2 History of the compatible SIMATIC PCS 7 AS Bundles

2.1 Type-specific order number history of the SIMATIC PCS 7 automation systems

The introduction of configurators for the individual configuration of modular SIMATIC PCS 7 automation systems of the S7-400 series (AS Bundles) has the following effect: any technical change with an AS type will result in the second to last digit of the order number - as read from the left (identifier for the version), to change uniformly with all automation systems in ascending alphabetical order. It follows that a technical change not only has an effect on the order numbers of the directly affected automation systems, but always on the order numbers of all automation systems.

The tables in this section list the currently valid order numbers for each AS type and those of the corresponding predecessor unit.

1.1 How to use the tables "History of compatible SIMATIC PCS 7 AS Bundles"

Predecessor order numbers (MLFBs)

The predecessor order numbers are arranged in each block one below the other in chronological form, so that the immediate successors follow directly below one another. The latest PCS 7 AS Bundle of this configuration (current successor) is listed on the right-hand side for all order numbers of a block.

Brief description

The brief descriptions describes the important changes with the components of this configuration. This makes it easier to identify the reason for the change of the order number digit "Version". However, a change in the order number is not necessarily due to a component change in this configuration. It can also be due to purely logistical reasons, e.g. due to a component change in another configuration.

Current successor

The current successor or the current bundle MLFB is for all previous MLFBs of the left column the bundle MLFB of a block on the right.

* Symbol

The symbol * in the order number represents a variable digit. The meaning of the variable digits differs, depending on whether the order number is based on the PCS 7 AS Configurator (Scheme A) or was defined before the introduction of the PCS 7 AS Configurator (Scheme B). The meaning of the variable digit is the same within a order number scheme. A change of the order number scheme also means a change in the assignment of the components. The exact meaning of the variable digits resp. the assigned components is described on the following pages.

Example:

You are looking for the current order number of the PCS 7 AS Bundle 6ES7654-8CH23-5DB0. Since the order number is already based on the PCS 7 AS Bundle configurator, the variable digits remain unchanged. The current order number is therefore 6ES7654-8CH23-5DF0.

2 History of the compatible SIMATIC PCS 7 AS Bundles

2.1.a Type-specific order number history of the SIMATIC PCS 7 automation systems S7-400

The tables below show for each AS type the currently valid order numbers (current successor) and the corresponding predecessor units. Variable digits of an order number are identified with the symbol "*" and can be identified via the legend, if required. The brief description describes technical differences (where necessary) of the comparable automation systems with consecutive order numbers.

2.3 History of the CPU types

01/2017

The module history of the CPUs used in the SIMATIC PCS 7 AS Bundles is represented below. The current successor of a CPU type is listed in the right column. The modules of a block (CPU type) are spare part compatible. Spare part compatible CPUs can be used without having to change the configuration. Please bear in mind, however, that the interfaces may have changed.

2.4 Compatibility remarks

CP443-1EX20 (industrial Ethernet)

The CP 443-1EX20, in contrast to the CP 443-1EX11, only has two RJ45 ports. The FAQ ID:34894744 describes how to connect a CP 443-1EX20 with a AUI system and the dependencies when upgrading the CP 443-1EX11 to a CP 443-1EX20, taking the CPUs into consideration.

V6.0 H-CPU (412-5H, 414-5H, 417-5H)

If V4.x H CPUs in redundant systems are replaced by V6.0 H CPUs, both CPUs and both Sync modules must be replaced. When you use V6.0 H CPUs in SIMATIC PCS 7 versions below V8.0, please select the corresponding V4.5 or V4.0 CPU in your hardware configuration with HW Config. V6.0 H CPUs are spare part compatible without having to change the existing hardware configuration. In SIMATIC PCS 7 V7.0+SP3 and higher the DB/FB/FC blocks, the performance and the memory of the V6.0 H CPUs can be used to their full extent even with the existing V4.x configuration.
