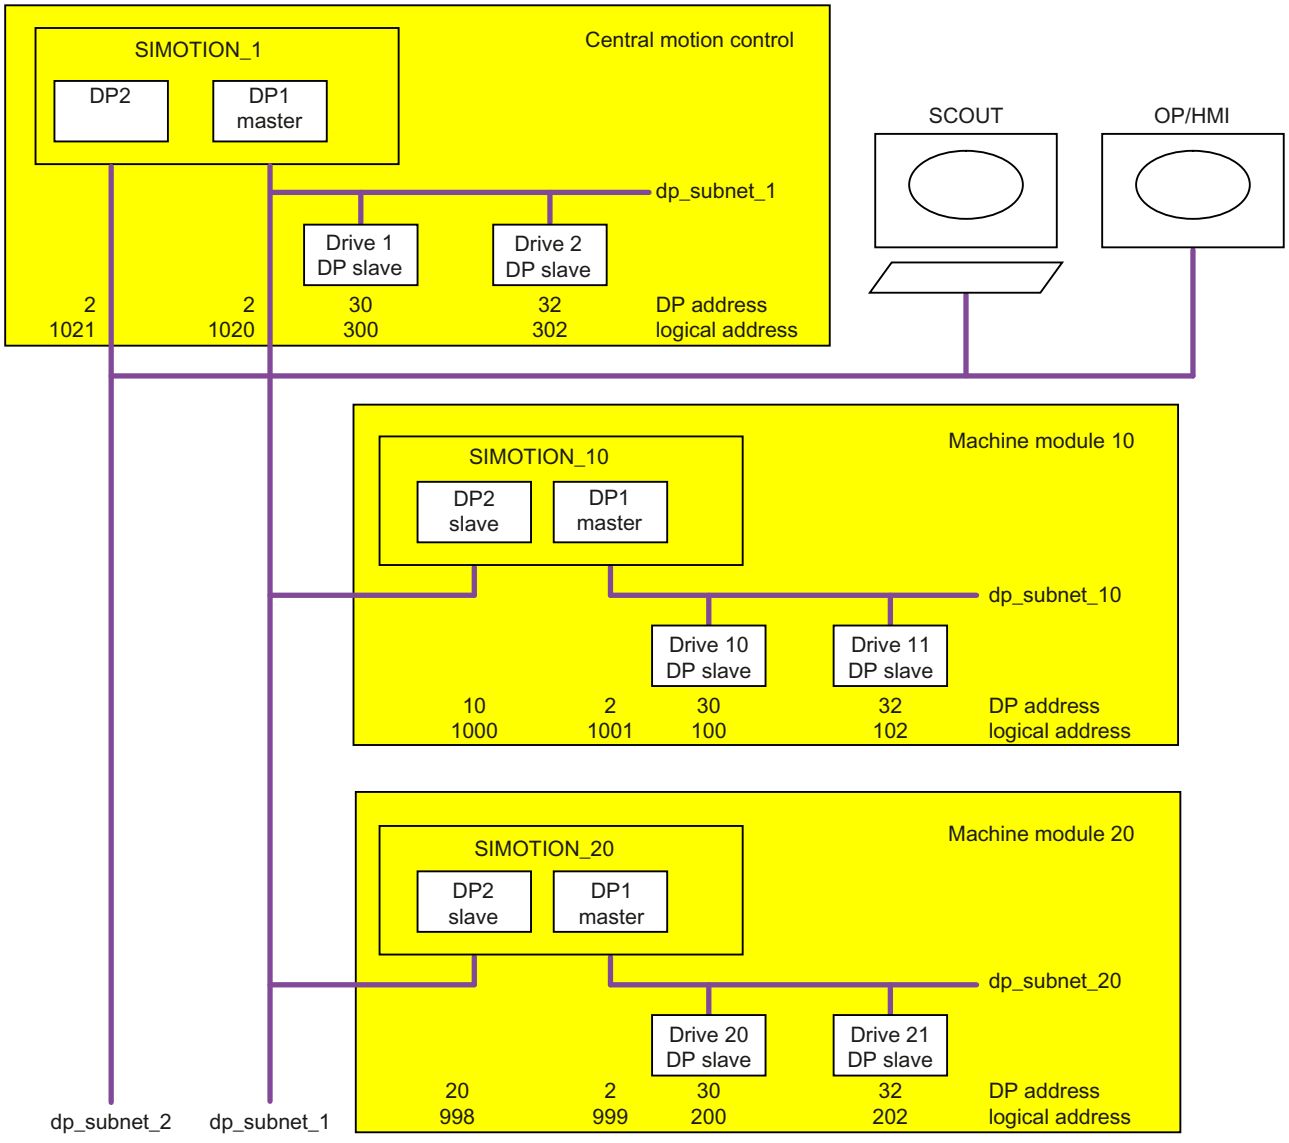

Figure 4-14 Example of a modular machine with differentiation between DP address and logical diagnostics address

System functions

You can use the **_deactivateDpSlave** and **_activateDpSlave** system functions to execute the following actions during operation:

- In the user program of the central unit: Activate or deactivate the machine modules 10 and 20.
- In the user program of the individual machine modules: Activate or deactivate the respective drives.

You can specify the node to be deactivated or activated (DP slave or IO device) using the logical diagnostics address for its interface; this address is unique across the project. The functions can be used on all DP slaves or IO devices (e.g. drives, ET 200, DP standard slaves, other stations).

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index). Please also note the information relating to the status diagram (Page 1034), asynchronous calls (Page 1035) and synchronous calls (Page 1037).

Functions (Page 1041) are available for converting a PROFIBUS address or device number for PROFINET IO into the logical diagnostics address and vice versa.

Note

The technology objects assigned to the nodes (e.g. the axes assigned to the drives) must be activated and deactivated separately (see Activating and deactivating technology objects (Page 1066)).

Observe the correct order (see Procedure for deactivating and activating components (Page 1075)).

Status diagram for the functions _activateDpSlave and _deactivateDpSlave

The figure below shows the states of the system functions _activateDpSlave and _deactivateDpSlave.

The functions can be called asynchronously and synchronously.

- With an asynchronous call (parameter **nextCommand** := IMMEDIATELY), the user program is continued immediately after the start of the system function.
  You must regularly query the state of the function to be able to determine when a command has been executed in full.
  The asynchronous call is required in cyclic tasks to ensure that their time monitoring function does not start.
- With a synchronous call (parameter **nextCommand** : =WHEN_COMMAND_DONE), the user program waits until the system function has been completed. The return value directly indicates whether the function call was successful.
  The synchronous call is recommended for MotionTasks.

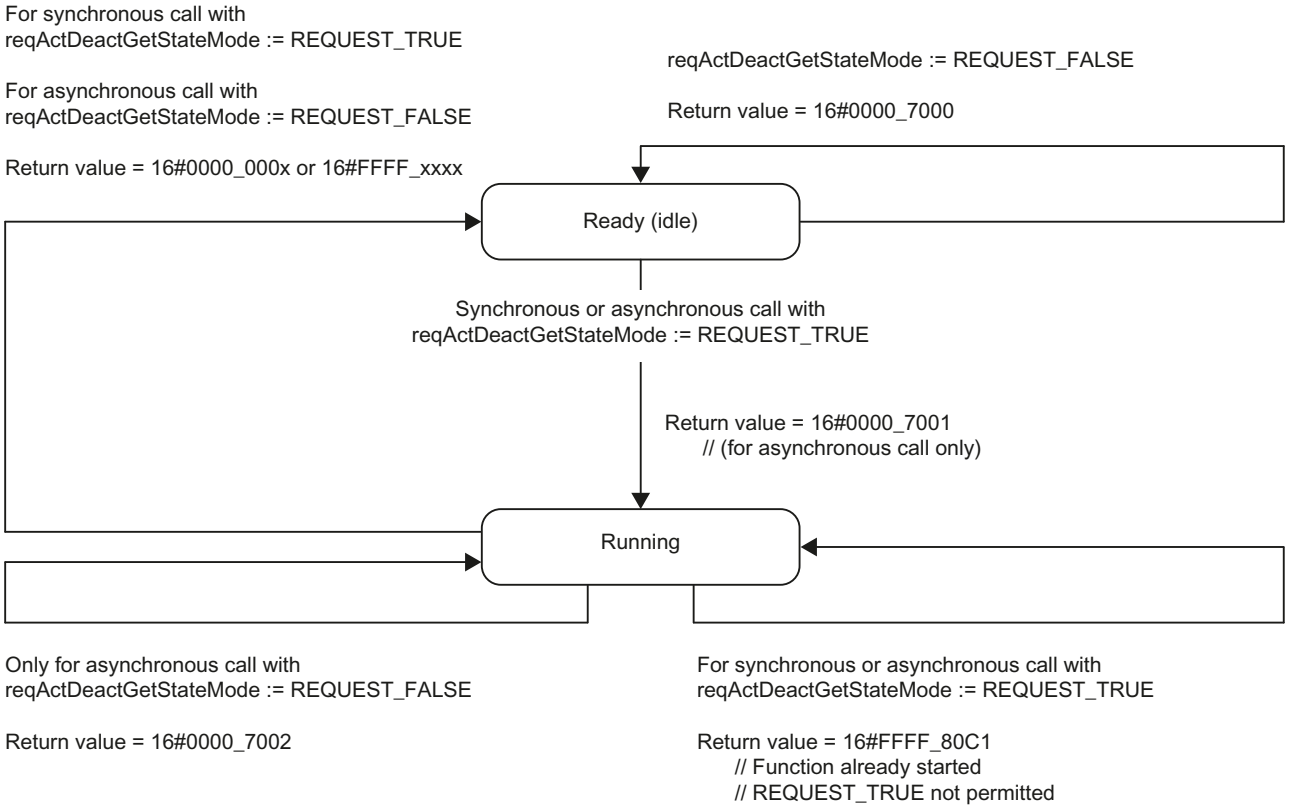
To execute the function (e.g. activation or deactivation of a DP slave or I/O device), start this with parameter **reqActDeactGetStateMode :=** REQUEST_TRUE.

Start the status query of the function with parameter **reqActDeactGetStateMode :=** REQUEST_FALSE. Use the same command ID as for the first call.

Note

To correctly complete the function with an asynchronous call, you must call the function with the parameter **reqActDeactGetStateMode :=** REQUEST_FALSE as often as necessary until you obtain 16#0000_000x as the return value or an error message.

You can execute the function only once at the same time for each bus node.



Return values:

16#0000_0001	// Activation successful, station recovery alarm is issued
16#0000_0002	// Deactivation successful, station failure alarm is issued
16#0000_0005	// Station already activated, station recovery alarm is not issued
16#0000_0006	// Station already deactivated, station failure alarm is not issued
16#0000_7000	// Function not active, initial call required with REQUEST_TRUE
16#0000_7001	// Function started (only for asynchronous call)
16#0000_7002	// Function active
16#FFFF_xxxx	// Function terminated with error

Figure 4-15 Status diagram of the system functions _activateDpSlave and _deactivateDpSlave

Asynchronous call for the functions _activateDpSlave and _deactivateDpSlave

The asynchronous call of the functions is required in cyclic tasks to ensure that the time monitoring function for the task does not start.

With an asynchronous call, the user program is continued immediately after the start of the system function. You must query the state of the function regularly to determine whether it has been completed without errors.

Proceed as follows for the asynchronous call:

1. Call the following parameters to start the system function:
   - reqActDeactGetStateMode := REQUEST_TRUE
   - nextCommand := IMMEDIATELY
2. Check the return value.
   - The return values 16#0000_0001, 16#0000_0002, 16#0000_0005, and 16#0000_0006 indicate that the function has been completed without errors.
   - The return value 16#0000_7001 indicates that the function has been started successfully, but has not yet been completed.
   - A return value < 0 indicates that the function has been terminated with errors. You can program error routines, depending on the return value.
3. For the state query and to check whether the system function has been completed, call these again, but with the following parameters:
   - reqActDeactGetStateMode := REQUEST_FALSE
   - nextCommand := IMMEDIATELY
4. Check the return value:
   - Return value 16#0000_7002 indicates that the function is still running.
     Repeat step 3.
   - A return value < 0 indicates that the function has been terminated with errors. You can program error routines, depending on the return value.
   - The return values 16#0000_0001, 6#0000_0002, 16#0000_0005, and 16#0000_0006 indicate that the function has been completed without errors.

The example program below shows the asynchronous call of the **_activateDpSlave** function in the BackgroundTask.

Example program for the asynchronous call for the _activateDpSlave function

```
INTERFACE
    PROGRAM backGround;

    VAR_GLOBAL
        bgrRequestActivate : DINT := 0;
        bgrResultActivate  : DINT := 0;
        bgrLogAddrDpSlave  : DINT := 16#FFFF_FFFF;
        bgrReqActDeactMode : enumReqActDeactGetStateMode := REQUEST_TRUE;
        bgrDpAlarmMode     : enumDeviceDpAlarmMode := SET_DP_ALARM;
        bgrNextCommand     : enumNextCommandMode := IMMEDIATELY;
        bgrTimeToWait      : UDINT := 30; // 30 seconds
    END_VAR
END_INTERFACE
IMPLEMENTATION
PROGRAM backGround // Assigned to the BackgroundTask
    VAR
        retVal : DINT;
    END_VAR
    // ... Further instructions
```

Example program for the asynchronous call for the _activateDpSlave function

```
    IF ( 0 <> bgrRequestActivate ) THEN
        retVal := _activateDpSlave (
            logicalAddressOfDpStation := bgrLogAddrDpSlave,
            reqActDeactGetStateMode := bgrReqActDeactMode,
            dpAlarmMode := bgrDpAlarmMode,
            nextCommand := bgrNextCommand,
            timeToWaitForStationAlarm := bgrTimeToWait
            (* As of SIMOTION Kernel version V4.4
               Waiting time for station ramp-up *)
            );
        CASE retVal OF
            16#0000_0001: bgrRequestActivate := 0;
                // Node successfully activated.
            16#0000_0005: bgrRequestActivate := 0;
                // Node was already activated, no alarm.
            16#0000_7001: bgrReqActDeactMode := REQUEST_FALSE;
                // Function started successfully
            16#0000_7002: ; // Function running.
        ELSE // Troubleshooting
            bgrRequestActivate := 0;
        END_CASE;
        IF ( 0 = bgrRequestActivate ) THEN
            // Function completed, prepare next call.
            bgrReqActDeactMode := REQUEST_TRUE;
            bgrResultActivate := retVal;
        END_IF;
    END_IF;
    // ... Further instructions
END_PROGRAM
END_IMPLEMENTATION
```

Synchronous call for the functions _activateDpSlave and _deactivateDpSlave

The synchronous call is recommended for MotionTasks.

With a synchronous call, the user program waits until the system function has been completed. The return value directly indicates whether the function call was successful.

Proceed as follows for the synchronous call:

1. Call the following parameters to start the system function:
   - reqActDeactGetStateMode = REQUEST_TRUE
   - nextCommand = WHEN_COMMAND_DONE
2. Check the return value:
   - A return value < 0 indicates that the function has been terminated with errors. You can program error routines, depending on the return value.
   - The return values 16#0000_0001, 16#0000_0002, 16#0000_0005, and 16#0000_0006 indicate that the function has been completed without errors.

The example program below shows the synchronous call of the **_activateDpSlave** function in a MotionTask.

Example program for the synchronous call for the _activateDpSlave function

```
INTERFACE
    PROGRAM motion_1;

    VAR_GLOBAL
      motion_1_RequestActivate : DINT := 0;
      motion_1_ResultActivate  : DINT := 0;
      motion_1_LogAddrDpSlave  : DINT := 16#FFFF_FFFF;
    END_VAR
END_INTERFACE

IMPLEMENTATION
PROGRAM motion_1 // Assigned to a MotionTask
    VAR
        retVal : DINT := 0;
    END_VAR
    // ... Further instructions
    IF ( 0 <> motion_1_RequestActivate ) THEN
        retVal := _activateDpSlave (
            logicalAddressOfDpStation := motion_1_LogAddrDpSlave,
            reqActDeactGetStateMode := REQUEST_TRUE,
            dpAlarmMode := SET_DP_ALARM,
            nextCommand := WHEN_COMMAND_DONE,
            timeToWaitForStationAlarm := 30 // 30 seconds
            (* As of SIMOTION Kernel version V4.4
               Waiting time for station ramp-up *)
            );
        CASE retVal OF
            16#0000_0001: motion_1_RequestActivate := 0;
                // Node successfully activated.
            16#0000_0005: motion_1_RequestActivate := 0;
                // Node was already activated, no alarm.
        ELSE // Troubleshooting
            motion_1_RequestActivate := 0;
        END_CASE;
        IF ( 0 = motion_1_RequestActivate ) THEN
            // Function completed.
            motion_1_ResultActivate := retVal;
        END_IF;
    END_IF;
    // ... Further instructions
END_PROGRAM
END_IMPLEMENTATION
```

Querying activation process and status of the nodes (DP slaves or IO devices)

For the PROFIBUS and PROFINET IO nodes (DP slaves, IO devices) you can:

- Query the status of the activation process using system functions (Page 1039)
- Query the status using system functions (Page 1040)

Note

The freely available and SIEMENS-supported PRONETA tool can be used to set and configure the PROFINET communication addresses. Associated information and the download are available:

- on the Internet (http://w3.siemens.com/mcms/automation/en/industrial-communications/profinet/productportfolio/proneta/Pages/proneta.aspx).
- in SIOS (https://support.industry.siemens.com/cs/document/67460624/proneta-2-3-0-26-commissioning-and-diagnostics-tool-for-profinet?dti=0&lc=en-WW):

Querying the status of the activation process of the DP slaves and IO devices using system functions

System function

The **_getStateOfDpSlave** system function is used to specifically query the status of the activation or deactivation procedure of a DP slave or IO device, which is defined via its logical diagnostics address.

The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Functions (Page 1041) are available for converting a PROFIBUS address or device number for PROFINET IO into the logical diagnostics address and vice versa.

Status diagram, asynchronous call and synchronous call

As regards the main features, the same information applies as for the _activateDpSlave and _deactivateDpSlave functions, see:

- Status diagram for the functions _activateDpSlave and _deactivateDpSlave (Page 1034)
- Asynchronous call for the functions _activateDpSlave and _deactivateDpSlave (Page 1035)
- Synchronous call for the functions _activateDpSlave and _deactivateDpSlave (Page 1037)

Querying the status of the DP slaves and IO devices using system functions

System functions

The system functions **_getStateOfAllDPStations**, **_getStateOfAllDpSlaves**, and **_getStateOfSingleDpSlave** can be used to query the status of all or just one DP slave or IO device in a user program. In addition to the activation status, information on availability is also provided.

- With the **_getStateOfAllDPStations** function you obtain:
  - For **PROFIBUS**: the status of all DP slaves configured on a DP master with the logical diagnostics addresses of their PROFIBUS interfaces. You can specify the DP master using the logical diagnostics address for its PROFIBUS interface.
  - For **PROFINET IO**: the status of all IO devices that you can reach from a controller (also via routers), as well as the logical diagnostics addresses for their PROFIBUS interfaces. You can specify the controller using the logical diagnostics address for its PROFINET IO interface.

  With one call of the function, you obtain the status for a maximum of 10 DP slaves or IO devices. If more DP slaves and/or I/O devices are available, you will receive the value 16#0000_0001 in the functionResult component of the return value. Following this, keep calling up the function using the parameter RequestMode := REQUEST_FALSE as often as is necessary until the functionResult component of the return value contains the value 16#0000_0000. Use the same command ID as for the first call.
- With the **_getStateOfAllDpSlaves** function you obtain:
  - For **PROFIBUS**: for every legal PROFIBUS address on a DP master, whether a DP slave is configured for this address and, if necessary, its status. You can specify the DP master using the logical diagnostics address for its PROFIBUS interface.
    This function exists only with PROFIBUS DP.
- With the **_getStateOfSingleDpSlave** function you obtain:
  - For **PROFIBUS**: the status of an individual DP slave that you can specify using the logical diagnostics address for its PROFIBUS interface.
  - For **PROFINET IO**: the status of an individual IO device that you can specify using the logical diagnostics address for its PROFINET IO interface.

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" Parameter Manual (reference list) and in the online help (see index).

Functions (Page 1041) are available for converting a PROFIBUS address or device number for PROFINET IO into the logical diagnostics address and vice versa.

Status diagram, asynchronous call and synchronous call

As regards the main features, the same information applies as for the _activateDpSlave and _deactivateDpSlave functions, see:

- Status diagram for the functions _activateDpSlave and _deactivateDpSlave (Page 1034)
- Asynchronous call for the functions _activateDpSlave and _deactivateDpSlave (Page 1035)
- Synchronous call for the functions _activateDpSlave and _deactivateDpSlave (Page 1037)

Converting a PROFIBUS address or device number for PROFINET IO into the logical diagnostics address and vice versa

The PROFIBUS address and device number for PROFINET IO are unique in the related PROFIBUS subnet or PROFINET IO segment, but not across the project. Only the logical diagnostics addresses are unique across the project.

Using the **_getLogDiagnosticAddressFromDpStationAddress** function you can convert the PROFIBUS address for a bus node (or device number for PROFINET IO) into the associated logical diagnostics address in the user program by specifying the related local interface.

Using the **_getDpStationAddressFromLogDiagnosticAddress** function you can convert the logical diagnostics address into the PROFIBUS address for a bus node (or device number for PROFINET IO), as well as the related local interface, in the user program.

By executing the **_getGeoAddressFromLogAddress** function you will obtain, in the user program, the geographical address for a logical diagnostics address across the project (e.g. bus system, slot number).

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

4.1.5.2 Activating and deactivating SIMATIC ET200 components (option handling)

Introduction

The activation and deactivation of SIMATIC ET200 components is referred to below as "configuration control".

Configuration control (option handling) is used to operate various standard machine configuration levels in one project without changing the configuration or the user program.

Detailed information is provided in the *SIMATIC ET 200SP Distributed I/O System* System Manual.

Operating principle of configuration control

You can use configuration control to operate different standard machine configurations with a single configuration of the ET 200SP distributed I/O system.

- A station master is configured in a project (maximum configuration). The station master comprises all modules needed for all possible plant parts of a modular standard machine.
- The project's user program provides for several station options for various standard machine configuration levels as well as selection of a station option. A station option uses, for example, only some of the configured modules of the station master and these modules are inserted in the slots in a different order.
- The standard machine manufacturer selects a station option for a configuration of the standard machine. To do this, the project need not be modified, and it is not necessary to load a modified configuration.

You use a control data record you have programmed to notify the CPU/interface module as to which modules are missing or located on different slots in a station option as compared to the station master. The configuration control does not have an impact on the parameter assignment of the modules.

Configuration control allows you to flexibly vary the centralized/distributed configuration. This is only possible if the station option can be derived from the station master.

The following figure shows three configurations of a standard machine with the corresponding station options of the ET 200SP distributed I/O system.

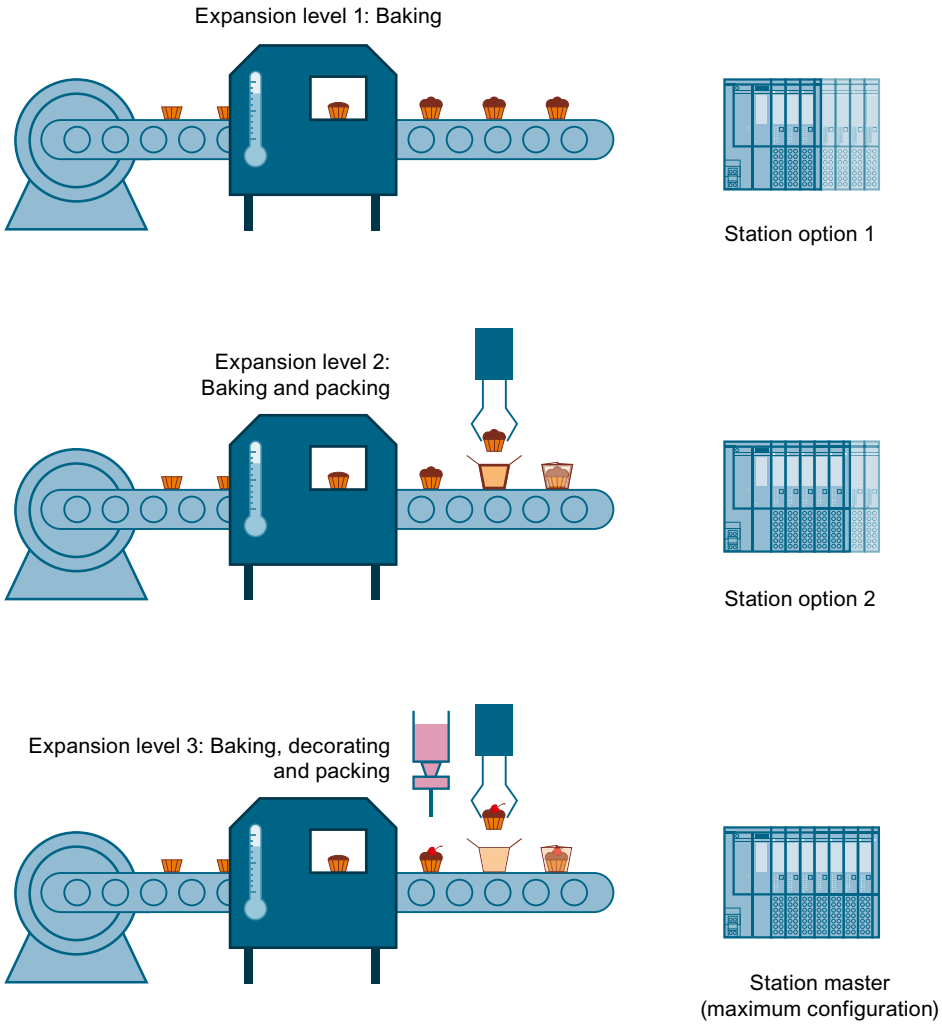


Figure 4-16 Various configuration levels of a standard machine with the corresponding station options of the ET 200SP distributed I/O system.

Advantages

- Simple project management and commissioning by using a single STEP 7 project for all station options.
- Simple handling for maintenance, versioning and upgrade:
- Hardware savings: Only those I/O modules are installed that are required for the machine's current station option.

- Savings potential in the creation, commissioning and the documentation for standard machines.
- Simple station expansion by using pre-wired empty slots. To expand, you simply exchange the BU cover for the new model.

Procedure

To set up the configuration control, follow these steps:

Step	Procedure	See...
1	Enable configuration control in STEP 7	Section Configuring (Page 1043)
2	Create control data record	Section Creating the control data record (Page 1045)
3	Transfer control data record	Section Transferring the control data record in the startup program of the CPU (Page 1055)

Application examples

A number of application examples are available to download (https://support.industry.siemens.com/cs/#document/29430270?lc=en-WW) from the Internet.

Block library "OH_S71x00_Library"

The block library OH_S71x00_Library is available to download (https://support.industry.siemens.com/cs/#document/29430270?lc=en-WW) from the Internet. The block library contains data types with the structure of the control data records for the ET 200SP distributed I/O system. These data types will make it easy for you to integrate your flexible automation solution into the SIMOTION system.

Configuring

Requirements

Configuration control is supported by the ET 200SP distributed I/O system with both an ET 200SP CPU and with interface modules via PROFINET IO and PROFIBUS DP.

Centrally for ET 200SP CPU:

- STEP 7 Professional V13 Update 3 or higher
- CPU 1510SP-1 PN/CPU 1512SP-1 PN

- Firmware version V1.6 or higher
- All modules of the CPU must be able to start up even with different configurations.
  - The startup parameter "Comparison preset to actual configuration" of the CPU is set to "Startup CPU even if mismatch" (default setting) and the module parameter "Comparison preset to actual module" of the module is set to "From CPU" (default setting).
    or
  - The module parameter "Comparison preset to actual module" for the module is set to "Startup CPU even if mismatch".

Distributed via PROFINET IO:

- Engineering Tool (e.g. STEP 7)
- IM 155-6 PN BA/ST/HF
- You have assigned the interface module to an IO controller.

Distributed via PROFIBUS DP:

- Engineering Tool (e.g. STEP 7)
- IM 155-6 DP HF
- You have assigned the interface module to a DP master.
- The startup parameter is set to "Operate if preset configuration does not match actual configuration"

Required steps

Enable the "Allow to reconfigure the device via the user program" parameter when configuring the CPU/interface module in STEP 7 (TIA Portal).

- The "Allow to reconfigure the device via the user program" parameter is located in the "Configuration control" area for an ET 200SP CPU.
- The "Allow to reconfigure the device via the user program" parameter is located in the "Module parameter" area under "General" for an IM 155-5 PN interface module.

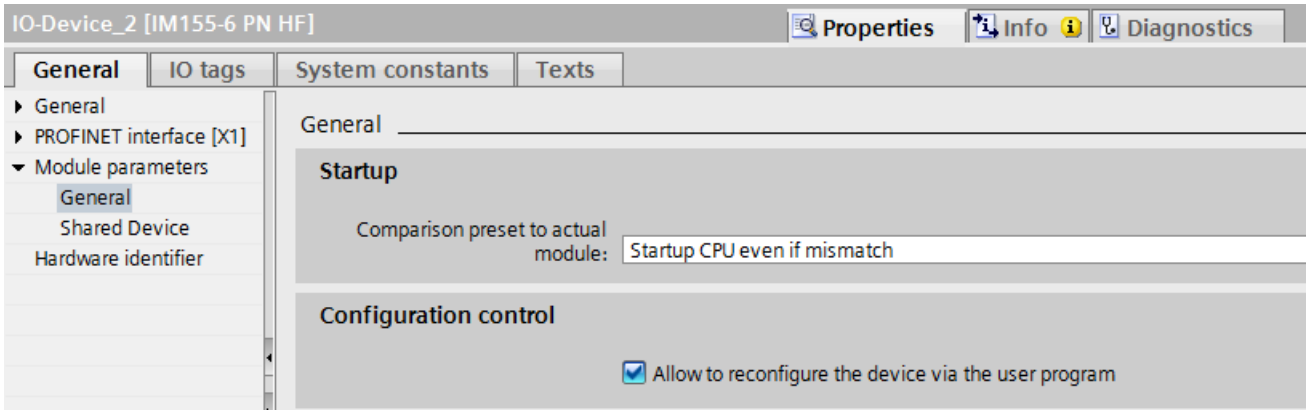

Figure 4-17 Enabling configuration control using an IM 155-6 PN HF as an example

You can find more information on the Internet (https://support.industry.siemens.com/cs/#document/29430270?lc=en-WW).

Creating the control data record

Introduction

Required steps

To create a control data record for the configuration control, follow these steps:

1. Create a PLC data type which contains the structure of the control data record.
   The following figure shows a PLC data type "CTR_REC", which contains the structure of the control data record for an ET 200SP interface module.

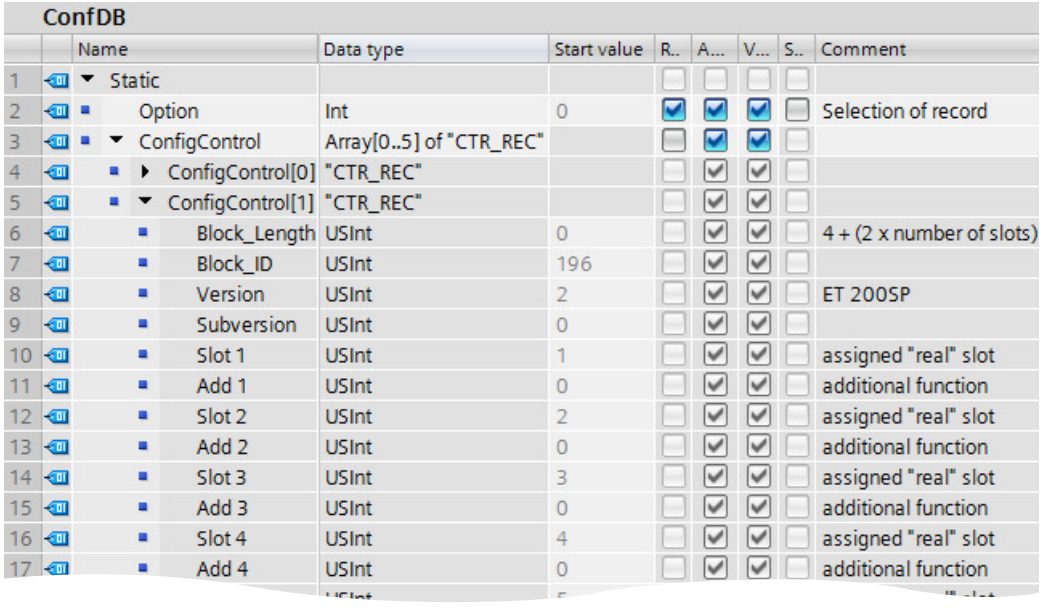
CTR_REC

	Name	Data type	Default value	A...	V...	S...	Comment
1	Block_Lenght	USInt	134	☑	☑	☐	4 + (2 x number of Slots)
2	Block_ID	USInt	196	☑	☑	☐	
3	Version	USInt	2	☑	☑	☐	ET 200SP
4	Subversion	USInt	0	☑	☑	☐	
5	Slot 1	USInt	1	☑	☑	☐	assigned "real" slot
6	Add 1	USInt	0	☑	☑	☐	additional function
7	Slot 2	USInt	2	☑	☑	☐	assigned "real" slot
8	Add 2	USInt	0	☑	☑	☐	additional function
9	Slot 3	USInt	3	☑	☑	☐	assigned "real" slot
10	Add 3	USInt	0	☑	☑	☐	additional function
11	Slot 4	USInt	4	☑	☑	☐	assigned "real" slot
12	Add 4	USInt	0	☑	☑	☐	additional function

Figure 4-18 Creating control data record 196 using an IM 155-6 PN HF as an example

2. Create a global data block.

3. In the data block, create an array that is based on the created PLC data type.
4. In the control data records, enter the slot assignments in the "Start value" column.
   The figure below shows the global data block "ConfDB". The data block "ConfDB" contains an array [0..5] of the PLC_DataType "CTR_REC".



ConfDB

	Name	Data type	Start value	R..	A...	V...	S..	Comment
1	Static			☐	☐	☐	☐	
2	Option	Int	0	☑	☑	☑	☐	Selection of record
3	ConfigControl	Array[0..5] of "CTR_REC"		☐	☑	☑	☐	
4	ConfigControl[0]	"CTR_REC"		☐	☑	☑	☐	
5	ConfigControl[1]	"CTR_REC"		☐	☑	☑	☐	
6	Block_Length	USInt	0	☐	☑	☑	☐	4 + (2 x number of slots)
7	Block_ID	USInt	196	☐	☑	☑	☐	
8	Version	USInt	2	☐	☑	☑	☐	ET 200SP
9	Subversion	USInt	0	☐	☑	☑	☐	
10	Slot 1	USInt	1	☐	☑	☑	☐	assigned "real" slot
11	Add 1	USInt	0	☐	☑	☑	☐	additional function
12	Slot 2	USInt	2	☐	☑	☑	☐	assigned "real" slot
13	Add 2	USInt	0	☐	☑	☑	☐	additional function
14	Slot 3	USInt	3	☐	☑	☑	☐	assigned "real" slot
15	Add 3	USInt	0	☐	☑	☑	☐	additional function
16	Slot 4	USInt	4	☐	☑	☑	☐	assigned "real" slot
17	Add 4	USInt	0	☐	☑	☑	☐	additional function

Figure 4-19 Data block for configuration control

Rules

Observe the following rules:

- Slot entries in the control data record outside the station master are ignored by the CPU/ interface module.
- The control data record must contain the entries up to the last slot of the station option.
- Multiple configured slots may not be assigned to the same actual slot. In other words, each station option slot may be present only once in the control data record.

Control data record for an ET 200SP CPU

Slot assignment

The following table shows the possible slots for the various modules for an ET 200SP CPU:

Table 4-3 Slot assignment

Modules	Possible slots	Comment
CPU	1	Slot 1 is always the CPU
I/O modules	2 - 65	Downstream of CPU
Server module	2 - 66	The server module completes the configuration of the ET 200SP station after the CPU/the last I/O module.

Control data record

For the configuration control of an ET 200SP CPU, you define a control data record 196 V2.0, which includes a slot assignment. The maximum slot corresponds to the slot of the server module.

The table below shows the structure of a control data record with explanations of the individual elements.

Table 4-4 Configuration control: Structure of control data record 196

Byte	Element	Code	Explanation
0	Block length	4 + (number of slots × 2)	Header
1	Block ID	196	
2	Version	2	
3	Version	0	

Byte	Element	Code	Explanation
4	Slot 1 of the station master	Slot assignment 1 in the station option (always 1, because the CPU is always in slot 1)	**Control element** Contains the information on which module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0. **Additional function** Contains information on whether a new potential group will be opened in the station option - by replacing a dark-colored BaseUnit with a light-colored BaseUnit. • If you replace a dark-colored BaseUnit with a light-colored BaseUnit, enter 1 as additional function. • If you accept the BaseUnit from the station master, enter 0 as additional function.
5	Additional function for slot 1		
6	Slot 2 of the station master	Slot assignment in the station option	
7	Additional function for slot 2		
8	Slot 3 of the station master	Slot assignment in the station option	
9	Additional function for slot 3		
:	:	:	
4 + ((max. slot - 1) × 2)	Server module slot	Server module slot assignment in the station option*	
4 + ((max. slot - 1) × 2) + 1	Additional function for server module slot		

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Control data record for an interface module

Slot assignment

The following table shows the possible slots for the various modules for an ET 200SP interface module:

Table 4-5 Slot assignment

Modules	Possible slots	Comment
Interface module	0	The interface module (slot 0) is not an element of the configuration control, but instead controls this.
Station extension BA-Send	1	For mixed configuration with ET 200AL modules, BA-Send is always on slot 1.

Modules	Possible slots		Comment
ET 200SP I/O module	1 - 12	for IM 155-6 PN BA	Downstream from the interface module
	1 - 32	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 64	for IM 155-5 PN HF	
Server module	1 - 13	for IM 155-6 PN BA	The server module completes the configuration of the ET 200SP station after the last I/O module.
	1 - 33	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 65	for IM 155-5 PN HF	
ET 200AL I/O module	34 - 49	for IM 155-6 DP HF	For mixed configuration with ET 200AL modules
	66 - 81	for IM 155-6 PN ST, IM 155-6 PN HF	

Simplified control data record (V1)

For the configuration control of interface modules of the ET 200SP distributed I/O system, you define a control data record 196 V1.0, which includes a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or ET 200AL I/O module (in a mixed ET 200SP / ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 4-6 Structure of the simplified control data record V1.0

Byte	Element	Code	Explanation
0	Block length	4 + maximum slot	Header
1	Block ID	196	
2	Version	1	
3	Version	0	
4	Slot 1 of the station master	Slot assignment in the station option	**Control element ET 200SP** Contains the information on which ET 200SP module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element) • If the module does not exist in the station option, enter 0.
5	Slot 2 of the station master	Slot assignment in the station option	
:	:	:	
4 + (slot server module - 1)	Server module slot	Assignment of server module slot in the station option*	
:	:	:	:

Byte	Element	Code	Explanation
4 + (first slot ET 200AL - 1)	First slot ET 200AL	Slot assignment in the station option	**Control element ET 200AL** Contains information on which ET 200AL module is inserted in which slot. The value that you need to enter in the corresponding byte depends on the following rule: • If the module exists in the station option, enter the slot number of the module. • If the module does not exist in the station option, enter 0.
:	:	:	
4 + (last slot ET 200AL - 1)	Last slot ET 200AL	Slot assignment in the station option	

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Control data record (V2)

If you change the potential groups in the station option compared to the station master, define a control data record 196 V2.0 for the ET 200SP interface module which contains a slot assignment. The maximum slot of the configuration corresponds to the slot of the server module or ET 200AL I/O module (in a mixed ET 200SP / ET 200AL configuration).

The table below shows the structure of a control data record with explanations of the individual elements.

Table 4-7 Structure of control data record 196 V2.0

Byte	Element	Code	Explanation
0	Block length	4 + (maximum slot x 2)	Header
1	Block ID	196	
2	Version	2	
3	Version	0	

<table>
<tr><th>Byte</th><th>Element</th><th>Code</th><th>Explanation</th></tr>
<tr><td>4</td><td>Slot 1 of the station master</td><td>Slot assignment in the station option</td><td rowspan="11">Control element ET 200SP
Contains the information on which ET 200SP module is inserted in which slot.
The value that you need to enter in the corresponding byte depends on the following rule:
• If the module exists in the station option, enter the slot number of the module.
• If the module exists as empty slot (with BU cover), enter the slot number of the module + 128. (Example: module as empty slot on slot 3: Enter 131 in the control element)
• If the module does not exist in the station option, enter 0.
Additional function
Contains information on whether a new potential group will be opened in the station option - by replacing a dark-colored BaseUnit with a light-colored BaseUnit.
• If you replace a dark-colored BaseUnit with a light-colored BaseUnit, enter 1 as additional function.
• If you accept the BaseUnit from the station master, enter 0 as additional function.</td></tr>
<tr><td>5</td><td colspan="2">Additional function for slot 1</td></tr>
<tr><td>6</td><td>Slot 2 of the station master</td><td>Slot assignment in the station option</td></tr>
<tr><td>7</td><td colspan="2">Additional function for slot 2</td></tr>
<tr><td>8</td><td>Slot 3 of the station master</td><td>Slot assignment in the station option</td></tr>
<tr><td>9</td><td colspan="2">Additional function for slot 3</td></tr>
<tr><td>:</td><td>:</td><td>:</td></tr>
<tr><td>4 + ((server module slot - 1) × 2)</td><td>Server module slot</td><td>Server module slot assignment in the station option*</td></tr>
<tr><td>4 + ((server module slot - 1) × 2) + 1</td><td colspan="2">Additional function for server module slot</td></tr>
<tr><td>:</td><td>:</td><td>:</td><td>:</td></tr>
<tr><td>4 + ((first slot ET 200AL - 1) x 2)</td><td>First slot ET 200AL</td><td>Slot assignment in the station option</td><td rowspan="5">Control element ET 200AL
Contains information on which ET 200AL module is inserted in which slot.
The value that you need to enter in the corresponding byte depends on the following rule:
• If the module exists in the station option, enter the slot number of the module.
• If the module does not exist in the station option, enter 0.</td></tr>
<tr><td>4 + ((first slot ET 200AL - 1) x 2) + 1</td><td colspan="2">Reserved</td></tr>
<tr><td>:</td><td>:</td><td>:</td></tr>
<tr><td>4 + ((last slot ET 200AL - 1) x 2)</td><td>Last slot ET 200AL</td><td>Slot assignment in the station option</td></tr>
<tr><td>4 + ((last slot ET 200AL - 1) x 2) + 1</td><td colspan="2">Reserved</td></tr>
</table>

* The server module must be present in the station option and must not be marked as empty slot (BU cover).

Note

If a BU cover or no I/O module is plugged on a light-colored BaseUnit, you should enter 1 in the additional function for the slot.

The function "Group diagnostics: Missing supply voltage L+" requires proper assignment of the slots to a shared supply voltage L+ (potential group). All light-colored BaseUnits must be known to the interface module. By entering 1 in the additional function, you make a light-colored BaseUnit known to the interface module, even if an I/O module is not inserted.

Combination of configuration control and shared device (for PROFINET)

The configuration control function in a shared device is therefore only for the I/O modules of the IO controller to which the interface module has subscribed. I/O modules that are assigned to no controller or a different controller behave like a station without activated configuration control.

You cannot make any change to the slot assignment for modules that are assigned to another IO controller or are not assigned to an IO controller (shared device on module level). The CPU assumes a one-to-one assignment for the modules.

If additional IO controllers subscribe to a module intended for configuration control (shared device on submodule level), only one-to-one assignment is permitted for this module. It is not possible to deselect such a module using the control data record (code 0 for this slot in the control data record). This means the combination of "Configuration control" and "Shared device on submodule level" is only possible to a limited extent.

Please note that all modules affected by the configuration control including all assigned submodules are reset when you change the module assignment. Submodules that are assigned to a second IO controller are affected as well.

Feedback data record for interface modules

Operating principle

The feedback data record informs you about the accuracy of the module assignment and gives you the option of detecting assignment errors in the control data record. The feedback data record is mapped via a separate data record 197 V2.0. The feedback data record exists only with configured configuration control.

Slot assignment

The feedback data record refers to the configured station configuration and always includes the maximum configuration limits. The maximum configuration limits comprise 13/49/81 slots depending on the interface module in use. Partial reading of the feedback data record is possible.

The following table shows the slot assignment of the modules:

Table 4-8 Slot assignment

Modules	Possible slots		Comment
Station extension BA-Send	1		For mixed configuration with ET 200AL modules, BA-Send is always on slot 1.
ET 200SP I/O module	1 - 12	for IM 155-6 PN BA	Downstream from the interface module
	1 - 32	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 64	for IM 155-5 PN HF	
Server module	1 - 13	for IM 155-6 PN BA	The server module completes the configuration of the ET 200SP station after the last I/O module.
	1 - 33	for IM 155-6 PN ST, IM 155-6 DP HF	
	1 - 65	for IM 155-5 PN HF	
ET 200AL I/O module	34 - 49	for IM 155-6 DP HF	For mixed configuration with ET 200AL modules
	66 - 81	for IM 155-6 PN ST, IM 155-6 PN HF	

Feedback data record

Table 4-9 Feedback data record

Byte	Element	Code	Explanation
0	Block length	4 + (number of slots x 2)	Header
1	Block ID	197	
2	Version	2	
3		0	
4	Slot 1 status	0/1	Status = 1: • Module from station master is inserted in the station option • Slot is marked as not available in the control data record Status = 0: • Module pulled • Incorrect module inserted in the station option*
5	Reserved	0	
6	Slot 2 status	0/1	
7	Reserved	0	
:	:	:	
4 + ((max. slot - 1) × 2)	Max. slot status	0/1	
4 + ((max. slot - 1)× 2) + 1	Reserved	0	

* Not possible if the slot is marked as not available.

Note

The data in the feedback data record is always mapped for all modules. In a shared device configuration, it is therefore irrelevant which IO controller the respective modules are assigned to.

As long as no control data record has been sent, a one-to-one module assignment is assumed for the compilation of data record 197 (station master → station option).

Error messages

In case of error, the RDREC instruction returns the following error messages via the STATUS block parameter while reading the feedback data record:

Table 4-10 Error messages

Error code	Meaning
$80B1_H$	Invalid length; the length information in data record 197 is not correct.
$80B5_H$	Configuration control not configured
$80B8_H$	Parameter error The following events cause a parameter error: • Incorrect block ID in the header (not equal to 197) • Invalid version identifier in the header • A reserved bit was set • Multiple slots in the station master are assigned to the same slot in the station option

Data records and functions

Supported data records and functions

The table below shows a comparison of the supported data records and functions depending on the CPU/interface module used.

	CPU...		Interface module (IM...)			
Supported data records and functions	**1510SP-1 PN 1510SP F-1 PN**	**1512SP-1 PN 1512SP F-1 PN**	**155-6 PN HF**	**155-6 PN ST**	**155-6 PN BA**	**155-6 DP HF**
Control data record (V2)	✓	✓	✓	✓	✓	✓
Simplified control data record (V1)	--	--	✓	✓	✓	--
Read back control data record *	✓	✓	✓	✓	✓	✓
Read feedback data record	--	--	✓	✓	✓	✓

* You can read back the control data record with the RDREC instruction.

Transferring the control data record to the ET200SP

The example program shown below creates the control data record for the example options in section Examples of configuration control (Page 1059) and transfers it to the ET200SP. The program must be assigned to the BackgroundTask.

```
INTERFACE
  PROGRAM pConfigControlET200SP_Station1;

  TYPE
    eConfigControlET200SPoptionType : (STATION_OPTION_1, STATION_OPTION_2,
                                       STATION_OPTION_3, STATION_OPTION_4);
  END_TYPE

  END_PROGRAM
END_IMPLEMENTATION
```

Behavior during operation

Effect of discrepancy between station master and station option

For the online display and for the display in the diagnostics buffer (module OK or module faulty), the station master is always used and not the differing station option.

Example: A module supplies diagnostic information. This module is configured in slot 4 in the station master, but is inserted in slot 3 in the station option (missing module; see example in the next section). The online view (station master) shows a faulty module in slot 4. In the real configuration, the module in slot 3 indicates an error via an LED display.

Response when modules are missing

If modules are entered as not present in the control data record, the automation system behaves as follows:

- Modules designated as not present in the control data record do not supply diagnostics and their status is always OK. The value status is OK.
- Direct write access to the outputs that are not present or write access to the process image of the outputs that are not present: Remains without effect; no access error is signaled.
- Direct read access to the inputs that are not present or read access to the process image of the inputs that are not present: Value "0" is supplied; no access error is signaled.
- Write data record to module that is not present: Remains without effect; no error is signaled.
- Read data record from module that is not present: An error is signaled because a valid data record cannot be returned.

Examples of configuration control

A station master consisting of an interface module, three I/O modules and the server module is configured in STEP 7 in the following section.

Four station options are derived from the station master with the configuration control:

- Station option 1 with module that is not present
- Station option 2 with modified order of modules
- Station option 3 with empty slot
- Station option 4: Opening a new potential group

Station option 1 with module that is not present

The module that is located in slot 3 in the station master is not present in the station option 1. Slot 3 must be designated in the control data record accordingly with 0 (= not present). The server module is located in slot 3 in the station option.

4.1.5.3 Activating and deactivating SINAMICS components

There is a fundamental difference between how individual components are activated and deactivated within a SINAMICS S120 multi-axis group and the corresponding procedures for, say, I/O components. This is due to the specific architecture involved.

Drives, I/O components in the SINAMICS S120 series, and their control instances are described in a complex parameter object model that is stored in the central control unit. Entire drives, including their control or individual components, can be activated or deactivated there. The following parameters are used for this purpose:

- Activate/deactivate drive objects (also on Terminal Modules or Controller Extension CX32):
  - Adjustable parameter p0105 (Activate/deactivate drive object)
  - Display parameter r0106 (Drive object active/inactive)
- Activate/deactivate power units:
  - Adjustable parameter p0125[PDS] (Activate/deactivate power unit component)
  - Display parameter r0126[PDS] (Power unit components active/inactive)
- Activate/deactivate encoders (on motor modules):
  - Adjustable parameter p0145[EDS] (Activate/deactivate encoder interface)
  - Display parameter r0146[EDS] (Encoder interface active/inactive)
- Activate/deactivate Voltage Sensing Module (on line modules):
  - Adjustable parameter p0145[VSM] (Activate/deactivate Voltage Sensing Module)
  - Display parameter p0146[VSM] (Voltage Sensing Module active/inactive)

There is a description of these parameters in the SINAMICS S120/S150 List Manual.

Note

Pay attention to the boundary conditions for the individual parameters described in the SINAMICS S List Manual.

Example of a sub-topology

The figure below shows an example of a sub-topology.

Parameters have been set on a machine for 1 active line module and 2 motor modules. The related configuration is saved on the CompactFlash Card of the control unit for the SINAMICS drive (reference topology).

- With the machine switched off, "drive 1" is removed and the DRIVE-CLiQ cable from the control unit is connected directly to "drive 2" (sub-topology, actual topology).
- On ramping up, the control unit detects a difference between the reference topology and the actual topology.
- The user program must then execute the following actions:
  - Set the drive object (DO) "drive 1" to "deactivate and not available". For this purpose the program must set the parameter p0105 = 2 in this DO.
  - Save all parameters in non-volatile memory on the CompactFlash Card; for this purpose the program must set the parameter p0977 = 1 in the control unit.

The actual topology is then saved as the reference topology. No further errors are triggered on ramping up.

Note

You can use the same procedure to deactivate all drive objects on a Controller Extension CX32 at the same time. For this purpose, set the parameter p0105 = 2 in the drive object CU_LINK.

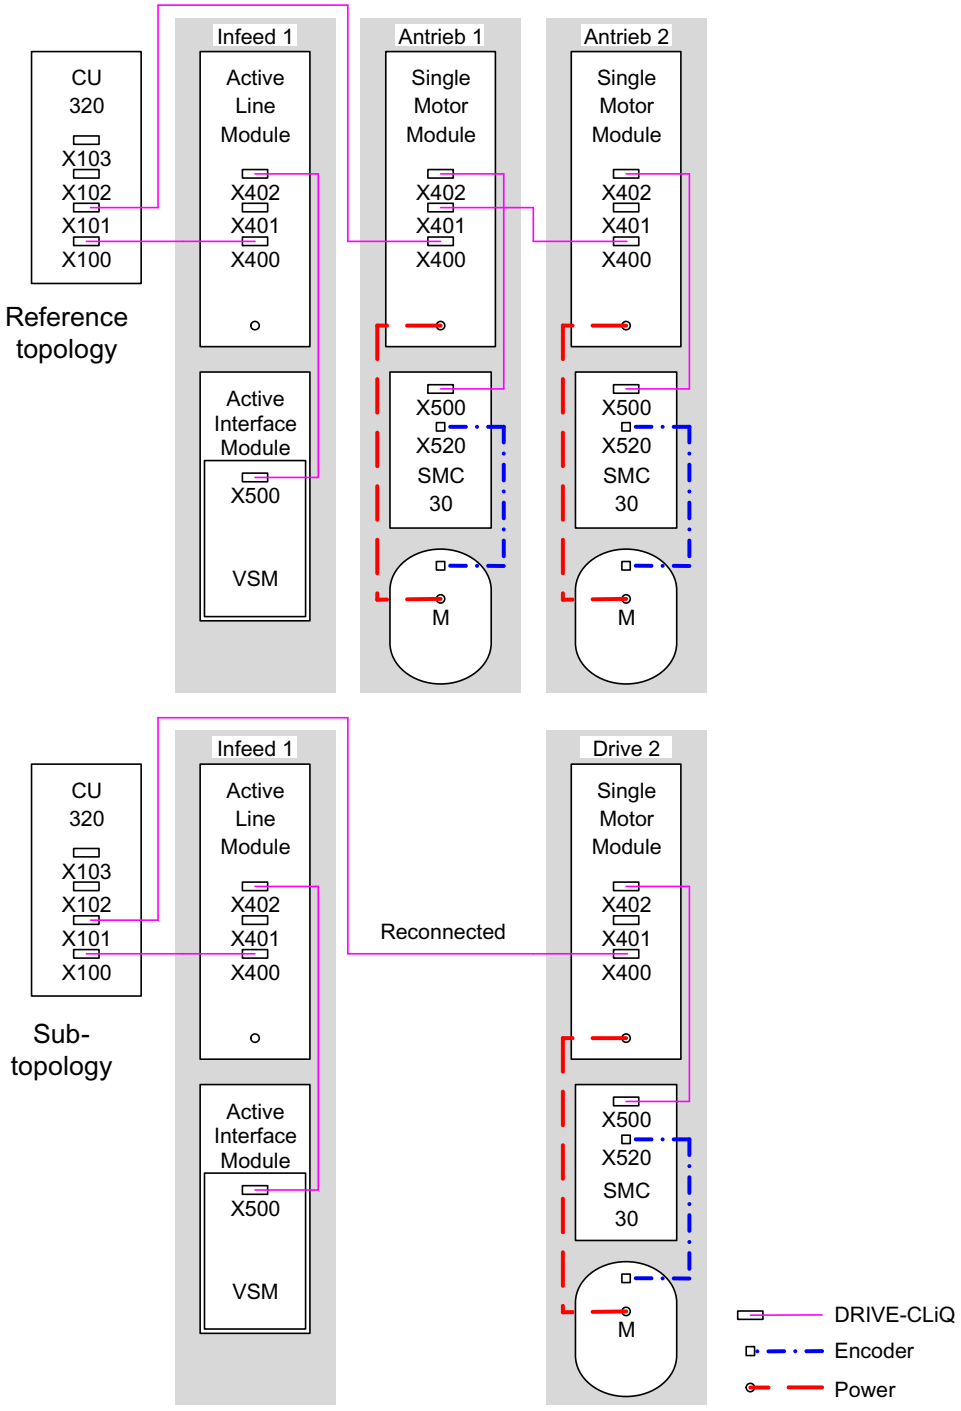

Figure 4-24 Example of a sub-topology

4.1.5.4 Activating and deactivating technology objects

The user has configured and programmed a maximum configuration. Technology objects which are not required (e.g. those assigned to deactivated DP slaves or IO devices) can be deactivated without restarting during operation.

The required technology objects (together with the DP slaves or IO devices to which they are assigned) can also be activated during operation.

This has the following advantages:

- The processor performance is concentrated on the activated technology objects. The computing time available for the MotionTasks and the BackgroundTask is increased.
- The system cycle clocks do not have to be dimensioned for calculating all the technology objects present in the maximum configuration, but only for the maximum number of simultaneously active technology objects. They can then generally be selected with shorter times: This increases the time resolution and reduces any response times; motion control is improved.
- A single project is suitable for various machine configurations; changes to the machine configuration can be made without a restart during operation.
- A default setting can be specified in the project as to which technology objects are active during the transition to the RUN operating mode.

Note

Licenses are required for all axes of the maximum configuration.

System functions

- _activateTo (Page 1067)
- _deactivateTo (Page 1067)
- _getStateOfTo (Page 1074)

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

Technology objects are often assigned to the distributed I/O (DP slave, IO device); therefore, please note the information in Procedure for deactivating and activating components (Page 1075).

System functions for activating and deactivating technology objects

System functions

Use the functions **_deactivateTo** and **_activateTo** to activate and deactivate the technology objects during runtime.

The related technology object is transferred in parameter **TO_Instance** (data type ANYOBJECT).

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index). Please also note the

information relating to the status diagram (Page 1068), asynchronous calls (Page 1069) and synchronous calls (Page 1071).

Note

The temperature channel technology object can only be activated and deactivated in the engineering system (see Activating or deactivating technology objects in the engineering system (Page 1074)).

Status diagram for the functions _activateTo and _deactivateTo

The figure below shows the states of the system functions _activateTo and _deactivateTo. It also applies to the _getStateOfTo system function, see also Querying the activation state of technology objects (Page 1074).

The functions can be called asynchronously and synchronously.

- With an asynchronous call (Page 1069) (parameter **nextCommand** := IMMEDIATELY), the user program is continued immediately after the start of the system function.
  You must regularly query the state of the function to be able to determine when a command has been executed in full.
  The asynchronous call is required in cyclic tasks to ensure that their time monitoring function does not start.
- With a synchronous call (Page 1071)
  (parameter **nextCommand** : =WHEN_COMMAND_DONE), the user program waits until the system function has been completed. The return value directly indicates whether the function call was successful.
  The synchronous call is recommended for MotionTasks.

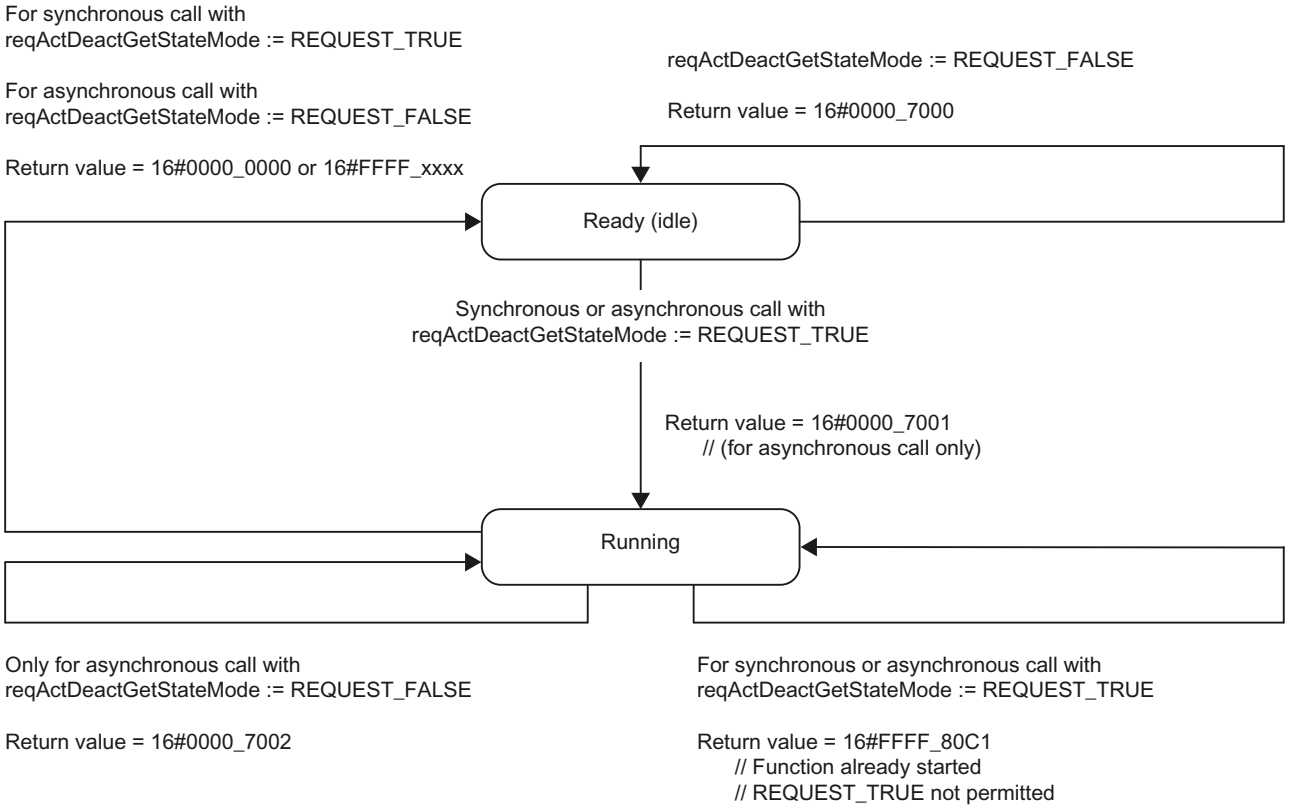
Use parameter **reqActDeactGetStateMode :=** REQUEST_TRUE to start execution of the function (e.g. activation or deactivation of a technology object).

Start the status query of the function with parameter **reqActDeactGetStateMode :=** REQUEST_FALSE. Use the same command ID as for the first call.

Note

To correctly complete the function on an asynchronous call, you must call the function with the parameter reqActDeactGetStateMode := REQUEST_FALSE as often as necessary until you obtain 16#0000_0000 as the return value or an error message.

You can only execute the function once at the same time for each technology object.



Return values

16#0000_0000	// Activation or deactivation successful
16#0000_7000	// Function in ready mode (idle), initial call required with REQUEST_TRUE
16#0000_7001	// Function started (only for asynchronous call)
16#0000_7002	// Function running (only for asynchronous call)
16#FFFF_xxxx	// Function terminated with error

Figure 4-25 Status diagram of the system functions _activateTo and _deactivateTo

Asynchronous call for the functions _activateTo and _deactivateTo

The asynchronous call is required in cyclic tasks to ensure that their time monitoring function does not start.

With an asynchronous call, the user program is continued immediately after the start of the system function. You must query the state of the function regularly to determine whether it has been completed without errors.

Proceed as follows for the asynchronous call:

1. Call the following parameters to start the system function:
   - reqActDeactGetStateMode := REQUEST_TRUE
   - nextCommand := IMMEDIATELY
2. Check the return value.
   - Return value 16#0000_0000 indicates that the function has been completed without errors.
     Continue with step 5.
   - The return value 16#0000_7001 indicates that the function has been started successfully, but has not yet been completed.
     Continue with step 3.
   - A return value < 0 indicates that the function has been terminated with errors. You can program error routines, depending on the return value.
3. For the state query and to check whether the system function has been completed, call these again, but with the following parameters:
   - reqActDeactGetStateMode := REQUEST_FALSE
   - nextCommand := IMMEDIATELY
   - commandId: Use the same command ID as for the first call.
4. Check the return value:
   - Return value 16#0000_7002 indicates that the function is still running.
     Repeat step 3.
   - A return value < 0 indicates that the function has been terminated with errors. You can program error routines, depending on the return value.
   - Return value 16#0000_0000 indicates that the function has been completed without errors.
5. On error-free completion of the functions _activateTo and _deactivateTo note the information below.

Note

Note for versions up to and including V4.0 of the SIMOTION Kernel:

The activation or deactivation of the technology object is not yet finished on completion without errors of the functions _activateTo or _deactivateTo.

Therefore, keep calling the _getStateOfTo (Page 1074) system function until the commandIdState component of the return value (data type EnumStateOfTo) has the value ACTIVE or INACTIVE.

Example program for the asynchronous call for the _activateTo function

```
INTERFACE
    USEPACKAGE Cam;
    PROGRAM backGround;

    VAR_GLOBAL
        bgrRequestActivate : DINT := 0;
        bgrResultActivate  : DINT := 0;
        bgrToInstance      : posaxis;
        bgrReqActDeactMode : enumReqActDeactGetStateMode := REQUEST_TRUE;
        bgrCommandId       : CommandIdType;
        bgrNextCommand     : enumNextCommandMode := IMMEDIATELY;
    END_VAR
END_INTERFACE

IMPLEMENTATION
PROGRAM backGround // Assigned to the BackgroundTask
    VAR
        retVal : DINT := 0;
    END_VAR

    // ... Further instructions

    IF ( 0 <> bgrRequestActivate ) THEN
        retVal := _activateTo (
                    TO_Instance             := bgrToInstance,
                    reqActDeactGetStateMode := bgrReqActDeactMode,
                    commandId               := bgrCommandId,
                    nextCommand             := bgrNextCommand );

        CASE retVal OF
            16#0000_0000: bgrRequestActivate := 0;
                // Node successfully activated.
            16#0000_7001: bgrReqActDeactMode := REQUEST_FALSE;
                // Function started successfully
            16#0000_7002: ; // Function running.
        ELSE // Troubleshooting
             bgrRequestActivate := 0;
        END_CASE;

        IF ( 0 = bgrRequestActivate ) THEN
            // Function completed, prepare next call.
            bgrReqActDeactMode := REQUEST_TRUE;
            bgrResultActivate := retVal;
        END_IF;
    END_IF;

    // ... Further instructions

END_PROGRAM
END_IMPLEMENTATION
```

Synchronous call for the functions _activateTo and _deactivateTo

The synchronous call is recommended for MotionTasks.

With a synchronous call, the user program waits until the system function has been completed. The return value directly indicates whether the function call was successful.

Proceed as follows for the synchronous call:

1. Call the following parameters to start the system function:
   - reqActDeactGetStateMode = REQUEST_TRUE
   - nextCommand = WHEN_COMMAND_DONE
2. Check the return value:
   - A return value < 0 indicates that the function has been terminated with errors. You can program error routines, depending on the return value.
   - Return value 16#0000_0000 indicates that the function has been completed without errors.

For the functions _activateTo and _deactivateTo note the information below.

Note

Note for versions up to and including V4.0 of the SIMOTION Kernel:

The activation or deactivation of the technology object is not yet finished on completion without errors of the functions _activateTo or _deactivateTo.

Therefore, keep calling the _getStateOfTo (Page 1074) system function until the commandIdState component of the return value (data type EnumStateOfTo) has the value ACTIVE or INACTIVE.

Example program for the synchronous call for the _activateTo function

```
INTERFACE
    USEPACKAGE Cam;
    PROGRAM motion_1;

    VAR_GLOBAL
      motion_1_RequestActivate  : DINT := 0;
      motion_1_ResultActivate   : DINT := 0;
      motion_1_ToInstance       : posaxis;
      motion_1_CommandId        : CommandIdType;
    END_VAR
END_INTERFACE

IMPLEMENTATION
PROGRAM motion_1 // Assigned to a MotionTask
    VAR
        retVal : DINT := 0;
    END_VAR

    // ... Further instructions

    IF ( 0 <> motion_1_RequestActivate ) THEN
        retVal := _activateTo (
                    TO_Instance             := motion_1_ToInstance,
                    reqActDeactGetStateMode := REQUEST_TRUE,
                    commandId               := motion_1_CommandId,
                    nextCommand             := WHEN_COMMAND_DONE );

        CASE retVal OF
            16#0000_0000: motion_1_RequestActivate := 0;
                // Node successfully activated.
        ELSE // Troubleshooting
            motion_1_RequestActivate := 0;
        END_CASE;

        IF ( 0 = motion_1_RequestActivate ) THEN
            // Function completed.
            motion_1_ResultActivate := retVal;
        END_IF;
    END_IF;

    // ... Further instructions

END_PROGRAM
END_IMPLEMENTATION
```

Activating or deactivating technology objects in the engineering system

You can also activate or deactivate technology objects in the engineering system (e.g. SIMOTION SCOUT). After downloading the project to the target system, these technology objects are activated or deactivated during ramp-up of the system (default setting: all technology objects are activated).

Note

You can only make the settings with the engineering system in offline mode. They only take effect after the project is downloaded to the target system.

1. Make sure that the engineering system (e.g. SIMOTION SCOUT) is in offline mode.
2. Select the SIMOTION device (e.g. D435) in the project navigator.
3. Select the **Edit > Object states** menu.
   A list of all technology objects configured on this SIMOTION device is displayed. The check box in front of the identifier of each technology object indicates whether it is activated during the transition from STOP to RUN operating mode.
4. For each technology object, define whether the object is to be activated when the system is ramped up:
   – Activate the check box if the relevant technology object is to be activated (default setting).
   – Deactivate the check box if the relevant technology object is not to be activated.
5. Repeat steps 2 to 4 for all SIMOTION devices.
6. Change to online mode and download the project to the target system.

After the system is ramped up, you can change the activation and deactivation settings by calling the system functions **_activateTo** and **_deactivateTo** (e.g. in the StartupTask).

You can monitor the current state in online mode using the engineering system (see Querying the activation state of technology objects (Page 1074)).

Querying the activation state of technology objects

You can now carry out the following for individual technology objects:

- Query the activation state using system functions (Page 1074)
- Monitor the activation state in the engineering system (e.g. SIMOTION SCOUT) (Page 1075).

Querying the activation state of technology objects using system functions

System function

The **_getStateOfTo** system functions can be used to query the status of an individual technology object in a user program.

The following information is contained in the return value of the function (data type StructRetGetStateOfTo):

- The state of the function in the functionResult component (data type DINT)
- The activation state of the technology object in the commandIdState component (data type EnumStateOfTo) (only when component functionResult = 16#0000_0000)

The syntax of these system functions is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Status diagram, asynchronous and synchronous call

As regards the main features, the same information applies as for the _activateTo and _deactivateTo functions, see: .

- Status diagram for the functions _activateTo and _deactivateTo (Page 1068)
- Asynchronous call for the functions _activateTo and _deactivateTo (Page 1069)
- Synchronous call for the functions _activateTo and _deactivateTo (Page 1071)

Monitoring the activation state of technology objects in the engineering system

You can monitor the current activation state of the technology objects of a SIMOTION device in the engineering system (e.g. SIMOTION SCOUT). The engineering system must be in online mode.

Note

You cannot make any settings for the activation or deactivation of technology objects in online mode.

1. Make sure that the engineering system (e.g. SIMOTION SCOUT) is in online mode.
2. Select the SIMOTION device (e.g. C240) in the project navigator.
3. Select the **Edit > Object states** menu.
   A list of all technology objects configured on this SIMOTION device is displayed. The check box in front of the identifier of each technology object indicates the activation state after the transition to RUN operating mode and the current activation state:
   - Check mark in the check box: activation state after the transition to RUN operating mode (setting in offline mode)
   - Color of the check box: current activation state (green = activated).

4.1.5.5 Procedure for deactivating and activating components

The following is a brief summary of the steps that must be performed when deactivating and activating each component (e.g. machine modules, DP slave with assigned technology objects):

- Deactivating components (Page 1076)
- Activating components (Page 1077)

Note

If possible, deactivate technology objects and components first before activating other technology objects and components. In this way you will avoid level overflows.

Deactivating components

Proceed in this sequence if you want to deactivate technology objects and the distributed I/O to which they are assigned:

1. Terminate all commands that are present on the technology objects to be deactivated (e.g. motion, homing).
2. Remove all enables for these technology objects with the specific system function for the technology object in question, e.g. _disableAxis.
   Also remove the enables for dependent technology objects (for axes, e.g. measuring inputs, output cams, synchronous objects).
3. Deactivate these technology objects individually:
   - Observe the correct sequence if technology objects are dependent on one another: First deactivate all dependent technology objects (e.g. measuring inputs, output cams, synchronous objects) before deactivating their base technology object (e.g. axis).
   - Start the deactivation process with the system function _deactivateTo (Page 1067).
   - Only up to version V4.0 of the SIMOTION kernel:
     After error-free completion of the _deactivateTo system function, keep calling the _getStateOfTo (Page 1074) system function until the commandIdState component of the return value (data type EnumStateOfTo) has the value INACTIVE.
4. When all technology objects that are assigned to a distributed I/O (e.g. drive) are deactivated:
   - Deactivate the distributed I/O (e.g. drive) with the system function _deactivateDpSlave (Page 1032)
     Or
   - Deactivate individual drive objects in the SINAMICS S120 drive line-up with parameter p0105, see Activating and deactivating SINAMICS components (Page 1064).
5. If required, remove the component (e.g. machine module).

Activating components

Proceed in this sequence if you want to activate the distributed I/O and the technology objects assigned to it:

1. Connect the component (e.g. machine module).
2. Activate the distributed I/O:
   - Activate the distributed I/O (e.g. drive) with the system function _activateDpSlave (Page 1032)
     Or
   - Activate individual drive objects in the SINAMICS S120 drive line-up with parameter p0105, see Activating and deactivating SINAMICS components (Page 1064).
3. Activate the assigned technology objects individually:
   - Observe the correct sequence if technology objects are dependent on one another: First activate the base technology object (e.g. axis) before activating the dependent technology objects (e.g. measuring inputs, output cams, synchronous objects).
   - Start the activation process with the system function _activateTo (Page 1067).
   - Only up to version V4.0 of the SIMOTION kernel:
     After error-free completion of the _activateTo system function, keep calling the _getStateOfTo (Page 1074) system function until the commandIdState component of the return value (data type EnumStateOfTo) has the value ACTIVE.
4. Set the required enables for these technology objects with the specific system function for the technology object in question, e.g. _enableAxis.
5. If required, home the axis with the _homing system function.
6. Start further motion commands.

4.1.6 Changing the active configuration or the active kernel

A configuration contains all configuration data for a SIMOTION device (e.g. device configuration, communications configuration, technology objects, global device variables, I/O variables, user programs). The active configuration is stored on the SIMOTION device's memory card and is loaded with each system ramp-up (after POWER ON).

This section describes how you can perform the following actions in the user program:

1. Replace the active configuration by another one whose card image is present on the memory card. You can explicitly specify the configuration to be activated (see Activating a configuration (Page 1078)) or select it via an initial configuration (see Selecting and activating a configuration using an initial configuration (Page 1089)).
2. Replace the active kernel of the SIMOTION device with another one whose card image is present on the memory card (see Activating a kernel (Page 1084)).

In this way, you can update the configuration and/or the SIMOTION Kernel without replacing the memory card.

Note

If need be, you may have to update the corresponding firmware of interlinked SINAMICS drive units.

4.1.6.1 Activating a configuration

A configuration contains all configuration data for a SIMOTION device (e.g. device configuration, communications configuration, technology objects, global device variables, I/O variables, user programs). The active configuration is stored on the SIMOTION device's memory card and is loaded with each system ramp-up (after POWER ON).

This section describes how you can replace the active configuration by another one whose card image is present on the memory card by means of a user program. In this case, the configuration to be activated is specified explicitly or determined by the user program. In this way, a configuration adapted for each task can be added:

- The memory and computing capability of the SIMOTION device are only used for the configured functionalities
- Cycle times and cycle clocks (e.g. DP cycle clock, position control cycle clock, IPO cycle clock) can be optimized for each requirement.

A typical application case is as follows: On a SIMOTION device (base machine), various machine modules are connected in turn. The configuration data for each arrangement (base machine with connected machine module) is stored as its own configuration on the memory card of the SIMOTION device. After the machine module is connected to the base machine, the user program identifies the relevant machine module.

System function

When the **_activateConfiguration** system function is initiated, the user program loads the required configuration and restarts the SIMOTION device. Provide the configuration to be activated in parameter projectDataId (data type UDINT). The hexadecimal number to be provided corresponds to the last six characters of the relevant file name assigned to the card image of the respective configuration on the memory card (example: File name = PR000001.ZIP, projectDataId = 16#000001).

The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

Note when activating a configuration:

- Retentive global device variables are always initialized.
- The values of the following variables of the last active configuration can be preserved: Retentive unit variables and retentive system variables of the technology objects. Observe the measures described in Retaining retentive data in the event of a configuration change (Page 1095).
- If the SINAMICS Safety Integrated Functions configuration is used, an acceptance test is mandatory when the SIMOTION device is restarted (see "SINAMICS S120 Safety Integrated" Function Manual).
- After restarting the SIMOTION device, check the Activation state of the configuration (Page 1094) with the _getConfigurationData system function.

The activated configuration remains after the SIMOTION device is turned off. After the device is turned on (POWER ON), the configuration is reloaded.

A detailed description of how the card images of configurations are created is provided in Section "Procedure for creating the card images of configurations" (Page 1098).

Note

The following applies up to version V4.2 of the SIMOTION Kernel:

- If one or more CX32/CX32-2 controller extensions are connected to a SIMOTION D4x5/ D4x5-2, note the following when activating a configuration with the _activateConfiguration function:
  The activated configuration will only take effect on the CX32/CX32-2 controller extension after the CX32/CX32-2 has been restarted. This restart must be specifically initiated by the user, as the _activateConfiguration function does not perform a restart automatically.
- Note the information in the Section "Special considerations when a CX32/CX32-2 controller extension is connected" (Page 1080).

As of SIMOTION Kernel version V4.3, restart of the CX32/CX32-2 takes place automatically with the function _activateConfiguration.

Note

For the implementation of a modular machine, several projects with their drive configurations can be stored on the SIMOTION memory card. These configurations can then be activated, and it is possible to switch between the different configurations. You must therefore ensure that all projects with their drive configurations (incl. safety configuration) stored on the SIMOTION memory card for SINAMICS Integrated function correctly on the entire system and have been subject to a full safety acceptance test. For projects with mixed operation, the user is responsible for the installation of passive (e.g. marking or suitable safety precautions) or active (e.g. monitoring of the relevant axes) safety measures.

Mixed operation is the switchover between safety and non-safety axes. This also includes the replacement of safety axes with the same safety parameterization with regard to the communication with the safety module in the different configurations.

Note

If the size of the retentive data blocks changes in the new configuration, fragmentation of the retentive memory may make it impossible to activate the configuration.

The following applies as of version V4.5 of the SIMOTION Kernel:

- The retentive memory will be reorganized when the device is restarted.
  The values of the retentive global unit variables are retained if the symbol information is saved in the device. For this purpose, the compiler option "Permit OPC-UA / -XML (load symbols to RT)" must be activated for all relevant program sources during compilation.
- Please also note the relevant information in section "Retaining retentive data" (Page 1095).

The following applies up to version V4.4 of the SIMOTION Kernel:

- You must perform a memory reset on the device.
  The retentive data is lost.

Special considerations when a CX32/CX32-2 controller extension (up to Kernel V4.2) is connected

The following applies up to version V4.2 of the SIMOTION Kernel:

- If one or more CX32/CX32-2 controller extensions are connected to a SIMOTION D4x5/ D4x5-2, note the following when activating a configuration with the _activateConfiguration function:
  The activated configuration will only take effect on the CX32/CX32-2 controller extension after the CX32/CX32-2 has been restarted. This restart must be specifically initiated by the user, as the _activateConfiguration function does not perform a restart automatically.

Forcing restart (procedure)

To force the CX32/CX32-2 controller extension to restart, proceed as follows (3 options):

- Power Off/On for the entire system
- Power Off/On of the CX32/CX32-2 controller extension
- Set p0972 = 1 on the CX32/CX32-2 controller extension:
  - In the user program: with the function _writeDriveParameter, for example
    Or
  - In SIMOTION SCOUT: In the expert list for the "Control_Unit" of the CX32/CX32-2 controller extensions

  This restarts the CX32/CX32-2 immediately.

⚠ DANGER
Avoid unsafe states
Ensure the system is in a safe state!
No attempt should be made to access the memory card of the SIMOTION D4x5/D4x5-2.

Example for the activation of a configuration

Description

In the figure below, a transport device with a SIMOTION control transports a workpiece to various machining stations. The following sequences can be observed here:

1. Drawing a blank from the store and transporting it to the machining station.
2. Machining the blank.
3. Unloading the semi-finished part at the packing station.

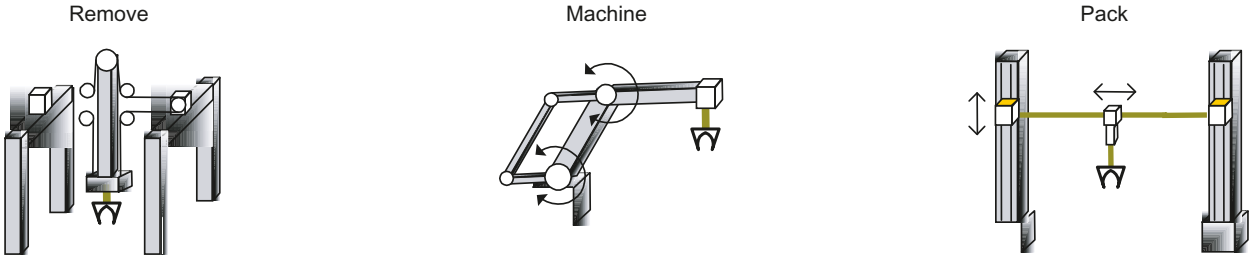


Figure 4-26 Sequences of an automation task

Implementation

For each machining step, the associated optimized configuration is stored on the memory card of the transport device. After the transport device has been coupled to one of the machining stations, it identifies the relevant machining station (e.g. by evaluating a connector coding) and loads the necessary configuration. The table below shows examples of the following for the machining stations shown in the figure above:

- Their connector coding
- The file name of the associated configuration on the memory card of the transport device and
- The projectDataId associated with the file name, which is required when calling the **_activateConfiguration** system function

Table 4-11 Identifying the configuration

Designation of the machining station	Connector coding	File name of the configuration	projectDataId
Remove	001	PR000001.ZIP	16#000001
Machine	010	PR000002.ZIP	16#000002
Pack	100	PR000003.ZIP	16#000003

Example program

The following programming example shows:

- The identification of the required configuration in accordance with the table above
- The activation of the required configuration

Example program for the identification and activation of a required configuration

```
// Variable declaration
VAR
    retActivateConf  : StructRetConfiguration;
    plugCode AT %IB0 : BYTE;  // Connector coding
    configId         : UDINT; // projectDataId of the
                              // required configuration
END_VAR

// Identify the required configuration
// by evaluating the connector coding
CASE plugCode OF
    2#001   : configId := 16#000001; // Remove  (PR000001.ZIP)
    2#010   : configId := 16#000002; // Machine (PR000002.ZIP)
    2#100   : configId := 16#000003; // Pack  (PR000003.ZIP)
    ELSE
         ; // ... Error response
END_CASE;

// Activate the required configuration
retActivateConf := _activateConfiguration (
        projectData   := YES,
        projectDataId := configId,
        timeOut       := T#5m       // 5 minutes
    );

IF ( 0 <> retActivateConf.result ) THEN
    // Error response
    ; // ...
END_IF;
```

About parameter timeOut

The timeOut parameter specifies the maximum time the SIMOTION device can require after the restart until the RUN mode is reached. When this time is exceeded, the system performs the following actions:

1. The system tries to activate the initial configuration (if present), and to use this to select a configuration (see Selecting and activating a configuration using an initial configuration (Page 1089)).
2. In the event of an error, the device switches to the STOP operating mode.

Monitoring is deactivated when timeOut = T#0s.

Note

Make sure that the selected system cycle clocks are long enough, otherwise a timeout (internal error) may occur while a configuration is powering up.

4.1.6.2 Activating a kernel

Activating a kernel

This section describes how you can exchange the active kernel of the SIMOTION device using the user program and, for example, carry out an update to a new version without having to replace the memory card of the device. In this regard, you must replace all configurations (configuration data) of the SIMOTION device.

To do this, you transfer the card images of the kernel and all necessary configurations to the INSTALL\SIMOTION\VExxxxxx directory on the SIMOTION device's memory card. In the directory name VExxxxxx there is a 6-digit hexadecimal number xxxxxx. You specified this directory name when creating the card images with the /i"VExxxxxx" option. A detailed description of how the card images of the kernel and configurations are created is provided in Section "Procedure for creating the card images of configurations (Page 1098)".

Note

With SIMOTION P3xx devices, it is not possible to exchange the SIMOTION Kernel in the way described above. It is necessary to make additional changes in the Windows system that necessitate replacement of the entire image.

The required data is saved in the following subdirectories in the VExxxxxx directory:

- INITIAL directory: The card image of an initial configuration (file name INITIAL.ZIP), if present
- KERNEL directory:
  - For SIMOTION C2xx devices
    The card image of the SIMOTION Kernel (file name KERNEL.ZIP).
  - For the SIMOTION D devices:
    The card image of the SIMOTION Kernel including the firmware for the SINAMICS Integrated (file name KERNEL.ZIP)
- PACKAGE directory: The card images of the technology objects
- PROJECT directory: The card images for all configurations (file name PRyyyyyy.ZIP, where yyyyyy is a hexadecimal number that corresponds to the projectDataId)

Note

Select a designation for the VExxxxxx directory from which the version of the SIMOTION Kernel can be clearly identified, e.g. VE004156 for version V4.1 SP5 HF6.

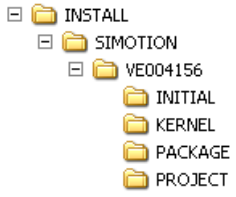

Figure 4-27 Directory structure on the memory card

System function

To activate the SIMOTION Kernel stored on the card, call in the user program the **_activateConfiguration** system function with the kernel := YES parameter. In the kernelId parameter, specify the last six characters of the directory name on the memory card (example: Directory name = VE004156, kernelId = 16#004156).

The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Specify the configuration to be activated in the projectData and projectDataId parameters:

- projectData := NO: The projectDataId parameter will be ignored; the initial configuration will be activated. In this initial configuration, the required configuration will be determined, for example, by evaluating a connector coding, and loaded by calling the _activateConfiguration system function again.
  See "Example *without* details of a configuration to be activated" in "Examples for activating a kernel" (Page 1086).
  For information on the initial configuration, see Selecting and activating a configuration using an initial configuration (Page 1089).
- projectData := YES: The configuration specified in the projectDataId parameter (UDINT data type) will be activated. The hexadecimal number to be transferred corresponds to the last six characters of the relevant file name of the configuration on the memory card (for example, File name = PR000001.ZIP, projectDataId = 16#000001).
  See "Example *with* details of a configuration to be activated" in "Examples for activating a kernel" (Page 1086).

