Notice: If communication between the Control Unit and the Motor Module is interrupted (e.g. by switching off the Motor Module), this display parameter is no longer updated. The last transferred status of the Motor Module is displayed.

Note: Re bit 00:

When STO is selected, the cause is displayed in bits 16 ... 18 and in bit 20.

Re bit 05:

When SS1 is selected, the cause is displayed in bits 22 and 23.

Re bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

SMM: Safe Motion Monitoring

Re bit 22, 23:

These bits show via which path the SS1 was triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Re bit 24:

Only for parallel connection and active motion monitoring functions: Slave Motor Module ready for communication

	Min 0000 hex	Max FFFF FFFF hex	Factory setting 0000 hex
Description:	If, when comparing the actual topology and target topology, only error has occurred, that can be acknowledged, then using this parameter, a new comparison can be started - acknowledging the error in the target topology. Differences that can be acknowledged: - topology comparison, component shifted - topology comparison, serial number of a component has been detected to be different (byte 3 = 1) - topology comparison shows one component that is connected differently The following parameter values are available: p9904 = 1 --> the procedure is started. p9904 = 0 after starting --> the procedure has been successfully completed. p9904 = 1 after starting --> the procedure has not been successfully completed. The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2. Byte 2: Number of structural differences. Byte 3: Number of differences that can be acknowledged (p9904). Byte 4: Number of differences. These differences can be resolved as follows: - sets the topology comparison (p9906 or p9907/p9908). - change over the actual topology. The appropriate action should be selected corresponding to the message that is displayed/output.		
Note:	In order to permanently accept the acknowledgement of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).

	P-Group: Topology	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 2	Factory setting 0
Description:	With p9905 = 1, the serial numbers and the hardware versions of all of the components are transferred from the actual topology into the target topology and a new comparison is started. For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers. With p9905 = 2, the serial numbers, the hardware versions and the order numbers of all of the components are transferred from the actual topology into the target topology and a new comparison is started. For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers and order numbers.		
Note:	p9905 is automatically set to 0 at the end of the operation. In order to permanently accept the data, it is necessary to save in a non-volatile fashion (p0977).

--	---	--	--

Min	Max	Factory setting
0	99	0

Description: Sets the type of comparison of a component in the target topology with the actual topology.
The comparison is started by setting the required value.

Value:
0: High: Compares the complete electronic rating plate
1: Average: Compares the component type and the Order number
2: Low: Compares the component type
3: Minimum: Compares the component class
99: Topology has different comparison stages

Dependency: Refer to: p9907

Note: The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- Order No. (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Order No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Order No.

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

p9909 Topology comparison component replacement / Topo_cmpr replace

CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: C1(1) Data type: Unsigned8 P-Group: Topology Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1
--	---	--	--

Min	Max	Factory setting
0	1	1

Description: For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.

For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:

- component type (e.g. "SMC20")
- Order No. (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency: Refer to: p9904, p9905

Note: The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).

Special case for Control Unit and option slot modules:

When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: C1(30) Data type: Unsigned16 P-Group: - Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min 0	Max 199	Factory setting 0
Description:	Excessive components that have not been assigned can be removed from the component target topology using this parameter. Index 0: The values 2 ... 199 are permissible. Index 1: = 0: Ready. = 1: Reset (only indices 0 and 1) = 2: Reset all (indices 0 and 1 and flagged entries). = 3: Check and flag for deletion.		
Index:	[0] = Component number [1] = Reset or check and flag for deletion		
Note:	Only for internal Siemens use. The parameter is not displayed for the STARTER commissioning software.		

p9920[0...99]	Licensing enter license key / Enter license key		
CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Unsigned8 P-Group: - Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1
	Min -	Max -	Factory setting -
Description:	Enters the license key for this drive unit. Example of the license key: EACZ-QBCA = 69 65 67 90 45 81 66 67 65 dec (ASCII characters) Index 0 = license key character 1 (e.g. 69 dec) Index 1 = license key character 2 (e.g. 65 dec) ... Index 8 = license key character 9 (e.g. 65 dec) Index 9 = license key character 10 (e.g. 0 dec) ...		
Dependency:	Refer to: r7843, p9921 Refer to: A13000, A13001, F13010		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. With the STARTER commissioning software, ASCII characters are not entered coded, i.e. the characters of the license key can be entered as printed in the Certificate of License. In this case, STARTER codes the characters.		

Note: For an invalid license key, all the indices have the value 0 dec.
 Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-").
 When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec.
 After entering the license key, the license key must be activated (p9921).
 If the licensing is not adequate, then the following alarm is displayed together with LED:
 - A13000 --> licensing not sufficient
 - LED READY --> flashes green/red with 0.5 Hz

p9921	Licensing activate license key / Act license key		
CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1
	Min 0	Max 1	Factory setting 0
Description:	Activates the entered license key. The following is executed when activating the license key. - the checksum of the entered license key is checked. - the entered license key is saved in a non-volatile fashion on the memory card. - re-enter the license key.		
Value:	0: Inactive 1: Activate start license key		
Dependency:	Refer to: p9920 Refer to: A13000, A13001, F13010		
Note:	Before activation, the license key entered using parameter p9920 is checked. If this check identifies an error, activation is rejected. In this case, writing a 1 to p9921 is rejected. When the license key has been activated, p9921 is automatically set to 0.

	Min -	Max -	Factory setting 0000 0000 0000 0000 bin		
Description:	Sets the configuration for the DRIVE-CLiQ diagnostics (error counter r9936). Using this function, connections and cables of DRIVE-CLiQ connections can be checked for transfer errors. The error counter is evaluated in the PHY blocks involved.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Alarm for connection error	Yes	No	-
	08	Reset error counter	Yes	No	-
Dependency:	Refer to: r9936, p9938 Refer to: A01839				
Note:	Re bit 00: To activate this function, p9938 must be set to 0 (inactive). After changing the error counter (r9936), an appropriate alarm is output. The alarm automatically disappears after 5 seconds. Re bit 08: With p9937.8 = 1, the error counters are reset (r9936[0...199]). After the reset, p9937.8 is automatically set to 0.

Description: Selects an input terminal to start the test stop.
The test stop is started with a 0/1 signal at the input terminal and is then only possible if the drive is not in commissioning mode.

Dependency: Refer to: p10001, p10002, p10003, p10040, p10046

Description: Sets the signal source to initiate the test stop.
For example, a digital input of the Control Unit or one of the other Terminal Modules can be set as signal source.
The test stop is triggered on a 0/1 signal edge.
The TM54F must be in the "ready" state (p0010 = 0).

Dependency: Refer to: p10001, p10003, p10041, p10046

Notice: Digital inputs of the TM54F must not be used to trigger the test stop.

Note:	If a safety function is assigned to an input (e.g. via p10022), then the following applies: - logical "0": Safety function is selected - logical "1": Safety function is de-selected The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function: With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level. This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function. With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level. This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.			

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- If the Safety Extended Functions are enabled by means of activation via F-DI.
- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Note:	If a safety function is assigned to an input (e.g. via p10022), then the following applies:				
	- logical "0": Safety function is selected				
	- logical "1": Safety function is de-selected				
	The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function:				
	With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.				
	This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.				
	With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.				
	This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

Description:	Selects a fail-safe digital input for the "Retract SLP" function. A rising edge at this FDI makes it possible to retract the axis, if at this instant in time indicates a violation of the SLP limit. After safe acknowledgment of the active safety faults, the axis can be traversed in the direction of the permitted position range. In the retract mode, SLP becomes inactive, and SDI, if enabled, is selected in the direction of the permitted position range. A 0 signal at the F-DI for retraction, deactivates the active retraction mode (SLP becomes active again, and SDI selected corresponding to the actual F-DIs).		
Value:	0: Function inactive 1: F-DI 0 2: F-DI 1 3: F-DI 2		

Note:

- Retraction is only possible, if SDI in the opposite direction of the permitted position range is not already selected.
- A discrepancy at this F-DI must be acknowledged using a safe acknowledgment.

	01	F-DI 1 processor 2	High	Low	-
	02	F-DI 2 processor 2	High	Low	-

Dependency: Refer to: p9501, p9601, p10117, p10140, p10150

Note: F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10140) of the input as either NC or NO contact and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- If the Safety Extended Functions are enabled by means of activation via F-DI.
- If transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

1.4.2 Parameters with "KHP_WRITE_NO_LOCK"

The following list contains the parameters with the "KHP_WRITE_NO_LOCK" attribute.

These parameters are not affected by the know-how protection.

Product: SINAMICS S120/S150, Version: 4601800, Language: eng, Type: KHP_WRITE_NO_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev comm par_filt
p0124[0...n]	Power unit detection via LED / PU detection LED
p0124[0...23]	Main component detection using LED / M_comp detect LED
p0144[0...n]	Voltage Sensing Module detection via LED / VSM detection LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0154[0...n]	Voltage Sensing Module 2 detection via LED / VSM2 detection LED
p0154	DRIVE-CLiQ Hub Module detection via LED / Hub detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no

Data sets		Information on parameters, binectors, connectors					
Symbol	Meaning	Symbol	Meaning				
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).	Parameter name	Parameter name (up to 18 characters).				
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).	[Unit]	[dimension unit] rotary axis, for linear axis see list of parameters.				
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).	rxxx[y] or rxxx[y...z] or rxxx[y].ww or rxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "y" specifies the valid index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).	pxxxx[y] or pxxx[y...z] or pxxx[y].ww or pxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "y" specifies the applicable index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).	from ... to	Value range.				
		(xxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.				
		(Def)	Factory setting.				
		(Def.w)	Factory setting with bit number as prefix.				
		[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]				
		Samplings times					
		Symbol	Meaning				
		pxxxx[Y] (ZZ.ZZ μs)	Setting parameter with factory setting to select the time slice.				
		p0115[y] (Drive Object)	Time slice depending on the pre-setting p0112 of the drive object. "y" specifies the applicable index.				
		p0115[y] (Motor Modules)	Time slice depending on the rated pulse frequency of the motor module. "y" specifies the applicable index.				
		PROFIdrive sampling time	Presetting for IF1 in p2048. Presetting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.				
		CAN bus sampling time	Presetting in p8848.				
		Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.				
		Not relevant	A static state is displayed here. The sampling time data is not relevant.

Handling BICO technology

Binector: 

Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector: 

Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
 "BI:" parameter for binectors (BI = Binector Input)
 or
 "CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

Parameterizing steps:

- ① p1055[0] = 722.0 Terminal X122.1 acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> The connection shown as a dashed line applies when used as digital output (p0728.x = 1).
 <2> Can be used as fast measuring probe inputs (refer to [4735], [4740]).
 <3> The digital output access authority is displayed in r0729.
 <4> Can only be used with drive object CU_I (e.g. SIMOTION D).

<1> The drive object CU_LINK only exists for automation systems with SINAMICS Integrated (e.g. SIMOTION D, SINUMERIK NCU) and the corresponding controller extension (e.g. CX32-2, NX10).
 On the SINAMICS Integrated, each controller extension is represented by a drive object CU_LINK.
 <2> p8800: CU_LINK address.
 Address of the controller extension, represented by the drive object CU_LINK. The address correlates with the DRIVE-CLiQ socket of the control unit connected to the controller extension configured.
 Value range: See p0918 (PROFIBUS address)
 The parameter p8800 is only readable through non-cyclic parameter access via DPV1 services.

<1> Depending on the drive object, only specific telegrams can be used.
 <2> If p0922 = 999 is changed to another value, the telegram is automatically assigned as specified in [2415] - [2423].
 If p0922 ≠ 999 is changed to p0922 = 999, the "old" telegram assignment is maintained as specified in [2415] - [2423].
 <3> The maximum number of PZD words depends on the drive object type.
 <4> Only for CU_I_D410.
 <5> Connected Only for CU_S_AC or CU_I_D410.