Note

When activating a kernel and the associated configuration, please note:

- Retentive global device variables are always initialized.
- The values of the following variables of the last active configuration can be preserved: Retentive unit variables and retentive system variables of the technology objects. Observe the measures described in "Retaining retentive data in the event of a configuration change" (Page 1095).
- If the SINAMICS Safety Integrated Functions configuration is used, an acceptance test is mandatory when the SIMOTION device is restarted (see "SINAMICS S120 Safety Integrated" Function Manual).
- After restarting the SIMOTION device, check the Activation state of the kernel and the configuration (Page 1094) with the _getConfigurationData system function.

The chronological sequence of the activation of a kernel and the required configuration is described in the Status diagram (Page 1089).

The activated kernel and the activated configuration are retained after the SIMOTION device is turned off. After the device is turned on (POWER ON), they are reloaded.

User administration for SIMOTION IT

The SIMOTION IT user administration depends on the SIMOTION Kernel version:

- The following applies up to SIMOTION Kernel version V4.3:
  The user administration is integrated in the `webcfg.xml` file. This file is on the memory card of the SIMOTION device under the path: `\user\simotion\hmicfg`
- The following applies as of SIMOTION Kernel version V4.4:
  The user administration is contained in the `userdatabase.xml` file. This file is on the memory card of the SIMOTION device in path: `\user\simotion\hmicfg \userdatabase`

When changing the SIMOTION Kernel version from 4.3 to V4.4, an attempt is made to convert the previous user administration into the new format. However, this is not always possible (e.g. "simotion" user available with standard password). Note Section "Firmware upgrade to V4.4" in the "SIMOTION IT Diagnostics and Configuration" Diagnostics Manual as well as further sections in Chapter "Manage Config".

For this reason, it is recommended that you integrate the user administration in the configurations when changing the kernel. Refer to the information on "User administration for SIMOTION IT" in Section "Saving the configuration files in the work directories on the PC/PG" (Page 1102).

Example programs for activating a kernel

The following two examples for activating a kernel make a distinction between two scenarios:

- The configuration to be activated is not specified (see "Example *without* details of a configuration to be activated").
- The configuration to be activated is specified (see "Example *with* details of a configuration to be activated").

Example *without* details of a configuration to be activated

The following example shows the activation of a kernel without details of a configuration to be activated.

After activating the kernel and restarting the system, the initial configuration will be loaded. In this initial configuration, the required configuration will be determined, for example, by evaluating a connector coding, and activated by calling the _activateConfiguration system function again.

For information on the initial configuration, see "Selecting and activating a configuration using an initial configuration" (Page 1089).

Example for activating a kernel without details of a configuration to be activated

```
// Variable declaration
VAR
    retActivateConf : StructRetConfiguration;
    newKernelId : UDINT;    // kernelId of the
                            // kernel to be loaded
END_VAR

newKernelId := 16#004156;   // Corresponds to directory
                            // VE004156

// Activate the required configuration
retActivateConf := _activateConfiguration(
        projectData     := NO,          // Mandatory parameters
        projectDataId   := UDINT#MAX,   // 16#FFFF_FFFF
        kernel          := YES,
        kernelId        := newKernelId,
        timeOut         := T#5m         // 5 minutes
    );

IF ( 0 <> retActivateConf.result ) THEN
    // Error response
    ; // ...
END_IF;
```

The timeOut parameter is described in detail in Section "Example of the activation of a configuration" (Page 1081). The time should be at least five minutes for the activation of a kernel.

Example *with* details of a configuration to be activated

The following example shows the activation of a kernel with details of a configuration to be activated.

After activating the kernel and restarting the system, the configuration specified in the projectDataId parameter will be loaded.

Example for activating a kernel with details of a configuration to be activated

```
// Variable declaration
VAR
    retActivateConf : StructRetConfiguration;
    newKernelId : UDINT; // kernelId of the
                         // kernel to be loaded
    configId    : UDINT; // projectDataId of the
                         // required configuration
END_VAR

newKernelId := 16#004156; // Corresponds to directory
                          // VE004156
configId    := 16#000001; // Corresponds to file
                          // PR000001.ZIP

// Activate the required configuration
retActivateConf := _activateConfiguration (
        projectData := YES,
        projectDataId := configId,
        kernel := YES,
        kernelId := newKernelId,
        timeOut := T#5m // 5 minutes
    );

IF ( 0 <> retActivateConf.result ) THEN
    // Error response
    ; // ...
END_IF;
```

The timeOut parameter is described in detail in Section "Example of the activation of a configuration" (Page 1081). The time should be at least five minutes for the activation of a kernel.

Status diagram for activating a kernel

The figure below shows the chronological sequence for the activation of a kernel depending on the projectData parameter (specification of a configuration to be activated).

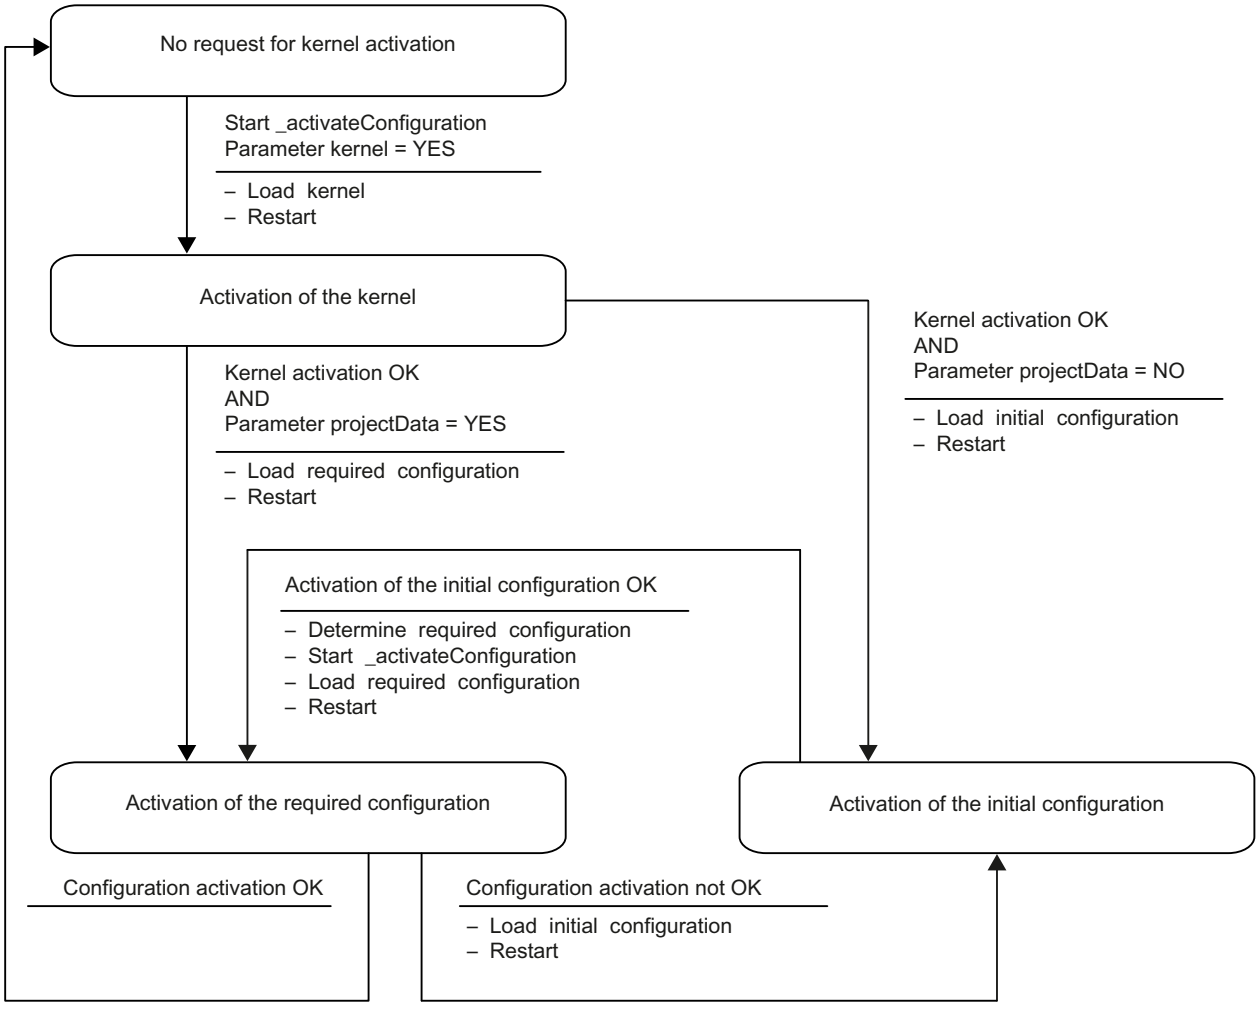

Figure 4-28 Status diagram for activating a kernel depending on the projectData parameter

4.1.6.3 Selecting and activating a configuration using an initial configuration

Selecting and activating a configuration using an initial configuration

Loading an initial configuration during ramp-up (after POWER ON) of a SIMOTION device ensures that it can be integrated failure-free into a running communication network of another device after switch-on.

For example, a SIMOTION device (machine module) is connected to a different SIMOTION device (base machine). After POWER ON, the machine module ramps up, identifies its position at the base machine (e.g. using a connector coding), and automatically loads the required configuration.

The card images for all configurations that the SIMOTION device (machine module) can transfer to the base machine is stored on its memory card. The initial configuration also stored there will be loaded automatically after POWER ON. This identifies (e.g. using a connector coding) the required configuration and loads it.

Note

Note the following restrictions on configuring the initial configuration:

1. The interface to the base machine must be configured with a communication address (e.g. PROFIBUS address or IP address) that is not used in the associated communication network of the base machine.
   This does not disturb communication in this network.
2. There must be no retentive data (e.g. retentive unit variables) in the user program. You can check this with **Display reference data > Code attributes**.
   The retentive unit variables of the last activated configuration thereby remain intact.
3. No instances of technology objects may be configured.
   This prevents retentive instance data of the technology objects. The retentive system variables of the technology objects of the last active configuration remain intact.
4. No drives should be configured.
   This reduces the loading time for the initial configuration.

The card image of the initial configuration (file name INITIAL.ZIP) is located in the INITIAL subdirectory of the relevant kernel version (e.g. INSTALL\SIMOTION\VE004156). A detailed description of how the card images of the initial configuration and the configurations to be activated are created is provided in "Procedure for creating the card images of configurations" (Page 1098).

SelfAdaptingConfiguration functionality

The initial configuration will be started automatically during ramp-up of the SIMOTION device if the SelfAdaptingConfiguration functionality has been activated on its memory card. This will be the case if the following actions have been performed:

- The /a"ON" option was also specified when creating the card images of the configurations (Page 1106) with the u7mkcnfx.exe program (/m"MAKE_STORE" option).
- In the last user program to run (before POWER OFF),
  the **_setModeSelfAdaptingConfiguration** system function was called with the mode := ON parameter.

This makes a corresponding entry on the memory card, which causes the initial configuration to be loaded after POWER ON.

You can disable the SelfAdaptingConfiguration functionality by calling the **_setModeSelfAdaptingConfiguration** system function with the mode := OFF parameter. This makes a corresponding entry on the memory card, which causes the last active configuration to be loaded after POWER ON.

The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

Note

The activation and the deactivation of the SelfAdaptingConfiguration functionality only take effect the next time the SIMOTION device is switched on (POWER ON).

Note

In a communication network (PROFIBUS subnet or PROFINET or Ethernet segment), only one SIMOTION device may be active simultaneously with the initial configuration.

The existence of several nodes with the same communication addresses in a communication network causes a fault.

Note

When activating a configuration through an initial configuration, please note:

- Retentive global device variables are always initialized.
- The values of the following variables of the last active configuration can be preserved: Retentive unit variables and retentive system variables of the technology objects. Please note in this regard:
  - The restrictions for the initial configuration given in the **Notice** information at the start of this section
  - The measures for the configuration to be activated described in "Retaining retentive data in the event of a configuration change" (Page 1095)

Note

If one or more CX32 controller extensions are connected to a SIMOTION D4x5, please note the following when activating a configuration with the _activateConfiguration function:

The activated configuration will only take effect on the CX32 controller extension after the CX32 has been restarted. This restart must be specifically initiated by the user, as the _activateConfiguration function does not perform a restart automatically.

Note the information in the section titled "Special considerations when a CX32 controller extension is connected" (Page 1080).

Status diagram for what happens when a SIMOTION device is switched on depending on whether or not the SelfAdaptingConfiguration functionality is active

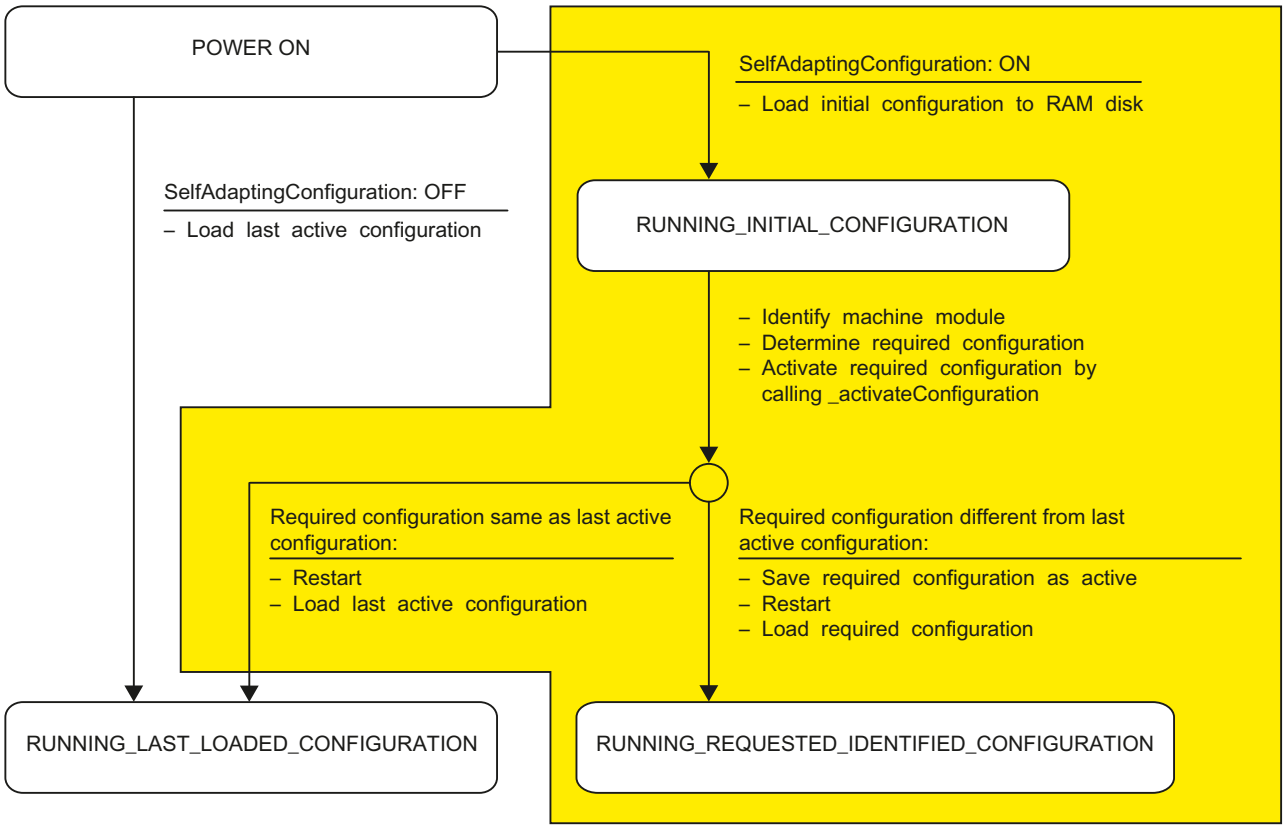

Figure 4-29 Status diagram for what happens when a SIMOTION device is switched on depending on whether or not the SelfAdaptingConfiguration functionality is active

When the device is switched on (POWER ON), the SIMOTION performs a one-off run through the status diagram:

- If the SelfAdaptingConfiguration functionality is activated, the initial configuration will be loaded.
  The initial configuration identifies the position of the machine module on the base machine, determines the required configuration, and activates it using the _activateConfiguration system function.
  The system function checks whether the configuration to be activated is identical to the most recently active configuration:
  - **Identical**: After the device restart, the most recently active configuration will be loaded.
  - **Not identical**: The required configuration will be saved as the active configuration and will be loaded after a device restart.
- If the SelfAdaptingConfiguration functionality is deactivated, the most recently active configuration will be loaded.

Example program for an initial configuration

The following example program shows the determination and activation of a configuration in the initial configuration:

Example for activating a configuration in an initial configuration

```
// Variable declaration
VAR
    ipRead          : ARRAY [1..2] OF StructRetIpConfig;
    setIpAddress    : ARRAY [0..5] OF USINT;
    setIpSubnet     : ARRAY [0..5] OF USINT;
    setIpGateway    : ARRAY [0..5] OF USINT;
    retUdint        : UDINT;
    retActivateConf : StructRetConfiguration;
    // IP address and projectDataId of the configuration are
    // read from output with address 0.
    ip_conf_id AT %IB0 : USINT;
END_VAR

// Read the current data of the Ethernet interfaces
ipRead[1] := _getIpConfig (
        ethernetInterface:= IE_01);
ipRead[2] := _getIpConfig (
        ethernetInterface:= IE_02);

// Change of the Ethernet interface IE_01.
// Check whether a change is necessary.
IF ( ip_conf_id <> ipRead[1].ipAddress[3] ) THEN
    // Make available the data to be changed
    setIpAddress    := ipRead[1].ipAddress;
    setIpAddress[3] := ip_conf_id;
    setIpSubnet     := ipRead[1].subnetMask;
    setIpGateway    := ipRead[1].gatewayAddress;
    // Check whether, following the change, the subnet masks
    // of the two Ethernet interfaces are different:
    IF ( ipRead[2].subnetMask <> setIpSubnet ) THEN
        // Set the data of the Ethernet interface IE_01
        retUdint := _setIpConfig (
            ethernetInterface := IE_01,
            ipAddress         := setIpAddress,
            subnetMask        := setIpSubnet,
            gatewayAddress    := setIpGateway
          );
        // Activate the required configuration
        retActivateConf := _activateConfiguration(
            projectData   := YES,
            projectDataId := ip_conf_id,
            timeOut       := T#1m // 1 minute
          );
    ELSE
      ; // No change, error response,
        // change interface IE_02 too, if necessary.
    END_IF;
END_IF
```

4.1.6.4 Reading the activation state of configurations

You can use the **_getConfigurationData** function to query the status of the last two calls of the **_activateConfiguration** system function.

The syntax of this system function is described in detail in the "System Functions/Variables Devices" List Manual (reference list) and in the online help (see index).

A description of some input parameters follows:

- You specify in the **configurationInfoId** parameter (EnumConfigurationInfoId data type), the configuration whose status you want to query:
  - ACTUAL_ACTIVATED: The status of the currently active configuration (last call of the _activateConfiguration function) will be queried.
  - PREVIOUS_ACTIVATED: The status of the previously active configuration (next to last call of the _activateConfiguration function) will be queried.
- In the **requestMode** parameter (EnumReqSysFunctMode data type), you specify whether the actual function (query of the configuration state) is to be executed or whether the status of the command is to be queried.
  - REQUEST_TRUE: The function (query of the configuration state) will be executed.
  - REQUEST_FALSE: The query of the status of the command will be executed (required for asynchronous call).
    The same principles illustrated by the Status diagram for the functions _activateTo and _deactivateTo (Page 1068) and _getStateOfTo, apply.
- You specify in the **nextCommand** parameter (EnumNextCommandMode data type) when the next command is to be executed:
  - IMMEDIATELY: Immediately (asynchronous call - required for cyclic tasks).
    See "Asynchronous call for the functions _activateTo and _deactivateTo" (Page 1069).
  - WHEN_COMMAND_DONE: After the completion of the command (synchronous call - recommended for MotionTasks).
    See "Synchronous call for the functions _activateTo and _deactivateTo" (Page 1071).

The return value (**StructRetGetConfigurationData** data type) shows

- In the functionResult component (DINT data type), the general result of the function call
- In the configuration component (StructDeviceConfigurationData data type):
  - The general status of the _activateConfiguration function
  - The value of the timeOut parameter

  And for each functionality to be activated (configuration, technology object, drive, kernel)
  - Its activation status
  - The activation request placed in _activateConfiguration
  - The ID of the functionality to be loaded (e.g. the projectDataId of the configuration)

The example program below shows the status query for a configuration with a synchronous call.

Example program for the _getConfigurationData (synchronous call) function

```
// Variable declaration
VAR
    configurationInfoId     : EnumConfigurationInfoId;
    locRequest              : EnumReqSysFunctMode;
    nextCommand             : EnumNextCommandMode;
    locCommandId            : CommandIdType;
    retConfigurationInfo    : StructRetGetConfigurationData;
END_VAR

// Provide the parameter data
configurationInfoId := PREVIOUS_ACTIVATED;
locRequest      := REQUEST_TRUE; // Start request
nextCommand     := WHEN_COMMAND_DONE; // Synchronous call
locCommandId    := _getCommandId ();

// Query status
retConfigurationInfo := _getConfigurationData (
        configurationInfoId := configurationInfoId,
        requestMode         := locRequest,
        commandId           := locCommandId,
        nextCommand          := nextCommand
    );

// Check and evaluate result
If ( 0 <> retConfigurationInfo.functionResult ) THEN
    ; // ... Error response
ELSE
    ; // ... Evaluate the structure
      //     retConfigurationInfo.configuration
END_IF;
```

4.1.6.5 Retaining retentive data

Retaining retentive data in the event of a configuration change

The following section describes which measures you must adopt so that the following retentive data is retained during a change of configuration:

- Retentive unit variables
- Retentive system variables of the technology objects (e.g. absolute encoder adjustment)

Note

Note when activating a configuration:

- Retentive global device variables are always initialized.
- Without the described measures, retentive unit variables and retentive system variables of the technology objects are also initialized.

Measures for retaining retentive unit variables

Proceed as follows to ensure the values of retentive unit variables are retained (not initialized) during a configuration change:

1. Declare the retentive unit variables in a separate unit with the same identifier and the same object address in all configurations.
2. Ensure that an identical data structure is used in all configurations within this unit - particularly because of HMI device access.
3. Use several declaration blocks in the unit, if necessary.

The retentive unit variables thus receive the same version code in all configurations.

If the retentive unit variables in the most recently activated configuration and the configuration to be activated have the same version code, they are not initialized.

Note

When activating a configuration using an initial configuration, please also note the restrictions for the initial configuration given in Selecting and activating a configuration using an initial configuration (Page 1089) (in the **Notice** information).

Note

If you do not observe the above procedure, the retentive unit variables will be initialized when a different configuration is activated.

Also ensure the following setting is made for the download: The initialization of retentive variables must be disabled (**Options > Settings** menu, **Download** tab).

Alternatively, unit variables even with functions **_exportUnitDataSet** and **_importUnitDataSet** can be exported, saved and imported again.

Measures for retaining the retentive system variables of technology objects

Proceed as follows to ensure the retentive system variables of technology objects are retained (not initialized) during a configuration change.

Configure the SIMOTION devices and the technology objects in the following manner in all configurations:

1. Set the system variable of the SIMOTION device _configurationManagement.preserveToRetainData := YES in offline.
2. Assign identical identifiers and object addresses for the same technology objects.

This prevents the retentive system variables of a technology object from being initialized when the following conditions are met in the last configuration activated and the configuration to be activated:

1. Identifier and object address of the technology object are identical.
2. The structure of the retentive system variables of the technology object is the same.

Note

When activating a configuration using an initial configuration, please also note the restrictions for the initial configuration given in Selecting and activating a configuration using an initial configuration (Page 1089) (in the **Notice** information).

Note

If you do not observe the above procedure, the retentive system variables of a technology object will be initialized when a different configuration is activated.

The _configurationManagement.preserveToRetainData system variable can only be changed in offline mode and takes effect after the configuration has been activated or downloaded. It cannot be changed in online mode or in a user program.

The setting for the download for the initialization of retentive variables (**Options > Settings** menu, **Download** tab) has no effect.

Retaining retentive data when a kernel is activated

Exchanging the active kernel of the SIMOTION device, e.g. when updating to a new version, can result in the loss of retentive data.

Data loss of this kind occurs in cases where the SIMOTION Kernel is updated to a new main version and the system data types used in the declaration blocks for retentive unit variables have been extended or modified (e.g. addition of an enumerator data type) in the new main version. In this case, the version code of the declaration block is changed and the relevant data block initialized.

Workaround for updating to SIMOTION Kernel versions up to V4.3

The only way in which the loss of retentive unit variables can be avoided is to do the following:

1. Export the retentive unit variables using the **_exportUnitDataSet** system function in a user program of the old main version.
   The compiler option "Permit OPC-UA / -XML (load symbols to RT)" must be activated for all relevant program sources during compilation.
2. Import the retentive unit variables using the **_importUnitDataSet** system function in a user program of the new main version.

Workaround for updating to SIMOTION Kernel versions as of V4.4

It is no longer necessary to back up and restore the data using the **_exportUnitDataSet/ _importUnitDataSet** system function. Instead, the backed up symbol information is used to restore the retentive unit variables as far as possible.

Note

The compiler option "Permit OPC-UA / -XML (load symbols to RT)" must be activated for all relevant program sources during compilation.

The contents of retentive unit variables are retained in the following scenarios:

- The name and the data type of a variable are unchanged.
- The name of a variable is unchanged but its data type has changed and the value to be restored fits the value range of the new data type.

Update of versions V4.2 and V4.3:

The symbol information must be manually backed up on the memory card:

1. Create a directory named `\SIMOTION\RT_BACKUP` on the memory card.
2. Copy the directory `\SIMOTION\RT_DIR\UPP` together with all subdirectories and files into the directory `\SIMOTION\RT_BACKUP`.

Update of versions as of V4.4:

The symbol information is automatically backed up on the memory card.

4.1.6.6 Procedure for creating the card images of configurations

The individual steps of how to create the card images of the configurations and the associated kernel are described in the following.

1. Preparing the memory card of the SIMOTION device (Page 1098)
2. Creating the work directories on the PC/PG (Page 1098)
3. Saving the configuration files in the work directories on the PC/PG (Page 1102)
4. Creating the compressed configuration files (Page 1105)
5. Saving the kernel in the work directory on the PC/PG (Page 1106)
6. Creating the card images of the configurations (Page 1106)

Note

The following steps can also be automated by means of SCOUT scripting. Appropriate scripts are shown in the appendix in "Creating the card images for configuration servers by means of SCOUT scripting" (Page 1112).

Preparing the memory card of the SIMOTION device

Check the following:

1. The SIMOTION Kernel for the associated SIMOTION device is present on the card.
2. The `INSTALL` directory in the root directory of the card does not contain any files or subdirectories.

Creating the work directories on the PC/PG

You must create the required work directories in the file directory of the PC/PG on which the SIMOTION SCOUT engineering software is installed.

The directory structures for the following applications are described in the following:

1. Activation of a kernel (e.g. update to a new version) with several associated configurations
2. Activation of several kernels (e.g. various firmware versions) each with several associated configurations

Directory structure for a kernel with several associated configurations

You want to activate, for example, a new kernel with three configurations and create the required card images. The following is a detailed description of how to create the required work directories on the PC/PG.

You require a work directory for storing all the generated data (e.g. `D:\modular_machine`). In this directory you require three further directories each with specific subdirectories for each individual configuration:

- One directory (e.g. `download`) for storing the uncompressed (executable) configuration files.
  In this directory, you require a subdirectory with the `DExxxxxx` designation for each configuration, where `xxxxxx` is a hexadecimal number. With this number, you specify the associated configuration for the call of the _activateConfiguration (Page 1078) system function.
- One directory (e.g. `zip`) for storing the compressed configuration files.
  In this directory too, you require a subdirectory with the `DExxxxxx` designation for each configuration, where `xxxxxx` is a hexadecimal number. With this number, you specify the associated configuration for the call of the _activateConfiguration (Page 1078) system function.
- One directory (e.g. `cardfiles`) for storing the card images.
  You must duplicate the directory structure on the memory card in this directory. This is described in Section "Activation of a kernel" (Page 1084).

You create these directories with the corresponding subdirectories with the command line application `u7mkcnfx.exe` as follows:

1. In the Windows Explorer, create a directory that you want to use to store all generated files (e.g. `D:\modular_machine`).
2. Create a batch file (e.g. `make_dirs.bat`).

3. Edit this batch file. Write a command line to start the u7mkcnfx.exe application with the following options:
   - /m"Mode" option: /m"MAKE_DIRS".
   - /l"Load Path" option: Specification of the complete path for the directory for storing the uncompressed configuration files (e.g. /l"d:\modular_machine\download").
   - /s"Source Path" option: Specification of the complete path for the directory for storing the compressed configuration files (e.g. /s"d:\modular_machine\zip").
   - /d"Destination Path" option: Specification of the complete path for the directory for storing the card images (e.g. /d"d:\modular_machine\cardfiles").
   - /i"Identifier" option: Specification of the identifier for the version of the SIMOTION Kernel in the form VEyyyyyy, where yyyyyy is a hexadecimal number (e.g. /i"VE004156"). With this number you specify the kernel version for the call of the _activateConfiguration system function, see Activating a kernel (Page 1084).
   - /n"Number of Projects" option: Specification of the number of configurations for which the subdirectories are to be created.

   Example:
   ```
   rem make_dirs.bat Create work directories
   rem The command must be written in a command line
   u7mkcnfx /m"MAKE_DIRS"
       /l"d:\modular_machine\download"
       /s"d:\modular_machine\zip"
       /d"d:\modular_machine\cardfiles"
       /i"VE004156" /n"3"
   pause
   ```
   The syntax of the command line application u7mkcnfx.exe is described in the appendix in Command line application u7mkcnfx.exe (Page 1109).

4. Execute the batch file.
   The directories for the uncompressed and compressed configuration files as well as the directory for the card images are created. The following is also created:
   - In the directories for the uncompressed and compressed configuration files (e.g. download), the following subdirectories:
     DE000001, DE000002, etc.: Consecutively numbered directories for the files of the associated configuration, in accordance with the number of configurations. The identifier of these directories (DExxxxxx), corresponds to xxxxxx of a hexadecimal number with which you identify the respective configuration when calling the _activateConfiguration system function, see Activating a configuration (Page 1078).
     INITIAL: Directory for the files of the initial configuration
     KERNEL: Directory for storing the kernel
   - In the directory for the card images (e.g. cardfiles), the following INSTALL\SIMOTION subdirectory containing a subdirectory with the identifier specified with the /i"Identifier" option (e.g. VE004156).

   Further directories, not specified here, are created within these subdirectories.

The figure below shows an example of the directory structure for three configurations identified by means of 16#000001, 16#000002, and 16#000003.

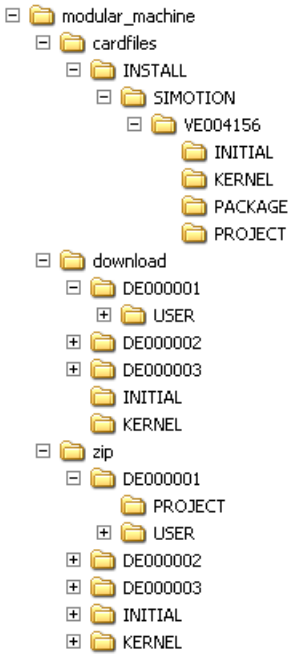

Figure 4-30 Directory structure for one kernel with three configurations

Note

The steps described in this chapter can also be automated by means of SCOUT scripting. A corresponding script is shown in the appendix under "Creating the work directories on the PC/PG" (Page 1113).

Directory structure for several kernel versions with the respective associated configurations

If you want to create the card images for several kernel versions with their respective associated configurations, proceed as follows:

1. Create the work directories (e.g. `download`, `zip`, `cardfiles`) as described above.
2. Create the new directories corresponding to the number of kernel versions and assign them unique names (e.g. `VE004153` and `VE004156`).
3. Copy or move the `download` and `zip` directories to the directories that you have just created (e.g. `VE004153` and `VE004156`).
4. In the `cardfiles\INSTALL\SIMOTION` directory, copy the `VEyyyyyy` directory (e.g. `VE004156`) corresponding to the number of kernel versions. Assign unique names to the copies in the form of `VEyyyyyy`, where `yyyyyy` is a hexadecimal number (e.g. `VE004153`).

The following figure shows the resulting directory structure:

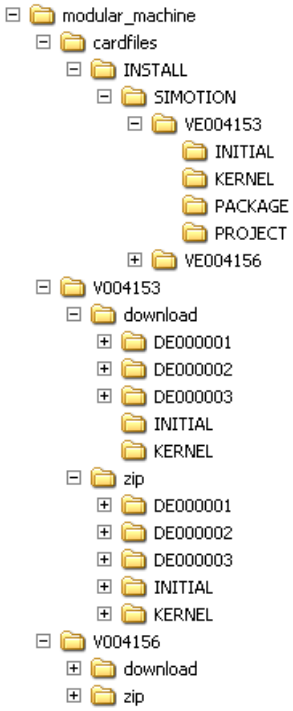

Figure 4-31 Directory structure for two kernels each with three configurations

Saving the configuration files in the work directories on the PC/PG

This section describes how you can save different configurations for a kernel (e.g. for a kernel update) in the work directories on the PC/PG.

Requirements

You have created a project in the SIMOTION SCOUT engineering system in which the required configurations are configured as dedicated devices (with technology objects, programs, etc.).

This project has been compiled without errors.

If an initial configuration (Page 1089) is required, it must also be configured as a dedicated device.

Note

All SIMOTION devices must be configured with the same version of the SIMOTION Kernel.

Procedure

This description applies to:

- All SIMOTION C2xx, P3xx and D4xx-2 devices, regardless of the SIMOTION Kernel version
- The SIMOTION D4xx device, as of SIMOTION Kernel version V4.1.5 (V4.1 SP5)

Note

For the procedure with SIMOTION D4xx devices up to version V4.1.4 (V4.1 SP4) of the SIMOTION Kernel: See the appendix, "Storing configuration files for SIMOTION D4xx devices up to kernel version V4.1.4 (Page 1119)".

To store the configuration files in the work directories on the PC/PG:

1. Select the appropriate device in the project navigator.
2. Select (alternatively):
   - The **Edit > Load to file system** menu or
   - The **Load to file system** context menu
3. In the window, select: **Save normally**.
4. Click the **Select target** button to select the directory.
5. Select the directory for the uncompressed configuration files (e.g. `D:\modular_machine\download`).
   In this directory, select the `DExxxxxx` folder with which you can identify the configuration by the hexadecimal number in the file name (`xxxxxx`), and confirm with **OK**.
   The device with all technology objects and programs is compiled and saved in the specified directory in the `USER` subdirectory.
6. Repeat steps 1 to 5 for all devices, other than the device that represents the initial configuration.
   Save the configuration files of the initial configuration in the `INITIAL` directory.
7. If required, copy the the user administration files for SIMOTION IT to the `DExxxxxx` directories. These files depend on the SIMOTION Kernel version:
   Refer to the appropriate information in this section.

Note

It is absolutely necessary to save configuration files that differ from each other (e.g. different devices or different configuring of the same device) in the folders `DExxxxxx`.
Otherwise, activation of the configuration (Page 1078) with the system function _activateConfiguration will not be possible later.

Note

The steps described in this chapter can also be automated by means of SCOUT scripting. A corresponding script is shown in the appendix at "Storing the configuration files in the file system" (Page 1114).

User administration for SIMOTION IT

The SIMOTION IT user administration depends on the SIMOTION Kernel version:

- The following applies up to SIMOTION Kernel version V4.3:
  The user administration is integrated in the `webcfg.xml` file. This file is on the memory card of the SIMOTION device under the path: `\user\simotion\hmicfg`.
- The following applies as of SIMOTION Kernel version V4.4:
  The user administration is contained in the `userdatabase.xml` file. This file is on the memory card of the SIMOTION device under the path: `\user\simotion\hmicfg \userdatabase`.

The required users must be taken into the files specified above.

The user administration and login administration are described in detail in the "SIMOTION IT Diagnostics and Configuration" Diagnostics Manual of the corresponding SIMOTION Kernel version.

Note

In the following cases, it may be necessary to save the user administration to the `DExxxxxx` directory of the respective configuration:

- The user administration depends on the configuration to be activated.
- The SIMOTION Kernel version changes (particularly for a change from a version up to 4.3 to a version as of 4.4) with the configuration to be activated.

To make sure that the user administration suitable for the SIMOTION Kernel version is activated:

1. Copy the `webcfg.xml` or `userdatabase.xml` files specified above from the memory card (depending on the SIMOTION Kernel version) to a temporary directory on the PC.
   Insert the memory card in a card reader connected to the PC or use the FTP access to the SIMOTION device.
2. If required, edit the files to make the changes to the user administration.
3. Depending on the SIMOTION Kernel version, proceed as follows for each configuration (`DExxxxxx` directory):
   - For a SIMOTION Kernel version up to 4.3:
     In the `DExxxxxx` directory, create the `user\simotion\hmicfg` subdirectory.
     Copy the `webcfg.xml` file to this subdirectory.
   - For a SIMOTION Kernel version as of 4.4:
     In the `DExxxxxx` directory, create the `user\simotion\hmicfg\userdatabase` subdirectory.
     Copy the `userdatabase.xml` file to this subdirectory.

Creating the compressed configuration files

Proceed as follows to compress the configuration files

1. Create a batch file (e.g. `make_zip.bat`).
2. Edit this batch file. Write a command line for each configuration to start the `u7mkcnfx.exe` application with the following options:
   - /m"Mode" option: `/m"MAKE_ZIP"`
   - /s"Source Path" option: Specification of the complete path in which the uncompressed files of the respective configuration are stored (e.g. `/s"d:\modular_machine\download\DE000001"`).
   - /d"Destination Path" option: Specification of the complete path for the directory for storing the compressed configuration files (e.g. `/d"d:\modular_machine\zip"`).
   - /i"Identifier" option: Specification of the subdirectory in which the compressed files of the respective configuration are stored. This name is identical to the name of the corresponding subdirectory for the uncompressed files (e.g. `/i"DE000001"`).
     You use the hexadecimal number in the name to specify the configuration for the call of the _activateConfiguration system function, see Activating a configuration (Page 1078).
     You create the compressed files of the initial configuration with the `/i"INITIAL"` option.

   Example:

```
rem make_zip.bat Compress configuration files
rem he command must be written in a command line
u7mkcnfx /m"MAKE_ZIP"
         /s"d:\modular_machine\download\DE000001"
         /d"d:\modular_machine\zip" /i"DE000001"
u7mkcnfx /m"MAKE_ZIP"
         /s"d:\modular_machine\download\DE000002"
         /d"d:\modular_machine\zip" /i"DE000002"
u7mkcnfx /m"MAKE_ZIP"
         /s"d:\modular_machine\download\DE000003"
         /d"d:\modular_machine\zip" /i"DE000003"

rem Compress files of the initial configuration
u7mkcnfx /m"MAKE_ZIP"
        /s"d:\modular_machine\download\initial"
        /d"d:\modular_machine\zip" /i"INITIAL"
pause
```

   The syntax of the command line application `u7mkcnfx.exe` is described in the appendix in Command line application u7mkcnfx.exe (Page 1109).
3. Execute the batch file.
   The compressed files are created in the specified directories (the `PROJECT.ZIP` file in each `PROJECT` subdirectory).

Note

The steps described in this chapter can also be automated by means of SCOUT scripting. A corresponding script is shown in the appendix in "Creating the compressed configuration files" (Page 1115).

Saving the kernel in the work directory on the PC/PG

You can obtain the kernel (firmware) suitable for the stored configurations in two ways:

- As of version V4.1 of the SIMOTION Kernel, directly from a SIMOTION device that is connected via Ethernet to the PC/PG:
  You can download the kernel from the device with the SIMOTION IT DIAG function package contained in the kernel, which enables direct diagnostics of the SIMOTION device via an HTML standard browser.
  To do this, call the **Manage Config** standard page and also the **Device update** tab. Activate the **FW** checkbox.
  The procedure is described in the "SIMOTION IT Diagnostics and Configuration" Diagnostics Manual.
  You are provided with a ZIP archive (file name *name*.zip) that contains the `KERNEL.ZIP` file.
  SIMOTION P3xx devices do not support kernel download.
- Irrespective of the version of the SIMOTION Kernel as download from the SIMOTION Service and Support pages on the Internet:
  http://support.automation.siemens.com/WW/view/en/10805436
  Rename the ZIP archive that you have downloaded to `KERNEL.ZIP`

The `KERNEL.ZIP` file contains the SIMOTION Kernel of the respective device as well as the SINAMICS Integrated firmware for the SIMOTION D devices.

Proceed as follows:

1. Open the directory for the compressed configuration files (e.g. `D:\modular_machine\zip`).
2. Copy the `KERNEL.ZIP` file to the `KERNEL\PROJECT` subdirectory.

Creating the card images of the configurations

Requirement

A read/write device for the memory card is connected to the PC.

Proceed as follows to create the card images and copy them to the memory card

1. Create a batch file (e.g. `make_store.bat`).
2. Edit this batch file. Write a command line to start the `u7mkcnfx.exe` application with the following options:
   - /m"Mode": `/m"MAKE_STORE"` option.
   - /s"Source Path" option: Specification of the complete path for the directory for storing the compressed configuration files (e.g. `/d"d:\modular_machine\zip"`).
   - /d"Destination Path" option: Specification of the complete path for the directory for storing the card images (e.g. `/d"d:\modular_machine\cardfiles"`).
   - /a"ModeSelfAdaptingConfiguration" option: Specification of whether the initial configuration, in which the appropriate configuration is selected, should be automatically loaded after POWER ON, see Selecting and activating a configuration using an initial configuration (Page 1089):
     `/a"ON"`: The initial configuration is started after each POWER ON.
     `/a"OFF"`: The initial configuration is not started after POWER ON.
     /i"Identifier" option: Specification of the identifier for the version of the SIMOTION Kernel (as described in Creating the work directories on the PC/PG (Page 1098)). The identifier has the form `VEyyyyyy`, where `yyyyyy` is a hexadecimal number (e.g. `/i"VE004156"`). With this number you specify the kernel version for the call of the _activateConfiguration system function, see Activating a kernel (Page 1084).

   Example:

```
rem make_store.bat Create card images
rem The command must be written in a command line
u7mkcnfx /m"MAKE_STORE" /s"d:\modular_machine\zip"
         /d"d:\modular_machine\cardfiles"
         /a"ON" /i"VE004156"
pause
```

   The syntax of the command line application `u7mkcnfx.exe` is described in the appendix in Command line application u7mkcnfx.exe (Page 1109).

3. Execute the batch file.
   The card images are created in the \INSTALL\SIMOTION\VEyyyyyy subdirectory of the directory specified for the card images (e.g. D:\modular_machine\cardfiles):
   - The PROJECT subdirectory contains the card images of the configurations in the form PRxxxxxx.ZIP, where xxxxxx is the hexadecimal number which was defined in the DExxxxxx identifier when the compressed files were created, see Creating the compressed configuration files (Page 1105).
   - The INITIAL subdirectory contains the card image of the initial configuration INITIAL.ZIP.
   - The PACKAGE subdirectory contains the card image of the technology packages.
   - The KERNEL subdirectory contains the card image of the SIMOTION Kernel KERNEL.ZIP.

   A BOOT.INI file is also created in the specified directory (e.g. D:\modular_machine\cardfiles).

   Note

   Existing card images will be deleted and overwritten

   The command line application u7mkcnfx.exe deletes all existing data in the \INSTALL \SIMOTION subdirectory of the directory specified for the card images (e.g. D:\modular_machine\cardfiles) with the /m"MAKE_STORE" option.

   If you want to create the card images for several kernel versions, proceed as follows:
   1. Create the card images for the first kernel version as described above.
   2. Copy the VEyyyyyy directory from the \INSTALL\SIMOTION subdirectory to an arbitrary directory outside this directory structure (e.g. D:\temp).
      You can use the following command line, for example, in the batch file:
      `xcopy /e /f d:\modular_machine\cardfiles\INSTALL\SIMOTION d:\temp`
   3. Create the card images for a further kernel version as described above.
   4. Repeat steps 2 to 3 for each additional kernel.
   5. Copy the VEyyyyyy directories from the temporary directory back to the \INSTALL \SIMOTION subdirectory.
      You can use the following command line, for example, in the batch file:
      `xcopy /e /f d:\temp d:\modular_machine\cardfiles\INSTALL \SIMOTION`

4. Copy the following from the directory of the card images (e.g. D:\modular_machine \cardfiles) to the memory card's root directory:
   - The INSTALL directory with all subdirectories and files
   - The BOOT.INI file

   Overwrite any files and directories that exist.
5. Back up the symbol information of retentive variables if necessary.
   See Retaining retentive data when a kernel is activated (Page 1097).

Note

The steps described in this chapter can also be automated by means of SCOUT scripting. A corresponding script is shown in the appendix in "Creating the card images of the configurations" (Page 1117).

4.1.7 Appendix

4.1.7.1 Command line application u7mkcnfx.exe

Command line application for Windows, with which the card images of the configurations and the SIMOTION Kernel are created in several steps (/m"Mode" option).

Options

The following options are available:

/m"Mode"

Specification of the functional principle of the command line application.

/m"MAKE_DIRS" Creating the work directories

The following additional options must be specified:

- /s"Source Path"
- /d"Destination Path"
- /i"Identifier"

The following options can be specified:

- /l"Load Path"
- /n"Number of projects"

For application information and an example, see Chapter Creating the work directories on the PC/PG (Page 1098) and Creating the work directories on the PC/PG (Page 1113) in the appendix.

/m"MAKE_ZIP" Compressing individual configurations

The following additional options must be specified:

- /s"Source Path"
- /d"Destination Path"
- /i"Identifier"

For application information and an example, see Chapter Creating the compressed configuration files (Page 1105) and Creating the compressed configuration files (Page 1115) in the appendix.

/m"MAKE_ZIP_ALL"	Compressing all configurations The following additional options must be specified: • /s"Source Path" • /d"Destination Path"
/m"MAKE_STORE"	Creating card images The following additional options must be specified: • /s"Source Path" • /d"Destination Path" • /a"Mode Self Adapting Configuration" • /i"Identifier" For application information and an example, see Chapter Creating the card images of the configurations (Page 1106) and Creating the card images of the configurations (Page 1106) in the appendix.
/m"MAKE_STORE_ARCHIVE"	Archiving card images The following additional options must be specified: • /s"Source Path" • /d"Destination Path" • /i"Identifier" For application information and an example, see Creating the card images of the configurations (Page 1117) in the appendix.

/s"Source Path"

Specification of the complete path for the source directory

- For options /m"MAKE_DIRS" and /m"MAKE_STORE"
  Specification of the complete path for the directory for storing the compressed configuration files (e.g. `/s"d:\modular_machine\zip"`).
- For option /m"MAKE_STORE_ARCHIVE"
  Specification of the complete path for the directory for storing the card images (e.g. `/s"d:\modular_machine\cardfiles"`).
- For option /m"MAKE_ZIP"
  Specification of the complete path in which the uncompressed files of the respective configuration are stored (e.g. `/s"d:\modular_machine\download\DE000001"`).
- For option /m"MAKE_ZIP_ALL"
  Specification of the complete path for the directory for storing the uncompressed configuration files (e.g. `/s"d:\modular_machine\download"`).

/d"Destination Path"

Specification of the complete path for the source directory

- For options /m"MAKE_DIRS" and /m"MAKE_STORE"
  Specification of the complete path for the directory for storing the card images (e.g. `/d"d:\modular_machine\cardfiles"`).
- For option /m"MAKE_STORE_ARCHIVE"
  Specification of the complete path for the directory for storing the card images (e.g. `/d"d:\modular_machine\cfes"`).
- For options /m"MAKE_ZIP" and /m"MAKE_ZIP_ALL"
  Specification of the complete path for the directory for storing the compressed configuration files (e.g. `/d"d:\modular_machine\zip")`.

/l"Load Path"

Optional, only for option /m"MAKE_DIRS"

Specification of the complete path for the directory for storing the uncompressed configuration files (e.g. `/l"d:\modular_machine\download"`).

/i"Identifier"

Only for options m/"MAKE_DIRS", /m"MAKE_STORE" and m/"MAKE_ZIP

- For options /m"MAKE_DIRS", /m"MAKE_STORE" and /m"MAKE_STORE_ARCHIVE"
  Specification of the identifier for the version of the SIMOTION Kernel. The identifier has the form `VEyyyyyy`, where `yyyyyy` is a hexadecimal number (e.g. `/i"VE004156")`. With this number you specify the kernel version for the call of the _activateConfiguration system function (see Activating a kernel (Page 1084)).
- For option /m"MAKE_ZIP"
  Specification of the subdirectory in which the compressed files of the respective configuration are stored. This name is identical to the name of the corresponding subdirectory for the uncompressed files (e.g. `/i"DE000001")`.
  You use the hexadecimal number in the name to specify the configuration for the call of the _activateConfiguration system function (see Activating a configuration (Page 1078)).
  You create the compressed files of the initial configuration with the `/i"INITIAL"` option.

/a"Mode Self Adapting Configuration"

Only for option /m"MAKE_STORE"

Specification of whether the initial configuration, in which the appropriate configuration is selected, should be automatically loaded after POWER ON (see Selecting and activating a configuration using an initial configuration (Page 1089)).

/a"ON" The initial configuration is started after each POWER ON.

/a"OFF" The initial configuration is not started after POWER ON.

/n"Number of projects"

Only for option /m"MAKE_DIRS"

Specification of the number of subdirectories to be created for the individual configurations. For `/n"3"`, for example, three subdirectories `DE000001`, `DE000002` and `DE000003` are created. These configurations are identified by the hexadecimal numbers 16#00001, 16#00002 and 16#00003.

4.1.7.2 Creating the card images for the configuration server by means of SCOUT scripting

This function is available in SIMOTION Kernel as of version V4.1.

The steps for creating the card images of configurations (as described in Procedure for creating the card images of configurations (Page 1098)) can be largely automated by means of SCOUT scripting.

After you have set up the folder for the scripts (Creating the script folder in the SCOUT project (Page 1112)), create the individual scripts for the following tasks:

- Creating the work directories on the PC/PG (Page 1113)
- Saving the configuration files in the work directories on the PC/PG (Page 1114)
- Creating the compressed configuration files (Page 1115)
- Creating the card images of the configurations (Page 1117)

Script to call up the individual scripts to create the card image (Page 1118) in the appendix defines another script which calls up the ones specified above.

Creating the script folder in the SCOUT project

First, you must set up the folder in the engineering system (e.g. SIMOTION SCOUT) in which the scripts will be stored.

Proceed as follows:

1. Select the project in the project navigator.
2. Select the **Expert > Insert script folder** context menu.
   The SCRIPTS folder is created in the project. The scripts defined in the following sections are stored in this folder.

Proceed as follows to create a script in this folder:

1. Select the folder.
2. Select the **Insert new object > Script** context menu.
3. Specify the name.
4. Confirm with **OK**.

Creating the work directories on the PC/PG

The following script "createDirsModMach" deletes any directories present in the `d:\modular_machine` directory and also sets up the required directories there, see also Creating the work directories on the PC/PG (Page 1098).

```
' createDirsModMach

App.LogActive = True
APP.LogMode = 1

Set objFso = CreateObject("Scripting.FileSystemObject")

basePath = "d:\modular_machine"

App.PrintToLog "remove dirs ...\cardfiles ..." _
    & "\download ...\zip ...\cfes"
If (objFso.FolderExists(basePath)) Then
    App.PrintToLog "delete folder basePath"
    call objFso.deleteFolder(basePath)
End If

If not (objFso.FolderExists(basePath)) Then
    App.PrintToLog "create basePath ...\modMach"
    Call objFso.createFolder(basePath)
End If
createPath = basePath & "\cardfiles"
App.PrintToLog "path: " & createPath

If not (objFso.FolderExists(createPath)) Then
    App.PrintToLog "create folder ...\cardfiles"
    Call objFso.createFolder(createPath)
End If
createPath = basePath & "\cfes"
App.PrintToLog "path: " & createPath

If not (objFso.FolderExists(createPath)) Then
    App.PrintToLog "create folder ...\cfes"
    Call objFso.createFolder(createPath)
End If
createPath = basePath & "\download"
App.PrintToLog "path: " & createPath

If not (objFso.FolderExists(createPath)) Then
    App.PrintToLog "create folder ...\download"
    Call objFso.createFolder(createPath)
End If
createPath = basePath & "\zip"
App.PrintToLog "path: " & createPath

If not (objFso.FolderExists(createPath)) Then
    App.PrintToLog "create folder ...\zip"
    Call objFso.createFolder(createPath)
End If
```

```
createPath = basePath & "\export"
App.PrintToLog "path: " & createPath

If not (objFso.FolderExists(createPath)) Then
    App.PrintToLog "create folder ...\export"
    Call objFso.createFolder(createPath)
End If

App.LogActive = False
```

Saving the configuration files in the work directories on the PC/PG

The following "downl" script stores the configuration files of the configured device in the `download` directory, see also Storing the configuration files in the file system (Page 1102).

Note

The SIMOTION IT user administration depends on the SIMOTION Kernel version.

Note the information for the user administration in Section Storing the configuration files in the file system (Page 1102).

```
' downl
' download project-data into filesystem of hd

App.LogActive = True
APP.LogMode = 1

'App.PrintToLog "update project"
basePath = "d:\modular_machine"

App.PrintToLog "download into filesystem"
'APP.Time 1
App.PrintToLog "D435_1"
downloadPath = basePath & "\download\1"
call PROJ.Devices("D435_1").DownloadFileSystem _
    ( downloadPath, "overwrite" ) ', FALSE )
App.PrintToLog "D435_2"
downloadPath = basePath & "\download\2"
call PROJ.Devices("D435_2").DownloadFileSystem _
   ( downloadPath, "overwrite" ) ', FALSE )
App.PrintToLog "D435_3"
downloadPath = basePath & "\download\3"
call PROJ.Devices("D435_3").DownloadFileSystem _
    ( downloadPath, "overwrite" ) ', FALSE )
```

```
App.PrintToLog "D435_initial"
downloadPath = basePath & "\download\initial"
call PROJ.Devices("D435_initial").DownloadFileSystem _
    ( downloadPath, "overwrite" ) ', FALSE )

App.PrintToLog "end script download"
App.LogActive = False
```

Creating the compressed configuration files

The following script "makezip" compresses the configuration files present in the `download` directory and stores them in the `zip` directory, see also Creating the compressed configuration files (Page 1105).

```
' makezip

Dim WshShell, oExec', script

Set WshShell = CreateObject("WScript.Shell")

basePath = "d:\modular_machine"
App.LogActive = True
App.PrintToLog "make_zip 1"
App.LogActive = false

sourcePath = basePath & "\download\1"
destinationPath = basePath & "\zip"

Set oExec = WshShell.Exec _
("C:\Program Files\siemens\step7\s7bin\u7mkcnfx " _
    & " /m""MAKE_ZIP""" _
    & " /s""" & sourcePath & """" _
    & " /d""" & destinationPath & """" _
    & " /i""DE000001""")

' needed !!! for waiting end execute zip
Do While oExec.Status = 0
    APP.time 1
Loop
```

```
App.LogActive = True
App.PrintToLog "make_zip 2"
App.LogActive = false

sourcePath = basePath & "\download\2"
destinationPath = basePath & "\zip"

Set oExec = WshShell.Exec _
("C:\Program Files\siemens\step7\s7bin\u7mkcnfx " _
    & " /m""MAKE_ZIP""" _
    & " /s""" & sourcePath & """" _
    & " /d""" & destinationPath & """" _
    & " /i""DE000002""")

' needed !!! for waiting end execute zip
do While oExec.Status = 0
    APP.Time 1
loop
App.LogActive = True
App.PrintToLog "make_zip 3"
App.LogActive = false

sourcePath = basePath & "\download\3"
destinationPath = basePath & "\zip"
'   App.LogActive = false

Set oExec = WshShell.Exec _
("C:\Program Files\siemens\step7\s7bin\u7mkcnfx " _
    & " /m""MAKE_ZIP""" _
    & " /s""" & sourcePath & """" _
    & " /d""" & destinationPath & """" _
    & " /i""DE000003""")

' needed !!! for waiting end execute zip
do While oExec.Status = 0
    APP.Time 1
loop
App.LogActive = True
App.PrintToLog "make_zip initial"
App.LogActive = false

sourcePath = basePath & "\download\initial"
destinationPath = basePath & "\zip"

Set oExec = WshShell.Exec _
("C:\Program Files\siemens\step7\s7bin\u7mkcnfx " _
    & " /m""MAKE_ZIP""" _
    & " /s""" & sourcePath & """" _
    & " /d""" & destinationPath & """" _
    & " /i""INITIAL""")

'   needed !!! for waiting end execute zip
do While oExec.Status = 0
    APP.Time 0.1
loop
```

Creating the card images of the configurations

The following script "makestore" creates from the compressed configuration files in the `zip` directory the corresponding card images and stores them in the `cardfiles` directory. These card images are then archived in the `cfes` directory, see also Creating the card images of the configurations (Page 1106).

```
' makestore

Dim WshShell, oExec', script

Set WshShell = CreateObject("WScript.Shell")

basePath = "d:\modular_machine"
App.LogActive = True
App.PrintToLog "make_store"
App.LogActive = false

sourcePath = basePath & "\zip"
destinationPath = basePath & "\cardfiles"

Set oExec = WshShell.Exec _
("C:\Program Files\siemens\step7\s7bin\u7mkcnfx " _
    & " /m""MAKE_STORE""" _
    & " /s""" & sourcePath & """" _
    & " /d""" & destinationPath & """" _
    & " /i""VE000041""" _
    & " /a""ON""")

' needed !!! for waiting end execute zip
do While oExec.Status = 0
    countTime = countTime + 1
loop
App.LogActive = True
App.PrintToLog "make_archive"
App.LogActive = false

sourcePath = basePath & "\cardfiles"
destinationPath = basePath & "\cfes"

Set oExec = WshShell.Exec _
("C:\Program Files\siemens\step7\s7bin\u7mkcnfx " _
    & " /m""MAKE_STORE_ARCHIVE""" _
    & " /s""" & sourcePath & """" _
    & " /d""" & destinationPath & """" _
    & " /i""ARCH0041""")

' needed !!! for waiting end execute zip
do While oExec.Status = 0
    APP.Time 1
loop

App.LogActive = True
App.PrintToLog "ende make_archive"
App.LogActive = false
```

The card images in the `cardfiles` directory and the `BOOT.INI` file can then be transferred to the memory card of the SIMOTION device via a read/write device connected to the PG/PC (Creating the card images of the configurations (Page 1106)).

The archived card images in the `cfes` directory as well as the `BOOT.INI` file can be transferred directly to the corresponding SIMOTION device. Corresponding scripts are shown in the appendix under Loading the card image to the target device by means of SCOUT scripting (Page 1118).

Script to call up the individual scripts to create the card image

The individual scripts mentioned above are executed by a central script. In this, only the actions that run in the engineering system are summarized (no target required). This is possible by means of the syntax listed below:

```
'   allToDo

WBScript.addCode(Scripts("createFoldersModMach").code)
WBScript.addCode(Scripts("downl").code)
WBScript.addCode(Scripts("makezip").code)
WBScript.addCode(Scripts("makestore").code)
```

4.1.7.3 Loading the card image to the target device by means of SCOUT scripting

This function is available in SIMOTION Kernel as of version V4.1.

The following scripts show examples of how an archived card image stored in the subfolder of the `d:\modular_machine\cfes` directory can be transferred to the corresponding target device.

For other target devices, the scripts are to be changed accordingly.

After loading the card images, the SIMOTION devices must be restarted in order for the card images to become effective as the active configuration.

Setting up an online connection to the target device

The following script "online" sets up an online connection to the SIMOTION device with the identifier "D435_1."

```
' online

' connection to device "D435_1"

App.LogActive = True
PROJ.Devices("D435_1").EnableOnline = TRUE
PROJ.Online = true
```

Loading the card image to the target device

The following script "dwldtarg" loads the archived card image of the configuration into the SIMOTION device with the identifier "D435_1."

```
' dwldtarg

' enable log activities
App.LogActive = True
App.PrintToLog "begin download into filesystem of target"

basePath = "d:\modular_machine"
bootIniPath = basePath _
    & "\cfes\INSTALL\SIMOTION\BOOT.INI"
archivePath = basePath _
    & "\cfes\INSTALL\SIMOTION\ARCH0041.ZIP"

call PROJ.Devices _
    ("D435_initial").DownloadConfigServerData( _
    bootIniPath, _
    archivePath )

App.PrintToLog "end download into filesystem of target"

' disable log activities
App.LogActive = False
```

Ending the online connection to the target device

The following script "online" breaks the online connection to the SIMOTION device with the identifier "D435_1."

```
' offline

PROJ.Devices("D435_1").EnableOnline = false
PROJ.Online = false
```

4.1.7.4 Storing configuration files for SIMOTION D4xx devices up to kernel version V4.1.4

Requirements

1. You have created a project in the SIMOTION SCOUT engineering system in which the required configurations are configured as dedicated devices with technology objects, programs, etc.
2. This project has been compiled without errors.
3. If an initial configuration (Page 1089) is required, it must also be configured as a dedicated device.

4. The following options are **deactivated** (**Options > Settings** menu **Download** tab) in the SIMOTION SCOUT engineering system:
   – Compile all programs before loading
5. The PC with the SIMOTION SCOUT engineering system is connected to the SIMOTION device (e.g. via PROFIBUS).
6. The PC is included in the network of the SIMOTION device (e.g. with NetPro).
7. A read/write device for the memory card is connected to the PC.

Procedure

1. Insert the memory card in the SIMOTION device and switch it on.
2. Execute the following steps in succession in the SIMOTION SCOUT engineering system:
   – Select the appropriate device in the project navigator.
   – Select the **Edit > Open object** menu to open the HW configuration of the device.
   – In the HW Config program, select the **Target system > Load to module** menu to load the hardware configuration to the device.
   Then exit the HW Config program.
   The appropriate device is still selected in the project navigator of the SIMOTION SCOUT engineering system.
   – In the SIMOTION SCOUT engineering system, select the **Project > Connect to target system** menu.
   – Select the **Target system > Load > Load CPU / drive unit to target device** menu to load the configuration data to the device.
   – Select the **Target system > Copy RAM to ROM** menu to store this data on the memory card.
   – Select the **SINAMICS_Integrated** element below the respective device in the project navigator.
   – Select the **Target system > Load > Load CPU / drive unit to target device** menu to load the drive data to the device.
   – Select the **Target system > Copy RAM to ROM** menu to store this data on the memory card.
   – Select the **Project > Disconnect from target system** menu.
3. Switch off the SIMOTION device and remove the memory card.
4. In the Windows Explorer in the directory for uncompressed configuration files (e.g. `D:\modular_machine\download`), select the `DExxxxxx` folder whose hexadecimal number you want to use to identify the configuration in the file name (`xxxxxx`).

5. Copy the configuration files from the memory card to the selected directory:
   – Insert the memory card into a card reader on your PC.
   – Copy the USER directory from the memory card (e.g. B:\USER) to the selected directory DExxxxxx. Overwrite any existing USER directory.
6. Repeat steps 1 to 5 for all devices, other than the device that represents the initial configuration.
   Proceed as described above for the initial configuration, but copy the USER directory from the memory card (e.g. B:\USER) to the INITIAL directory.

4.2 Basic functions

Preface

Content

This document is part of the **System and Function Descriptions documentation package**.

Scope of validity

This manual is valid for SIMOTION SCOUT product version V5.4:

- SIMOTION SCOUT V5.4 (engineering system of the SIMOTION product family)
- SIMOTION Kernel V5.4, V5.3, V5.2, V5.1, V4.5, V4.4, V4.3, V4.2, V4.1, V4.0, V3.2
- SIMOTION technology packages CAM, PATH (as of kernel V4.1), CAM_EXT and TControl in the version for the associated kernel.

Sections in this manual

This manual describes the generally applicable functions of SIMOTION and technology objects.

- **System overview**
  General information on SIMOTION.
- **Technology Packages and Technology Objects**
  Basic information on the technology packages and the technology objects.
- **Symbolic assignment**
  Information on symbolic assignment of SINAMICS objects to SIMOTION.
- **Programming of Technology Objects**
  Information on how and with which system functions technology objects can be programmed.
- **Error Handling in Technology Objects**
  General information on technological alarms and command return values.

- **Execution System, Tasks, and System Cycles**
  Information on the execution system and tasks.
- **Programming Execution System / Tasks / System Cycles**
  Information on the programming of the execution system, tasks, and system cycles.
- **Programming of General System Functions**
  Information on which general system functions exist and how they are used.
- **Programming of General System Function Blocks**
  Information which general system function blocks exist and how they are used.
- **SIMOTION Memory Concept (in the target device)**
  Information on the memory concept in the target device.
- **Downloading Data to the Target Device**
  Information on downloading data to the target device or target system.
- **Appendix**
  Information on symbolic constants and identifiers
- **Index**
  Keyword index for locating information

SIMOTION Documentation

An overview of the SIMOTION documentation can be found in the SIMOTION Documentation Overview document.

This documentation is included as electronic documentation in the scope of delivery of SIMOTION SCOUT. It comprises ten documentation packages.

The following documentation packages are available for SIMOTION product version V5.4:

- SIMOTION Engineering System Handling
- SIMOTION System and Function Descriptions
- SIMOTION Service and Diagnostics
- SIMOTION IT
- SIMOTION Programming
- SIMOTION Programming - References
- SIMOTION C
- SIMOTION P
- SIMOTION D
- SIMOTION Supplementary Documentation

Hotline and Internet addresses

SIMOTION at a glance

We have compiled an overview page from our range of information about SIMOTION with the most important information on frequently asked topics - which can be opened with only one click.

Whether beginner or experienced SIMOTION user – the most important downloads, manuals, tutorials, FAQs, application examples, etc. can be found at

https://support.industry.siemens.com/cs/ww/en/view/109480700

Additional information

FAQs

Frequently Asked Questions can be found in SIMOTION Utilities & Applications, which are included in the scope of delivery of SIMOTION SCOUT, and in the Service&Support pages in **Product Support**:

https://support.industry.siemens.com/cs/de/en/ps/14505/faq

Technical support

Country-specific telephone numbers for technical support are provided on the Internet under **Contact**:

https://support.industry.siemens.com/cs/ww/en/sc/2090

4.2.1 Fundamental safety instructions

4.2.1.1 General safety instructions

⚠ WARNING

Danger to life if the safety instructions and residual risks are not observed

The non-observance of the safety instructions and residual risks stated in the associated hardware documentation can result in accidents with severe injuries or death.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

Malfunctions of the machine as a result of incorrect or changed parameter settings

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

4.2.1.2 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

4.2.1.3 Note regarding the general data protection regulation

Siemens observes the principles of data protection, in particular the principle of data minimization (privacy by design). For this product this means:

The product does not process / store any personal data, only technical functional data (e.g. time stamp). If the user links this data with other data (e.g. shift plans) or stores personal data on the same medium (e.g. hard disk) and thus establishes a personal reference, the user must ensure compliance with data protection regulations.

4.2.1.4 Danger to life due to software manipulation when using removable storage media

⚠ WARNING

Danger to life due to software manipulation when using removable storage media

The storage of files on removable storage media involves a high risk of infection, e.g. via viruses or malware. Incorrect parameter assignment can cause machines to malfunction, which can lead to injuries or death.

- Protect the files on removable storage media against harmful software through appropriate protective measures, e.g. virus scanners.

4.2.2 System overview

4.2.2.1 System architecture

SIMOTION system architecture

The SIMOTION system architecture enables trends towards decentralization, heterogeneous target systems, and distributed intelligence to be implemented.

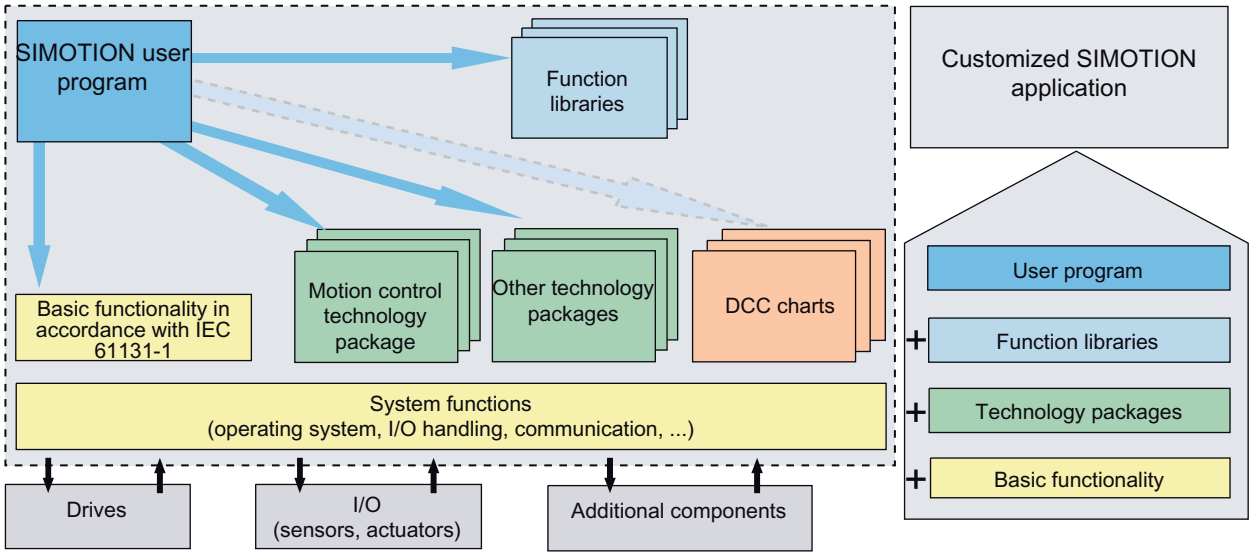

Figure 4-32 SIMOTION system architecture

The basic functionality of the device (SIMOTION Kernel) includes functions for open-loop and closed-loop control as well as logic and arithmetic. Program execution can be cyclical, time-triggered or interrupt-triggered. As a result, the SIMOTION Kernel contains the functions needed for virtually all applications and corresponds in essence to a PLC with the IEC 61131-3 command set plus system functions for controlling various components, such as inputs and outputs.

You can expand the SIMOTION Kernel of the device by downloading technology packages. You access the technology packages from the user program using special language commands, in the same way that you access the SIMOTION Kernel.

For particular tasks, you can either use existing applications or you can program and link the required applications yourself. The applications are programmed in compliance with IEC 61131-3 and can be adapted to your specific task.

In addition, SIMOTION provides function libraries that include the system functions and motion functions. The function libraries contain functions and access to system variables of a technology object and are linked to the associated device and technology package in SIMOTION SCOUT.

For special tasks, such as closed-loop control functions, you can use wiring diagrams and execute them in the corresponding DCC execution tasks using blocks connected with a graphical tool.

SIMOTION SCOUT Engineering System

The following activities are required for machine automation:

- Selection/configuration of the hardware and software components, configuration of hardware and software, including the communication networks with **HW Config**
- Creation and configuration of the technology objects
- Creation of the user program
- Testing and commissioning of the drive units
- Linking of the machine operator control (HMI)
- Concluding steps, such as the generation of machine documentation.

The **SIMOTION SCOUT** engineering system offers a uniform user view and flexible functionality.

Individual automation tasks for production machines are formulated in a uniform and consistent user interface.

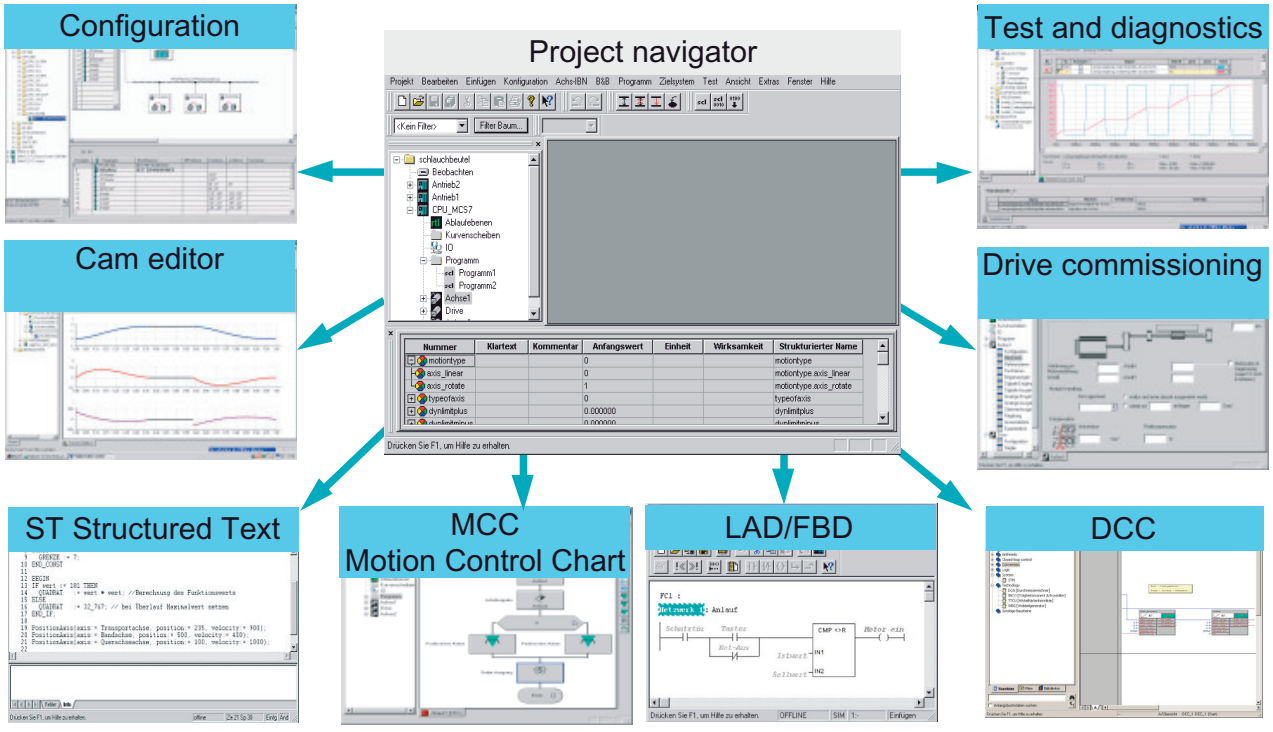

Figure 4-33 SIMOTION SCOUT engineering system

The **SIMOTION SCOUT** engineering system is a powerful tool that acts as the PC development environment to provide optimal support for the required engineering steps in a user-friendly way. It is integrated in the SIMATIC landscape, where it operates as an option package for **STEP7**. Special attention has been given to optimum usability and a comprehensive, function-oriented view of the automation task.

SIMOTION project

The **project** includes all SIMOTION devices, drives, etc. The associated devices are hierarchically assigned to technology objects and programs. This hierarchical structure is displayed in the **Project navigator**.

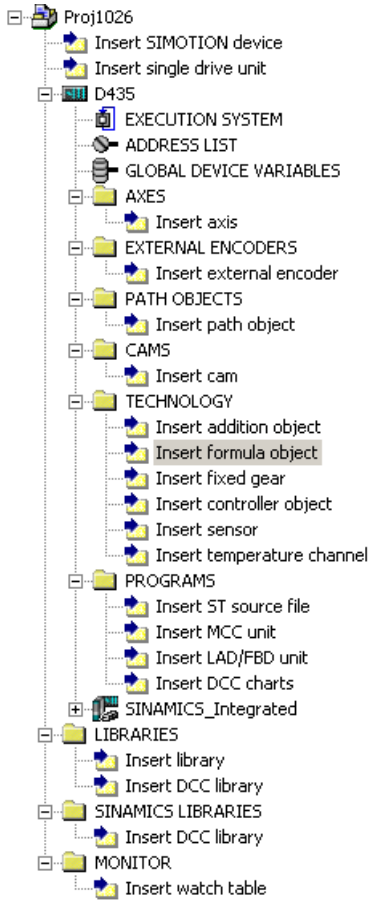

Figure 4-34 SIMOTION SCOUT project navigator

The project is the highest level in the data management hierarchy. SIMOTION SCOUT saves all data which belongs, for example, to a production machine, in the project directory.

Offline/online mode

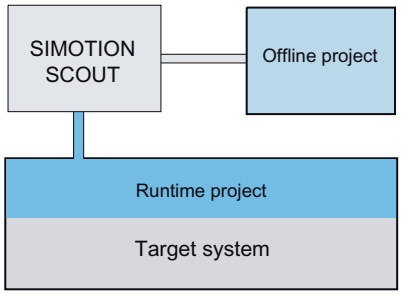

Figure 4-35 Connection between offline and runtime project with SIMOTION SCOUT

SIMOTION SCOUT can be used in two modes:

- In **offline mode**, you can create projects and user programs.
  In offline mode, you work with the SCOUT engineering system without connection to the runtime system. The data and technology objects are maintained in the engineering system. The offline mode is the *leading* work mode, i.e. changes of system variables and configuration data should be made offline.
- In **online mode**, you can load projects and data into the target system, control and monitor the application.
  The data in the SCOUT engineering system is retained as offline project.
  Configuration data changed online can be reloaded into the offline project; this is not possible with system variables changed online.

Programming

The open-loop control and motion control tasks are predefined in the user program.

The following programming languages are available to create your user programs:

- **MCC - Motion Control Chart**
  Is a graphical programming language for programming logic and motion control functions. MCC charts are created.
- **ST - Structured Text**
  Is a text-based programming language compliant with IEC 61131-3 that enables you to create an ST source that can comprise several programs.
  You can also edit an ST source file using an external ST editor.
  Programs created using MCC can be converted to ST, but *not vice versa*.
- **LAD/FBD - Ladder Logic / Function Block Diagram**
  Are graphics-based programming languages in compliance with IEC 61131-3 for programming logic as well as motion control via PLCopen blocks.
- **DCC - Drive Control Chart**
  Is a graphic programming language for programming drive functionality.
  It is possible to edit a Drive Control Chart with an external DCC editor.
- **CLib Studio (C/C++ programming)**
  Is a creation environment in Windows to program functions / function blocks in C/C++ that are stored in user libraries.
  When imported into SIMOTION SCOUT, they can be used in all SIMOTION languages (MCC, ST, LAD/FBD, DCC).

Detailed information for the programming languages is provided in the Programming and Operating Manuals **SIMOTION MCC**, **SIMOTION ST**, **SIMOTION LAD/FBD** and **SINAMICS / SIMOTION DCC editor description**.

Programming in SIMOTION provides the following advantages:

- Programs of different programming languages can be used in one project (**MCC**, **ST** and **LAD/FBD**)
- Programming is independent of the hardware platform
- PLC, motion control and technology can be implemented in one program
- There are functions for direct access to drive parameters available via PROFIDRIVE

Modular machines are supported by the following:

- Modular software development with libraries
- Division into individual machine modules
- Activation/deactivation of DP slaves and technology objects
- Commands for the synchronization

Execution system

SIMOTION provides an execution system with a cyclic task as well as sequential, time-controlled, isochronous, and event-triggered tasks. User programs may be "hooked into" each task; it is even possible for multiple programs to be "hooked into" a task.

Each block is able to use the entire range of SIMOTION functions, i.e. logic, motion, and technology functions.

There is no need to program calls, coordination/synchronization, and monitoring for programs; instead, these functions can be entirely delegated to the system.

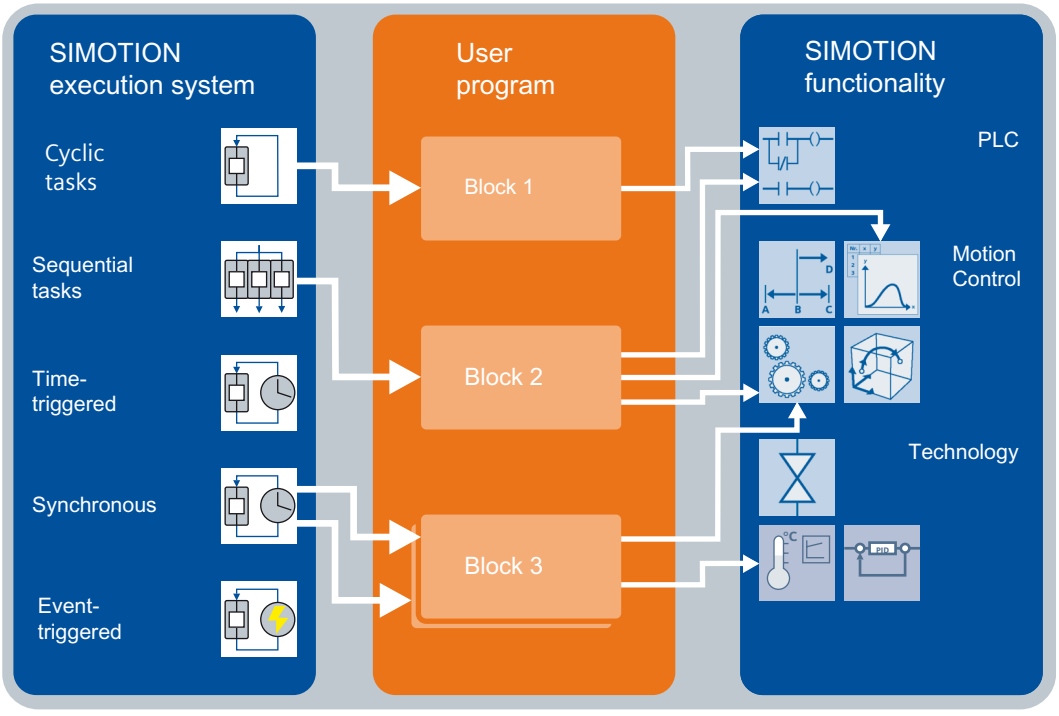

Figure 4-36 SIMOTION execution system

4.2.2.2 SIMOTION motion control

SIMOTION offers an optimized system platform for automation and drive solutions with emphasis on motion control applications and technology tasks.

SIMOTION is the answer to the latest trends in production machines:

- **Mechatronics**
  Mechatronics means that a machine is regarded not only from the mechanical aspect, but as a complete system in which mechanical components, electrical components, and control and software technologies are integrated equally. As part of mechatronics, relatively inflexible mechanical components (such as cams, gears, couplings, line shafts, etc.) are replaced by intelligent software solutions.
- **Fusion of PLC functionality and motion control technology**
  The historical separation of pure automation functions and motion functions has been eliminated. These functions are combined both on the hardware and on the software side.
- **Usability**
  A uniform engineering system (SIMOTION SCOUT) ensures consistency in configuration, parameterization and programming. Automation tasks and motion control tasks are programmed in the same language.
- **Standards**
  Industrial automation is increasingly governed by standards in the PC world such as Microsoft Windows and Ethernet. Standardized global programming languages have greatly facilitated system handling for the customer.
- **Modular machine concepts**
  The trend towards standardization is also encompassing machine designs. As a consequence, attempts are being made to break down machine design into various subcomponents. By virtue of this modularity, it is possible to standardize individual subcomponents and install them as *standard* components in different types of machines.

4.2.2.3 Fields of application

An efficient control system requires that today's tasks and future trends in the field of production machines are implemented using open control concepts.

SIMOTION is a uniform **motion control system** that focuses on the automation of production machines. The uniformity involves engineering, programming, communication, data management and human machine interface (HMI), and thus encompasses the whole system - even on different hardware platforms.

These trends relate primarily to the following mechanical engineering sectors, for which our motion control system is particularly well-suited:

- Packaging machines
- Plastics processing machines
- Metal forming technology
- Textile machines
- Printing machines
- Machines used in the wood, glass, and ceramics industries
- And other machines

In addition to the standard logic and drive-related tasks, the automation solutions in these sectors are also increasingly requiring the incorporation of integrated, uniform motion control and technology tasks.

The SIMOTION modular system consists of the SCOUT engineering system and a common runtime system for various hardware platforms. The SCOUT engineering system is identical for all hardware platforms. Configuration, parameter assignment, and programming are performed using graphics-based or text-based methods. This also provides the basis for sector-specific solutions.

You decide which runtime software (position, gear, ...) to load to enhance the basic functions based on your application. The fact that SIMOTION runs on a variety of hardware platforms makes it a versatile solution that satisfies all requirements

4.2.2.4 Fusion of PLC and motion control

SIMOTION combines open-loop control, technology and motion control. Thus, there are no hardware and software interfaces between the controls required.

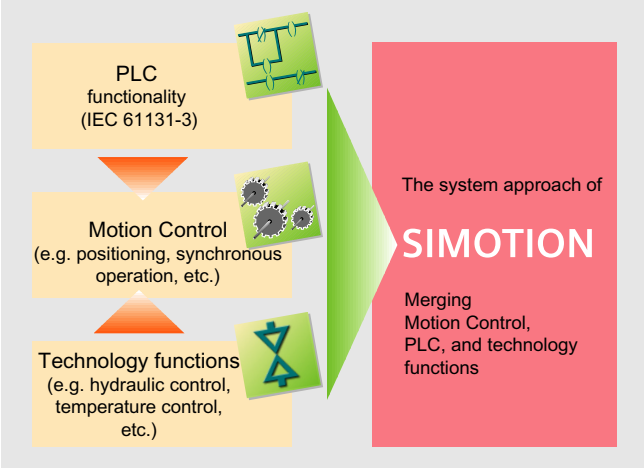

Figure 4-37 Fusion of PLC and motion control

On the hardware side, this means that the programmable controller is able to process motion functions. The hardware platform can be selected individually and hardware components reduced.

On the software side, the fusion of automation functions and motion functions makes for simpler engineering. This starts with the configuration and continues through parameter assignment and programming.

This fusion also means there are no delay times, which results in quick responses and higher cycle rates compared with systems that have separate tasks/CPUs for motion control and the PLC. Not only this, but it is also possible to determine response times more accurately, ensuring high reproducibility of machine behavior and thus of products. In turn, this has a direct impact on product quality.

Consistency with SIMATIC is another essential feature, since both systems can be used together in one plant.

4.2.2.5 Totally Integrated Automation

Threefold consistency in programming and configuration, data management, and communication is at the heart of Totally Integrated Automation: In this way, every automation task solved by SIMATIC can also make full use of the many advantages of Totally Integrated Automation:

- Marked reduction in engineering costs
- No system breaks within the automation landscape
- One software basis for all components

It makes no difference whether your automation task involves implementation of customized solutions in machines or systems, or small-scale automation tasks. Totally Integrated Automation with SIMATIC includes all of the technologies that your automation landscape requires, including programmable controllers, PC-based control, automation computers, distributed I/O, HMI systems, communication networks or process control systems. Because of its modularity, you can use one complete, uniform system to implement the exact solution that satisfies your process requirements and is economically feasible.

SIMOTION and SIMATIC are integrated in the sense of Totally Integrated Automation. This is achieved by integrating SIMOTION SCOUT into SIMATIC Manager and by adopting the same engineering philosophy for comparable activities. Engineering processes that are not available in SIMATIC (motion control, output cam controller, etc.) or that are required by SIMOTION to meet the demands of a distributed system are selected based on optimal usability. Moreover, SIMOTION is integrated into PROFINET and includes all of the requisite system features for this purpose.