- <1> The number of PZD receive words depends on the drive object type.
- <2> The connector-binector converter only converts the lower 16 bits irrespective of the input variable.
- <3> The following representation applies for words: 4000 hex = 100 % for double words 4000 0000 hex = 100 %.
The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).
The following applies for temperature values: 100° C -> 100 % = 4000 hex or 4000 0000 hex; 0° C -> 0 %.
- <4> In order to maintain the PROFdrive profile, receive word 1 must be used as control word (STW1) (due to bit 10 "control requested").
- <5> Using the connector-binector converters, the bits can be extracted from two of the PZD receive words 5 to 32 and used as binectors.
- <6> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters r2050 or r2060 can have a value ≠ 0 for a PZD word.
- <7> When interconnecting a connector output multiple times all the connector inputs must have either Integer or FloatingPoint data type.

- <1> The number of PZD send words depends on the drive object type.
- <2> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD).
The two corresponding connector inputs cannot be interconnected.
- <3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x).
The following applies for temperature values: 100° C -> 100 % = 4000 hex or 4000 0000 hex; 0° C -> 0%.
- <4> To comply with the PROFdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.

- <1> POWER ON = 24 V electronics supply OFF --> ON or RESET button.
- <2> The sequence control is implemented according to the PROFIdrive profile.
- <3> Only for SINAMICS S120 and G150:
If a DO Infeed (A_INF, B_INF and S_INF) is used, it closes the line contactor (refer to [8732][8832][8932]) and not the DO SERVO/VECTOR.
- <4> These control commands can also be triggered by a fault response.
- <5> STWA.xx = control word, sequence control, bit xx (r0898) [2501]; ZSWA.xx = status word, sequence control bit xx (r0899) [2503].
- <6> Only if „Safety Integrated“ is active.

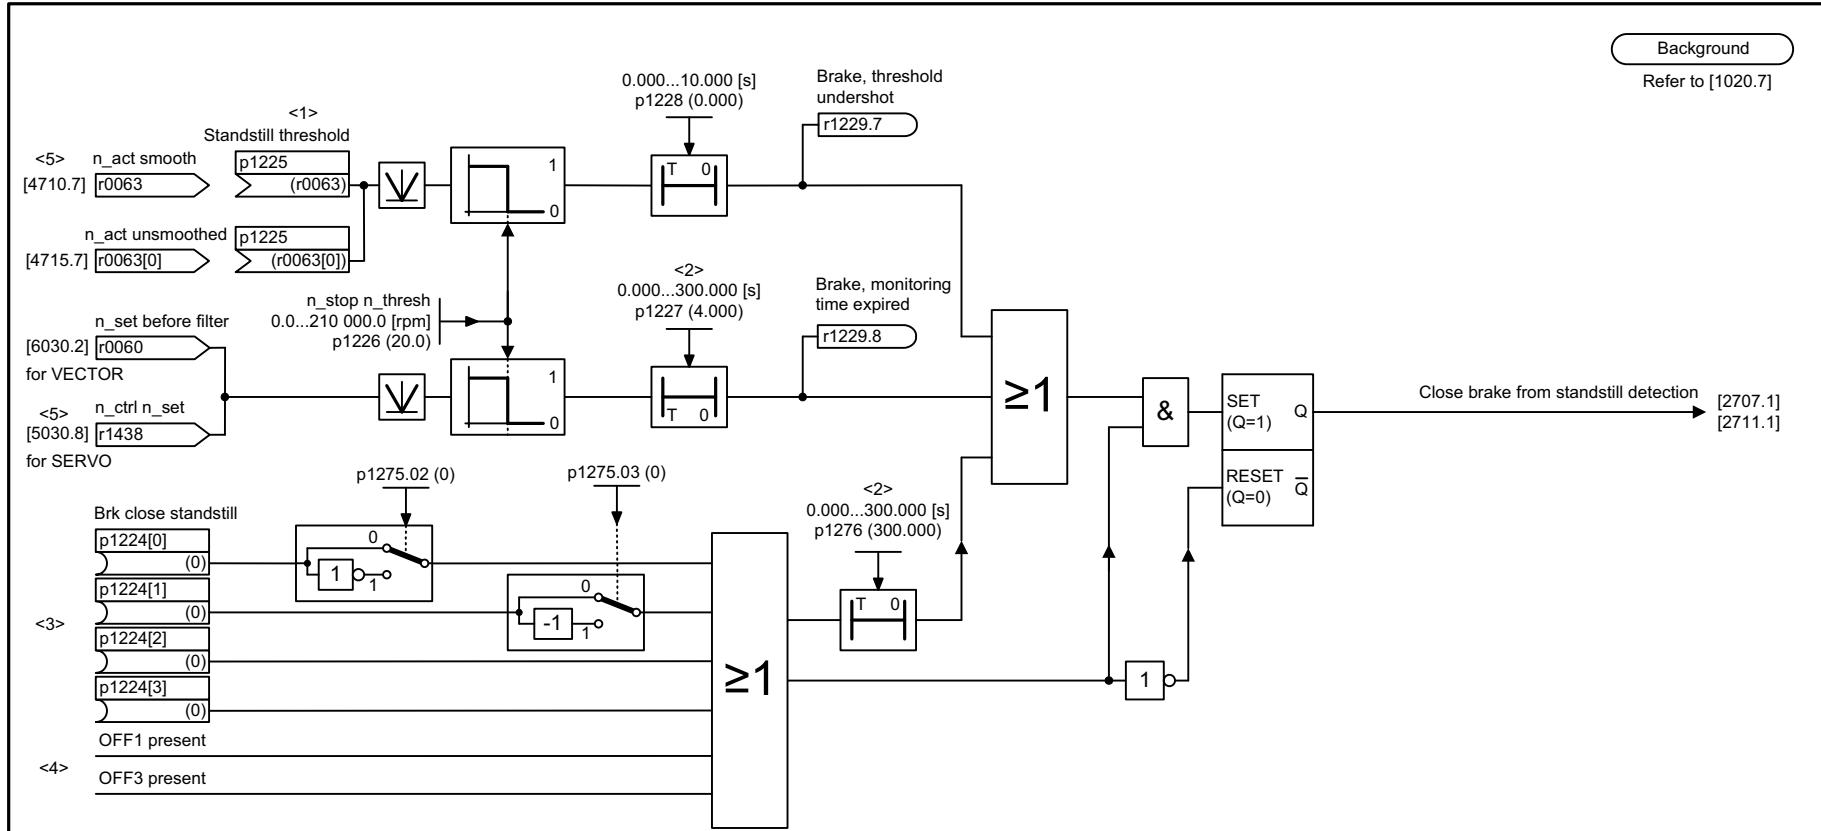

Fig. 2-123 2701 – Basic brake control (r0108.14 = 0)

- <1> Motor holding brake configuration (p1215)
 0 = No motor holding brake being used.
 1 = Motor holding brake acc. to sequence control.
 2 = Motor holding brake always released.
 3 = Motor holding brake like sequence control, connection via BICO.
- <2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
- <3> If p1215 = 0, 2 -> t = 0 ms.
- <4> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
- <5> For p1227 = 300 s, the monitoring function is deactivated.
- <6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
- <7> r046.21 = 0, as long as r046.0 = 1 (OFF1 enable missing or power-on inhibit).
 r046.21 = 1, if p0858 = 1 or p0856 = 0.
 The signal generation is shown simplified.
- <8> The internal signal includes signals that lead to OFF1 or OFF3 (e. g. BICO or fault response).
- <9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.
- <10> Only for SINAMICS S120.

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay). <10>
 Note: With VECTOR with activated "parallel circuit" Function Module (r0108.15 = 1), the holding brake may only be connected to a power unit (p7015).

Background
Refer to [1020.7]

- <1> Shutdown threshold of the standstill detection. In this case (e.g. when using a brake), another criterion than the speed actual value can be selected to clear the pulses. Otherwise, we recommend to keep the factory setting.
- <2> For p1276 = 300.000 s, the timer is de-activated, i.e. the timer output is always 0. Note: When operating a motor with a brake which must not be applied while the motor is rotating, the monitoring time of both timers must be set to 300 s.
- <3> For operation without brake, p1224[0...3] must be 0 (factory setting) in order to avoid undesirable interaction with the sequence control.
- <4> The internal signal comprises signals that lead to OFF1 or OFF3, e.g. BICO or fault response.
- <5> Only for SINAMICS S120.

<1> This pulse enable path only works for operation with brake (p1215 > 0).
 <2> For brakes with one single checkback signal, the inverted signal has to be interconnected to the BICO input for the second checkback. The switching times of the brake are set in p1216 and p1217.
 <3> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
 <4> If an external motor holding brake is used, p1215 should be set to 3 and r1229.1 should be used as control signal.
 <5> The internal signal comprises signals that lead to OFF1 or OFF3, e.g. BICO or fault response.
 <6> If the function module "extended brake control" is active (r0108.14 = 1), r1229.1 should be interconnected as control signal.
 <7> Only for SINAMICS S120 booksize.
 <8> Only for SINAMICS S120 Chassis/S150/G130/G150.
 Note: Braking signal diagnostic evaluation (p1278) is only relevant for SBC (Safe Brake Control) (controls the Safe Brake Relay).

Fig. 2-167 3070 – Extended ramp-function generator

- <1> For p1145 > 0, ramp-function generator tracking is activated when the torque limiting responds. This means that the speed controller output only exceeds the torque limit by a deviation that can be set via p1145.
- <2> For OFF1/OFF3, the ramp-function generator ramp is active. The ramp-function generator is set (SERVO: to the actual value, VECTOR, VECTOR3P, VECTORGL, VECTORMV, VECTORSL: to the setpoint (r1170)) and stops the drive with the ramp-downtime (p1121 or p1135). STW1.4 (enable ramp-function generator) is effective while the drive is stopped via the ramp-function generator. Depending on the p1115, the basic ramp-function generator [3060] or the extended ramp-function generator [3070] is effective.
For SERVO is valid: When the function module "extended setpoint channel" is not active (r108.8 = 0), for OFF1/OFF3 the down ramp of the basic ramp-function generator is effective (refer to n_set_4 on [3060.8]).
- <3> The interpolator is only active with activated "basic positioner" Function Module or with isochronous PROFIdrive mode and sign of life received by the master (STW2.12 ... STW2.15).
- <4> Behavior of the response ramp of the torque limiting:
p1145 = 0.0: No ramp-function generator tracking. The ramp-function generator ramp is no longer in the range of the speed actual value.
p1145 = 1.0: The ramp-function generator ramp remains as close as possible to the speed actual value.
p1145 > 1.0: The ramp-function generator ramp is steeper than for p1145 = 1.0 (higher "speed following error").
- <5> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).
- <6> For SERVO only.
- <7> For VECTOR, VECTOR3P, VECTORMV only.
- <8> For VECTORGL only.
- <101> To view the pre-assignment of the sampling times in p0115, refer to p0112.

Refer to [1020.7] <101>

Fig. 2-170 3090 – Dynamic Servo Control (DSC) linear and DSC Spline (r0108.6 = 1)

- <1> Principle of operation of Dynamic Servo Control (DSC): The feedback branch {2} completely compensates the feedback coupling branch {1} in respect of the position actual value sent from the drive. The fast actual value channel {3} allows for a high dynamic performance and high Kv factors.
- <2> For the motor encoder (p1192 = 1) p1193 = 1 is effective. When using encoder 2 or 3 (p1192 = 2, 3), p1193 corresponds to the "Increments per motor encoder revolution/increments of the encoder selected (2, 3) during one motor rotation" (considering gear ratios and also different encoder lines and fine resolutions).
- <3> The deadtime for the PROFIdrive data transfer is set automatically.
- <4> Sample & Hold element; refer to [1021].
- <5> The position deviation must be referred to the increments of the motor including the fine resolution.
- <6> Normalization of KPC: If signal $\Delta x = 1$ motor revolution and KPC = 1, then "n_set from DSC" = 0.001 motor revolutions/s.
- <7> Clock-synchronous operation must be active for DSC.
- <8> Only for p1400.17 = 1 and at limitation becomes p1407.19 = 1.