4.2.2.6 Hardware platforms

SIMOTION supports various hardware platforms. The choice of hardware components is largely driven by your requirements. You can also distribute your automation tasks to different target systems.

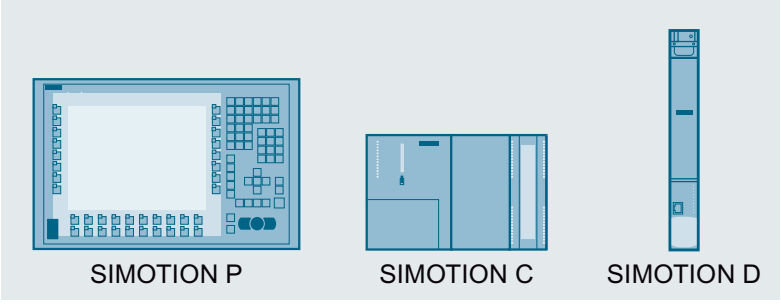

Figure 4-38 SIMOTION hardware platforms

The following platforms are available:

- PC-based (**SIMOTION P**)
  As a PC-based motion control system, SIMOTION P works with the Windows XP operating system, equipped with a real-time expansion for SIMOTION. Apart from SIMOTION applications, other PC applications can also be started.
  SIMOTION P is suitable for:
  - Applications requiring an open architecture to the PC world
  - Applications requiring hardware-based control and visualization
  - Extensive data storage, evaluation and logging
- Controller-based (**SIMOTION C**)
  This controller in SIMATIC S7-300 mounting technology comprises integrated analog drive interfaces and several digital inputs and outputs.
  Moreover, it can be expanded by I/O modules from the SIMATIC S7-300 product range. Two PROFIBUS connections with PROFIdrive interface and one Industrial Ethernet connection allow for communication with other machine parts.
  PROFIBUS can also be used for communication with operator panels (such as those from the SIMATIC HMI range) or with higher-level controls such as SIMATIC S7.
  SIMATIC HMI panels as well as PCs with WinCC flexible or OPC interfaces are suitable as operator systems.
  SIMOTION C enables:
  - Freedom in the selection of the drives
  - Wide range of process signals
  - Retrofit applications via integrated analog interfaces
  - Direct connection of analog drives and stepper drives
- Drive-based (**SIMOTION D**)
  SIMOTION D is a compact, drive-based version of SIMOTION based on the SINAMICS S120 drives family.
  The SIMOTION D Control Units are available in the following variants:
  - SIMOTION D410-2 are compact Control Units for single-axis applications with multi-axis option. The Control Units are available in variants D410-2 DP and D410-2 DP/PN and are snapped onto the SINAMICS S120 PM240-2/PM340 Power Modules in blocksize format. In order to create a multi-axis grouping with SIMOTION D410-2, additional SINAMICS S110/S120 Control Units are connected to the SIMOTION D410-2 by means of PROFIBUS or PROFINET. Motion control is performed centrally by the SIMOTION D410-2 using the SIMOTION technology objects.
  - SIMOTION D4x5-2 are Control Units for multi-axis applications in the SINAMICS S120 booksize format and are available in the four performance variants (D425-2, D435-2, D445-2 and D455-2).
    A SIMOTION D4x5-2 axis grouping comprises a SIMOTION D4x5-2 Control Unit, a Line Module (infeed unit) as well as one or more Motor Modules (power units) to control the motors.
    The fine scalability of SIMOTION D ensures a quick response to changing requirements in automation without having to change the system.

4.2.3 Technology Packages and Technology Objects

4.2.3.1 Introduction

SIMOTION basic functionality

A SIMOTION system without technology packages and without technology objects provides the execution system and basic functionality of a control system in accordance with IEC 61131-3.

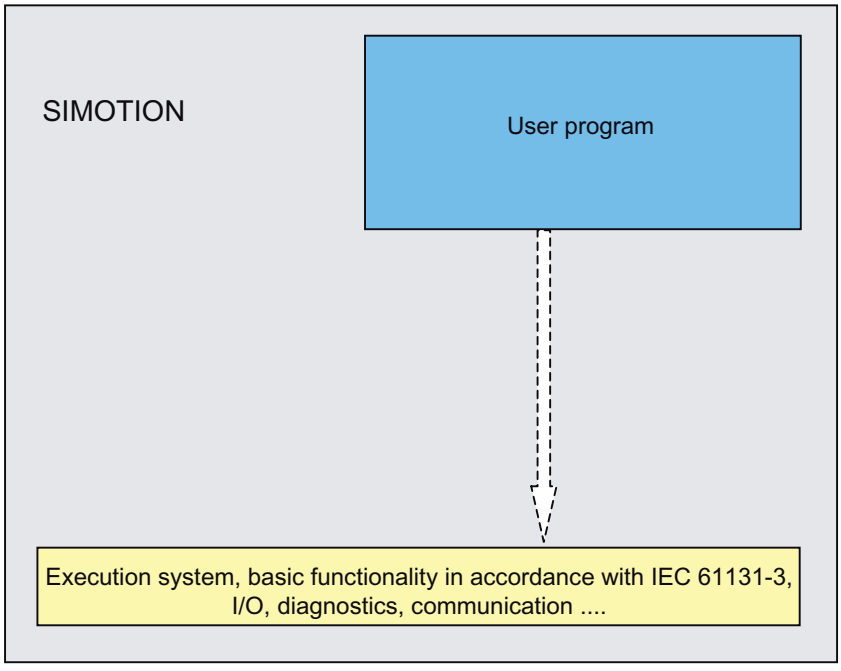

Figure 4-39 SIMOTION basic functionality

The user programs can arbitrarily be assigned to the various tasks.

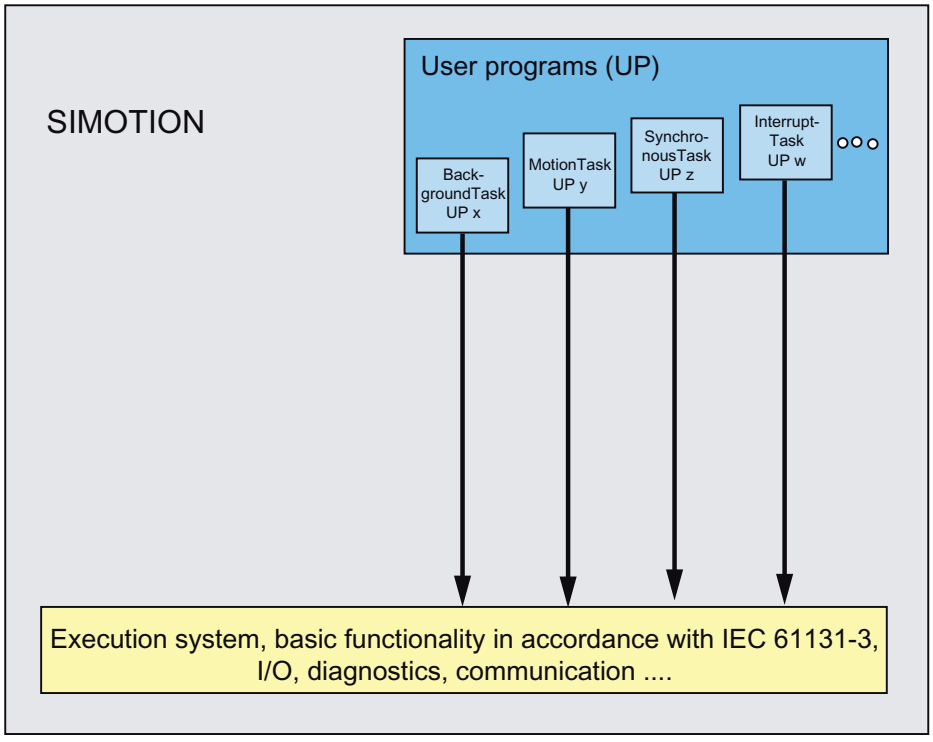

Figure 4-40 Assignment of the user programs to tasks

Technology Objects

The SIMOTION runtime system is implemented in an object-oriented rather than a function-oriented manner, i.e. independent technology objects (TO) are used. These technology objects are available for technology and motion control. Technology objects have a high degree of functionality integrated into them. For example, a TO axis contains the capability for communication with the drive, as well as measured value processing, position control, and positioning functions.

The TOs are created and parameterized by means of configuration and then run automatically in the core of the system. Their functions are called in the user program using appropriate commands. The TOs then process the jobs independently and provide relevant status messages (in a similar way to a driver).

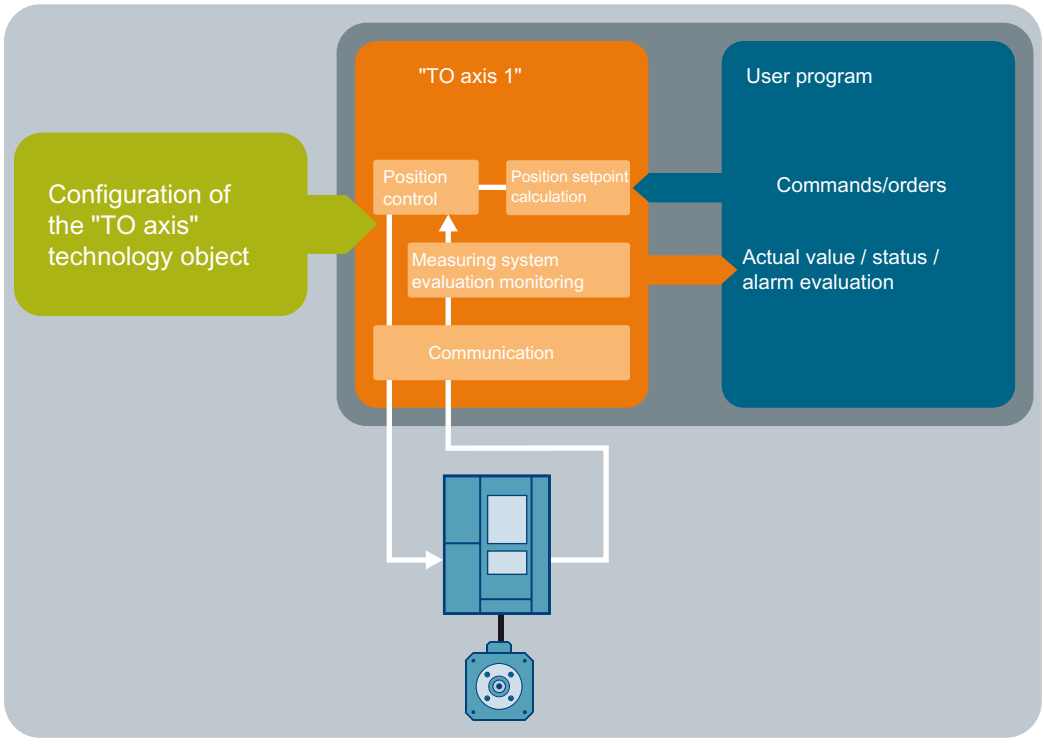

Figure 4-41 SIMOTION technology objects

In principle, there are no limits concerning the number of objects; in other words, you can have any number of axes, synchronous operation links, output cams/cam tracks at an axis, external encoders as master values, etc. The TOs can be activated or deactivated from the program. This enables straightforward adaptation to various machine configurations (e.g. if an axis is not present in a particular configuration).

The technology objects offer the user a technological view of actuators and sensors and provide technological functions for these, for example:

- the TO axis for drive and encoder
- the TO external encoder for one encoder only
- the TO outputCam/camTrack for an output to be switched in a defined way
- the TO measuringInput for a measuring input

Moreover, technology objects for the preparation of technological data on the system level are available, for example:

- the TO FollowingObject for synchronous operation between two axes or one axis on an encoder value
- the TO path for traversing path axes along a path and a position axis synchronous to the path
- the TO cam for representing complex programmable functions
- the TO additionObject, TO formulaObject for the processing of motion data and technology data on the system side

The technology objects are implemented by the system in system tasks, e.g. IPO task, IPO_2 task or servo task.

Instantiation

Technology objects are provided by the system as **technology object types** adapted to the specific application using instantiation.

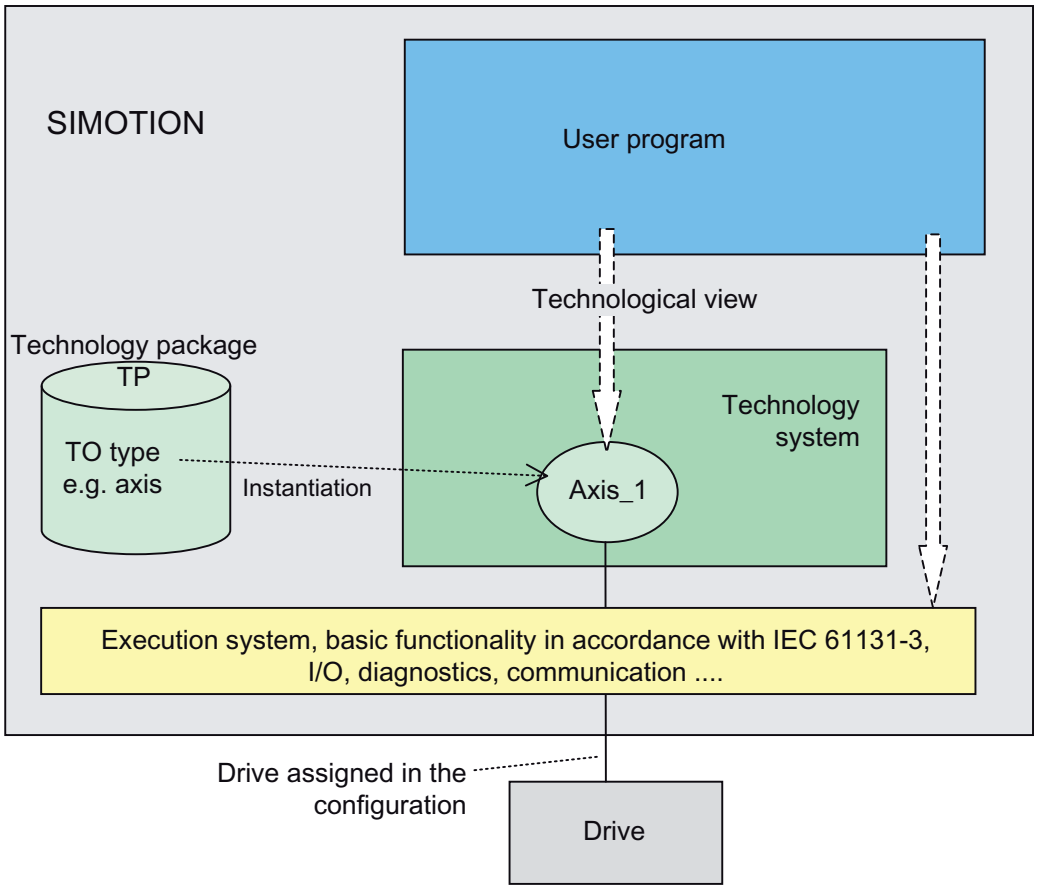

Figure 4-42 Programming model on technology object instances, e.g. on TO axis

Technology object types are combined in one technology package and loaded to the runtime system.

4.2.3.2 Technology packages

In SIMOTION, the technology object types are provided via **technology packages**. They are loaded to the SIMOTION runtime system together with the project.

The following technology packages are available:

- **TP CAM** contains the basic technologies for motion control, such as drive axis, position axis, following axis, synchronous object, cam, output cam, cam track, and measuring input.
- **TP Path** contains TP CAM and also the Path technology.
- **TP CAM_ext** contains TP Path and also objects for the preparation of technological data at system level, e.g. addition object, formula object
- **DCC** contains interconnectable blocks for drive-based controller functions.
- **TControl** contains temperature controller technology.

Shell diagram for technology packages

The range of functions offered by the technology packages can be graphically represented in the form of a shell diagram.

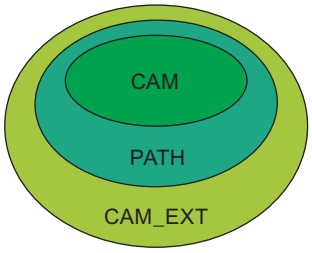

Figure 4-43 Shell diagram for technology packages

Other technology packages

Other sector-specific technology packages are also available as separate products.

4.2.3.3 Technology objects (TO)

Technology objects / technology object types provide the functionality for technology and motion control, thus comprising technological system functions and hiding the concrete hardware connection.

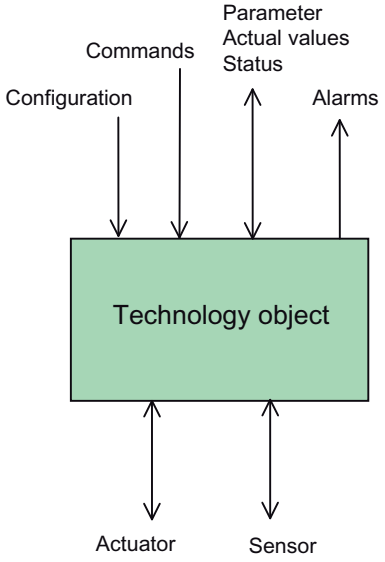

Figure 4-44 Possible interfaces to technology objects

For the cross-TO processing of technological data on the system level, the technology objects provide defined input and output interfaces.

See also

Available technology objects (Page 1148)

Interconnections (Page 1144)

Instantiation and configuration

With **Add <technology object>**, you create an instance of the corresponding TO type in **SIMOTION SCOUT**. (Data, parameters, alarm lists, etc. are created in the system.)

If necessary, the technology object type must be specified, e.g. for an axis: drive axis, position axis, following axis.

The hardware/software interfaces to the actuator/sensor are defined, e.g. hardware addresses, data width, message frame type for PROFIdrive message frames.

Basic settings are defined, e.g. the processing of the technological system functions in the IPO or IPO_2 cycle clock, see Task runtimes (Page 1358).

SIMOTION SCOUT provides wizards and dialogs for the **configuration** of the technology objects. The basic functionality of a technology object is defined by the configuration data.

All entries in the configuration and parameterization screen forms are output in configuration data and system variables, which are displayed in the screen forms as tooltips.

For a detailed description of the configuration data and system variables, please refer to the SIMOTION Reference Lists.

For a description of the procedure of creation and configuration of the individual technology objects, please refer to the respective **function manuals**.

A majority of the configuration data can be modified during the runtime via the user program or the expert list.

See also

Programming of general standard functions - overview (Page 1469)

System variables (Page 1245)

Configuration data (Page 1249)

Parameter assignment

System variables comprise technological parameters and display values of technology objects.

SIMOTION SCOUT usually provides screen forms for the setting of technological parameters and standard values/defaults.

System variables are individual values or structures that are read out consistently.

Additional information on the system variables can be found in System variables (Page 1245).

Programming

The technological functions are activated/deactivated using specific commands.

Synchronous/asynchronous command execution

The commands can be set *synchronously* or *asynchronously*.

With the synchronous setting of motion commands, it is possible to wait for a certain motion status or for the end of the motion, e.g. of a positioning, on the command. This setting is especially advantageous when programming motion sequences in sequential tasks (motion tasks).

Return value

The return value supplies the result of the function call, e.g. function was/is carried out as planned or there is an error.

CommandId

CommandId can be used to uniquely identify and trace a TO command.

For information on parameters, step enabling conditions, diagnostics, etc., please refer to the following:

- Functions for CommandID (Page 1541) and various examples in this manual.
- **SIMOTION MCC Motion Control Chart**, Programming MCC Charts

For a detailed description of the TO commands, please refer to the SIMOTION Reference Lists.

Programming model

The commands are assigned to tasks which are in turn assigned to the execution levels of the task system.

Commands can be issued from all user program tasks of the system.

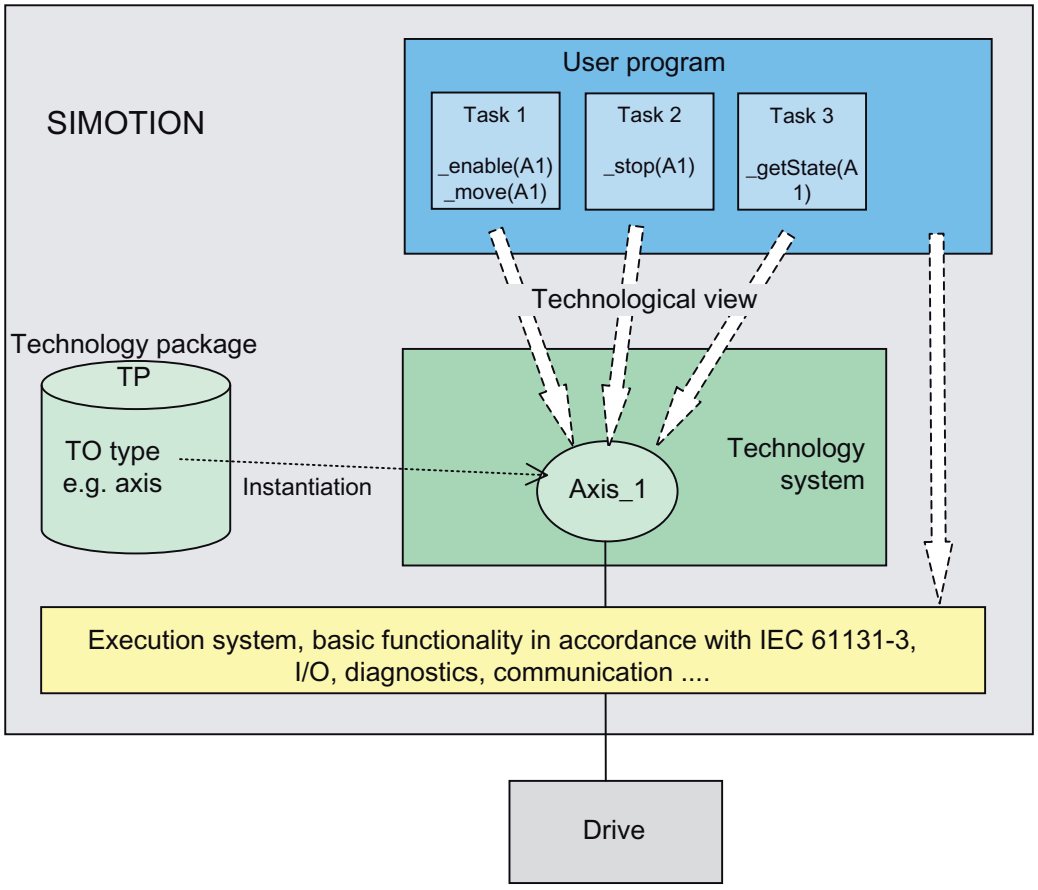

Figure 4-45 Programming model on technology object instances, e.g. on TO axis

The execution time of a command on the technology object is the only factor that determines the effectiveness of the command.

If commands are issued from multiple tasks, programming consistency must be ensured by the user program.

Command execution on the TO / effectiveness of TO commands

The commands issued from the user program, the user program tasks, to the TO can generally be subdivided as follows:

- Commands which are executed immediately in the context/sequence of the user program tasks
  These are handled like a function within the user program tasks.
  These commands are synchronous since the user program is continued only upon the return of the function result.
  Example: Reading TO values
- Commands which are entered in a command buffer and which overwrite each other
- Commands which are entered in a command buffer and which are rejected if the command buffer is occupied

In the TO commands you specify the response of the commands on the TO if more than one command is issued to a command group between two processing cycle clocks, e.g. replace/ overwrite or, command rejection.

Information on the command buffer and command activation can be found in the **function manuals** of the individual technology objects.

Execution properties

The execution properties of technology objects are object-specific.

The following synchronous execution levels are provided for the execution of the technology objects: DP cycle clock, servo cycle clock and IPO or IPO_2 cycle clock (except for temperature controllers).

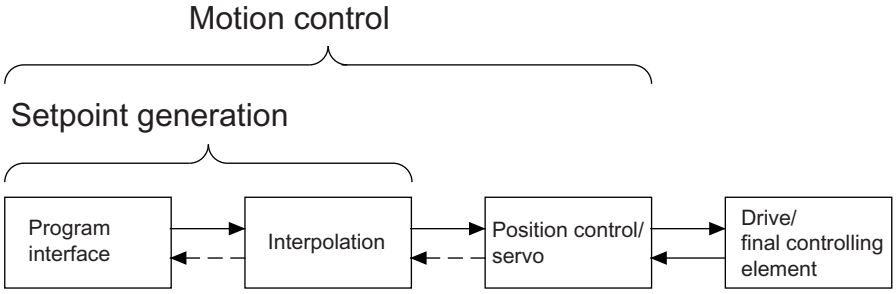

Figure 4-46 Flow chart

The instances of the technology objects are processed in different execution levels.

- The command evaluation and motion control are processed in the IPO/IPO_2 cycle clock.
- The position and setpoint control are processed in the servo cycle clock.
- Communication with the drive is processed via PROFIBUS DP in the DP cycle clock or PROFINET IO with IRT in the PN cycle clock.

The processing can be influenced by means of the system and object configurations.

- System cycle clock setting
  Setting the system cycle clocks also sets the sampling time for the motion control of axes (IPO, IPO_2), the position control (servo), and the communication via PROFIBUS DP or PROFINET IO with IRT.
- When configuring objects, you can specify whether motion control is to be executed in the IPO or IPO_2 cycle clock. This allows you to distinguish between operations that are time critical and those that are not.
- Technology objects are controlled from the user program through system function calls.

With V4.2 and higher, Servo_fast and IPO_fast can also be used as an option in a second application cycle clock.

Alarms

A technology object monitors the execution and executability of technological functions as well as the I/O required for the TO, and creates a **technological alarm**, if necessary.

A **technological alarm** has a TO-local alarm response, e.g. stop motion, and a global response, e.g. stop system or call alarm task in which further responses can be specified. The local and global responses can be set for specific alarms.

For a detailed description of the TO alarms, please refer to the SIMOTION Reference Lists.

See also

Execution system (Page 1298)

Differences between cyclical and sequential programming (Page 1227)

Process Alarms (Page 1281)

Interconnections

The technology objects can be flexibly interconnected (for example, following axes can be switched over or interlinked) and even distributed among several SIMOTION devices. The functionality required for this is in the object and does not need to be programmed. This enables maximum flexibility in terms of functionality and distributability.

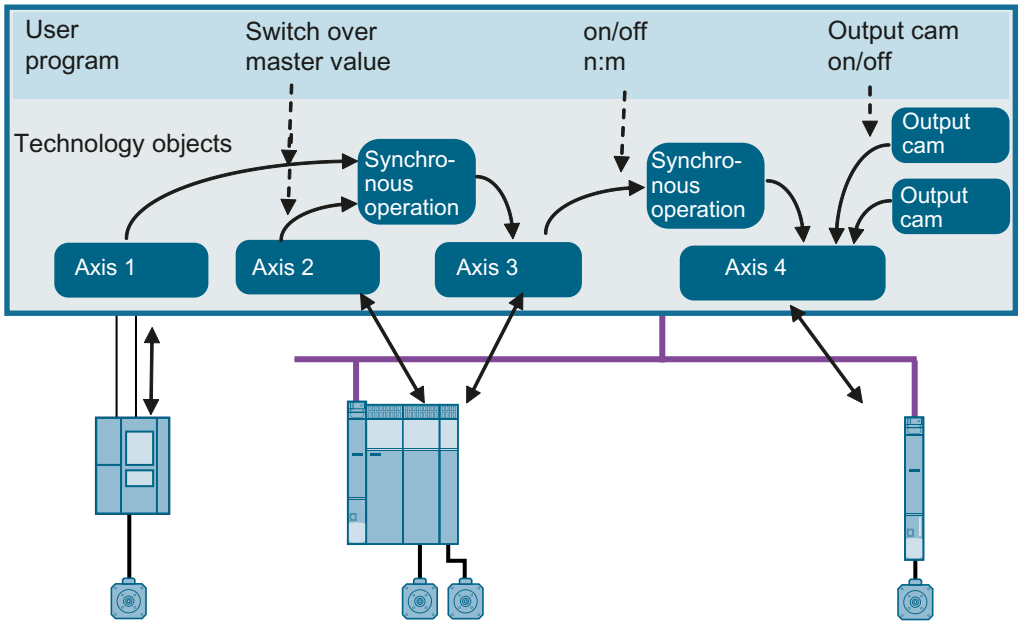

Figure 4-47 Interconnection example

There are interconnection interfaces defined on the technology objects for the exchange of data/information between the technology objects on the system level. These interfaces generally allow for the bidirectional exchange of data between individual technology objects.

The type of the external interfaces can be different on each TO type. There are no interconnections or actuators/sensors required.

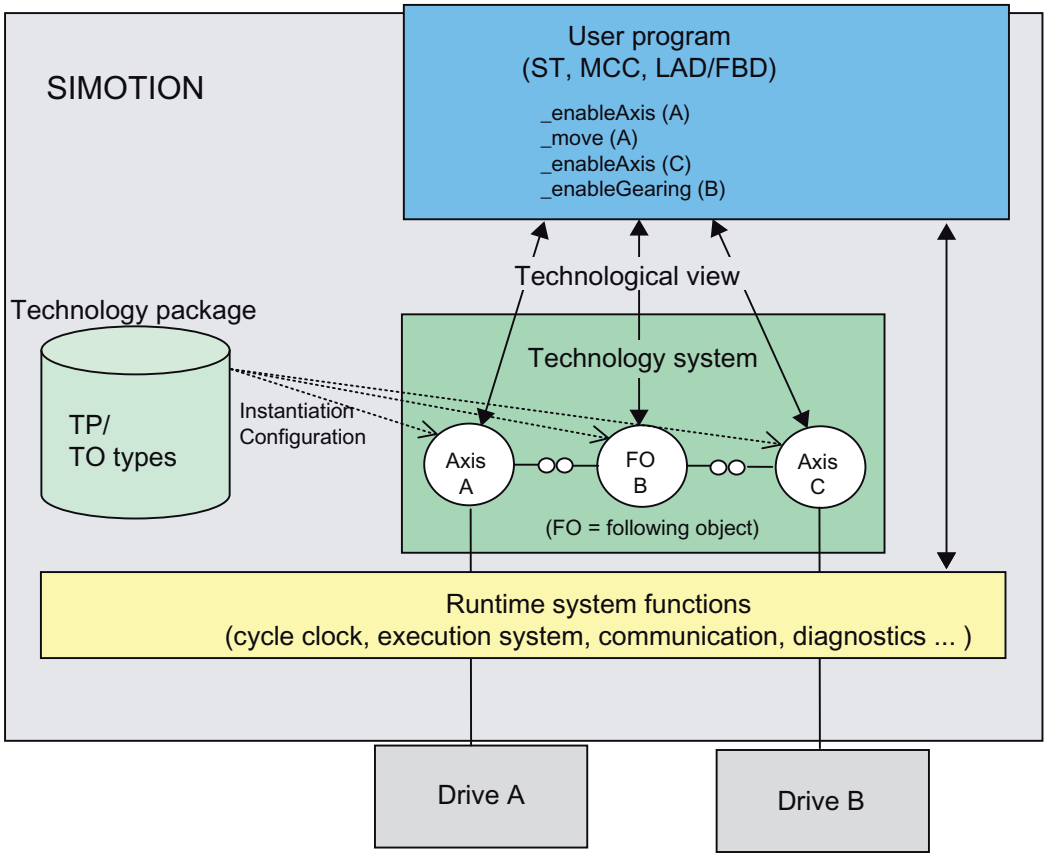

Figure 4-48 Interconnection between technology objects, example: Master axis - Following object - Slave axis

Depending on the interface type, interconnection interfaces can exchange different data in cyclic mode (cyclic motion data, e.g. s,v,a for the motion vector of type motion) and during initialization (e.g. modulo information, units).

Implicit interconnection

If an interconnection is mandatory and unambiguous, it is implicitly created by the SIMOTION SCOUT engineering system, e.g. measuring input with axis, cam with axis, synchronous operation with axis. The corresponding TO types are offered under the axis.

Interconnection using technological interconnection screen forms

There are specific screen forms provided for further interconnections, e.g. for:

- Following axis with master axis/master value
- Following object with cams
- Profile inputs with cams

Interconnection using general interconnection screen form (for experts only)

There is a general interconnection screen form provided for special interconnections, e.g. for:

- MotionIn interface interconnection (for motion vectors)
- Torque input interface interconnection

Interconnection interface type 'Motion' (for experts) (Page 1167)

Interconnection interface type 'LREAL' (for experts) (Page 1168)

Interconnection of technology objects (Page 1159)

Technology objects and DCC

Description

The data exchange between DCC and TO is performed by DCC charts

- using the direct interconnection of block inputs and block outputs with system variables of the TO;
  for TO axes, it is possible to transfer cyclically the data specified in system variables, such as override and setpoints, without commands needing to be issued each time in the user program.
- or by forwarding values calculated in DCC via commands and variables in the user programs to the TO. The TOs have specific function-related interconnection interfaces.

The TOs themselves are not available as blocks in the DCC charts.

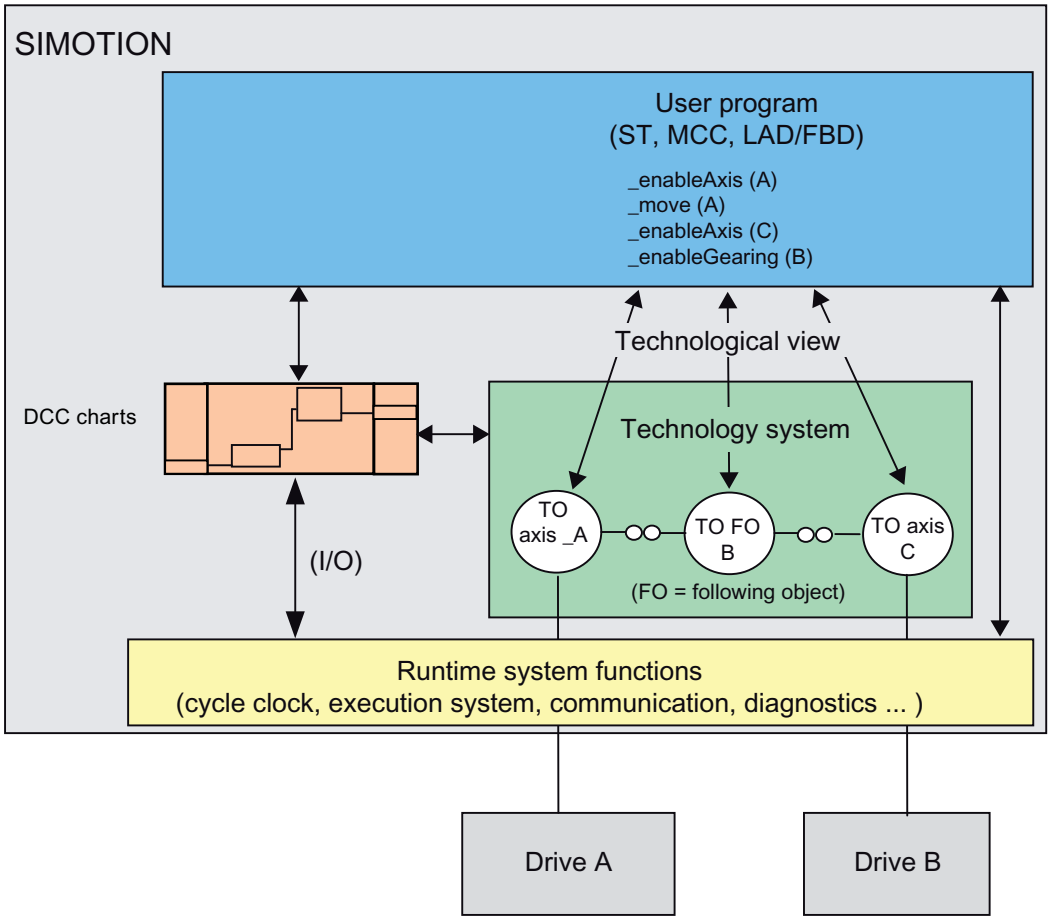

Figure 4-49 Technology and DCC

Sequence model for DCC blocks (DCB) (Page 1394)

Available technology objects

Table 4-12 Overview of the technology objects available in SIMOTION

Technology object	Symbol	Brief description
Axis		Axes are available in various versions. There are: • Real or virtual axes • Position axes or drive axes • Electrical axes or hydraulic axes • Standard axes or force/pressure controlled • Modulo axes • Following axes • Path axes For detailed information, refer to the Motion Control TO Axis Electric/Hydraulic, External Encoder Function Manual.
Following object		If an axis is created with the synchronous operation technology, the following object will then be created below the axis. The settings for the synchronous operation are stored in the following object. For detailed information, refer to the Motion Control TO Synchronous Operation, Cam Function Manual.
Path object (as as of V4.1)		You can use the Path object technology object to configure the path interpolation. For detailed information, refer to the Motion Control Path Interpolation Function Manual.
Measuring input		Measuring inputs are used for fast, accurate measurement of actual positions. For detailed information, refer to the Motion Control TO for Output Cam and Measuring Input Function Manual.
Output cam		The TO outputCam creates position-dependent switching signals and can be assigned to position axes, following axes or external encoders. For detailed information, refer to the Motion Control TO for Output Cam and Measuring Input Function Manual.
Cam track		Cam tracks are used to group several output cams to form a technology object. For detailed information, refer to the Motion Control TO for Output Cam and Measuring Input Function Manual.
External encoder		The technology object external encoder provides the functionality in the system for connecting an external encoder without an axis, e.g. a shaft encoder on a press. For detailed information, refer to the Motion Control TO Axis Electric/Hydraulic, External Encoder Function Manual.
Cam		The TO cam can be used to define a transmission function and apply it with other technology objects. For detailed information, refer to the Motion Control TO Synchronous Operation, Cam Function Manual.
Temperature channel		The TO temperatureChannel can be used to configure temperature controls in SIMOTION. For detailed information, refer to the Motion Control Additional Technology Objects Function Manual.

Technology object	Symbol	Brief description
Additional technology objects (for experts): The advantage of these technology objects is that they are executed on the system level like other TOs. The interconnected signals are processed directly in the technology objects within a system cycle clock. Applicative solutions in structured text, in contrast, bring about frequent changes between system and application and thus dead times. The additional technology objects are used for the implementation of winder applications, for example.		
Fixed gear		You can use the fixed gear technology object to implement a fixed synchronous operation (without synchronization/desynchronization) using a specified gear ratio. For detailed information, refer to the Motion Control Additional Technology Objects Function Manual.
Addition object		You can use addition objects to add up to four input vectors to produce an output vector. For detailed information, refer to the Motion Control Additional Technology Objects Function Manual.
Formula object		With formula objects, you can use mathematical operations on scalar (LREAL, DINT) and on motion vectors of the Motion type. For detailed information, refer to the Additional Technology Objects Function Manual.
Sensor		The TO sensor can be used to record scalar measured values. For detailed information, refer to the Motion Control Additional Technology Objects Function Manual.
Controller object		The controller object can be used to prepare and control scalar variables. For detailed information, refer to the Motion Control Additional Technology Objects Function Manual.

4.2.3.4 Expert list

In addition to accessing the configuration data and system variables via wizards and parameterization screen forms, you also have the option of direct access via the **expert list**.

Since all important configuration data and system variables can be parameterized via dialogs, the expert list is, however, only required in exceptional cases (such as online modification of configuration data).

These lists state the most important configuration data and system variables for the programming and diagnostics of axes, following object and external encoder.

Starting in V4.1, the expert list has a separate view containing a selection of the most important configuration data and system variables (**Selected Parameters**). This gives you easy access to the most important configuration data and system variables for programming and diagnostics for each individual technology object.

As of V4.2, it is no longer possible to create user-defined lists of values/parameters. The only way to convert existing user-defined lists of values/parameters without encountering any problems is to open them in a watch table with exactly the same range of functions.

Note

Special knowledge of the system is required to modify parameters in the expert list.

- You can overwrite entries made using the expert list by calling wizards and parameterization screen forms.
- No check is made on dependencies with other parameters.

Invoking the expert list

1. Highlight the required technology object in the project navigator.
2. Select **Expert list** in the object context menu or press **Ctrl+E** on the keyboard (if, for example, an axis dialog is open).

Or

- Double-click on the **Expert list** entry in the project navigator below a TO.

Expert list for configuration data and system variables

The **system variables** and **configuration data** for the technology object are displayed in the first two tabs in the **expert list** .

You can change the configuration data values in OFFLINE mode and in ONLINE mode. Parameters which can be written are displayed in green, those which cannot be written are displayed in yellow. Grayed-out values cannot be changed.

As of V4.2, it is no longer possible to create user-defined lists of values/parameters. The only way to convert existing user-defined lists of values/parameters without encountering any problems is to open them in watch tables with exactly the same range of functions.

Table 4-13 The following information is displayed in the expert list:

Button / Table column	Meaning/Note
Configuration data	The **Configuration data** tab lists the configuration data of the TO in alphabetical order. All configuration data can generally be modified by the user (displayed in green).
System variables	The **System Variables** tab lists the system variables of the TO in alphabetical order. There are system variables which can be written (displayed in green) and which cannot be written (displayed in yellow).
Selected parameters	On the **Selected Parameters** tab, the most important system variables and configuration data of a technology object are displayed in alphabetical order, separated according to system variables and configuration data. The tab can be closed, but it will be displayed again at the next call. The selection is a factory setting and cannot be changed.

Button / Table column		Meaning/Note
Convert list into watch table 		Click this button to convert a user-defined list created using an earlier version to a watch table. A message containing more detailed information appears before the conversion takes place. When you have confirmed the message, you can select the list in a file dialog. Once selected, the list is converted and opens as a watch table.
Quick search 		In this text field, you can carry out a quick search within the expert list. The columns Parameter, Parameter text and Value are searched.
Compare configuration data or system variables 		Click this button if you want to compare configuration data and system variables of 5 technology objects max. and the differences in ONLINE and OFFLINE mode of an object. For further information, see Comparing expert lists (Page 1156).
Collect changes 		While the button is activated, all the configuration data changed by you with an effectiveness of "immediately" and "restart" is collected but the new values do not take effect in the target system. The collected changes to the configuration data only take effect in the target system when you click **Activate changes**. See below.
Activate changes 		• If all the collected changes to the configuration data **only** have an effectiveness of **immediately**, the changes take effect as soon as you click **Activate changes**. • If some of the collected changes to the configuration data have an effectiveness of **restart**, **all** changes only take effect after a technology object **restart**.
Activate TO restart 		For configuration data that only take effect after a restart of the TO, the restart can be performed by either activating the system variable "restartActivation" or by clicking the **Restart** button. The button restarts the axis. The button becomes active when you have changed an effective data item after a restart, but not yet accepted it.
Configuration selection list		Select whether the parameters for a linear axis or rotary axis are to be displayed or changed for standard, force or pressure in the table in the expert list.
Parameter 		The name of the configuration data item or the system variable is displayed here. Click the plus sign to open the entire structure.
Parameter text		A short description of the system variable or the configuration data is displayed.
Offline value		The value of the configuration data item or the system variable is displayed here. Depending on the type of parameter, you can enter the value directly as a numerical value or select a symbolic identifier from the selection list.
Configured value	(ONLINE only, configuration data)	The configured value of the configuration data item is displayed here. This value is saved to the RAM of the target device.

Button / Table column		Meaning/Note
Current value	(ONLINE only)	The current value of the system variable or the configuration data is displayed here. You can change the value of the system variable directly in ONLINE mode. Changes to the configuration data can only be made in the **Next value** column. Current values are stored in the **current data memory**. To transfer these values to the RAM, **Target system > Copy current data to RAM** must first be selected in the menu. **Note:** System variables changed ONLINE cannot be copied to RAM. This also means that it is not possible to **Save to memory card (Ram2Rom)** or **"Save in the engineering project (load configuration data in PG)**. See SIMOTION memory concept.
Next value	(ONLINE only, configuration data)	You can enter the **Next value** of the configuration data item in ONLINE mode here. This value is then taken over as Current value depending on when the configuration data item is to take effect. With Immediately, the new value takes immediate effect in the target system after pressing the ENTER key or selecting a value.
Units		The unit of the system variable or the configuration data is displayed.
Effectiveness		This displays when the value of the changed configuration data item takes effect, e.g. with **restart**, the changed value takes effect in the target system after a restart. You cannot change certain configuration data in ONLINE mode. With V4.1.2 and higher, this column is also displayed OFFLINE.
Data type		The **data type** of the system variable or the configuration data item is displayed here (e.g. INT for an integer value).
Minimum		The minimum value of the system variable or the configuration data item is displayed.
Maximum		The maximum value of the system variable or the configuration data item is displayed.
Filter		This line allows you to enter filtering criteria for the contents of the various columns in the table. Alternatively, you can select predefined filters in the selection box. To reset the filters, select the criterion **All** in the selection box or click the  symbol.

Comparing expert lists (Page 1156)

Using the expert list

Displaying the help for the system variables and the configuration data

1. Select **Help > Context help**.
   Or
   Press the **SHIFT+F1** keys.
   Or
   Select **Parameter help** in the context menu.
   The cursor changes to a question mark.
2. Click the configuration data item or the system variable in the expert list for which help is required.
   The help for this is displayed.

Changing the data in the expert list offline

1. In the expert list, select the Configuration data or System variables tab.
   A tabular overview is displayed.
2. In the **Parameter** column of the expert list, click the plus sign in front of an entry to display subentries.
   You cannot change entries highlighted in yellow.
3. Click the **Offline value** column of the entry to be changed.
4. Enter the value directly or select a value when a selection list appears.

Carrying out a quick search

When entering a search term, the cursor jumps to the first line in which the search term is found.

- Enter the search term and press the ENTER key.

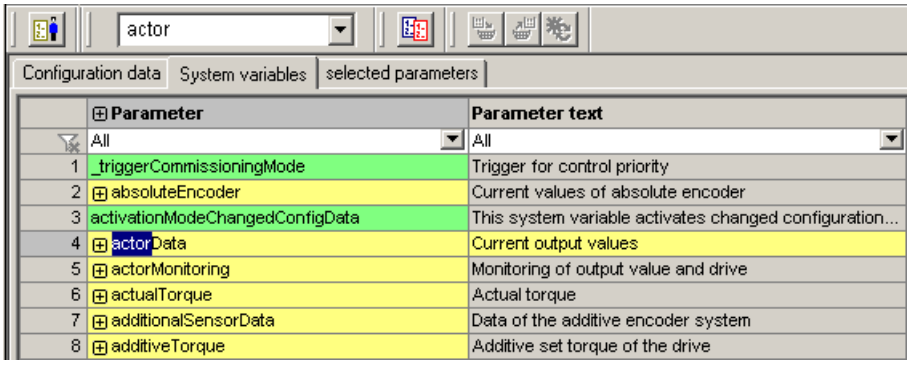

Figure 4-50 Example of quick search

If it is a writable parameter, the cursor jumps directly to the value field.

If a structure shell is found that does not have a separate parameter value, the jump is made directly to the cell in which the term was found.

Continue search:

- Press the **F3** key.
  The next cell containing this term is searched.

If the search function does not find any further entry in the list, a message is output.

Navigating within the expert list using the arrow keys

Each cell within the expert list can be selected using the arrow keys.

1. Press an arrow key.
   The cell located next is selected.
2. With the **Ctrl+arrow** key combination, the cursor jumps to the end or beginning of the respective line or column.

Selecting cells using the keyboard

If you want to select the complete expert list, including the cells in the non-visible area:

- Press the **Ctrl+A** key combination.

In online mode, this key combination also initiates a read process for all of the parameter values (with technology objects as of V4.0).

Individual cell areas can be selected by navigating with the arrow keys or with the mouse:

- The cells are selected in the course of navigating by simultaneously pressing the **Shift** key.

Cell areas can also be selected using the mouse:

- Place the cursor on a line, press the left mouse button and drag the mouse pointer across the cell area to be selected.

Copying cell contents into other Windows applications

Selected rows or cells can be copied into other Windows applications using the Windows clipboard:

- Press the **Ctrl+C** key combination or select **Copy** in the context menu.

From the clipboard, the cell content can be inserted, e.g. in an Excel or Word document.

How to create a watch table

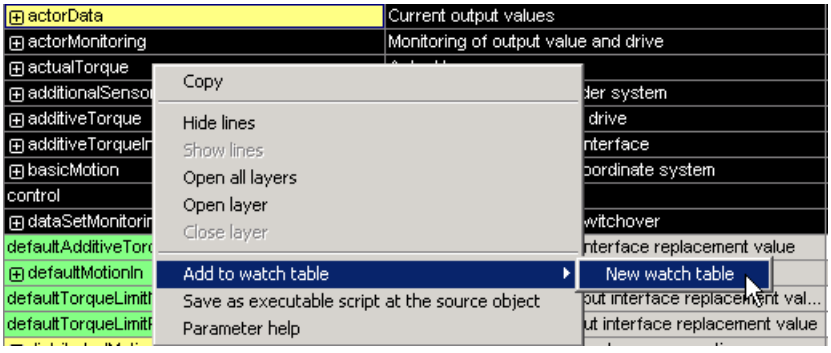

Figure 4-51 Context menu in the expert list (right-click)

Table 4-14 Context menu in the expert list

Menu command	Meaning/function
Copy	Copies the parameters selected
Hide lines	Hides the marked lines.
Show lines	Shows the hidden lines again.

Menu command		Meaning/function
Open all levels		Opens all levels
Open level		Opens all the levels selected
Close level		Closes any levels which are open
Add to watch table		
	New watch table	Creates a new watch table and opens it in the **<Watch table name>** tab of the detail view
	Watch table name	Adds parameters to an existing watch table
Add to watch table, values as control values		
	New watch table	Creates a new watch table and opens it in the **<Watch table name>** tab of the detail view
	Watch table name	Adds parameters to an existing watch table
Save as executable script at the source object		Saves as executable script
Parameter help		Calls the help for the parameter selected

Procedure for creating a watch table

1. Select the lines in the expert list to be transferred to the watch table.
2. In the context menu (right-click), select **Add to watch table > New watch table**. The **Insert Watch Table** dialog opens.

   Note

   To add to an existing watch table, select **Add to watch table > <Watch table name>**. No more dialogs are called. The values are added to the existing watch table.

3. In the **Insert Watch Table** dialog, you can enter the name, author, version, and comment. The name is preassigned automatically.

Note

You can also save the results of an expert list comparison as a watch table or as an executable script, see Comparing expert lists (Page 1156).

Notes on the structure of scripts:

- Each converted script receives a header with date and origin, and then an empty line.
- The logging mechanism of the script engine is activated in the next line. This causes each write and read action to be output in the script output window.
- Headings in the watch table are entered in the script as comments with a leading additional empty line.
- Comments in the watch table are entered in the script as simple comments without an additional empty line.

- For each write parameter in the watch table, a write request is entered in the script. Numbers and enumerations are written as integer values. The parameter text of the parameter is added as comment at the right-hand side next to the write request.
- Read-only parameters in the watch table are no longer saved in scripts as of V4.2. When parameters are saved as a watch table, only the parameter (without a value) is added to the watch table.

Example for the use of scripts:

- Any changed unit systems will not be used when the script is executed. You must yourself ensure that the acceptance of the parameter values is sensible in the current context.
- Parameters that change the structure (e.g. TypeOfAxis.typeOfAxis) are not treated differently. You must yourself ensure that these parameters are at the top of the parameter selection.
- Only the current value is written; this means the script may not be executed online if it contains configuration data.

Application: You can also transfer the parameter assignment from one axis to the other with scripts.

Comparing expert lists

Description

In this window, you can compare the differences in parameter settings of a maximum of five objects (TOs) and the differences in ONLINE and OFFLINE mode of an object.

The displayed data is always the current data in effect. For TOs in ONLINE mode, this data is the actual values. System variables are not permanently updated, only if you update the representation with **Start comparison**.

You can change the values of the comparison objects as well as the values of the reference objects. Objects that cannot be changed are indicated with "???".

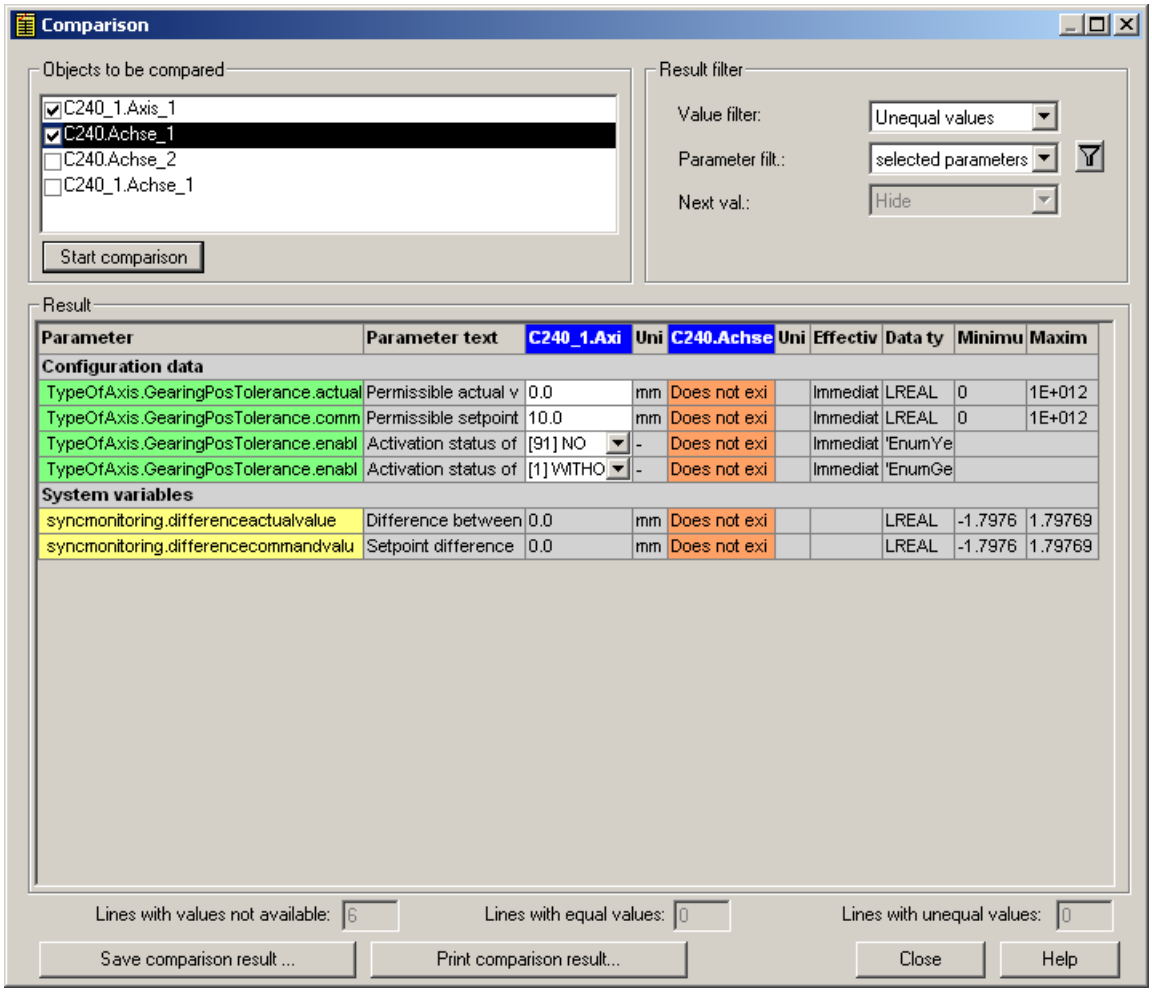

Figure 4-52 Experts list comparison

Parameters with different settings or parameters not available for an object are presented in a list.

Note

A comparison can only be made within groups of compatible objects (TOs). Only the eligible objects for the comparison will be made available.

Button / table column	Meaning/information
Objects to be compared	Select the checkbox for the objects you want to compare. You can compare up to five objects with one another and objects in OFFLINE and ONLINE mode. In ONLINE mode, separate checkboxes are available for ONLINE and OFFLINE parameterization of an object. The uppermost list, which is grayed out, is used as a reference list. The display is always dictated by the structure and, thus, the parameter set of the reference object. As a result, for comparison objects it can only be indicated whether or not they have the parameter of the reference object. Parameters that only the comparison objects have but not the reference object are not displayed. If the values of a setting are different, this is indicated by the appearance of a light-orange colored background in the relevant cell in the columns of the relevant comparison objects. However, the relevant cell of the reference object does not display a colored background.
Start comparison	Click **Start comparison** to compare the parameter settings of the selected objects. The compared settings are listed under **Result**.
Value filter	Select the parameter types that are to be displayed under **Result** after the comparison.
All	All the parameters that can be compared are displayed under **Result**.
Unequal	Only the parameters whose values are unequal will be displayed under **Result**.
Equal	Only the parameters whose values are equal will be displayed under **Result**.
Parameter filter	Only the type of parameters are displayed which you select in the drop-down list.
Display filter	Click the button to open the **Display Filter** window. Here you can edit the display of the columns.
Next value	The next values (values in the next memory) are also displayed.
Result	**Result** displays the parameters found to have different settings during comparison of the objects and other parameters that are not available for an object. Diverging values and non-comparable values of parameters are displayed with a colored background.
Save comparison result	Click the button to save the comparison results as a new watch table or as an executable script. The button is active only if the parameters of a device are displayed under **Result**. For further information, see Save expert list comparison (Page 1159).
Print comparison result	Click the button to print the comparison results in a tabular form. The parameter number, the value for the respective object and the unit will be printed in each case.

See also

Save expert list comparison (Page 1159)

Save expert list comparison

Description

In this window, you can save the result of the comparison.

The button is active only if the parameters of a device are displayed under Result.

- Click **As watch table** to create a new object-granular watch table. The left column is always the reference column, i.e. only the parameters of the reference object are compared and saved.
- Click **Executable script on source object** and select the object to which you want to assign the script. A SCRIPTS folder will then be created under this object.

See also Comparing expert lists (Page 1156).

You can save only the comparison results of one object. Prior to storing, you must specify which object is to be saved.

4.2.3.5 Interconnection of technology objects

Technology objects are automatically interconnected when they are created (synchronous axis, output cam, measuring input). Additional interconnections can be established using a general interconnection screen form.

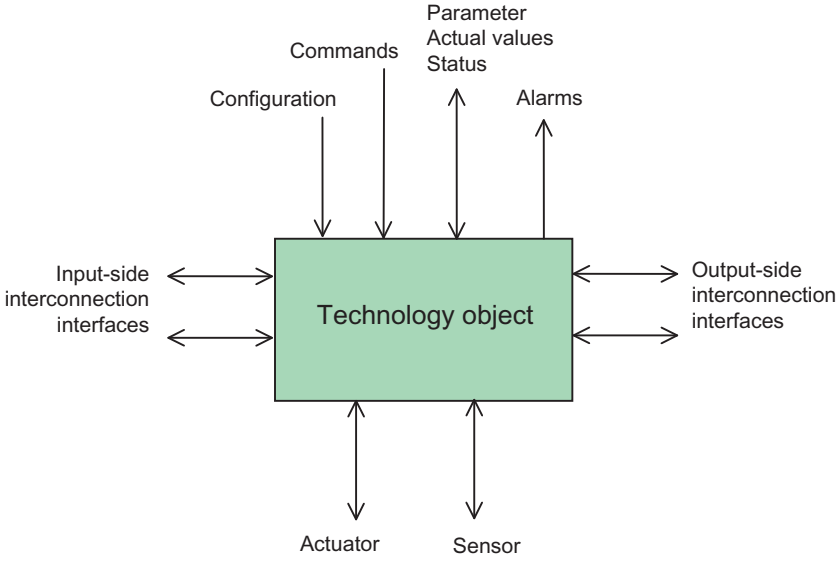

Figure 4-53 Interconnection interfaces to technology objects

Interconnection overview for technology objects

Introduction

With the interconnection overview you can display all motion input and output interconnections of technology objects in the project via an interconnection tree. The tree display enables the interconnections to be displayed in cascades.

Note

As of V4.3, it is possible to assign device names that do not comply with the ST naming convention. Names with special characters such as "." are displayed in the interconnection overview in " ".

An interconnection table shows the technology objects interconnected on the input or output side with interface designation for the technology object selected in the interconnection tree.

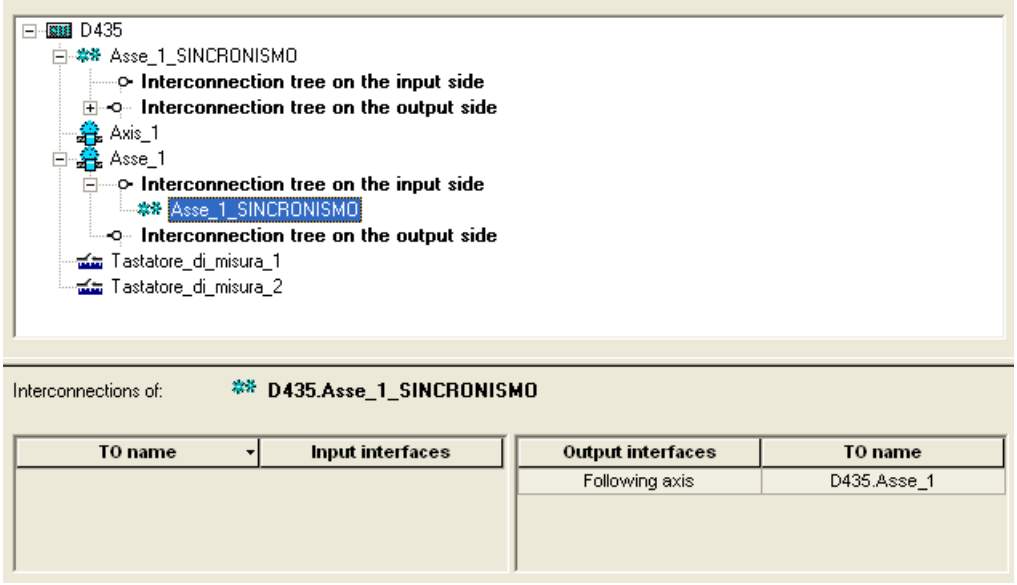

Figure 4-54 Interconnection overview

Properties of the interconnection overview

The interconnection overview can be started with the button or via **Edit > Interconnection overview**.

- After the interconnection overview has been started, the device level (CPUs) is displayed first. You can then display all instantiated TOs under each CPU by opening the appropriate interconnection tree of the CPU. The TOs are sorted according to TO type and displayed in alphabetical order within a TO type.
- Two interconnection trees are offered for the TOs that are displayed directly below the CPUs:
  - Input-side interconnection tree; indicates the motion input interconnection
  - Output-side interconnection tree; indicates the motion output interconnection

- All technology objects that have motion inputs and outputs interconnected to other technology objects, e.g axes, synchronous objects or encoders, can be opened further. This is possible at every hierarchy level of the interconnection tree.
- Recursion is shown if the interconnection tree contains a node which already exists on the path to the root of the tree. The lower part of the tree is not shown for the sake of simplicity. Continue to the node which is closer to the root.

The interconnection trees can only be opened up sequentially, not all at once with one click.

Displaying interconnection table

Select a TO in the interconnection table.

The associated interconnection table is displayed below the interconnection overview. The input and output interconnections of all interconnected TOs are listed.

Implicit interconnection when creating

Description

Interconnections are generated automatically when the following TOs are created:

- Synchronous axis; synchronous object is interconnected to the synchronous axis (following axis)
- Output cam; this is interconnected to the master value
- Cam track; this is interconnected to the master value
- Measuring input; this is interconnected to the master value

These interconnections are also displayed in the interconnection overview (Page 1160).

Interconnection using general interconnection screen form in SCOUT (for experts)

SCOUT offers the **Interconnection** view for interconnection of various technology objects.

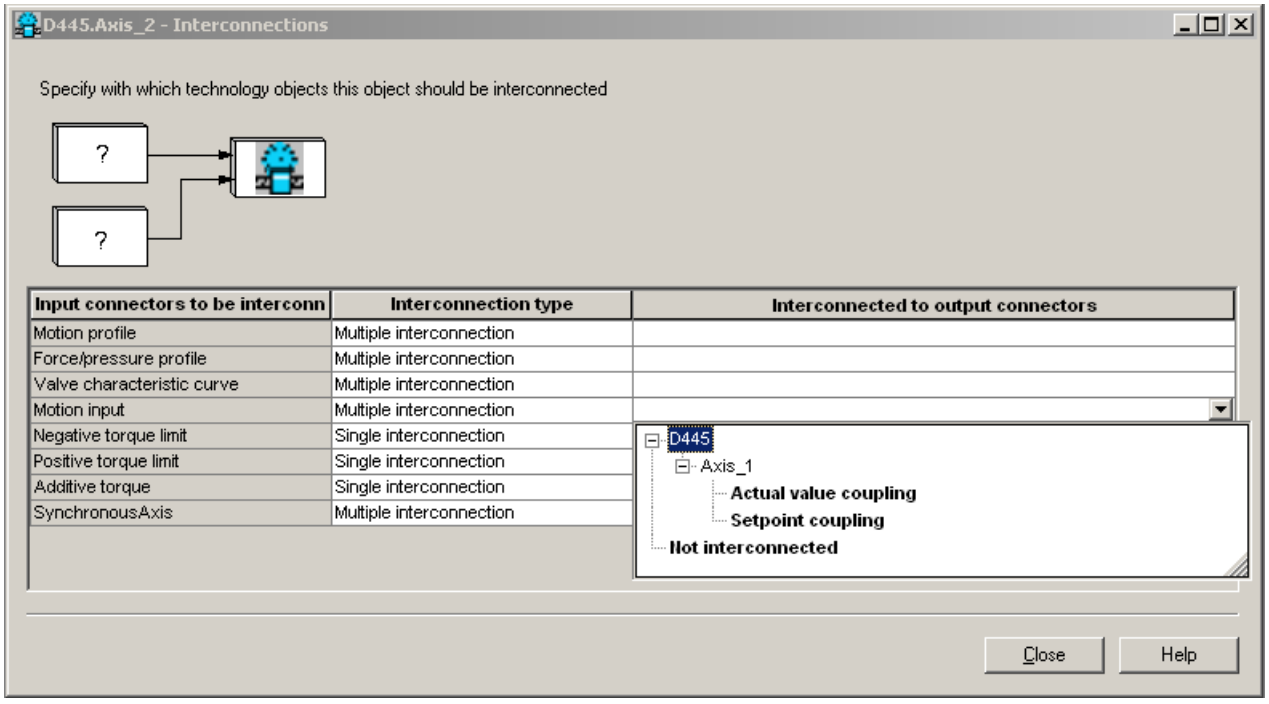

Figure 4-55 Interconnection in the SCOUT - axis example

On the left-hand side, all input-side interconnection interfaces of the selected object are listed, on the right-hand side, the output-side interconnection interfaces of the same type. Only the output-side interfaces displayed bold can be selected.

- When one of these lines is highlighted (clicked), you can open a tree that displays all interconnection possibilities.

Only those elements displayed **bold** can be selected.

The display of the devices and technology objects is used only for orientation purposes.

- Direct input can be made in the input line.

Only complete and correct inputs are accepted. The input field cannot be exited if incorrect inputs are made.

If the input-side interconnection interface has the characteristic of multiple interconnectability and can therefore be interconnected with several output-side interconnection interfaces, another line is added for the interconnection of the input-side interconnection interface after the interconnection with an output-side interconnection interface.

- An interconnection can be removed by deleting a line.

The value will be accepted when the input line is exited.

General properties of interconnection interfaces

Configuration of interconnection interfaces

The input-side interconnection interfaces are created:

- Implicitly with the instantiation of the TO
- Via technology-specific interconnection screen forms
- Via general interconnection screen forms

Enabling/disabling

The input-side interconnection interfaces are activated with a command on the associated TO or they are active by default.

In the case of multiple interconnectability of an input-side interconnection interface, enabling/disabling is carried out with a command for the technological function, e.g.:

- Selection of the cam in **_enableCamming()** via the **cam** parameter
- Selection of the technology object for the master value in the **_setMaster()** command via the **master** parameter
- Selection of the technology object for the reference value of the MotionIn interface in the **_run...basedMotionIn...()** command via the **mastertype.reference** parameter
- Selection of a profile or the cam in the **_run...Profile()** commands via the **profile** parameter

For information on this topic, please refer to the function manuals of the respective technology objects.

Indicator for status and interconnection values

The indicator for the status of the input-side interconnection and the interconnection values is defined on the TO for the individual interface types.

For information on this topic, please refer to the function manuals of the respective technology objects.

Validity

Interconnection interfaces have valid values when the interconnection is established and the interconnection values have the 'valid' status; invalid interconnections / interconnection values have the value 0.

If a (virtual) axis is set to simulation, the output-side setpoints will continue to be updated, the actual values will be frozen.

The status available in the system variables can be read out to determine whether the interconnection value or the substitute value is valid after ramp-up.

Alarm Response

In the case of a faulty interconnection, a technological alarm is only issued when a function on the interconnection interface is activated.

In the case of multiple interconnectability of an input-side interconnection interface, a reference TO must be selected.

Programmed functions will be aborted during the transition from **STOP U** to **STOP**; interconnection functions remain active during the transition from **STOP U** to **STOP**.

Interconnection interfaces on the TOs (for experts)

The input-side interconnection interfaces can only be interconnected with output-side interconnection interfaces of the same type.

TO	Interface	Type
Drive axis		
	Input-side interconnection interfaces:	
	Motion input	Motion
	Torque limit, positive	LREAL
	Torque limit, negative	LREAL
	Additive torque	LREAL
	Motion profile	MotionProfile
	Force/pressure profile	ForceProfile
	Valve characteristic (hydraulic axis)	ValveCharacteristics
	Output-side interconnection interfaces:	
	Motion setpoint	Motion
	Motion actual value with extrapolation	Motion
	Actual torque	LREAL
Position axis		
	Input-side interconnection interfaces:	
	As for drive axis	
	Output-side interconnection interfaces:	
	As for drive axis plus additionally:	
	Interface for output cam, cam track (implicitly interconnected with the axis by the system when creating an output cam, cam track)	Specific
	Interface for measuring input (implicitly interconnected with the axis by the system when creating a measuring input)	Specific
Following axis		
	Input-side interconnection interfaces:	
	As for position axis, plus:	
	Interface for synchronous object (implicitly interconnected by the system when creating a following axis/following object)	Specific
	Output-side interconnection interfaces:	
	As for position axis, plus:	
Path axis		
	Input-side interconnection interfaces	
	Interface as for the following axis, in addition:	
	Path motion	Specific
	Output-side interconnection interface	
	As for position axis	
Following object		

TO	Interface	Type
	Input-side interconnection interfaces:	
	Motion input	Motion
	Cam	CAM
	Output-side interconnection interfaces:	
	Interface for slave axis (implicitly interconnected by the system when creating a following axis/following object)	Specific
Path object		
	Input-side interconnection interfaces:	
	Velocity profile	MotionProfile
	Output-side interconnection interfaces:	
	Path motion (path axis 1)	Specific
	Path motion (path axis 2)	Specific
	Path motion (path axis 3)	Specific
	Path synchronous motion	Specific
	Motion output (path object.x)	Motion
	Motion output (path object.y)	Motion
	Motion output (path object.z)	Motion
External encoder:		
	Input-side interconnection interfaces:	
	None	
	Output-side interconnection interfaces:	
	Interface for output cam, cam track (implicitly interconnected by the system when creating an output cam, cam track)	Specific
	Interface for measuring input (implicitly interconnected by the system when creating a measuring input)	Specific
	Motion setpoint	Motion
	Motion actual value with extrapolation	Motion
Measuring input		
	Input-side interconnection interfaces:	
	Measuring input interface (implicitly interconnected with the axis, external encoder by the system when creating a measuring input)	Specific
	Input interface 'Listening measuring input' (as of V4.0) (via general interconnection screen form)	Specific
	Output-side interconnection interfaces:	
	Output interface for 'Listening measuring input' (as of V4.0)	Specific
Output cam, cam track		
	Input-side interconnection interfaces:	
	Output cam interface (implicitly interconnected with the axis, external encoder by the system when creating an output cam, cam track)	Specific

TO	Interface	Type
Cam		
	Input-side interconnection interfaces:	
	None	
	Output-side interconnection interfaces:	
	Cam	CAM
	Motion profile	MotionProfile
	Force/pressure profile	ForceProfile
	Valve characteristic (hydraulic axis)	ValveCharacteristics
Temperature controller		
	No interconnection interfaces	
Addition object		
	Input-side interconnection interfaces:	
	Motion output 1	Motion
	Motion input 2	Motion
	Motion input 3	Motion
	Motion input 4	Motion
	Output-side interconnection interfaces:	
	Motion output	Motion
Formula object		
	Input-side interconnection interfaces:	
	Motion input 1	Motion
	Motion input 2	Motion
	Motion input 3	Motion
	LREAL input 1	LREAL
	LREAL input 2	LREAL
	LREAL input 3	LREAL
	LREAL input 4	LREAL
	DINT input 1	DINT
	DINT input 2	DINT
	DINT input 3	DINT
	DINT input 4	DINT
	Output-side interconnection interfaces:	
	Motion output 1	Motion
	Motion output 2	Motion
	Motion output 3	Motion
	LREAL output 1	LREAL
	LREAL output 2	LREAL
	LREAL output 3	LREAL
	LREAL output 4	LREAL
	DINT output 1	DINT
	DINT output 2	DINT
	DINT output 3	DINT
	DINT output 4	DINT

TO	Interface	Type
Fixed gear		
	Input-side interconnection interfaces:	
	Motion input	Motion
	Output-side interconnection interfaces:	
	Motion output	Motion
Sensor		
	Input-side interconnection interfaces:	
	None	
	Output-side interconnection interfaces:	
	Sensor value	LREAL
	Sensor value derivation	LREAL
	Motion output	Motion
Controller object		
	Input-side interconnection interfaces:	
	Setpoint	LREAL
	Actual value	LREAL
	Feedforward control	LREAL
	Motion input setpoint	Motion
	Motion input actual value	Motion
	Output-side interconnection interfaces:	
	Output value on motion output	Motion
	Output value	LREAL

Interconnection interface type 'Motion' (for experts)

The interconnection interface type **Motion** contains the motion vector (s, v, a), internal information such as validity status and, if applicable, modulo information.

Motion basis

The motion vector can have a different motion basis: position or velocity.

The position component is zero for the "velocity" motion basis.

A drive axis provides only the motion vector with the velocity motion basis on the output side.

Commands / command parameters (TO axis) or the configuration (TO additionObject, TO fixedGear) are used to consider/set the motion basis.

The components of the motion vector are maintained consistent at the output side of the TO axis, TO fixedGear (the derivation of the position value is the velocity value, the derivation of the velocity value is the acceleration).

The components of the motion vector are not maintained consistent at the output side of the TO additionObject and TO formulaObject.

The velocity and the acceleration can be specifically defined in this item for the position.

'MotionInput' input-side interconnection interfaces of the 'Motion' type

The TO type specifies whether a 'MotionInput' input-side interconnection interface of the Motion type can be interconnected once or several times.

The following technology objects have, for example, an input-side interconnection interface 'MotionInput' of the 'Motion' type:

- Drive axes
- Positioning axes
- Following axes
- Fixed gear
- Addition object
- Formula object
- Following object (master value)

Output-side interconnection interfaces of the 'Motion' type

The following technology objects have, for example, an output-side interconnection interface of the 'Motion' type:

- Drive axes
- Positioning axes
- Following axes
- Path object
- Fixed gear
- Addition object
- Formula object
- External encoder

Interconnection interface type 'LREAL' (for experts)

There is an interconnection interface of the LREAL type available for scalar variables.

Input-side interconnection interface on the axis 'TorqueLimitPositive' and 'TorqueLimitNegative' for specifying the torque limit.

To specify the **B+/B-** torque limits, the 'TorqueLimitPositive' and 'TorqueLimitNegative' input-side interconnection interfaces of the axis can be interconnected with output-side interconnection interfaces of the LREAL type of other TOs.

Prerequisite is the activation of the process-related field on the TO axis.

The input-side interfaces 'TorqueLimitPositive' and 'TorqueLimitNegative' cannot be interconnected several times and they cannot be distributed.

Output-side interconnection interfaces of the LREAL type have, for example:

- TO axis with the output-side interconnection interface 'Torque'
- TO formula object with the output-side interconnection interface 'LRealOut'

- Sensor TO
- Controller Object TO

'Torque' output-side interconnection interface on the axis for providing the actual torque

There is a 'Torque' output-side interconnection interface available on the axis for issuing the actual torque to other TOs.

Prerequisite is the activation of the process-related field on the TO axis.

The actual torque supplied by the drive in the additive process-related field is issued.

It is issued in the unit set on the axis.

The output-side interconnection interface can be interconnected several times.

The output-side interconnection interface 'ActualTorque' cannot be distributed.

'AdditiveTorque' Input-side interconnection interface on the axis for specifying an additive torque

There is a 'AdditiveTorque' input-side interconnection interface of the LREAL type available on the axis for specifying an additive torque to the drive using the additive process-related field.

To specify an additive torque depending on other technology objects, the input-side interconnection interface 'AdditiveTorque' can be interconnected with output-side interconnection interfaces of the LREAL type of other technology objects on the axis.

The input-side interface 'AdditiveTorque' cannot be interconnected several times and it cannot be distributed.

Output-side interconnection interfaces of the LREAL type have, for example:

- TO axis with the output-side interconnection interface 'Torque'
- TO formula object with the output-side interconnection interface 'LRealOut'
- Sensor TO
- Controller Object TO

4.2.3.6 Technology object trace

Introduction

You can monitor commands at a technology object and track access to the system variables and configuration data.

In SIMOTION, technology objects can be influenced by configuration data, system variables, and commands during runtime. In order to represent the influences on a technology object during runtime through the user program, a TO trace / object trace, which records the last n actions at the technology object and arranges these in chronological order, is available as of V4.2.

Note

Simultaneous use of the **Trigger through program call** trigger condition for the TO trace and the device trace is not permitted.

If the TO trace and the device trace are active simultaneously, different trigger conditions must be used.

The recording can be read out from the technology object on request and represented in the ES.

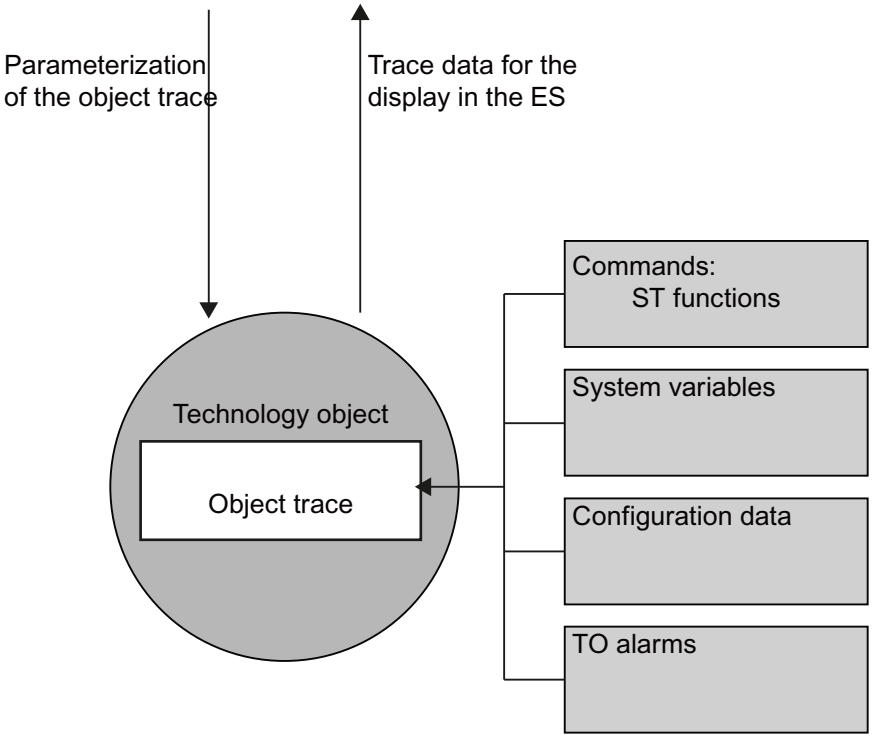

Figure 4-56 Principle of the object trace

The TO trace is used for the diagnostics of technology objects and displays the information and the events that influence a technology object during runtime in tabular form. The TO trace can be configured separately for each technology object.

It records commands and access to configuration data and system variables with their command and error statuses when the TO trace is read out. As of SIMOTION V4.4, alarms of the individual technology objects can also be recorded and an automatic trace is available. It can be used to trigger a recording automatically according to the trigger conditions immediately after a restart. You can parameterize the automatic trace in the Settings tab (Page 1180) at **Save in the device (memory card)**.

The TO trace is represented in a table/list with a time stamp.

The TO trace is available for the following technology objects:

- Drive axis
- Position axis
- Following axis
- Path interpolation
- Following object
- External encoder
- Measuring input
- Output cam
- Cam track
- Addition object
- Formula object
- Sensor
- Temperature channel
- Fixed gear
- Controller object

Events

Events

The TO trace supports recording of events which influence a technology object during runtime.

Events

These events include:

- Command execution
- Writing of system variables and
- Writing or activation of configuration data
- Alarms

TO trace for PLCopen function blocks

Block calls of PLCopen function blocks are entered in the command buffer. Edge-triggered blocks are entered in the buffer with their rising edge. Level-triggered blocks are entered in the buffer each time the input level changes.

TO trace for commands or function blocks

You can use the TO trace to read out the last commands issued to the technology object.

As command execution advances, the more information can be read out concerning the relevant commands. This means you can determine the status (executed or aborted) of commands which have already been completed/terminated as well as any error code. As the TO trace takes a snapshot, this information is based on the situation at the time of reading out. The status is not updated automatically once the command is finished. You can trigger an update by performing a further readout.

Note

The command value on the TO displayed for commands or function blocks is the value transferred on the interface.

The value that is active on the TO, e.g. through limits, is not displayed.

The TO trace provides the following information:

Table 4-15 Information on commands in the TO trace:

Parameter	Description
Command type	The command name in plain text can be ascertained from the command type.
Time stamp 1	The RT time for when the command is issued is stored in the time stamp.
Time stamp 2	The RT time for when the command takes effect is stored in the time stamp.
Time stamp 3	The RT time for when the command is completed is stored in the time stamp.
Taskstack	The call point for the command in the user program can be ascertained from the taskstack.

Parameter	Description
Command status / block status	Status of the command. The phase of the current motion is also given for motion commands. Possible values are as follows: • BUFFERED • WAIT_SYNC_START • IN_EXECUTION • IN_ACCELERATION • IN_CONSTANT_MOTION • IN_DECELERATION • INTERPOLATION_DONE • EXECUTED • ABORTED
Error code	Return value when the command is finished. The error code is only valid if the motion status is EXECUTED or ABORTED.
n command parameters	The TO trace records the transfer parameters of the command. The programmed value and the command value on the TO are recorded for each command parameter.
n return values	All the return values of the commands are also recorded, in addition to the command parameters. Recording takes place in the user program when the command is finished.

TO trace for configuration data

The TO trace records write accesses

Table 4-16 Information on configuration data in the TO trace

Parameter	Description
Configuration data element	Name of configuration data element in plain text
Time stamp	The RT time for when the configuration data element is written is stored in the time stamp.
Target data range	The target data range shows the effectiveness of the configuration data element. Possible values are the NEXT data range or the ACTUAL data range.
Data type	Date type of configuration data element
New value	Value written in the configuration data element

TO trace for system variables

The write accesses to the system variables through the user program are recorded with the TO trace

Table 4-17 Information on system variables in the TO trace

Parameter	Description
System variable name	System variable name in plain text
Time stamp	The RT time for when the system variable is written is stored in the time stamp.
Data type	Data type of the system variables
New system variable value	Value written in the system variable

TO trace for alarms

The TO trace records alarms

Table 4-18 Information on alarms in the TO trace

Parameter	Description
Time stamp	The following times are saved in the time stamp: • Time alarm occurred • Time alarm was acknowledged
Alarm number	Number of the alarm

Call

The TO trace can be called in a number of ways

Call via the main menu

You can call the TO trace by selecting **Target system -> Technology object trace**. You need to select a device in the project navigator; otherwise, the menu command remains hidden. Where there is more than one device, you can call the TO trace individually for each device.

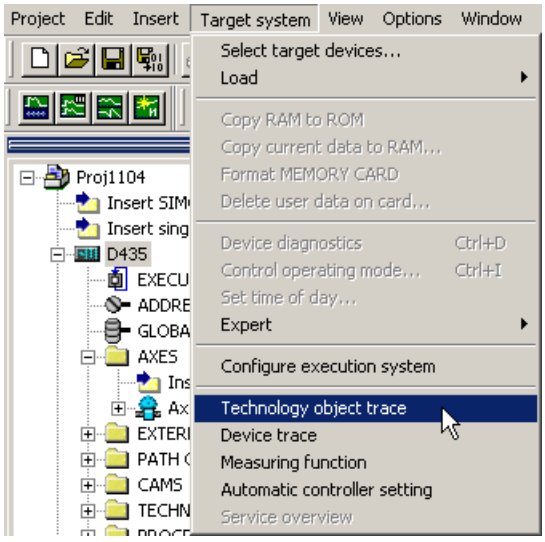

Figure 4-57 Call via the main menu

Call via the context menu

You can call the TO trace via the device's context menu.

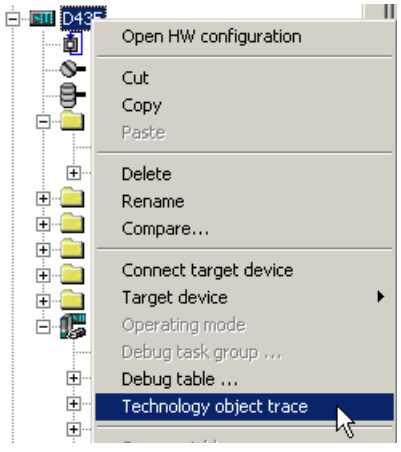

Figure 4-58 Call via the context menu

Call via the toolbar

The toolbar contains the button for calling the TO trace. The button is activated when a device is selected in the project navigator.

Parameterization

Overview of the parameterization

The parameterization and trace data are available both offline and online.