Fig. 2-210 5610 – Torque limiting/reduction/interpolator

<1> For p1400.4 = 1, the first torque limit applies for motoring operation and the other for regenerative operation, independently of the sign of the torque and the speed (compatible with SIMODRIVE).
"Normal case": If neither dynamic limits nor offsets are required, the torque limit when motoring is entered via p1520. The torque limit when regenerating is entered via p1521 (as a negative value).

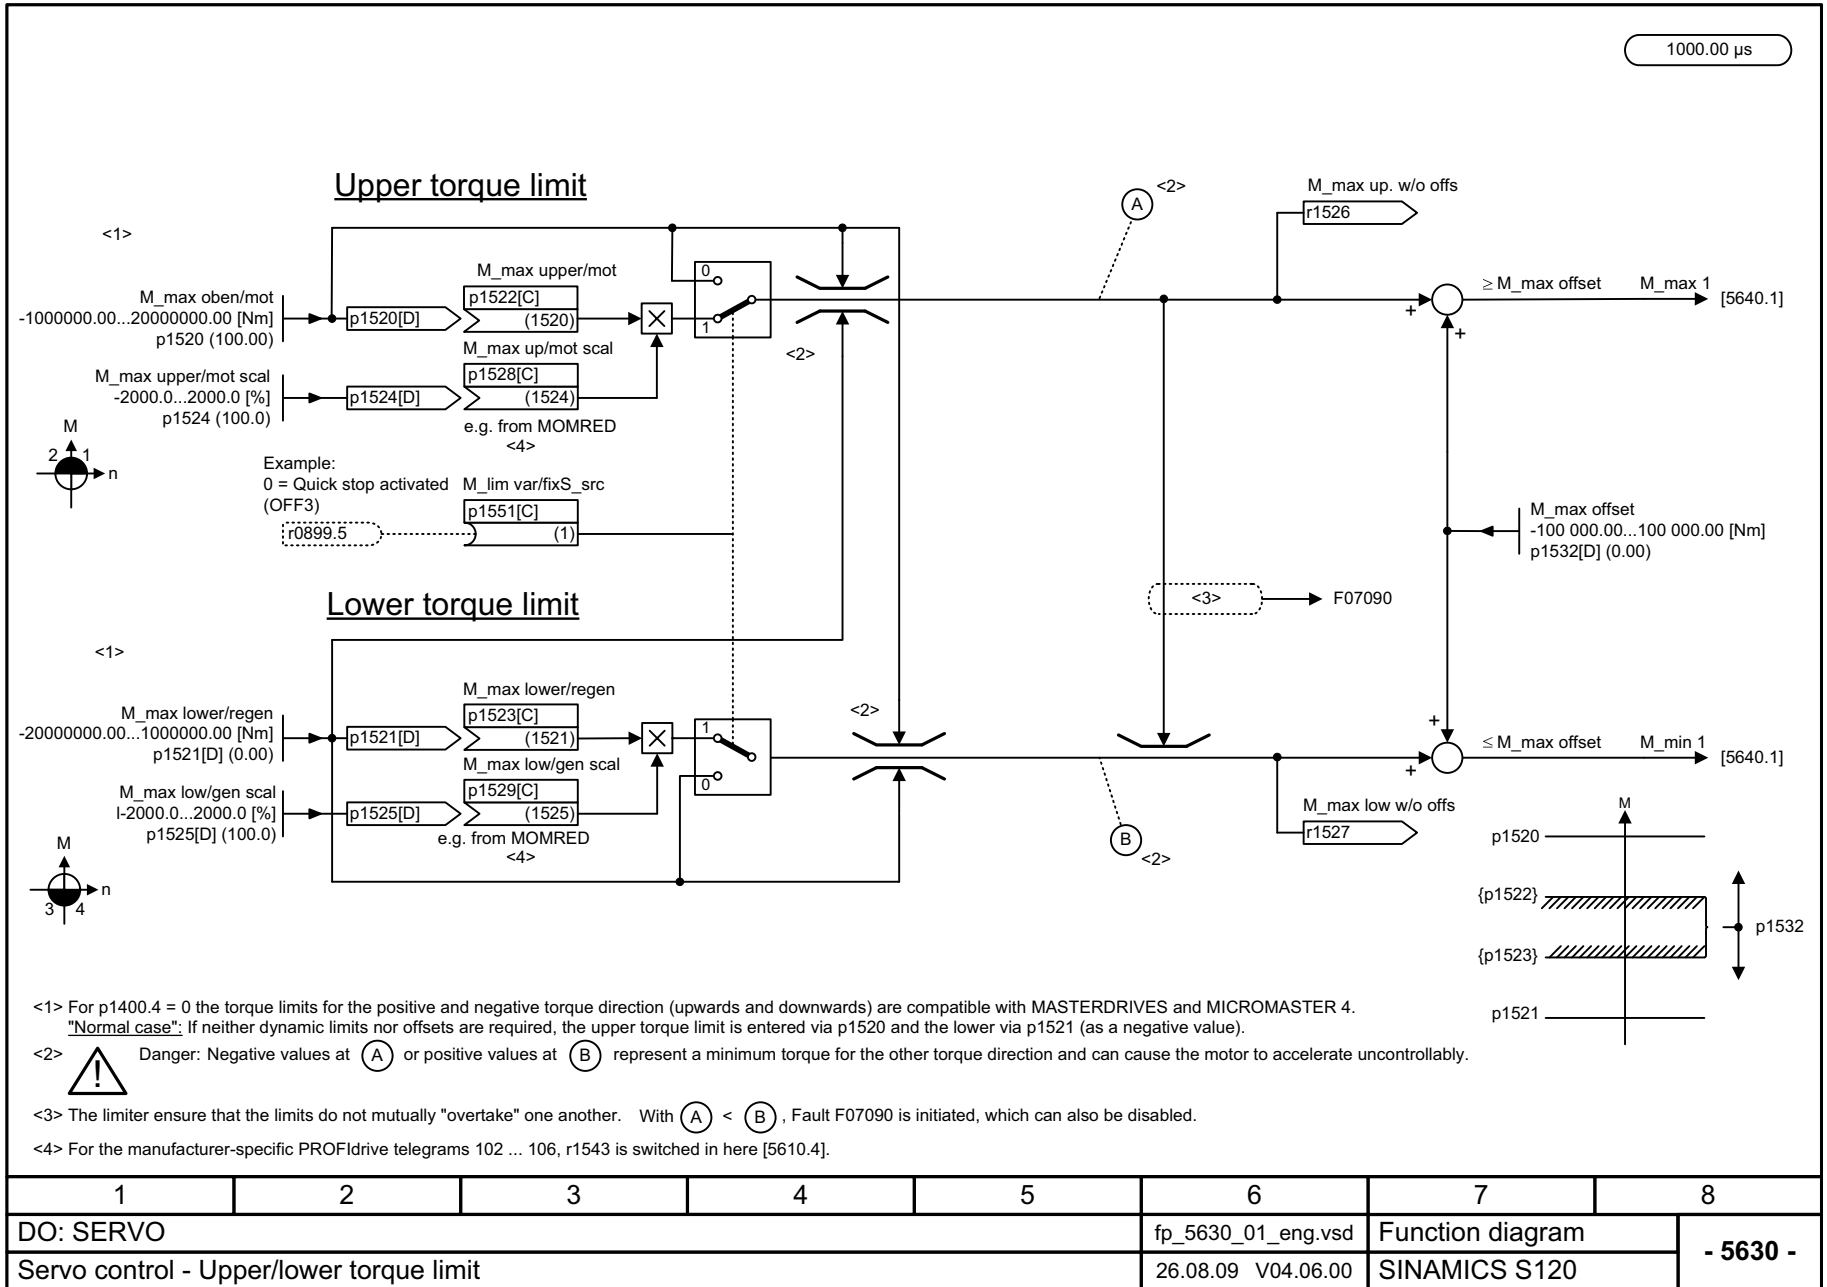

<2> For the manufacturer-specific PROFIdrive telegrams 102 ... 106, r1543 is entered here [5610.4].

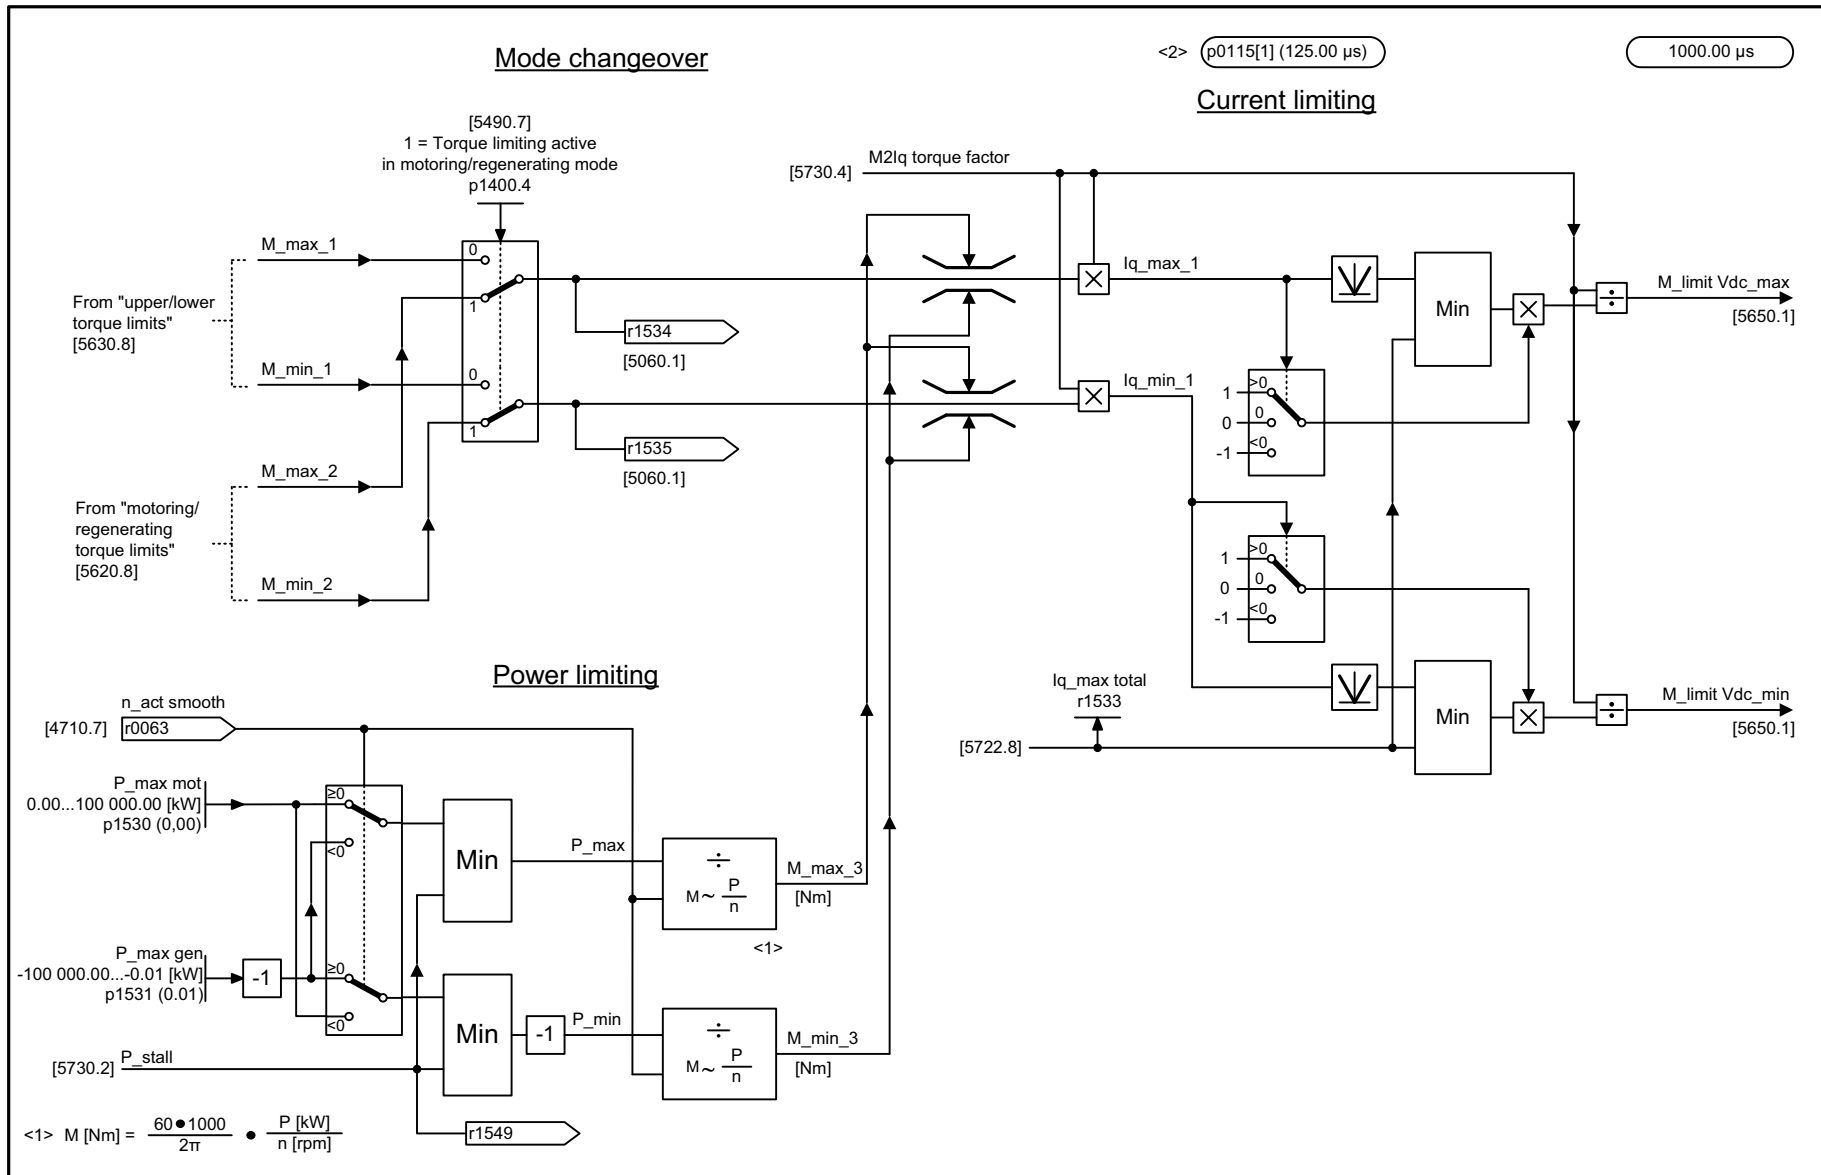

<3> With p1400.13 = 0, the following applies: if n_act < p1546, the motor limit is effective.
With p1400.13 = 1, the following applies: if n_set = 0, the regenerative limit is effective.

<1> For KTY, PT100, PT1000 and PTC, the value p0606 = 0 has a different meaning:
 KTY, PT100, PT1000: 0 ≙ The output of the timer is always switched out (logical 0)
 PTC: 0 ≙ Delay time = 0 s

<2> As for the switch-in delay, refer to [1022]. p0607 = 0 suppresses fault F07016.

<3> For KTY, PT100, PT1000 and "No sensor", temperature as defined in the model.

<4> Applies only for VECTOR.

<5> p0606 does not work for alarms via p0616.

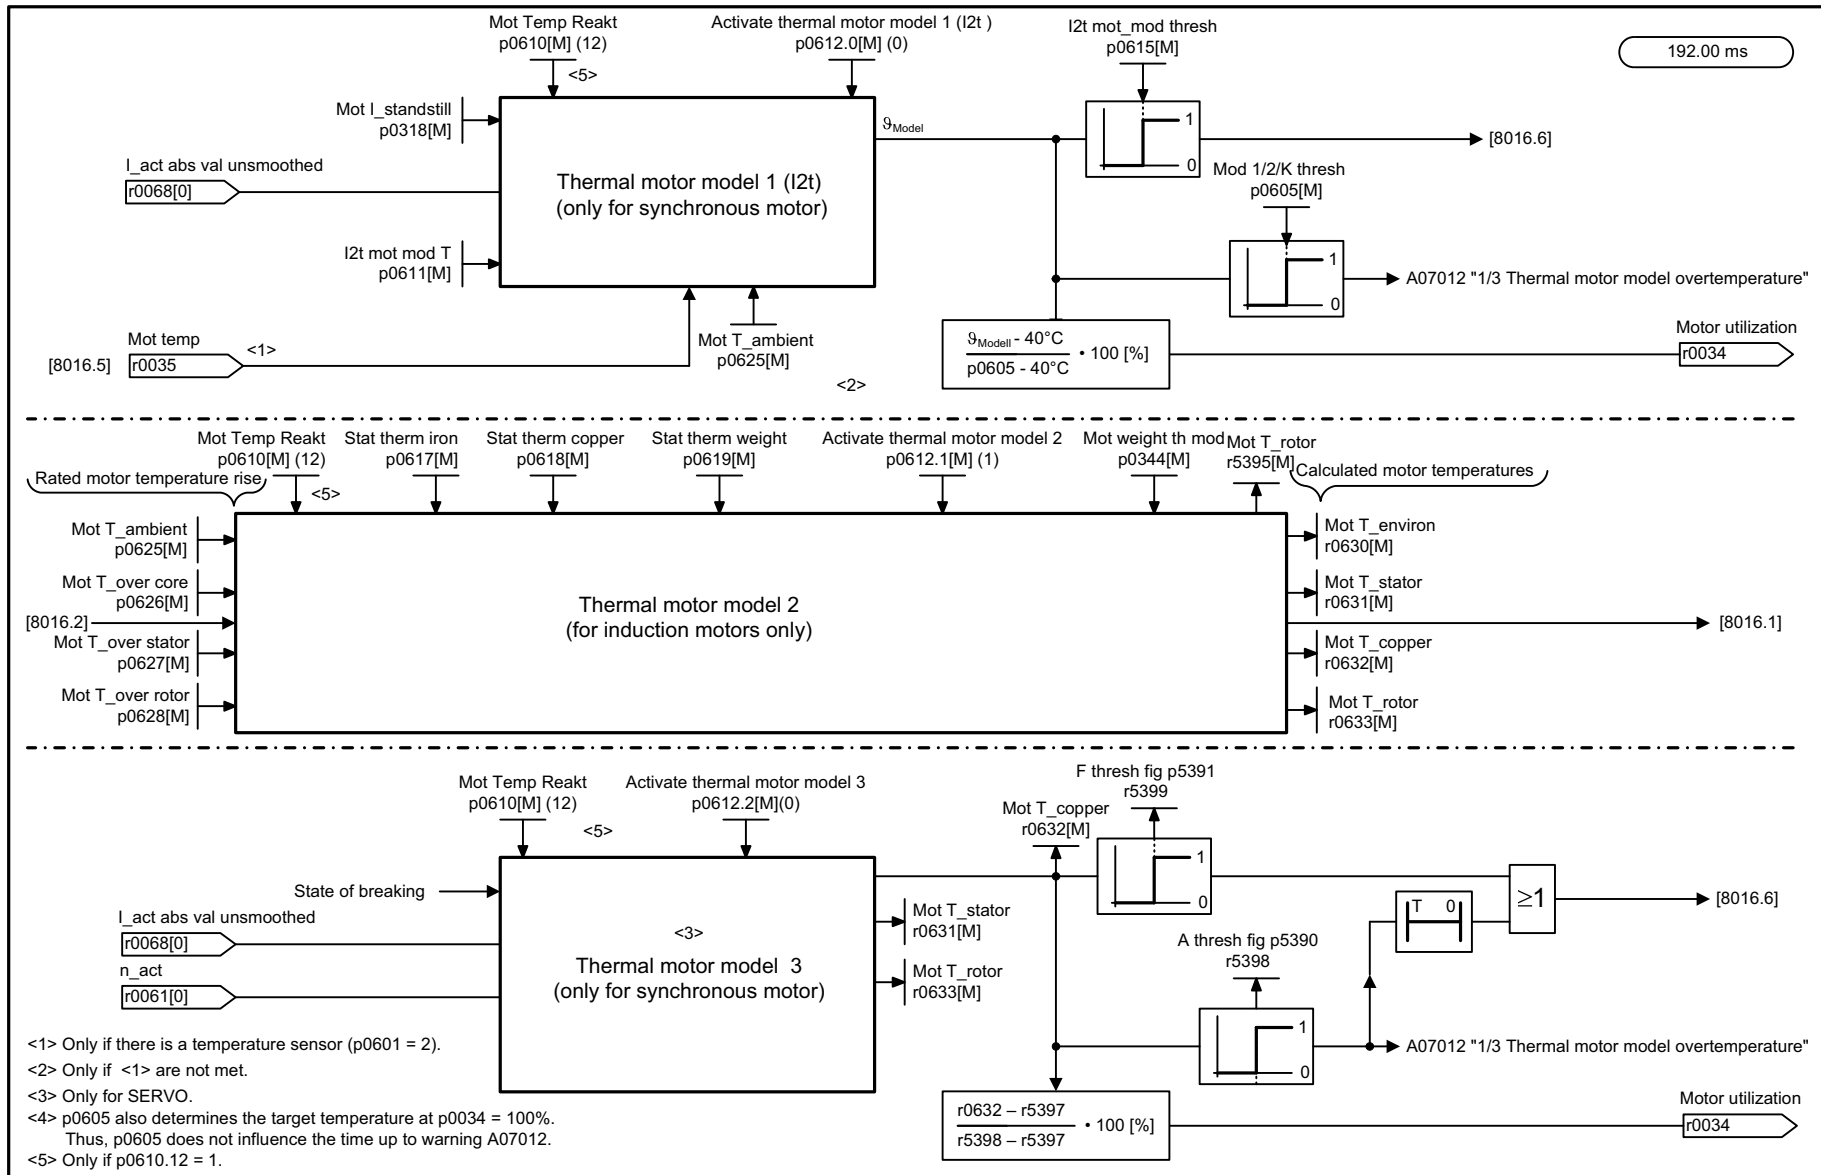

<6> p0601 = 5 can only be evaluated if r0192.15 = 1 and p0600 = 11; PT100 is calibrated via p0624.

<7> The assignment of temperature channels 1 ... 4 depends on the hardware used.

<8> The relevant rated response temperature (°C) depends on the temperature sensor chosen by the motor manufacturer.