Only part of the overall functionality is available offline:

- Parameterization of the TO trace
- Displaying the latest TO trace to be uploaded
- Saving the data to a TO trace file
- Opening an existing TO trace

Additional online functionality:

- Parameterizing the TO trace and downloading it to RT
- Starting, stopping the trace recording
- Uploading and downloading the parameterization
- Delete the parameterization in the target system

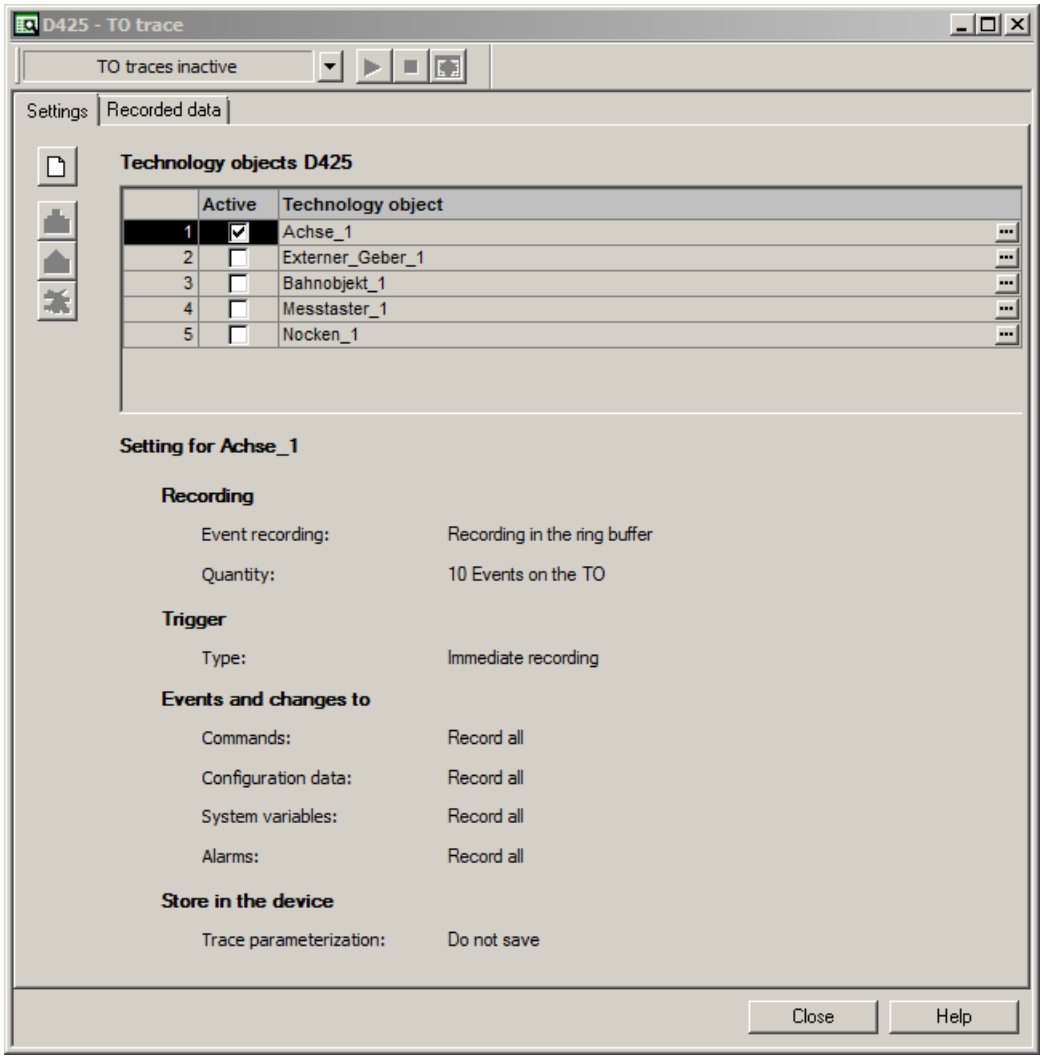

Figure 4-59 Dialog for parameterization

Toolbar

You control the recordings via the TO trace toolbar. The toolbar is displayed with the snap-in. This toolbar can be used to start or stop the trace for all technology objects and to upload a recording. The device to which the trace applies is fixed and cannot be changed. A separate trace window is opened for each device.

Table 4-19 Possible settings

Field/button	Description
TO traces inactive	Current state of the trace for all technology objects The field displays the state and availability of the TO trace. **Possible states:** • TO trace inactive (if all are complete or yet to start) • TO trace parameterization faulty (if at least one has an incorrect parameterization) • TO trace active (if at least one is running or waiting for a trigger)
	Opens a drop-down list to display the states of the individual TOs **Possible states:** • Inactive • Ready • Waiting for trigger • Running • Parameterization faulty • Recording finished
	Start TO trace
	Stop TO trace
	Upload data TO trace data can be uploaded at any time. If an endless trace is set at the time of the upload, the recording is appended to the existing trace in each case. If the time-limited trace is activated, the existing trace is overwritten.

Settings

The tab displays the technology objects created below the device. The settings of the Technology object trace event selection (Page 1180) dialog box are displayed below the table for the technology object selected in the table.

Table 4-20 Possible settings

Function	Description
Menu commands	
	Reset parameterization
	Download parameterization
	Upload parameterization

Function	Description
	Delete the parameterization in the target system
Technology objects	All the technology objects created in the project are displayed under the **Technology objects** setting. To select a line, click any cell within it. The settings for a line are displayed under the technology objects. Use the  button to change the settings for a technology object. All the technology objects are deselected under the default setting. The relevant technology object must be selected for the recording.
No.	Number of the technology object
Active	Activates or deactivates the trace for the technology object
Technology object	Name of the technology object
	The Technology object trace event selection (Page 1180) dialog box is called with this command.

Recorded data

The tab displays the recorded data and enables results to be saved and loaded in XML format.

Table 4-21 Possible settings

Function	Description
Menu commands	
	Load result
	Save results in XML format.
Reference time	Time specification to which the time stamp of the recorded events refer. The absolute time of the controller is used for the TO trace recording. Through the specification of the absolute time of the controller from the device or system trace recording as reference time, TO trace recordings can be chronologically assigned to the trace recordings. The absolute time of the controller in the device or system trace recording is displayed with the measuring cursor.
Time specifications relative to the reference time	Activation or deactivation of the reference time for the display
Columns	
Type	Type of recording
Time stamp	Time stamp of recording
Technology object	The reference object
Event	The event recorded
Current status	Status of recording
Detailed information for the selection	Detailed information is displayed in tabular form. Chronological sequence of events is structured as follows for time stamp, code position, event and current status: - Issued - Has become effective - Completed/aborted

Note

With PLCopen blocks, the return values are also current values and change while the block is running. In addition, the time stamp for **issued** corresponds to the **execute edge** on the block.

Technology object trace event selection

Commands, configuration data, and system variables are always selected as the default setting. Signals can be deselected on the individual tabs.

Make the settings for the recording for the selected TO in the **Technology Object Trace Event Selection** dialog. You can select or deselect certain commands, configuration data, system variables and alarms for the recording in separate tabs. Activate or deactivate the checkbox of a node to select or deselect the whole of the branch beneath.

The commands are sorted and grouped in the same way in which they are displayed in the command library.

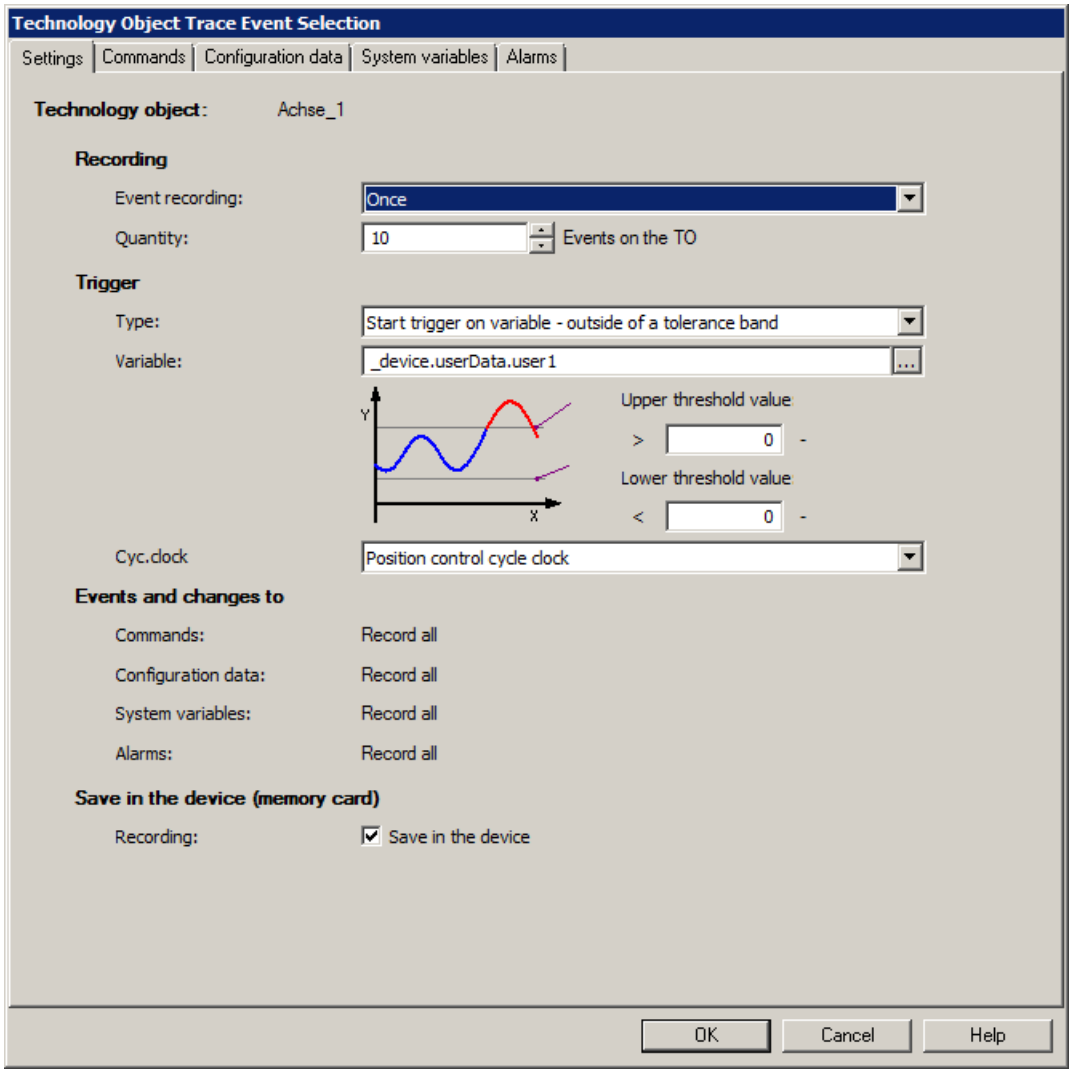

Figure 4-60 Technology Object Trace Event Selection

Table 4-22 You can set the following parameters:

Field/button	Meaning/instruction
Record	
Event recording	Recording of the events once or endlessly in a ring buffer With the setting **Once**, the trigger acts as the start trigger, with **Recording in the ring buffer** as the stop trigger.
Number	Buffer size of the number of events on the TO Up to 100 events can be recorded. The default setting is 10 events.
Trigger (the description is formulated for a start trigger and analogously is also valid for the stop trigger)	
Type	**Record immediately** Recording is started with the start of the TO trace.

Field/button	Meaning/instruction		
	Start trigger on variable ... Recording is started when a certain trigger threshold of the variable value is reached. The threshold value to be reached and a specific system variable can be specified for the trigger. Select the **cycle clock** for this trigger type. • **Positive edge** If the entered trigger threshold is exceeded, the signal recording will be started. You can enter the trigger threshold under **Threshold value**. • **Negative edge** If the entered trigger threshold is undershot, the signal recording will be started. You can enter the trigger threshold under **Threshold value**. • **Within a tolerance band** The signal recording is started when the variable value enters a tolerance band. Enter the **lower** and **upper threshold value**. • **Outside a tolerance band** The signal recording is started when the variable value leaves a tolerance band. Enter the **lower** and **upper threshold value**.		
		Variable	Variable used as trigger
		Threshold value	Value that is to be used as the trigger threshold
		Upper/lower threshold value	Upper and lower threshold value for the tolerance band
		Cycle clock	Cycle clock in which the monitoring is to be performed for when the trigger event occurs. **Servo cycle clock** The servo cycle clock is used as the basis for the trigger. **IPO cycle clock** The IPO cycle clock is used as the basis for the trigger. **IPO2 cycle clock** The IPO2 cycle clock is used as the basis for the trigger.
	Start trigger through 'TraceTrigger1' program call and **Start trigger through 'TraceTrigger2' program call** The recording starts when the program call is triggered by the trigger event. In MCC, use the "Activate Trace" command and in ST, you can set the tracecontrol[0].tracetrigger system variable to the value "Start". **Note** Simultaneous use of the **Trigger through program call** trigger condition for the TO trace and the device trace is not permitted. If the TO trace and the device trace are active simultaneously, different trigger conditions must be used.		
	Start trigger at code position The recording of variables is triggered by a defined code position in the program once the code position has been executed in the program sequence. You can parameterize the code position at **Program source**, **Program line** and **Trigger in the task**.		

Field/button	Meaning/instruction		
		Program source	Name of the program from which the program variables are to be recorded. Note that only the name of the source is to be entered without a preceding controller name.
		Program line	Enter here the program line of the code position where the recording is to be started. Note that only lines containing executable code or program-local variable declarations will result in a recording. Empty program lines, lines that only contain comments or program lines with global declarations will result in an error message. How to calculate the program line: 1. Open the cross-reference list. 2. Select a line or cell in the list. If the **Calculate program line...** button is selected then the line can be used for the trigger. 3. Open the dialog to display the program line using the **Calculate program line...** button. 4. Adopt the line number displayed in the dialog as the **program line** for the recording. **Note** With ST programs the number displayed in the cross-reference list under **Line/Block** can be adopted as the **program line**. With MCC or LAD/FBD programs the **program line** must always be calculated using the **Calculate program line...** button. The program line calculated here does not match the number displayed under **Line/Block**.

Field/button	Meaning/instruction		
		After the n-th pass	How often the code position is to be executed until the measured value is acquired. The measured value acquisition is performed cyclically after each n-th pass.
		Trigger in the task	Task in which the program variables are to be recorded. If you have assigned the program to several tasks, only the task selected here will be considered for the recording.
Events and changes of			
	Commands	Displays whether all or only selected objects are to be recorded.	
	Configuration data	Displays whether all or only selected objects are to be recorded.	
	System variables	Displays whether all or only selected objects are to be recorded.	
	Alarms	Displays whether all or only selected objects are to be recorded.	
Save in the device (memory card) (as of SIMOTION V4.4)			
	Trace parameterization	Activation of saving in the device The trace parameterization is stored in the device or in the file system. Activate the TO trace in the Toolbar (Page 1178) with the **Start TO trace** button. The TO trace is activated automatically during ramp-up. These measurements are retained after the controller is switched off. Read out the measurements with SIMOTION SCOUT (toolbar - **Upload data** button) or SIMOTION IT DIAG.	

Examples/applications

Saving the TO trace recording to the device (memory card)

The TO trace recordings can be saved retentively in the device with the **Save in the device** setting. In this way, a loaded TO trace can be automatically activated again the next time the controller is switched on.

Requirement

- The TO trace has been opened.
- An online connection has been established to the device.

Procedure

To parameterize a TO trace and save the recording in the device, proceed as follows:

1. In the Settings (Page 1178) tab of the TO trace for a technology object, call the Technology Object Trace Event Selection (Page 1180) dialog box.
2. Activate the **Save in the device** checkbox.
3. Close the Technology Object Trace Event Selection (Page 1180) dialog box with **OK**.

4. Load the parameterization to the device.
   The icon for deleting the parameterization in the target system is activated.

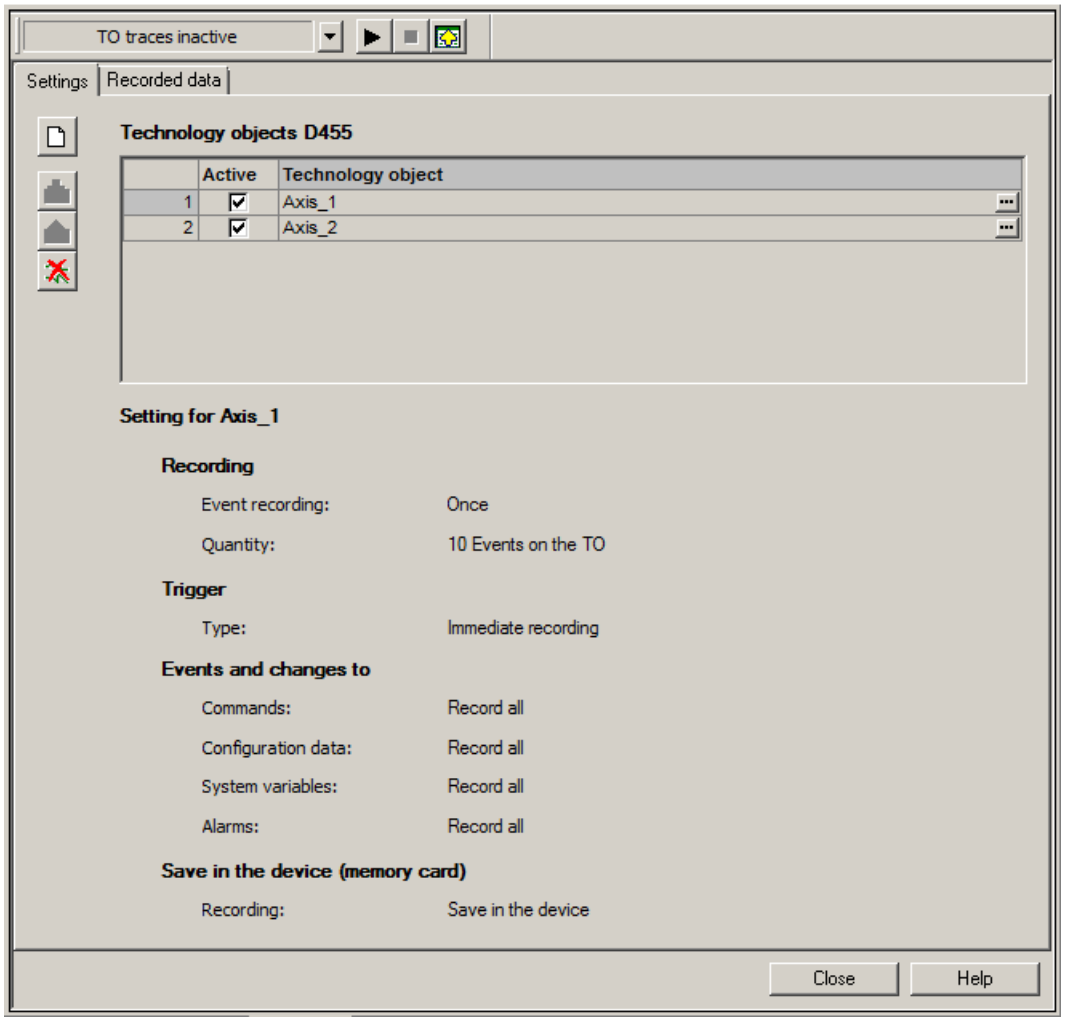

Figure 4-61 Settings tab for loaded parameterization in the device

5. Start the trace recording.
   The status is displayed in the toolbar.

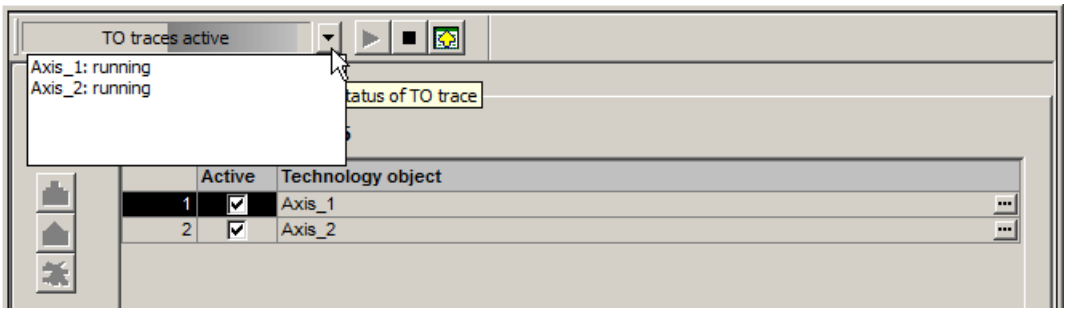

Figure 4-62 Status of the individual TOs

Reading out the TO trace recording from the device after a reconnection

TO trace recordings with the **Save in the device** setting can be read out with the TO trace even after disconnection of the online connection.

Note

A download of the TO trace parameterization may delete existing recordings in the device.

Requirement

The TO trace has been opened.

Procedure

To read out a recording saved in the device with TO trace, proceed as follows:

1. Establish an online connection to the device.
   The activated buttons to upload the parameterization and delete the parameterization in the target system indicate that a TO trace parameterization is available on the device.

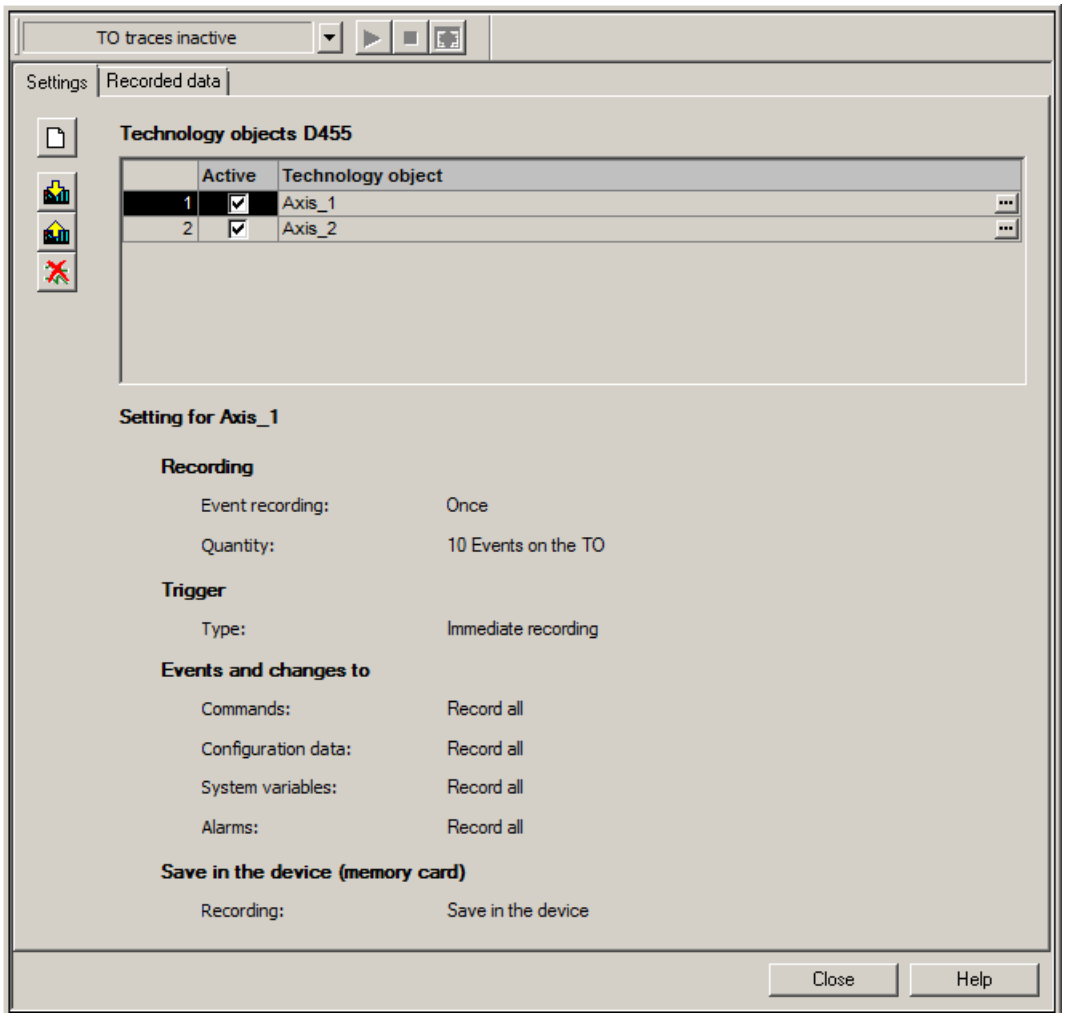

Figure 4-63 Settings tab after a reconnection when a TO trace parameterization is available on the device

2. Click the button to upload the parameterization.

Result

The elements of the offline parameterization are replaced by the online parameterization.

TO trace shows the status and, if required, the results gathered since the start of the trace. If the TO trace is still active in the device, further results are recorded.

4.2.4 Symbolic assignment (as of V4.2)

4.2.4.1 Symbolic assignment - introduction

Symbolic assignment of axis and drive

As of version V4.2, SIMOTION supports symbolic assignment to SINAMICS drive objects (DOs, drive objects) in the context of the configuration of technology objects (TOs) and I/Os.

This simplifies the configuration of the technological links including communication between the controller and the drive.

By means of symbolic assignment:

- Only compatible assignment partners are listed for selection in an assignment dialog
- The engineering system sets up communication between axis and drive automatically, along with the required PROFIdrive axis telegrams and the addresses used
- Telegrams are extended and assignments are created automatically in the drive depending on the selected TO technology (e.g. SINAMICS Safety Integrated)
- Axis and drive configuration can initially be carried out independently of one another
- Communication links are established automatically during the configuration of I/O variables on SINAMICS I/Os (telegrams and addresses are set up automatically and the I/Os are interconnected with the telegram).

Thus, other than symbolic assignment, no more configuration settings are required for communication. Since addresses no longer have to be configured, the connection is maintained even if addresses change.

Note

You can deactivate **automatic telegram configuration** and **automatic telegram adaptation** when configuring drive objects (DO drive, DO encoder, etc.) and in the dialog for telegram configuration.

If deactivated you will lose many of the benefits referred to above, we recommend it only in justifiable exceptional circumstances.

The TO axis, TO external encoder, TO output cam, TO cam track, and TO measuring input support symbolic assignment. It is also possible to establish symbolic assignment involving the onboard I/O of a SIMOTION D, a SINAMICS S110/S120 Control Unit, the TB30 and selected Terminal Modules.

The following components support symbolic assignment:

Module	Supports symbolic assignment
SIMOTION C, P, D	As of SIMOTION V4.2
Controller Extension • CX32-2 • CX32	As of SIMOTION V4.2
SINAMICS S110 CU305	As of SINAMICS V4.3
SINAMICS S120 • CU310 • CU310-2 • CU320 • CU320-2	 • As of SINAMICS V2.6.2 • As of SINAMICS V4.4 • As of SINAMICS V2.6.2 • As of SINAMICS V4.3
TB30, TM15 DI/DO, TM31	As of SIMOTION V4.2
TM41 (not DI/DO or AI)	As of SIMOTION V4.2
TM15, TM17 High Feature	As of SIMOTION V4.2

Note

The previous method of drive/axis and I/O configuration continues to be available. Symbolic assignment must be deactivated in such cases. Symbolic assignment is used by default for newly created projects.

Where projects are being upgraded to V4.2, symbolic assignment is deactivated by default and needs to be activated if required.

Symbolic assignment can be activated/deactivated in SIMOTION SCOUT via the menu "Project" > "Use symbolic assignment", see Using symbolic assignment (Page 1218).

Adaptation

In addition to the benefits offered by symbolic assignment, configuration is also made easier as of SIMOTION V4.2 with the addition of automatic adaptation of SINAMICS S120 data. When SIMOTION devices ramp up, reference variables, along with drive and encoder data for SINAMICS S120, are transferred automatically for the configuration data of the SIMOTION technology objects "Axis" and "External Encoder". This data no longer has to be entered in SIMOTION.

Events, after which an adaptation is carried out:

- When the controller boots
- STOP->RUN transition, if no adaptation has been made yet
- In the case of a restart of a TO
- _activateTO
- For _enableAxisInterface, if the status "not adapted" is present at the interface

- Via a user command (driveControlConfig)
- After a data set changeover; encoder changeover does not cause adaptation

For further information, see Setting as a real axis with digital drive coupling in the Axis TO Electrical/Hydraulic, External Encoder Function Manual.

4.2.4.2 Symbolic assignment of TOs

Assigning the TO axis and TO external encoder

Description

In the axis wizard, the assignment dialog shows the available drives which can be symbolically assigned to the axis.

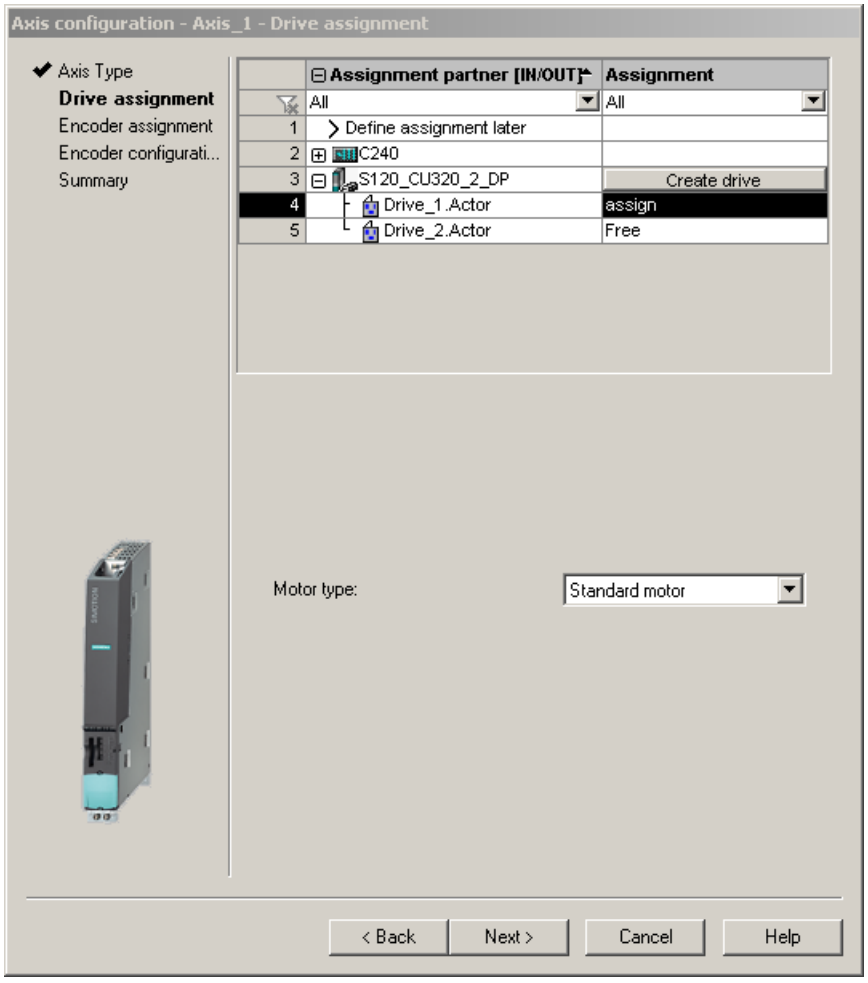

Figure 4-64 Assign axis and drive

Setting options

The following setting options are available:

- Assign drive
  Assign a previously configured drive
- Assign later
  The axis should not be assigned to a drive until a later point in time.
  Accordingly:
  - A programmer can use technology objects (Axis TO, for example) to make all the necessary configuration settings for the PLC and motion control functions and load them to the device; drive know-how is not required.
  - The drives can be configured and optimized separately by a drive expert and then, at a later point in time, the technology objects can be symbolically assigned to the drive objects via an interconnection dialog
- Create drive
  This function, which can be accessed in the assignment dialog, creates a new drive on an existing drive unit (e.g. S120 CU320-2 or SINAMICS Integrated) and assigns it to the axis directly. This allows the axis, including the drive, to be created in a single operation. It is not necessary to configure a drive before creating an axis.

Note

If you want to operate the drive directly via an application and not via a technology object, you must deactivate the "Automatic telegram setting" on the drive object, see also Message frame configuration (Page 1212).

Encoder assignment

With a position axis, encoder 1 is also created at the Axis TO (motor encoder) and automatically assigned to the first encoder on the drive.

If encoder 2 (direct encoder) is created at the Axis TO, it is assigned to the second encoder of the drive control. See also axis wizard overview.

On completion of the axis wizard, the symbolic drive assignment can be viewed using the following methods:

- Via the "configuration" of the axis
- Via the address list (view all addresses)

The assignment dialog can be called again from these dialogs using the " ... " button.

Instead of calling the assignment dialog, it is also possible to edit the input field containing the symbolic name directly.

Technology data block (TDB) and drive safety data block (DSDB)

The activation of the technology data block and support for SINAMICS Safety Integrated functions by the technology object can be set in the configuration dialog of the Axis TO for functions under the "Change" button. The assignment is always made to the drive DO of the axis actuator. The system automatically generates a telegram extension and the BICO interconnection of the relevant SINAMICS parameters.

Assignment of the I/O signals on the Axis TO

For the assignment of I/O signals at the Axis TO, e.g. the inputs for the homing output cam or hardware limit switches, call the assignment dialog from the axis dialogs or from the address list (view all addresses) by clicking the " ... " button.

The detailed structure and the identifiers of the component types for symbolic assignment can be found in Assignment types for symbolic assignment (Page 1783).

For further information about drive assignment, see the Axis Function Manual.

Address list

The address list in the "All addresses" view provides an overview of the assignments to all interfaces of the Axis TO. From this view, the assignments can also be changed via the assignment dialog (... button).

Assigning I/O variables via the address list (Page 1202)

Using the assignment dialog (Page 1207)

Assigning the TO measuring input

Description

The assignment dialog displays the available encoders can be symbolically assigned to the external encoder.

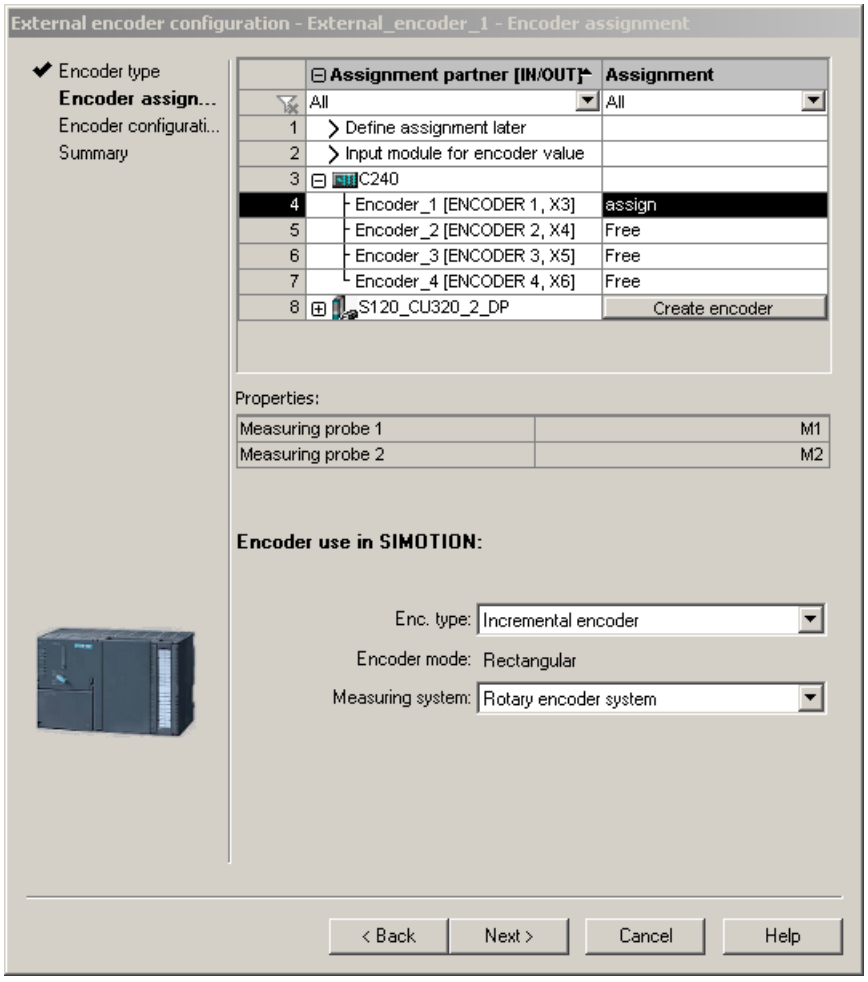

Figure 4-65 Assign External Encoder TO

For information about the axis wizard, which can also be used to configure the external encoder DO, see Overview of axis wizard.

See also

Using the assignment dialog (Page 1207)

Assigning the TO output cam and cam track

Description

Before configuring the technology object, the functionality of the terminals must be configured accordingly (configuration of a DI/DO as a digital output, for example).

The configuration settings for the technology objects to access I/Os are made symbolically, whereby only "function-compatible" I/O channels are listed for selection in the assignment dialog.

Example 1:

Only MI (measuring input) type symbolic assignments are listed for selection for the Measuring Input TO.

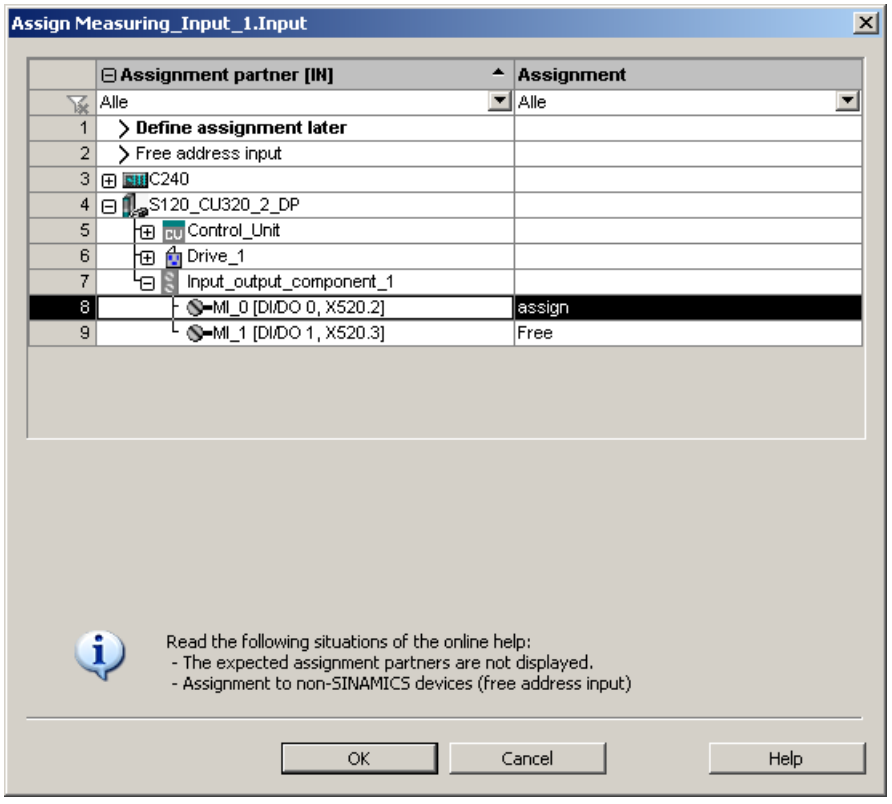

Figure 4-66 Assign measuring input

For further information, see the Output Cams and Measuring Inputs Function Manual:

- Assigning the TO output cam
- Assigning the TO cam track
- Assigning the TO measuring input

For information on the assignment dialog, see Using the assignment dialog (Page 1207).

Assigning the TO sensor

Description

It might be necessary to configure the functionality of the terminals prior to assignment.

The analog inputs are listed for selection of the TO sensor in the assignment dialog.

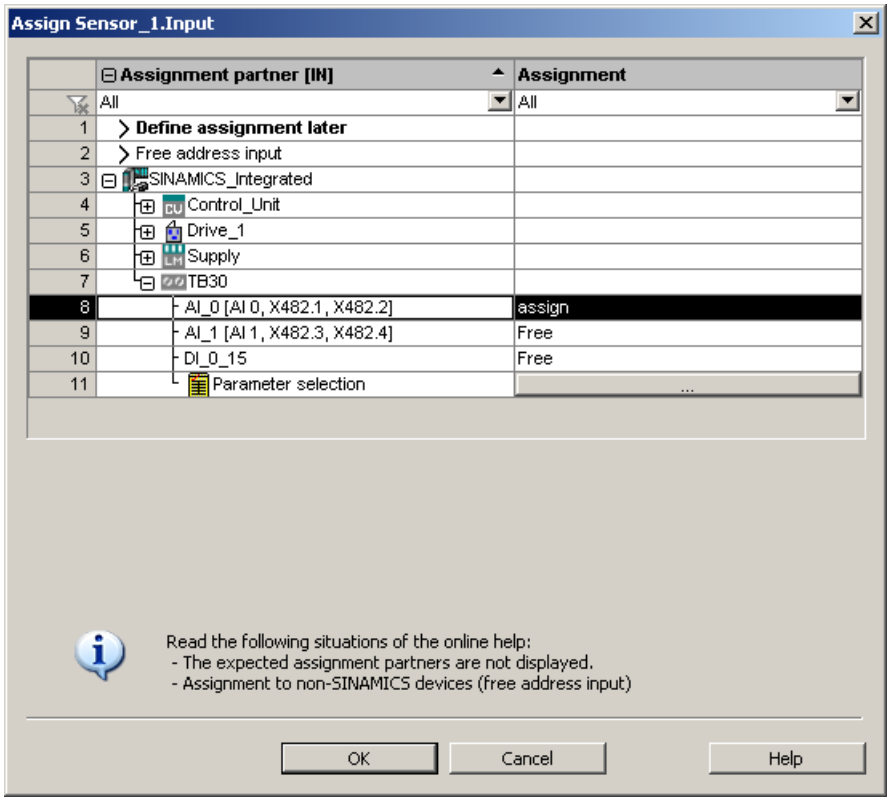

Figure 4-67 Assigning the TO sensor

For a description of the TO sensor, see the section titled TO Sensor in the "Additional technology objects" Function Manual.

The section titled Using the assignment dialog (Page 1207) contains a description of the assignment dialog.

4.2.4.3 Symbolic assignment of I/O variables

Symbolic assignment of I/O variables to the PROFIdrive message frame of the Axis TO

Description

You can assign I/O variables from the address list which you require for display and diagnostic purposes, for example, to individual components (status word, for example) of the PROFIdrive telegram using the assignment dialog. Only components suitable for the data type of the I/O variable are displayed. If no data type is specified at the I/O variable, the data type this is determined by the assignment partner after selection.

To assign an I/O variable to an individual component of a PROFIdrive telegram

1. Open the address list and create a variable.
2. During I/O variable configuration, enter the identifier IN or OUT (or make a selection from the drop-down list box) under the I/O address for the direction.
3. Select the data type and open the assignment dialog by clicking the "..." button.
   The assignment dialog will then only show assignment targets which are suitable for this data type. If you do not select a data type, all parameters will be offered. The assignment dialog returns the parameter data type when it is closed.

4. Under Assignment partner, select the component (e.g. the word) that you wish to assign.
5. Click **OK** to assign the component.

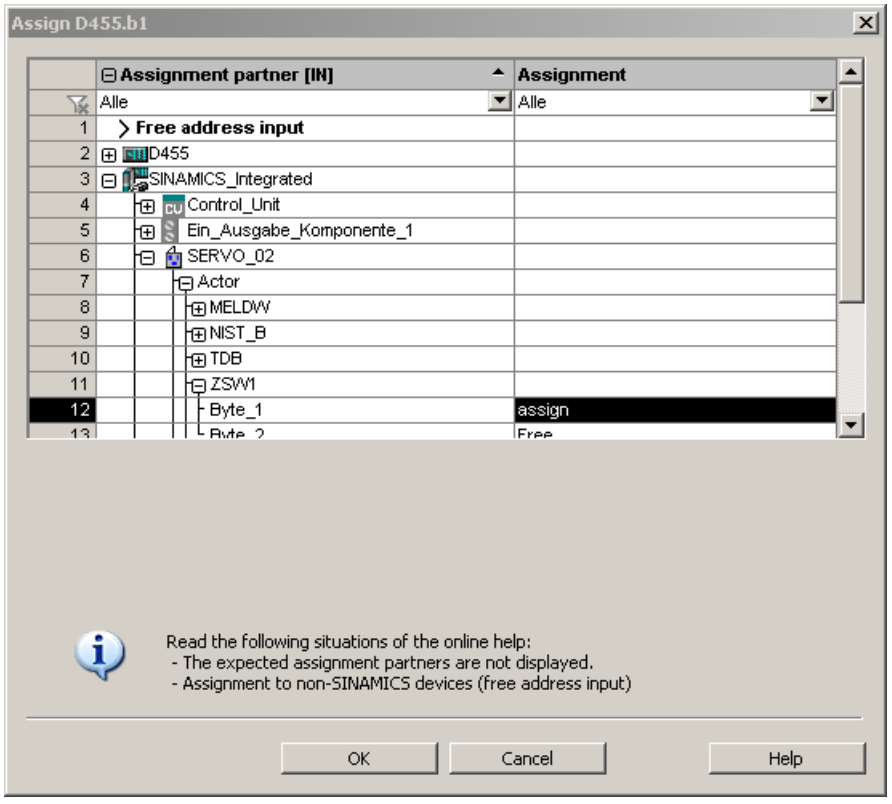

Figure 4-68 Assigning I/O variables to the PROFIdrive telegram of TO Axis

The detailed structure and the identifiers of the component types for symbolic assignment can be found in Assignment types in standard telegrams (Page 1788).

Interconnecting parameters via BICO

Description

I/O variables from the address list can be assigned to drive parameters using the assignment dialog. Only parameters suitable for the data type of the I/O variable are displayed. If no data type is specified at the I/O variable, this is determined following parameter selection.

The system automatically extends the standard telegram for the drive for the transfer of the parameters.

BICO interconnection

You can interconnect a BICO parameter with a telegram by specifying the parameter numbers, the transmission width (WORD, DWORD), and the transmission direction in the assignment dialog.

As part of this, you can also select the parameter of a different signal source (SINAMICS DO). The parameter will then be transmitted automatically along with the telegram of the assignment partner.

How to assign I/O variables to drive parameters

1. Open the address list.
2. During I/O variable configuration, enter the identifier IN or OUT (or make a selection from the drop down list box) under the I/O address for the direction.
3. Select the data type and open the assignment dialog by clicking the "..." button.
   The assignment dialog will then only show assignment destinations which are suitable for this data type. If you do not select a data type, all parameters will be offered. The assignment dialog returns the parameter data type when it is closed.

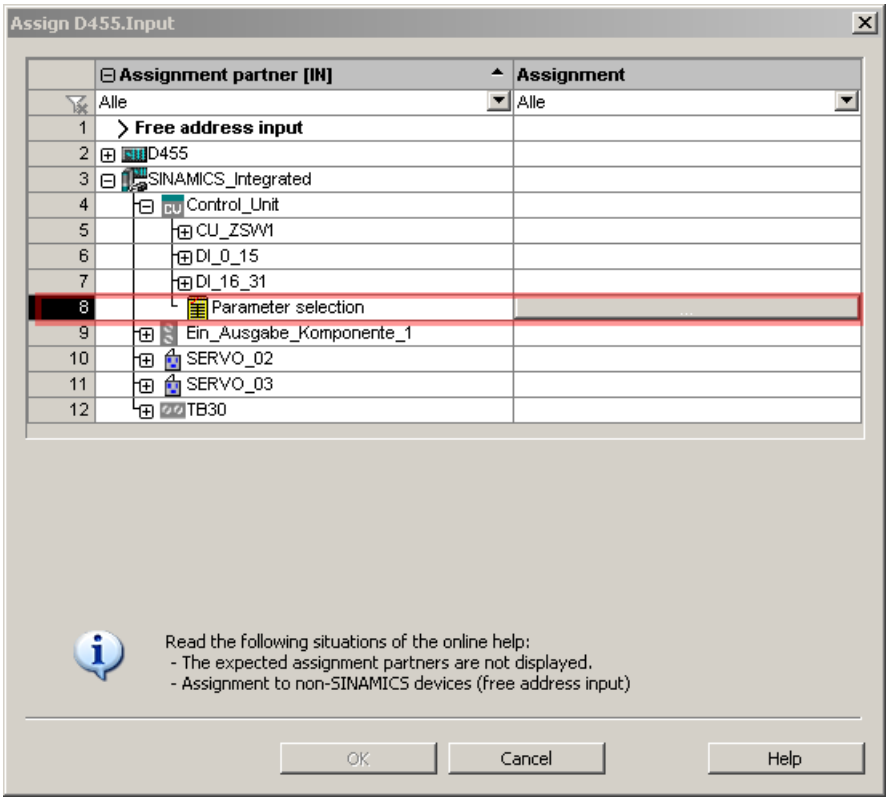

Figure 4-69 Assignment dialog for drive parameters

4. Click the ... button in the parameter selection line to open the parameter list.

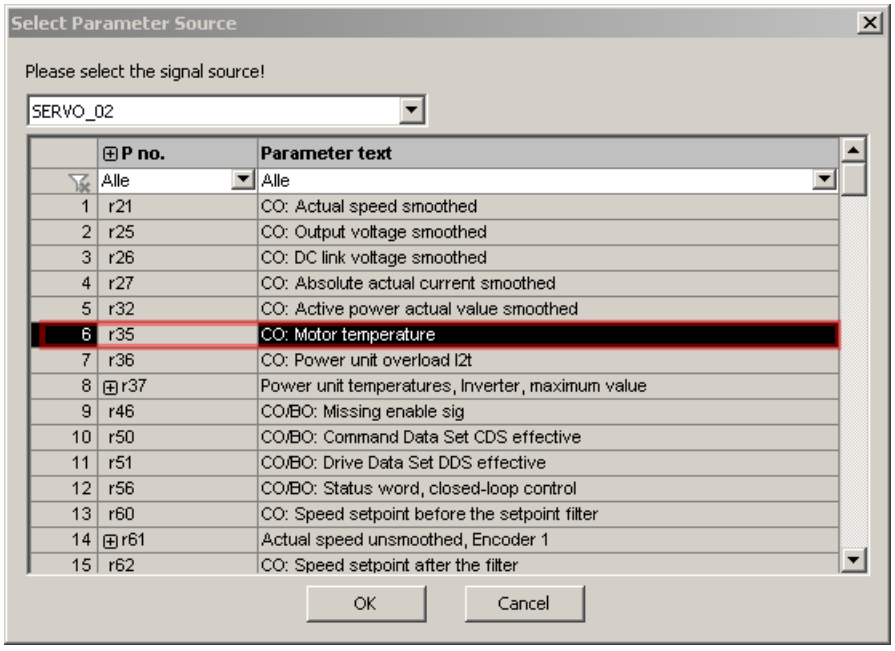

Figure 4-70 Dialog for parameter and DO selection

5. If necessary, select the signal source (SINAMICS DO) which makes the parameter available, followed by the parameter itself.
6. Click **OK** to accept the selection.

7. A SINAMICS parameter is assigned to the I/O variable in the assignment dialog.

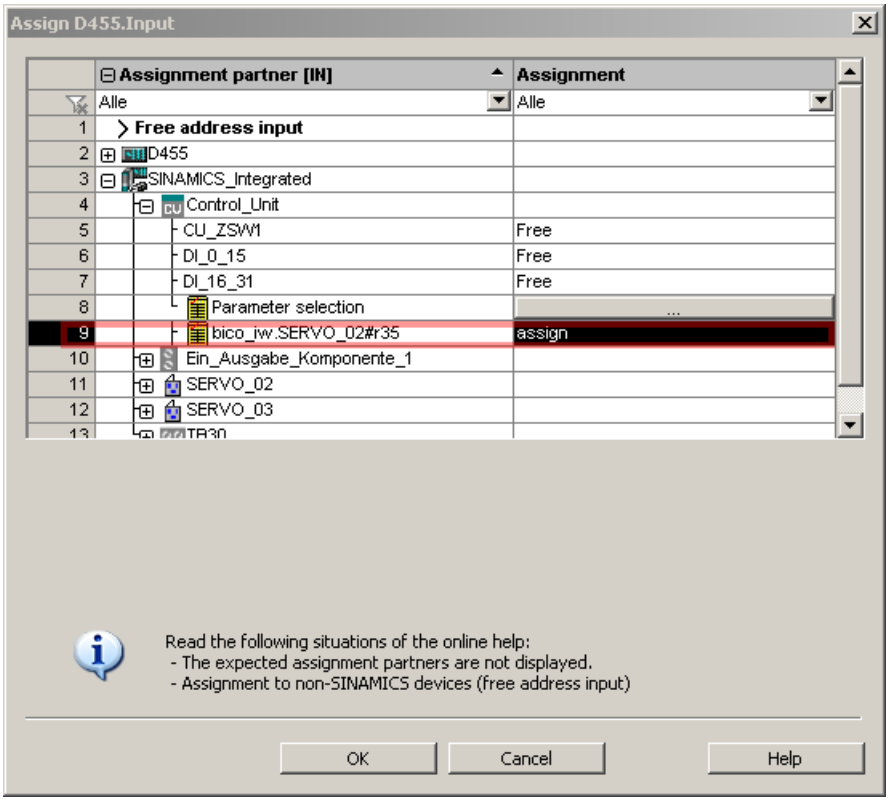

Figure 4-71 Assigned drive parameter

8. Click **OK** to accept the assignment.

Assignment types

The following table shows the possible types of assignment:

Name of the BICO interface	Data type	Direc-tion	Transferrable BICO parameters
BICO_IW.<parameter number>	WORD	Input	All CO parameters (BICO source)
BICO_QW.<parameter number>	WORD	Output	All CI parameters (BICO sink)
BICO_ID.<parameter number>	DWORD	Input	All CO parameters (BICO source)
BICO_QD.<parameter number>	DWORD	Output	All CI parameters (BICO sink)

Syntax of the assignment names:

- A number of parameters (separated by periods) are specified for outputs (SINAMICS side = received data) which can be interconnected with a number of BICO sinks.
- If the transferred parameter is on another DO, the DO name precedes the parameter. "#" is used as a separator between the DO name and the parameter.
- Individually transferred bits of a parameter appear in brackets [x].

Assigning I/O variables via the address list

Description

Prior to assignment, the functionality of the terminals might have to be configured accordingly (configuration of a DI/DO as a digital output, for example).

There are several ways to assign an I/O variable to terminals:

- Assignment of a terminal signal via the SIMOTION preferential interconnection. To do this, you must use the SIMOTION preferential interconnection for the corresponding input/ outputs of the SINAMICS DOs. The BICO interconnection is automatically executed.
- Assignment of a terminal signal via PZD interfaces, e.g. DI_0_15 or DO_0_15. The interfaces are, for example, assigned to PZD 2 (A_DIGITAL or E_DIGITAL).
  Please note for these signals that the BICO interconnection is not executed (e.g. for TB30, TM31 or TM15DIDO), although a q of the appropriate length is generated.

To activate the SIMOTION preferential interconnection for all terminals in a SINAMICS DO

1. In the project navigator, open the folder inputs/outputs of the relevant drive DOs.

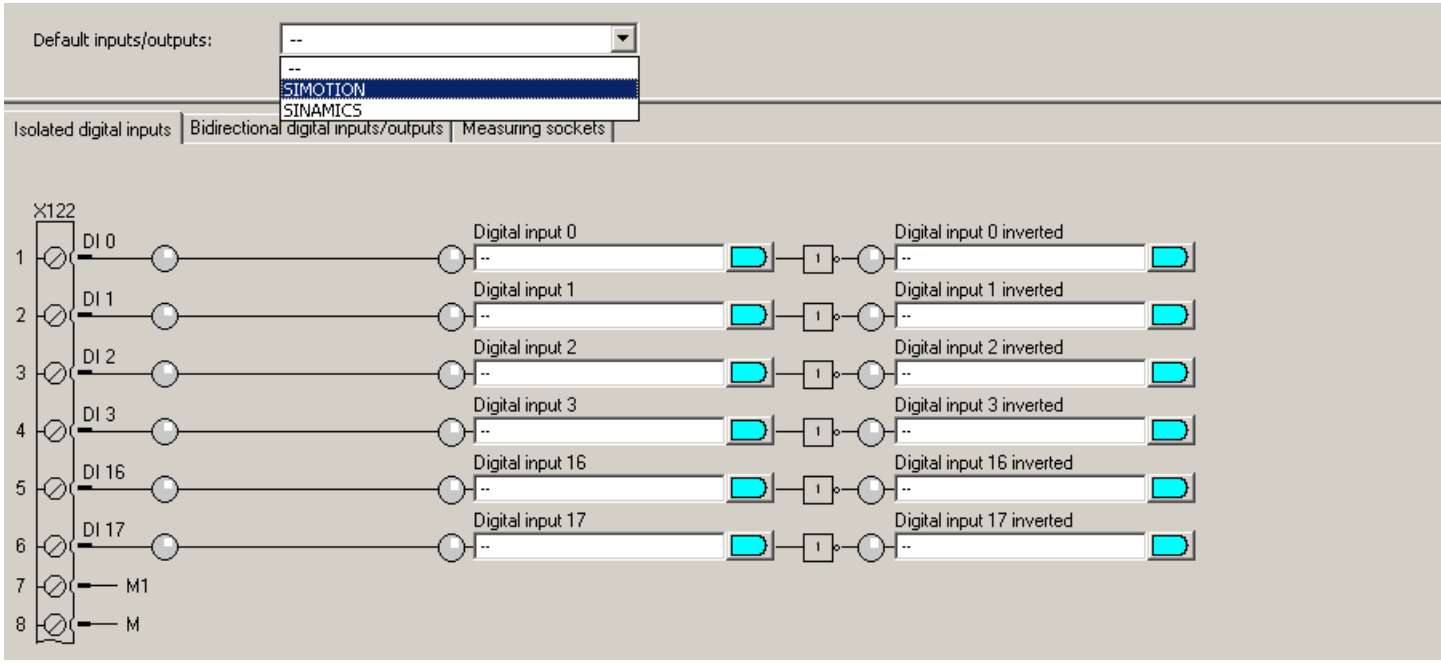

Figure 4-72 SIMOTION preferential interconnection

2. Select the entry **SIMOTION** in the **Default inputs/outputs** drop-down list box. All inputs/outputs are assigned to the SIMOTION preferential interconnections.

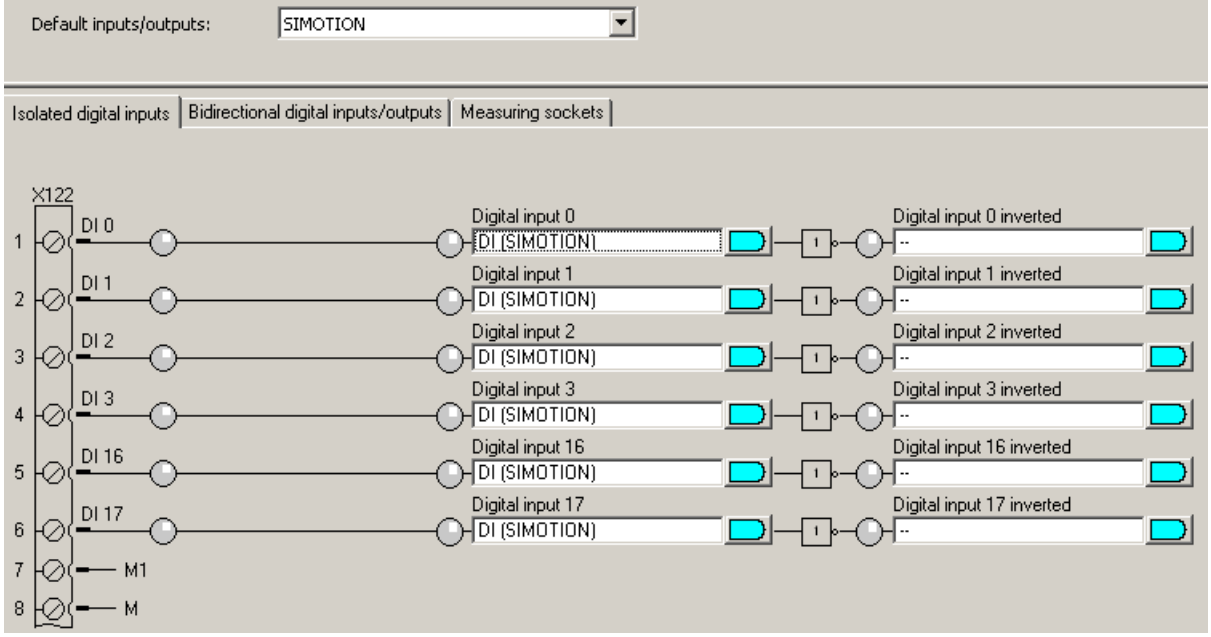

Figure 4-73 SIMOTION preferential interconnection active

With this setting, the BICO interconnections will be performed automatically.

If you wish to undo the interconnection, you must select SINAMICS in the drop-down list box for pre-assignment of the inputs/outputs.

To switch a single terminal

1. In the project navigator, open the folder inputs/outputs of the relevant drive DOs.
2. Click the tab in the foreground which shows the required inputs/outputs.
3. Click in the BICO field to display the possible interconnection targets.

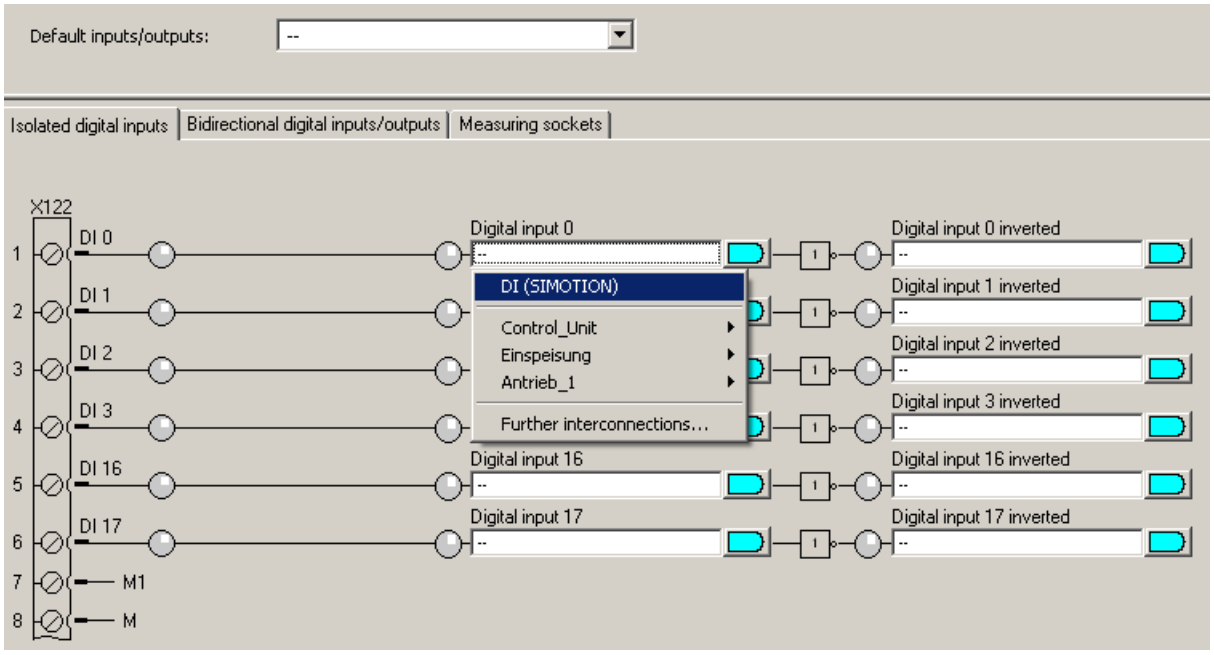

Figure 4-74 Setting the SIMOTION preferential interconnection locally

4. Select, for example, the entry DI (SIMOTION), to assign a digital input.

This is the way to proceed with a symbolic assignment with the SIMOTION preferential interconnection:

1. Activate in the drive DO the SIMOTION preferential interconnection (see above).
2. Open the address list in SCOUT.
3. For the configuration of the I/O variables, enter the identifier IN or OUT (or make a selection from the drop-down list box) under the I/O address for the direction, select the data type, and open the assignment dialog by clicking the " ... " button.

4. The assignment dialog will then only show assignment targets which are suitable for this data type.
   If no data type is selected, every known assignment parameter is listed for selection (e.g. bit, WORD, DWORD, input/output terminals). The assignment dialog returns the data type of the assignment partner when it is closed.
5. Select the appropriate terminal signal and click **OK**.

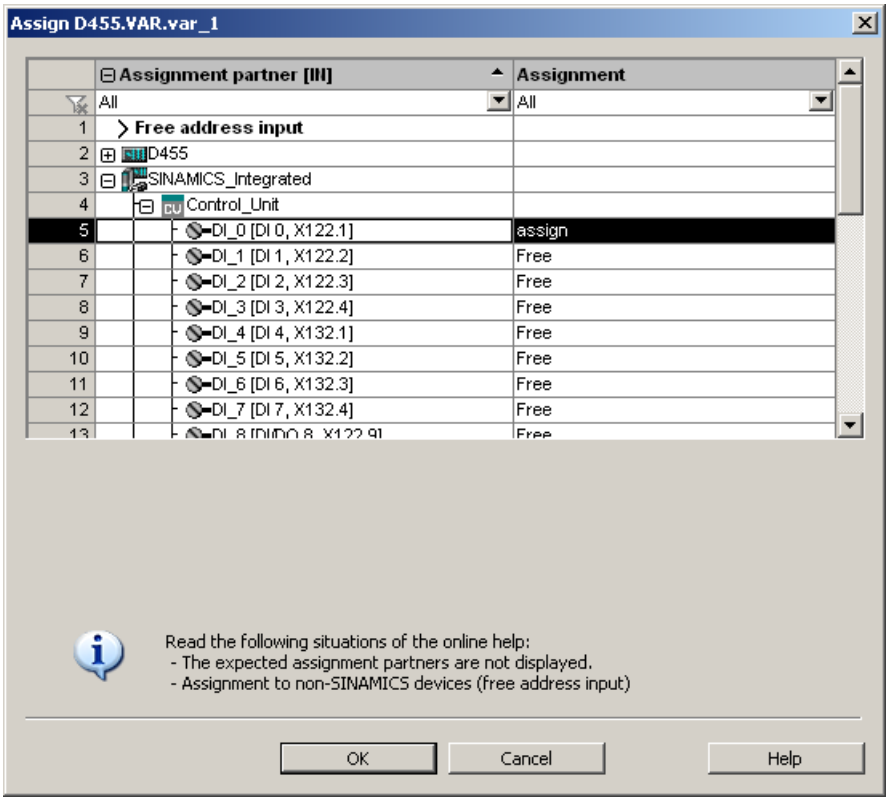

Figure 4-75 Assigning an I/O variable

Note

If the SIMOTION preferential interconnection is not activated, you only see entries like DI_0_15 in the dialog (see below). In this case, only interconnect the I/O variable to one bit in DI_0_15. The BICO interconnections must then be created manually, otherwise the interconnection does not function.

This is the way to proceed with a symbolic assignment of telegrams via PZDs:

1. Open the address list in SCOUT.
2. For the configuration of the I/O variables, enter the identifier IN or OUT (or make a selection from the drop-down list box) under the I/O address for the direction, select the data type, and open the assignment dialog by clicking the " ... " button.

3. Select the interface, to which you wish to assign an I/O variable, e.g. DI_0_15.
   You can also selectively assign the variable to a bit.

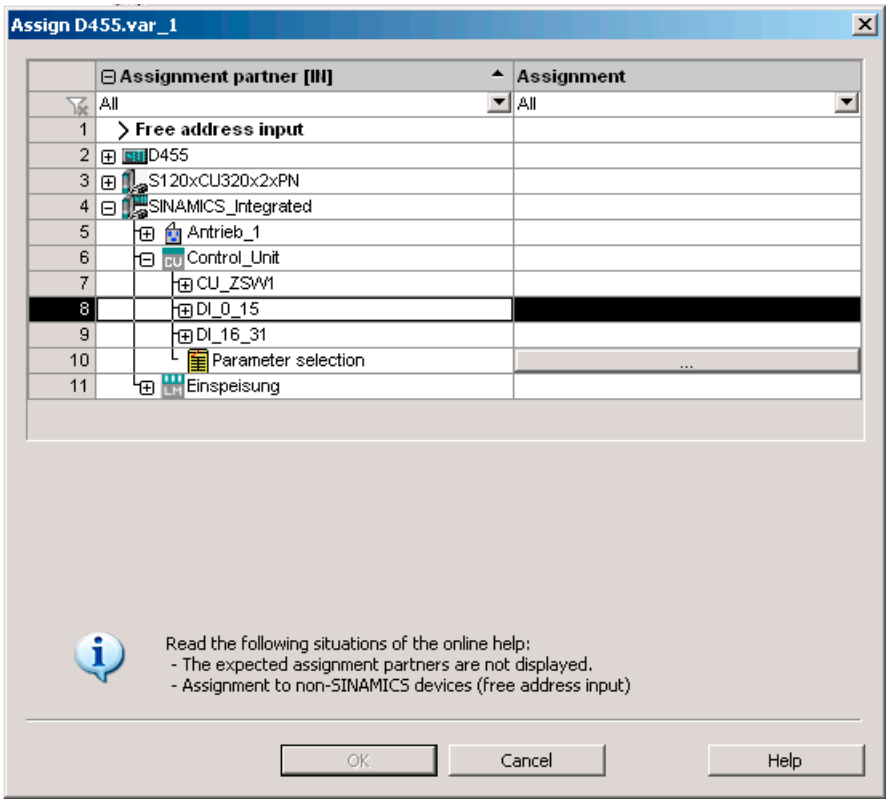

Figure 4-76 Assignment dialog for PZDs

4. Click **OK** to accept the assignment.
5. Now change to the dialog **communication** of the relevant SINAMICS DO. You can now see the individual bits of the PZD (e.g. E_Digital or A_Digital) listed there.
6. Interconnect the corresponding bit of the PZD with a signal, e.g. **External warning active**. This will execute the BICO interconnection.

Note

When you have activated the symbolic assignment, the telegrams 39x will be automatically assigned for the SINAMICS Control Units (at least telegram 390). The following interconnection of the terminals is, however, not executed in line with the original definition of the telegrams (without symbolic interconnection) since the terminal configuration is defined by it with the symbolic interconnection and managed by the symbolic interconnection.

Assignment of I/O variables with substitute values

Substitute values cannot be specified for I/O variables of data type BOOL. If you do need substitute values, however, proceed as follows:

1. Assign a Bool-type variable to, for example, the actuator interface of a drive, Drive_1.Control_Unit.DI_0_15
2. Create a global variable (with WORD as the minimum data type).
3. Assign the actuator interface of the drive to the variable in the assignment dialog, Drive_1.Control_Unit.MELDW.
   Bit1 of the substitute value must then contain the substitute value for the Bool variable.
   You can assign a substitute value to a BICO parameter using the same kind of method.

Additional, higher-level interfaces for assigning substitute values are available for various SINAMICS DOs, see SINAMICS assignment types (Page 1786).

See also

Assigning the TO axis and TO external encoder (Page 1191)

Assigning the drive I/O symbolically (Page 1407)

4.2.4.4 Working with the assignment dialog

Using the assignment dialog

Description

A SIMOTION object can be assigned to a SINAMICS object using the assignment dialog.

You can call the assignment dialog from various technology object configuration dialogs and from the address list. The display of the dialog is dependent on the assignment for which you call it; for example, if an input, an output, or an actuator/encoder is to be assigned.

The analog outputs of a C240 cannot be interconnected symbolically. These must be interconnected using the input of addresses.

Signal or assignment type not found

The assignment dialog only shows assignment types which are suitable for the SIMOTION type. If you were expecting a different assignment type, check:

- The data type of the assignment type (e.g. for I/O variables)
- The configuration of the SINAMICS DO (input/output)
- Whether symbolic assignment is switched on (**Project > Symbolic assignment**)

Structure of the assignment dialog with symbolic assignment activated

The assignment dialog with symbolic assignment activated is available in the axis wizard, the address list, and TO configuration screen forms.

The assignment dialog has the following structure:

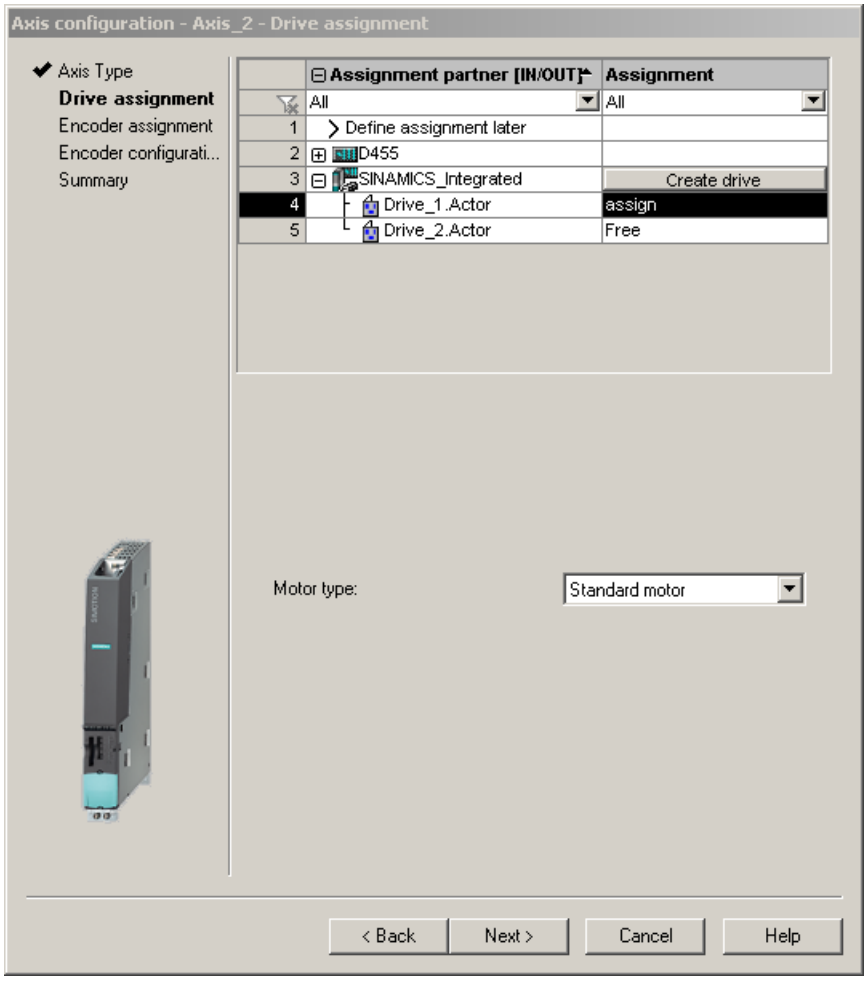

Figure 4-77 Assignment dialog with symbolic assignment activated

Field	Description
Title bar	The title bar contains the name of the SIMOTION interface or I/O variable to be interconnected. The dialog only shows the assignment parameters which are suitable for this interface.
Filter line	The filter line enables you to filter what is displayed in the table according to the criteria **all**, **free**, and **assigned**.
Assignment partner	This column lists all the devices and DOs. Click the "+" sign to expand the groups and display suitable interfaces, e.g. under the control unit. Note: If you assign an I/O variable to an I/O terminal of SINAMICS modules, you must still execute the BICO interconnection in the drive DO when using the interfaces DI_0_15 or DO_0_15 (name can vary depending on the number of terminals), see also Assigning I/O variables via the address list (Page 1202).

Field		Description
	Define assignment later	Select **Assign later** if you want to assign the SIMOTION interface at a later time.
	Free address input	Select this entry if you need/want to enter the address for the assignment partner yourself (e.g. for devices not assigned symbolically, hydraulic axes, or analog modules). You then have to read out the address in HW Config and enter it here.
	Parameter selection	Under Parameter selection you can select parameters of the SINAMICS DO. See also Interconnecting parameters via BICO (Page 1198).
Assignment		This column shows whether the SIMOTION interface is already assigned: • Blank or empty, the interface is still unassigned. • Assign; the interface is assigned to the selected assignment partner. • <assigned interface>; the interface is already assigned. The assigned SIMOTION interface is shown.
Create drive (Axis wizard - Assign drive)		Click the button to call the drive wizard for creating and configuring a SINAMICS drive.
Create encoder (Axis wizard - Assign encoder)		Click on the button to call the wizard for configuring the encoder DO.

Structure of the assignment dialog with symbolic assignment deactivated

The assignment dialog with symbolic assignment deactivated is only available in the axis wizard (drive assignment and encoder assignment).

The assignment dialog has the following structure:

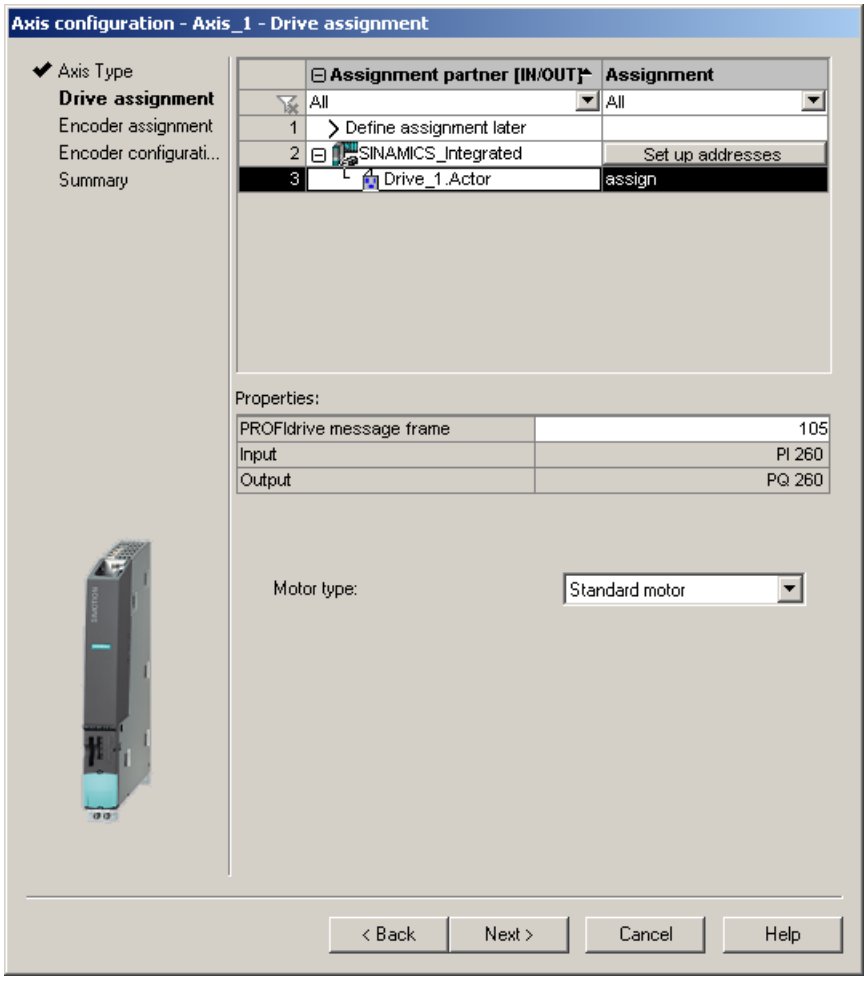

Figure 4-78 Assignment dialog

Field		Description
Title bar		The title bar contains the name of the SIMOTION interface or I/O variable to be interconnected. The dialog only shows the assignment parameters which are suitable for this interface.
Filter line		The filter line enables you to filter what is displayed in the table according to the criteria **all**, **free**, and **assigned**.
Assignment partner		This column lists all the devices and DOs. Click the "+" sign to expand the groups and display suitable interfaces, e.g. under the control unit.
	Free address input	Select this entry if you need/want to enter the address for the assignment partner yourself (e.g. for devices not assigned symbolically or hydraulic axes). You then have to read out the address in HW Config and enter it here.
	Parameter selection	Under Parameter selection you can select parameters of the SINAMICS DO.
Assignment		This column shows whether the SIMOTION interface is already assigned: • Blank or empty, the interface is still unassigned. • Assign; the interface is assigned to the selected assignment partner. • <assigned interface>; the interface is already assigned. The assigned SIMOTION interface is shown.

Field		Description
	Set up address	This button is for transferring the addresses, message frames, etc. of devices that are not symbolically assigned to HW Config.
Properties		In this table you can enter settings for the drive or encoder.

Assignment dialog with symbolic assignment deactivated or for drives which do not support symbolic assignment

The drives are only fully visible once you have performed "Set up addresses" (using HW Config). This affects SIMODRIVE or MASTERDRIVES drives, for example, and the PROFIBUS modules ADI4 or IM174. See also AUTOHOTSPOT.

Free address input

In addition to the symbolic assignment, you can also enter a hardware address directly under "Free address input". This is necessary, for example, if the hardware components do not support symbolic assignment.

The address entry in the text box is checked and depends on the data type

specified when calling the dialog.

- If a data type was not entered when the dialog was called, the correct syntax of the address is checked and the data type is determined on the basis of the address. It is then entered in the address list, for example.
- The address of an output variable cannot be entered for input variables, and vice versa.

4.2.4.5 Setting up addresses and message frames

Setting up addresses and message frames - overview

Overview

After all SINAMICS components have been configured, addresses must be determined for the process data exchange between the drive and the controller.

This procedure depends on whether **symbolic assignments** are used.

- With **symbolic assignment**, the addresses are determined automatically by the engineering system; see the section titled Setting up communication for symbolic assignment (Page 1212).
- Without **symbolic assignment**, the addresses must be determined manually; see the section titled Message frame configuration (Page 1212).

See also

Acyclic communication with the drive (Page 1604)

Setting up communication for symbolic assignment

You can set up communication for symbolic assignment using the following methods:

- Via the SCOUT menu (call the following in the menu: **Project > Set up communication for symbolic assignment**)
- By downloading to the target system
- By saving the project and compiling changes

When you set up communication, the message frames, BICO interconnections, and addresses are set up for the entire project.

See also

Setting up addresses and message frames - overview (Page 1211)

Message frame configuration (Page 1212)

Downgrading to versions <V4.2 (Page 1221)

Message frame configuration

Requirement

You have configured the drive unit.

Note

You only need to carry out these steps if symbolic assignment is not active or cannot be used (as is the case with devices < V4.2, for example).

On the basis of this configuration, one or more of the following actions should be performed:

- The automatic PROFIdrive telegram setting for a drive object should be activated/deactivated
- The automatic telegram extension for a drive object should be activated/deactivated
- The automatic address adaptation for a drive object should be activated/deactivated
- PROFIdrive telegrams should be configured for drive objects
- The addresses should be set up
- Telegrams should be extended manually.

Note

Telegram synchronization

The telegram synchronization process cannot delete any safety slots for which F-proxy is activated. For this reason, telegram synchronization cannot take place.

- Remove F-proxy, perform telegram synchronization and enable F-proxy again.

Procedure

To do so, proceed as follows:

- In the project navigator, open the entry for the SINAMICS drive unit, e.g. an external S120 or a SIMOTION D.
- In the project navigator, open the **Communication > Telegram configuration entry** under **Control Unit** (SINAMICS standalone CU3xx or **SINAMICS_Integrated)**.
  The **Telegram configuration** dialog is displayed on the tab **IF1 PROFIdrive PZD telegrams**.

The dialog lists all the available drive objects. The possible setting options are described in the following.

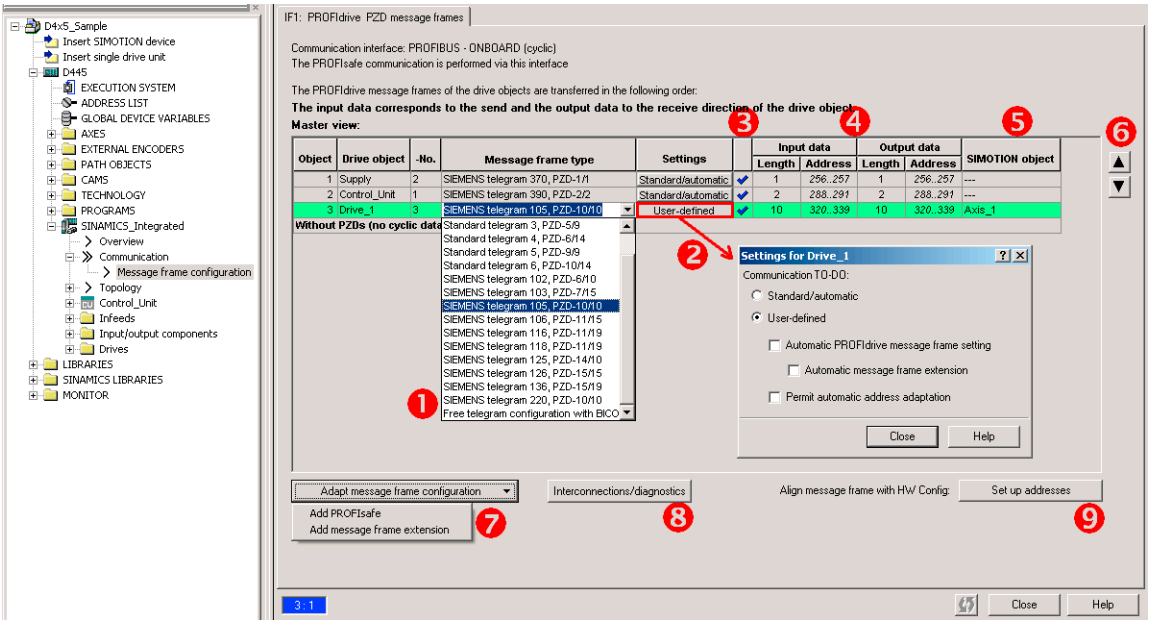

Figure 4-79 Telegram configuration

Table 4-23 Explanation of the figure

Number	Meaning
1	Selection of a telegram • The drive telegrams (telegrams 1 ... 6 and telegram 1xx) are defined in accordance with the PROFIdrive specification and can be selected based on the required functional scope. • You can transfer the signals of the I/Os or the global measuring inputs for the Control Unit, for example, via the telegrams 39x. Telegram 39x is also required for the time-of-day synchronization between SIMOTION and SINAMICS. • Free telegram configuration with BICO allows you to define your own telegram. • Free telegram configuration with p915/p916 (for TM15/17). • Telegrams 37x for control of the infeed.
2	The setting "Standard/automatic" and "User-defined" is visible only if "Use symbolic assignment" is activated. It is generally recommended to use the setting "Standard/automatic". With the "User-defined" setting, the automatic telegram setting, telegram extension and address adjustment can be deactivated and/or activated. • With "Automatic PROFIdrive telegram setting", the telegram is set by the system depending on the configured technology (telegram selection, e.g. for infeed, drive and Control Unit incl. onboard I/O). • With "Automatic telegram extension", the telegram is extended by the system depending on the configured technology (e.g. when the technology data block is activated in the axis configuration). • With "Allow automatic address adjustment", the addresses can be adapted for address displacements, for example, by the system. Address displacements can occur, for example, when a telegram is extended and the adjacent addresses are already occupied by other telegrams. For the TM15 / TM17 High Feature, deactivation of the "Automatic PROFIdrive telegram setting", the "Automatic telegram extension" and the "Automatic address adjustment" is in principle not possible since with these drive objects the telegram is always set up according to the parameterized terminal functionality (DI, DO, output cams, measuring inputs) and cannot be extended. In case the telegrams are to be manually configured for TM15 DI/DO, TM31 and TB30, and BICO is to be interconnected, then "Automatic PROFIdrive telegram setting" and "Automatic telegram extension" must be deactivated. See also Performing message frame configuration in the Online Help.
3	The icons in the status column show the following information:
	 The telegram is configured differently in HW Config. You must align the configuration with HW Config.
	 You are using a predefined standard telegram or free BICO interconnection.
	 You are using an altered standard telegram, which you have extended to include supplementary data.
	 You are using a telegram for which one of the two telegram lengths (I or O) is too long. The drive object cannot process this entry.
4	Length: Displays the size of the telegram component. Address: Address range in HW Config The addresses will be displayed only if they have been defined.
5	Displays the SIMOTION object that is interconnected to the SINAMICS object (e.g. axis or encoder).
6	Change the telegram order. Before the alignment, all drive objects without input/output addresses ("---..---") must be moved behind the objects with valid input/output addresses or those still to be aligned ("???..???").
7	"Manual" adaptation of the telegram configuration (e.g. when additional data, such as a motor temperature, is to be transferred via the telegram)

Number	Meaning
8	Display of the individual control and status words of the associated telegram.
9	Setting up of the addresses (alignment of the addresses with HW Config)

Note

If the telegrams for drive objects change (drives, Terminal Modules, etc.), you must set up the addresses again. The addresses are not updated automatically.