Changing the fault response for maximum 20 faults <1>

Changing the message type - fault <==> alarm for maximum 20 faults/alarms <1>

Changing the acknowledge mode for maximum 20 faults <1>

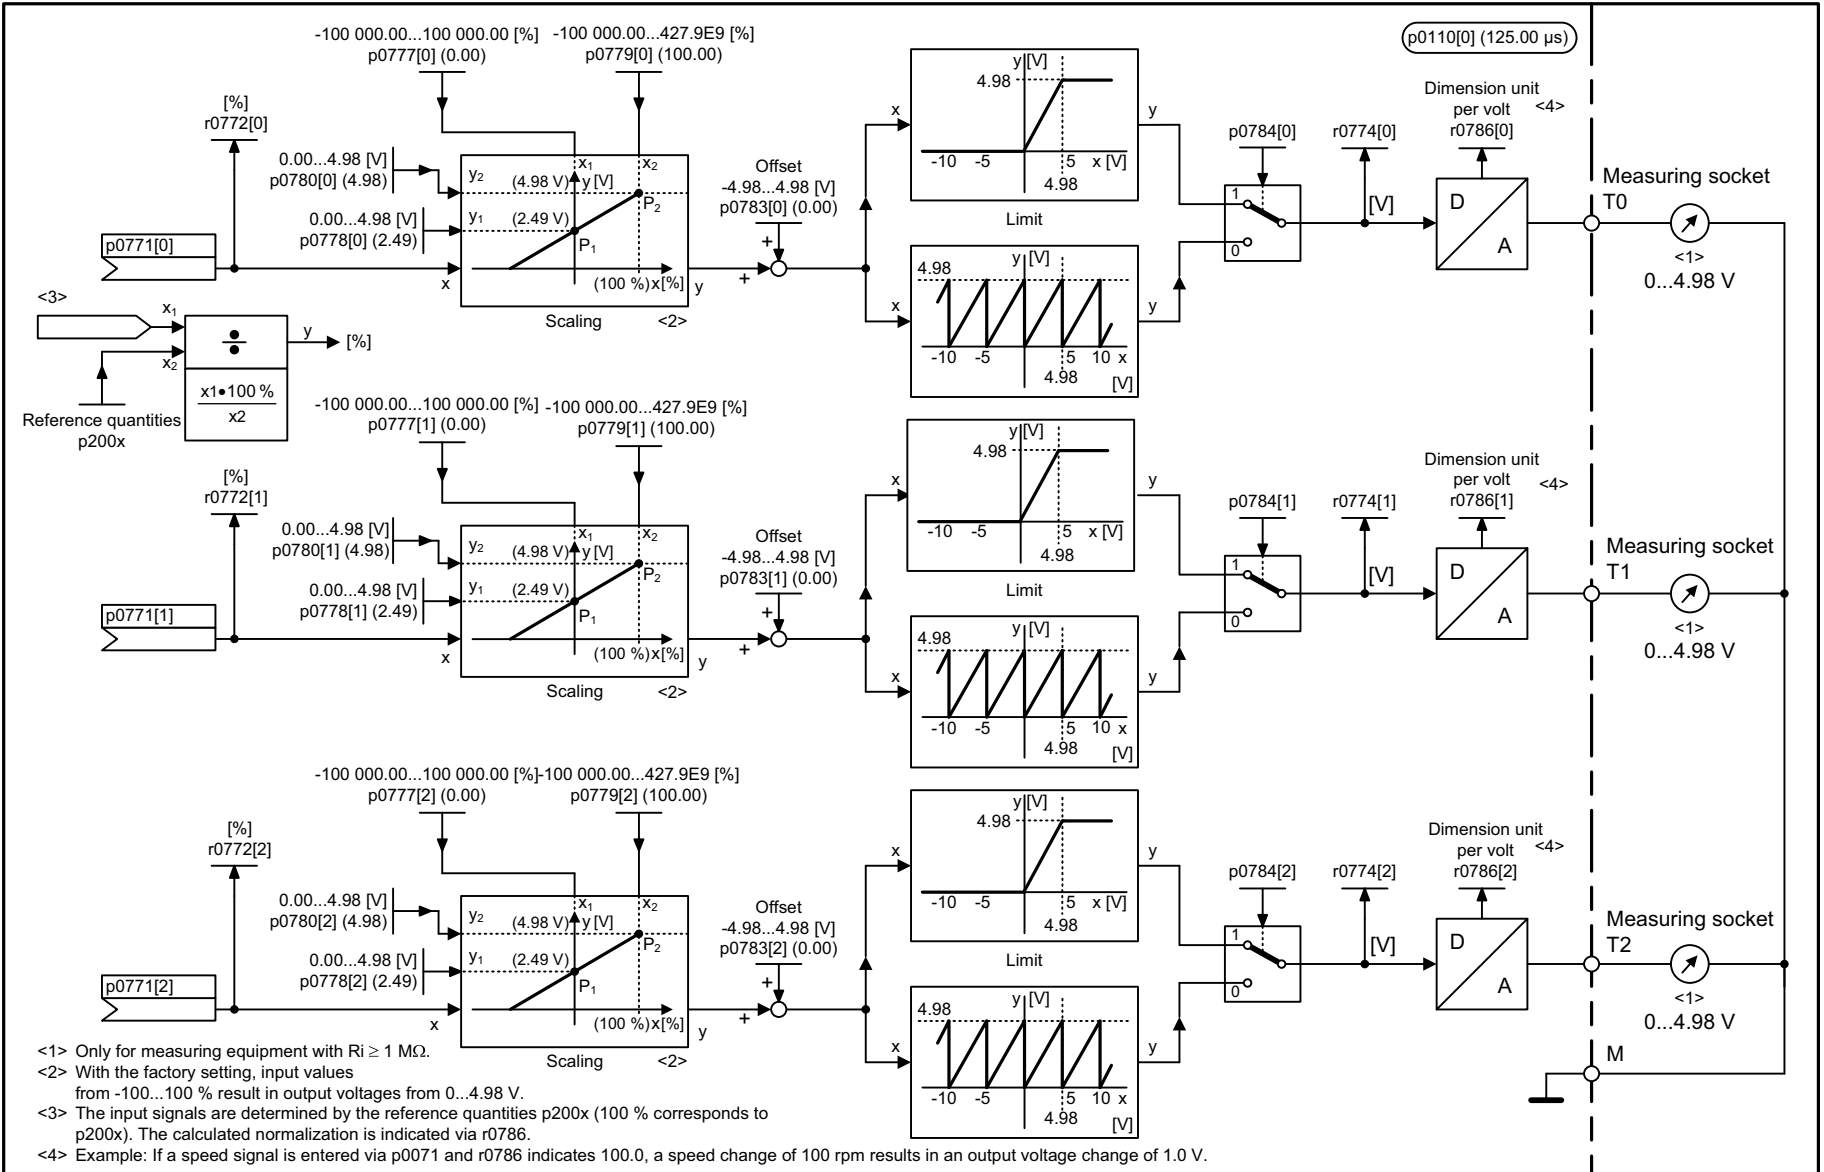

<1> The fault response, acknowledge mode and message type for all faults and alarms are set to meaningful default values in the factory setting. Changes that may be required are only possible in specific value ranges specified by SIEMENS. When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

- <2> With the factory setting, input values from -100...100 % result in output voltages from 0...4.98 V.
- <3> The input signals are determined by the reference quantities $p200x$ (100 % corresponds to $p200x$). The calculated normalization is indicated via $r0786$.
- <4> Example: If a speed signal is entered via $p0071$ and $r0786$ indicates 100.0, a speed change of 100 rpm results in an output voltage change of 1.0 V.

3.1 Overview of faults and alarms

3.1.1 General

Display of faults/alarms (messages)

If a fault occurs, the drive indicates the fault and/or alarm.

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 3-1 Differences between faults and alarms

Type	Description
<p>Faults</p>	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault reaction is initiated. • Status signal ZSW1.3 is set. • The fault is entered in the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
<p>Alarms</p>	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered in the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms are "self acknowledging". They are reset automatically when the cause of the alarm has been eliminated.

Fault reactions

Note:

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 3-2 Fault reactions

List	PROFId- rive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs.</p> <p>Note: When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p>Closed loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the ramp-function generator deceleration ramp (p1121). When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. <p>Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired.</p> <p>Closed loop torque control (p1300 = 23)</p> <ul style="list-style-type: none"> The following applies to closed-loop torque control mode: Reaction as for OFF2 When the system switches to torque control with p1501, the following applies: No separate braking reaction. <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault reaction only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>

Table 3-2 Fault reactions, continued

List	PROFId- rive	Reaction	Description
OFF2	COAST STOP	Internal/external pulse inhibit	<p>Closed-loop speed and torque control</p> <ul style="list-style-type: none"> Instantaneous pulse suppression, the drive "coasts" to a standstill. The motor holding brake (if one is being used) is closed immediately. Switching on inhibited is activated.
OFF3	QUICK STOP	Brake along the OFF3 down ramp followed by pulse inhibit	<p>Closed loop speed control (p1300 = 20, 21)</p> <ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 down ramp (p1135). When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the brake application time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired. Switching on inhibited is activated. <p>Closed loop torque control (p1300 = 23)</p> <ul style="list-style-type: none"> Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.

STOP2	-	n_set = 0	<ul style="list-style-type: none"> n_set = 0 is input immediately to brake the drive along the OFF3 down ramp (p1135). The drive remains in speed control mode.
IASC/ DCBRK	-	-	<ul style="list-style-type: none"> For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed. For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1232, p1233, p1234).
ENCODER	-	Internal/external pulse inhibit (p0491)	<p>The fault reaction ENCODER is applied as a function of the setting in p0491.</p> <p>Factory setting: p0491 = 0 --> Encoder fault causes OFF2</p> <p>Notice: When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.</p>

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Table 3-3 Acknowledgement of faults

Acknowledgment	Description
POWER ON	<p>The fault is acknowledged by a POWER ON process (switch drive unit off and on again).</p> <p>Note: If this action has not eliminated the fault cause, the fault is displayed again immediately after power-up.</p>
IMMEDIATELY	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Acknowledge by setting parameter: p3981 = 0 --> 1</p> <p>2 Acknowledge via binector inputs:</p> <p>p2103 BI: 1. Acknowledge faults p2104 BI: 2. Acknowledge faults p2105 BI: 3. Acknowledge faults</p> <p>3 Acknowledge using PROFIBUS control signal: STW1.7 = 0 --> 1 (edge)</p> <p>4 Acknowledge all faults p2102 BI: Acknowledge all faults</p> <p>All of the faults on all of the drive objects of the drive system can be acknowledged using this binector input.</p> <p>Note:</p> <ul style="list-style-type: none"> • These faults can also be acknowledged by a POWER ON operation. • If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment. • Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged.
PULSE INHIBIT	<p>The fault can only be acknowledged with a pulse inhibit (r0899.11 = 0).</p> <p>The same possibilities are available for acknowledging as described under acknowledge IMMEDIATELY.</p>

3.1.2 Explanation of the list of faults and alarms

The data in the following example has been chosen at random. The information listed below is the maximum amount of information that a description can contain: Some of the information is optional.

The list of faults and alarms (See Section 3.2) is structured as follows:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name
Message value:	Component number: %1, fault cause: %2
Drive object:	List of objects.
Reaction:	NONE
Acknowledgment:	NONE
Cause:	Description of possible causes Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional)
Remedy:	Description of possible remedies
Reaction to F:	A_INFEED: OFF2 (OFF1, NONE) SERVO: NONE (OFF1, OFF2, OFF3) VECTOR: NONE (OFF1, OFF2, OFF3)
Acknowledgment for F:	IMMEDIATELY (POWER ON)
Reaction to N:	NONE
Acknowledgment for N:	NONE

----- **End of example** -----

- Axxxxx Alarm xxxxx**
- Axxxxx (F, N) Alarm xxxxx (message type can be changed to F or N)**
- Fxxxxx Fault xxxxx**
- Fxxxxx (A, N) Fault xxxxx (report type can be changed to A or N)**
- Nxxxxx No message**
- Nxxxxx (A) No message (message type can be changed to A)**
- Cxxxxx Safety message (separate message buffer)**

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm".
- F means "Fault".
- N means "No message" or "Internal message".
- C means "Safety message"

The optional parentheses indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note:

You can change the default properties of a fault or alarm by setting parameters.

Section "Diagnostics"

The list of faults and alarms (see Section 3.2) provides information in relation to the properties of a message that have been set as standard. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value tells you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note:

See Table 3-2

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note:

See Table 3-3

Cause:

Describes the possible causes of the fault/alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

Remedy:

Description of the methods available for eliminating the cause of the active fault/alarm

Alarm

In certain cases, servicing and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

3.1.3 Number ranges of faults and alarms

Note:

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in Section 3.2.