Error correction (symbolic assignment deactivated)

SIMOTION generates further configuration information (FastIO configuration) for the following functions using the 39x telegram:

- Time-of-day synchronization SIMOTION↔ SINAMICS
- Use of onboard I/Os of SIMOTION CU or CX
- Use of output cams and global measuring inputs
- _setDriveObjectSTW system function

If the telegrams are manually defined (symbolic assignment is deactivated), a 39x telegram must be created in the telegram configuration. The telegram must then be compared to the HW Config via "Set up addresses".

If the above functions cannot be used, create a new FastIO configuration. To do this, select the associated SIMOTION CPU in the project tree and right-click to open the "Fast IO" > "Create new configuration" context menu. Compile the project and load it into the CPU. Restart the computer.

The FastIO configuration is also used for the telegram of the Terminals Modules TM15 and TM17 High Feature. Follow the same procedure in the event of problems.

Setting up communication for symbolic assignment (Page 1212)

Assigning the TO axis and TO external encoder (Page 1191)

4.2.4.6 Switching over projects to symbolic assignment

Working with and without symbolic assignment

Description

The symbolic assignment simplifies the configuration of the technological relationships including the communication between controller and drive significantly. The names of the symbolic assignments in plain text is also advantageous for project maintenance.

The symbolic assignment is therefore recommended for new projects as of V4.2 and is automatically activated.

If symbolic assignment is used in a project, telegrams, interconnections and addresses are automatically created by the engineering system per default.

The engineering system sets the "optimum" PROFIdrive telegrams and telegram extensions for the system, makes the required BICO interconnections and determines the addresses.

Activating the symbolic assignment later

It is also possible to change updated projects to symbolic assignment. This must be decided individually, as follow-up work may be required. Particularly in the case of free telegram configurations, comprehensive follow-up work is to be expected.

NOTICE
Possible changes in telegrams and BICO interconnections If symbolic assignment is subsequently activated for a project in which telegrams have already been configured and interconnected, these can be changed together with the BICO interconnections! For this reason, make a backup copy of your project before activating the symbolic assignment.

If symbolic assignment is subsequently activated and telegrams have already been configured and interconnected in the project, the engineering system attempts to identify symbolic assignment for this configuration.

If a symbolic assignment was able to be identified for all communication connections, when the symbolic assignment is activated for the first time, the automatic telegram determination/ extension and address adaptation must then be activated for all drive objects (DOs).

It is not possible to determine a symbolic assignment for all communication connections. This is signaled via a dialog.

The corresponding warnings are then issued in the "Set up assignments" dialog.

Should such a case arise, one of the following measures is required PRIOR TO COMPILATION:

- Option 1: Deactivate automatic for drive object
  In the "Communication" > "Telegram Configuration" drive dialog, the automatic telegram determination/extension and address adaptation for the affected drive objects must be deactivated (user-defined setting, all check marks deselected).
  When the symbolic assignment is activated for the first time, the automatic telegram determination/extension and address adaptation is deactivated for all drive objects (DOs) as standard.
- Option 2: Reconfigure assignments
  The symbolic assignments must be made via the corresponding assignment dialogs of the TO configuration or the address list

Basic information

If necessary, the degree of reconfigurations required is thereby determined, as well as how well "already defined telegram/interconnections" correspond to the settings that the engineering system makes for optimization.

Given the individuality of the "Free telegram configuration with BICO" and the "Telegram extension", it is particularly important to take into account the fact that a symbolic assignment cannot always be determined.

As there is no standard telegram for TB30, TM15 DI/DO and TM31, and "Free telegram configuration with BICO" or "Telegram extension" is thereby applied, these components are particularly affected.

The same applies to the onboard I/Os of a Control Unit (D4x5-2, CX32-2, CU320-2, etc.), if the "Free telegram configuration with BICO" was used here.

Example 1:

If, for example, onboard I/Os of a Control Unit are connected via "Free telegram configuration with BICO", the telegram length, telegram format and interconnection are very individual.

If symbolic assignment is now activated, the image is usually generated on the basis of standard telegram 39x, whereby the telegram length, telegram format and interconnection change.

This then causes disturbances, for example, to the addressing of an onboard I/O that is to be used by SIMOTION.

Example 2:

Telegram 106 is configured for a drive (transfers two encoder values). Only one encoder is used, however.

If symbolic assignment is now activated, optimization of telegram 105 automatically occurs (transfers one encoder value).

NOTICE
Possible changes in telegrams and BICO interconnections
If symbolic assignment is subsequently activated for a project in which telegrams have already been configured and interconnected, these can be changed together with the BICO interconnections!
For this reason, make a backup copy of your project before activating the symbolic assignment.
TB30, TM15 DI/DO and TM31 are especially affected.

Upgrading projects <V4.2 (Page 1219)

Using symbolic assignment

Description

Symbolic assignment of SIMOTION and SINAMICS interfaces can be switched on or off as follows. As of V4.2, symbolic assignment is activated by default when new projects are created.

Where projects < V4.2 are being upgraded, symbolic assignment is deactivated by default and needs to be activated if required.

Activating symbolic assignment

1. If the menu entry **Project>Use symbolic assignment** is checked, the function is already activated. If it is not checked, select **Project>Use symbolic assignment**.
   A message dialog opens.
2. Click **OK** to confirm.
   Symbolic assignment is activated and the necessary steps are executed:
   - Assignments between the objects are determined and created symbolically based on the logical addresses
   - Addresses are set up (at the latest automatically before the download)

Note

If you are using symbolic assignment, SCOUT is entirely responsible for managing the telegram between SIMOTION and the drive DO. In other words, SCOUT independently creates telegrams that all contain the necessary signals according to the technological configuration. SCOUT automatically manages the positioning of signals in the telegram and its size; the user is no longer able to influence this process or make any changes.

If you have upgraded a project to V4.2 or started a project initially without symbolic assignment and then select symbolic assignment later on, SCOUT automatically extracts the signal objects contained in the existing telegram configuration and uses them to generate new telegrams automatically based on the pattern you defined. As a specific consequence of this, the number and size of telegram modules (PROFIBUS) or telegram submodules (PROFINET) are bound to change if symbolic assignment is selected (e.g. the number of telegram modules/submodules may be reduced in order to optimize performance).

Deactivating symbolic assignment

The menu item **Project > Use symbolic assignment** is checked if the function is activated.

1. Perform **Project > Use symbolic assignment**.
   A message dialog is displayed indicating that addresses and symbolic names will be set up and checked accordingly.
2. Click **No** to leave symbolic assignment activated.
3. Click **Yes** to deactivate symbolic assignment.

The logical addresses are reassigned priority for the connections between the objects. If this process results in invalid addresses, a message dialog brings this to your attention.

Upgrading projects <V4.2

Description

Should you wish to upgrade projects with a version <V4.2 in order to work with symbolic assignment, you must carry out the following steps where necessary. See also Working with and without symbolic assignment (Page 1216).

NOTICE
Possible changes in telegrams and BICO interconnections
If symbolic assignment is subsequently activated for a project in which telegrams have already been configured and interconnected, these can be changed together with the BICO interconnections!
For this reason, make a backup copy of your project before activating the symbolic assignment.
TB30, TM15 DI/DO and TM31 are especially affected.

Procedure

- Open project in SCOUT: The project is opened with deactivated symbolic assignment. In the **Telegram configuration** dialog of the corresponding SINAMICS Control Unit, the dialogs for the symbolic assignment telegram settings are deactivated. As a result, the telegrams, addresses and BICO interconnections that have already been configured are retained.
- Upgrading device version to ≥ V4.2. Only devices as of version V4.2 support symbolic assignment. Devices can be upgraded in HW Config, for example.
- Activating symbolic assignment: When symbolic assignment is activated, the assignments are introduced between axes and drives and are first updated when the project is saved and compiled. The addresses and telegram configuration of SINAMICS DOs continue to remain intact until the automatic telegram configuration is activated in the **Telegram configuration** dialog. In the **Set up assignments** tab, error messages that occur during assignment are output. Using these error messages, you can check and, if necessary, change the TO-DO interconnections.

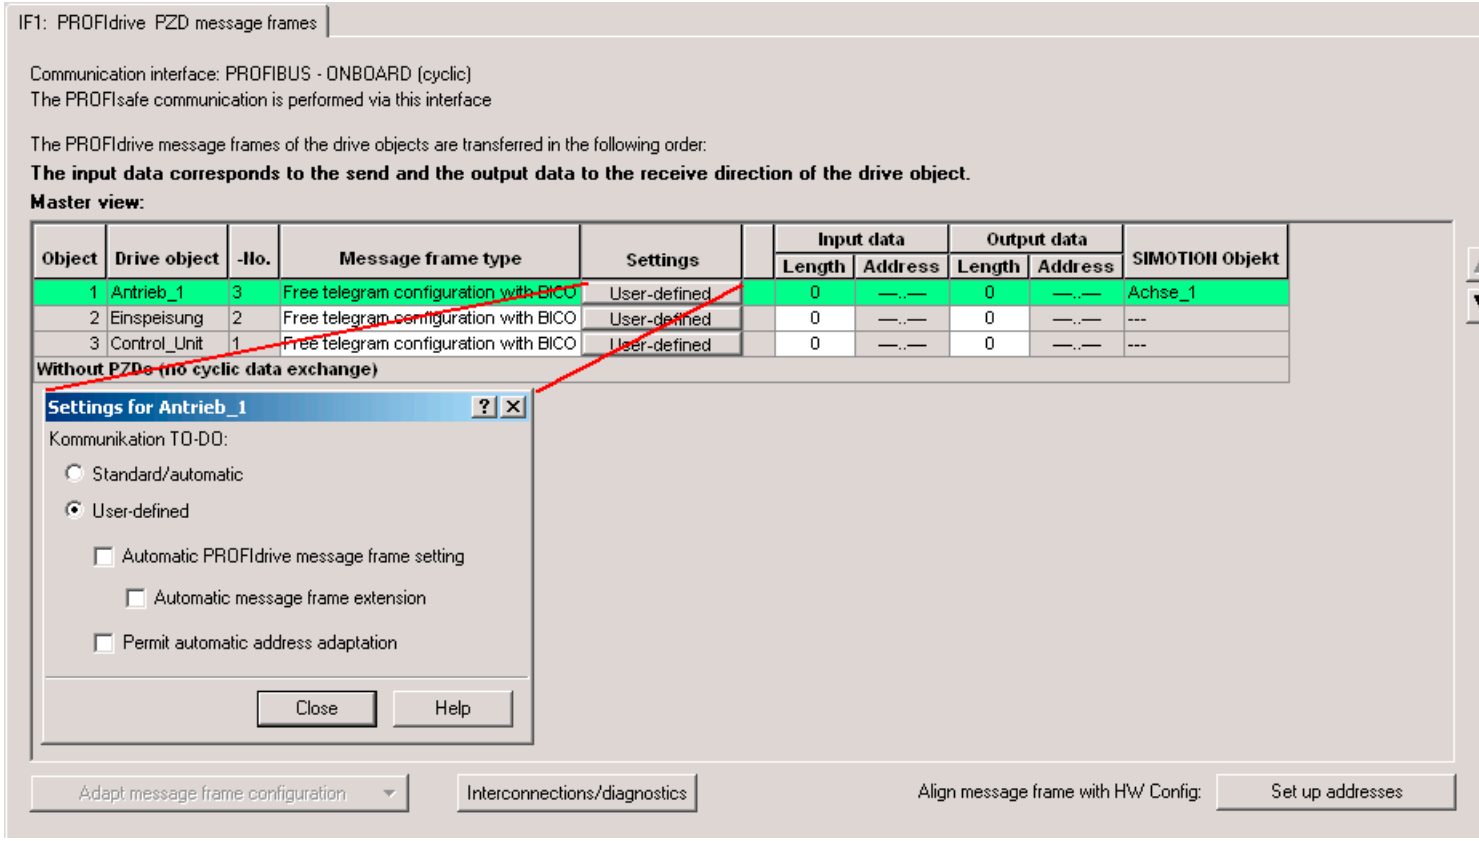

Figure 4-80 Telegram configuration according to high converting

- Assigning SINAMICS DOs: In order to ensure that the SINAMICS DOs are able to participate in the symbolic assignment, the following steps must be carried out in the **Telegram configuration** dialog for each DO:
  - Call dialog **Setting for <DO>** and select the **Standard/Automatic** option when you want to automatically execute the telegram configuration.
    Or
    Call dialog **Setting for <DO>** and select the option **User-defined** if you wish to execute the telegram configuration user-defined, e.g. if you wish to use the setting **Free telegram configuration via BICO** (deselct **Automatic PROFIdrive telegram setting**).
- Setting up communication for symbolic assignment: When you have checked all interconnections, you can run **Project>Setting up communication for symbolic assignment**. All telegrams, addresses and BICO interconnections are then updated via symbolic assignment.

Downgrading to versions <V4.2

Description

If a SIMOTION device is downgraded by replacing a device in HW Config, you must take into account the fact that symbolic assignments are only available as of version V4.2.

If symbolic assignments are used and downgrading to a SIMOTION device <V4.2 occurs, the "Communication for symbolic assignment" must be set up before replacing the device in HW Config. As a result of this, the addresses that are required for a project "without symbolic assignment" are identified.

See also Setting up communication for symbolic assignment (Page 1212) for more information.

Safety data block for a SINAMICS device version less than V4.x

Description

Problems occur with older SIMOTION modules and SINAMICS CUs that have a firmware version less than V4.x in the following combination:

- Used STANDARD telegram 4/6 or SIEMENS telegram 103/106 (each with and without a technology data block)
- Safety data block
- Servo drive
- Double-encoder system

Occurring problems

Upgraded projects:

The following message is output during subsequent activation of the symbolic interconnection for upgraded projects:

"Address/value of I/O variable 'Axis_x: TypeOfAxis.TechnologicalData.DriveSafetyExtendedFunctionsInfoDataIn.logAdress' (address: PIB xxx[x]) is invalid or is not supported by the hardware. (If required, perform FastIO "Create new configuration".)"

Newly created projects:

With newly created projects (and therefore activated symbolic assignment), the SIDB cannot be created by the system because the limited velocity must be interconnected to a double word.

Message output at activation of SINAMICS Safety Integrated Extended Functions on the TO axis: "SINAMICS_Integrated: Drive_x: Not enough space to set up the telegram extension".

Procedure

Upgraded projects:

In the "Telegram configuration", do not set the settings to "Standard/automatic" and deactivate the automatic PROFIdrive telegram setting and the automatic telegram extension, or make the appropriate settings.

If the system has deleted the telegram extension due to the "Standard/automatic" setting, make the settings as described above and interconnect the safety data block again (parameter 9733[0] to the first free word after the safety data block and leave the following word empty).

Newly created projects:

Deselect "Standard/automatic" in the telegram configuration settings and deactivate the automatic PROFIdrive telegram setting and the automatic telegram extension. Interconnect parameter 9733[0] to the first free word after the safety data block and leave the following word empty.

With upgraded and new projects:

Go to the address list and set the view to "All addresses". At the appropriate axis ("Axis name".Actor.SIDB), enter the address PIxxx at which the safety data block is located. For example, SIEMENS telegram 106 has 15 PZD and therefore the following applies:

Logical start address of the drive +30 / when using the technology data block +32

For further information, see also AUTOHOTSPOT in the TO Axis Function Manual.

4.2.5 Programming with Technology Objects

4.2.5.1 Definitions

The following section provides an introduction to the motion components primarily from the perspective of the ST programming language. This mainly involves system functions, system variables and configuration data. Some definitions are provided below:

- System functions are functions used for the system management. They provide access to technology-neutral functionality of the device. System functions are always available.
- A technology object (TO) represents a technological functionality (for example, positioning an axis, assigning parameters for an output cam) in the SIMOTION user program.
- Technology object functions or technology commands are language commands provided by the individual technology objects, i.e. functions for a technology object.
- A technology package contains one or more technology object types, from which the respective TO instance is generated with <Insert technology object>.
- System variables and configuration data are attributes of the technology objects and the basic system. You can use system variables to assign parameters for technology objects and the basic system or to read their status.

Note

You will find additional information about the basics, configuration and programming of motion control technology and, in particular, technology objects, in the SIMOTION Motion Control <Technology Objects> Function Manuals.

The specified topics are only briefly described in this documentation.

4.2.5.2 Programming technology objects (TOs)

Using technology functions in a program

In order to use technology functions (TO functions), you must select a technology package once. Technology objects (TOs) and, thus, TO functions are contained in the technology package. Formally, these are functions with a function name, input parameters and, usually, a return value. Below is an overview of the codes and components of the technology objects and TO functions except for the input parameters, which are described in the **Function parameters of the technology functions** section.

The following is presented from the ST programming perspective. For LAD/FBD and MCC programming see the respective manuals.

Selecting a technology package

You use the following command to select the technology package:

`USEPACKAGE` *tp-name*

Here *tp-name* is the name of the technology package (see next table).

Table 4-24 Technology packages

Technology package	Description of contents
CAM	• Basic motion control commands, positioning, gearing and discontinuous synchronous operation (cam) • Commands for external encoders, measuring inputs, output cams, and cam tracks
PATH[1]	As for TP CAM plus commands for path interpolation
CAM_EXT	As for TP PATH plus commands for supplementary technology objects (fixed gear, addition object, formula object, sensor, controller object)
TControl	Commands for temperature controllers

[1] Available as of version V4.1.

Technology object (TO) codes

A technology package provides technology objects (TOs); they are instantiated in the SIMOTION SCOUT. An instantiated TO is addressed (referenced) in the program by means of its name.

Codes of technology functions (TO functions)

TO functions are primarily commands that execute specific actions on the technology object, which is why they are also referred to as TO commands. You can also use TO functions in user-defined FBs. For more information about the format rules of user-defined FCs and FBs, please refer to the SIMOTION ST Programming Manual. The following table shows an overview of the formal codes of the TO functions.

Table 4-25 Codes of the TO functions

Code	Description
Name	All TO function names (*_enableAxis* in the example) are defined identifiers in the SIMOTION system that always begin with _ (underscore). To maintain a distinction between these TO functions and user-defined FBs and FCs, you should not create source file sections beginning with the _ character.
Input parameter	When called, TO functions can contain one or more input parameters and always supply a return value to the call location. Output parameters are not supported. For additional information, see Input parameters (Page 1574).
Return value	All commands normally return a double-precision integer (DINT data type). This indicates whether the command was successfully transferred to the system and processed normally (return value of zero) or whether an error occurred (return value other than zero).

Example

If the application requires you to enable a virtual axis, you could program a source file like the one shown in the following figure.

The following conditions must be fulfilled:

- An instance of a position axis or speed axis has been created in SIMOTION SCOUT as a virtual axis called Axis_1.
- The *myPos* program has been assigned to *MotionTask_1*, for example. The **Activation after StartupTask** option has been selected in the task configuration of *MotionTask_1*.
- The source file has been downloaded to the target system.

After the CPU has changed to RUN mode, virtual axis *Axis_1* will issue an enable. You can verify the status of the axis enable in system variable *Axis_1.control*.

Table 4-26 Example for using TO functions in a program

```
INTERFACE
    USEPACKAGE CAM;
    PROGRAM myPos;
END_INTERFACE
IMPLEMENTATION
(* The following program must be assigned to a MotionTask. The "Activation
after StartupTask" option must be selected in the task configuration. *)
    PROGRAM myPos
        VAR
            retVal : DINT;
        END_VAR
        // Axis is enabled for positioning.
        retVal := _enableAxis (
            axis := Achse_1,
            // TO instance identifier
            nextCommand := WHEN_COMMAND_DONE,
            // Condition for program advance.
            commandId := _getCommandId() );
            // Unique command ID
    END_PROGRAM
END_IMPLEMENTATION
```

Note

Use the long form for passing parameters (with value assignment) described in **Function parameters of the technology functions**. This form is clearer and more flexible. For example, the program code therefore remains compatible with new function parameters for a function extension.

You will find tips on efficient use of parameters in system functions in **Error sources and efficient programming**.

See also

Function parameters of the technology functions (Page 1228)

Sample program with namespace option

You can use the optional *namespace* add-on AS to define a name space. You can then also access types, variables, functions and function blocks in the technology package that have the same name as those in the ST source file.

The following example shows how to select the CAM technology package, assign it the namespace Cam1, and use the namespace:

Table 4-27 Example of selecting a technology package and using a namespace

```
INTERFACE
    USEPACKAGE CAM AS Cam1;
    USES ST_2;
    FUNCTION function1;
END_INTERFACE

IMPLEMENTATION
    FUNCTION function1 : VOID
    VAR_INPUT
        p_Axis : posAxis;
    END_VAR
    VAR
        retVal : DINT;
    END_VAR

    retVal:= Cam1._enableAxis (
            axis := p_Axis,
            nextCommand := Cam1.WHEN_COMMAND_DONE,
            commandId := _getCommandId() );
    END_FUNCTION
END_IMPLEMENTATION
```

Note

If a namespace is defined for an imported library or technology package, this must **always** be specified if a function, function block or data type from this library or technology package is being used. See above example: Cam1._enableAxis, Cam1.WHEN_COMMAND_DONE.

Function parameters of the technology functions (Page 1228)

Efficient programming - overview (Page 1686)

Differences between cyclical and sequential programming

Cyclic tasks

Cyclic tasks (such as the BackgroundTask) will be started by the system after their completion or automatically after a defined time frame. The values of the static variables of the assigned programs are retained. Cyclic tasks have a time monitoring and a defined error response should the time monitoring be exceeded. This means the code contained in cyclic tasks must perform its tasks quickly and efficiently. Tasks with a waiting character (for example, wait for the positioning of an axis) can only be performed in several call cycles of the cyclic task. This means TO system commands must normally be called with the IMMEDIATELY step enabling condition for the nextCommand parameter. The subsequent call cycles must then check the result of the system command for successful processing or error. This procedure is also called asynchronous execution.

Sequential tasks

After start, sequential tasks (e.g. MotionTasks) are executed once and then terminated. At each start, all local variables of the assigned programs are initialized; see Influence of the compiler on variable initialization (Page 1419) for variable initialization. Because sequential tasks do not have any time monitoring, they can attain a run time of any length. Sequential tasks are subject only to the control of the application. This means the application can start, stop, pause and resume tasks. The code contained in sequential tasks processes tasks successively, where the following task is normally performed only when the previous task has been completed. For example, an axis is first released and then homed. This means TO system command calls should be performed using the WHEN_COMMAND_DONE step enabling condition for the nextCommand parameter. The system function returns to the calling sequential task only when the command has been processed. This is also called synchronous execution.

General Procedure

In general, it is better to program sequential sequences in MotionTasks. The differences between a sequential programming in a MotionTask and the cyclical programming in the BackgroundTask are:

- As part of the sequential processing of a the MotionTask, one and only one (but nevertheless linked) step enabling condition can be awaited at any point in time. The step enabling condition is checked with high priority in the interpolator cycle clock. To reduce the response time for continuing the MotionTask, its priority can be increased temporarily (-> WAITFORCONDITION).
- A normally cyclical program checks in each cycle a number of signal states and step enabling conditions. This heavily loads and extends the cycle time. The advantage compared with the sequential type of programming lies in the parallel processing of requests and sequences.

Synchronous and asynchronous command execution

Synchronous command execution:

Further processing of the program is suspended at the command until the command has been fully executed (preferably in synchronous tasks).

Asynchronous execution:

The function is activated via a command and program processing continues (preferably in cyclic tasks) while the function is still being executed by the system.

For more information, please read Transition and step enabling condition (Page 1233).

Function parameters of the technology functions

The function parameters of the TO functions are:

- *mandatory*, i.e. they must be specified, for example, the TO instance and the target position for positioning;
- *optional predefined*, i.e. they can be specified; otherwise, a default setting for the system is activated, for example, IMMEDIATELY for the step enabling condition;
- *optionalUserDefault*, i.e. they can be specified, but if they are not, a user-defined default behavior takes effect (programmable or configurable in the associated userDefault variable). For information about the use of parameter values in motion control programs, refer to the documentation for the technology objects (TOs).

The TO instance name must always be specified for the TO commands as they cannot be preset by the system. In our **Example of variables to be specified**, you must specify which axis is to be activated (axis := myaxis).

Short and long form of the function parameter specification

The function parameters can be specified with or without function parameter identifiers.

The following variants are supported (see IEC1131/3 2nd Edition, 11/98):

- **Short form**
  "Call by value" as call with fixed arrangement and number of input variables corresponding to the function declaration
- **Long form**
  "Call by name" as call with variable arrangement and number of input variables

Short form

The function parameters (parameter identifiers) are omitted and only the current data values (parameter values) are specified. An assignment operator is not permitted.

All parameter values (even optional ones) must be separated by commas *in the correct order*!

Only a few system functions (see **Functions for the runtime measurement of tasks**, **Task control commands** and **Functions for the message configuration**) require the short form of parameter transfer when called. This is specified explicitly for the relevant functions.

Long form

The transfer parameters are assigned to the formal operands. Transfer parameters with assigned default values can be specified optionally, but this is not essential.

Note

Use the described long form (with value assignment). This form is clearer and more flexible. For example, the program code therefore remains compatible with new function parameters for a function extension.

Mandatory rules for specifying function parameters

The following table shows the rules you must follow when specifying function parameters.

Table 4-28 Rules for specifying function parameters

Rule	Example
Short form	
All function parameters must be transferred.	In the **Example of variables to be specified** the actual values *myAxis* (variable) and *IMMEDIATELY* (value) are assigned to the function parameters *axis* and *nextCommand*.
The order of the function parameters according to the function declaration must be maintained.	-
Long form	
Only function parameters that are not optional must be specified. The default value is used for parameters that are not specified.	In the **Example of variables to be specified**, the following is also possible: *_enableAxis (axis:=myAxis)*
The order of the function parameters is optional.	In the **Example of variables to be specified**, the following is also possible: *_enableAxis (nextCommand:= IMMEDIATELY, axis:=myAxis)*
Several function parameters	
Several function parameters are separated by commas.	In the **Example of variables to be specified**: *_enableAxis (axis:=myAxis, nextCommand := IMMEDIATELY)*
Actual values as variables	
The advantage is that you can reuse the source file sections that use these variables. For example, a user-defined function block (FB) is to call a TO function with variable axis identifiers as function parameters. It would be awkward to have to call the function several times using constant axis names and would also mean that you could not reuse the FB. You can also use other actual values as variables.	In the **Example of variables to be specified**, the user-defined function block *posFB* defines the TO instance *myAxis* (*myAxis:PosAxis*). When you call a TO function from this FB, the TO instance is used as actual values (*Axis := myAxis*). The values for the TO instance are derived not from the user-defined FB, but from the program called by this FB with *myFB (myAxis := Axis)*. For the reasons named, you can also call the FB and, thus, the TO function with *myAxis := Axis2* or *myAxis := Axis3*, etc. This means you can use the FB in all programs of the ST source file and in programs of other source files with the aid of the export function.
Actual values as values (enumerators)	

Rule	Example
If you enter actual values as values (*next Command: = IMMEDIATELY* in the example), you must usually choose a value from various specific states (only for enumerators). Enumerators are a derived data type. You will find basic information about enumerators in Chapter "User-defined data types" in the ST Programming Manual. You can also specify direct values for other data types.	In the **Example of variables to be specified**, enumerators IMMEDIATELY and WHEN_COMMAND_DONE are available for function parameter *nextCommand* in TO function *_enableAxis*. The compiler rejects other values during compilation of the program.
Parameters for the transition and step enabling condition	
With many motion commands, you can specify when the TO function is executed on the technology object and when the next statement is processed (see **Transition and step enabling condition**)	-
Parameters for command identification	
All motion commands must contain a parameter for the command identification. This allows you to track the status of the command execution (see **Diagnosis of the command execution**).	-

Note

All system data types for enumerations (in system functions and system variables) begin with the word *Enum*. For example, function parameter *nextCommand* has enumeration data type *EnumNextCommandEnable* (with values *IMMEDIATELY* or *WHEN_COMMAND_DONE*).

All system data types for structures (in system functions and system variables) begin with the word *Struct*.

If you do not begin user-defined data types with character string *Enum* or *Struct*, names cannot overlap. For a detailed description of of the name spaces, see ST Programming Manual.

Appendix D of this manual contains all reserved identifiers of the ST (Structured Text) programming language, the system functions, the system blocks and the SIMOTION devices.

The reserved identifiers of the SIMOTION technology packages can be found in the List Manuals for the SIMOTION technology packages.

Reference and value specification for motion variables

The parameters of motion variables (e.g. velocity, acceleration) are defined using a reference parameter and a value parameter.

- The reference parameter specifies which system variable the motion variable to be transferred references and, if required, how the following value parameter is to be interpreted.
  The identifier of a reference parameter is formed from the identifier of the motion variable with the suffix *Type*, e.g. *velocityType*.
- The value parameter specifies:
  - For reference parameter = DIRECT: The numerical value of the motion variable.
  - For reference parameter = USER_DEFAULT: The scaling factor of the default value stored in the system variable.

  The value parameter has no significance for other reference parameter settings.
  The identifier of a value parameter is the identifier of the motion variable, e.g. *velocity*.

Table 4-29 Frequent reference parameters and effect of the associated value parameters

Reference parameter	Value parameter	Value of the motion variable
DIRECT	Absolute value	Content of the value parameter (with the unit of the motion variable specified during the configuration of the technology object). See example in the table below.
USER_DEFAULT	Relative value [%]	Default setting * value parameter / 100 The default settings for the motion variable are stored in a system variable. See example in the table below.
ACTUAL	–[1]	Current actual value
CURRENT	–[1]	Current setpoint of the interpolator
EFFECTIVE	–[1]	Last programmed value
[1] Value parameter is ignored		

Table 4-30 Example of velocityType (reference parameter) and velocity (value parameter)

velocityType	velocity	Value of the motion variable
DIRECT	(No details)	100 [configured unit]
	50.0	50 [configured unit]
	200.0	200 [configured unit]
USER-DEFAULT	(No details)	100% of the system variable value[1]
	50.0	50% of the system variable value[1]
	200.0	200% of the system variable value[1]
[1] For motion commands of an axis: system variable *userDefault.velocity*		

Data type of TO instance variables

You can use TO instance variables, for example, for object specification in TO function calls.

Note

New TO data types (as of V4.0) begin with a "_" to prevent confusion with user variables.

You must first declare the variables, however, and you must choose from a predefined selection of data types (see table for **Data types for technology objects**). In our **Use of TO functions in the program** examples in this section (**Example of variables to be specified**), the data type is *PosAxis*, because you want to create TO instance variables for position axes. The *Cam* (*discontinuous synchronous operation*) technology package you have selected contains the *PosAxis* data type for the *Position Axis* technology object.

Table 4-31 Data types of technology objects (names of technology objects)

Technology object	Data type	Contained in the technology package
Drive axis	DriveAxis	CAM, PATH[1], CAM_EXT
External encoder	ExternalEncoderType	CAM, PATH[1], CAM_EXT
Measuring input	MeasuringInputType	CAM, PATH[1], CAM_EXT
Output cam	OutputCamType	CAM, PATH[1], CAM_EXT
Cam track	_CamTrackType	CAM, PATH[1], CAM_EXT
Position axis	PosAxis	CAM, PATH[1], CAM_EXT
Following axis	FollowingAxis	CAM, PATH[1], CAM_EXT
Following object	FollowingObjectType	CAM, PATH[1], CAM_EXT
Cam	CamType	CAM, PATH[1], CAM_EXT
Path axis[1]	_PathAxis	PATH[1], CAM_EXT
Path object[1]	_Pathobjecttype	PATH[1], CAM_EXT
Fixed gear	_FixedGearType	CAM_EXT
Addition object	_AdditionObjectType	CAM_EXT
Formula object	_FormulaObjectType_	CAM_EXT
Sensor	_SensorType	CAM_EXT
Controller object	_ControllerObjectType_	CAM_EXT
Temperature channel	TemperatureControllerType	TControl
General data type, to which every TO can be assigned	ANYOBJECT	

As of Version V4.1

Variables of the technology object (TO) data type are initialized by default with the value TO#NIL. You can use this to check whether a valid TO was assigned to a variable; see **Example of variables to be specified**.

Example of variables to be specified

An example of variables to be specified with a technology object data type (an example of optional use was described in **Data types for technology objects**) follows. A reusable FB will be written, which will enable any axis. Since the axis name is variable, you must define a variable with the data type of the axis.

The axis to be enabled is provided when the FB is called. This is verified for safety reasons. If no TO is available (TO#NIL), execution of the FB is interrupted.

Table 4-32 Example of variables to be specified with a technology object data type

```
// ...
FUNCTION_BLOCK posFB
    VAR_INPUT
        myAxis: posAxis;
    END_VAR

    VAR_OUTPUT
        // Return value of the TO function,
        // also output parameter of the FB
        return_value: DINT := -1;
    END_VAR
    // Check for valid TO
    IF myAxis = TO#NIL THEN RETURN; END_IF;
        // Example of call with variable of data type of TO
        return_value := _enableAxis (
        axis:= myAxis, // TO function
        nextCommand:= IMMEDIATELY, //optional
        commandId    := _getCommandId() );
END_FUNCTION_BLOCK
PROGRAM Example
    VAR
        myFB: posFB;
    END_VAR
    myFB (myaxis := Axis1);
    // Name is created on start-up // in the SIMOTION SCOUT.
    myFB (myaxis := Axis2);
    // Name is created on start-up // in the SIMOTION SCOUT.

END PROGRAM
//...
```

Transition and step enabling conditions

Fundamentals for the processing of a TO function (command execution)

The TO functions are transferred as commands to the technology function for execution. The TO executes or activates these commands in the processing cycle clock, which was specified during their configuration (e.g. IPO cycle clock).

The outputCam, measuringInput, externalEncoder and cam technology objects have a direct command execution. A new command on the same technology object supersedes a command which is active there.

In addition to commands for direct command execution, motion commands can be issued on the following technology objects: driveAxis, posAxis, followingAxis, and followingObject. The technology objects have structure elements for command management.

An example of the command management for axes is described below.

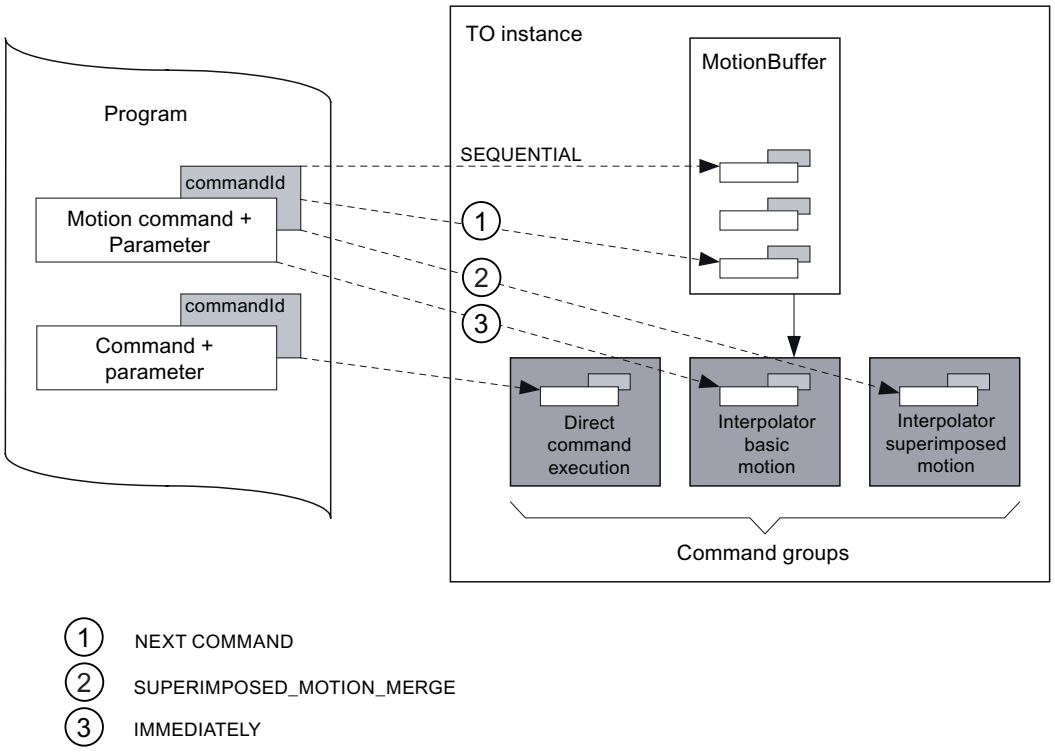

Figure 4-81 Command execution on the axes

The MotionBuffer stores motion commands that are executed sequentially by the interpolator. The number of motion commands that can be stored in the motion buffer is defined via the configuration data *TypeOfAxis.DecodingConfig.numberOfMaxbufferedCommandId*. Multiple motion commands can therefore be issued on the technology object, irrespective of the execution status of the active command.

A **commandId** is assigned to each command when it is issued. This is stored in the command and provides a reference to the issued command.

The commands are assigned to command groups. The pending commands in the existing command groups are processed in parallel by the interpolator. Certain commands become

active on the technology object immediately and form a queue in the motion buffer; other commands, i.e. superimposing commands, take effect immediately.

Note

The behavior of the command groups and command buffers, e.g. MotionBuffer, is TO-specific. Thus, for example, you cannot call the _enableaxistorquelimitpositive and _enableaxistorquelimitnegative commands simultaneously within one IPO2 cycle clock. Only one of the commands will be executed.

An exact description of command groups and command buffers can be found in the TO manuals, e.g. in the "TO Axis Electric / Hydraulic, External Encoder" function manual.

Transition behavior of the currently active motion command

You specify the transition behavior of the currently active motion command on the technology object in the TO function with the parameter *MergeMode*. Here you specify, how the TO function is placed in the command execution sequence on the technology object, or to which command group it is assigned.

Table 4-33 Frequent merge modes

Merge mode	Description
IMMEDIATELY	The motion specified in the command becomes active immediately; already active motions are replaced, pending commands/motions are aborted.
NEXT_MOTION	Execute after the active motion and delete further pending commands/motions.
SEQUENTIAL	Attach to previous commands/motions.
SUPERIMPOSED_ MOTION_MERGE	Superimposed motion on the axis is possible in addition to the basic motion.

Command step enabling condition

A step enabling condition can be programmed for TO functions that are executed in the interpolator. It specifies when the next statement in the program source is executed.
The *nextCommand* parameter is used for this purpose. Refer to the SIMOTION Cam Technology Package, System Functions List Manual (reference list) for the permissible conditions for each command.

The main difference is between asynchronous and synchronous command execution:

- Asynchronous command execution:
  The TO function is transferred to the technology object and the program continued immediately. The *nextCommand* = IMMEDIATELY is set for this.
  In this case, the application must ensure that TO functions are issued only once and checkback signals are evaluated explicitly by scanning the axis or command status (see **Diagnosis of the command execution**).
  Example: see the following two figures
  This method of motion control is referred to as *cyclic programming*. It is permitted in all system tasks and is intended especially for the programming of cyclic tasks.
  The asynchronous command execution is the default setting when parameter *nextCommand* is not specified.
- Synchronous command execution:
  The TO function together with the parameterization for the step enable are transferred to the technology object and the called task stopped. The technology object executes the function and calls for program execution to be resumed as soon as the specified step enabling condition is satisfied or the command has been aborted. For this, *nextCommand* is set to the desired step enabling condition.
  Example: see **Asynchronous program execution (sequential programming)**.
  This method of motion control is referred to as *sequential programming*. It is supported especially by the MotionTasks.
  Programming command sequences in cyclic tasks leads to task timeouts and therefore to runtime errors.

Table 4-34 Example of asynchronous program execution (cyclic programming) - Part 1

CommandID overview (Page 1541)

Command execution diagnostics

Command identification – commandId

When a system function issues a command, a commandId is transferred. While the command is being executed by the technology object, it stores the commandId in the command, thus identifying the command.

A project-wide unique commandId is obtained with the *_getCommandId* system function. This ensures that no further command with the same commandId exists in the system (unique reference to the command).

Table 4-37 Example of the use of the commandId

```
//...
VAR
    myCommandId : CommandIdType;
END_VAR
//...
// Save unique ID
myCommandId := _getCommandId ();
// Execute function with ID
myFC := _pos (axis := myAxis,
        position        := position_1,
        nextCommand        :=IMMEDIATELY,
        commandId        :=myCommandId);
//...
```

The description how you can track the execution status of a command with the aid of the commandId follows.

System functions for scanning the command/execution status

Technology objects, on which several commands are issued for execution, have *_getStateOf...Command* system functions (e.g. *_get StateOfAxisCommand*). The return value of data type *StructRetCommandState* provides information on the execution status of a motion command by the interpolator in the *EnumCommandIdState* component.

With *EnumCommandIdState* = ABORTED, the abort reason is specified in the component *abortId* (data type DINT). The values correspond to the reason in the technological alarm "30002 Command aborted".

Status check after completion or abort of a command

Once a command has been aborted or has finished executing, it is normally deleted from the internal command management system of the technology object. As a result, it is not possible to diagnose the command status *End* or *Abort* by calling the system functions indicated above.

To enable the status of a command to be scanned even after it has been aborted or its execution is complete, the commandId of the relevant command must be made known to the internal command management of the technology object. This is performed using the *_buffer...CommandId* system function (e.g. _bufferAxisCommandId).

After the *End* or *Abort* status has been evaluated, the commandId must be explicitly removed from the command management of the technology object. This is performed via the system function *_removeBuffered...CommandId* (e.g. *_removeBufferedAxisCommandId*).

Example 1	The _buffer... command is not issued, and the _pos command for which the query is to be made is already finished.
Result	Because a matching command for the CommandId specified in the _getStateOf...CommandId was not found (_pos is already finished), NOT_EXISTENT ('commandId' is not known or command is already finished) is returned.
Example 2	The _buffer... command is issued, and the _pos command for which the query is to be made is already finished.
Result	The _pos command is no longer found, but the result was stored in the CommandId buffer. The result is now either EXECUTED (command processing finished) or ABORTED (command processing aborted).

The size of the CommandID buffer is limited and can be set, for example, for the axis with configuration data item *TypeOfAxis.DecodingConfig.NumberOfMaxBufferedCommandId*. Thus, you can notify the TO regarding the maximum number of commands it has to manage simultaneously.

On the STOP-RUN transition, the buffered Command IDs will be deleted. The CommandID buffer is then empty.

Example: see **Asynchronous program execution (cyclic programming), Part 1 and Part 2**.

The behavior of the "buffer and removeBuffer" commands is the same in all TOs that support this functionality (exceptions: names of commands and name of the configuration data item for the buffer size).

Note

The description applies analogously to the external encoder, as well.

Status check after resetting a technology object

The CommandID can be buffered in such a way that it is not deleted when a technology object is reset. It is then also available after resetting a technology object.

- To do this, call the TO function *__buffer...CommandId* with the parameter *deleteCommandIdWithReset = NO*. The commandId can then only be deleted explicitly with the command *_removeBuffered...CommandId*.
- If you call the *_buffer...CommandId* TO function with the *deleteCommandIdWithReset= YES* (default setting) parameter, the commandId is also deleted with the *_reset...* function (e.g. *_resetAxis*) when resetting the technology object.

CommandID overview (Page 1541)

Identifiers of technology object instances

The identifiers of technology object instances are defined during their configuration in SIMOTION SCOUT. They must be defined uniquely within a SIMOTION device.

In general, you can call the instance of a technology object with its identifier.

However, if the same identifier is defined as data type, variable, function or function block in ST source files or if a global device variable or I/O variable of the same name was created, these identifiers cover the technology object instance.

You can use the predefined name space *_to* so that you can still access the technology object instance, for example to access its system variables or configuration data (see **Name spaces** in the ST Programming Manual). Place the name space identifier in front of the corresponding name, separated by a period, for example *_to.to-name*.

If you want to access the instance of a technology object on another SIMOTION device, place the name of the SIMOTION device in front of the instance identifier, separated by a period, for example *dev-name.to-name* or *dev-name._to.to-name*.

If the identifier of a device is covered, you can use the predefined name space *_project*, for example *_project.dev-name.to-name* or *_project.dev-name._to.to-name*.

Note

With a project-wide unique identifier for the technology object instance, you can use the predefined name space *_project* also for identifying the instance.

Determining the TO name at runtime (as of V4.4)

The system function *_getObjectName* as string is used to determine the configured TO name at runtime.

E.g., you can use it to determine the name of an object causing an error and to display it on an HMI.

When the function is called in the TechnologicalFaultTask, you can transfer TSI#toInst directly from the TaskStartInfo in the function's input parameter.

Conversion of TO data types

Type conversions within the hierarchical data types

The *driveAxis*, *posAxis*, *followingAxis* TO data types are hierarchically structured by the functional scope.

- A position axis (*posAxis* data type) contains the functionality of a speed-controlled axis (*driveAxis* data type).
- A following axis (*followingAxis* data type) contains the functionality of a position axis (*posAxis* data type) and, therefore, also of a speed-controlled axis (*driveAxis* data type).

Type conversions are only possible within these hierarchical data types and with the general ANYOBJECT technology object data type.

Note

Other type conversions are not possible (for example, between a measuring input and following object).

Implicit type conversion

Variables (with TO data type) or TO instances can be assigned to the following variables without specifying a conversion function:

- Variables of a lower hierarchy TO data type:
  - *followingAxis* to *posAxis* or *driveAxis*
  - *posAxis* to *driveAxis*
- Variables of general ANYOBJECT TO data type

See the table below.

Table 4-38 Example of implicit type conversion

```
// The following TO instance (axis) is configured in the project navigator:
fol_axis_real as a following axis

VAR
    drv_axis1 : driveAxis;
    pos_axis1 : posAxis;
    any_obj1 : ANYOBJECT;
END_VAR

drv_axis1 := pos_axis1;
any_obj1  := fol_axis_real;...
```

Explicit type conversion

The *anyObject_to_Object* type conversion function is used to assign variables (with a TO data type) to variables with higher hierarchy TO data types.

A requirement for this is that the source variable (with the hierarchically lower TO data type) must refer to a TO instance that at least corresponds hierarchically to the TO data type of the target variable (see example in the following table).

Table 4-39 Example of successful type conversions

```
// The following TO instances (axes) are configured in the
 // project navigator:
 // pos_axis_real as position axis
 // fol_axis_real as a following axis

VAR
    drv_axis1 : driveAxis;
    pos_axis1 : posAxis;
    any_obj1 : ANYOBJECT;
END_VAR

// Implicit type conversions
drv_axis1 := pos_axis_real;
any_obj1  := fol_axis_real;

// Successful type conversions

pos_axis1 := anyObject_to_Object (in := drv_axis1);
 // Type conversion successful,
 // because drv_axis1 refers to a position axis.

pos_axis1 := anyObject_to_Object (in := any_obj1);
 // Type conversion successful,
 // because any_obj1 refers to a following axis.

//...
```

In the event of a failed type conversion, the value TO#NIL is assigned to the target variable:

Table 4-40 Example of a failed type conversion

```
// The following TO instance (axis) is configured in the
 // project navigator:
 // drv_axis_real as a drive axis

VAR
    pos_axis1 : posAxis;
    any_obj1 : ANYOBJECT;
END_VAR

// Implicit type conversions
any_obj1  := drv_axis_real;

// Type conversion failed
pos_axis1 := anyObject_to_Object (in := any_obj1);
        // Type conversion is not required,
        // because any_obj1 refers to a speed-controlled axis.
        // pos_axis1 has the value TO#NIL.
```

System variables

You can use system variables to assign parameters for technology objects and the basic system or to read their status.

Syntax of system variables

System variables are queried using a structure access with the following syntax. The following table shows the significance of the individual syntax components.

[_to.]TO name.variable.component or

[_device.]variable.component

Table 4-41 Syntax components of system variables

Syntax component	Meaning
TO name	*TO name* stands for the name of a technology object (TO), e.g. of an axis. You have performed one of the following: • Inserted the technology object in SIMOTION SCOUT. • Or declared a variable of the data type of this technology object in the program. You will find a list of all the data types for technology objects in **Function parameters of the technology functions**.
_to	The optional word *_to* identifies the predefined name space for technology objects. It should be used to unambiguously specify a technology object with *TO name*. Also see **Name spaces** in the ST programming manual.

Syntax component	Meaning
_device	The optional word *_device* identifies the predefined name space for device-specific variables (system variables of the SIMOTION devices, I/O variables, global device variables). It should be used to unambiguously specify the variable as system variable of the SIMOTION device. These system variables are also available when no technology object is loaded. Also see **Name spaces** in the ST programming manual.
Variable	*Variable* stands for the name of the system variable as found in the list of all system variables (see List Manual for the SIMOTION technology package system variables).
Component	*Component* stands for the part of the structure you want to query. This can be an additional structure that contains further components, as well. The depth of the structure depends on the system variable and can be zero.

Using system variables

Read access to a system variable is always possible. A system variable can be assigned to a variable in two ways:

- With a value assignment (see also **Value assignments** in the ST programming manual). This means ExecutionFaultTask is called in the event of an error (please also refer to *Reading out the substitute value or last values* at the end of the chapter). For more information on the error reaction, see Accesses to system variables (Page 1258).
- With the *_getSafeValue* and *_setSafeValue* system functions (see _getSafeValue function (Page 1514), _setSafeValue function (Page 1517), and Accesses to system variables and inputs/outputs (Page 1514)). In this case it is possible to program the desired response in the event of an error.

The use in an expression or as a parameter in a function or function block is also possible. In this case, ExecutionFaultTask is also called in the event of an error (see Accesses to system variables (Page 1258)).

If a system variable can be written is specified in the List Manual (reference list) of the system variables of the technology objects (TO) in the following entry:

- Effective: *immediately* (can be read and written to)
- Effective: *read only* (can only be read).

If a system variable can be written to, it can be assigned a value in two ways:

- With a value assignment (see also **Value assignments** in the ST programming manual). This means ExecutionFaultTask is called in the event of an error (please also refer to *Reading out the substitute value or last values* at the end of the chapter). For more information on the error reaction, refer to Access errors to system variables and configuration data, as well as I/O variables for direct access (Page 1258).
- With the system function _setSafeValue (see function _setSafeValue (Page 1517)). In this case it is possible to program the desired response in the event of an error.

TO#NIL is a special variable value. You can use this value to check whether a valid technology object is present (see the example in **Function parameters of the technology functions**).

Note

For performance reasons, you should only access system variables when absolutely necessary. Instead, save their contents in a local variable of the same data type. Local variable accesses need much fewer resources because less processor time is used. For more information, see **Efficient programming**.

Also note that a source of error can be comparing REAL variables, LREAL variables, and system variables (for example, axis position) with each other, see **Compare REAL or LREAL variables**.

Note

As of SIMOTION Kernel V4.4, system variables can be accessed from synchronous user tasks.

Note

System variables saved ONLINE cannot be saved with "Save to memory card (Ram2Rom)" or "Save in the engineering project (load configuration data to PG)" is not possible.

So that values of system variables can also be saved in the engineering project and on the memory card, the default value of system variables must be changed OFFLINE and then loaded to the target system per download and saved. See Storage concept in the target system (Page 1637).

Scope of system variables

1. System variables, for example, the status flag, may only exist for just one IPO cycle clock.
2. All system variables have the documented **Update** property.
3. If you want to query the status of a task with a lower cycle time, the status should be linked with the following OR status. The OR operation ensures that all states of the application are used. The operation ensures that the subsequent ENUMS of the status flag are grouped.

Examples of system variables

You want to check the axis position and dynamic axis state of *Axis1*.

Requirements:

- You have created Axis1 in SIMOTION SCOUT or have defined and initialized it in the program, e.g. using the *myAxis* variable of *PosAxis* data type.
- You have defined variables in the program for recording the axis position and the dynamic axis state. The data type of these variables must match the data type of the variables to be checked, e.g.:

```
VAR
act_pos : LREAL;
```

```
act_motionState : EnumAxisMotionState;
END_VAR
```

Example of accessing a system variable using a structure element of an elementary data type:

```
act_pos := Axis1.positioningState.actualPosition;
```

PositioningState is the system variable and *actualPosition* is the structure element of data type LREAL that will be queried.

Example of querying a system variable with an enumeration element:

```
act_motionState := Axis1.motionStateData.motionState;
```

motionStateData is the system variable and *motionState* is the structure element of enumerator data type *EnumAxisMotionState* that will be queried.

Initialization of system variables

System variables are not reinitialized as a rule when you download the project; their actual values are not reset to the initial values. In general, system variables are only reinitialized when the SIMOTION device is restarted.

Substitute value or the last value of system variables at TO restart or where TO is deactivated (as of V4.1)

The access to system variables is also possible at RESTART of the TO or at activated TO, without the system going to STOP. Instead of reading out the system variables using the _getSaveValue function, you can configure the following by means of an entry in the config data (restart.behaviorInvalidSysvarAccess) to enable direct access:

- Read out last value (LAST_VALUE = default)
- Read out default value (=value when loading the project; DEFAULT_VALUE)
- Go to STOP (STOP_DEVICE)

Exception

Variables that deliver the current TO status, also return the correct status at RESTART. This affects the system variable restartActivation, which you can access via _getSafeValue.

Note

TO system variables can be written to during a TO restart or where a TO is deactivated (apart from STOP_DEVICE). The values will be applied or are effective after the RESTART. If writing system variables exceeds the limits, the CPU will go into STOP mode. As of V4.2, writing can take place outside the valid limits. The limit value will be accepted in this case.

Function parameters of the technology functions (Page 1228)

Configuration data

Configuration data defines the basic functionality of a technology object. It is normally set during the configuration of the technology object with SIMOTION SCOUT and for the most part cannot be modified during runtime.

A major part of this configuration data can, however, be modified while the program is running. Whether or not a configuration data item can be modified during runtime is specific to each configuration data item and is documented in the List Manual for SIMOTION technology package configuration data.

Depending on the configuration data item, the following options are available:

- Cannot be modified online:
  This configuration data can only be modified during configuration of the technology object with SIMOTION SCOUT.
- Can be modified online, effective after restart:
  This configuration data can be changed by variable access from the user program. The change does not take effect until the technology object is restarted (see **Resetting a technology object**).
- Can be modified online, immediately effective:
  This configuration data can be changed by variable access from the user program. Change is immediately effective.

Note

If you make a change to configuration data which only takes effect after a TO restart, subsequent changes to "effective immediately" configuration data will also only take effect after the TO restart.

Note

As of SIMOTION Kernel V4.4, configuration data can be accessed from synchronous user tasks.

Note

Configuration data changed ONLINE can be saved on a memory card with "Copy current data to RAM" and subsequent "Copy from RAM to ROM" or saved with "Load to PG" in the engineering project. See Storage concept in the target system (Page 1637).

Reading the configuration data

You can read each configuration data item of a technology object and assign it to a variable, for example:

- The value saved in the SIMOTION device's RAM (can be read in the "Next value" column in the expert list)
  To do so, use the syntax: *TO-name*.setconfigdata.*config-date*.
- Value currently in effect on the technology object
  To do so, use the syntax: *TO-name*.activeconfigdata.*config-date*.

See example in the table below.

Only access to individual variables of the configuration data is permitted.

Table 4-42 Read access to a configuration data item of a technology object

```
VAR
    lreal_var : LREAL;
    drive_var : driveaxis;
END_VAR

lreal_var :=
    drive_var.setconfigdata.TypeOfAxis.MaxJerk.maximum;
    // Read access to saved value
lreal_var :=
    drive_var.activeconfigdata.TypeOfAxis.MaxJerk.maximum;
    // Read access to value currently in effect
```

A configuration data item can be assigned to a variable in two ways:

- With a value assignment, such as the example in the previous table (see also **Value assignments** in the ST Programming Manual). This means *ExecutionFaultTask* is called in the event of an error (please also refer to *Substitute value or last value* at the end of the chapter). For more information about the error reaction, see Errors when accessing configuration data (Page 1514).
- With the *_getSafeValue* system function (see function _getSafeValue (Page 1514)). In this case it is possible to program the desired response in the event of an error.

The use in an expression or as a parameter in a function or function block is also possible. In this case, the *ExecutionFaultTask* is called in the event of an error.

Modifying configuration data at runtime (online modification)

Configuration data is modified online by a simple variable write access to the value stored in the RAM. To do so, use the syntax:
TO-name.setconfigdata.*config-date*.

The effectiveness (adoption as the current value in effect on the technology object) is determined by the configuration data item (effective immediately / effective after restart).

See example of **write access to a configuration data item**.

Only access to individual variables of the configuration data is permitted.

Table 4-43 Write access to a configuration data item of a technology object

```
VAR
    lreal_var : LREAL;
    drive_var : driveaxis;
END_VAR

drive_var.setconfigdata.TypeOfAxis.MaxJerk.maximum :=
    200000.0;
    // Write access to saved value
```

A configuration data item can be assigned a value in two ways:

- With a value assignment, such as the example in the previous table (see also **Value assignments** in the ST programming manual). This means *ExecutionFaultTask* is called in the event of an error (please also refer to *Substitute value or last value* at the end of the chapter). For more information about the error reaction, see Errors when accessing configuration data (Page 1258).
- With the system function *_setSafeValue* (see function _setSafeValue (Page 1517)). In this case it is possible to program the desired response in the event of an error.

In addition, there is the option to control the activation via a system variable.

Use technology object system variable *activationModeChangedConfigData* to define when the modified configuration data is to take effect:

- If *activationModeChangedConfigData = ACTIVATE_CHANGED_CONFIG_DATA* is set, the modified data is set immediately active. If the system variable is set to this value, data collected up to this point is also activated.
- If *activationModeChangedConfigData = COLLECT_CHANGED_CONFIG_DATA* is set, the modified data is collected.
  They are activated as a body as soon as this system variable is set to *ACTIVATE_CHANGED_CONFIG_DATA*.
  The collected, modified configuration data can be deleted (without activation) by calling the corresponding technology object system function (e.g. *_resetAxisConfigDataBuffer*).

Note

When *activationModeChangedConfigData*:= *ACTIVATE_CHANGED_CONFIG_DATA*, it takes a certain amount of time for a modified configuration data item to take effect after it has been written.

In particular, when several configuration data items are changed simultaneously, timeouts can occur in the tasks.

Note

If you want to change several configuration data items at the same time, it is advisable to collect them first with *activationModeChangedConfigData = COLLECT_CHANGED_CONFIG_DATA* and then activate them as a body in a sequential task using the *ACTIVATE_CHANGED_CONFIG_DATA* setting.

Configuration data changed at runtime can be saved on card and in the ES project, see Memory access (Page 1640).

Note

When accessing configuration data from the user program (e.g. in a general FB), make sure that the respective configuration data is also available depending on TO type.

Access to configuration data for TO references and axis arrays

Access to configuration data for TO references is possible. To access configuration data of an axis array you must use an intermediate variable. If you attempt to use axis arrays directly you will get a compiler message that an intermediate variable should be used.

Example

```
VAR_TEMP
    myPosAxis  :posaxis;
END_VAR
myPosAxis      :=Pos[2]

myPosAxis.setconfigdata.TypeOfAxis.MaxJerk.maximum :=
    200000.0;
```

Because you are accessing the axis directly via a reference, no further assignment is necessary to access the value. You do not have to reassign pos[2] to myPosAxis.

Note

Write operations to configuration data are possible during a TO restart or where a TO is deactivated (apart from STOP_DEVICE). The values will be applied or are effective after the RESTART.

Substitute value or the last value of configuration data at TO restart or where TO is deactivated (as of V4.1)

Configuration data can also be accessed when a RESTART of the TO is performed or where the TO is deactivated without the system going to STOP. Instead of reading out the configuration data using the _getSaveValue function, you can configure the following by means of an entry in the configuration data (restart.behaviorInvalidSysvarAccess):

- Read out last value (LAST_VALUE = default)
- Read out default value (=value when loading the project; DEFAULT_VALUE)
- Go to STOP (STOP_DEVICE)

If writing configuration data exceeds the applicable limits, the CPU will go to STOP. As of V4.2, writing can take place outside the valid limits. The limit value will be accepted in this case.

Resetting a technology object

⚠ CAUTION
Resetting a technology object aborts the current motion without an error message.

To integrate configuration data that require a restart of the technology object, you must reset the technology object. The procedure depends on the *restart.restartActivationSetting* configuration data item of the technology object:

- For the setting *restart.restartActivationSetting* = RESTART_BY_COMMAND:
  The technology object can only be restarted by means of the corresponding system function (e.g. *_restartAxis*). To do so, set the parameter *activateRestart* = ACTIVATE_RESTART.
- For the setting *restart.restartActivationSetting*= RESTART_BY_SYSVAR_AND_COMMAND:
  The restart can be performed in two ways:
  - By calling the corresponding system function (e.g. *_restartAxis*). By setting parameter *activateRestart* = ACTIVATE_RESTART.
  - By assigning a value to the technology object system variable: *restartActivation*= ACTIVATE_RESTART. The system variables are initialized, the technology object loses all of its status information, such as axis homed.

  The restart is always performed asynchronously. After a successful restart of the technology object, this system variable has the value NO_RESTART_ACTIVATION.

Use of technology packages in libraries

Libraries can also contain TO functions and accesses to the system variables of a technology object.

You specify the SIMOTION device and the technology object for which the library is being compiled in the object properties for the library as follows:

1. Select the library in the project navigator.
2. Select the **Edit > Object properties** menu command.
3. Then select the **Technology packages** tab.
4. Select the SIMOTION devices (including the version number) and the technology packages for which the library is to be compiled.

Note

To compile a project without errors, observe the rules governing the selection of SIMOTION devices and technology packages in the following table!

You can also specify the technology package in the library's ST source files if you want (with the USEPACKAGE command), however, this is not necessary.

Table 4-44 Selecting devices and technology packages in a library

Selection	Description
Device-independent	You must also select: • The technology packages • The version number of the selected technology packages **Note:** 1. The library is compiled without reference to a SIMOTION device or a version of the SIMOTION kernel. **For this reason, the following must not be used:** – System functions of SIMOTION devices – System variables of SIMOTION devices – Version-dependent system functions – Configuration data of the technology objects 2. The library is compiled precisely to the version selected. The use of system functions or variables which are not available in the selected version will result in a compilation error. 3. If a device-independent library is to be made available for another version it must be copied and inserted under a different name. This copy must be recompiled with a different version reference.
SIMOTION device including version (multiple selection possible)	Only those technology packages are displayed that are available for all of the selected devices. **Note:** 1. The library is compiled for all of the selected devices and technology packages (of the selected device versions). 2. The use of system functions or variables which are not available for one of the selected devices, or the technology package of the respective device version, will result in a compilation error. 3. The library can only be used for the selected devices and technology packages. When you use the library in an ST source file, the following is therefore checked: – Whether the library is compiled for the SIMOTION device (including version) that contains the importing ST source file. – Whether the technology package set on the SIMOTION device and specified in the ST source file with the USEPACKAGE command corresponds to the one in the library. Any inconsistencies will result in compilation errors.

4.2.5.3 Response to faults and events

Evaluating faults and events

The SIMOTION system has various execution levels for scheduling programs. One of these execution levels is the interrupt execution level, which is started in response to specific events, such as errors.

Options for responding to faults and events

There are two classes of events that can start tasks in the interrupt execution level:

- When events are user-defined, they are called UserInterruptTasks; the programs assigned to these tasks are also user-defined.
- If the events are system or technology-related (system errors or technology objects), we refer to SystemInterruptTasks. The following table lists the available SystemInterruptTasks. Messages generated by the system are known as alarms. The reaction is defined in the alarm configuration (see below).

Table 4-45 Specified SystemInterruptTasks

SystemInterruptTask	Called for the following events
ExecutionFaultTask	Execution errors in programs
PeripheralFaultTask	Process and diagnostic alarms from I/O modules
TechnologicalFaultTask	Alarms, warnings, and notes from technology objects
TimeFaultBackgroundTask	Timeout for the BackgroundTask
TimeFaultTask	Timeouts for TimerInterruptTasks

Note

Message generation is another system feedback option. User-assigned messages can be used in programs, e.g. if certain events occur (tank empty, etc.). For more information, see Programming messages (Page 1563).

Alarm configuration

You can define the system behavior for technological alarms in SIMOTION SCOUT (alarm configuration). You can choose between:

- STOP: Transition to STOP mode (all system and user tasks are stopped.)
- STOP U: Transition to STOP U mode (only user program tasks are stopped.)
- START TechnologicalFaultTask: Starts the associated SystemInterruptTask
- NONE: No response

Each alarm has a default response. Details for the alarm configuration can be found at Error handling for technology objects (Page 1281).

When you select **START TechnologicalFaultTask**, you must assign a program to the TechnologicalFaultTask that responds to the associated alarm.

Besides a configurable response to program execution, alarms also have a reaction in the technology object (see SIMOTION Motion Control Technology Objects function manuals).

Execution errors in programs

You set the response to execution errors in programs in the task configuration (see **Configuring the execution system**).

This affects the following operations, for example:

- Invalid operation with floating-point numbers (Page 1257) (e.g. logarithm of a negative number)
- Incorrect type conversions
- Division by zero
- Violation of array limits

The possible error responses are listed in the following table.

Table 4-46 Error response in case of execution errors in the program

Error response	Task type	Description
CPU to STOP	All tasks	SIMOTION device switches to STOP mode and the ShutdownTask is started.
ExecutionFaultTask	Sequential (non-cyclic)	The ExecutionFaultTask is started. The task in which the error occurred, is aborted; the aborted task can be dispatched again by the user.
	Cyclic	The ExecutionFaultTask is started. The task in which the error occurred is aborted. When the ExecutionFaultTask is finished, the SIMOTION device switches to STOP mode; the ShutdownTask is started.

Specifications for the configuring (Page 1417)

Error during operations with floating-point numbers (FPU exceptions)

Invalid floating-point numbers

The data types for REAL and LREAL floating-point numbers are implemented with their bit patterns according to IEEE 754. Accordingly, the following bit patterns for invalid floating-point numbers are also supported:

- Signaling NaN (NaNs): Invalid bit pattern (Not a Number), which triggers an error (FPU exception) on each operation.
- Quiet NaN (NaNq): Invalid bit pattern (Not a Number), which triggers an error (FPU exception) only on certain operations.
- Infinity: Bit pattern for + infinity or – infinity.

Note

You can create an NaN or infinity from the corresponding bit pattern, e.g. with system function DWORD_TO_REAL, BigByteArray_to_AnyType or LittleByteArray_to_AnyType.

Note

When a floating-point number is displayed in the engineering system (e.g. in the symbol browser of SIMOTION SCOUT), no distinction is made between a signaling and a quiet NaN.

FPU exceptions

The operations with floating-point numbers are also implemented according to IEEE 754. If any of the indicated errors for the operations below occur, an FPU exception will be triggered:

- Any operation with a signaling NAN (NaNs).
- Addition: Both addends are infinity but have different signs.
- Subtraction: Minuend and subtrahend are infinity and have the same sign.
- Multiplication: One factor is 0 and the other is infinity.
- Division:
  - Both operands are 0 or infinity.
  - Divisor is 0.
- Modulo division (x MOD y): x = infinity or y = 0.

- The argument of a system function is outside the domain, e.g.:
  - SQRT: The radicand is < 0.
  - LN, LOG: The argument is ≤ 0.
  - EXPT or Operator "**": Base is ≤ 0:
    Exceptions as of Version 4.1 of the SIMOTION Kernel:
    Base is < 0 and exponent has an integer value.
    Base is = 0 and exponent is > 0.
  - SIN, COS, TAN: The argument is infinity.
  - ASIN, ACOS: Argument is > 1
- Conversion of a floating-point number to an integer or its assigned bit data type with the corresponding system function (e.g. LREAL_TO_DINT, REAL_VALUE_TO_DWORD):
  - Range of target data type is exceeded.
  - Argument is a signaling or quiet NaN (NaNs or NaNq).
  - Argument is infinity.
- Comparison operations:
  - At least one operand is a signaling or quiet NaN (NaNs or NaNq).
  - At least one operand is infinity.
- Range is exceeded for operations with valid floating-point numbers

The behavior specified for the processing errors in programs (Page 1256) will be carried out. If the ExecutionFaultTask is called, then TSI#executionFaultType = _SC_INVALID_FLOATING_POINT_OPERATION, see TaskStartInfo of the ExecutionFaultTask (Page 1267).

Note

No error (no FPU exception) is triggered:

- For operations with quiet NaN (NaNq), if not mentioned explicitly above.
  For example, the addition of a valid floating-point number to a quiet NaN (NaNs) produces the same quiet NaN (NaNs).
- For operations with + infinity or - infinity, if not mentioned explicitly above.
  For example, the addition of a valid floating-point number to + infinity produces +infinity again.

Access errors to system variables and configuration data, as well as I/O variables for direct access

This section describes the behavior when errors occur while accessing system variables, configuration data or I/O variables with the usual methods (using the variable identifier in an expression or variable assignment), see also TaskStartInfo of the ExecutionFaultTask (Page 1267).

Errors in system variables and configuration data:

As of V4.1 SP2/V4.1 SP3, system variables and configuration data can also be accessed when a RESTART of the TO is performed or where the TO is deactivated without the system entering STOP mode.

You can configure the following by means of an entry in the configuration data (restart.behaviorInvalidSysvarAccess):

- Read out last value (LAST_VALUE = default)
- Read out default value (=value when loading the project; DEFAULT_VALUE)
- Go to STOP (STOP_DEVICE)
  The ExecutionFaultTask is started, and the additional error response depends on the task type (sequential or cyclic) in which the error occurs (see the following table).
  Response at start of ExecutionFaultTask for incorrect access to system variables and configuration data

Task type	Description
Sequential (non-cyclic)	The ExecutionFaultTask is started. The task in which the error occurred is aborted; the aborted task can be dispatched again by the user.
Cyclic	The ExecutionFaultTask is started. The task in which the error occurred is aborted. When the ExecutionFaultTask is finished, the SIMOTION device switches to STOP mode; the ShutdownTask is started.

Writing of system variable values outside the applicable limits is not affected by the configuration data referred to above (e.g. STOP_DEVICE). As of V4.2, the limit value is written. See also System variables (Page 1245), Configuration data (Page 1249), General information on accessing system variables and inputs/outputs (Page 1514) or Errors when accessing system data with _get/_setSafeValue (Page 1295).

Definition of DEFAULT_VALUE and LAST_VALUE

- DEFAULT_VALUE
  The DEFAULT_VALUE is the configured value. This is the value transferred during a download (system variables and configuration data).
- LAST_VALUE
  - Configuration data
    The last value can be the configured value. The value will then be equivalent to the value shown under "Current value" in the expert list.
    OR
    The last value can be the last configured value. The value will then be equivalent to the value shown under "Next value" in the expert list.
    Either of these values can be output, depending on the configuration data entered.
  - System variables
    With system variables, the last value is the value which is currently set and effective.

Errors for I/O variables (direct access to inputs and outputs)

The error response is specified when the I/O variables are defined (see **Direct access and process image of the cyclical tasks** in the ST programming manual).

- CPU stop: The ExecutionFaultTask is started. The SIMOTION device then switches to STOP mode; the ShutdownTask is started.
- Substitute value: The substitute value specified when the I/O variable was defined is adopted, and the task is continued.
- Last value:
  With read access (to inputs or outputs): The last valid value is applied, and the task is continued.
  With write access (to outputs): The value is written to the variable. However, it will not be active at the output until the output becomes available again. The task is continued.

In specific cases it is necessary to respond differently to errors, to deviate from the defined error response, or to avoid errors by performing queries beforehand. The functions _getSafeValue (Page 1514) and _setSafeValue (Page 1517), and getInOutByte (Page 1520) serve this purpose. The functions *_getSafeValue* and *_setSafeValue* are very time intensive.

Errors when generating the process image

This section describes the behavior when I/O access errors occur during updating of the process image with the assigned task. Possible causes:

- The I/O module is not present.
- The I/O module is switched off.
- The connection to the I/O module is missing or faulty.
- The I/O module is signaling an error.

The behavior is as follows:

- For the process image of the cyclic tasks (see **Direct access and process image of the cyclic tasks** in the programming manuals)
  The error response is specified when the I/O variables are defined:
  - CPU stop: For response information, see the following table.
  - Substitute value: The substitute value specified when the I/O variable was defined is adopted, and the cyclic task is continued.
  - Last value:
    Process input image (reading of inputs): The value of the process image at the address is not changed; the cyclic task is continued.
    Process output image (writing to outputs): The value only takes effect at the output with the address when the output is available again; the cyclic task is continued.
- For the fixed process image of the BackgroundTask (see **Accesses to the fixed process image of the BackgroundTask** in the programming manuals):
  The error response depends on whether direct access was defined at the same address using I/O variables:
  - **No** direct access is defined: Error response is always CPU STOP; for response information, see the following table.
  - Direct access is defined: The error response specified in the definition of the I/O variables does apply (see above, like process image of cyclic tasks).

Table 4-47 Error response during process image update for CPU STOP response

Event	Description
Error occurs	1. An incoming message is generated once. 2. If no program is linked to the PeripheralFaultTask, the SIMOTION device goes to STOP mode, and the ShutdownTask is started. 3. Otherwise: – The PeripheralFaultTask is started once **immediately** (rather than in the next IPO cycle clock): *TSI#interruptId* = _SC_IMAGE_UPDATE_FAILED. *TSI#logBaseAdrIn* or *TSI#logBaseAdrOut* contains the address at which the error occurred. See TaskStartInfo of the PeripheralFaultTask (Page 1269). – Process input image: The substitute value is assigned to the value of the process image at the address. Process output image: Value will not take effect at the output with the address until the output becomes available again. – The cyclic task in which the error occurred is continued.
Error persists	• No additional messages are generated. • The PeripheralFaultTask is not restarted. • Process input image: The value of the process image at the address is not changed. Process output image: Value will not take effect at the output with the address until the output becomes available again.
Error disappears	1. An outgoing message is generated once. 2. The PeripheralFaultTask is started once **immediately** (rather than in the next IPO cycle clock): *TSI#interruptId* = _SC_IMAGE_UPDATE_OK, see TaskStartInfo of the PeripheralFaultTask (Page 1269). 3. The cyclic task is continued.

Using Taskstartinfo

Important information about starting the task is stored in the Taskstartinfo for each task, e.g.:

- Start time of task
- For the TechnologicalFaultTask: the triggering instance of the Technology Object and the alarm number,
- For the TimeFaultTask: TimerInterruptTask that caused the timeout error.

Within a task, you can query the relevant Taskstartinfo of this task. To do this, use the **TSI#<info>** system variable; where **<info>** is the particular information to be queried. The content and scope of the TaskStartInfo and the associated system variables depend on the relevant task. This is described in the following sections.

Details on the TaskStartInfo of the

StartupTask (Page 1263)
MotionTasks (Page 1264)
BackgroundTask (Page 1264)
TimerInterruptTasks (Page 1264)
UserInterruptTasks (Page 1265)
SynchronousTasks (Page 1265)

SystemInterruptTasks
- ExecutionFaultTask (Page 1267)
- PeripheralFaultTask (Page 1269)
- TechnologicalFaultTask (Page 1277)
- TimeFaultBackgroundTask (Page 1278)
- TimeFaultTask (Page 1279)

ShutdownTask (Page 1279)

The TaskStartInfo query is used mainly for SystemInterruptTasks, see example for using the TaskStartInfo of the TechnologicalFaultTask (Page 1280).

TSI#interruptID	:	UDINT	• _SC_PROCESS_INTERRUPT (= 200) Process alarm occurred at I/O module Additional information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#details – TSI#eventClass – TSI#faultId For information about process alarms, refer to **Process alarms** below. • _SC_DIAGNOSTIC_INTERRUPT (= 201) Diagnostic interrupt occurred at I/O module Additional information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#logDiagAdr – TSI#details – TSI#eventClass – TSI#faultId • _SC_STATION_DISCONNECTED (= 202) PROFIBUS DP: A DP slave station has failed PROFINET IO: Station failure of an I/O device Additional information in the following TSI: – TSI#logDiagAdr – TSI#eventClass – TSI#faultId

Designation	:	Data type	Meaning
TSI#interruptID (continued)	:	UDINT	• _SC_STATION_RECONNECTED (= 203) PROFIBUS: Station reconnection of a DP slave PROFINET IO: Station reconnection of an I/O device Additional information in the following TSI: – TSI#logDiagAdr – TSI#eventClass – TSI#faultId • _SC_IMAGE_UPDATE_FAILED (= 204) Error during process image update (for DP slave: in connection with station failure) Additional information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#loDiagAdr See Errors when generating the process image (Page 1260). • _SC_PC_INTERNAL_FAILURE (= 205) Error in local controller module Additional information in the following TSI: – TSI#details • _SC_IMAGE_UPDATE_OK (= 206) Process image update works again (for DP slave: In connection with station reconnection) Additional information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – #logDiagAdr See Errors when generating the process image (Page 1260). • _SC_DP_CLOCK_DETECTED (= 207) Clock signal detected for the first time, and valid PRM telegram is received • _SC_DP_SYNCHRONIZATION_LOST (= 208) Multiple cycle failure or PLL has slipped (in internal DP_INTERFACES_SYNCHRONIZED state). PLL switches to uncontrolled mode • _SC_DP_SLAVE_SYNCHRONIZED (= 209) PLL has slipped into synchronized operation • _SC_DP_SLAVE_NOT_SYNCHRONIZED (= 210) Multiple cycle failure or PLL has slipped (in internal DP_SLAVE_SYNCHRONIZED state). PLL remains in controlled mode

Designation	:	Data type	Meaning
TSI#interruptID (continued)	:	UDINT	• _SC_IO_MODULE_SYNCHRONIZED (= 214) e.g. onboard SINAMICS measuring input (Control Unit) e.g. TM15 / TM17 High Feature / DO1 with telegram 39x: Synchronization attained. More information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#logDiagAdr • _SC_IO_MODULE_NOT_SYNCHRONIZED (= 215) e.g. TM15/TM17 High Feature/DO1 with telegram 39x: Synchronization failed. More information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#logDiagAdr • _SC_PULL_PLUG_INTERRUPT (= 216) PROFINET IO: Unplugging or plugging of modules in an I/O device. More information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#eventClass – TSI#faultId – TSI#logDiagAdr • _SC_DRIVE_OBJECT_FAULT (= 217) Fault message from DO1; cause of fault stored in the fault buffer, can be read out with _readDriveFaults. The alarm must be acknowledged with _resetDriveObjectFault. More information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#logDiagAdr • _SC_DRIVE_OBJECT_ALARM (= 218) Warning message from DO1; warnings are stored in the warning parameters, can be read out with _readDriveParameter. The alarm cannot be acknowledged. It is triggered by the arrival and departure of the last warning (see TSI#details). More information in the following TSI: – TSI#logBaseAdrIn – TSI#logBaseAdrOut – TSI#logDiagAdr – TSI#details

Designation	:	Data type	Meaning
TSI#logBaseAdrIn	:	DINT	Logic start address for following *TSI#interruptID* if the alarm was caused by an input range on the module: • _SC_PROCESS_INTERRUPT (= 200) • _SC_DIAGNOSTIC_INTERRUPT (= 201) • _SC_IMAGE_UPDATE_FAILED (= 204) • _SC_IMAGE_UPDATE_OK (= 206) • _SC_PULL_PLUG_INTERRUPT (= 216) • _SC_IO_MODULE_SYNCHRONIZED (= 214) • _SC_IO_MODULE_NOT_SYNCHRONIZED (= 215) Otherwise _SC_INVALID_ADDRESS (= -1)
TSI#logBaseAdrOut	:	DINT	Logic start address for following *TSI#interruptID* if the alarm was caused by an output range on the module: • _SC_PROCESS_INTERRUPT (= 200) • _SC_DIAGNOSTIC_INTERRUPT (= 201) • _SC_IMAGE_UPDATE_FAILED (= 204) • _SC_IMAGE_UPDATE_OK (= 206) • _SC_PULL_PLUG_INTERRUPT (= 216) • _SC_IO_MODULE_SYNCHRONIZED (= 214) • _SC_IO_MODULE_NOT_SYNCHRONIZED (= 215) Otherwise _SC_INVALID_ADDRESS (= -1)
TSI#logDiagAdr	:	DINT	Diagnostics address of a DP slave or I/O device for following *TSI#interruptID* • _SC_DIAGNOSTIC_INTERRUPT (= 201) • _SC_STATION_DISCONNECTED (= 202) • _SC_STATION_RECONNECTED (= 203) • _SC_IMAGE_UPDATE_FAILED (= 204) • _SC_IMAGE_UPDATE_OK (= 206) • _SC_IO_MODULE_SYNCHRONIZED (= 214) • _SC_PULL_PLUG_INTERRUPT (= 216) • _SC_DRIVE_OBJECT_FAULT (= 217) • _SC_DRIVE_OBJECT_ALARM (= 218) Otherwise _SC_INVALID_ADDRESS (= -1)
TST#logDiagAdrIoType		DINT	Specifies the I/O type of a diagnostics address for the following *TSI#interruptID* • DSC_SVS_DEVICE_INPUT (= 198) • DSC_SVS_DEVICE_OUTPUT (= 199)
TSI#details	:	DWORD	Detailed information depending on the TSI#interruptID. See **Meaning of the TSI#details** table
TSI#eventClass	:	UINT	Event class depending on the TSI#interruptID Description in connection with TSI#faultId: See **Significance of the TSI#eventClass and TSI#faultId** table

Designation	:	Data type	Meaning
TSI#faultId	:	UINT	Fault ID depending on the TSI#interruptID Description in connection with TSI#eventClass: See **Significance of the TSI#eventClass and TSI#faultId** table
TSI#taskType	:	ENUM...	Type of task As of version V4.5 of the SIMOTION Kernel Data type: EnumTaskType, see StartupTask (Page 1263) Value: SYSTEM_:INTERRUPT

Table 4-56 Significance of TSI#details depending on TSI#interruptID (PeripheralFaultTask)

TSI#interruptID	Significance of TSI#details
_SC_PROCESS_INTERRUPT (= 200)	• Interrupt data of module signaling interrupt The structure of these data is presented in the module manual. • If interrupt source is in a SIMOTION I-slave: Call parameters of the *_sendProcessInterrupt()* system function
_SC_DRIVE_OBJECT_ALARM (= 218)	• 1 = Incoming warning • 0 = Outgoing warning
_SC_DIAGNOSTIC_INTERRUPT (= 201)	DS0 (= byte 0 - 3 of DS1) of module/station signaling interrupt The structure of the DS0 is described in the "Communication" function manual in the section "PROFINET IO - diagnostics and alarm behavior".

TSI#interruptID	Significance of TSI#details	
_SC_PC_INTERNAL_FAILURE (= 205)	The cause of the interrupt is represented as an OR operation to the following causes (sum of hexadecimal values).	
	Value	**Cause**
	16#00000001	"Fatal error" of host operating system (Windows blue screen - SIMOTION P).
	16#00000002	Temperature error (SIMOTION P, SIMOTION D)
	16#00000004	Temperature returned to normal (SIMOTION P, SIMOTION D)
	16#00000008	Battery warning (battery voltage low, but still sufficient - SIMOTION P, SIMOTION D)
	16#00000010	Battery voltage returned to normal (SIMOTION P, SIMOTION D)
	16#00000020	Battery failure (battery voltage too low – SIMOTION P, SIMOTION D)
	16#00000040	Battery module removed (SIMOTION P, SIMOTION D)
	16#00000080	Fan or dual fan failed (SIMOTION P, SIMOTION D)
	16#00000100	UPS in buffer state (SIMOTION P)
	16#00000200	UPS non-chargeable interval expired, PC is booting (SIMOTION P)
	16#00000400	UPS OK again (SIMOTION P)
	16#00000800	UPS battery warning (SIMOTION P)
	16#00001000	UPS battery error (battery no longer operational – SIMOTION P)
	16#00002000	UPS battery warning (SIMOTION P)
	16#00004000	One fan in dual fan failed (SIMOTION P, SIMOTION D)

Table 4-57 Significance of TSI#eventClass and TSI#faultId depending on TSI#interruptID (PeripheralFaultTask)

TSI#interruptID	TSI#eventClass	TSI#faultId	Bus system[1]	Meaning
_SC_PROCESS_INTERRUPT (= 200)	16#11	16#41	PROFIBUS DP PROFINET IO I/O bus	Process alarm
_SC_DIAGNOSTIC_INTERRUPT (= 201)	16#39[2]	16#42	PROFIBUS DP PROFINET IO I/O bus	Incoming diagnostic interrupt
	16#38[3]	16#42	PROFIBUS DP	Last error on the slot has gone
			PROFINET IO I/O bus	Last error on the subslot has gone

TSI#interruptID	TSI#eventClass	TSI#faultId	Bus system[1]	Meaning
_SC_STATION_DISCONNECTED (= 202)	16#39[2]	16#C4	PROFIBUS DP	A DP slave station has failed
		16#CA	PROFINET IO	System error PROFINET IO[4]
		16#CB	PROFINET IO	Station failure of a connected I/O device Shared I-device: No submodule of the I-device is currently subscribed through higher-level I/O controllers.
		16#CC	PROFINET IO	IO device fault present. Channel diagnostics or manufacturer-specific diagnostics pending. **Note:** 16#39:16#CB is always used for station failure and 16#38:16#CC is always used for the arrival with error
		16#F8	PROFINET IO	Partial station failure Shared iDevice: Submodules of the iDevice are partially subscribed to by the higher level IO controller.
_SC_STATION_RECONNECTED (= 203)	16#38[3]	16#C4	PROFIBUS DP	A DP slave station has been reconnected
		16#CB	PROFINET IO	Station reconnection of an IO device with error or warning. Shared iDevice: All submodules of the iDevice are currently subscribed to by the higher level IO controller.
		16#CC	PROFINET IO	Station reconnection of an IO device with error or warning.
		16#CD	PROFINET IO	An I/O device has been reconnected, but error: Set configuration <> actual configuration
		16#CE	PROFINET IO	An I/O device has been reconnected, but error in module parameterization
		16#F8	PROFINET IO	Partial station reconnection Shared iDevice: Submodules of the iDevice are partially subscribed to by the higher level IO controller.

TSI#interruptID	TSI#eventClass	TSI#faultId	Bus system[1]	Meaning
_SC_PULL_PLUG_INTERRUPT (= 216)	16#39[2]	16#51	PROFINET IO	PROFINET IO module has been removed or cannot be addressed.
		16#61	PROFIBUS DP	PROFINET DP module has been removed or cannot be addressed.
		16#54	PROFINET IO	PROFINET IO submodule has been removed or cannot be addressed.
		16#61	PROFIBUS DP	Station is faulted or module has been removed.
	16#38[3]	16#54	PROFINET IO	PROFINET IO module or submodule has been inserted, module type OK (actual configuration = set configuration)
		16#55	PROFINET IO	PROFINET IO module or submodule has been inserted, but wrong module type (actual configuration <> set configuration)
		16#56	PROFINET IO	PROFINET IO module or submodule has been inserted, but error during module parameterization
		16#58	PROFINET IO	I/O status of a module has changed from BAD to GOOD
		16#61	PROFIBUS DP	PROFINET DP module or submodule has been inserted, module type OK
		16#63	PROFIBUS DP	PROFINET DP module or submodule has been inserted, but wrong module type or module inserted

1 Bus system which signals the TSI#interruptID with the specified TSI#eventClass and TSI#faultId

2 Signals incoming event

3 Signals outgoing event

4 Outgoing event (TSI#eventClass = 16#38) is signaled for each existing station as station reconnection. Depending on the error status, the values 16#CB, 16#CD or 16#CE are displayed in TSI#faultId

Process alarms

Process alarms are indicated using the TSI "_SC_PROCESS_INTERRUPT".

Once a module triggers a process alarm, the alarm is read out, the PeripheralFaultTask is called and the alarm is acknowledged. If a process alarm of the same module occurs again during this time, note the following:

- If the process alarm occurs in the same channel that previously triggered a process alarm, then the relevant alarm is lost.
- If the process alarm occurs in a different channel of the same module, then no process alarm can be triggered at that moment. However, this alarm is not lost, but rather is triggered after the first active process alarm has been acknowledged. The behavior is analogous if a process alarm is triggered:
  - On another module of the same station
  - On another module of another station

TaskStartInfo of the TechnologicalFaultTask

Table 4-58 TaskStartInfo of the TechnologicalFaultTask

Designation	:	Data type	Meaning
TSI#startTime	:	DT	Start time of the task
TSI#currentTaskId	:	StructTaskId	TaskId of task
TSI#cycleTime	:	TIME	Configured cycle time of task in ms (= 0, because the task is sequential)
TSI#cycleTime_us	:	UDINT	Configured cycle time of task in µs (= 0, because the task is sequential) SIMOTION kernel as of version V4.4:
TSI#dwuser_1	:	DWORD	Reserved for internal use
TSI#dwuser_2	:	DWORD	Reserved for internal use
TSI#alarmNumber	:	DINT	Number of the triggered alarm (see description in the SIMOTION Alarms Diagnostics Manual) The parameters output in the alarm message are available in *TSI#alarmP1_DINT to TSI#alarmP5_LREAL* (e.g. *TSI#alarmP3_UDINT* is parameter 3 with data type UDINT).
TSI#toInst	:	ANYOBJECT	TO instance responsible for error, can be converted with the *AnyObject_to_Object* function. Comparison to the instance of the technology object is also possible, see example for using the TaskStartInfo of the TechnologicalFaultTask (Page 1280).
TSI#commandId.low	:	UDINT	CommandId of triggering command (least significant word)
TSI#commandId.high	:	UDINT	CommandId of triggering command (most significant word)
TSI#alarmP1_DINT TSI#alarmP1_UDINT TSI#alarmP1_LREAL	: : :	DINT UDINT LREAL	Parameters 1 to 5 (associated value) of the message for the triggered alarm in the respective data type. Example: *TSI#alarmP3_UDINT* contains parameter 3 with UDINT data type. You can obtain the significance of the parameter from the description of the alarm in the SIMOTION Alarms Diagnostics Manual. This states the number and data type of the parameter with the following syntax: */n/%A* Where: • */n/* : Number of the parameter • *%A* : Abbreviation for the data type – *%d*: DINT – *%X*: UDINT – *%lf* : LREAL Example: */3/%X* means parameter 3 with UDINT data type. Only the parameters documented in the SIMOTION Alarms Diagnostics Manual for the triggered alarm are released for use. For information about process alarms, refer to *Process alarms* below.
TSI#alarmP2_DINT TSI#alarmP2_UDINT TSI#alarmP2_LREAL	: : :	DINT UDINT LREAL	
TSI#alarmP3_DINT TSI#alarmP3_UDINT TSI#alarmP3_LREAL	: : :	DINT UDINT LREAL	
TSI#alarmP4_DINT TSI#alarmP4_UDINT TSI#alarmP4_LREAL	: : :	DINT UDINT LREAL	
TSI#alarmP5_DINT TSI#alarmP5_UDINT TSI#alarmP5_LREAL	: : :	DINT UDINT LREAL

TSI#Alarmgroup	:	DINT	Alarm group (as of version V4.5 of the SIMOTION kernel)
TSI#taskType	:	ENUM...	Type of task As of version V4.5 of the SIMOTION Kernel Data type: EnumTaskType, see StartupTask (Page 1263) Value: SYSTEM_:INTERRUPT

TaskStartInfo of the TimeFaultBackgroundTask

Table 4-59 TaskStartInfo of the TimeFaultBackgroundTask

Designation	:	Data type	Meaning
TSI#startTime	:	DT	Start time of the task
TSI#currentTaskId	:	StructTaskId	TaskId of task
TSI#cycleTime	:	TIME	Configured cycle time of task in ms (= 0, because the task is sequential)
TSI#cycleTime_us	:	UDINT	Configured cycle time of task in µs (= 0, because the task is sequential) SIMOTION Kernel as of version V4.4:

Designation	:	Data type	Meaning
TSI#dwuser_1	:	DWORD	Reserved for internal use
TSI#dwuser_2	:	DWORD	Reserved for internal use
TSI#interruptID	:	UDINT	Triggering event: • _SC_BACKGROUND_TIMER_OVERFLOW (= 300) Additional events are not defined at this time.
TSI#taskType	:	ENUM...	Type of task As of version V4.5 of the SIMOTION Kernel Data type: EnumTaskType, see StartupTask (Page 1263) Value: SYSTEM_:INTERRUPT

TaskStartInfo of the TimeFaultTask

Table 4-60 TaskStartInfo of the TimeFaultTask

Designation	:	Data type	Meaning
TSI#startTime	:	DT	Start time of the task
TSI#currentTaskId	:	StructTaskId	TaskId of task
TSI#cycleTime	:	TIME	Configured cycle time of task in ms (= 0, because the task is sequential)
TSI#cycleTime_us	:	UDINT	Configured cycle time of task in µs (= 0, because the task is sequential) SIMOTION Kernel as of version V4.4:
TSI#dwuser_1	:	DWORD	Reserved for internal use
TSI#dwuser_2	:	DWORD	Reserved for internal use
TSI#interruptID	:	UDINT	Triggering event: • _SC_CYCLE_TIMER_OVERFLOW (= 301) Additional events are not defined at this time.
TSI#taskId	:	StructTaskId	TaskId of TimerInterruptTask during which the time watchdog responded.
TSI#taskType	:	ENUM...	Type of task As of version V4.5 of the SIMOTION Kernel Data type: EnumTaskType, see StartupTask (Page 1263) Value: SYSTEM_:INTERRUPT

TaskStartInfo of the ShutdownTask

Table 4-61 TaskStartInfo of the ShutdownTask

Designation	:	Data type	Meaning
TSI#startTime	:	DT	Start time of the task
TSI#currentTaskId	:	StructTaskId	TaskId of task
TSI#cycleTime	:	TIME	Configured cycle time of task in ms (= 0, because the task is sequential)
TSI#cycleTime_us	:	UDINT	Configured cycle time of task in µs (= 0, because the task is sequential) SIMOTION Kernel as of version V4.4:
TSI#dwuser_1	:	DWORD	Reserved for internal use
TSI#dwuser_2	:	DWORD	Reserved for internal use

Designation	:	Data type	Meaning
TSI#shutDownInitiator	:	UDINT	Initiate transition to STOP: • _SC_MODE_SELECTOR (= 400): Mode selector switch • _SC_DEVICE_COMMAND (= 401): System function in user program • _SC_EXTERNAL_COMMAND (= 402): Command in SIMOTION SCOUT • _SC_EXCEPTION (= 403): Exception • _SC_ALARM_CONFIGURATION (= 404) Configured response to technological alarm Example of exceptions: • Execution errors in programs • Level overflow • Withdrawing a central module in RUN mode
TSI#taskType	:	ENUM...	Type of task As of version V4.5 of the SIMOTION Kernel Data type: EnumTaskType, see StartupTask (Page 1263) Value: SHUTDOWN

Example for using the TaskStartInfo of the TechnologicalFaultTask

The following example shows you how to query the TO instance that initiated the alarm and the alarm number using the Taskstartinfo in the TechnologicalFaultTask. The *TO_AlarmProg* program must therefore be assigned to the TechnologicalFaultTask.

Table 4-62 Example of polling for Taskstartinfo in the TechnologicalFaultTask

```
PROGRAM TO_AlarmProg
    VAR
        dintVar  : DINT;
        dtVar    : DT;
    END_VAR;
    dtVar   := TSI#startTime;
    dintVar := TSI#alarmNumber;
    IF TSI#toInst = axis_1 THEN // Instance of the technology object
        ; // Statements
    END_IF;
    IF TSI#alarmNumber = 30002 THEN    // Triggering alarm
        ; // Statements
   END_IF;
END_PROGRAM
```

For an additional example, refer to Evaluating in the user program (Page 1293).

4.2.6 Error Handling in Technology Objects

4.2.6.1 Possible errors in technology objects

The following basic errors are possible in the programming of technology objects:

- The technology object itself cannot execute the function required by the application or reports certain events or states:
  → A **technological alarm** is output.
  You can find information on the individual alarms in the SIMOTION Reference Lists.
- The command issued to a technology object cannot be executed:
  → The **return value** of the command provides information about the cause.
  You can find information on the return values of the commands in the SIMOTION Reference Lists.
- Error while accessing configuration data, system variables or I/O variables
  The ExecutionFaultTask is called in the event of errors when configuration data or variables are being read or written

Process Alarms (Page 1281)

Return values of commands (Page 1294)

Errors when accessing system data with _get/_setSafeValue (Page 1295)

4.2.6.2 Process Alarms

If an event (error, note) occurs on a technology object, the object issues a **technological alarm**.

A maximum of 160 technology object alarms can be stored in the system at one time. In this regard per TO identical alarms are counted as one alarm. If this buffer overflows because more than 160 alarms are pending simultaneously, the system switches to STOP mode with a **Message buffer overflow** diagnostics entry. The user cannot read out the buffer level.

If a series of the same alarms occur in succession, the detailed information will only be displayed on the first alarm. For the subsequent alarms the information will only be displayed when the first alarm that occurred has been acknowledged.

Effects of alarms

Technological alarms cause subsequent responses in the system. A distinction is made between:

- Effects on the affected technology object itself: **Local response**
- Effects on other technology objects or the execution system: **Global response**

For each alarm, certain effects have a default setting. However, you can adapt these settings to suit your requirements.

- By specifying the **error activation**, you can define whether the alarm is to be activated immediately, after repeated occurrences of an error, or after a certain period of time.
- You can hide some alarms. This allows you, for example, to suppress unimportant information.

Alarm group association

TO alarm numbers are assigned to an alarm group. Some alarm groups are defined for each TO type, whereas others are TO-specific. For example, alarm numbers 20006 and 20011 are assigned for a TO from the "Configuration error" alarm group.

The alarm group association of the pending technological alarms is displayed via the "errorGroup" system variable. A bit of this variable is assigned to each alarm group. Bit 1 (the lowest is bit 0) is assigned to the "Configuration error" alarm group. If bit 1 is set, this means there is an alarm from the "Configuration error" group at the TO. The following table lists the various alarm groups.

Description	Bit number	Meaning
SYSTEM_FAULT	0	System error
CONFIG_FAULT	1	Configuration error
USER_FAULT	2	User error
PERIPHERAL_FAULT	3	I/O error
FUNCTION_FAULT	4	Function/command error
FUNCTION_ABORTED	5	Function/command abort
RESET_RESTART_FAULT	6	Reset/restart error
DISTRIBUTED_MOTION_FAULT	7	Error during distributed synchronous operation
FOLLOWING_ERROR	8	Dynamic following error monitoring
STANDSTILL_POSITIONING_ERROR	9	Standstill/positioning monitoring error
DYNAMIC_LIMIT	10	Limitation of velocity, acceleration or jerk
CLAMPING_ERROR	11	Clamping monitoring error
SOFTWARE_LIMIT	12	Software limit position switch
LIMIT_SWITCH	13	Hardware limit position switch
SENSOR_FAULT	14	Encoder error
REFERENCE_NOT_FOUND	15	Homing output cam/zero mark error
OUTPUT_LIMIT	16	Output variable limitation
FORCE_DYNAMIC_LIMIT	17	Limitation of force and/or pressure
ADDITIONAL_SENSOR_FAULT	18	Error on additional encoder
SYNCHRONOUS_MOTION_FAULT	19	Synchronous operation error
FOLLOWING_OBJECT	20	Following object error
PATH_SYNCHRONOUS_MO-TION_FAULT	21	Synchronous path operation error
PATH_MOTION_FAULT	22	Path motion error
PATH_OBJECT	23	Path object error

Local response (Page 1283)

Global response (Page 1283)

Error activation (Page 1284)

Configure technological alarms (Page 1285)

Displaying and acknowledging technological alarms (Page 1287)

Acknowledging via the user program (Page 1288)

Evaluating in the user program (Page 1293)

Local response

With the *Local response* setting, you specify how the relevant technology object is to react when the alarm occurs and how subsequent commands for this TO will be handled.

Alarm responses are prioritized. Only one response can be in progress at any given time. This is the response with the highest priority of all the alarms pending at that particular point in time. When an alarm response occurs (except for NONE), the command decoder is always stopped. Any programmed commands issued subsequently are rejected. Command execution can continue after the alarm has been acknowledged in cases where the global error response for the alarm does not automatically require a Power ON.

You can select specific response options depending on the individual technology object and technology object alarm.

For information on the specific local response, please refer to the function manuals of the respective technology objects.

Global response

The *global response* describes the effect of a technology object alarm on the execution system. You can select the following response options depending on the respective TO alarm.

- **NONE**
  System does not respond when the alarm occurs.
- **START TechnologicalFaultTask**
  The **TechnologicalFaultTask** is started. Programs assigned to this task are started. This provides the user with the option of programming an application-specific response to the TO alarm. If there is no program assigned to this task, the system switches to STOP mode.
- **STOP**
  The system switches to **STOP** mode. In this mode, all technology objects are inactive, the user program is not executed, and all outputs are at zero. All system services are still active, and user programs can be loaded.
- **STOP U**
  The system switches to **STOP U** mode. The program execution is terminated, the axis enable and thus the position control is deactivated. The technology objects also remain active and can still process requests for testing and commissioning functions. Otherwise, identical to STOP mode.

Error activation

Type of error activation (TypeOfActivation)

Alarms and their associated alarm responses can be triggered in a variety of ways. Depending on the error type, the error activation is preset to one of the following values.

Table 4-63 Type of error activation

TypeOfActivation parameter	Meaning
ACTIVATE_IMMEDIATELY	The alarm is activated immediately when the error occurs.
ACTIVATE_AFTER_NTIME	The alarm is activated after the error occurs n times. The number n of error repetitions is set in the Continue parameter, see Error reproducibility table.
ACTIVATE_AFTER_NTIME_CONSECUTIVE	The alarm is activated after time t. The error must be pending without interruption over the entire time t. The time is set in the Time parameter, see Error response time table.

Error repeatability (Continue)

Table 4-64 Error repeatability

Continue parameter	Meaning
NO_TIME	The alarm is activated immediately when the error occurs.
TIME_n	The alarm is activated after the error occurs n times.

This parameter is relevant only if the **TypeOfActivation** parameter is set to ACTIVATE_AFTER_NTIME.
TIME_n can be set to values TIME_10, TIME_100, and TIME_1000, depending on the alarm.

Error response time (Time)

Table 4-65 Error response time

Time parameter	Meaning
NO_TIME	The alarm is activated immediately when the error occurs.
TIME_n	The alarm is triggered after a temporally uninterrupted error presence of n milliseconds.

This parameter is relevant only if the **TypeOfActivation** parameter is set to ACTIVATE_AFTER_NTIME_CONSECUTIVE.
TIME_n can be set to values TIME_1, TIME_10, TIME_100, and TIME_1000, depending on the alarm.

Type

You can set the **Type** parameter to specify whether certain technology object alarms are to be displayed. If you select the *Hidden* setting, an alarm message is not displayed when this alarm occurs and no entry is written to the diagnostics buffer. You can thereby prevent an overflow of the alarm buffer when a particular technology alarm is issued frequently, or suppress a note message that is not important to you.

Configure technological alarms

Individual responses are preset for each alarm. To change these default settings, proceed as follows:

1. Select the **Execution System** path in the project navigator. The **Execution System** window opens. Select the path **SystemInterruptTasks → TechnologicalFaultTask**. Then click the **Alarm configuration** button in the window.

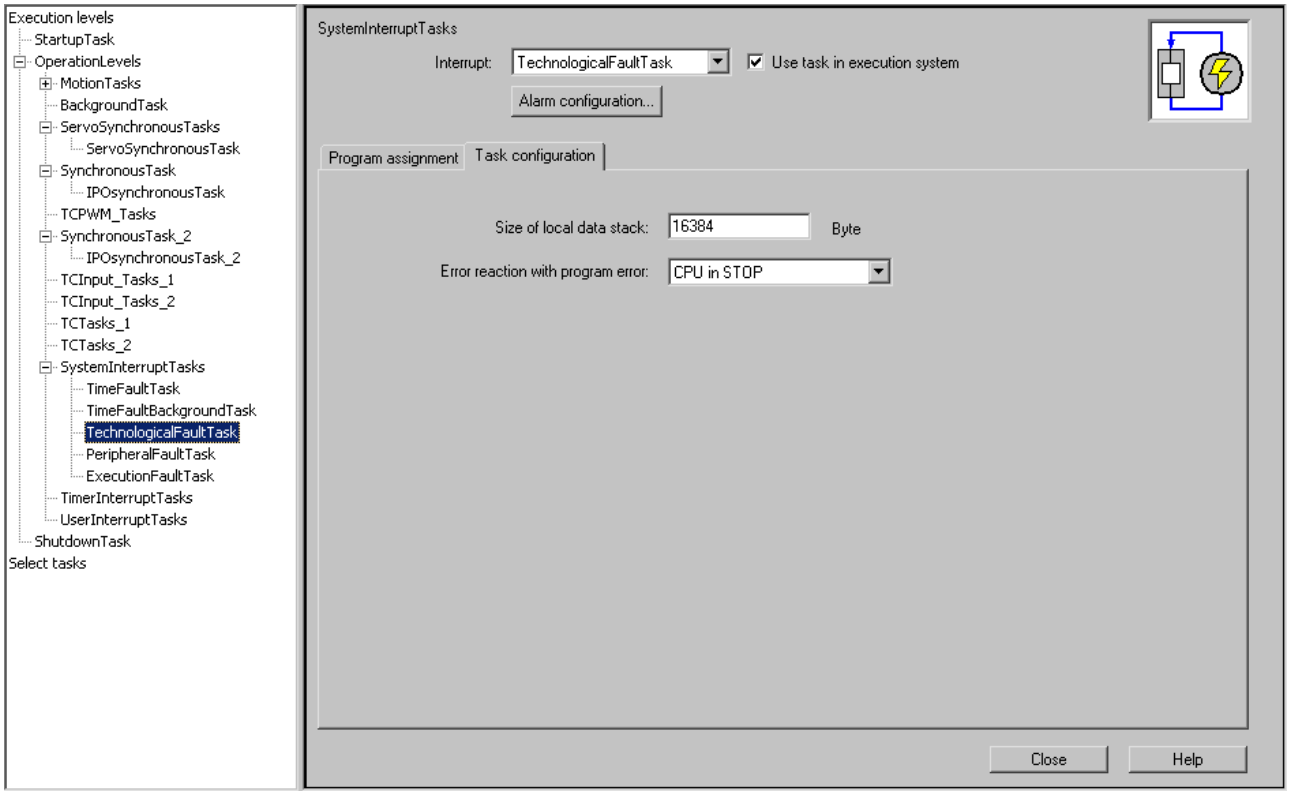

Figure 4-82 Configuring a technological alarm

2. In the combo box, select the technology object for which you want to configure alarms. The alarms for the technology object are displayed.

3. Select the alarm for which you want to change the response.
4. Select the required response from the list for the corresponding technology object alarm. The options available depend on the type of alarm.

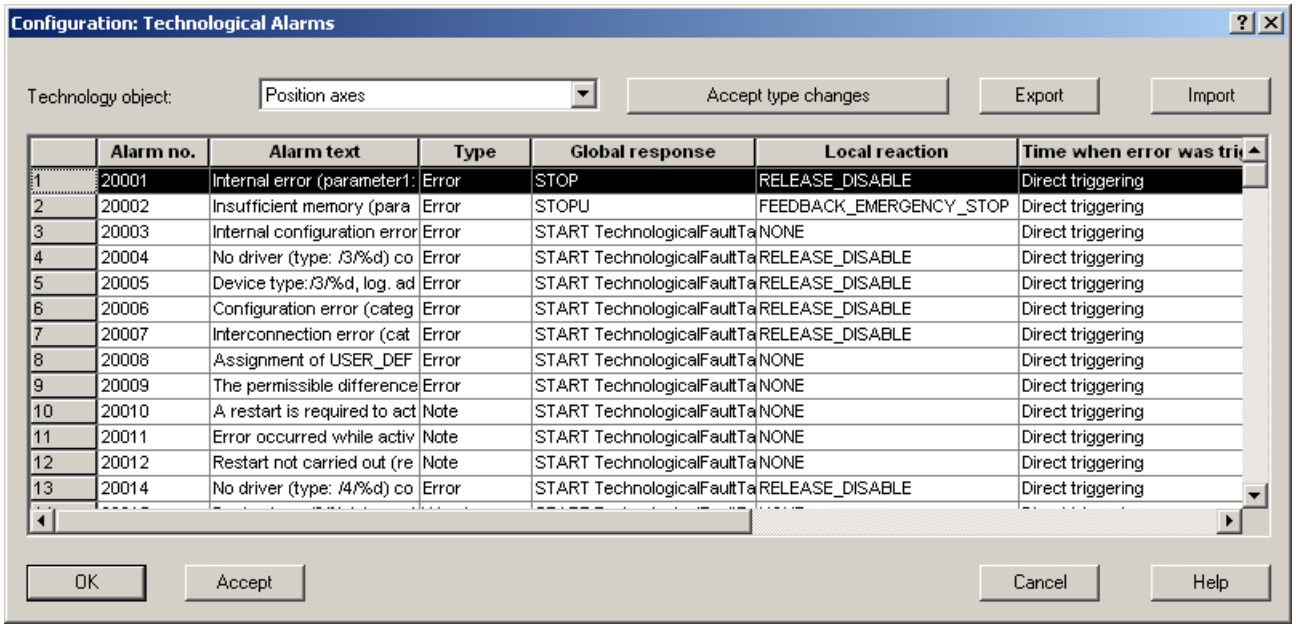

Figure 4-83 Selecting a technological alarm

Note

The technology object whose alarms you want to configure must already be configured.

The alarm configuration can be transferred to other technology objects via the corresponding buttons in the **Alarm configuration** dialog (via export/import).

Exporting or importing technological alarms

Note

So that all changes that you have made in the dialog **Configuration: Technological alarms** are exported, the button **Export** remains inactive until you have applied all changes using **Apply**.

To export all TO alarms in XML format, proceed as follows:

1. Open the **Configuration: Technological alarms** dialog.
2. Click on export to select the **Export alarm configuration** dialog.
3. Select a path for the export and confirm with **OK**.
   The alarms are stored there.

To import TO alarms in XML format, proceed as follows:

1. In the **Configuration: Technological alarms** dialog click on Import.
   This displays the **Import alarm configuration** dialog.
2. Under **Source path and source name of the import** select the desired XML file.
3. Click **OK** to import the data.
   The alarms will then be displayed in the dialog.

Configuring messages (alarms) for all TOs of a certain TO type

If several technology objects of the same TO type are configured on the SIMOTION device, you can assign one alarm configuration to all TOs of this type. For example you can assign a configuration to all position axes.

1. Open the **Configuration: Technological alarms** dialog.
2. Select the TO type from the list, e.g. **- All positioning axes**.
3. Click on **OK** to assign the settings to all preciously configured TOs of the selected type.

Displaying and acknowledging technological alarms

Technological alarms can be evaluated and acknowledged in different ways:

- When SIMOTION SCOUT is in **online mode**, alarms and messages are displayed on the **Alarms** tab in the detail view of the workbench.
  With **Acknowledge**, all alarms of the associated type are deleted.
- Alarms can be output, displayed, and acknowledged via the **H**uman **M**achine **I**nterface (HMI).
- All pending or individually selected alarms of a technology object can also be queried, evaluated, and acknowledged via the user program.

Note

If during the acknowledgement of TO alarms, a new alarm occurs at the TO with the same or lower priority, then the new alarm is no longer reported in the system. This behavior must be taken into account during error acknowledgement.

Acknowledging via SIMOTION SCOUT

Acknowledging individual alarm:

1. Select the alarm in the **Alarms** tab of the detail view.
2. Click **Acknowledge**.

Acknowledging all alarms:

- Click on **Acknowledge all**.

All alarms of the associated type are then deleted.

Note

Because drive alarms usually generate technology object alarms as well, the drive alarms are also deleted with the **Acknowledge (TO)** switch. If however the cause of a drive alarm still exists then a new TO alarm will be triggered immediately. In this case first correct the cause of the drive alarm.

Display and acknowledge via HMI

1. Connecting via WinCC flexible
   Alarms are displayed in a configured message line or in message windows.
   WinCC devices are acknowledged via the ACK key or via user-configured softkeys or buttons.
   (For operating instructions, see **WinCC flexible** description)
2. Link via OPC
   Alarms can be displayed and acknowledged in SimaticNet as of V6.0 SP4 OPC Alarms & Events. In addition the diagnostic buffer can be read out and acknowledged if necessary.
   (For handling, see the *SIMOTION IT Diagnostics and Configuration* Function Manual which you can find on the SIMOTION SCOUT CD documentation)

Acknowledging via the user program

Acknowledge all pending technology object alarms

_resetTechnologicalErrors → Acknowledge all currently pending technology object alarms

ST call example: Acknowledge all pending alarms

```
INTERFACE
    USEPACKAGE CAM;
    PROGRAM EXAMPLE;
END_INTERFACE

IMPLEMENTATION
    PROGRAM EXAMPLE
        VAR
            s_i_RetVal : DINT;
        END_VAR;
        (* Acknowledge all TO alarms *)
        s_i_RetVal := _resetTechnologicalErrors();
    END_PROGRAM
END_IMPLEMENTATION
```

MCC call: Acknowledge all pending alarms

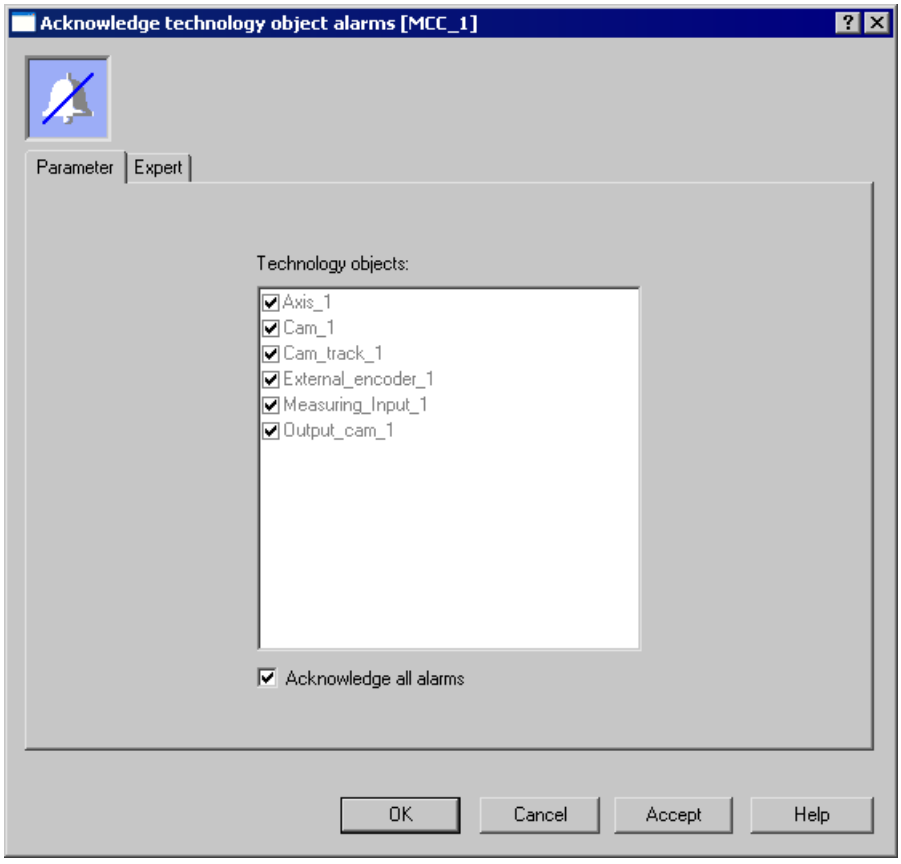

Figure 4-84 MCC call: Acknowledge all pending alarms

Acknowledge all pending alarms of a technology object

ST call example: Acknowledge all alarms on a TO axis, TO measuring input and TO output cam

```
INTERFACE
    USEPACKAGE CAM;
    PROGRAM EXAMPLE;
END_INTERFACE

IMPLEMENTATION
    PROGRAM EXAMPLE
        VAR
            s_i_RetVal : DINT;
        END_VAR;
        (* Acknowledge TO alarms ('ResetTOAlarms') *)
        s_i_RetVal := _resetAxisError(axis := Axis_1);
        s_i_RetVal := _resetMeasuringInputError(
                measuringInput := Measuring_input_1);
        s_i_RetVal := _resetOutputCamError(
                outputCam := Output_cam_1);
    END_PROGRAM
END_IMPLEMENTATION
```

MCC call: Acknowledge all alarms on a TO axis, TO measuring input and TO output cam

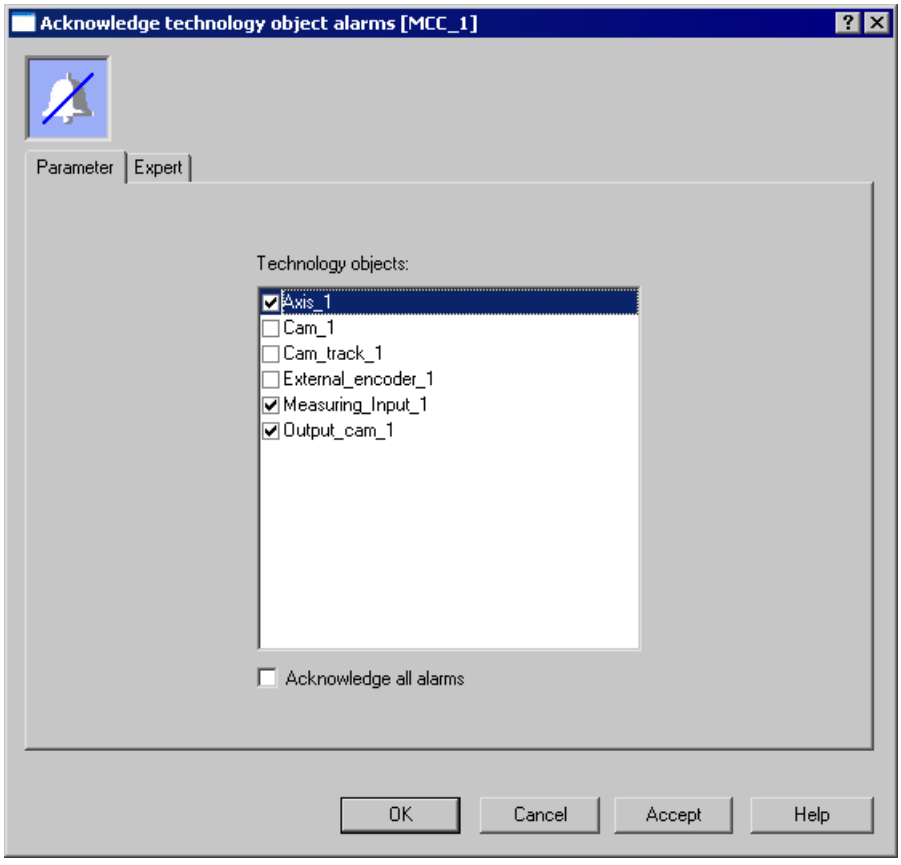

Figure 4-85 MCC call: Acknowledge all alarms on a TO axis, TO measuring input and TO output cam

Acknowledging a specific alarm of a technology object

By adding **errorResetMode** := SPECIFIC_ERROR and **errorNumber** := XXXXX to the **_reset..** commands, it is possible to specifically acknowledge a certain alarm.

Example:

_resetAxisError (..., **errorResetMode** := SPECIFIC_ERROR, **errorNumber** := 30002)

ST call example: Acknowledge alarm 30002 on a TO axis

```
INTERFACE
    USEPACKAGE CAM;
    PROGRAM EXAMPLE;
END_INTERFACE

IMPLEMENTATION
    PROGRAM EXAMPLE
        VAR
            s_i_RetVal : DINT;
        END_VAR;
        (* Acknowledge specific TO alarm ('ResetSingleTOAlarm') *)
        s_i_RetVal:= _resetAxisError(axis := Axis_1,
                errorResetMode:= SPECIFIC_ERROR,
                errorNumber := 30002);
    END_PROGRAM
END_IMPLEMENTATION
```

MCC call: Acknowledge alarm 30002 on a TO axis

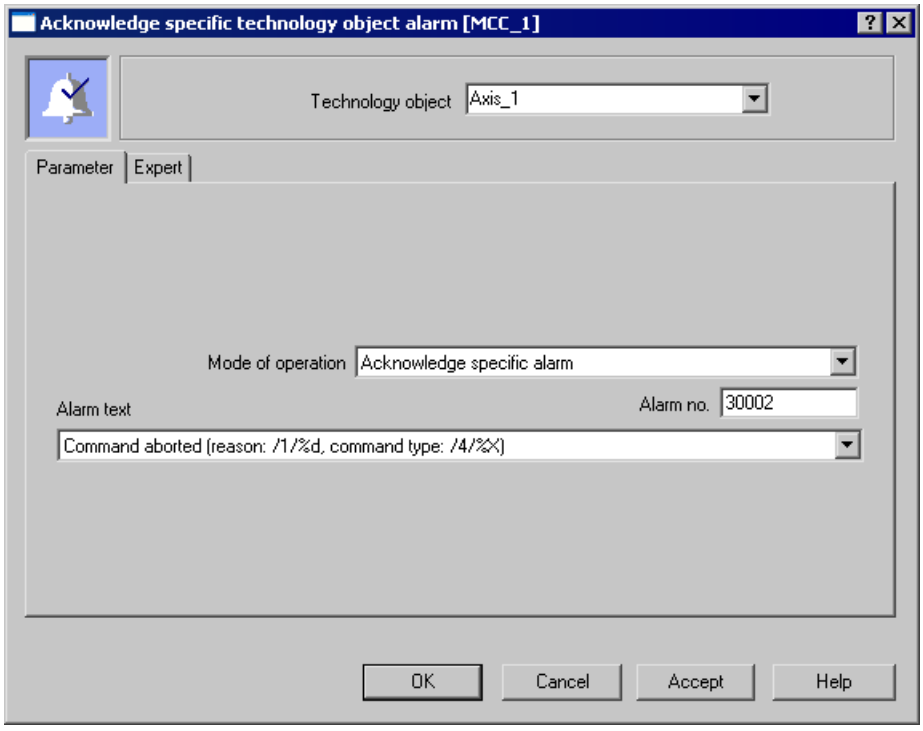

Figure 4-86 MCC call: Acknowledge alarm 30002 on a TO axis

Resetting a technology object

The technology object is set to its initial state and all pending alarms are acknowledged.

Note

In addition to troubleshooting the commands for reset have other effects on the TO as well. Therefore, as a general rule, errors should be acknowledged with the **_reset...Error** commands.

In contrast to the **_reset...Error** command, the **_reset...** commands also bring the respective TO to a safe state. In addition to acknowledging the alarms, the following actions are performed for each TO type:

- Stop the active commands
- Clear the command buffer
- Reset system variables (parameter userDefaultData)
- Execute a TO restart (parameter activateRestart)

In addition, actions dependent on the TO type are executed:

- Axes: Generate a braking ramp
- Output cam and cam track: Switch off the hardware output
- Cam: Delete the curve geometry
- Path object: Stop the path group

Call example: Resetting TO axis, TO measuring input and TO output cam

```
INTERFACE
    USEPACKAGE CAM;
    PROGRAM EXAMPLE;
END_INTERFACE

IMPLEMENTATION
    PROGRAM EXAMPLE
        VAR
            s_i_RetVal : DINT;
        END_VAR;
        (* Reset object ('ResetObject') *)
        s_i_RetVal := _resetAxis(
                axis := Axis_1,
                userDefaultData := DO_NOT_CHANGE);
        s_i_RetVal := _resetMeasuringInput(
                measuringInput := Measuring_input_1,
                userDefaultData := DO_NOT_CHANGE);
        s_i_RetVal := _resetOutputCam(
                outputCam := Output_cam_1,
                userDefaultData := DO_NOT_CHANGE);
    END_PROGRAM
END_IMPLEMENTATION
```

Evaluating in the user program

In the case of alarms for which the **StartTechnologicalFaultTask** global response is configured, the **TechnologicalFaultTask** is called once with every alarm occurrence. The number of the pending alarm and the technology object triggering the alarm can be scanned in this task. The information is passed to the **TechnologicalFaultTask** via the task start info (TSI).

You can add a program to the **TechnologicalFaultTask** and thus program an individual error response for specific alarms or, for example intercept alarms and forward them to higher-level alarm evaluation.

Note

If you have not added any program to the **TechnologicalFaultTask**, the CPU will switch to **STOP** mode if the task is called by an alarm.

The following parameters are transferred in **TechnologicalFaultTask** for evaluation:

TSI#startTime	→	time at which the alarm was registered
TSI#alarmNumber	→	alarm number
TSI#toInst	→	name of the technology object that triggered the alarm (e.g. Axis_1)

Programming example

Every time **Alarm 30002** occurs on Axis_1, a counter (**s_i_Count**) is to be incremented and the alarm acknowledged automatically.

Note: This sample program must be added to the **TechnologicalFaultTask** in the execution system!

```
UNIT ST_1;
INTERFACE
  USEPACKAGE CAM;
  PROGRAM TO_AlarmProg;
END_INTERFACE

IMPLEMENTATION
  PROGRAM TO_AlarmProg
    VAR
      s_i_Count : INT;
      s_i_RetVal: DINT;
    END_VAR;

    (* Query whether alarm 30002 is pending for Axis_1 *)
    IF (TSI#alarmNumber = 30002) AND
                        (TSI#toInst = Achse_1) THEN
      (* Increment counter *)
      s_i_Count:= s_i_Count + 1;
      (* Acknowledge specific technology object alarm *)
      s_i_RetVal := _resetAxisError (
                        axis:=Achse_1,
                        errorResetMode := SPECIFIC_ERROR,
                        errorNumber := 30002);
    END_IF;
  END_PROGRAM
END_IMPLEMENTATION
```

4.2.6.3 Return values of commands

The user program indicates whether or not an executed command was able to be executed successfully during runtime.

Any error information is contained in the return value of the block. You do not have to acknowledge this error information.

Evaluating the return value

When a command returns a value of zero, this signifies that the command has been executed without error. If an error has occurred, the return value contains an error number that can be used to identify the cause of the error.

The possible error numbers for the respective commands can be found in the SIMOTION Reference Lists.

You can respond to possible errors during system function execution in the user program, thus preventing secondary errors.

Likewise for MCC commands you can program a specific error response by entering a return variable with the return value of the command (see MCC Programming Manual, section Expert tab).

Call example

If an error occurs when the **_pos** command is being executed, the **g_bo_error** variable is to be set to **true**, the return value entered in the **g_i_errornumber** parameter and the block aborted.

Note: This sample program must be added to a **MotionTask** in the execution system!

```
UNIT ST_1;
INTERFACE
    USEPACKAGE CAM;
        VAR_GLOBAL
            g_bo_error: BOOL;
            g_i_errornumber: DINT;
            g_i_RetVal: DINT;
        END_VAR
    PROGRAM RETURN_VALUE;
END_INTERFACE
IMPLEMENTATION
    PROGRAM RETURN_VALUE

         (* Position axis ('Pos') *)
        g_i_RetVal:= _pos(axis:=Axis_1,
        direction:=SHORTEST_WAY,
        positioningMode:=ABSOLUTE,
        position:=222,
        velocityType:=DIRECT,
        velocity:=1000,
        velocityProfile:=TRAPEZOIDAL,
        blendingMode:=INACTIVE,
        mergeMode:=IMMEDIATELY,
        nextCommand:=WHEN_MOTION_DONE,
        commandId:=_getCommandId());
         (*Evaluation of the return value *)
        IF g_i_RetVal <> 0 THEN
            g_i_errornumber := g_i_RetVal;
            g_bo_error := true;
            Return;  // End block
        END_IF;
    // Further user program as of here.
    END_PROGRAM
END_IMPLEMENTATION
```

4.2.6.4 Errors when accessing system data with _get/_setSafeValue

Error while accessing configuration data, system variables or I/O variables

With V4.1.3 and higher, these system functions are not necessarily required for system variables and config data. In the event of access errors (e.g. technology object in restart), a "replacement value" or "last value" can be configured; see System variables (Page 1245) or Configuration data (Page 1249).

Where direct access is involved, ExecutionFaultTask is called in the event of errors occurring when configuration data or system variables are being read or written (see Access errors to system variables and configuration data, as well as I/O variables for direct access (Page 1258)).

However, in certain cases it is necessary to avoid calling the ExecutionFaultTask, to respond differently to an error or to deviate from the configured error response. The functions _getSafeValue, _setSafeValue, and getInOutByte serve this purpose. Configuration data item *restartInfo.behaviorInvalidSysvarAccess* can be used for accessMode = CONFIGURED (see System variables (Page 1245) or Configuration data (Page 1249)).

Replacement value strategy and errors when accessing system variables, configuration data, and I/O variables

There are various situations in which the reading or writing of a system variable, a configuration data item or an I/O variable can fail.

Table 4-66 Possible causes for the read/write failure

Cause	System variable	Config data item	I/O variable
Variable temporarily not available	TO in restart TO deactivated	TO in restart TO deactivated	Faulty input
	-	Data not visible in the current configuration	Faulty output
Illegal value (for write)	Value lies outside the limits	Value lies outside the limits	-
	Value not in the grid	Value not in the grid	-

Depending on the cause, the following responses are possible:

Table 4-67 System response in the event of an error when using _getSafeValue

Required response		System variable	Config data item	I/O variable
A value that temporarily cannot be accessed while reading:				
Go to STOP	Call = accessMode	STOP_DEVICE	STOP_DEVICE	STOP_DEVICE
	Answer	→ STOP	→ STOP	→ STOP
	Value	Unchanged	Unchanged	Unchanged
Do not read	Call = accessMode	NO_CHANGE	NO_CHANGE	Not implemented
	Answer	NO_CHANGE	NO_ACCESS	
	Value	Last value	Configured value	
Read substitute value	Call = accessMode	DEFAULT_VALUE	DEFAULT_VALUE	DEFAULT_VALUE
	Answer	NO_ACCESS	INVALID_VALUE	DEFAULT_VALUE
	Value	Default value	Default value	Substitute value
Read last valid value	Call = accessMode	CONFIGURED	CONFIGURED	NO_CHANGE
	Answer	(In acc. with configuration data item behavior, etc.)	(In acc. with configuration data item behavior, etc.)	NO_CHANGE
	Value			Last valid value

Table 4-68 System response in the event of an error when using _setSafeValue - when writing a temporarily inaccessible value

Required response		System variable	Config data item	I/O variable
Go to STOP	Call = accessMode	STOP_DEVICE	STOP_DEVICE	STOP_DEVICE
	Answer	→ STOP	→ STOP	→ STOP
	Value	Unchanged	Unchanged	Current value
	Return value setValue	Current value	Current value	-
Do not write	Call = accessMode	NO_CHANGE	NO_CHANGE	Not implemented
	Answer	NO_CHANGE	NO_ACCESS	
	Value	Unchanged	Unchanged	
	Return value setValue	Current value	Current value	
Do not write	Call = accessMode	DEFAULT_VALUE	DEFAULT_VALUE	Not implemented
	Answer	NO_ACCESS	NO_ACCESS	
	Value	Unchanged	Unchanged	
	Return value setValue	Current value	Current value	
Do not write	Call = accessMode	CONFIGURED	CONFIGURED	Not implemented
	Answer	(In acc. with configuration data item behavior, etc.)	(In acc. with configuration data item behavior, etc.)	
	Value			
	Return value setValue	Current value	Current value	
Accept substitute value, will take effect later	Call = accessMode	Not implemented	Not implemented	DEFAULT_VALUE
	Answer			DEFAULT_VALUE
	Value			Substitute value
Accept current value, will take effect later	Call = accessMode	Not implemented	Not implemented	NO_CHANGE
	Answer			NO_CHANGE
	Value			Current value

Table 4-69 System response in the event of an error when using _setSafeValue - error when writing an invalid value

Required response		System variable	Config data item	I/O variable
Go to STOP	Call = accessMode	STOP_DEVICE	STOP_DEVICE	Does not occur
	Answer	→ STOP	→ STOP	
	Value	Unchanged	Unchanged	
	Return value setValue	Current value	Current value	
Do not write	Call = accessMode	NO_CHANGE	NO_CHANGE	
	Answer	NO_CHANGE	NO_CHANGE	
	Value	Unchanged	Unchanged	
	Return value setValue	Current value	Current value	
Write default value	Call = accessMode	DEFAULT_VALUE	DEFAULT_VALUE	
	Answer	DEFAULT_VALUE	INVALID_VALUE	
	Value	DEFAULT_VALUE	Unchanged	
	Return value setValue	Current value	Current value	

Legend for tables above

- DEFAULT_VALUE
  The DEFAULT_VALUE is the configured value. This is the value transferred during a download (system variables and config data).
- LAST VALUE - configured value (config data)
  The last value can be the configured value. The value will then be equivalent to the value shown under "Current value" in the expert list.
  OR
  The last value can be the last configured value. The value will then be equivalent to the value shown under "Next value" in the expert list.
  Either of these values can be output, depending on the configuration data entered.
- LAST VALUE - last value (system variables)
  With system variables, the last value is the value which is currently set and effective.

4.2.7 Execution System, Tasks, and System Cycle Clocks

4.2.7.1 Execution system

The SIMOTION **execution system** provides various **execution levels**.

- The execution levels are assigned to **user program tasks**.
  - **Programs** are assigned to the user program tasks.

  All programs - and thus also tasks - can contain PLC and motion control tasks.

The following execution levels are available:

- Synchronous execution levels: synchronous with control and interpolator cycle clocks
- Time-driven execution levels
- Event-driven execution levels
- Interrupt-controlled execution levels
- Sequential execution levels
- Free-running execution levels

Various **tasks** with different execution properties are available for specific tasks:

System tasks

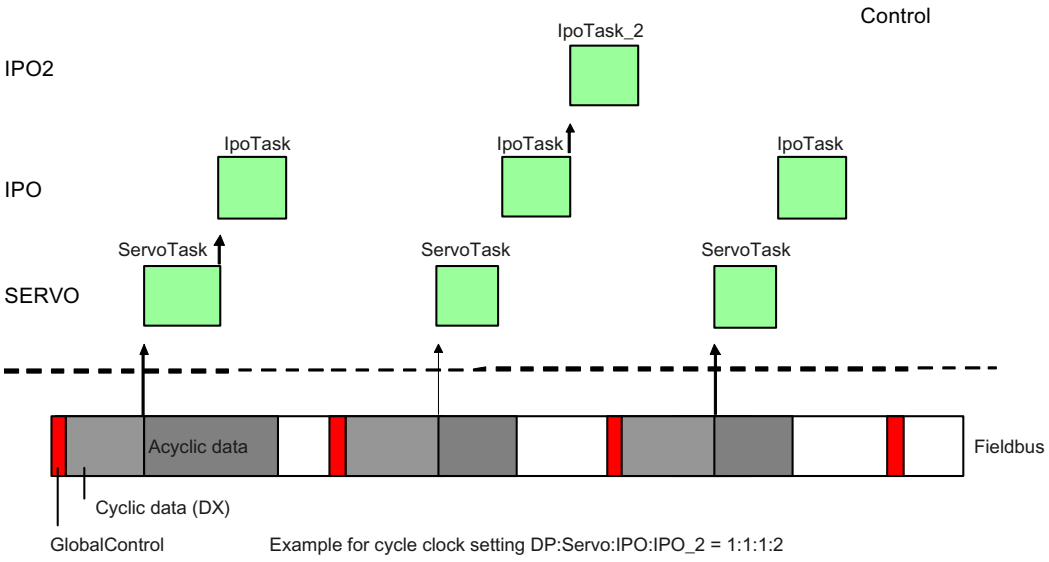
System tasks are regularly executed by the system.

The system cycle clock can be specified.

The following tasks are executed by system tasks:

- **Communication**
  System tasks for the connection to the isochronous PROFIBUS, to PROFINET IO with IRT or the system cycle clock and for I/O processing.
- **Motion control**
  - Base cycle clock/bus cycle clock
    The base/bus cycle clock (DP cycle clock or PN cycle clock) is based on the cycle of the isochronous bus and determines the intervals for data exchange with the DP/PN I/O. The base/bus cycle clock is used as the basis for setting further cycle clocks.
  - Position control cycle clock
    Among other things, position control and monitoring of axes, drive communication, and I/O processing take place during the time slice of the position control cycle clock. The cycle for the position control cycle clock determines the interval between two position controller cycle clocks. The position control cycle clock can be set as a multiple of the base/bus cycle clock. A cycle clock ratio of 1:1 is recommended.
  - IPO cycle clock
    The time slice of the interpolator cycle clock is used, amongst other things, to calculate the setpoints. The cycle for the interpolator cycle clock determines the interval between two interpolator cycle clocks. Time slice requirements may increase briefly at the start of one or more commands. The IPO cycle clock can be set as a multiple of the position control cycle clock. A cycle clock ratio of 1:1 is recommended.
  - IPO2 - cycle clock 2
    Interpolator cycle clock 2 handles the same tasks as the interpolator cycle clock and can be used for technology objects of lower priority classes. The IPO2 cycle clock can be set as a multiple of the IPO cycle clock.
  - Servo_fast/IPO_fast
    An additional faster position control cycle clock option and an IPO option can be configured as of V4.2, see also Servo_fast (application cycle clock for fast bus system) (Page 1364).

  Adjustable gear ratios between bus task, servo, and IPO support appropriate load distribution and optimum system utilization.
  With digital drives, these execution levels are synchronized with the isochronous PROFIBUS or PROFINET IO with IRT. For analog drives without isochronous PROFIBUS, the execution levels are supplied with an adjustable system cycle clock from an internal timer.



- **Temperature control**
  In connection with the **TControl** technology package, execution levels are available for the temperature control: Actual value measurement, control and pulse width modulation of the output signals.

User programming

Execution levels for the task-related programming are available for the user programming (**user program tasks**): Motion control, logic and technological functions.

See also

Specifications for the configuring (Page 1417)

Execution levels / tasks

The execution levels define the chronological sequence of programs in the execution system. Each execution level contains one or more tasks.

A task provides the execution framework for the programs. Each task is executed when specific conditions are satisfied. You can assign one or more user programs to each task and specify their order within the task.

Besides user program tasks there are also several system tasks, the contents and execution sequence of which you cannot influence.

Execution levels

The following figure shows the execution levels with their tasks.

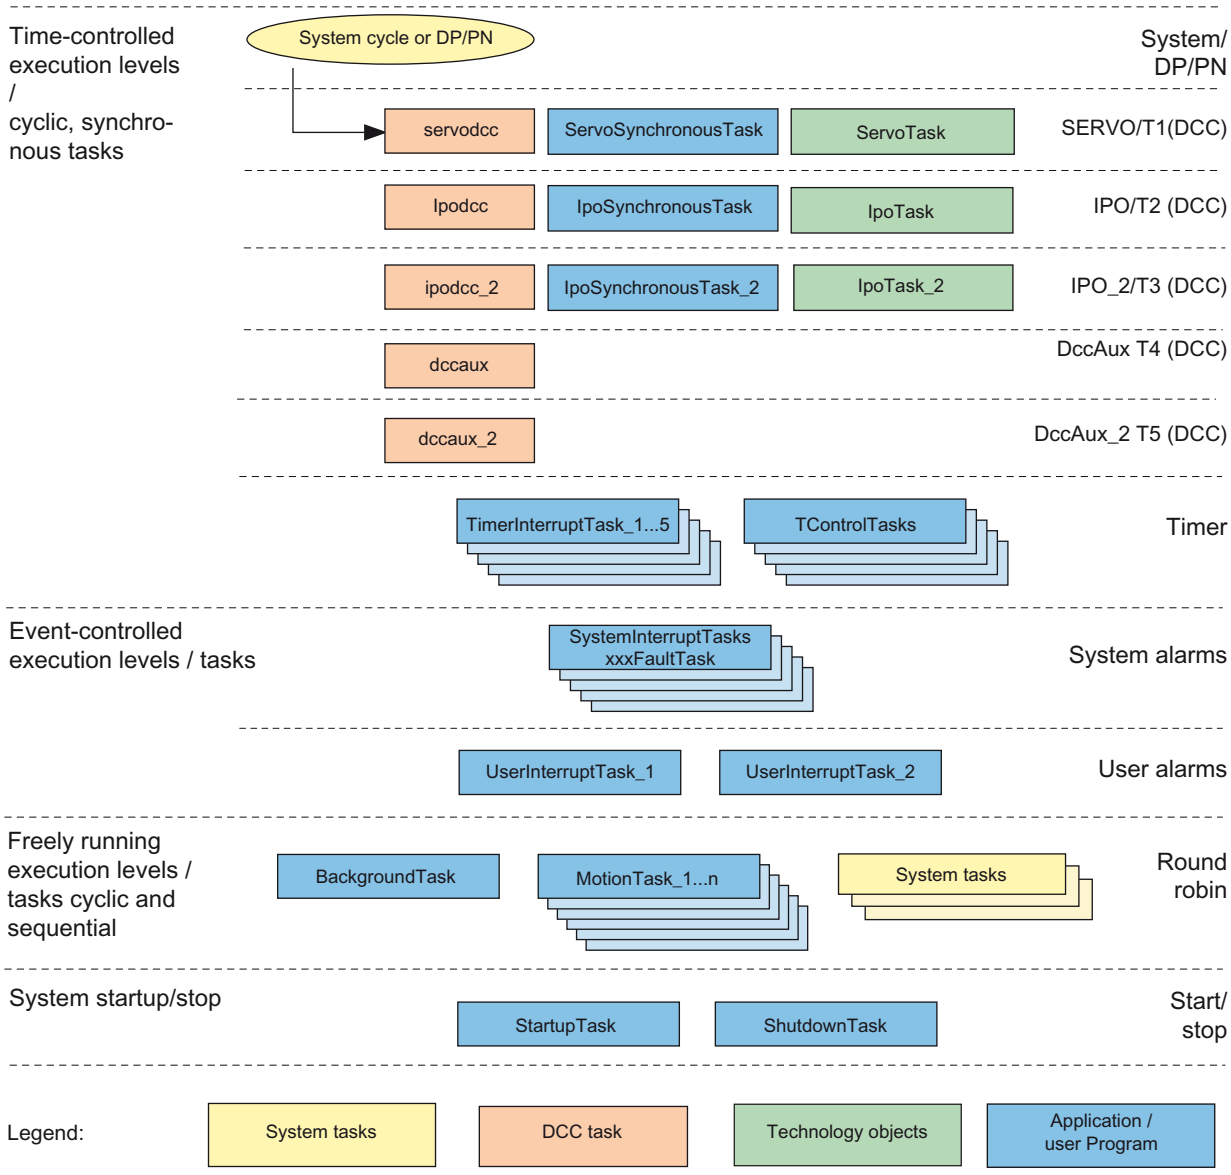


Figure 4-87 Execution levels and tasks in the SIMOTION runtime system

When you use technology packages, the execution levels provided by the system are automatically assigned. The user program cannot influence the processing of technology functions in these execution levels. System tasks are acyclic communication (Ethernet, PROFIBUS DP, PROFINET IO), debug services or trace preprocessing, for example.

The DCC levels and tasks are not visible in the execution system in the SCOUT user interface. The DCC plans are arranged in the DCC editor via execution groups, see **Description of the DCC editor**.

The following example for the Axis technology object demonstrates how the system and user program tasks interact with each other. At the end of cyclic data transmission, the ServoSynchronousTask and ServoTask are started, followed by the IPOSynchronousTask and IPOTask.

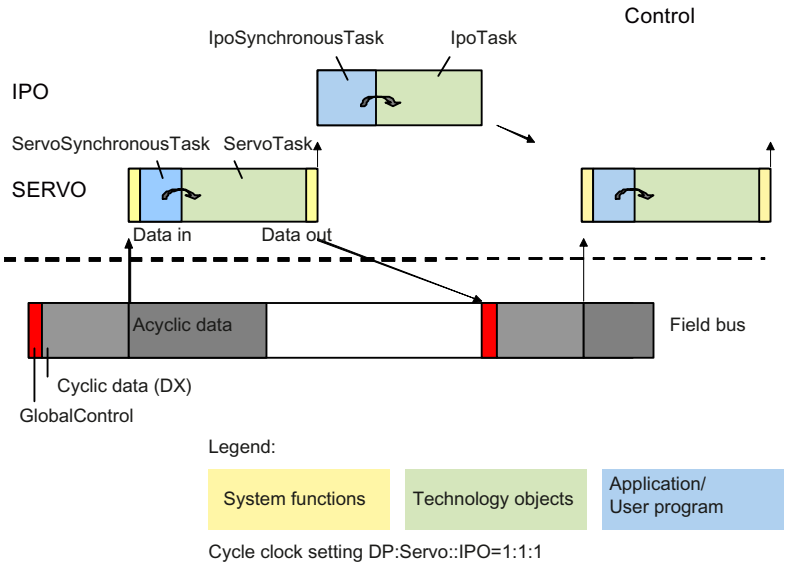

Figure 4-88 Task interaction

For more information, go to:

Isochronous I/O processing on fieldbus systems (Page 1383)

Dynamic response with respect to data processing in the control (Page 1389)

Tasks

One or more tasks are available in each execution level for user programming.

The main features of the tasks are:

- Start behavior: When and under what conditions a task is started. (refer to Table)
- Priority: Which task is interrupted by which other task. (refer to the table for the task priorities in the next section)

The following table shows the tasks available for user programs.

Table 4-70 Tasks in the SIMOTION runtime system

Task		Description
StartupTask		The **StartupTask** is executed once at the transition from **STOP** or **STOP U** mode to **RUN** mode. It is intended for initialization and resetting of technology objects.
Free-running tasks:		In the **round robin execution level**, the **MotionTasks** and **BackgroundTask** are executed by the system in the background in the time-slice procedure.
	MotionTasks	**MotionTasks** are intended for the programming of sequences, for programmed motion control or other *sequential* executions. MotionTasks are started by user programs and executed once.
	BackgroundTask	The **BackgroundTask** is provided for the programming of *cyclic* sequences without a fixed time frame. The BackgroundTask is started after system start-up and then executed cyclically and free-running.
Time-driven tasks and synchronous tasks:		**Cyclic tasks**. They are called cyclically in a certain time frame and are automatically restarted after the execution of the assigned programs.

Task		Description
	TimerInterruptTasks	**TimerInterruptTasks** are intended for the periodical starting of programs.
	SynchronousTasks	**SynchronousTasks** are started periodically, synchronous with a specified system cycle clock.
Event-driven tasks:		**Sequential tasks**. They are started and executed once when an event occurs and then terminated.
	SystemInterruptTasks	**SystemInterruptTasks** are started and executed once when a system event occurs.
	UserInterruptTasks	**UserInterruptTasks** are started and executed once when a user-defined event occurs.
ShutdownTask		The **ShutdownTask** is executed once at the transition from **RUN** mode to **STOP** or **STOP U** mode.

Note

In addition to the user program tasks, there are various system-internal tasks that the user cannot influence.

The **ControlPanelTask** is such a system-internal task, for example. It is visible during the task run times of the device diagnosis, but not in the execution system.

As of V4.1.2, the TaskTrace is also available. The SIMOTION Task Trace records the sequence of the individual tasks, labels "user events", which you can generate using a program command, and represents these graphically; see the Task Trace Function Manual.

UserInterruptTasks (Page 1338)

ShutdownTask (Page 1343)

Isochronous I/O processing on fieldbus systems (Page 1383)

Execution system in SIMOTION SCOUT

All tasks used in the execution system can be viewed in SIMOTION SCOUT.

- Select the SIMOTION device in the project navigator and select **Target system > Configure execution system** in the menu or double-click **EXECUTION SYSTEM**.

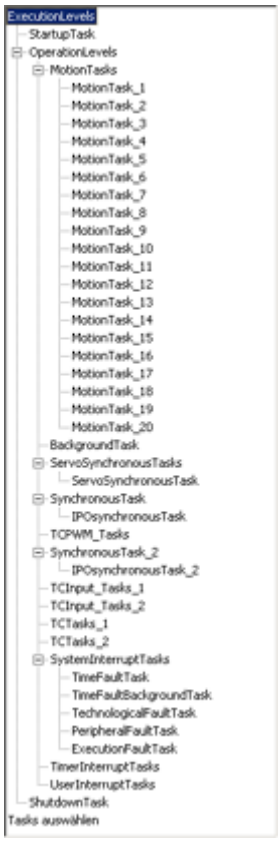

Figure 4-89 Overview of the tasks in SCOUT

Execution system

The execution system with the execution levels and the assigned tasks are displayed here.

Execution levels tree

The execution levels tree displays the available execution levels / tasks as fixed entries.

The **OperationLevels** folder contains the tasks that are available in the **RUN** mode.

- To open the **OperationLevels** folder, click the plus sign in front of it.

The list below each execution level or task name shows the configured tasks and the programs assigned to them.

After you have assigned programs to tasks, they are displayed in the execution levels tree.

Use task in execution system

Select the tasks from the list that should be used in the execution system.

- Activate the checkbox of the respective task.

Only those tasks that have been selected will be shown in the execution levels tree.

Execution system - context menu

You can select the following functions:

Function		Meaning/Note
Open		Use this to open the execution level configuration.
Expert		
	Set system cycle clocks	Use this to set the ratio between the system cycle clocks (e.g. between the interpolator cycle clock and the position control cycle clock) depending on a parameterized isochronous operation at the PROFIBUS or PROFINET interface.
Print		Use this to print the contents of the execution system. All tasks with the associated configuration are printed.
Print preview		Use this to open the print preview for the execution system.

Task priorities

Tasks and the programs assigned to them are started and executed at a certain time. If several tasks are to be started and executed at the same time, the task priority determines which task will be executed first.

Table 4-71 Overview of the task priorities

Priority	Execution level	Task	Cyclic/ sequential	Meaning
High	Servo, DP communication	-	z	
	Servo/T1 (DCC)	**Servodcc** **ServoSynchronousTask** **ServoTask**	z	Task of a DCC runtime group (T1) User program task in the servo cycle clock System task
	IPO/T2 (DCC)	**Ipodcc**	z	Task of a DCC runtime group (T2)
		IPOSynchronousTask • Check UserInterrupt • User program	z	User program task in the interpolator cycle clock
		IPOTask • Check the condition for WAITFORCONDITION (IPO, system)	z	System task in the IPO cycle clock
	IPO_2/T3 (DCC)	**Ipodcc_2**	z	Task of a DCC runtime group (T3)
		IPOSynchronousTask_2	z	User program task in the interpolator cycle clock 2
		IPOTask2	z	System task in the IPO cycle clock 2
	TControlTasks	**PWMsynchronousTask**	z	Temperature controller task
		PWMTask	z	System task
		InputTask_1	z	System task
		InputSynchronousTask_ 1	z	Temperature controller task
		InputTask_2	z	System task
		InputSynchronousTask_ 2	z	Temperature controller task
		ControlTask_1	z	System task
		PostControlTask_1	z	Temperature controller task
		ControlTask_2	z	System task
		PostControlTask_2	z	Temperature controller task
	DccAux (DCC)	**Dccaux**	z	Task of a DCC runtime group (T4)
	DccAux_2 (DCC)	**Dccaux_2**	z	Task of a DCC runtime group (T5)
	SystemInterruptTasks	**TimeFaultTask**	s	System alarm (in the order of events)
		TimeFaultBackgroundTask	s	System alarm (in the order of events)
		TechnologicalFaultTask	s	System alarm (in the order of events)
		PeripheralFaultTask	s	System alarm (in the order of events)
		ExecutionFaultTask	s	System alarm (in the order of events)
	UserInterruptTasks	**UserInterruptTask_1**	s	User alarm (in the order of events)
		UserInterruptTask_2	s	User alarm (in the order of events)

Priority	Execution level	Task	Cyclic/ sequential	Meaning
	TimerInterruptTasks	**TimerInterruptTask1 ... TimerInterruptTask5**	z ... z	Timer alarms
	Round robin	**BackgroundTask**	z	User program task (the sequence cannot be specified)
		MotionTask_1 ... MotionTask_32	s ... s	User program tasks (the sequence cannot be specified)
Low				

Priorities

The priority of a task *cannot* be changed by the user. For information on the execution levels of Servo_fast and IPO_fast, see also Priorities and sequences of synchronous tasks (Page 1369).

Note

Tasks run according to their priorities. Thus, higher priority tasks supersede lower priority tasks.

Therefore, fluctuations of the cycle time can occur for lower priority tasks.

- **TimerInterruptTasks:**
  The shorter a time slice, the higher its priority.
- **UserInterruptTasks:**
  All tasks have the same priority and are executed in the order of their activation events.
- **Wait for condition / WAITFORCONDITION** temporarily increases the priority of a MotionTask:
  - The condition is checked with the same priority as for **UserInterruptTasks**.
  - If the condition is satisfied, the MotionTask (that was previously pending) is reactivated.
  - The commands enclosed between **WAITFORCONDITION** and **ENDWAITFORCONDITION** are executed with increased priority (between **SystemInterruptTasks** and **TimerInterruptTasks**).

Further information on **Wait for condition** / **WAITFORCONDITION** can be found in the **SIMOTION MCC** or **SIMOTION ST** programming manuals.

Checking the condition for UserInterruptTask

The condition for the UserInterruptTasks is checked in the IPOSynchronousTask, prior to the execution of the user program of the IPOSynchronousTask.

Any errors that occur for the UserInterruptTask condition will be handled as if they came from the IPOsynchronousTask.

The time required for checking the condition of the UserInterruptTask is part of the runtime of the IPOsynchronousTask.

Checking the wait condition

If wait conditions can be used, such as **Wait for condition** / **WAITFORCONDITION**, the system performs the check, the task is not started for the check.

A synchronous setting on the command (e.g. Wait until motion end) is reasonable especially in sequential tasks.

The WAITFORCONDITION condition is checked after the user program for the IPOSynchronousTask at the start of the IPOTask.

Any errors that occur for WAITFORCONDITION will be handled as if they came from the associated MotionTask.

The time required for checking the WAITFORCONDITION condition(s) is part of the runtime of the IPOTask.

Task start sequence

When the StartupTask is completed, **RUN** mode is reached.

The following tasks are then started:

- SynchronousTasks
- TimerInterruptTasks
- BackgroundTask
- MotionTasks for which the attribute for automatic start is set

Note

The priorities of the execution levels or their tasks do not indicate the order in which the MotionTasks, BackgroundTask and time-triggered tasks are started after **RUN** mode is reached.

Priorities of the temperature controller tasks

The PWM tasks have a separate layer; their priority is located between servo level and IPO level. In terms of priority, all other temperature controller tasks are sorted between the DccAux task and the Fault tasks and are located on the same layer.

Runtime model in SIMOTION

The following diagram shows the general sequence and (from top to bottom) the priorities of the tasks in SIMOTION.

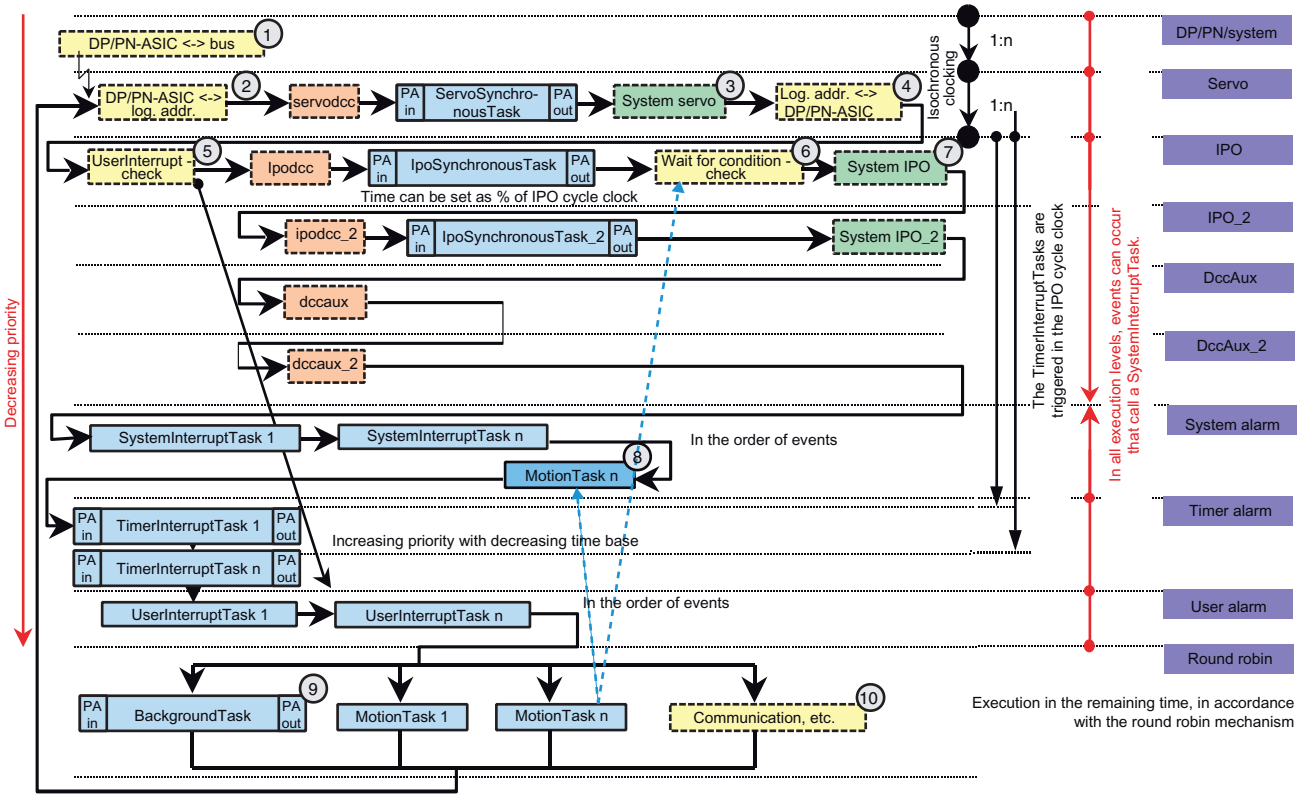

Figure 4-90 Runtime model in SIMOTION - general sequence, priorities

Explanations for the figure:

The display applies to a ratio between DP, Servo and IPO of 1:1:1

- Color blue/green: available to the user (application / technology objects)
- Color yellow (dashed): not available to the user (system tasks)

Explanation of the system tasks

1. **DP/PN-ASIC <-> Bus:**
   Data is copied from the communications chip to the PROFIBUS or PROFINET IO with IRT or fetched from there. The transfer of the I/O inputs on the logical addresses (2) is started at the end of the copy action.
   The copy action runs on its own processor and thus asynchronously to the remaining execution system. The synchronization point is the end of the data exchange between the bus and the ASIC.
2. **DP/PN-ASIC -> log. addr.:**
   The I/O inputs are loaded from the communications chip.

3. **System servo:**
   System calculations in the servo cycle clock (position controller, etc.).
   If all tasks of the servo level cannot be calculated in a single cycle (bus cycle clock), a level overflow occurs and the system enters STOP mode, the start-up lock is set and a corresponding entry is made in the diagnostic buffer. Only after a ramp-up (power on/off) or download can the system return to RUN mode.
4. **Log. addr. -> DP/PN-ASIC:**
   The I/O outputs are written to the communications chip.
5. **UserInterrupt - Check:**
   The conditions of the two user interrupts are checked.
6. **Wait for condition - Check:**
   The conditions for WAITFORCONDITION (wait for axis, wait for signal, etc.) are checked.
7. **System IPO/IPO_2:**
   The system-side components of the IPO cycle clock are calculated (motion control: Positioning profiles, synchronous operation, etc.).
8. **MotionTask n:**
   A MotionTask that is waiting with a WAITFORCONDITION will be switched in preference when the condition occurs (with higher priority).
9. **BackgroundTask:**
   The **BackgroundTask** runs here.
   The updating of the background process image (PI) is performed at the start and after completion of the complete BackgroundTask.
   The runtime model normally runs several times between the reading of the input image and the writing of the output image. I.e. depending on the size of the user program, the BackgroundTask is interrupted several times by higher priority tasks (starting with the ServoTask).
10. **Communication:**
    Communication functions (HMI, PG/PC, etc.).

BackgroundTask (Page 1319)

Execution system in the symbol browser

Description

You can monitor and, if required, change program instance data of programs that are used in the execution system. This data includes the values of local variables that are normally not monitored on the unit.

For example, you have used a function block several times in the execution system on MotionTasks. You can then view the program instance data under every MotionTask in the symbol browser of the execution system.

To display the symbol browser for the execution system:

1. Select the execution system in the project navigator.
2. Click the symbol browser into the foreground in the detail view.
   The available program instance data is then displayed for each task.

Note

If you have selected "Only create program instance data once" as the compiler option, the program instance data is no longer displayed. It is displayed locally on the unit.

Synchronism of all components

Description

All components (the SIMOTION system, user programs, drives, bus system, and accurately-timed I/O modules) work deterministically and in strict synchronism. The individual components are synchronized via an isochronous fieldbus (PROFIBUS or PROFINET).

SIMOTION synchronizes itself with the bus cycle clock and passes this on to a second bus as well.

This ensures determinism for all the components, even if multiple machine modules and bus segments are being used. Distributed synchronous operation is also possible, e.g. as shown in the figure below:

Although axes 1 to 4 and axes 5 and 6 are controlled by different SIMOTION devices, they can still be operated synchronously.

This consistent synchronism results in high dynamic response and precision throughout the entire machine.

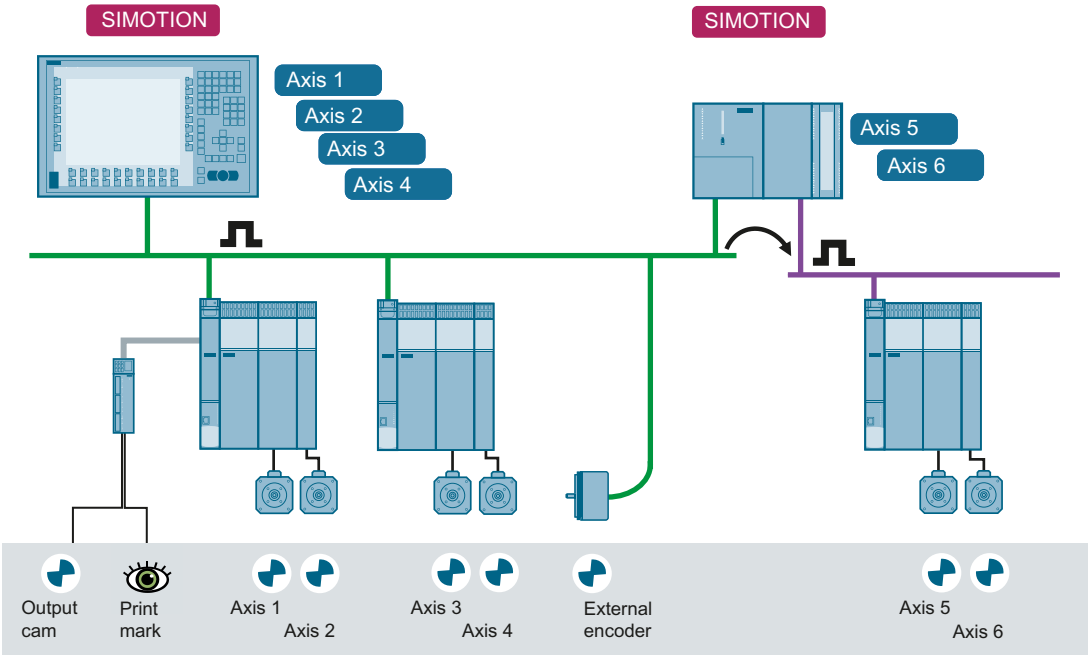

Figure 4-91 Synchronism with SIMOTION

Identifying the task name and type (as of Kernel V4.5)

With SIMOTION Kernel version V4.5 and higher, you can identify during runtime the name and type of the task assigned to a program.

To identify the task name, use the _getCurrentTaskName() function which is called without specification of a parameter. The return value of data type STRING contains the task name. A description of the function can be found in the "System Functions/Variables Devices" List Manual (reference list).

The task type is specified in the TaskStartInfo TSI#taskType. This TaskStartInfo contains the type of the task as an EnumTaskType. This data type is described in the TaskStartInfo of the StartupTask (Page 1263).

4.2.7.2 Description of the user program tasks

StartupTask

The **StartupTask** is provided for the one-time initialization and the resetting of the technology objects.

It is active when the operating mode switches from **STOP** or **STOP U** to **RUN**.

It must *not* be used for process start-up or homing or for setting up axes (motion commands must not be used).

While the StartupTask is being executed, no other user program tasks except for the **SystemInterruptTask** and the **UserInterruptTask** are active.

Access to process image and symbolic I/O variables is restricted. The process image of the inputs is updated before the startup task and remains constant for the duration of the startup task. The process image of the outputs is set to zero before the startup task, and output after the startup task. Direct accesses to inputs provide the current values. Write I/O variables can be set to initial values. These values, however, act only after the startup task with the enable of all outputs on the terminals.

When the StartupTask is completed, **RUN** mode has been reached. The following tasks are now started:

- **SynchronousTasks**
- **TimerInterruptTasks**
- **BackgroundTask**
- **MotionTasks**, in which the automatic start attribute is set

Note

The priorities of the execution levels or their tasks do not indicate the order in which the MotionTasks, BackgroundTask and time-triggered tasks are started after **RUN** mode is reached.

Select the **Program assignment** tab to assign the created and compiled programs to the StartupTask and define their execution sequence.

Configuring the StartupTask

1. Click **StartupTask** in the Execution Levels tree.

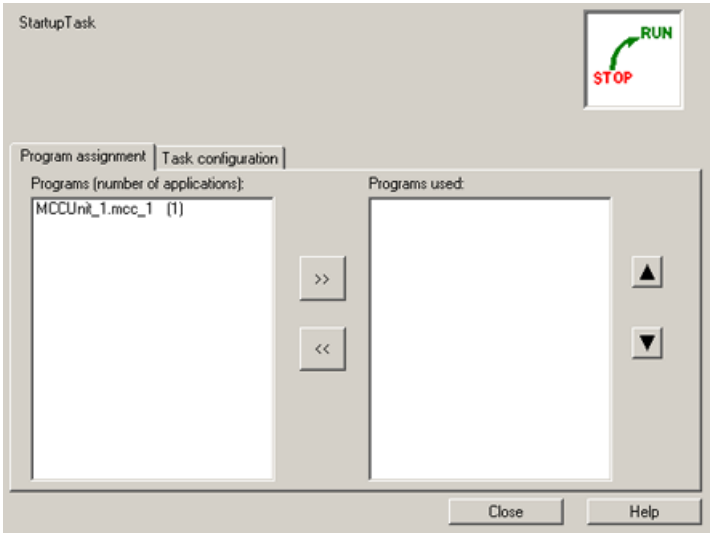

Figure 4-92 Configuration of the StartupTask (program assignment)

2. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
3. Switch to the **Task configuration** tab.

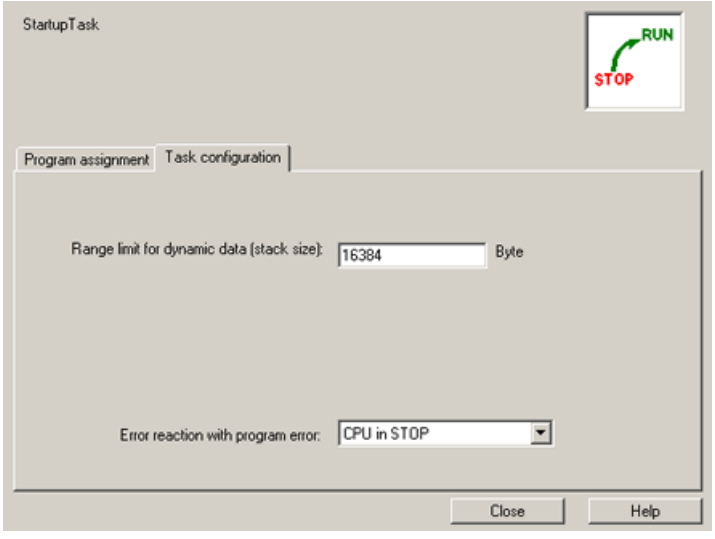

Figure 4-93 Configuration of the StartupTask (task configuration)

4. If required, enter the **Range limit for dynamic data** (**stack size**).
5. Specify the **Error response to program error** (e.g. **ExecutionFaultTask**).

Task configuration - StartupTask

In the **Task configuration** tab, parameterize the error response to program errors.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

See also

Assigning programs to the execution levels/tasks (Page 1345)

SystemInterruptTasks (Page 1334)

MotionTasks

MotionTasks are intended for the programming of sequences, for programmed motion control or other sequential executions.

Example for the sequential execution: An axis traverses to a target position, waits for an enable signal, and then traverses to the next target position.

Several MotionTasks are available:

- With SIMOTION D and SIMOTION P only: 32 MotionTasks **MotionTask_1** to **MotionTask_32**

The names of the MotionTasks can be changed, see below.

MotionTasks are executed in the round robin execution level.

Note

C2xx devices only have 20 MotionTasks; all other CPUs (see above) have 32. With the C2xx, the excess MotionTasks may be deleted. Once deleted, these MotionTasks cannot be recreated.

MotionTasks and **BackgroundTask** share the free time apart from the higher-priority system and user program tasks. The relationship of the time slices between both levels can be parameterized, see Setting the time allocation (Page 1376).

There is no fixed sequence of execution for MotionTasks and BackgroundTask.

Information on the influencing of the task execution is provided in Overview of the task control commands (Page 1435).

Starting a MotionTask

MotionTasks are usually controlled from the user program via task control commands such as **_startTaskID**, **_stopTaskID,**, ... With the corresponding configuration (set attribute), a MotionTask starts automatically when the **RUN** mode has been reached. You can scan the current task status using the **_getStateOfTaskID** system command.

A MotionTask does not have a time monitoring, i.e. once a MotionTask is started, it can remain active for an indefinite period.

A MotionTask that waits for a synchronous command remains active with regard to its status.

Completing a MotionTask

A MotionTask is completed when the task has been completed or at the transition to the **STOP** or **STOP U** mode (start of the **ShutdownTask**).

One way to automatically suspend the task is to use wait commands **Wait for condition** / **WAITFORCONDITION**.

The task is suspended when the wait command is issued. The condition specified in the command is checked in the IPO cycle clock. When the condition is fulfilled, the MotionTask is automatically resumed. Depending on where you position the wait command, you can influence the task priority when execution continues.

The commands (with MCC in the gray area behind the command) enclosed between **WAITFORCONDITION** and **ENDWAITFORCONDITION** are executed with increased priority (between **SystemInterruptTasks** and **TimerInterruptTasks**).

Select the **Program assignment** tab to assign the created and compiled programs to the MotionTasks and define the execution sequence.

You can set the following parameters:

Field/button	Meaning/information
MotionTask	Under MotionTask, select the MotionTasks you want to assign the programs to. You can assign several programs to one MotionTask.
MotionTask_1 to MotionTask_n	Predefined names of the possible MotionTasks.
Use task in execution system	Activate the checkbox to display and use the task in the execution system. If the checkbox is deactivated, you cannot assign any programs to this task.

Configuring MotionTasks

You can define which tasks are to be started automatically when the **RUN** mode is reached. Otherwise MotionTasks must be explicitly started via programmed task control commands.

1. Click **MotionTasks** in the execution level tree.
2. Select the required task in the **MotionTask** list. The task names can be changed.

3. To do so click in the **MotionTask** field and enter a new name. Umlauts and special characters are not permitted. The name is updated in the task list.

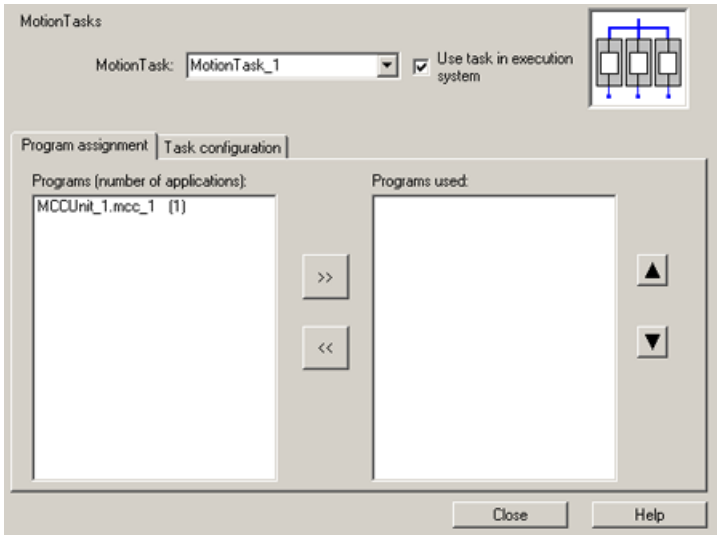

Figure 4-94 Configuration of the MotionTasks (program assignment)

4. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
5. Select the **Task configuration** tab.