Faults and alarms are organized into the following number ranges:

Table 3-4 Number ranges of faults and alarms

F01000 Internal software error

Message value: Module: %1, line: %2
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An internal software error has occurred.
 Fault value (r0949, interpret hexadecimal):
 Only for internal Siemens troubleshooting.
Remedy:

- evaluate fault buffer (r0945).
- carry out a POWER ON (power off/on) for all components.
- if required, check the data on the non-volatile memory (e.g. memory card).
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

F01001 FloatingPoint exception

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An exception occurred during an operation with the FloatingPoint data type.
 The error may be caused by the basic system or an OA application (e.g., FBLOCKS, DCC).
 Fault value (r0949, interpret hexadecimal):
 Only for internal Siemens troubleshooting.
Note:
 Refer to r9999 for further information about this fault.
 r9999[0]: Fault number.
 r9999[1]: Program counter at the time when the exception occurred.
 r9999[2]: Cause of the FloatingPoint exception.
 Bit 0 = 1: Operation invalid
 Bit 1 = 1: Division by zero
 Bit 2 = 1: Overflow
 Bit 3 = 1: Underflow
 Bit 4 = 1: Inaccurate result
Remedy:

- carry out a POWER ON (power off/on) for all components.
- check configuration and signals of the blocks in FBLOCKS.
- check configuration and signals of DCC charts.
- upgrade firmware to later version.
- contact the Hotline.

F01002 Internal software error

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: An internal software error has occurred.
 Fault value (r0949, interpret hexadecimal):
 Only for internal Siemens troubleshooting.
Remedy:

- carry out a POWER ON (power off/on) for all components.
- upgrade firmware to later version.
- contact the Hotline.

F01003 Acknowledgement delay when accessing the memory

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: A memory area was accessed that does not return a "READY".
 Fault value (r0949, interpret hexadecimal):
 Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (power off/on) for all components.
 - contact the Hotline.

N01004 (F, A) Internal software error

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: An internal software error has occurred.
 Fault value (r0949, hexadecimal):
 Only for internal Siemens troubleshooting.
Remedy: - read out diagnostics parameter (r9999).
 - contact the Hotline.
 See also: r9999 (Software error internal supplementary diagnostics)

F01005 Firmware download for DRIVE-CLiQ component unsuccessful

Message value: Component number: %1, fault cause: %2
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: It was not possible to download the firmware to a DRIVE-CLiQ component.
 Fault value (r0949, interpret hexadecimal):
 yyxxxx hex: yy = component number, xxxx = fault cause
 xxxx = 000B hex = 11 dec:
 DRIVE-CLiQ component has detected a checksum error.
 xxxx = 000F hex = 15 dec:
 The selected DRIVE-CLiQ component did not accept the contents of the firmware file.
 xxxx = 0012 hex = 18 dec:
 Firmware version is too old and is not accepted by the component.
 xxxx = 0013 hex = 19 dec:
 Firmware version is not suitable for the hardware release of the component.
 xxxx = 0065 hex = 101 dec:
 After several communication attempts, no response from the DRIVE-CLiQ component.
 xxxx = 008B hex = 139 dec:
 Initially, a new boot loader is loaded (must be repeated after POWER ON).
 xxxx = 008C hex = 140 dec:
 Firmware file for the DRIVE-CLiQ component not available on the memory card.
 xxxx = 008D hex = 141 dec:
 An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.
 xxxx = 008F hex = 143 dec:
 Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.
 xxxx = 0090 hex = 144 dec:
 When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.

xxxx = 0091 hex = 145 dec:
 Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.
 xxxx = 009C hex = 156 dec:
 Component with the specified component number is not available (p7828).
 xxxx = Additional values:
 Only for internal Siemens troubleshooting.

Remedy:

- check the selected component number (p7828).
- check the DRIVE-CLiQ connection.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download the firmware again. Depending on p7826, the firmware will be automatically downloaded.

A01006 Firmwre update for DRIVE-CLiQ component required

Message value: Component number: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.
 Alarm value (r2124, interpret decimal):
 Component number of the DRIVE-CLiQ component.
Remedy: Firmware update using the commissioning software:
 The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.
 Firmware update via parameter:
 - take the component number from the alarm value and enter into p7828.
 - start the firmware download with p7829 = 1.

A01007 POWER ON for DRIVE-CLiQ component required

Message value: Component number: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: A DRIVE-CLiQ component must be powered up again (POWER ON) (e.g. due to a firmware update).
 Alarm value (r2124, interpret decimal):
 Component number of the DRIVE-CLiQ component.
 Note:
 For a component number = 1, a POWER ON of the Control Unit is required.
Remedy:

- Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again.
- For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.

A01009 (N) CU: Control module overtemperature

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.
Remedy:

- check the air intake for the Control Unit.
- check the Control Unit fan.

Note:
 The alarm automatically disappears after the limit value has been undershot.

Reaction upon N: NONE
 Acknowl. upon N: NONE

F01010 Drive type unknown

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: An unknown drive type was found.
 Fault value (r0949, interpret decimal):
 Drive object number (refer to p0101, p0107).
Remedy: - replace Power Module.
 - carry out a POWER ON (power off/on) for all components.
 - upgrade firmware to later version.
 - contact the Hotline.

F01011 (N) Download interrupted

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The project download was interrupted.
 Fault value (r0949, interpret decimal):
 1: The user prematurely interrupted the project download.
 2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).
 3: The project download was prematurely ended by the commissioning software (e.g. STARTER, SCOUT).
 100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card".
 Note:
 The response to an interrupted download is the state "first commissioning".
Remedy: - check the communication cable.
 - download the project again.
 - boot from previously saved files (power-down/power-up or p0976).
 - when loading into the file system (download from memory card), use the matching version.
 Reaction upon N: NONE
 Acknowl. upon N: NONE

F01012 (N) Project conversion error

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY
Cause: When converting the project of an older firmware version, an error occurred.
 Fault value (r0949, interpret decimal):
 Parameter number of the parameter causing the error.
 For fault value = 600, the following applies:
 The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.
 Notice:
 Monitoring of the motor temperature is no longer ensured.
Remedy: Check the parameter indicated in the fault value and correctly adjust it accordingly.
 For fault value = 600:
 Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface.
 Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.
 Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.
 Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189.
 - If necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly.
 - If necessary, upgrade the firmware to a later version.

A01013 CU: Fan operating time reached or exceeded

Message value: %1
Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The maximum operating time of the fan in the Control Unit has either been reached or exceeded.
 Alarm value (r2124, interpret decimal):
 0: The maximum fan operating time is 500 hours.
 1: The maximum fan operating time has been exceeded (50000 hours).
Remedy: Replace the fan in the Control Unit and reset the operating hours counter to 0 (p3961 = 0).

F01015 Internal software error

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An internal software error has occurred.
 Fault value (r0949, interpret decimal):
 Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (power off/on) for all components.
 - upgrade firmware to later version.
 - contact the Hotline.

A01016 (F) Firmware changed

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.
 Alarm value (r2124, interpret decimal):
 0: Checksum of one file is incorrect.
 1: File missing.
 2: Too many files.
 3: Incorrect firmware version.
 4: Incorrect checksum of the back-up file.
Remedy: For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.
 Note:
 The file involved can be read out using parameter r9925.
 The status of the firmware check is displayed using r9926.

 Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP1, STOP2)
 Vector: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP1, STOP2)
Acknowledge: IMMEDIATELY
Cause: For active PC master control, no sign-of-life was received within the monitoring time.
 The master control was returned to the active BICO interconnection.

Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
 For the commissioning software, the monitoring time is set as follows:
 <Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
Notice:
 The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

Reaction: OFF2
Acknowledge: POWER ON
Cause: A parameter was changed in the drive system which means that it is necessary to save the parameters and re-boot.
Remedy:

- save the parameters (p0971/p0977).
- carry out a POWER ON (power off/on) for all components.
- Then:
- upload the drive unit (commissioning software).

F01040 Save parameter settings and carry out a POWER ON

Message value: -
Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: POWER ON
Cause: A parameter was changed in the drive system which means that it is necessary to save the parameters and re-boot.
 Examples:
 - p1810.2 (wobulation of the pulse frequency) and p1802 (edge modulation)
 - p1750.5 (cl.-loop control mode PESM up to f=0Hz with HF signal injection)
Remedy:

- save the parameters (p0971/p0977).
- carry out a POWER ON for all components (switch-on the Control Unit with or after the power units).

When changing p1750.5 or p1810.2 for edge modulation, a warm restart is sufficient (p0009 = 30, p0976 = 3).
 Then:
 - upload the drive unit (commissioning software).

F01043 Fatal error at project download

Message value: Fault cause: %1

Drive object: All objects

Reaction: Infeed: OFF2 (OFF1)
 Servo: OFF2 (OFF1, OFF3)
 Vector: OFF2 (OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: A fatal error was detected when downloading a project using the commissioning software.

Fault value (r0949, interpret decimal):

- 1: Device status cannot be changed to Device Download (drive object ON?).
 - 2: Incorrect drive object number.
 - 3: A drive object that has already been deleted is deleted again.
 - 4: Deleting of a drive object that has already been registered for generation.
 - 5: Deleting a drive object that does not exist.
 - 6: Generating an undeleted drive object that already existed.
 - 7: Regenerating a drive object already registered for generation.
 - 8: Maximum number of drive objects that can be generated exceeded.
 - 9: Error while generating a device drive object.

 - 11: Error while generating a drive object (global component).
 - 12: Error while generating a drive object (drive component).
 - 13: Unknown drive object type.
 - 14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).
 - 15: Drive status cannot be changed to drive download.
 - 16: Device status cannot be changed to "ready for operation".
 - 17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.
 - 18: A new download is only possible if the factory settings are restored for the drive unit.
 - 19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)
 - 20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A_INF, SERVO or VECTOR).
 - 21: Error when accepting the download parameters.
 - 22: Software-internal download error.
- Additional values: only for internal Siemens troubleshooting.

Remedy:

- use the current version of the commissioning software.
- modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
- change the drive state (is a drive rotating or is there a message/signal?).
- carefully note any other messages/signals and remove their cause.
- boot from previously saved files (power-down/power-up or p0976).

F01044 CU: Descriptive data error

Reaction: NONE
Acknowledge: NONE
Cause: An error was detected when evaluating the parameter files PSxxxxxyy.ACX, PTxxxxyyy.ACX, CAxxxxyyy.ACX, or CCxxxxyyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.
 Alarm value (r2124, interpret hexadecimal):
 Only for internal Siemens troubleshooting.
Remedy:

- Check the parameters displayed in r9406 up to r9408, and correct these if required.
- Restore the factory setting using (p0976 = 1) and re-load the project into the drive unit. Then save the parameterization in STARTER using the "Copy RAM to ROM" function or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.

As long as this fault is present, it is not possible to save the parameters (p0971, p0977). See also: r9976 (System utilization)
Remedy:	Re fault value = 1, 5: - reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %. - check the sampling times and adjust if necessary (p0115, p0799, p4099). - de-activate function modules. - de-activate drive objects. - remove drive objects from the target topology. - note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology. When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies - the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS). - if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001). - if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

Cause:	An internal software error has occurred. Fault value (r0949, interpret hexadecimal): Method ID. Note: Only for internal Siemens troubleshooting.
Remedy:	Contact the Hotline.
A01064 (F)	CU: Internal error (CRC)
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	CRC error in the Control Unit program memory
Remedy:	- carry out a POWER ON (power off/on) for all components. - upgrade firmware to later version. - contact the Hotline.
Reaction upon F:	Infeed: NONE (OFF1, OFF2) Servo: NONE (OFF1, OFF2, OFF3, STOP2) Vector: NONE (OFF1, OFF2, OFF3, STOP2)

F01068	CU: Data memory memory overflow
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The utilization for a data memory area is too large. Fault value (r0949, interpret binary): Bit 0 = 1: High-speed data memory 1 overloaded Bit 1 = 1: High-speed data memory 2 overloaded Bit 2 = 1: High-speed data memory 3 overloaded Bit 3 = 1: High-speed data memory 4 overloaded
Remedy:	- de-activate the function module. - de-activate drive object. - remove the drive object from the target topology.

A01069	Parameter backup and device incompatible
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	The parameter backup on the memory card and the drive unit do not match. The module boots with the factory settings. Example: Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.
Remedy:	- insert a memory card with compatible parameter backup and carry out a POWER ON. - insert a memory card without parameter backup and carry out a POWER ON. - save the parameters (p0977 = 1).
F01070	Project/firmware is being downloaded to the memory card
Message value:	%1
Drive object:	A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	An upgrade (project/firmware download) was initiated on the memory card. While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated. Caution: During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit. If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.
Remedy:	Not necessary. The fault automatically disappears after the upgrade has been completed.
F01072	Memory card restored from the backup copy
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective. After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.
Remedy:	Check that the firmware and parameterization is up-to-date.
A01073	POWER ON required for backup copy on memory card
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	The parameter assignment on the visible partition of the memory card has changed. In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit. Note: It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).
Remedy:	- carry out a POWER ON (power off/on) for the Control Unit. - carry out a hardware reset (RESET button, p0972).

A01099 **Tolerance window of time synchronization exited**

Message value: -

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: The time master exited the selected tolerance window for time synchronization.
See also: p3109 (RTC real time synchronization tolerance window)

Remedy: Select the re-synchronization interval so that the synchronization deviation between the time master and drive system lies within the tolerance window.
See also: r3108 (RTC last synchronization deviation)

A01100 **CU: Memory card withdrawn**

Message value: -

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The memory card (non-volatile memory) was withdrawn during operation.
Notice:
It is not permissible for the memory card to be withdrawn or inserted under voltage.

Remedy: - power down the drive system.
- re-insert the memory card that was withdrawn - this card must match the drive system.
- power up the drive system again.

F01105 (A) **CU: Insufficient memory**

Message value: %1

Drive object: All objects

Reaction: OFF1

Acknowledge: POWER ON

Cause: Too many functions have been configured on this Control Unit (e.g. too many drives, function modules, data sets, OA applications, blocks, etc).
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.

Remedy: - change the configuration on this Control Unit (e.g. fewer drives, function modules, data sets, OA applications, blocks, etc).
- use an additional Control Unit.

Cause: There is not sufficient free memory space available.

Remedy: Not necessary.

F01107 CU: Data save in the non-volatile memory unsuccessful

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: A data save in the non-volatile memory was not able to be successfully carried out.
- non-volatile memory is defective.
- insufficient space in the non-volatile memory.
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: - try to save again.
- replace the memory card or Control Unit.

F01110 CU: More than one SINAMICS G on one Control Unit

Message value: %1

Remedy: Only one SINAMICS G drive type is permitted.

F01111 CU: Mixed operation of drive units illegal

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: Illegal operation of various drive units on one Control Unit:
- SINAMICS S together with SINAMICS G
- SINAMICS S together with SINAMICS S Value or Combi
Fault value (r0949, interpret decimal):
Number of the first drive object with a different power unit type.
Remedy: Only power units of one particular drive type may be operated with one Control Unit.

F01112 CU: Power unit not permissible

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The connected power unit cannot be used together with this Control Unit.
Fault value (r0949, interpret decimal):
1: Power unit is not supported (e.g. PM240).
2: DC/AC power unit connected to CU310 not permissible.
3: Power unit (S120M) not permitted for vector control.
Remedy: Replace the power unit that is not permissible by a component that is permissible.

Actual number: Actual number for this drive object category. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): ddccbbaa hex: aa = drive object category, bb = number limited, cc = actual number, dd = no significance
Remedy:	- power down the unit. - suitably restrict the number of drive objects of the specified category by reducing the number of inserted components. - re-commission the unit.
F01200	CU: Time slice management internal software error
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	A time slice management error has occurred. It is possible that the sampling times have been inadmissibly set. Fault value (r0949, interpret hexadecimal): 998: Too many time slices occupied by OA (e.g. DCC). 999: Too many time slices occupied by the basic system. Too many different sampling times may have been set. Additional values: Only for internal Siemens troubleshooting.
Remedy:	- check the sampling time setting (p0112, p0115, p4099, p9500, p9511). - contact the Hotline.

F01205	CU: Time slice overflow
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	Insufficient processing time is available for the existing topology. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- reduce the number of drives. - increase the sampling times.
F01221	CU: Bas clk cyc too low
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The closed-loop control / monitoring cannot maintain the envisaged clock cycle. The runtime of the closed-loop control/monitoring is too long for the particular clock cycle or the computing time remaining in the system is not sufficient for the closed-loop control/monitoring. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	Increase the basic clock cycle of DRIVE-CLiQ communication. See also: p0112 (Sampling times pre-setting p0115)
F01222	CU: Basic clock cycle too low (computing time for communication not available)
Message value:	%1

Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	A time slice has not been defined that fulfills the requirements. The port cannot be correctly operated as the alternating cyclic clock cycle cannot be maintained. Fault value (r0949, interpret hexadecimal): Method ID. Note: Only for internal Siemens troubleshooting.
Remedy:	Contact the Hotline.
A01223	CU: Sampling time inconsistent
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified. Alarm value (r2124, interpret decimal): 1: Value lower than minimum value. 2: Value higher than maximum value. 3: Value not a multiple of 1.25 µs. 4: Value does not match clock-cycle synchronous PROFIBUS operation. 5: Value not a multiple of 125 µs. 6: Value not a multiple of 250 µs. 7: Value not a multiple of 375 µs. 8: Value not a multiple of 400 µs. 10: Special restriction of the drive object violated. 20: On a SERVO with a sampling time of 62.5 µs, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted).

- 21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account).
- 30: Value less than 31.25 μ s.
- 31: Value less than 62.5 μ s (31.25 μ s is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).
- 32: Value less than 125 μ s.
- 33: Value less than 250 μ s.
- 40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 μ s. Further, none of the nodes has a sampling time of less than 125 μ s.
- 41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 μ s.
- 42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 μ s.
- 43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.
- 44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).
- 45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5 μ s or 187.5 μ s (for a 2 or 3x parallel connection).
- 46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.
- 52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 μ s.
- 54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 μ s.
- 56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 μ s.
- 58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 μ s.
- 99: Inconsistency of cross drive objects detected.
- 116: Recommended clock cycle in r0116[0...1].
- General note:
The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).
The parameters of the sampling times can also be changed with automatic calculations.
Example for highest common denominator: 125 μ s, 125 μ s, 62.5 μ s --> 62.5 μ s
- Remedy:**
- check the DRIVE-CLiQ cables.
 - set a valid sampling time.

A01224	CU: Pulse frequency inconsistent
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	When changing the minimum pulse frequency (p0113) inconsistency between the pulse frequencies was identified. Alarm value (r2124, interpret decimal): 1: Value lower than minimum value. 2: Value higher than maximum value. 3: Resulting sampling time is not a multiple of 1.25 μ s. 4: Value does not match clock-cycle synchronous PROFIBUS operation. 10: Special restriction of the drive object violated. 99: Inconsistency of cross drive objects detected. 116: Recommended clock cycle in r0116[0...1].
Remedy:	Set a valid pulse frequency. See also: p0113 (Minimum pulse frequency, selection)

Remedy:
 - carry out a POWER ON.
 - replace the Control Unit.

A01251 CU: CU-EEPROM incorrect read-write data
Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: Error when reading the read-write data of the EEPROM in the Control Unit.
 Alarm value (r2124, interpret decimal):
 Only for internal Siemens troubleshooting.
Remedy:
 For alarm value r2124 < 256, the following applies:
 - carry out a POWER ON.
 - replace the Control Unit.
 For alarm value r2124 >= 256, the following applies:
 - for the drive object with this alarm, clear the fault memory (p0952 = 0).
 - as an alternative, clear the fault memory of all drive objects (p2147 = 1).
 - replace the Control Unit.

F01255 CU: Option Board EEPROM read-only data error

F01303 DRIVE-CLiQ component does not support the required function

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.
Fault value (r0949, interpret decimal):
1: The component does not support the de-activation.
101: The Motor Module does not support an internal armature short-circuit.
102: The Motor Module does not support the de-activation.
201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.
202: The Sensor Module does not support parking/unparking.
203: The Sensor Module does not support the de-activation.
204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.
205: The Sensor Module does not support the selected temperature evaluation (r0458).
206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.
207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.
208: The Sensor Module does not support de-selection of commutation with zero mark (via p0430.23).
211: The Sensor Module does not support single-track encoders (r0459.10).
212: The Sensor Module does not support LVDT sensors (p4677.0).
213: The Sensor Module does not support the characteristic type (p4662).
Remedy: Upgrade the firmware of the DRIVE-CLiQ component involved.
For fault value = 205:
Check parameter p0600 and p0601 and if required, adapt interpretation.
For fault value = 207:
Replace the power unit or if required set the device supply voltage higher (p0210).
For fault value = 208:
Check parameter p0430.23 and reset if necessary.

A01304 (F) Firmware version of DRIVE-CLiQ component is not up-to-date

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The non-volatile memory has a more recent firmware version than the one in the connected DRIVE-CLiQ component.
Alarm value (r2124, interpret decimal):
Component number of the DRIVE-CLiQ component involved.
Remedy: Update the firmware (p7828, p7829 and commissioning software).
Reaction upon F: NONE

F01305 Topology: Component number missing

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The component number from the topology was not parameterized (p0121 (for power unit, refer to p0107), p0131 (for servo/vector drives, refer to p0107), p0141, p0151, p0161).
Fault value (r0949, interpret decimal):
Data set number.

Note:

The fault also occurs if speed encoders have been configured (p0187 to p0189) but no component numbers exist for them.

In this case, the fault value includes the drive data set number plus 100 * encoder number (e.g. 3xx, if a component number was not entered in p0141 for the third encoder (p0189)).

A01306 Firmware of the DRIVE-CLiQ component being updated

Message value: %1

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: Firmware update is active for at least one DRIVE-CLiQ component.

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

Remedy:

Not necessary.

This alarm automatically disappears after the firmware has been updated.

A01314 Topology: Component must not be present

Message value: Component number: %1, Component class: %2, Connection number: %3

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: For a component, "de-activate and not present" is set but this component is still in the topology.

Alarm value (r2124, interpret hexadecimal):

ddccbaa hex:

aa = component number

bb = component class of the component

cc = connection number

Note:

Component class and connection number are described in F01375.

Remedy:

- remove the corresponding component.

- change the setting "de-activate and not present".

Note:

Under "Topology --> Topology view" the commissioning software where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

A01315 Drive object not ready for operation

Message value: -

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: For the active drive object involved, at least one activated component is missing.

Note:

All other active and operational drive objects can be in the "RUN" state.

Remedy:

The alarm automatically disappears again with the following actions:

- de-activate the drive object involved (p0105 = 0).

- de-activate the components involved (p0125 = 0, p0145 = 0, p0155 = 0, p0165 = 0).

- re-insert the components involved.

A01316 Drive object inactive and again ready for operation

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: If, when inserting a component of the target topology, an inactive, non-operational drive object becomes operational again. The associated parameter of the component is, in this case, set to "activate" (p0125, p0145, p0155, p0165).
Note:
This is the only message that is displayed for a de-activated drive object.
Remedy: The alarm automatically disappears again with the following actions:
- activate the drive object involved (p0105 = 1).
- again withdraw the components involved.
See also: p0105

A01317 (N) De-activated component again present

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: If a component of the target topology for an active drive object is inserted and the associated parameter of the component is set to "de-activate" (p0125, p0145, p0155, p0165).
Note:
This is the only message that is displayed for a de-activated component.
Remedy: The alarm automatically disappears again with the following actions:
- activate the components involved (p0125 = 1, p0145 = 1, p0155 = 1, p0165 = 1).
- again withdraw the components involved.