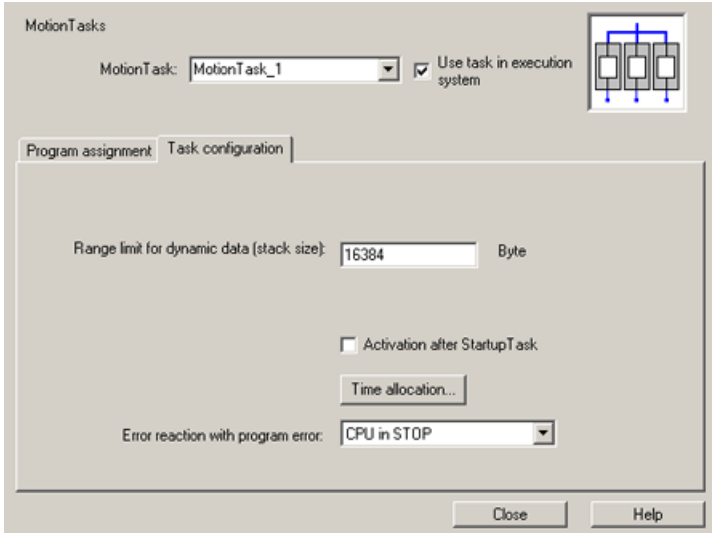

Figure 4-95 Configuration of the MotionTasks (task configuration)

6. Activate the **Activation after StartupTask** option to start the MotionTask once after the StartupTask.
7. If required, enter the **Range limit for dynamic data** (**stack size**).
8. Specify the **Error response to program error** (e.g. **ExecutionFaultTask**).
9. Repeat steps 2 through 7 for all the MotionTasks to be configured.
10. Specify the **time allocation in the round robin execution level** between MotionTasks and BackgroundTasks, see Setting the time allocation (Page 1376).

Task configuration - MotionTasks

In the **Task configuration** tab, parameterize the time allocation between the MotionTasks and BackgroundTasks in the round robin execution level, and define when the MotionTasks are activated.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Activation after StartupTask		Select this if you want the MotionTask to start once when **RUN** mode is reached (StartupTask is completed).
Time allocation		Clicking this button opens the screen form for **time allocation in the round robin execution level**. This is where you can parameterize the time allocated to MotionTasks and BackgroundTasks in the round robin execution level.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

Specifications for the configuring (Page 1417)

Description of the user program tasks (Page 1314)

BackgroundTask

The **BackgroundTask** is provided for the programming of cyclic sequences without a fixed time frame.

It is executed cyclically in the round robin execution level, which means it will be automatically restarted on completion.

The BackgroundTask is used in programs that have to be executed cyclically, e.g. interlocking tasks, PLC tasks.

The cycle time of the BackgroundTask is monitored. When the cycle time monitoring responds, the **TimeFaultBackgroundTask** is started. The CPU will switch to **STOP** mode if the task is not configured or there is no program assigned to it.

The process image of the inputs and outputs is generated for the BackgroundTask in address space 0.0 to 63.7. The process image remains consistent during the time the BackgroundTask is being processed.

You can use the BackgroundTask to implement lower-priority, cyclical logic functions, interlocks, calculations, monitoring functions.

The **BackgroundTask** shares available CPU time with the **MotionTasks**.

Note

The BackgroundTask shares CPU time with MotionTasks and SystemTasks (e.g. communication tasks). Relative to time allocation you must consider that the runtime, i.e. the performance, is influenced by the settings (time allocation of the round robin execution level).

Starting the BackgroundTask

The BackgroundTask is started automatically when the **RUN** mode has been reached or when the task has been completed (with the next position control cycle clock).

Completion of the BackgroundTask

A BackgroundTask is completed at the transition to the **STOP** or **STOP U** mode (start of the **ShutdownTask**).

Select the **Program assignment** tab to assign the created and compiled programs to the BackgroundTasks and define the execution sequence.

Configuring the BackgroundTask

1. Click **BackgroundTask** in the Execution Levels tree.

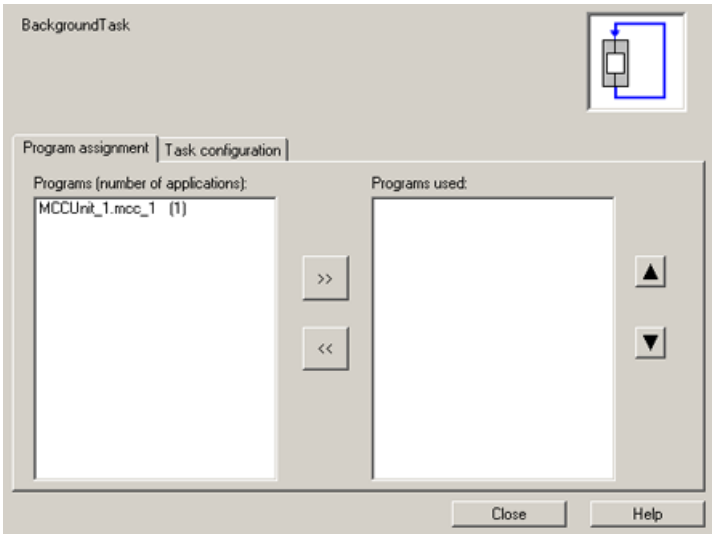

Figure 4-96 Configuration of the BackgroundTask (program assignment)

2. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
3. Switch to the **Task configuration** tab.

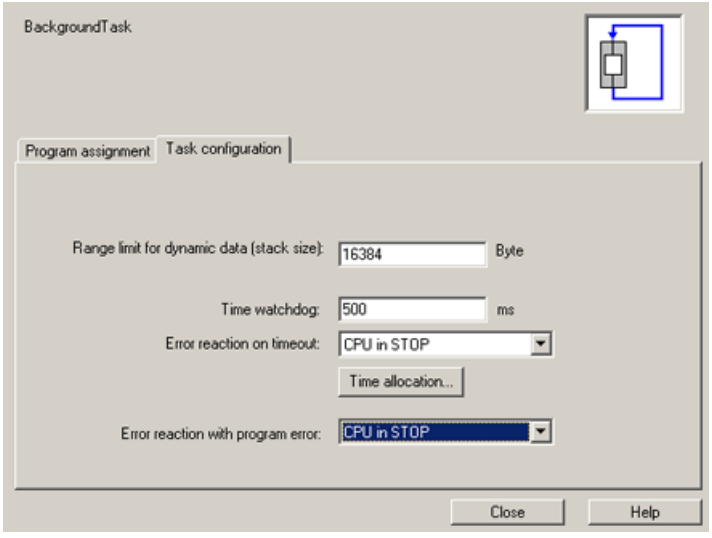

Figure 4-97 Configuration of the BackgroundTask (task assignment)

4. If required, enter the **Range limit for dynamic data (stack size)**.
5. Enter a value for the **time monitoring**.
   If this time is exceeded, the relevant SystemInterruptTask (**TimeFaultBackgroundTask**) can be called or the **CPU to STOP** can be set, 0 ms = no monitoring.
6. Specify the **Error response after timeout**.
   CPU in STOP or call **TimeFaultBackgroundTask**.

7. Specify the **time allocation in the round robin execution level** between MotionTasks and BackgroundTasks, see **Setting the time allocation**.
8. Specify the **Error response to program error** (e.g. **ExecutionFaultTask**).

Task configuration - BackgroundTask

You can parameterize the time monitoring and the error response in the **Task configuration** tab.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Time monitoring		Specify the time monitoring in ms within which the BackgroundTask must be calculated here. This allows you to specify the required cycle time for the BackgroundTask. The time monitoring is inactive if you enter 0 or no value.
Error response after timeout		You can select the error response, if the cycle for the BackgroundTask is not terminated within the time frame specified under Time monitoring.
	CPU to Stop	The CPU switches to **STOP** mode.
	TimeFaultBackgroundTask	The TimeFaultBackgroundTask is started. All programs assigned to this task are started.
Time allocation		Clicking this button opens the screen form for **time allocation in the round robin execution level**. This is where you can parameterize the time allocated to MotionTasks and BackgroundTasks in the round robin execution level.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to Stop	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. The CPU subsequently changes to **STOP**.

Watchdog (Page 1363)

Setting of the time allocation (Page 1376)

SystemInterruptTasks (Page 1334)

Time allocation in the round robin execution level (Page 1373)

TimerInterruptTasks

TimerInterruptTasks are intended for the periodical starting of programs.

Five TimerInterruptTasks, i.e. **TimerInterruptTask_1** to **TimerInterruptTask_5**, are available for different time levels.

TimerInterruptTasks are periodically started and executed in the configured fixed time frame (e.g. 100 ms).

This time frame must be a multiple of the interpolator cycle clock.

In this task, you can implement closed-loop control or monitoring functions that require a reproducible time reference without a direct link to I/O or motion control of the axes.

Additional system and user program tasks are provided for the TControl technology package. The TControl technology package is processed in the system tasks, whereas the application-specific adaptations are processed in the user program tasks.

You can find additional information in the functional description of the temperature controller, refer to the **Motion Control Additional Technology Objects** Function Manual.

Starting a TimerInterruptTask

TimerInterruptTasks are started periodically. A start delay can be set.

Completing a TimerInterruptTask

TimerInterruptTasks are completed automatically after completion of the programs assigned to the TimerInterruptTask.

You can assign the created and compiled programs to the selected TimerInterruptTask and define their execution sequence in the **Program assignment** tab.

You can set the following parameters:

Field/button	Meaning/information
For task	Use this to select one of the five TimerInterruptTasks to which you want to assign the programs. You can assign several programs to one TimerInterruptTask.
TimerInterruptTask_1 to **TimerInterruptTask_5**	Predefined names of the five TimerInterruptTasks.
Defined time level	Use this to select the time frame for restarting the TimerInterrupt-Task. You can choose time levels from the available list or enter additional ones as required. The value must be a multiple of the IPO cycle clock.
Use task in execution system	Activate the checkbox to display and use the task in the execution system. If the checkbox is deactivated, you cannot assign any programs to this task.

Configuring TimerInterruptTasks

1. Click **TimerInterruptTasks** in the Execution Levels tree.
2. Select the required task in the **For task** selection box. The names (**TimerInterruptTask_1** to **TimerInterruptTask_5**) are preset.

3. Activate the **Use task in execution system** checkbox.

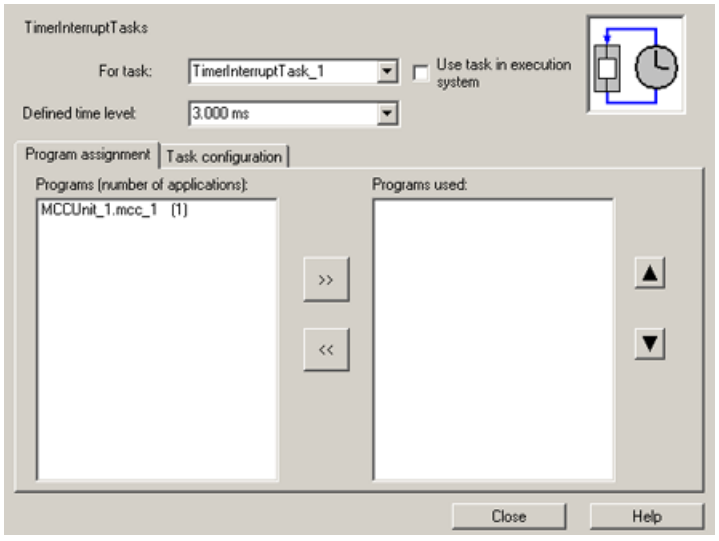

Figure 4-98 Configuration of the TimerInterruptTasks (program assignment)

4. Select a **Defined time level** or enter an arbitrary integer value. This value must be an integral multiple of the interpolator cycle clocks (IPO cycle clocks). Different settings are rounded up to the next integral multiple of the IPO cycle clock.
5. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
6. Switch to the **Task configuration** tab.

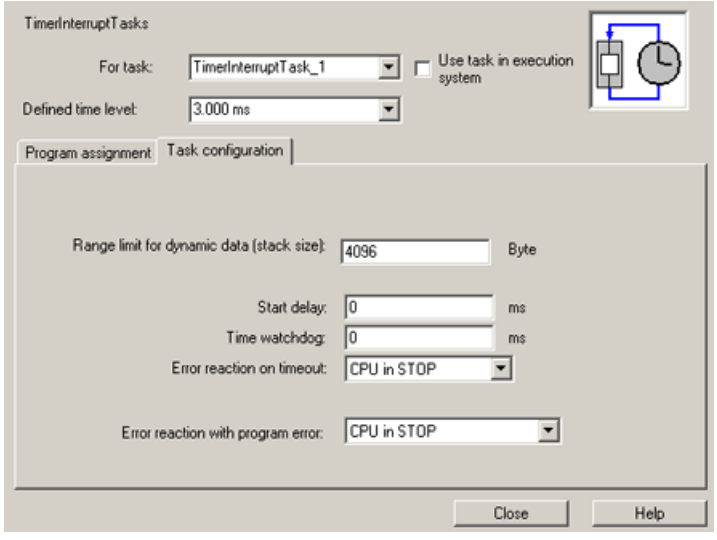

Figure 4-99 Configuration of the TimerInterruptTasks (task configuration)

7. If required, enter the **Range limit for dynamic data (stack size)**.

8. Enter the **Start delay** for this task, if applicable.
   To prevent different time-triggered tasks from starting at the same time, you can define a start delay for each task. This prevents different TimerInterruptTasks from being executed at the same time.
   Example:
   IPO cycle clock: 4 ms
   TimerInterruptTask_1: 8 ms
   TimerInterruptTask_2: 16 ms
   Both TimerInterruptTasks are started simultaneously in every fourth IPO cycle clock. By delaying the start of one of the two tasks by 4 ms, you can prevent them from being executed at the same time. In this way, the load on the system is distributed more evenly, and the behavior of the lower-priority tasks can be reproduced.
9. Enter a value for the **time monitoring**.
   If this time is exceeded, the associated SystemInterruptTask (**TimeFaultTask**) can be called or the **CPU to STOP** can be set, 0 ms = no monitoring.
10. Specify the **Error response with timeout**.
    CPU in STOP or call **TimeFaultTask**.
11. Specify the **Error response to program error** (e.g. **ExecutionFaultTask**).
12. Repeat steps 3 to 10 for all the TimerInterruptTasks to be configured.

Task configuration - TimerInterruptTasks

You can define the start delay, time monitoring and the error response for the TimerInterruptTasks in the **Task configuration** tab.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Start delay		Enter a time value in ms for the task start delay. The start of TimerInterruptTask is delayed by this time value. This delay ensures that different TimerInterruptTasks will not start simultaneously, resulting in a timeout.
Time monitoring		Specify the cycle time in ms for executing the TimerInterruptTask. Enter a value for time monitoring. The time monitoring is inactive if you enter 0 or no value.
Error response after timeout		You can select the error response if the TimerInterruptTask is not terminated within the time frame specified under Time monitoring.
	CPU to Stop	The CPU switches to **STOP** mode.
	TimeFaultTask	The TimeFaultTask is started. All programs assigned to this task are started.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.

Field/button		Meaning/information
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

Assigning programs to the execution levels/tasks (Page 1345)

Watchdog (Page 1363)

SystemInterruptTasks (Page 1334)

SynchronousTasks

SynchronousTasks are started synchronously to the specified system cycle clock on a periodic basis. They run with high priority in the time-triggered execution level.

The following SynchronousTasks are available:

- **ServoSynchronousTasks**
  - **ServoSynchronousTask** (as of V4.0): Synchronous with the position control cycle clock.
  - **ServoSynchronousTask_fast** (as of V4.2): Synchronous with the Servo_fast_clock_cycle (optional, only available for specific SIMOTION modules, see Servo_fast (application cycle clock for fast bus system) (Page 1364)).

  In the servo-synchronous tasks, you can implement time-critical terminal - terminal responses for I/O or fast influencing of setpoints on the servo level.
  See also isochronous I/O processing on fieldbus systems (Page 1383).
  Application, such as for fast terminal - terminal response. If a TO is configured for execution in the position control cycle clock then TO and motion commands can also be issued.
- **IPOsynchronousTasks**
  - **IPOsynchronousTask**: Synchronous with interpolator cycle clock IPO.
  - **IPOsynchronousTask_2**: Synchronous with interpolator cycle clock IPO_2
  - **IPOSynchronousTask_fast** (as of V4.2): Synchronous with the interpolator cycle clock IPO_fast (optional, only available for specific SIMOTION modules, see Servo_fast (application cycle clock for fast bus system) (Page 1364)).

  In IPO-synchronous tasks, you can implement time-critical functions that have a direct effect on the functions of the technology object. The user program is executed prior to the interpolator, i.e. the programmed functions can be effective in the same IPO cycle clock.
  Application, e.g. for a fast start depending on the event, fast response to events terminal - axis

Additionally, there are further SynchronousTasks for TControl:

- **PWMsynchronousTask**: Synchronous with the PWM cycle clock
- **InputSynchronousTask_1/InputSynchronousTask_2**: Synchronous with the Input1/2 cycle clock before temperature control
- **PostControlTask_1/PostControlTask_2**: Synchronous with the Control1/2 cycle clock after temperature control

You can assign the created and compiled programs to the selected SynchronousTask and define their execution sequence on the **Program assignment** tab.

You can set the following parameters:

Field/button		Meaning/information
For cycle clock level		Use this to select the SynchronousTask to which you want to assign the programs. You can assign several programs to one SynchronousTask.
	ServoSynchronousTask_fast	Optional. SynchronousTask which is started in the application cycle for the fast bus system (Servo_fast).
	IPOsynchronousTask_fast	Optional. SynchronousTask which is started in the interpolator cycle for the fast bus system (IPO_fast).
	ServoSynchronousTask	SynchronousTask which is started in the position control cycle clock
	IPOsynchronousTask	SynchronousTask which is started in the interpolator cycle clock (IPO cycle clock).
	IPOsynchronousTask_2	SynchronousTask which is started in the second interpolator cycle clock (IPO2 cycle clock).
	PWMsynchronousTask (TCPWM_Tasks)	SynchronousTask which is used for the actuating signal output of the TO temperature controller (temperature channel). Defines the basic cycle clock for further tasks of the TO temperature controller.
	InputSynchronousTask_ 1/2 (TCInput_Tasks_1/2)	SynchronousTask which is used for the actual value measurement of the TO temperature controller.
	PostControlTask _1/2 (TCTasks_1/2)	SynchronousTask which is used for the control of the TO temperature controller.
Use task in execution system		Activate the checkbox to display and use the task in the execution system. If the checkbox is deactivated, you cannot assign any programs to this task.

ServoSynchronousTask/ServoSynchronousTask_fast

ServoSynchronousTasks are intended for applications in which fast processes are to be implemented using isochronous mode.

ServoSynchronousTasks run within a position control cycle clock and behave similar to IPOsynchronousTasks.

ServoSynchronousTasks_fast run within a Servo_fast cycle clock and behave similar to the ServoSynchronousTasks.

The ServoSynchronousTasks are suitable for:

- Fast responses (e.g. for short terminal-terminal times for I/O processing)
- Influencing servo-effective system variables
  Information on servo effectiveness of the system variables is provided in the SIMOTION reference list technology package CAM system variables.
- For motion commands if a TO (in exceptional cases) is configured for execution in the position control cycle clock.

They are not suitable for:

- Communication
- For motion commands if a TO is configured for execution in the IPO cycle clock (since this is evaluated in the IPO cycle clock)

If a TO is configured for execution in the position control cycle clock then TO and motion commands can also be issued.

The same characteristics apply as for the IPOSynchronousTasks.

The ServoSynchronousTask can be configured in the execution system. The cycle time of the servo execution level is set with the servo. The default setting is active.

The ServoSynchronousTask_fast can be configured in the execution system. The default setting is inactive.

There is a process image available for the ServoSynchronousTask as for the other cyclic tasks. This only results in an improved performance if the same I/O addresses are accessed several times.

As of V4.1, the monitoring of the ServoSynchronousTasks can also be set. In this way, MOTION commands are also permitted in the ServoSynchronousTask, where the IPO share is executed in the servo (all commands with the step enabling condition IMMEDIATELY).

You can set the following parameters:

Field/button	Meaning/information
Range limit for dynamic data (stack size)	Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Monitoring when executing synchronous functions	You can select the error response if the ServoSynchronousTask is not completed within the system cycle clock.

Field/button		Meaning/information
	Discontinue time monitoring and interrupt the task	Compatible with the functionality up to V4.0 With synchronous functions, time monitoring is suspended and one servo cycle clock is lost - all old projects have this setting, too, if they have been updated to V4.1 (CPU replacement).
	Leave time monitoring active	Time monitoring is not suspended, i.e. the CPU goes to **STOP** with timeout when synchronous functions are called which really interrupt the ServoSynchronousTask. If overflows are tolerated, it might be possible to avoid **STOP** - this is the default setting for newly created CPUs. Diagnostics buffer entry: "STOP by execution system, cause: Timeout".
	CPU goes to STOP	There is no synchronous function permitted. In the case of a synchronous function, the CPU goes to **STOP** - even if the ServoSynchronousTask is not interrupted in the specific case. Diagnostics buffer entry: "Impermissible calling of a system/package function".
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

IPOsynchronousTask/IPOsynchronousTask_2/IPOsynchronousTask_fast

IPOSynchronousTasks are intended for applications that require, for example, fast and deterministic responses or correction movements. Optimum time transfer of motion commands to the motion control system is thus possible.

IPOsynchronousTasks run immediately before the interpolator within an IPO cycle clock. Thus, commands in these tasks can directly affect the motion control.

The **IPOSynchronousTask** is started synchronously to the IPO_clock_cycle while the **IPOSynchronousTask_2** is started synchronously to the IPO_clock_cycle_2, i.e. a reduced IPO cycle clock.

The **IPOSynchronousTask** is executed before the internal IPOTask and **IPOsynchronousTask_2** is executed before IPOTask_2.

The **IPOSynchronousTask_fast** is started synchronously with IPO_fast and, depending on the version, before the position control cycle clock.

The following properties must be specified for the **IPOsynchronousTasks**:

- Task configuration
- Number of level overflows in the IPO/IPO_2 cycle clock
  Not for IPOsynchronousTask_fast
  If the tasks in the IPO level (**IPOSynchronousTask**, **IPOTask**) are not completed within an IPO cycle clock, an overflow will occur. An overflow of a task in the cycle clock (n) must be processed in the following cycle clock (n+1).
  The same applies for the tasks in the IPO_2 level (**IPOSynchronousTask_2**, **IPOTask_2**).
  You can set the number of overflows which should be tolerated in sequence (n = 0 ... 5). The ratio can be violated n-times. The internal monitoring counter is reset when a task has been performed without overflowing.
  The accumulated level overflows are displayed in the **numberOfSummarizedTaskOverflow** system variables.
  No level overflows are permitted for **ServosynchronousTask_fast** and **IPOSynchronousTask_fast**.
- Error response after timeout (level overflow): The CPU goes to **STOP** mode and a starting lockout is set.
- **IPOsynchronousTask/IPO-clock_cycle or IPOsynchronousTask_2/IPO_2-clock_cycle**:
  Time ratio between IPOsynchronousTask and IPO cycle clock or IPOsynchronousTask_2 and IPO_2 cycle clock.
  A timeout occurs if an IPO-synchronous task exceeds this ratio.
  You also define the time frame for the IPOTask in the system cycle clocks. In the IPOSynchronousTask/IPOClockCycle parameter, you can specify the percentage of time that is to be made available for the IPOSynchronousTask per cycle clock.
  If, for example, 4 ms is set as IPO cycle clock and 25% set as ratio, the runtime of the IPOSynchronousTask must not exceed 1 ms, including possible interrupts due to higher priority tasks.
  Recommendation: With a gear ratio of servo: IPO > 1, enter a percentage as high as possible.

Note

If a synchronous system function is called that suspends the IPOSynchronousTask, the CPU will go into **STOP** mode with a diagnostic buffer entry.

- It is possible to configure whether time monitoring is to be performed.
- Note that the copy times of the non-equidistant I/O data are included in the runtime of the IPO/IPO_2 or the IPO-synchronous user tasks.

Configuring SynchronousTasks

1. Click the appropriate task in the Execution Level tree.
2. Select the required SynchronousTask in the **For cycle clock level** selection box.

3. Activate the **Use task in execution system** checkbox.

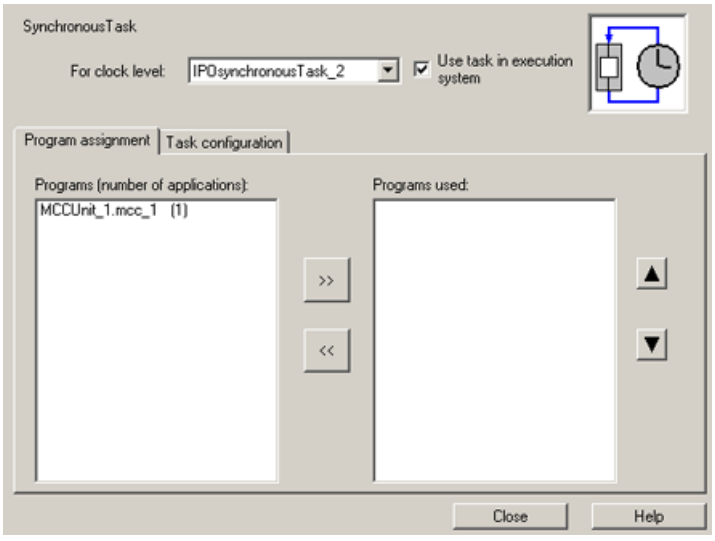

Figure 4-100 Configuration of the SynchronousTasks (program assignment)

4. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
5. Switch to the **Task configuration** tab.

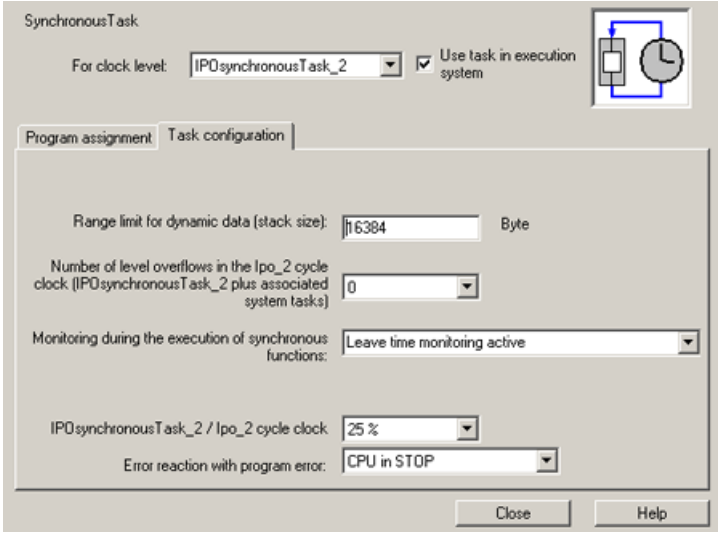

Figure 4-101 Example: Configuration of the IPOsynchronousTask (task configuration)

6. The following options are also available:
   - **Stack size** as an option in the Task configuration tab
   - Specify the number (0-5) of permitted level overflows in the **Level overflows** selection box
     No level overflows are permitted for ServoSynchronousTask_fast and IPOsynchronousTask_fast.
   - Select the ratio between SynchronousTask and IPO task
   - Select the **Error response to program error**
   - Configure the IPOSynchronousTask/IPOTask time monitoring
7. Repeat steps 3 through 5 for all the synchronous tasks to be configured.

Task configuration - SynchronousTasks

On the **Task configuration** tab you can select the error response for the SynchronousTask.

You can set the following parameters:

Table 4-72 Task configuration IPOsynchronousTasks

Field/button	Meaning/information
Range limit for dynamic data (stack size)	Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task.
Number of level overflows in the IPO cycle clock or IPO2 cycle clock	Not for IPOsynchronousTask_fast. Enter the number of tolerable level overflows in the IPO/IPO_2 cycle clock for the IPOsynchronousTasks. If the number of overflows is less than the entered overflows, there will be no error response. When arithmetic operations are processed, level overflows in the IPO/IPO_2 cycle clock can occur that can be tolerated by the user for the SynchronousTask and SynchronousTask_2 execution levels. Execution level overflows may occur if: • IPOSynchronousTask + IPO task > IPO cycle clock or • IPOSynchronousTask_2 + IPO_2 task > IPO_2 cycle clock This set tolerance level causes the next IPO cycle clock to be used for terminating the arithmetic operation of the previous cycle clock without triggering the set error response. When the set number of overflows is exceeded, or if no tolerance has been set, an entry is made in the diagnostic buffer and the error response (CPU to STOP with starting lockout) results. A maximum of 5 execution level overflows can be set.
Monitoring when executing synchronous functions	You can select the error response if the SynchronousTask is not completed within the system cycle clock.

Field/button		Meaning/information
	Discontinue time monitoring and interrupt the task	With synchronous functions, the time monitoring function is suspended and one IPO cycle is lost.
	Leave time monitoring active	Time monitoring is not suspended, i.e. the CPU goes to **STOP** with timeout when synchronous functions are called which really interrupt the IPOSynchronousTask. If IPO overflows are tolerated, it might be possible to avoid **STOP** - this is the default setting for newly created CPUs. Diagnostics buffer entry: "STOP by execution system, cause: Timeout".
	CPU goes to STOP	There is no synchronous function permitted. In the case of synchronous functions, the CPU goes to **STOP** - even if the IPOSynchronousTask is not interrupted in the concrete case. Diagnostics buffer entry: "Impermissible calling of a system/package function". The behavior applies to the IPOsynchronousTask, IPOsynchronousTask_2 and PWMTask.
IPOsynchronousTask / IPO-ClockCycle or **IPOsynchronousTask_2 / IPO_2Clock-Cycle**		Not for IPOsynchronousTask_fast. Here you select the duration for the specified tasks as a percentage of the cycle clock (e.g. IPOsynchronousTask / IPO cycle clock). If the task requires more time than set here, the system will respond according to the settings for error response. To configure the system cycle clocks, select the CPU in the project navigator and select Target system > Expert > Set system cycle clocks in the menu. **25%**: The maximum duration of the task is 25% of the cycle clock. **50%**: The maximum duration of the task is 50% of the cycle clock. **75%**: The maximum duration of the task is 75% of the cycle clock.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

Setting size of local data stack (Page 1685)

SystemInterruptTasks

SystemInterruptTasks are started and executed once when a system event occurs.

The following SystemInterruptTasks are available:

- **TimeFaultTask**: Starts in the event of a TimerInterruptTask timeout
- **TimeFaultBackgroundTask**: Starts in the event of a BackgroundTask timeout
- **TechnologicalFaultTask**: Starts in the event of an error on a technology object
- **PeripheralFaultTask**: Starts in the event of an error on the I/O
- **ExecutionFaultTask**: Starts in the event of an error when executing a program

Note

An exception in the DCC tasks does not call a SIMOTION fault task.

Starting a SystemInterruptTask

An internal system task checks approx. every 10 ms whether a configured event has occurred and then starts the applicable SystemInterruptTask automatically. The cycle clock for this internal system task is independent of the defined cycle clock for IPO or servo.

The SystemInterruptTask must be used in the execution system and a program must be assigned to this task. If this is not the case and an event occurs which starts this SystemInterruptTask, the CPU enters **STOP** state.

Up to eight different interrupts can be stored in the buffer. If another interrupt occurs, the buffer overflows and the CPU goes into **STOP** mode, too.

The events that caused a SystemInterruptTask to be called can be queried using the associated **TaskStartInfo** for this task and are described under Using Taskstartinfo (Page 1262).

Completing a SystemInterruptTask

A SysteminterruptTask is completed automatically after completion of the programs assigned to the SystemInterruptTasks.

You can assign the created and compiled programs to the selected SystemInterruptTask and define their execution sequence in the **Program assignment** tab.

You can set the following parameters:

Field/button		Meaning/information
For task		Use this to select one of the SystemInterruptTasks to which you want to assign the programs. You can assign several programs to one SystemInterruptTask.
	ExecutionFaultTask	Program processing error, for example, division by zero.
	PeripheralFaultTask	I/O alarms such as process alarms, diagnostic alarms, removing and inserting modules.
	TechnologicalFaultTask	Technological alarms such as alarms, warnings and notes.
	TimeFaultBackgroundTask	Timeout in the BackgroundTask.
	TimeFaultTask	Timeouts, for example in the TimerInterruptTasks, system runtime and cycle time.

Field/button	Meaning/information
Alarm configuration	This displays the window for the configuration of the technological alarms. You can configure the alarm response to a technological alarm for the SystemInterruptTasks.
Use task in execution system	Activate the checkbox to display and use the task in the execution system. If the checkbox is deactivated, you cannot assign any programs to this task.

TimeFaultTask

The **TimeFaultTask** is started when the time monitoring of a **TimerInterruptTask** responds. The CPU will switch to **STOP** mode if the TimeFaultTask is not configured or if there is no program assigned to it.

In the **TimeFaultTask**, you can program the response to timeouts of TimerInterruptTasks.

For additional information, see Using Taskstartinfo (Page 1262).

TimeFaultBackgroundTask

The **TimeFaultBackgroundTask** is started when the time monitoring of the BackgroundTask responds. The CPU will switch to **STOP** mode if the **TimeFaultBackgroundTask** is not configured or if there is no program assigned to it.

In the **TimeFaultBackgroundTask**, you can program how timeouts of **BackgroundTasks** are handled.

TechnologicalFaultTask

The **TechnologicalFaultTask** is started when the technology package generates an alarm or information message. The CPU will switch to **STOP** mode if the TechnologicalFaultTask is not configured or if there is no program assigned to it.

Generally, alarm messages have a direct effect on the behavior of the technology package and must be acknowledged before technology functions can be activated again.

In the **TechnologicalFaultTask** you can, for example, acknowledge errors directly and/or initiate further responses with respect to the sequence of operations on the machine.

For additional information, see Using Taskstartinfo (Page 1262).

PeripheralFaultTask

The **PeripheralFaultTask** is started immediately in accordance with its priority for I/O access errors.

I/O access errors can occur, for example, when the load voltage supply for the I/O module fails or other errors occur on the I/O module.

For further information, refer to the descriptions of the *I/O modules*.

The task for which an error occurred during its I/O access, *will not be terminated*.

The CPU will switch to **STOP** mode if the **PeripheralFaultTask** is not configured or if there is no program assigned to it.

For additional information, see Using Taskstartinfo (Page 1262).

ExecutionFaultTask

The **ExecutionFaultTask** is started immediately in accordance with its priority for program run errors.

Examples of program run errors:

- Faulty operations with floating-point numbers, such as logarithms of negative numbers, invalid numbers, etc.
- Division by zero
- Violation of array limits
- Error while accessing system variables

The task in which the error occurred is terminated.

The CPU will switch to **STOP** mode if the **ExecutionFaultTask** is not configured or if there is no program assigned to it.

The CPU to **STOP** error response is possible for all tasks and starts the **ShutdownTask**. The SIMOTION device switches to **STOP** mode.

An error response for the ExecutionFaultTask restarts the ExecutionFaultTask.

The following tasks can be restarted by commands in the program of the ExecutionFaultTask:

- StartupTask
- ShutdownTask
- MotionTasks

For the following tasks, the SIMOTION device switches to **STOP** mode once the ExecutionFaultTask is completed and the ShutdownTask is started:

- BackgroundTask
- TimerInterruptTasks
- SynchronousTasks

For additional information, see Using Taskstartinfo (Page 1262).

Note

Program errors in the **ExecutionFaultTask** and in the **ShutdownTask** switch the system to **STOP** mode immediately.

Configuring SystemInterruptTasks

1. Click **SystemInterruptTasks** in the Execution Levels tree.
2. Select one of the specified tasks in the **For task** selection box.

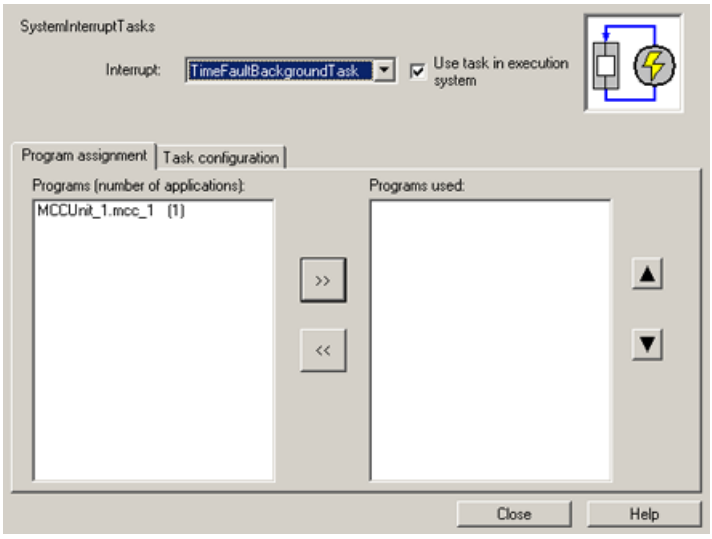

Figure 4-102 Configuration of the SystemInterruptTasks (program assignment)

3. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
4. Switch to the **Task configuration** tab.

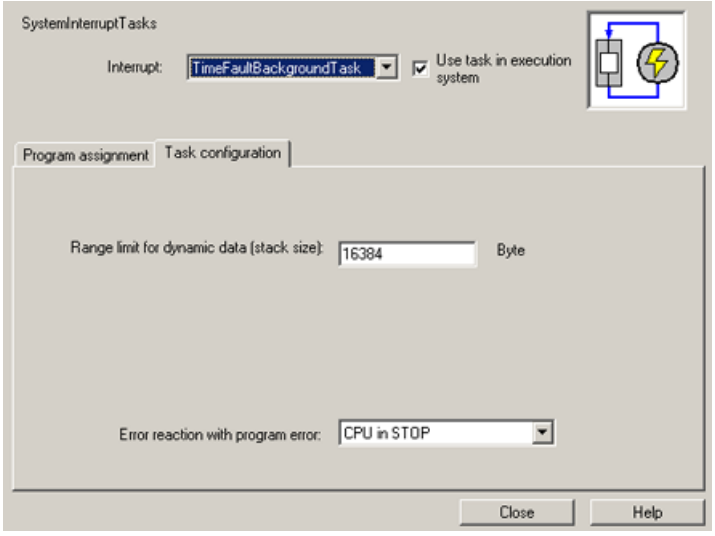

Figure 4-103 Configuration of the SystemInterruptTasks (task configuration)

5. Configure the task.
6. Repeat steps 3 to 5 for all the SystemInterruptTasks to be configured.
7. To configure the technological alarms:
   Click **Alarm configuration**.

Task configuration - SystemInterruptTasks

In the **Task configuration** tab, parameterize the error response to program errors.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

See also

Information on starting a task: TaskStartInfo (TSI) (Page 1363)

UserInterruptTasks

UserInterruptTasks are intended for user-defined actions.

Two UserInterruptTasks are available: **UserInterruptTask_1** and **UserInterruptTask_2**.

A defined condition must be specified for the UserInterruptTask. Each time the condition is fulfilled, the UserInterruptTask is started.

If you want to use a **UserInterruptTask**, the **IPOsynchronousTask** must be used in the execution system.

UserInterruptTasks are *not active* during a **StartupTask** and a **ShutDownTask**.

Starting a UserInterruptTask

UserInterruptTasks are started automatically as soon as the user-defined interrupt condition is fulfilled. The interrupt condition is checked in the interpolator cycle clock.

If both UserInterruptTasks are started at the same time, **UserInterruptTask_1** is processed before **UserInterruptTask_2**.

Note

If a user-defined interrupt occurs during shutdown, the UserInterruptTask is not started anymore.

During shutdown (ShutdownTask), starting a UserInterruptTask is only possible using the _startTaskId() command.

Completing a UserInterruptTask

UserInterruptTasks are completed automatically after completion of the programs assigned to the UserInterruptTask.

You can assign the created and compiled programs to the selected UserInterruptTask and define their execution sequence in the **Program assignment** tab.

You can set the following parameters:

Field/button		Meaning/information
For task		Use this to select one of the two UserInterruptTasks to which you want to assign the programs. You can assign several programs to one UserInterrupt-Task.
	UserInterruptTask_1 and **UserInterrupt-Task_2**	Predefined names of the UserInterruptTask.
Defined condition		Here you define the condition for the selected UserInterruptTask according to IEC 61131. During operation, the specified condition is checked in the interpolator cycle clock. If the condition is fulfilled, the UserInterruptTask is started with the assigned programs. You enter the condition in the input field by using the symbol browser (variables via drag and drop) and the **Command library** tab in the project navigator (operators via drag and drop). Only simple conditions (e.g. logic operations of inputs and local CPU variables) and Boolean variables are permissible (see below).
Use task in execution system		Activate the checkbox to display and use the task in the execution system. If the checkbox is deactivated, you cannot assign any programs to this task.

Configuring UserInterruptTasks

1. Click **UserInterruptTasks** in the Execution Levels tree.
2. Select a UserInterruptTask in the **For task** selection box.

3. Specify the condition for starting this task.

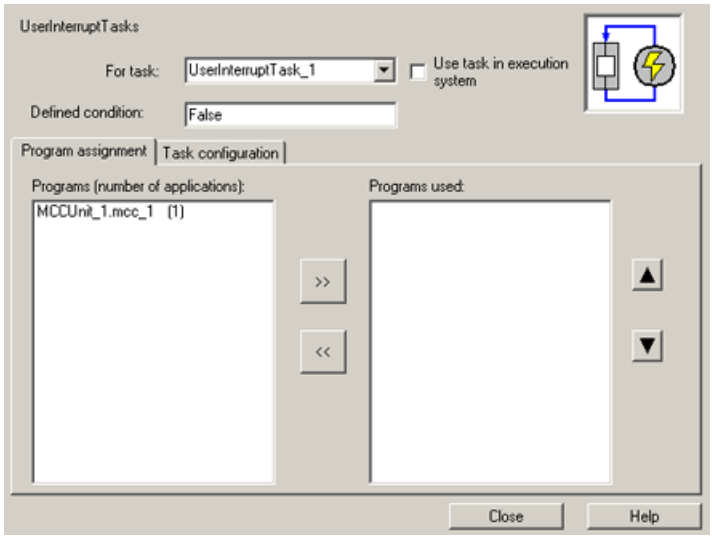

Figure 4-104 Configuration of the UserInterruptTasks (program assignment)

4. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
5. Switch to the **Task configuration** tab.

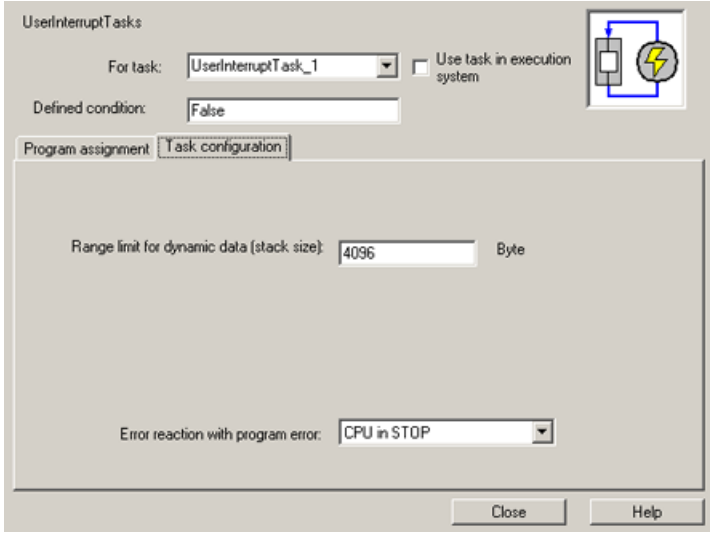

Figure 4-105 Configuration of the UserInterruptTasks (task configuration)

6. Configure the task.
7. Repeat steps 3 to 6 for the second UserInterruptTask.

Formulating a condition for a UserInterruptTask

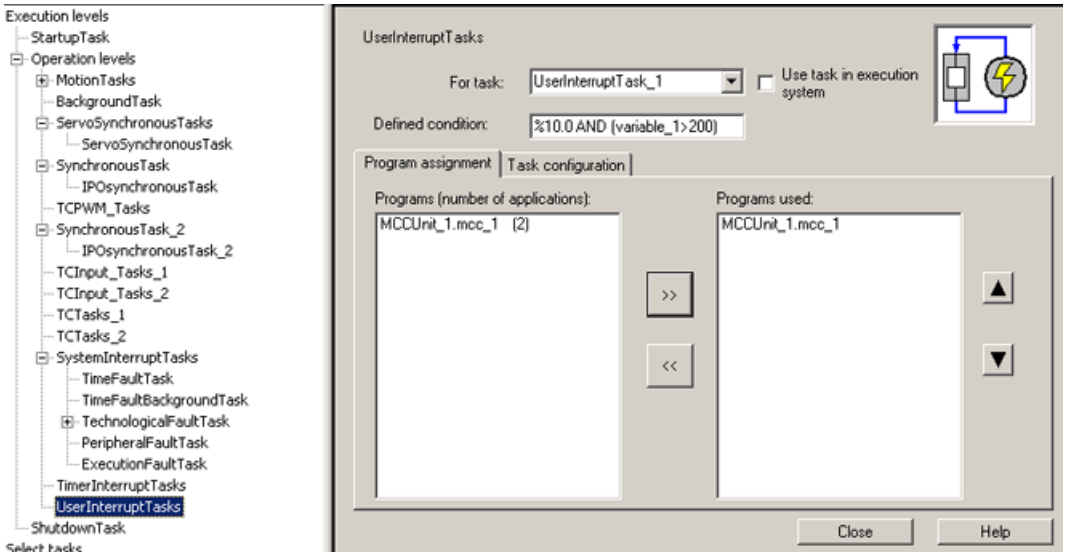

Figure legend - example:

When the digital input 0.0 = TRUE and the global variable "variable_1" has a value > 200.0, then the UserInterruptTask_1 is executed once.

Figure 4-106 Configuration of a UserInterruptTasks with condition

You enter the condition for starting a UserInterruptTask as a formula according to IEC 61131 (Structured Text). You can use the following variables:

- I/O variables
- Global device variables
- Unit variables in the interface section of a program source (ST/MCC or LAD/FBD unit). Syntax for the use of a *var_name* unit variable from the *src_name* program source:
  - Up to and including SIMOTION Kernel V4.3:
    Only specification of the variable name <VariableName>.
  - As of SIMOTION Kernel V4.4:
    The program source must also be specified in the form _device \<UnitName>.<VariableName>
    (example _device\mySourceFile.myVar).
    As previously, global device variables can only be specified directly via the variable names.

SIMOTION SCOUT helps you create the formula.

To formulate a condition for starting a UserInterruptTask:

1. Under **For task**, select the UserInterruptTask for which you want to define the start condition.
2. Take the required operators from the **Command library** tab and insert them in the **Defined condition** text field using drag and drop.
   Alternatively, you can enter the operators directly in the text field.
3. Take the operands from the symbol browser and insert them in the **Defined condition** text field using drag and drop or copy and paste. Alternatively, you can enter the operands directly in the text field.

Creating conditions with the command library

The **Command library** tab contains a list of mathematical operations and functions. You can use these to create conditions.

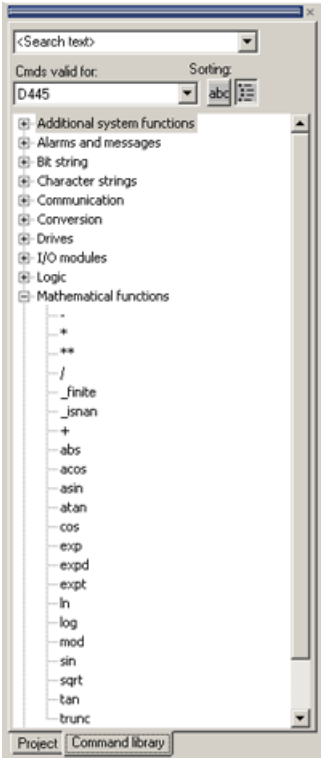

Figure 4-107 Command library in SCOUT

To open the individual operations, click the plus sign in front of the folders. You can drag the operators to the required text field via drag and drop. You can use these commands, for example, to define conditions.

Note

The following applies when updating the version of SIMOTION Kernel as of V4.4:

If you use unit variables of a program source in the start condition of a UserInterruptTask, you may have to adapt the syntax of the start condition.

Task configuration - UserInterruptTasks

In the **Task configuration** tab, parameterize the error response to program errors.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode and the ShutdownTask is started.
	ExecutionFaultTask	The ExecutionFaultTask is started. All programs assigned to this task are started. If no programs are assigned, the CPU switches to **STOP** mode. The task in which the error occurred is terminated.

See also

Assigning programs to the execution levels/tasks (Page 1345)

ShutdownTask

The **ShutdownTask** is intended for selective intervention in the transition from **RUN** to **STOP U**/**STOP** mode or for programming stop sequences with a preassigned braking ramp, e.g. selected setting of outputs, defined shutdown of axes.

The ShutdownTask is *not* called in the case of a power failure.

The **time monitoring** must be specified in the **Task configuration** for the ShutdownTask: You can configure the maximum duration for the execution of the ShutdownTask; 0 ms = no monitoring. After this time, the CPU switches to **STOP** mode.

The I/O can be accessed directly in the ShutdownTask. Access to process image and symbolic I/O variables is restricted. It is *not practical* to access the I/O by means of the process image, as the process image is no longer being updated.

For additional information, see **SIMOTION ST Structured Text**, "Access to inputs and outputs (process image, I/O variables)"

Select the **Program assignment** tab to assign the created and compiled programs to the ShutdownTask and define their execution sequence.

Note

Program errors in the **ExecutionFaultTask** and in the **ShutdownTask** switch the system to **STOP** mode immediately.

Configuring the ShutdownTask

1. Click **ShutdownTask** in the Execution Levels tree.

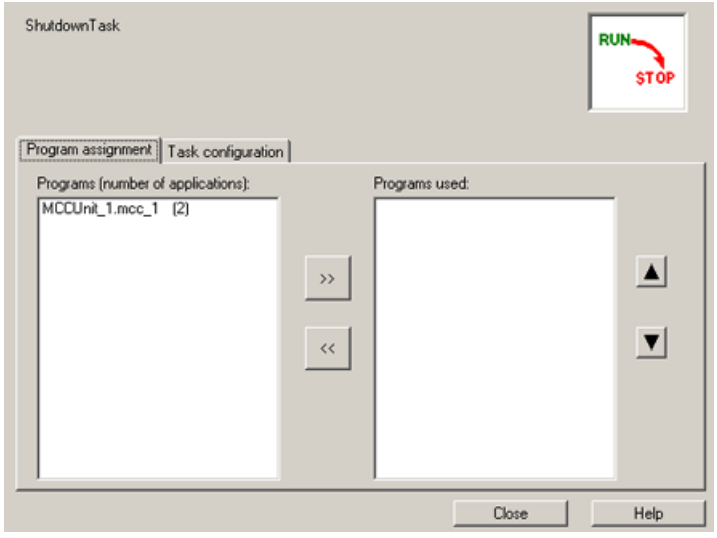

Figure 4-108 Configuration of the ShutdownTask (program assignment)

2. In the **Program assignment** tab, assign the required programs to this task and define the execution sequence.
3. Switch to the **Task configuration** tab.

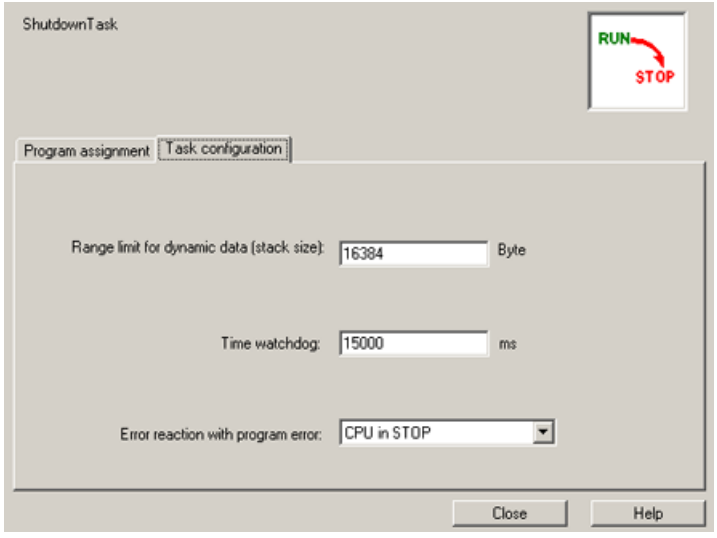

Figure 4-109 Configuration of the ShutdownTask (task configuration)

4. If required, enter the **Range limit for dynamic data (stack size)**.
5. Enter a value for the **time monitoring**.
6. Specify the **Error response to program error** (e.g. **ExecutionFaultTask**).

Task configuration - ShutdownTask

Select the **Task configuration** tab to parameterize the time monitoring.

You can set the following parameters:

Field/button		Meaning/information
Range limit for dynamic data (stack size)		Enter the local data stack size for this task in bytes. When the programs assigned to this task are executed, this size is made available for data in the stack. The guide value is 16 KB for a task. See also: • Setting the size of the local data stacks (Page 1685). • "Memory requirement of the variables on the local data stack" in the SIMOTION ST Programming Manual.
Time monitoring		Specify the cycle time in ms for executing the ShutdownTask. Enter a value for time monitoring. The time monitoring is inactive if you enter 0 or no value.
Error response to program error		Select the error response for errors that occur while processing programs. Program errors are, for example, faulty operations with floating-point numbers, division by zero, and overshooting array limits.
	CPU to STOP	The CPU switches to **STOP** mode.

See also

Assigning programs to the execution levels/tasks (Page 1345)

Watchdog (Page 1363)

4.2.7.3 Configure execution system

Configuration of the execution system involves the following steps:

- Assignment of user programs and definition of the task properties
- Enabling of the tasks used
- Selection of the cycle clock source and setting of the system cycle clocks

Assigning programs to the execution levels/tasks

The programs must be assigned to execution levels. Only then are the programs executed.

After creation, you can assign the programs of an MCC source, an ST source or a LAD/FBD source to one or more tasks with SIMOTION SCOUT.

You can assign more than one program to a task.

The assigned programs are then executed in the order in which they are listed; this order can be specified and modified using SIMOTION SCOUT.

If several programs are assigned to a task, execution of the first program must be finished before the next program in the same task can be started. If, for example, the first program is in a continuous loop, the second program will never be executed.

You can also assign one program to several tasks, which are then executed independently of each other.

With the program assignment, you specify the following:

- Priority with which the programs are executed
- The execution behavior: sequential/cyclic
- The initialization behavior of program variables
  See the **SIMOTION MCC** or **SIMOTION ST** Programming Manual - "Time of variable initialization" and Influence of the compiler on variable initialization (Page 1419).

Please note the following when assigning a program to one or more tasks:

- Before programs can be assigned, they must be compiled without error.
- The assignment must be made before downloading the program to the target system.
- It is possible that the program (if multiple tasks are assigned) may be called by another task while it is being executed. No measures are taken in the system to ensure data consistency.
- Once you have assigned a program to a task, it will remain assigned even in the event of recompilation.

Note

DCC tasks are assigned via the DCC editor, see the description of the DCC editor and Sequence model for DCC blocks (DCB) (Page 1394).

Execution system - program assignment

You can assign the created and compiled programs to the various tasks of the execution levels in the **Program assignment** tab.

You can set the following parameters:

Field/button	Meaning/note
Programs (number of uses)	A list of all compiled programs that are available in the project is displayed here. Non-compiled programs are not displayed. The number after the program name indicates how often the program has been assigned to the different tasks of the execution levels. MCC charts and LAD/FBD programs are displayed immediately after entering as long as they have been entered as "exportable".
›› **Assign**	Use this to assign selected programs to the task. 1. Select the program in the "Programs" list. 2. Click the ›› button or drag-and-drop the program into the "Used programs" list. The program is assigned to the task and displayed in the list of used programs.
‹‹ **Remove**	Use this to remove programs assigned to a task. 1. Select the program in the "Used Programs" list. 2. Click the ‹‹ button or drag-and-drop the program into the "Programs" list. The program is removed from the task.
Used Programs	A list of all programs assigned to this task is displayed here. The sequence of the programs in the list corresponds to the execution sequence when the program is executed. The program at the top of the list is executed first.

Field/button	Meaning/note
Arrow up	Use the arrow to move the selected program up one position within the task. In this way you can determine the order of program execution within the task.
Arrow down	Use the arrow to move the selected program down one position within the task. In this way you can determine the order of program execution within the task.

Assigning programs to the tasks

1. Select the SIMOTION device in the project navigator and select **Target system > Configure execution system** in the menu or double click **EXECUTION SYSTEM**.
   The **EXECUTION SYSTEM** window opens in the working area of the workbench.

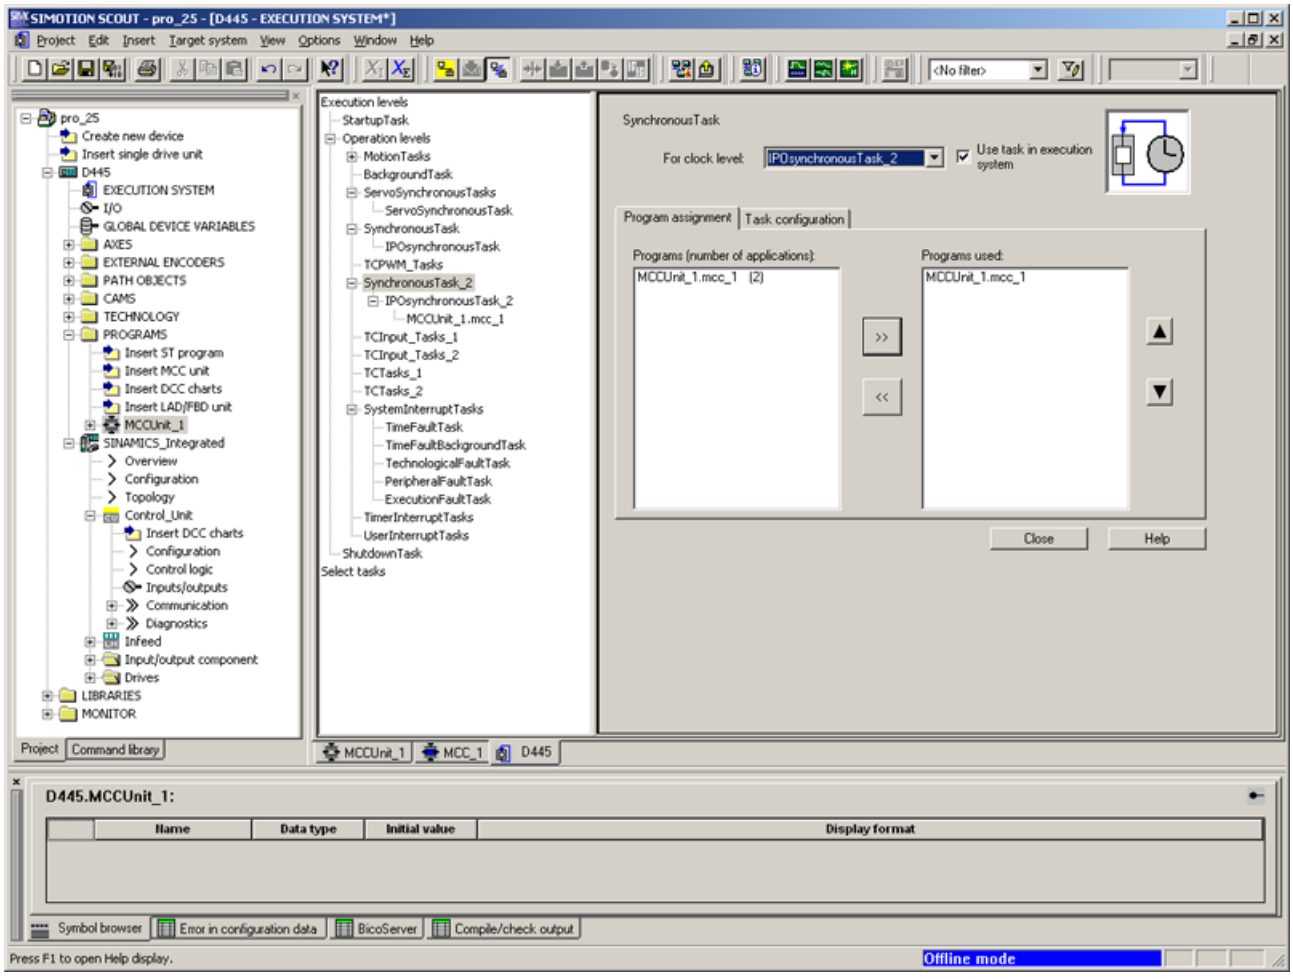

Figure 4-110 Configuration of the execution system in SCOUT

In the left-hand pane of the window, you can see the execution levels tree. It displays as entries the execution levels / tasks for which **Use task in execution level** has been clicked. The **OperationLevels** folder contains the tasks that are available in the **RUN** mode. The list below each execution level or task name shows the configured tasks and the programs assigned to them.

2. Select the task to be configured.

3. Select the **Program assignment** tab.
   The left-hand list box lists all available programs (ST programs, MCC charts and LAD/FBD with Program creation type).
4. Select the programs in the list box on the left that you want to assign to the task.
5. Click ».
   The assigned programs are listed in the right-hand list box.
   They are still listed in the left-hand list box. You can assign programs to several tasks. The number of assignments made appears in brackets.
6. Select the **Task configuration** tab and make any additional settings, such as:
   - Error response to program error
   - Time watchdogs for cyclic tasks
   - Start behavior of MotionTasks

   See the detailed description for the relevant task in Section "Description of the user program tasks (Page 1314)".

After you have assigned a program to one or more tasks, you can establish the connection to the target system, download the project to the target system, and start it.

Change execution sequence

Programs are executed in the order entered. You can change this order.

1. Select the entry to be moved in the right-hand list box.
2. Click ▲ or ▼ to move the element up or down.
3. Repeat Step 2 as often as required.

Task names

The names of the MotionTasks can be changed.

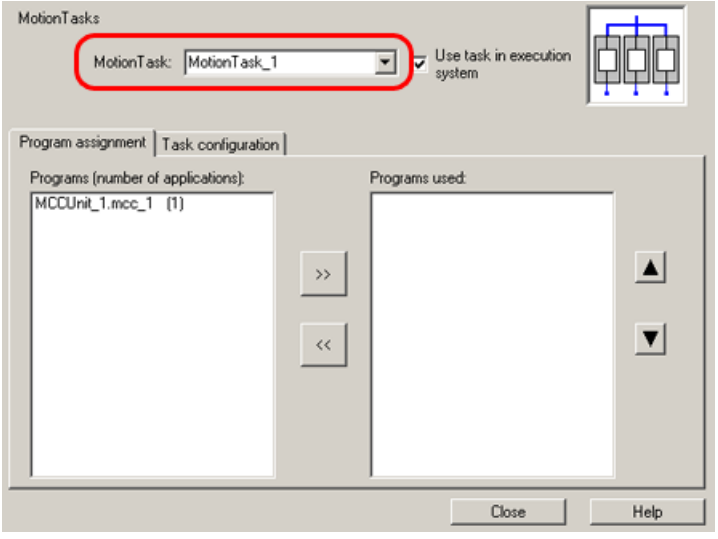

Figure 4-111 Task names in SCOUT

1. Select the desired task on the left-hand side.
2. Enter the desired new task name in the drop-down list on the right-hand side.

Task control

Various commands are available for the task control (e.g start, stop, etc.), see Section "Task control commands (Page 1435)". See also Task commands in the SIMOTION MCC programming language

Information is contained there about how to use these task control commands and several examples.

Stack size

In SIMOTION SCOUT, the stack size (limit for dynamic data) of the associated task can be set on the Task configuration tab of the Task Configuration window. A default value is specified for each task.

For further information, refer to the **SIMOTION ST** Programming Manual, "Setting the size of the local data stack".

Assignment of the program to a MotionTask

In the program assignment, you can see which MotionTasks the program is assigned to via a tooltip.

See also

Task priorities (Page 1307)

Selecting the cycle clock source

Selection of the cycle clock source is implemented in the device configuration in the **HW configuration**.

As soon as you parameterize one of the interfaces as isochronous DP/PN interface (select **"Isochronous mode"** in the Properties dialog box), the cycle clock setting is used as the bus cycle clock.

The DP/PN communication level and servo and interpolator levels are synchronized with the bus cycle clock. This setting is essential if you want to utilize the motion control functions of the **TP CAM/TP PATH/TP CAM_ext** technology package in combination with digital drives in accordance with PROFIDRIVE V3 on PROFIBUS DP/PROFINET. Drives that support and require this communication are, for example: SIMODRIVE 611U, MASTERDRIVES MOTION CONTROL, SINAMICS. Synchronization to the bus cycle clock if you must isochronously access I/O from your application.

You can still operate drives that do not support isochronous mode as drive axes on the isochronous bus. Examples of these drives are Micromaster MM4 and MASTERDRIVES VC.

If you are not using an isochronous DP/PN interface, you can set the basic system cycle clock. The servo and interpolator levels are synchronized to the basic cycle clock. You can select this setting if you are not using the **TP CAM/TP PATH/TP CAM_ext** technology package or are using it exclusively with analog drives on SIMOTION.

Defining system cycle clocks

Once the cycle clock source is selected, you specify the sampling times of the isochronous execution levels derived from the basic cycle clock. An additional faster servo cycle clock option and an IPO option can be configured as of V4.2, see also Servo_fast (application cycle clock for fast bus system) (Page 1364).

Included here:

- **Bus cycle clock (DP cycle clock / PN cycle clock)**: refer to the table for the execution system - system cycle clocks
  The "base cycle clock" is the basic cycle clock if no isochronous DP/PN interfaces have been parameterized in HW Config. The "bus cycle clock" is based on the equidistant bus cycle and is set in HW Config. The designation changes in accordance with the setting in the **Set system cycle clocks** dialog. The basic/bus cycle clock (DP cycle clock or PN cycle clock) is used as a basis for setting further tasks.
- **Servo_fast (fast position control cycle clock (as of V4.2))**
  Inputs/outputs are updated in the Servo_fast cycle clock (optional). Servo_fast is assigned to the faster bus system (PROFINET IO) and set in HW Config.
- **IPO_fast (fast interpolator cycle clock (as of V4.2))**
  The motion control for the axes on the fast bus system is calculated in the IPO_fast cycle clock (optional).
- **Servo cycle clock (position control cycle clock) / T1(DCC) cycle clock**
  Inputs/outputs are updated in the servo cycle clock.
  The position control for the axes and the processing of the centralized and distributed I/O are carried out in the servo cycle clock. The servo cycle clock can be operated relative to the bus cycle clock at a ratio of 1:1 or 1:2. The **ServoSynchronousTask** is being processed in this clock cycle.
  For isochronous PROFINET IO, the following applies:
  - The DP master interface must run in the same cycle clock as the servo cycle clock.
  - For SIMOTION C, P and D, the bus cycle clock for the external PROFIBUS interfaces must be at least 1 ms in order for these to be operated isochronously.
  - If the PN cycle clock is scaled down (e.g. 0.5 ms), the servo cycle clock must then be the same as the PROFIBUS cycle clock (for SIMOTION D: also the same as the bus cycle clock of PROFIBUS integrated).

  Note

  The reduction ratio between the bus and servo cycle clocks must also be set as the master application cycle on the drive. This setting is necessary to enable reciprocal life-sign monitoring. For further information, refer to the drive descriptions.
- **Interpolator cycle clock (IPO cycle clock) / T2(DCC) cycle clock**
  The axis motion control is calculated in the IPO cycle clock.
  The **IPOSynchronousTask** is executed in this cycle clock. The IPO cycle clock can be reduced relative to the servo cycle clock at a ratio of 1:1 to 1:6.
- **Interpolator cycle clock 2 (IPO_2 cycle clock) / T3(DCC) cycle clock**
  The IPO cycle clock 2 is the basis for motion control of lower-priority axes.
  The **IPOSynchronousTask_2** and the **PWM Task** (TControl) are executed in this cycle clock.
  The IPO_2 cycle clock can be reduced relative to the IPO cycle clock at a ratio of 1:2 to 1:64.

- **DCCAux T4(DCC) - cycle clock**
  The DCCAux cycle clock can be reduced relative to the T3(DCC) cycle clock at a ratio of 1:2 to 1:32.
- **DCCAux_2 T5(DCC) cycle clock**
  The DCCAux_2 cycle clock can be reduced relative to the DCCAux cycle clock at a ratio of 1:2 to 1:32.
- **PWM cycle clock**: For the TControl technology package

Note

The settings of the system cycle clocks affect the system operating sequence considerably. You must therefore exercise caution when making these settings.

Set system cycle clocks

1. Call the configuration window in the main menu via **Target system > Expert > Set system cycle clocks...**, or in the context menu of the device, or in the **EXECUTION SYSTEM** context menu via **Expert > Set system cycle clocks**.

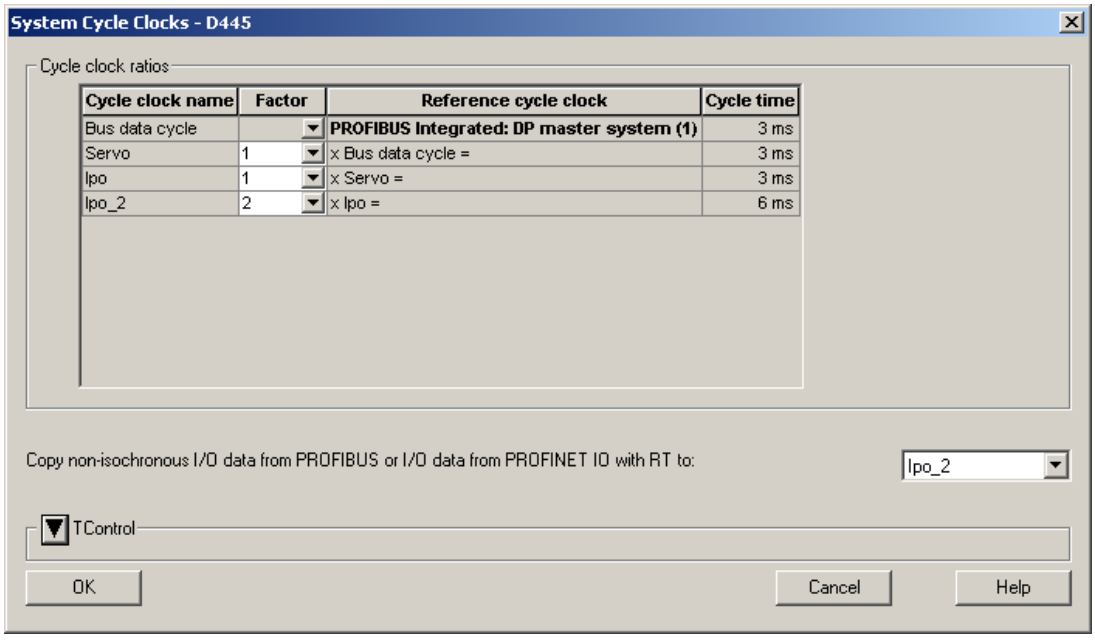

Figure 4-112 Setting of the system cycle clocks in SCOUT

2. Specify the basic/bus cycle clock (only if the isochronous mode is not configured). The bus cycle clock is specified in HW Config for the equidistant bus.
   Possible values: 1.0 ... 8.0 ms for PROFIBUS
   Possible values for PROFINET:
   - As of V4.0 of SIMOTION P and SIMOTION D4x5/D4x5-2: 0.5 ... 4.0 ms
   - As of V4.1 for SIMOTION P: 0.25 ms to 4 ms.
   - As of V4.2 for SIMOTION D: 0.25 ms to 4 ms.
   - As of V44 for SIMOTION D455-2 DP/PN: 0.125 ms to 4 ms.

   The cycle time for PROFIBUS must be an integer multiple of 0.125 ms, or of 0.25 ms in the case of SIMOTION C.
   The cycle time for PROFINET must be an integer multiple of 0.125 ms. Change the value in **HW Config** if this is not the case.
3. Specify the ratio between the cycle clocks.

Note

If the basic/bus cycle clock has been set too small for a large hardware configuration, this can result in the CPU not switching to the RUN mode. In this case, note the entries in the diagnostics buffer for timeouts.

Set system cycle clocks with two servo cycle clocks (Servo_fast)

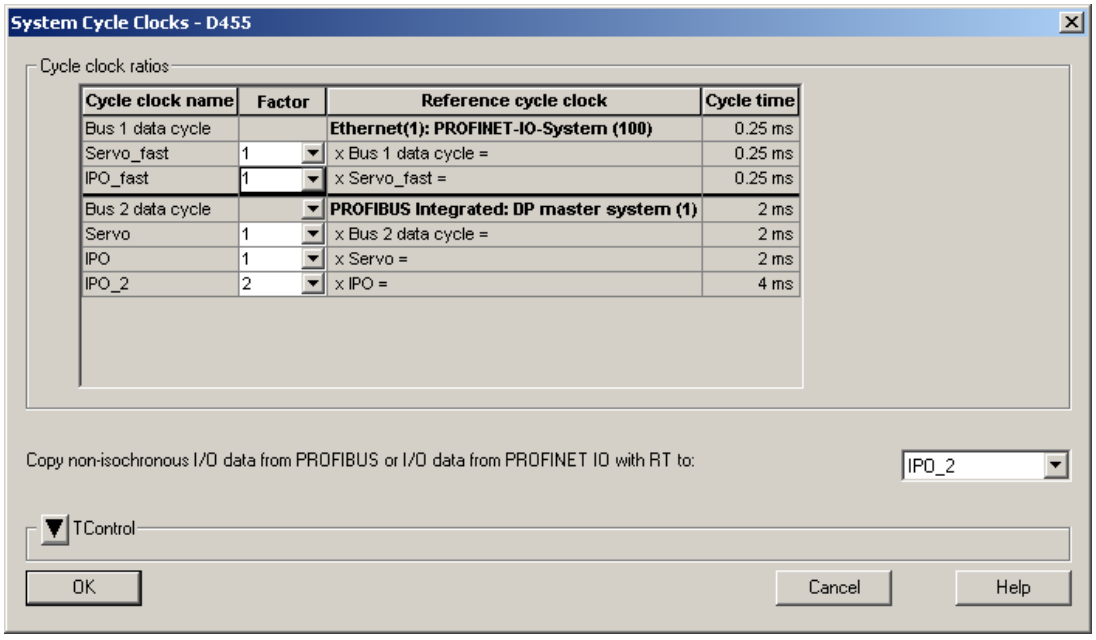

Figure 4-113 Servo and Servo_fast system cycle clocks

A description of how to configure a second servo cycle clock can be found in the *Communication* Function Manual under Servo_fast, scaling down of cycle clocks to the servo at the PROFINET interface.

System cycle clocks for DCC

The entries for DCC are displayed as soon as a chart has been added under programs. DCC charts are started automatically when the appropriate task is started.

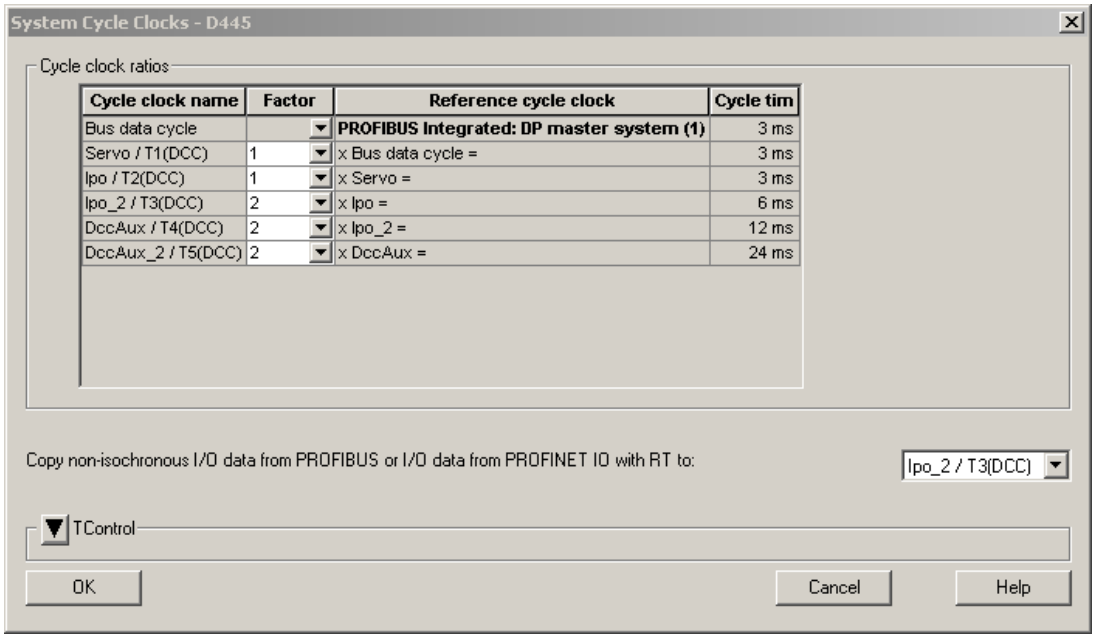

Figure 4-114 Setting of the system cycle clocks in SCOUT with DCC

Setting the system cycle clocks for TControl

1. You can use the **TControl** button in the **System Cycle Clocks** configuration window to display the settings for the TControl system tasks.
2. You can use the **Use system tasks for TControl** checkbox to activate or deactivate the TControl system tasks.
   If **Use system tasks for TControl** is activated, the special tasks for the temperature channels are displayed in the execution system.
   If you have not configured a temperature channel, you should deactivate the system tasks for TControl as they require unnecessary computation time.
3. Furthermore, you can specify here the cycle clock ratios of the TControl tasks.
   - The **PWM** cycle clock must be an integer multiple of the position control cycle clock.
   - The cycle clock of **InputTask_1/2** depends on the PWM cycle clock.
   - The cycle clock of **PostTask_1/2** depends on the cycle clock of **InputTask_1/2**.

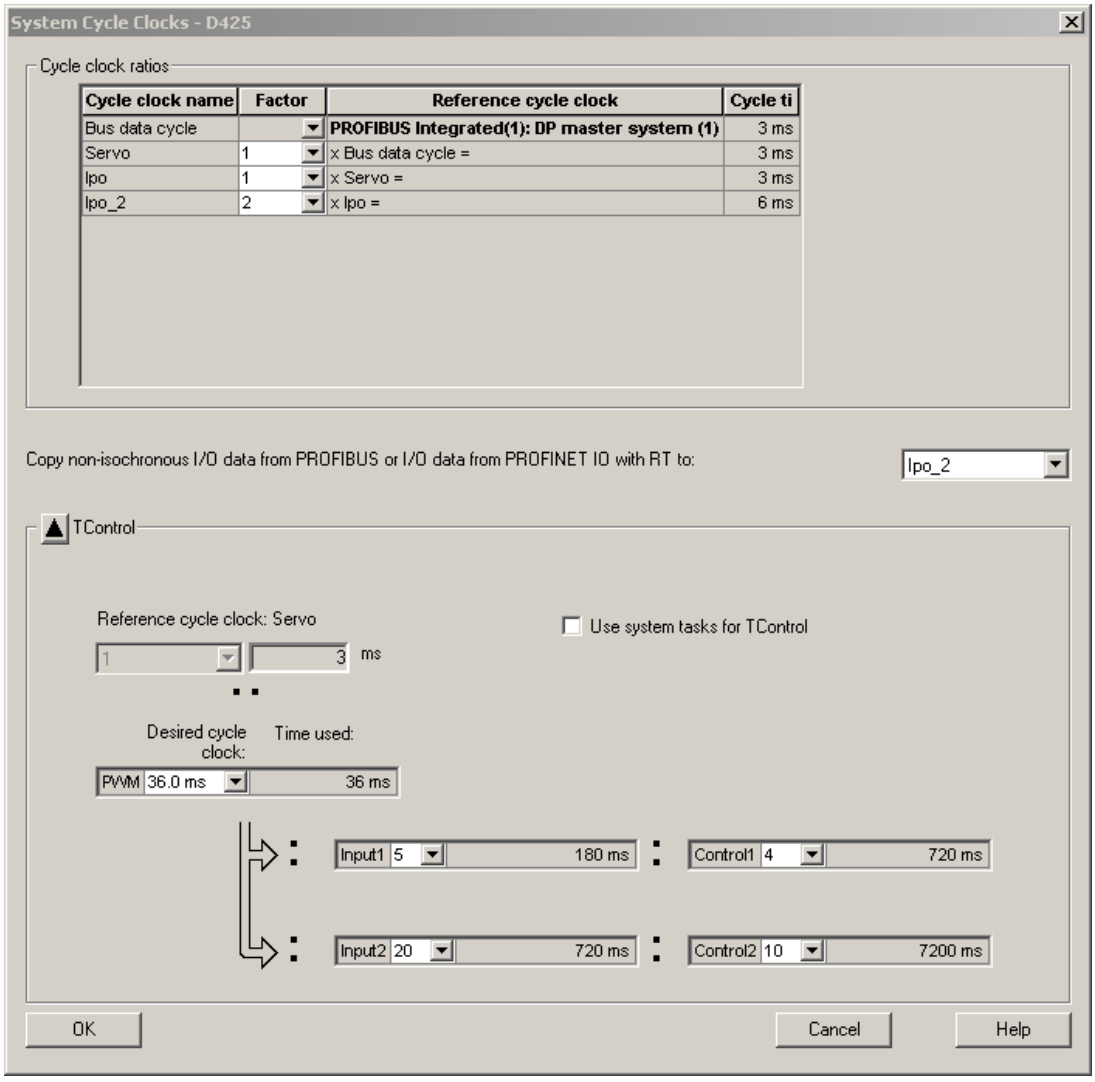

Figure 4-115 Setting of the system cycle clocks for TControl in SCOUT

Execution system - system cycle clocks

You can set the following parameters:

Field/button		Meaning/information
Cycle clock ratios		
	Basic cycle clock or **bus cycle clock**	The base cycle clock is the basic cycle clock if no isochronous DP/PN interfaces have been parameterized in HW Config. The "bus cycle clock" cannot be set in this dialog box if the "Equidistant bus cycle" setting is activated. The "bus cycle clock" is set in HW Config. This means the equidistant bus cycle forms the basic cycle clock for the system cycle clocks. The basic/bus cycle clock (DP cycle clock or PN cycle clock) is used as a basis for setting further tasks.
	Servo_fast	You can set the Servo_fast cycle clock here (optional). The reference cycle clock is the isochronous PROFINET IO cycle clock (for the faster bus system) set in HW Config.
	IPO_fast	You can set the IPO_fast cycle clock here. The reference cycle clock is the Servo_fast cycle clock.
	Servo / T1(DCC)	You can set an integer ratio between the servo cycle clock and the bus/Servo_fast cycle clock here. Among others, the position control of the axes is calculated in this cycle clock. Normally the factor 1 should be used. If you set the factor 2, although the dynamic performance of the controller will deteriorate, more computing time will be available for processing other tasks. The reduction ratio between the bus cycle and the servo cycle clock must also be set as the "master application cycle" on the drive. This setting is necessary to enable reciprocal life-sign monitoring. For further information, refer to the drive descriptions. If isochronous mode is not configured, the default setting for the basic time to servo cycle clock ratio is 1:1. It cannot be changed then! PROFIBUS DP: The servo cycle clock can be operated at a ratio of 1:1, 1:2, 1:3, and 1:4. PROFINET IO: The servo cycle clock can be operated at a ratio of 1:1, 1:2, 1:3, 1:4, 1:6, 1:8, 1:10, 1:12, 1:14, and 1:16.
	Ipo / T2(DCC)	You can set an integral ratio between the IPO cycle clock and servo cycle clock here. As standard, the motion control of the axes will be calculated in the interpolator cycle clock. The interpolator cycle clock factor is used to determine how fast the drive setpoints are calculated.
	Ipo2 / T3(DCC)	You can set an integral ratio between the IPO_2 cycle clock and IPO cycle clock here. The interpolator cycle clock 2 is used for the motion control of low-priority axes. The factor is used to determine how fast the setpoints of the low-priority drives are calculated.
	DCCAux T4(DCC)	You can set an integer ratio between the DCCAux DCC cycle clock and T3(DCC) DCC cycle clock here.
	DCCAux_2 T5(DCC)	You can set an integral ratio between the DCCAux_2 DCC cycle clock and DCCAux DCC bus cycle clock here.
TControl		Click the arrow to open the configuration of the system tasks for the TP TControl. There, you can set the ratio of the cycle clocks for the task of the temperature channels to the servo cycle clock.

Field/button		Meaning/information
	Use system tasks for TControl	Activate the checkbox if the special tasks for the temperature channels in the execution system should be displayed. If you have not configured a temperature channel, you should deactivate the system tasks for TControl as they require unnecessary computation time.
	Servo Reference Clock Cycle	The servo cycle clock is displayed here for information purposes. To change this, you must select the value further up in the dialog box. All other cycle clocks of the temperature channel are a multiple of the servo cycle clock.
	PWM (Pulse Width Modulation)	Cycle clock which is used for the actuating signal output of the temperature channel. Specifies the basic cycle clock for further cycle clocks. Select the cycle clock in ms or in Hz. If you select Hz, the ratios to the input cycle clock and the control cycle clock are specified automatically.
	Input1/2	Cycle clock which is used for the actual value measurement of the temperature channel. Select the ratio of this cycle clock to the PWM cycle clock. The duration is displayed in the grayed-out field.
	Control1/2	Cycle clock which is used for the closed-loop control of the temperature channel. Select the ratio of this cycle clock to the input cycle clock. The duration is displayed in the grayed-out field.

Copying asynchronous cyclic I/O data

As of V4.2, you can choose when the asynchronous cyclic I/O data is to be copied. This means you can now choose whether data is copied in the IPO (with DCC T2 (DCC)) or IPO_2 (with DCC T3 (DCC)).

- To do this, select the relevant cycle clock from the drop down list box **Copy non-equidistant I/O data from PROFIBUS or I/O data from PROFINET IO with RT to**.

The inputs are always copied at the start of the first task on a level. The outputs are always copied at the end of the last task on a level. If there is no DCC or user program task, the BackgroundTask serves as both the first and the last task on the level concerned.

Note

Copied are all non-equidistant data on the **PROFIBUS DP**, **PROFINET IO**, and**I/O bus**.

Assigning system cycle clocks to technology objects

Assigning system cycle clocks

You can make better use of the performance reserves of the SIMOTION CPU by assigning priorities to your technology objects and specifically assigning them to system cycle clocks. The definition of lower-priority tasks allows you to gain performance reserves for higher-priority tasks.

Consequently, a higher time level can be used for the TOs, particularly for uniform motions without large accelerations/decelerations. (e.g. call of the TO in the interpolator cycle clock 2).

Change the standard setting if you detect:

- A job processing that lasts too long
- Too great a utilization of the technology in the CPU

Assign the interpolator cycle clock 2 to the axis and external encoder technology objects with lower-priority tasks, and assign the IPO cycle clock or the interpolator cycle clock 2 to the output cam and the measuring input technology objects.

Assign the interpolator cycle clock or the servo cycle clock to the technology objects with high-priority tasks.

You can assign the following cycle clocks to the technology objects:

Motion control task	**High priority**	**...**	**Lower priority**
Technology object	Servo cycle clock	Interpolator cycle clock	Interpolator cycle clock 2
Drive axis	(x)	Standard	X
Position axis	(x)	Standard	X
Following axis	(x)	Standard	X
External encoder	(x)	Standard	X
Output cam	X	X	X
Cam track	X	X	X
Measuring input	X	X	X

The system cycle clocks for output cams and measuring inputs, as well as for axes, are set in SIMOTION SCOUT in the **Configuration** dialog.

As of V4.1 in exceptional cases the IPO share can also be calculated in the servo, in this regard see **Motion control / interpolator** in the **TO axis** manual.

Second position control cycle clock (Servo_fast) (Page 1364)

Task runtimes

You can use the task runtimes to check whether the computer performance of the system is sufficient for the demands of the application.

The task runtimes are displayed in the **Taskruntime** and **effectiveTaskruntime** device variables.

A distinction is made between:

- The runtimes of the individual tasks within a level (**Taskruntime**)
  The **Taskruntime** displays the sum of the net runtimes of the task (without the interrupt times).
- The runtime of the level (**effectiveTaskruntime**)
  The **effectiveTaskruntime** displays the effective runtime of a level (including the interrupt times). This is the time from the start of the level until the end of the last task in the level.

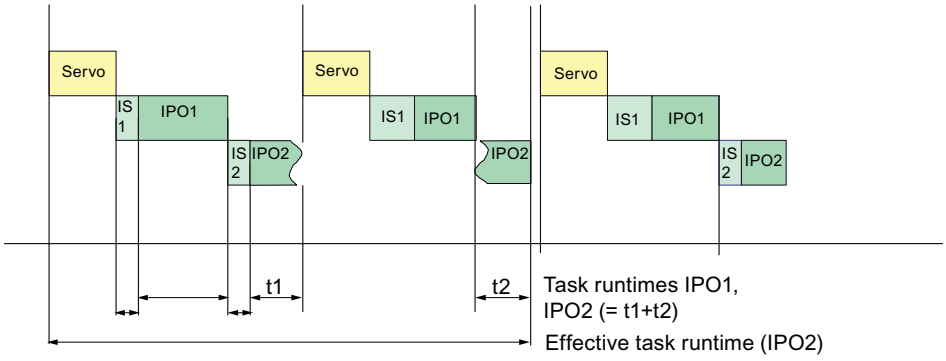

Figure 4-116 Representation of the Taskruntime and effectiveTaskruntime (cycle clock ratio IPO1 : IPO2 = 2)

Legend:

Servo: Servo cycle clock

IS1: IPOSynchronousTask

IS2: IPOSynchronousTask_2

IPO1: IPOTask

IPO2: IPOTask2

The following table shows the tasks and the levels for which a Taskruntime (tasks) and an effective Taskruntime (levels) can be determined.

Tasks (Taskruntime)	Levels (effective Taskruntime)
servodcc	Servo / T1(DCC)
servo	
servosynchronous	
servo_fast	Servo_fast
Ipodcc	Ipo / T2(DCC)
ipo	
iposynchronous	
ipo_fast	IPO_fast
ipodcc_2	Ipo_2 / T3(DCC)
ipo_2	
Iposynchronous_2	
dccaux	DCCAux T4(DCC)

Tasks (Taskruntime)	Levels (effective Taskruntime)
dccaux_2	DCCAux_2 T5(DCC)
background	Background[1]

[1] With "Background" level: Difference between 2 start times of the BackgroundTask

Note

To determine the task runtimes, the system variable **taskRuntimeMonitoring** must be set to **enable**.

The task runtimes are also shown in the SCOUT device diagnostics.

Note

Even when the module is in the **Stop** operating state, system tasks use computing time.

See also

Functions for runtime measurement of tasks - overview (Page 1446)

Optimizing the execution system (Page 1688)

Efficient programming - overview (Page 1686)

Timeouts and level overflows

Timeouts and/or level overflows may occur when executing computing processes. To monitor task runtimes, you can use the device diagnostics in SCOUT (ONLINE only). The evaluation of system variables is described in **Monitoring of timeouts and level overflows** (see below).

You have the possibility of configuring various responses for the system response to overflows of certain execution levels.

Timeout

You can configure maximum execution cycles for the execution levels **BackgroundTask**, **TimerInterruptTask**, **SynchronousTasks** and **ShutdownTask**.

If the set maximum duration is exceeded, the associated **SystemInterruptTask** (**TimeFaultTask** or **BackgroundFaultTask**) or a standard function (e.g. CPU to **STOP**) can be called up.

Level overflow

A toleration of level overflows can be set for the execution levels **IPO1** and **IPO_2**.

A level overflow occurs when a level (**IPOTask/IPOSynchronousTask** or **IPOTask2/ IPOSynchronousTask_2**) has not been executed within the set system cycle clock, IPO or IPO_2.

Note

A cyclic user task (IpoSync, Ipo2Sync) must be finished within its cycle.

A task overflow caused by a failed start attempt of a lower priority task produces an entry in the diagnostic buffer.

If the clock cycles be set too low so that level overflows continuously occur, the CPU will no longer function.

With a set tolerance, the next IPO cycle clock is used in order to:

- Complete the computing process of the previous cycle clock without triggering the set error response
- Start the computing process of the current cycle clock.

If another level overflow occurs in the next level cycle (if no tolerance is set or the number has been exceeded), the CPU is set to **STOP** in order to prevent a blockade of the entire system. This results in an entry in the diagnostic buffer and the error response (CPU to **STOP**) with starting lockout.

You can set a maximum of 5 level overflows to be tolerated in the task configuration in the execution system.

Examples

The following are examples of the execution relationships for level overflows:

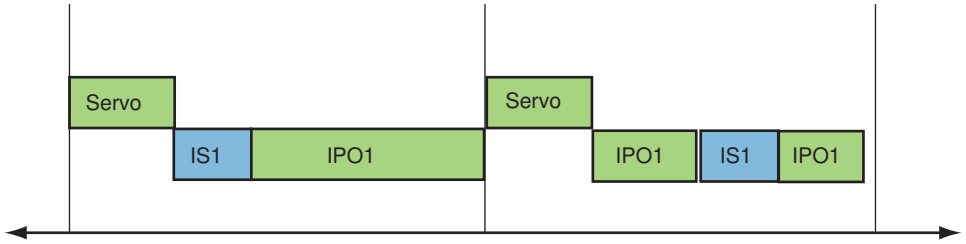

Figure 4-117 IPO overflow example

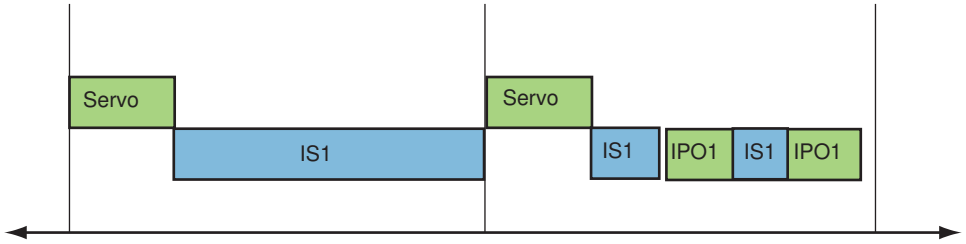

Servo: Servo cycle clock
IS1: IPOSynchronousTask
IPO1: IPOTask

Figure 4-118 Overflow of the IPOSynchronousTask example

High-performance programming

If level overflows occur, but it is not possible to increase the DP/servo cycle clock, the following measures can be taken:

- In task configuration for IPOSynchronousTask
  Ratio of IPOSynchronousTask : IPO cycle clock = 75%
  Tolerate two IPO overflows
- Use optimized PROFIBUS
  User-defined profile: HSA=2 (highest PROFIBUS address)
  with, for example, two nodes on the PROFIBUS, RetryLimit = 1, switch off cyclic distribution of the bus parameters (then, however, a PG can no longer be connected to the isochronous PROFIBUS)
- Change ratio BackgroundTask : MotionTasks
  If, for example, focus is placed on the MotionTask, an event in the BackgroundTask results in a MotionTask being quickly started and handled with few interruptions.
- Read system variables only once and temporarily store them in a local variable for later use

For additional information on high-performance programming, refer to Optimizing access to inputs and outputs (Page 1687) .

Monitoring of timeouts and level overflows

The system variables **Taskruntime** and **effectiveTaskruntime** can be used to determine whether a level overflow or a timeout has occurred.

- If the **Taskruntime** in the IPO/IPO_2 cycle clock is *the same* as the **effectiveTaskruntime** in the IPO/IPO_2 cycle clock, then the task has *not* been interrupted by a higher-priority task.
- If the **Taskruntime** in the IPO/IPO_2 cycle clock is *not the same* as the **effectiveTaskruntime** in the IPO/IPO_2 cycle clock, then the task has been interrupted by a higher-priority task.
  Recommendation: With a ratio of servo : IPO : IPO_2 > 1, enter a percentage value of the IPO cycle clock for the duration which is as large as possible in the task configuration of the **SynchronousTasks**.
- If the **effectiveTaskruntime** of the level which has overflowed is *less* than the set cycle clock of the level, a *timeout* has occurred.
  You can prevent this by adjusting the monitoring time of the levels to the values of the system variable **effectiveTaskruntime**.
- If the **effectiveTaskruntime** of the level which has overflowed is *very close to or greater* than the set cycle clock of the level, a *level overflow* has occurred.
  You can prevent this by adjusting the system cycle clocks, or you can tolerate these overflows.

See also

SynchronousTasks (Page 1326)

Task runtimes (Page 1358)

Information on starting a task: TaskStartInfo (TSI)

Every time a task is started, important information is stored in the **TaskStartInfo**, e.g.:

- The starting time of the task
- For the **TechnologicalFaultTask**: The triggering instance of the technology object and the alarm number
- For the **TimeFaultTask**: The TaskId of the **TimerInterruptTask** which caused the timeout error
- for **the ExecutionFaultTask**: The triggering event and the TaskId of the task in which the event occurred.

Within a task, you can query the relevant **TaskStartInfo** of this task, see Using Taskstartinfo (Page 1262).

Watchdog

The maximum duration for the execution of a task (cycle time) can be configured. If this time is exceeded, the associated SystemInterruptTask (**TimeFaultTask** or **TimeFaultBackgroundTask**) or the response CPU to **STOP** mode can be called.

The cycle time monitoring can be activated for the following tasks:

- BackgroundTask
- TimerInterruptTasks
- SynchronousTasks
- ShutdownTask

Configure cycle watchdog

- Switch to the **Task configuration** tab in the Configuration window for the task.

For BackgroundTask, TimerInterruptTask, ShutdownTask:

- Enter the maximum execution time in the **Time monitoring** field (0 ms = no monitoring).

For IPOsynchronousTask:

- Choose the ratio between the maximum execution period and the IPO cycle clock.

For tasks other than ShutdownTask:

- Select as error response to timeout either the associated **SystemInterruptTask** or the CPU to **STOP** mode response.

Note

For time-triggered tasks: If the task is restarted before it has been executed, there is a timeout error. The SystemInterruptTask is started or the CPU goes to **STOP** mode.

SystemInterruptTasks (Page 1334)

4.2.7.4 Second position control cycle clock (Servo_fast)

Servo_fast (application cycle clock for fast bus system)

Description

Synchronization (data copying, cyclic life-sign, time stamp for output cam and measuring input) with all the synchronous I/O (drive, external encoder, measuring input input, output of output cam, digital and analog inputs/outputs) occurs in the position control cycle clock. Further synchronous cycle clocks (IPO, IPO_2, DccAux, DccAux_2) are based on this cycle clock.

With only one servo, there is only one common application cycle clock available for all the bus systems. This application cycle clock may not be shorter than the cycle clock of the slowest bus system (example: PROFIBUS with 1 ms). Although the faster bus system (e.g. PROFINET IO with 250 µs send clock) is able to transfer the data using a faster cycle clock, the signals are only evaluated in the slow application cycle clock.

Second position control cycle clock (Servo_fast) for the fast bus system

As of V4.2, you can operate synchronous devices (drive, measuring input or output of output cam, I/Os) on the fast bus system (PROFINET) via Servo_fast. Servo_fast always finishes during the first send clock of the fast bus system with this type of arrangement. This makes it possible to operate two bus systems in different application cycle clocks. An assigned position control cycle clock and IPO cycle clock are available for each of the two application cycle clocks.

A description of how to configure a second position control cycle clock can be found in the *Communication* Function Manual under Servo_fast, scaling down of cycle clocks to the servo at the PROFINET interface.

A second position control cycle clock is only necessary in applications with special requirements, e.g.:

- For fast I/O processing via PROFINET IO (for particularly short sampling times and response times)
- If, in addition to the electric axes (e.g. servo drives), hydraulic axes with particularly high-performance pressure/position control are implemented
- If the electric axes have to be split into two performance classes (fast servo - slow servo)

Note

The following SIMOTION modules support the second position control cycle clock:

- V4.2 and higher SIMOTION D445-2 DP/PN and SIMOTION D455-2 DP/PN.
- V4.3 and higher SIMOTION D435-2 DP/PN.

If the axes have to be split into two performance classes, a split on the IPO level (IPO, IPO_2) is usually sufficient; a split on the servo level (Servo, Servo_fast) is only required in exceptional circumstances.

- The reference variable calculation/motion profile calculation of the axes is performed on the IPO level.
- The position control and monitoring of the axes is performed on the servo level.

Please also note that an additional Servo_fast/IPO_fast increases the overall load on the SIMOTION runtime system.

In addition, with DSC (Dynamic Servo Control) for servo axes, the dynamically effective part of the position controller in the drive is performed in the frequency of the speed control loop (i.e. usually with 125 µs in the case of SINAMICS S120). If symbolic assignment with automatic message frame determination is used, DSC is activated automatically.

Servo_fast and IPO_fast

This means the additional fast application cycle clocks can also be selected for the technology objects:

Expansion to include Servo_fast and IPO_fast	Expansion to include IPO_fast
TO axis	TO AdditionObjectType
TO external encoder	TO path object
TO synchronous operation	TO fixed gear
TO measuring input	TO formula Object
TO output cam	TO sensor
TO cam track	TO controller object

See also

Cycle clock model based on a single position control cycle clock (Page 1365)

Cycle clock model based on a single position control cycle clock

Description

The use of Servo_fast is optional and is only intended for certain applications. See also Servo_fast (application cycle clock for fast bus system) (Page 1364). An application cycle clock is sufficient for standard applications.

The graphic below shows an arrangement based on a single position control cycle clock.

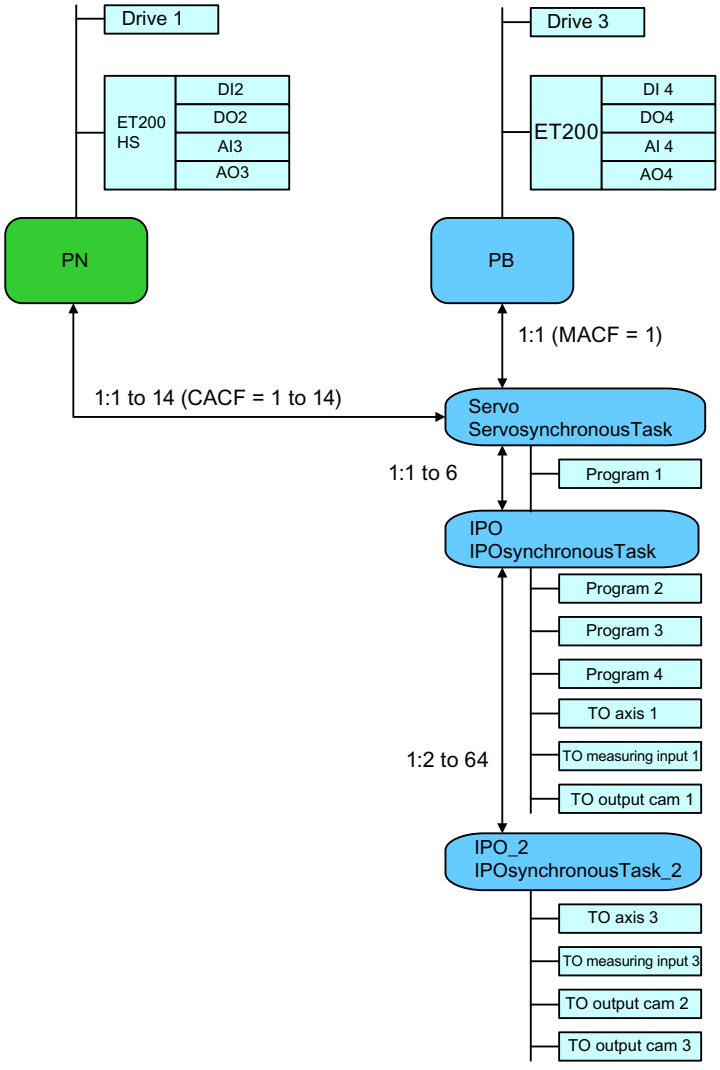

Figure 4-119 I/O with a single position control cycle clock

- MACF: The Master Application Cycle Factor describes the reduction ratio of the PROFIBUS DP send clock to the cycle clock of a higher-level control.
- CACF: The Controller Application Cycle Factor describes the reduction ratio of the PROFINET IO send clock to the cycle clock of a higher-level control.

Cycle clock model based on two position control cycle clocks

Description

The second servo cycle clock enables you to operate two bus systems in different application cycle clocks. An assigned servo cycle clock and IPO cycle clock are available for each of the two application cycle clocks. This enables you to divide your application into slow and fast sections (Servo_fast and IPO_fast).

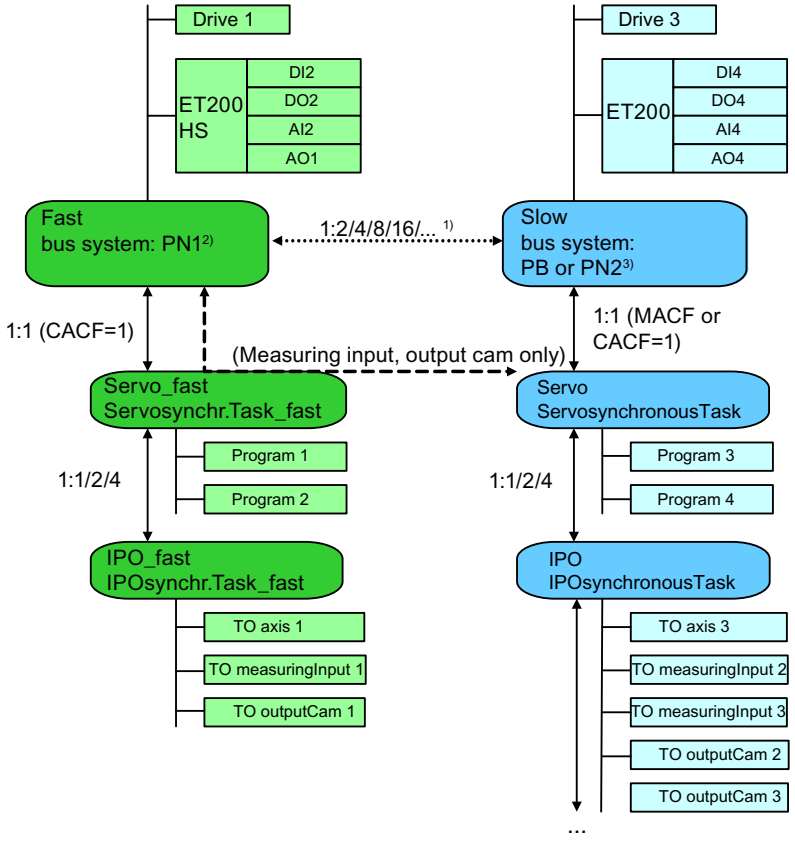
The basic principle is as follows:

- The TOs and I/Os on the fast bus system are processed isochronously in the fast Servo_fast/ IPO_fast.
- The TOs and I/Os on the slow bus system are processed isochronously in the slow Servo/IPO/ IPO_2.

Exception:

- The TO output cam and measuring input in the slow Servo/IPO/IPO_2 can also use the I/O of the fast bus system.

The graphic below shows an arrangement involving two servo cycle clocks.



1) Factor = 2 only for PN1 send cycle clock > 250 µs (for < V4.4 only factor 2, 4, 8 and 16 for all PN1 send cycle clocks)
2) PN1: Onboard PROFINET IO interface for D435-2 DP/PN, D445-2 DP/PN and D455-2 DP/PN
3) PN2: Optional second PROFINET IO interface with CBE30-2 (as of V4.3)

Figure 4-120 I/O with two servo cycle clocks

Generally, a PROFINET send cycle of max. 4 ms and a PROFIBUS bus cycle of max. 8 ms can be set.

For information on CACF and MACF, see also Cycle clock model based on a single position control cycle clock (Page 1365).

Cycle clock ratios and conditions with two servo cycle clocks

Description

For isochronous use, the application cycle is set in HW Config on the I/O module:

- The MACF (master application cycle) is set for PROFIBUS DP slaves. Only MACF=1 is supported if you are also using PROFINET IO. All PROFIBUS devices run in the slow servo cycle clock.
- The CACF is set for PROFINET IO devices. As of V4.2, you can also select the servo cycle clock (Servo_fast) on I/O devices. As of V4.3, a second PROFINET IO interface can be connected in D4x5-2 DP/PN Control Units. This allows the integrated PROFINET interface (X150) to be operated in the Servo_fast clock cycle and the second PROFINET IO interface (CBE30-2) in the Servo clock cycle.

The following settings are possible:

Product version	Property	Application cycle of the devices on		
		PROFINET IO Integrated (X150)	PROFINET IO (CBE30-2)	PROFIBUS DP
Before V4.2	1 servo cycle clock	--	--	Servo
As of V4.2 in addition	2 servo cycle clocks	Servo_fast	--	Servo
As of V4.3 in addition	2 servo cycle clocks	Servo_fast	Servo	Servo

Application cycle on the I/O device

The application cycle set in HW Config on the I/O device has the following effects on the isochronous use of technology objects and user programs:

- Standard I/O are only used in a precisely isochronous manner in the relevant servo. An "IPO-synchronous" process image of the outputs can be output in the 1st, 2nd, 3rd, etc. servo cycle clock within an IPO (with scaling down of the cycle clocks, servo to IPO) (depending on the servo + IPO runtimes). This means the interval between 2 outputs may fluctuate.
- Drive and encoder telegrams are synchronized in the relevant servo between the controller and device. They can be used isochronously by the TO axis in the associated IPO.
- Measuring inputs and output cam outputs with time stamps can also be used synchronously in a slower cycle clock.

Application cycle clock set	Cycle clocks for the isochronous use of		
	Standard I/O	Drive, external encoder	Measuring input, output cam output
Servo_fast	Servo_fast	Servo_fast IPO_fast	Servo_fast IPO_fast Servo IPO IPO_2
Servo	Servo	Servo IPO IPO_2	Servo IPO IPO_2

Factors and reference cycle clocks with two servo cycle clocks

The table below contains the factors and reference cycle clocks that are possible with 2 servos:

Task name	Factors which can be set	Reference cycle clock
Servo_fast	1	Send cycle clock of the onboard PROFINET IO interface (X150)
IPO_fast	1, 2, 4	Servo_fast
Servo	1	PROFIBUS DP bus cycle clock and send cycle clock of the optional second PROFINET IO interface (CBE30-2)
IPO	1, 2, 4	Servo
IPO_2	2, 3, 4, 5, ..., 64	IPO
DccAux	2, 3, 4, 5, ..., 32	IPO_2
DccAux_2	2, 3, 4, 5, ..., 32	DccAux

Possible cycle clock settings for equidistant cycle clocks

The following conditions must also be satisfied when using two servo cycle clocks:

- PROFIBUS DP bus cycle clock = N x send cycle clock of the onboard PROFINET IO interface X150
  N = 2, 4, 8, 16, ... (N = 2 only for send cycle clock > 250 µs)
  (for < V4.4: N = 2, 4, 8, 16 for all send cycle clocks)
- Send cycle clock of an optional second PROFINET IO interface (CBE30-2) = PROFIBUS DP bus cycle clock
- IPO ≥ IPO_fast
- Servo_fast and IPO_fast are always assigned to the onboard PROFINET IO interface X150
- The onboard PROFINET interface can only be operated as sync master (consequently with distributed synchronous operation via PROFINET, the D4x5-2 cannot participate as sync slave when Servo_fast/IPO_fast is used)
  If the onboard PROFINET interface is configured as sync slave, the faulty configuration is indicated via a diagnostic buffer entry and the controller goes into starting inhibit.

Priorities and sequences of synchronous tasks

Cycle clock division when there are two position control cycle clocks

Description

The following rules apply in terms of task priorities:

- Task levels with a shorter cycle time have a higher priority than task levels with a longer cycle time.
- If the cycle time is the same, the servo level has a higher priority than the IPO level.
- If the cycle time is the same, the fast IPO level (IPO_fast) has a higher priority than the slow IPO level (IPO).

There are two synchronous task sequences dependent upon the cycle clock settings. The following graphic shows the two options for the priority and sequence of the task levels.

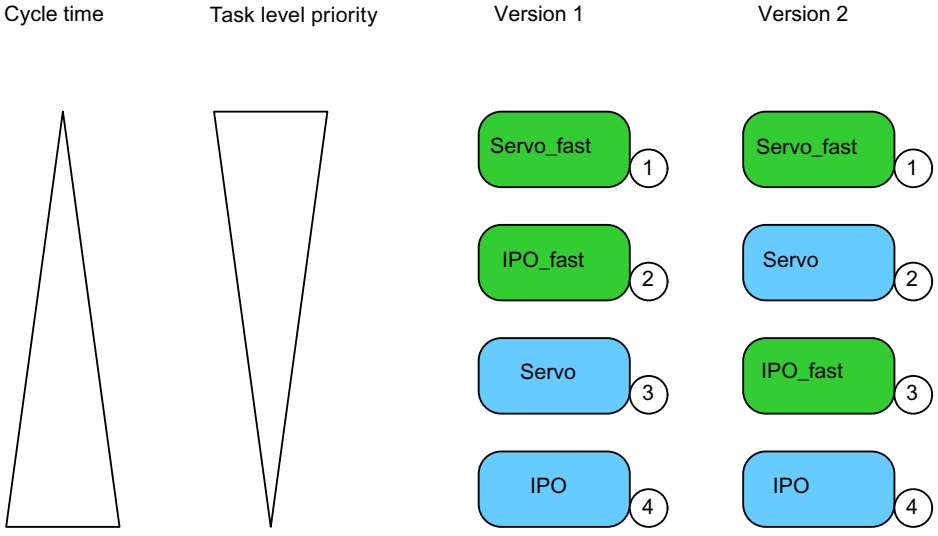


Figure 4-121 Dividing cycle clocks when there are two position control cycle clocks

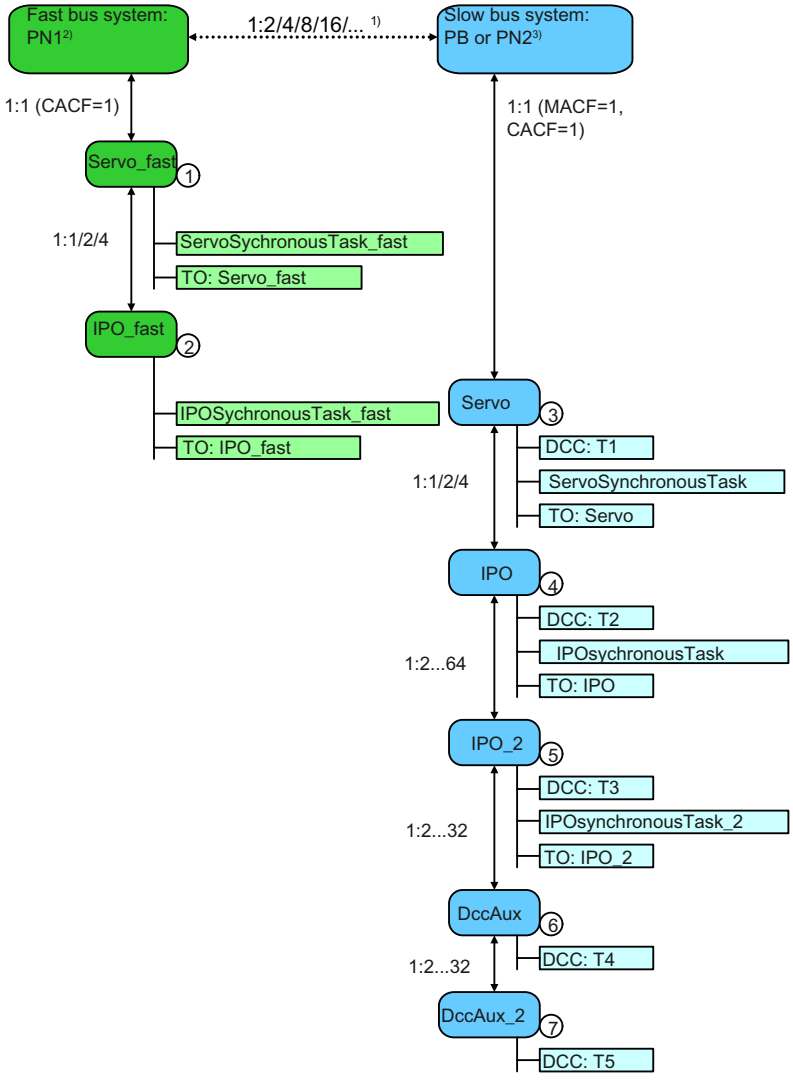
Rules for cycle clock division

- If the setting is made for scaling down of cycle clocks between PROFINET IO and PROFIBUS DP as well as between Servo_fast and IPO_fast, the user has a choice between version 1 (Servo_fast – IPO_fast – Servo – IPO) and version 2 (Servo_fast – Servo – IPO_fast – IPO).
- If IPO_fast has a shorter runtime than the servo, the priorities for version 1 are set within the execution level system.
- A very fast **terminal-terminal response** requires a very short cycle clock for Servo_fast. If there is a strong possibility that IPO_fast may not be finished in good time before Servo due to a high system load, then IPO_fast must be set to the same speed or a slower speed than Servo. The priorities for version 2 are then set within the execution level system.
- The IPO_fast cycle clock is not longer than the IPO cycle clock.
- The new Servo_fast and IPO_fast cycle clocks must not overrun.
- In the event of a level overflow, the system goes into STOP mode. The starting lockout is set and an appropriate entry is made in the diagnostics buffer. Only after a ramp-up (power on/off) or download can the system return to RUN mode.

Cycle clock division for the 2nd servo, version 1

Task assignment, version 1 (Servo_fast – IPO_fast – Servo – IPO)

The graphic below shows version 1 of cycle clock assignment.



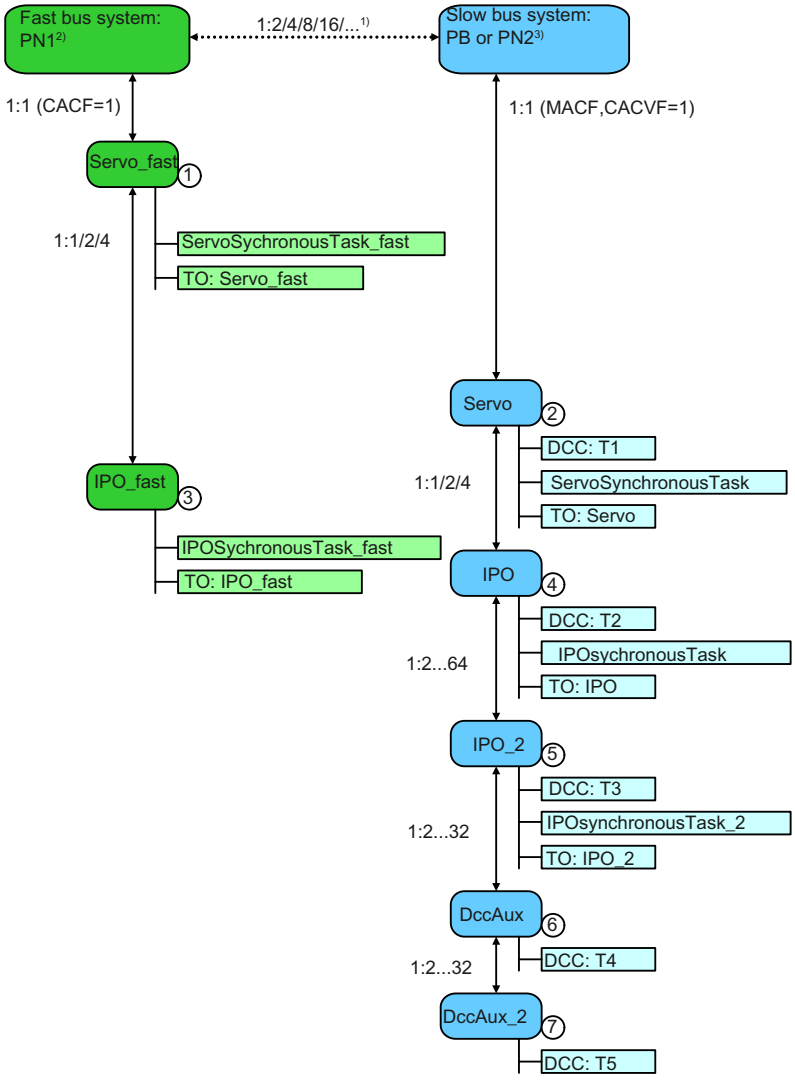
[1)] Factor = 2 only for PN1 send cycle clock > 250 µs (for < V4.4 only factor 2, 4, 8 and 16 for all PN1 send cycle clocks)
[2)] PN1: Onboard PROFINET IO interface for D435-2 DP/PN, D445-2 DP/PN and D455-2 DP/PN
[3)] PN2: Optional second PROFINET IO interface with CBE30-2 (as of V4.3)

Figure 4-122 Cycle clock division, version 1

Cycle clock division for the 2nd servo, version 2

Task assignment, version 2 (Servo_fast– Servo– IPO_fast – IPO)

The graphic below shows version 2 of cycle clock assignment.



[1] Factor = 2 only for PN1 send cycle clock > 250 µs (for < V4.4 only factor 2, 4, 8 and 16 for all PN1 send cycle clocks)
[2] PN1: Onboard PROFINET IO interface for D435-2 DP/PN, D445-2 DP/PN and D455-2 DP/PN
[3] PN2: Optional second PROFINET IO interface with CBE30-2 (as of V4.3)

Figure 4-123 Cycle clock assignment, version 2

Synchronization of cycle clock and bus systems

Description

Synchronization between the slower and faster bus systems occurs automatically, whereby the cycle clock of Servo_fast is always an integer multiple of the servo.

Example of cycle clock and bus synchronization

This example shows how the individual cycle clocks behave during a cycle.

- Fast servo cycle: 250 µs
- Fast IPO cycle: 500 µs
- Slow servo cycle: 1 ms
- Slow IPO cycle: 2 ms

Cycle clock	**0**	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**
Time	0000	0250	0500	0750	1000	1250	1500	1750	2000	2250
Start faster, servo_fast	x	x	x	x	x	x	x	x	x	x
Start faster, IPO_fast	x		x		x		x		x	
Start slower, servo	x				x				x	
Start slower, IPO	x								x	

4.2.7.5 Time allocation in the round robin execution level

The time *remaining* after high-priority user and system tasks have been processed is used by the **MotionTasks** and the **BackgroundTask**.

This time is allocated to the BackgroundTask and the MotionTasks according to the *round robin principle*.

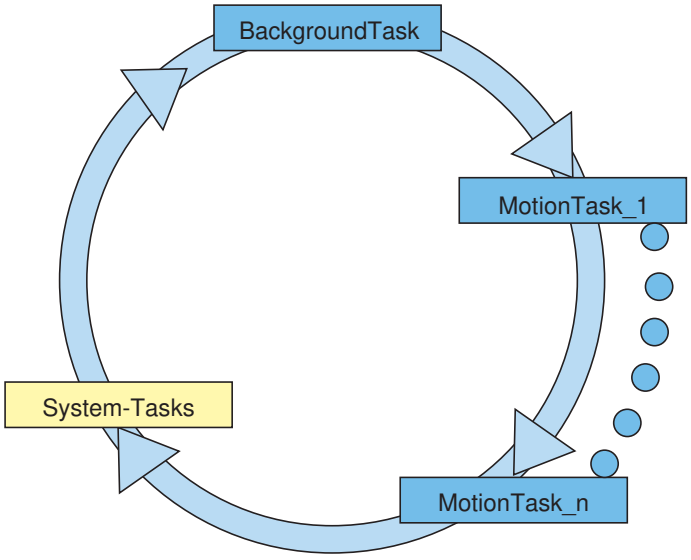


Figure 4-124 Overview of the time allocation in the round robin execution level

Round robin principle

Computing time that is not consumed by higher priority tasks is distributed over the remaining tasks in the round robin principle (Background Task, MotionTasks and Systemtasks); this means that these tasks run one after the other. Thus a quasi parallel (quasi "concurrent") processing of these tasks take place.

The next task is always started when the previous task gives up the computing time (task completed or in the "wait" state). The computing time of a round robin task is also limited to the maximum number of servo cycle clocks. In the next round robin cycle the computing time is continued at the point of interruption. The system ensures that a round robin task always gets at least the computing time of a servo cycle clock. BackgroundTasks can be favored so that the computing time of multiple successive servo cycle clocks can be made available to these tasks (slider execution system).

Additional tasks

In addition to the user program tasks (BackgroundTask, MotionTask), other system tasks (e.g. for communication) that require computing time in the round robin cycle also run in the round robin execution level.

Sequence

In general, the tasks run successively in the round robin cycle. (The sequence is *non-deterministic* and can, for example, change each time via a download, PowerON.)

Time allocation

A task can successively run a specified number of servo cycle clocks (remaining runtime) before it must transfer the computation time to the next task. However, it can also be transferred beforehand to the next task if it "does not have anything to do".

For the constructed case that all tasks in the round robin execution level have already been handled once, the first task is restarted. In this way, there is *no* IDLE time.

There are times in which no user program is being executed. This, for example, is the case when the BackgroundTask and the MotionTask are very brief (shorter than the remaining runtime in a servo cycle clock); the system tasks will then use the remaining runtime.

Restart / process image

After finishing, the BackgroundTask is not started again until the process image has been updated. The update is performed in the **ServoTask**.

Performance

A continuous loop in a MotionTask, without wait commands or synchronous motion commands, causes the MotionTask to use its maximum computation time. Consequently, the cycle of a BackgroundTask is additionally utilized (a larger part of the computation time goes into the MotionTask). Consequently, the system tasks in the round robin level are called at longer time intervals, which, for example, may influence the communication.

Note

MotionTasks with (continuous) loops without _waitTime (0 s) burden the round robin execution level as the MotionTask uses two complete servo cycle clocks.

During the allocation of the round robin execution level for the BackgroundTask and MotionTasks, the BackgroundTask in a complete round robin cycle receives at least one time slice, a MotionTask receives two time slices (if, for example, they are required because of a continuous loop).

Cyclic MotionTasks

Note when Motion Tasks should run cyclically:

If you want to use continuous loops in MotionTasks, then issue, for example, a **_waitTime(0s)** in each cycle. This MotionTask then passes to the following MotionTask.

Note

MotionTasks with (continuous) loops without _waitTime (0 s) burden the round robin execution level as the MotionTask needs two complete servo cycle clocks.

If you want a MotionTask to be executed cyclically, it is better to end the task in the normal way and restart the MotionTask again from a different task (e.g. BackgroundTask) rather than use a continuous loop or a step command at the start of the program. This also has advantages for a download during **RUN**.

See also

Optimizing the execution system (Page 1688)

Setting of the time allocation

You can use a slider accessible via the **Time allocation** button for **MotionTasks** or for the **BackgroundTask** to set the chronological weighting of the BackgroundTask to the remaining tasks of the round robin execution level.

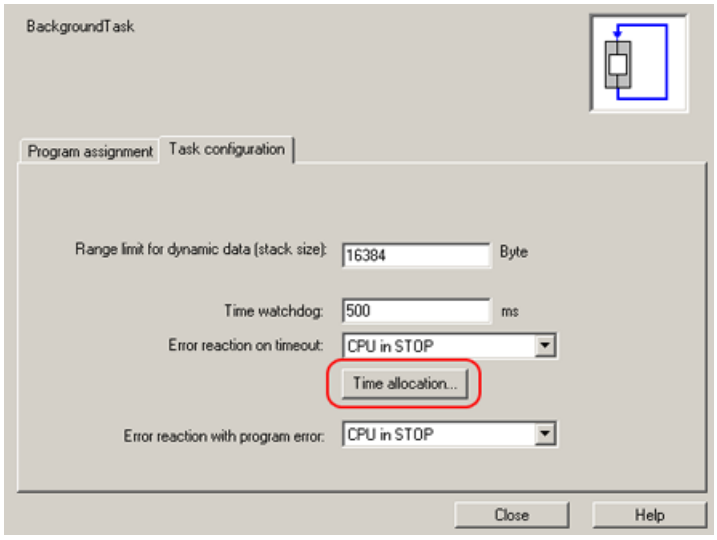

Figure 4-125 Task configuration in SCOUT

Specifying the time allocation in the round robin execution level

1. Select the **Task configuration** tab in the configuration window of a **MotionTask** or the **BackgroundTask**.
2. Click **Time allocation**.
   The Time Allocation in the Round Robin Execution Level window opens.
3. Use the slider to set the ratios of the computation times.
4. Click **OK** to confirm.

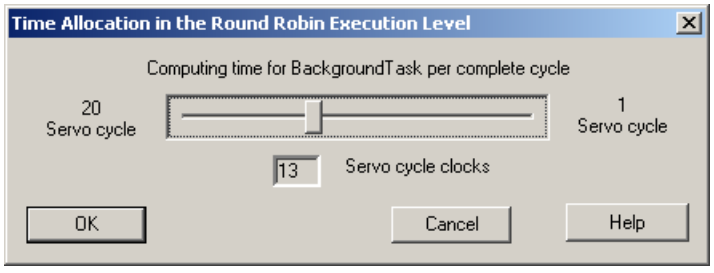

Figure 4-126 Time allocation in the round robin execution level

Time allocation in the round robin execution level

This is where you specify the ratio of the time allocation between the BackgroundTask and all other round robin tasks (MotionTasks and Systemtasks, see Execution levels/tasks (Page 1301)).

The BackgroundTask gets a (maximum) of n-times the computing time of a different round robin task (all other round robin tasks, e.g. MotionTask_1, each have the same maximum share of computing time). You can set this factor with the slider.

When the BackgroundTask has run to an end, it will be restarted when the inputs are updated, at the earliest (after the next servo cycle).

If the computing time of the BackgroundTask is set high, and thus disadvantages the other round robin tasks then, for example, this will slow the communication to SCOUT/OP. Such a setting should only be made for extremely time-critical applications.

Table 4-73 Effect of computation time allocation to MotionTasks and BackgroundTask

Increased computation time for	**Effect**
MotionTasks	BackgroundTask takes longer to run from beginning to end; time monitoring may respond in extreme cases.
BackgroundTask	Programs in the MotionTask may take longer to execute under some circumstances.
The computation time for the BackgroundTask also includes the time required for acyclic communication (via PROFIBUS or PROFINET IO with IRT).	

Settings (examples)

To explain the time allocation in the round robin execution level, two examples are provided here for setting the slider.

Case 1: Slider at the far right-hand side

The BackgroundTask runs for at least one servo cycle clock.

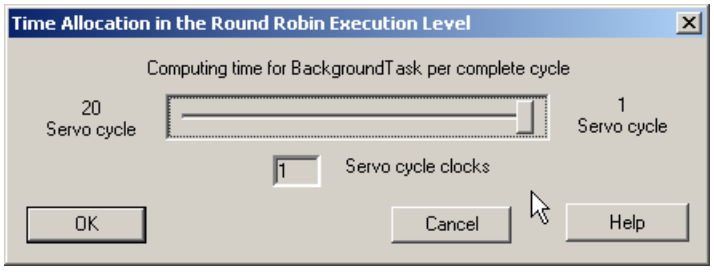

Figure 4-127 Time allocation in the round robin: Setting of the computation time for MotionTasks

In this setting, the BackgroundTask runs for one servo cycle clock, then all MotionTasks run (each MotionTask runs for maximum two servo cycle clocks, unless it enters the suspend mode beforehand), then the BackgroundTask runs again for one servo cycle clock, etc.

Table 4-74 Example:

Servo cycle clock 1	Servo cycle clock 2-3	Servo cycle clock 4-5	Servo cycle clock 6	Servo cycle clock 7-8
Background Task	MotionTask 1	MotionTask 2	Background Task	MotionTask 1

Sample program:

MotionTask 1 and 2 run concurrently with the BackgroundTask;
servo cycle clock = 3 ms

- A counter in a While loop is incremented in the BackgroundTask (green line).
- A counter in a While loop is incremented in MotionTask 1 (red line).
- A counter in a While loop is incremented in MotionTask 2 (blue line).

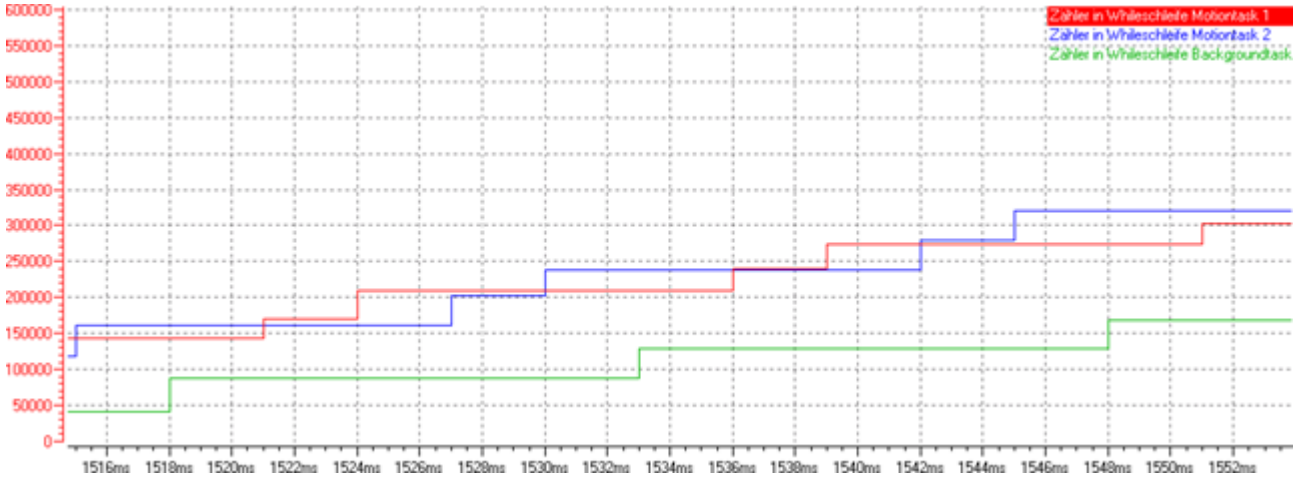

Figure 4-128 Execution example for the time allocation in the round robin: Setting of the computation time for MotionTasks

t = 1518 ms	BackgroundTask runs for one servo cycle clock
t = 1521 ms, 1524 ms	MotionTask 1 runs for two servo cycle clocks
t = 1527 ms, 1530 ms	MotionTask 2 runs for two servo cycle clocks
t = 1533 ms	BackgroundTask runs for one servo cycle clock

Case 2: Slider at the far left-hand side

The BackgroundTask runs for 20 servo cycle clocks.

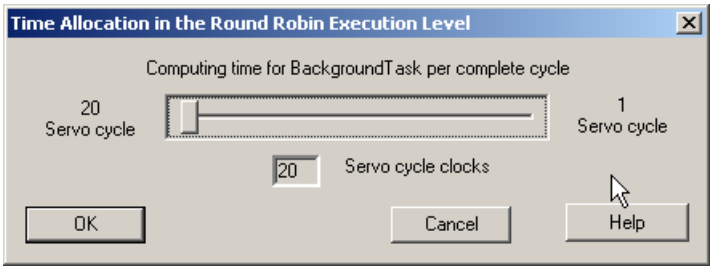

Figure 4-129 Time allocation in the round robin: Setting the computation time for BackgroundTask

In this setting, the BackgroundTask runs for 20 servo cycle clocks, then all MotionTasks run (each MotionTask runs for maximum two servo cycle clocks, unless it enters the suspend mode beforehand), then the BackgroundTask runs again for another 20 servo cycle clocks, etc.

Table 4-75 Example:

Servo cycle clock 1-20	Servo cycle clock 21-22	Servo cycle clock 23-24	Servo cycle clock 25-40	Servo cycle clock 41-42
Background Task	MotionTask 1	MotionTask 2	Background Task	MotionTask 1

Sample program:

MotionTask 1 and 2 run concurrently with the BackgroundTask;
servo cycle clock = 3 ms

- A counter in a While loop is incremented in the BackgroundTask (green line).
- A counter in a While loop is incremented in MotionTask 1 (red line).
- A counter in a While loop is incremented in MotionTask 2 (blue line).

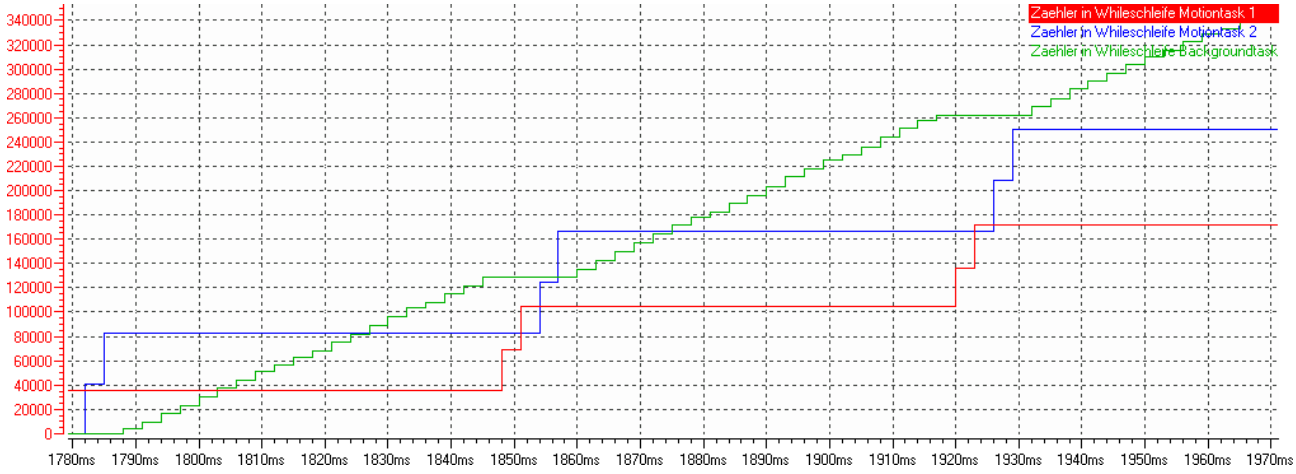

Figure 4-130 Execution example for the time allocation in the round robin: Setting the computation time for BackgroundTask

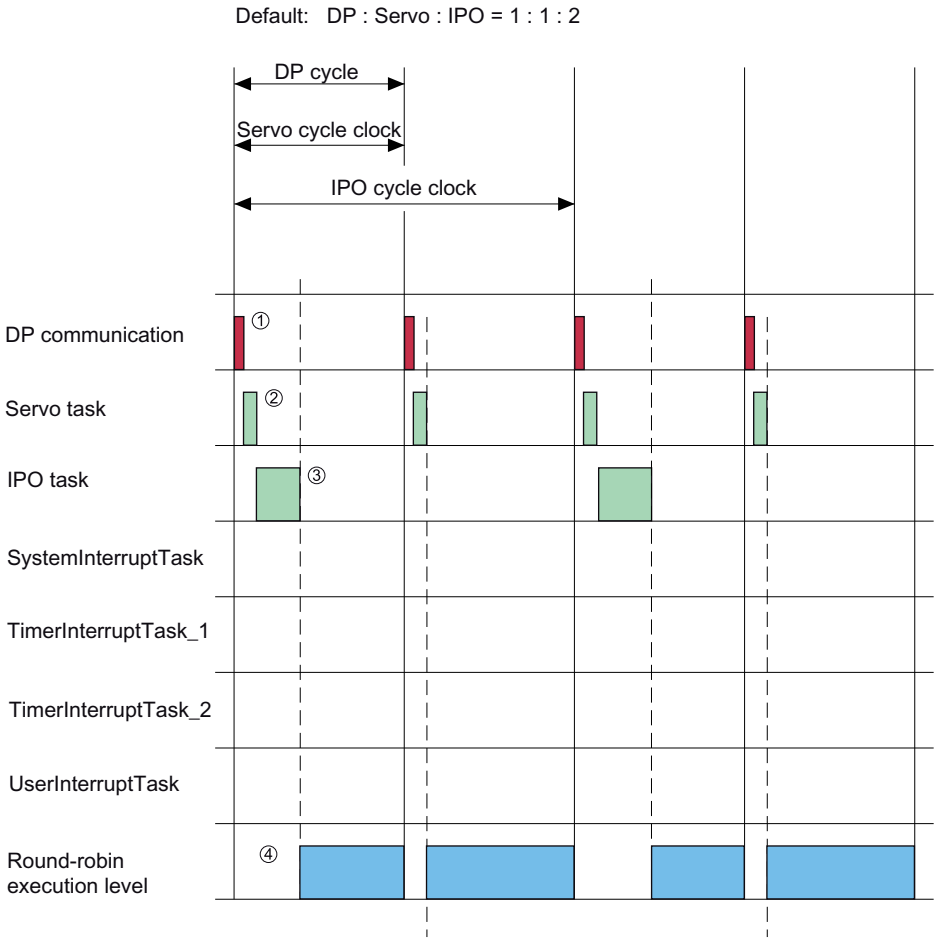
t = 1788-1845 ms	The BackgroundTask runs for 20 servo cycle clocks
t = 1848 ms, 1851 ms	MotionTask 1 runs for two servo cycle clocks
t = 1854 ms, 1857 ms	MotionTask 2 runs for two servo cycle clocks
t = 1860-1917 ms	The BackgroundTask runs for 20 servo cycle clocks

Processing of the tasks (examples)

The following examples illustrate the chronological execution of the various tasks.

The examples refer to PROFIBUS and apply to PROFINET IO with IRT analogously.

Example 1: Chronological execution when no InterruptTask is active



1 In the execution system, the cycle clocks have been selected as follows for this example:
DP cycle: Servo cycle clock: IPO cycle clock: 1:1:2
This means that the servo task is executed in each DP cycle and the IPO task is only executed in every second DP cycle.

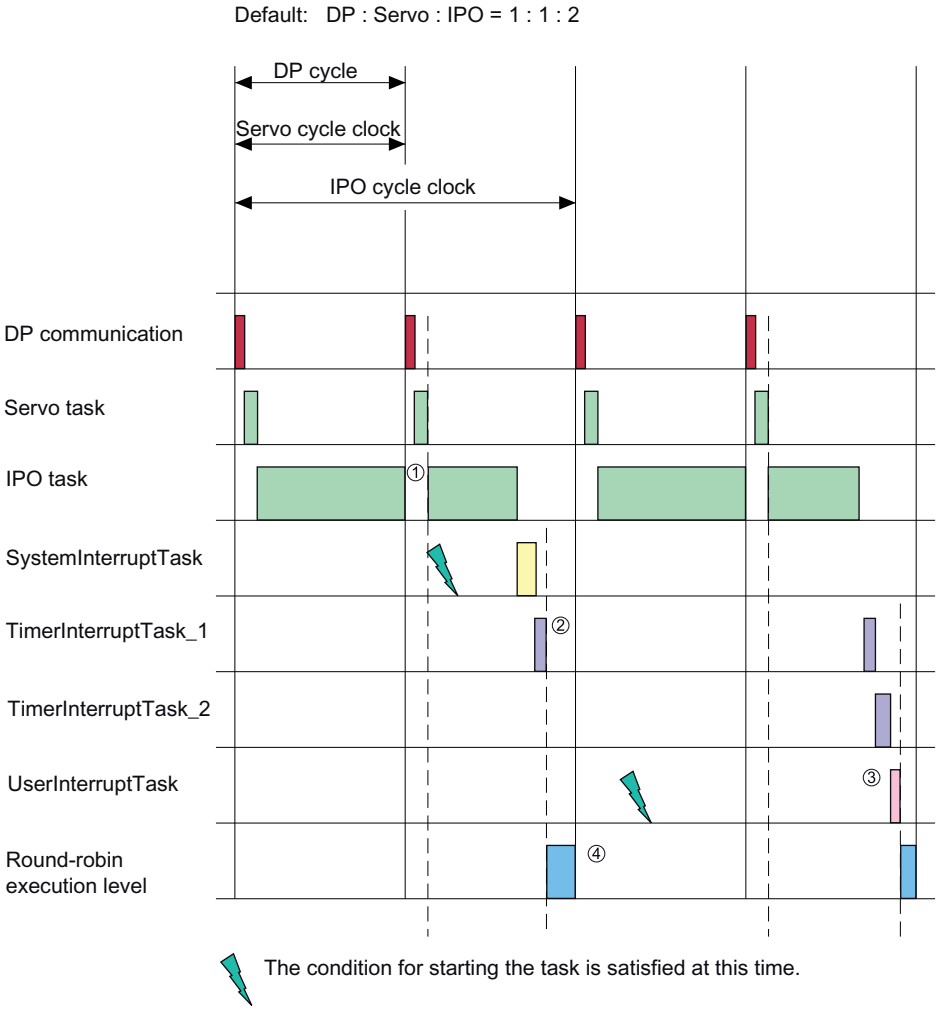
2 DP communication has the highest priority followed by the servo task.

3 IPO tasks are executed after servo tasks.

4 The round robin execution level is executed in the remaining time.

Figure 4-131 Chronological task execution, example: no InterruptTask active

Example 2: Chronological execution when an InterruptTask is active and IPOTask lasts longer than one servo cycle clock



1 The program executed in the IPO task lasts longer than the servo cycle clock. As a result, the IPO task is interrupted and the DP communication and the servo task are executed. Then, execution of the IPO task resumes.

2 After the IPO task is completed, the SystemInterruptTask is executed. Then the lower-priority TimerInterruptTask is started.

3 The UserInterruptTask is also not executed until the higher-priority tasks are completed, even if the condition for the UserInterruptTask was previously satisfied.

4 The round robin execution level is executed in the remaining time.

Figure 4-132 Chronological task execution, example: with InterruptTask active and IPOTask lasts longer than one servo cycle clock

Example 3: Special features for task change in multitasking

However the behavior of the multitasking with task changes, e.g., in case of wait commands or synchronous commands, must be taken into account when querying conditions in MotionTasks and also in the BackgroundTask.

Example:

Table 4-76 Example:

	BackgroundTask	**MotionTask1**	**MotionTask2**
Sources:	x=5	...	...
	... x=4 ...	if x <> 5 _enableAxis Endif	if x = 5 _stopAxis Endif
		...	...
	BackgroundTask	**MotionTask1**	**MotionTask2**
Execution sequence:	x=5		
	Task change →	if x <> 5 Condition not fulfilled endif	
		Task change →	if x = 5 Condition fulfilled Task change →
	x=4		
	Task change →	...	
		Task change →	...
			_stopAxis

Although the execution seems clear in MotionTask2, it may occur that the execution is other than intended due to a task change.

After the renewed change in the BackgroundTask (x=4), the if-queries have already been processed and the query results from before the task change are still valid. This means that although the condition x=5 is not fulfilled anymore at this time:

- _enableAxis is not executed in MotionTask1
- _stopAxis is executed in MotionTask2

The execution depends on when the task change is performed.

Note

To ensure multitasking runs smoothly, it is better not to use global variables from different tasks.

4.2.7.6 Task Trace overview

Using Task Trace

Description

The Task Trace is a tool for troubleshooting in the SIMOTION multitasking environment. The Task Trace offers the following options:

- Graphic display of the sequence of individual tasks and user events (generated using a program command).
- Trace of individual user tasks.
- Ability to configure the Task Trace using IT Diag or via the user program (system functions).
- Storage of the trace file on a memory card.
- Start of the SIMOTION Task Profiler as a separate application using IT Diag or the SCOUT device diagnostics.

For detailed information regarding the Task Trace, see the *Task Trace* function manual.

4.2.7.7 Isochronous I/O processing on fieldbus systems

The general sequence of isochronous I/O processing in a control system with I/O connection via a fieldbus system is presented below:

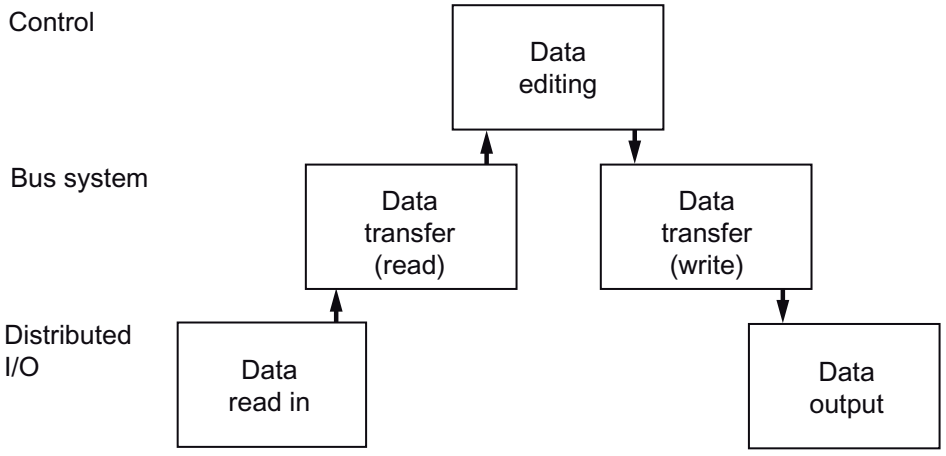


Figure 4-133 Data flow of isochronous I/O processing on fieldbus systems

In an isochronous system, the individual actions are chronologically synchronized with each other. Thus, short and reproducible response times (i.e. with the same length) are achieved.

Cycle clock and time reference are preset by an isochronous, i.e. clocked bus system.

Data protocol on PROFIBUS DP

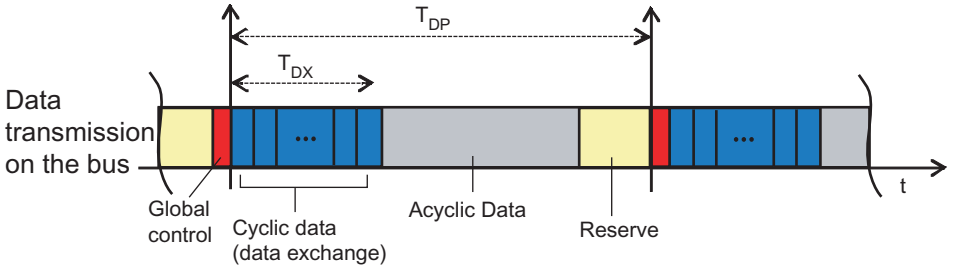

Figure 4-134 Data protocol on PROFIBUS DP

The data protocol on the bus contains the following:

- An isochronous **global control message frame (GC)** that defines the bus cycle clock
- **Cyclic data**: Data transmitted between the nodes in each cycle clock
  Cyclic data communication allows for especially short and reproducible process response times. The transfer of information is done *in each cycle*.
  A user program accesses this data via the process image or via direct access to the I/O.
- **Acyclic data**: Data transmitted only if required and in larger quantities
  The acyclic transmission is suitable especially for the non-time-critical transmission of larger data quantities; the data can be distributed to several tasks.
  Example of acyclic data: Alarms, diagnostic services and data sets
  A user program accesses this acyclic data, e.g. using the commands _readrecord, _writerecord.
- **Reserve**: Remaining time until the next global control.
  The residual time differs depending on the current running acyclic communication, and is a maximum of T_{DP}-T_{DX}.

Data protocol on PROFINET IO

Description

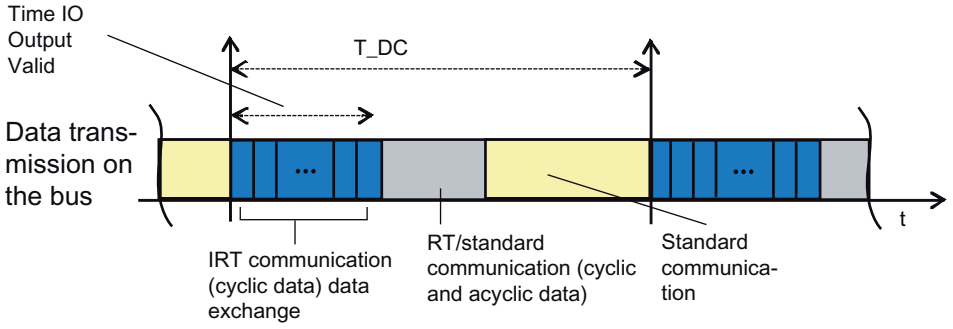

Figure 4-135 Data protocol on PROFINET IO

The data protocol on the bus contains the following:

- The IRT communication that transfers cyclic data in a planned time interval.
- The RT and standard communication in which the following data can be transferred:
  - Cyclic RTC message frames with which I/O data can be transferred, for example
  - Acyclic RTA telegrams with which alarm data can be transferred, for example
  - NRT data (standard communication), standard Ethernet telegrams with which all standard Ethernet-based protocols can be transferred
- Standard communication (last interval prior to synchronization telegram); here only communication can take place that is concluded by the time the synchronization telegram is used.

TIME IO Output Valid describes the time during which the new output data are available.

Isochronous data processing

Isochronous application

With an isochronous application, the processing cycle clock of the controller and any drives connected or distributed I/O are synchronized to the bus cycle.

Isochronous data transmission on PROFIBUS DP

For PROFIBUS the bus cycle clock is synchronized to the Global Control Telegram (GC). The GC embodies the bus cycle clock and is also the system cycle clock for the entire system.

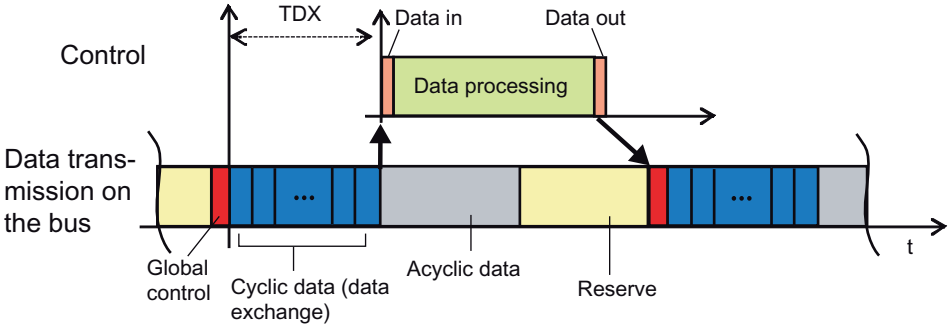

Figure 4-136 Structure of a bus cycle for PROFIBUS DP

Isochronous data transmission on PROFINET IO

For PROFINET IO the processing cycle clock of the controller is synchronized to the IRT communication.

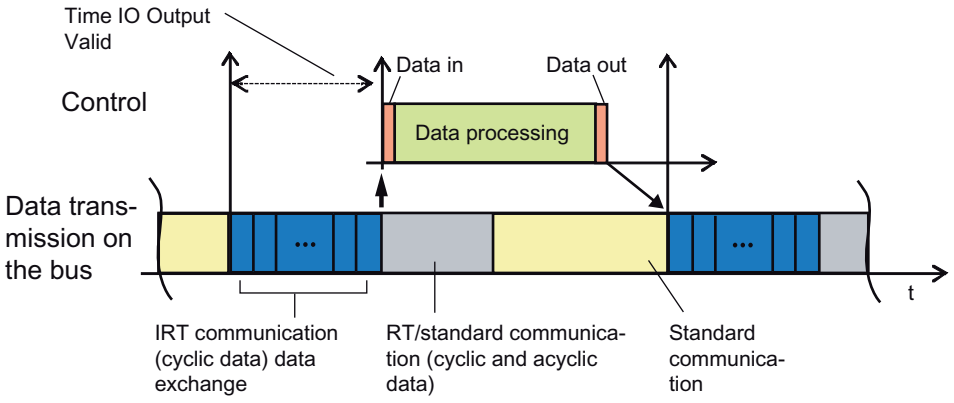

Figure 4-137 Structure of a bus cycle for PROFINET IO

The data transmitted via cyclic data communication can thus be processed isochronously.

Isochronous data acquisition with PROFIBUS DP

In an isochronous complete system, data acquisition, data processing and data output refer to the total system cycle clock.

The application is started when the cyclic data transfer has been completed (T_{DX}).

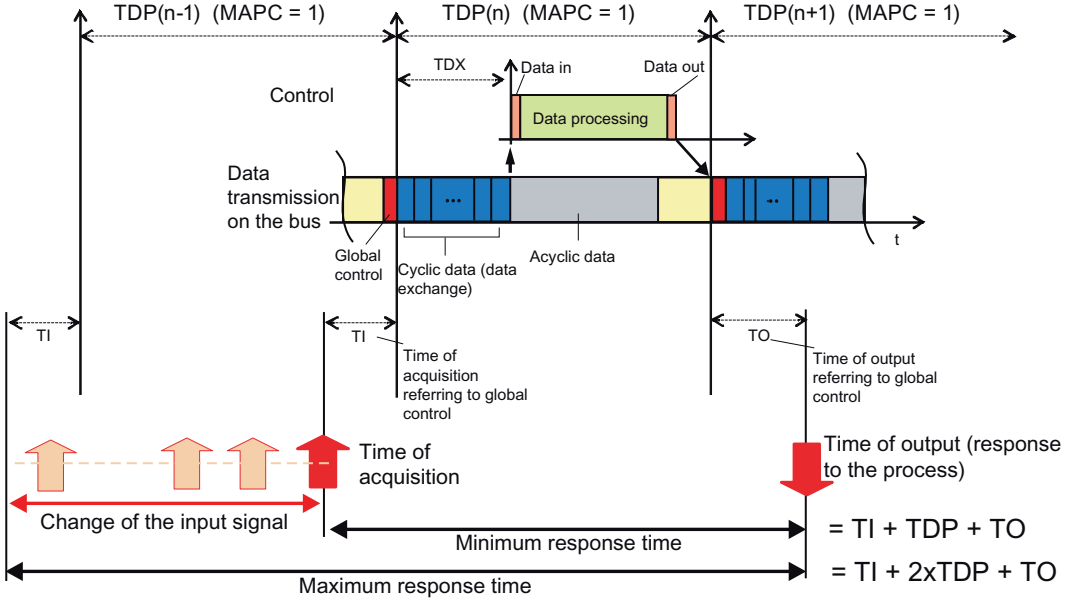

Figure 4-138 Calculation of the reaction times (PROFIBUS DP)

Isochronous data transmission with PROFINET IO

The application is started when the cyclic data transfer has been completed (Time IO Output Valid).

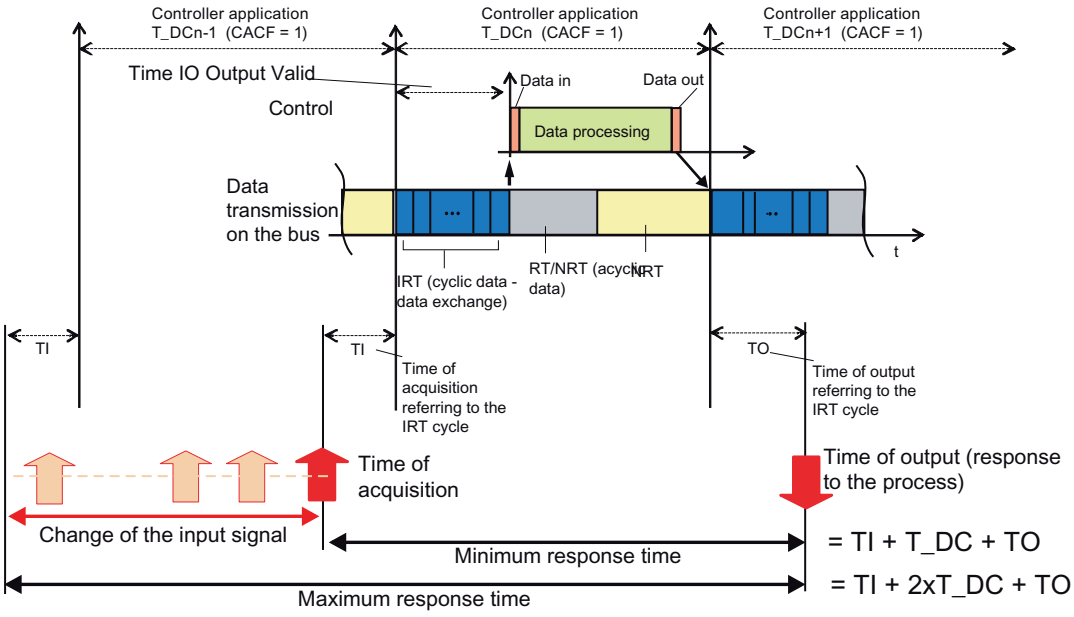

Figure 4-139 Calculation of the reaction times (PROFINET IO)

Calculation of the reaction times (PROFIBUS DP and PROFINET IO)

The read-in process in the distributed I/O must be brought forward, offset by time T_I, so that a consistent state of the inputs can be read in at the starting time of the new bus cycle.

The time T_I comprises at least the signal processing, and conversion time on the electronic modules, and in the case of a modular ET 200 I/O system also the transmission time of the inputs on the ET 200 backplane bus. In general T_I is selected in such a manner that it is the same for all modules, the slowest module determines the time in this regard.

The time T_O ensures that the process reactions of the user program (data processing) are switched through simultaneously and consistently to the "terminals" of the distributed I/O on the bus. analogously for drives the set point is made available for the drive control. The time T_O comprises at least the time for the cyclic data exchange of all nodes on the bus; in the case of a modular ET 200 I/O system the transmission time of the outputs on the ET 200 backplane bus and the signal processing, and conversion time on the electronic modules.

Reaction times or dead times (for drives)

By synchronizing the individual cycles it is possible to read the input data in the cycle clock "n-1", to transmit and process the data in the cycle clock "n", and to transmit the calculated output data at the beginning of the cycle clock "n+1", and to connect the output data to the "terminals" in the same cycle clock.

PROFIBUS

This results in a real process reaction time of:

- $T_I + T_{DP} + T_O$ minimum
- $T_I + 2 \cdot T_{DP} + T_O$ maximum

PROFINET

This results in a real process reaction time of:

- minimum $T_I + T\_DC + T_O$
- maximum $T_I + 2 \cdot T\_DC + T_O$

Dynamic response with respect to data processing in the control

Data processing in the ServoSynchronousTask

- For data processing in the ServoSynchronousTask, for the bus cycle clock: Servo = 1 : 1 the setting can produce a processing time of one bus cycle clock in the controller.
  This applies, for example, for the setting of output data, e.g. DO or AO, depending on the input signals.

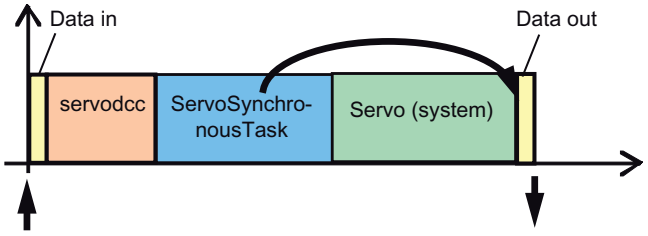

Figure 4-140 Data processing in the control - setting the output data

- When influencing axis data/axis motions, the processing time depends on the fact if the data is already active in the servo (e.g. superimposed setpoint or output value).

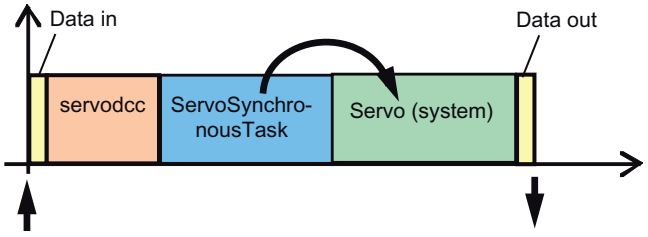

Figure 4-141 Data processing in the control - influencing motion data

- If the data or commands become effective not until the IPO (e.g. issuing of motion commands), the output data on the outputs only become effective with the next servo.
  Note: To keep the runtime of the ServoSynchronousTask low (and thus the time until Data Out), it is preferable to implement the programming of such tasks in the IPOSynchronousTask.

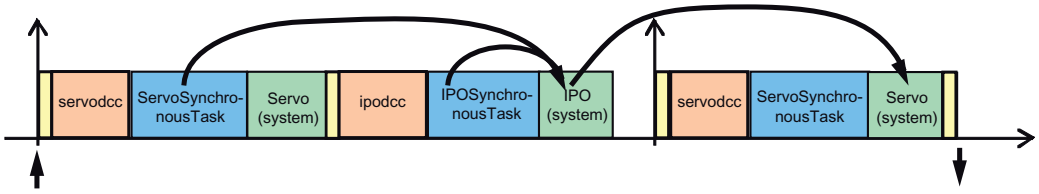

Figure 4-142 Data processing in the control - output data effective in the IPO

Data processing in the IPOSynchronousTask

- In the data processing in the IPOSynchronousTask, the output data on the I/O become effective with the next servo.

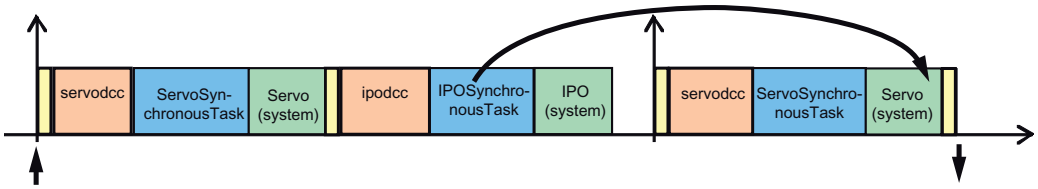

Figure 4-143 Data processing in the control - output data effective in the next servo

- Or: Motion data in the next IPO or servo (see above)

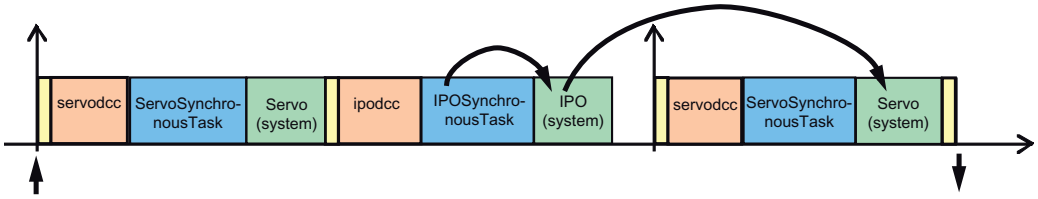

Figure 4-144 Data processing in the control - output data effective in the IPO - influencing motion data

In those cases where the output data of the I/O are only transmitted in the next servo, the reaction time is increased by one bus cycle clock each (for bus cycle clock: servo : IPO = 1 : 1 : 1).

Scenario	Recommendation for user program task
Fast terminal-terminal response on I/O	Use ServosynchronousTask
Fast influencing of the setpoint (servo level)	Use ServosynchronousTask
Switching/superimpositioning the motion (e.g. _stop, _move, _pos, ...) e.g. print mark	Use IPOsynchronousTask

As of V4.1 in exceptional cases the IPO share can also be calculated in the servo, in this regard see **Motion control / interpolator** in the **TO axis** manual.

Dynamic response with respect to data transmission from the acquisition to the processing

When using a PROFIBUS or PROFINET bus system, the specified times for data transmission (T_{DX}) must be taken into account in the calculation of the system cycle clock. Small T_{DX} allow for shorter cycle clocks or more processing time for the application with the same cycle clock length.

- For PROFIBUS DP T_{DX} is shown by the HW config.
- On SIMOTION D, a transmission time in the range of 125 µs ≦ T_{DX} ≦ 375 µs is set automatically on PROFIBUS integrated depending on the degree of extension of the SINAMICS project (I/O extension on SIMOTION D and SIMOTION CX32).
- For PROFINET IO $T_{DX} = 0.5 \bullet T_{DP}$ is set automatically

Dynamic response for data acquisition and data output

When configuring time T_O take T_{DX} into consideration. The following always applies: $T_{DX} \leqq T_O$.

- The times can be set in HW Config.
- When using TM15/TM17 High Feature modules for acquisition and output, the following times are to be set:
  - For the acquisition: T_I + 1 DRIVE-CLiQ cycle (typically 125 µs)
  - For the output T_O + 1 DRIVE-CLiQ cycle (typically 125 µs)

See also

Determination of Tdp, Ti and To using HW Config for ET 200 I/O devices on the PROFIBUS (Page 1391)

Determination of Tdp, Ti and To using HW Config for ET 200 I/O devices on the PROFIBUS

In HW Config in the **Isochronous mode** screen form (called from the **Edit > Isochronous mode** menu), the times for T_{DP}, T_I and T_O can be determined.

The dialog box gives an overview of the parameters and times set for the isochronous mode of the involved objects PROFIBUS, slaves and modules in the respective slaves.

All times in the dialog are specified in milliseconds.

- T_I/T_O setting
  - **in the network** means that the times T_I and T_O are centrally set "same for all slaves"
  - **in the slave** means that the times T_I and T_O are set individually on each slave
- T_I, T_O, T_{DP}
  Shows the currently set or calculated values T_I, T_O and T_{DP} for the selected DP master system.

For a detailed description of the screen form and all other parameters, please refer to the online help for HW Config.

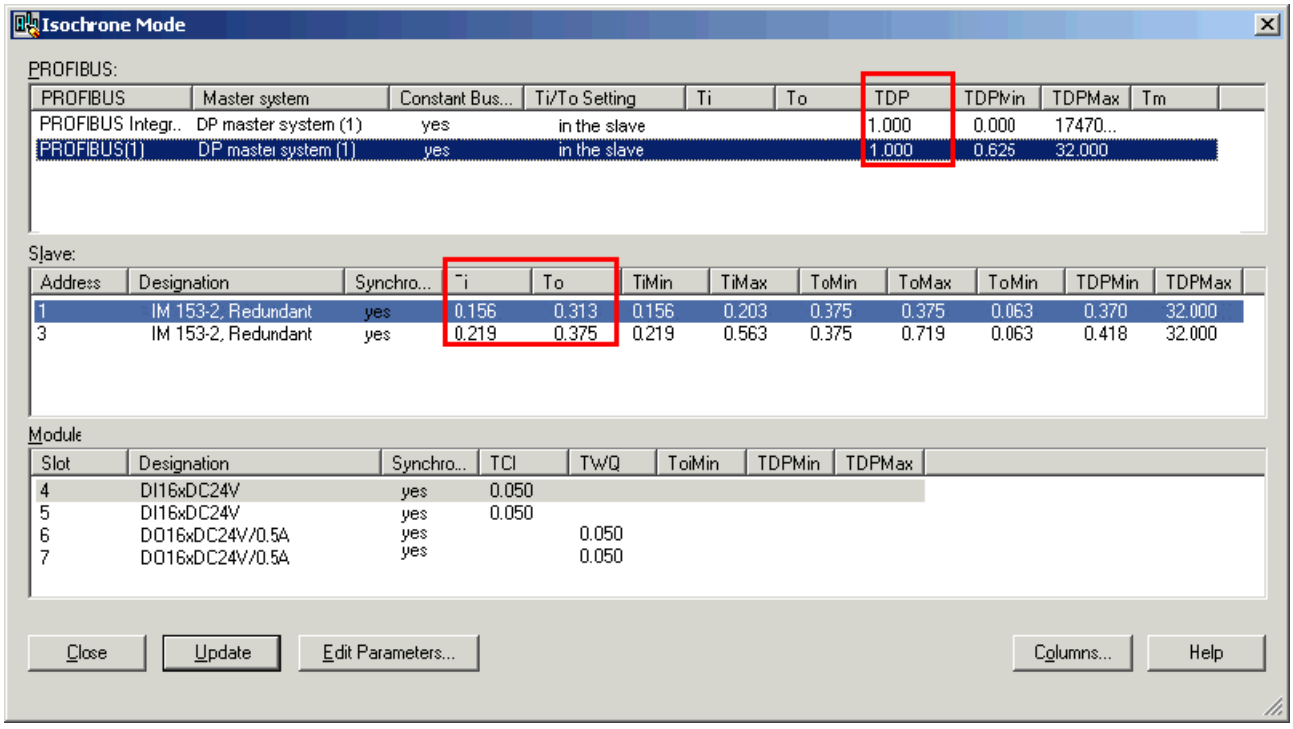

Figure 4-145 Isochronous mode screen form in HW Config

Note

Full "terminal-to-terminal" support of isochronous mode is only possible if all components within the sequence support the "isochronous mode" system property. When selecting from the PM10 catalog or the hardware catalog of HW Config, pay attention to the entry **Isochronous mode** in the information field of the module.

A current list of isochronous I/O modules can be found on the Internet under http://support.automation.siemens.com/WW/view/de/14747353.

Handling cycle clock scaling

The following must be observed for cycle clock scaling:

- At the end of an IPO synchronous task the process image is output with the next possible servo (Data Out) (= reaction time optimized). When scaling the servo cycle clock to the IPO cycle clock sooner or later this can cause the data of one or more servo cycle clocks to be output within an IPO cycle clock, if the I/O access are executed via the IPOSynchronousTask.
- At the end of the servo execution level, the process image of the ServoSynchronousTask is output with the next possible bus cycle clock (= reaction time optimized).
  - For PROFINET and downscaling PROFINET cycle clock to servo cycle clock this can cause the data of one or more bus cycle clocks to sooner or later be output within one servo cycle clock if the I/O accesses are executed via the ServoSynchronousTask and the runtime of the server execution level fluctuates beyond one bus cycle clock.
  - For PROFIBUS the data are always output with the first bus cycle clock as the servo execution level must always be concluded with the first bus cycle clock.

Thus with a different runtime of the servo execution level in the individual cycle clocks, the terminal-terminal time may vary.

If an always constant reaction time is to be achieved instead of a reaction time optimized behavior, the following must be set:

- For PROFIBUS:
  - A reduction ratio servo: IPO = 1 : 1 so that the I/O accesses from the IPOSynchronousTask are always implemented in isochronous mode.
    Comment: I/O accesses from the ServoSynchronousTask are always isochronous for PROFIBUS
- For PROFINET:
  - A reduction ratio bus cycle clock : Servo: IPO = 1 : 1 : 1 so that the I/O accesses from the IPOSynchronousTask are always implemented in isochronous mode
  - A reduction ratio bus cycle clock : servo = 1 : 1 so that the I/O accesses from the ServoSynchronousTask are always implemented in isochronous mode

4.2.7.8 Integrating DCC into the SIMOTION execution system