A01318 BICO: De-activated interconnections present

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: This alarm is used in the following cases:
- If an inactive/non-operational drive object is active again/ready for operation
- If there are items in the list of BI/CI parameters (r9498[0...29], r9499[0...29])
- If the BICO interconnections saved in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) have actually been changed
Remedy: Reset alarm:
- Set p9496 to 1 or 2
or
- de-activate the drive object again.

A01319 Inserted component not initialized

Message value: -
Drive object: A_INF, B_INF, CU_LINK, ENC, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: Initialization is required for at least one inserted component.
This is only possible if the pulses are inhibited for all the drive objects.
Remedy: Activate pulse inhibit for all drive objects.

A01320 Topology: Drive object number does not exist in configuration

F01340	Topology: Too many components on one line
Message value:	Component number or connection number: %1, fault cause: %2

Remedy:	<ul style="list-style-type: none"> - check the DRIVE-CLiQ connection. - Reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines. <p>Re fault value = 1yy - 4yy in addition:</p> <ul style="list-style-type: none"> - increase the sampling times (p0112, p0115, p4099). Fault value (r0949, interpret hexadecimal): yyxx hex: yy = component number, xx = cause. xx = 1: Component at this Control Unit not permissible. xx = 2: Component in combination with another component not permissible. Note: Pulse enable is prevented.
Remedy:	Remove the illegal components and restart the system.
F01355	Topology: Actual topology changed
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The device target topology (p0099) does not correspond to the device actual topology (r0098). The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning software. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: r0098 (Actual device topology), p0099 (Device target topology)
Remedy:	One of the following counter-measures can be selected if no faults have occurred in the topology detection itself: If commissioning is still not completed: - carry out a self-commissioning routine (starting from p0009 = 1). In general: Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107). Generating servo drives: Set p0097 to 1, set p0009 to 0. Generating vector drives: Set p0097 to 2, set p0009 to 0. Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0. In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107). If commissioning has already been completed: - re-establish the original connections and re-connect power to the Control Unit. - restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again. - change the device parameterization to match the connections (this is only possible using the commissioning software).

Notice:

Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning software and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

Cause:	The maximum number of BICO interconnections (signal sinks) when de-activating a drive object was exceeded. When de-activating a drive object, all BICO interconnections (signal sinks) are listed in the following parameters: - r9498[0...29]: List of the BI/CI parameters involved. - r9499[0...29]: List of the associated BO/CO parameters.
Remedy:	The alarm automatically disappears as soon as no BICO interconnection (value = 0) is entered in r9498[29] and r9499[29]. Notice: When re-activating the drive object, all BICO interconnections should be checked and if required, re-established.

F01510	BICO: Signal source is not float type
Message value:	Parameter: %1

Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The requested connector output does not have the correct data type. This interconnection is not established. Fault value (r0949, interpret decimal): Parameter number to which an interconnection should be made (connector output).
Remedy:	Interconnect this connector input with a connector output having a float data type.

F01511 (A)	BICO: Interconnection with different scalings
Message value:	Parameter: %1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. - the BICO output has different normalized units than the BICO input. - message only for interconnections within a drive object.

Example:

The BICO output has, as normalized unit, voltage and the BICO input has current.

This means that the factor $p2002/p2001$ is calculated between the BICO output and the BICO input.

p2002: contains the reference value for current

p2001: contains the reference value for voltage

Fault value (r0949, interpret decimal):

Parameter number of the BICO input (signal sink).

Cause: An attempt was made to determine a conversion factor for a scaling that does not exist.

Remedy: Apply scaling or check the transfer value.

F01513 (N, A) BICO: Interconnection cross DO with different scalings

Message value: Parameter: %1

Drive object: All objects

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.

An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different.

Example 1:

BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor $p2002/p2001$ is calculated between the BICO output and the BICO input.

p2002: contains the reference value for current

p2001: contains the reference value for voltage

Example 2:

BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor $p2001(DO1)/p2001(DO2)$ is calculated between the BICO output and the BICO input.

p2001: contains the reference value for voltage, drive objects 1, 2

Fault value (r0949, interpret decimal):

Parameter number of the BICO input (signal sink).

Remedy: Not necessary.

6072: F parameterization is inconsistent.

6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.

6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

Remedy:

Re fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the EP terminal at the Motor Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).

Re fault value = 1001, 1002:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Re fault value = 1900, 1901, 1902:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Control Unit software.
- replace Control Unit.

Re fault value = 2000, 2001, 2002, 2003, 2004, 2005:

- check the tolerance time SGE changeover and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F_Source_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

List of faults and alarms

- For fault value = 6067:
 - check the setting of the value in the F parameter F_WD_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!
- For fault value = 6068:
 - check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!
- For fault value = 6069:
 - check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!
- For fault value = 6070:
 - check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!
- For fault value = 6071:
 - check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.
- For fault value = 6072:
 - check the settings of the values for the F parameters and, if required, correct.
 The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:
 F_CRC_Length = 2-byte CRC and F_Par_Version = 0
 F_CRC_Length = 3-byte CRC and F_Par_Version = 1
- For fault value = 6165:
 - if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.
 - check the configuration and communication at the PROFIsafe slave.
 - check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- For fault value = 6166:
 - check the configuration and communication at the PROFIsafe slave.
 - check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
 - evaluate diagnostic information in the F host.
 - check PROFIsafe connection.

Remedy:

For enabled SI monitoring integrated in the drive (p9601/p9801 > 0):

- Upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function (p9501 > 0):

- correct the monitoring clock cycle (p9500) and carry out POWER ON.

For fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).

- for motion monitoring functions integrated in the drive (p9601/p9801bit 2 = 1) the actual value sensing clock cycle can be directly parameterized in p9511/p9311.

Re fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.

- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.

- increase the DP clock cycle for operation with a clock-cycle synchronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.

- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500 / p9300).

For fault value = 107:

- Set an actual value sensing clock cycle that matches the current controller clock cycle ($p9511 \geq 4 * p0115[0]$, $8 * p0115[0]$) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.

- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).

- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle ($p0115[0]$).

The following applies to SINAMICS S110:

- set the actual value sensing clock cycle to $p9511 = 250 \mu\text{s}$.

For fault value = 110:

- set the actual value sensing clock cycle in p9511 to 2 ms or higher.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller ($p0115[0]$).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

Re fault value = 200, 201:

- Increase the current controller sampling time ($p0115[0]$).

- If required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- Set the current controller sampling time to a sensible value ($p0115[0]$).

F01660 **SI CU: Safety-related functions not supported**

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The Motor Module (MM) does not support the safety-related functions (e.g. the Motor Module version is not the correct one). Safety Integrated cannot be commissioned.
 Note:
 This fault does not result in a safety stop response.

Remedy: - use a Motor Module that supports the safety-related functions.
 - upgrade the Motor Module software.

F01661 **SI CU: Simulation of the safety inputs active**

Message value: Fault cause: %1 bin

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The simulation of the digital inputs of the Control Unit (p0795) is active.
 It is not permissible that safety inputs are simulated.
 Fault value (r0949, interpret binary):
 The displayed bits indicate which digital inputs must not be simulated.

Remedy: - Deactivate the simulation of the digital inputs of the Control Unit for the safety inputs (p0795).
 - acknowledge fault.

F01663 **SI CU: Copying the SI parameters rejected**

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: One of the following values is saved in p9700 or was entered offline: 87 or 208.
 This is the reason that when booting, an attempt is made to copy SI parameters from the Control Unit to the Motor Module. However, no safety-relevant function has been selected on the Control Unit (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons.
 As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages.
 Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output.
 Note:
 This fault does not result in a safety stop response.
 See also: p9700 (SI Motion copy function)

- Remedy:**
- Set p9700 to 0.
 - Check p9501 and p9601 and if required, correct.
 - Restart the copying function by entering the corresponding value into p9700.
- Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode:
- Call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated").
 - Click on "Change settings".
 - Click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels).
 - save all parameters (p0977 = 1 or "copy RAM to ROM").
 - carry out a POWER ON (power off/on) for all components.

- Message value:** %1
- Drive object:** SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
- Reaction:** OFF2
- Acknowledge:** IMMEDIATELY (POWER ON)
- Cause:** During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled.
- Note:**
This fault does not result in a safety stop response.
See also: p7826 (Firmware update automatic)
- Remedy:** When safety functions are enabled (p9501 <> 0 and/or p9601 <> 0):
1. Activate the "Firmware update automatic" function (p7826 = 1).
 2. Save the parameters (p0977 = 1) and carry out a POWER ON.
- When de-activating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

A01666 (F) SI Motion CU: Steady-state (static) 1 signal at the F-DI for safety-relevant acknowledgement

- Message value:** -
- Drive object:** SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** A logical 1 signal is present at the F-DI configured in p10006 for more than 10 seconds. If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgement (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

Remedy: Set the fail-safe digital input (F-DI) to a logical 0 signal (p10006).

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The parameterization of a Sensor Module used for Safety Integrated is not permissible.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

1: No encoder was parameterized for Safety Integrated.

2: An encoder was parameterized for Safety Integrated that does not have an A/B track (sine/cosine).

3: The encoder data set selected for Safety Integrated is still not valid.

4: A communication error with the encoder has occurred.

5: Number of relevant bits in the encoder coarse position invalid.

6: DRIVE-CLiQ encoder configuration invalid.

7: Non-safety relevant component of the encoder coarse position for the linear DRIVE-CLiQ encoder not valid.

8: Parameterized Safety comparison algorithm not supported.

9: Relationship between the grid division and measuring step for linear DRIVE-CLiQ encoder is not binary.

10: For an encoder used for Safety Integrated, not all of the Drive Data Sets (DDS) are assigned to the same Encoder Data Set (EDS) (p0187 ... p0189).

12: No second encoder is parameterized.

Remedy: Re fault value = 1, 2:

- use and parameterize an encoder that Safety Integrated supports (encoder with track A/B sine-wave, p0404.4 = 1).

For fault value = 3:

- check whether the drive or drive commissioning function is active and if required, exit this (p0009 = p00010 = 0), save the parameters (p0971 = 1) and carry out a POWER ON

For fault value = 4:

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Sensor Module involved and if required, carry out a diagnostics routine for the faults identified.

For fault value = 5:

- p9525 = 0 (not permissible). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 6:

- check p9515.0 (for DRIVE-CLiQ encoders, the following applies: p9515.0 = 1). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 7:

Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	At least one enabled "Safety Cam" (SCA) is parameterized in p9536 or p9537 too close to the tolerance range around the modulo position. The following conditions must be complied with to assign cams to a cam track: - the cam length of cam x = p9536[x]-p9537[x] must be greater or equal to the cam tolerance + the position tolerance (= p9540 + p9542). This also means that for cams on a cam track, the minus position value must be less than the plus position value. - the distance between 2 cams x and y (minus position value[y] - plus position value[x] = p9537[y] - p9536[x]) on a cam track must be greater than or equal to the cam tolerance + position tolerance (= p9540 + p9542). Note: This fault does not result in a safety stop response. Fault value (r0949, interpret decimal): Number of the "Safe Cam" with an illegal position. Message value:	Parameter: %1
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2

Cause:	The axis configuration was changed (e.g. changeover between linear axis and rotary axis). Parameter p0108.13 is internally set to the correct value. Note: This fault does not result in a safety stop response. Fault value (r0949, interpret decimal): Parameter number of parameter that initiated the change. See also: p9502 (SI Motion axis type (Control Unit))
Remedy:	The following should be carried out after the changeover: - exit the safety commissioning mode (p0010). - save all parameters (p0977 = 1 or "copy RAM to ROM"). - carry out a POWER ON.

Once the Control Unit has been switched on, safety message F01680 or F30680 indicates that the checksums in r9398[0] and r9728[0] have changed in the drive. The following must, therefore, be carried out:

- activate safety commissioning mode again.
- complete safety commissioning of the drive.
- exit the safety commissioning mode (p0010).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON.

Cause:	The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions. Isochronous PROFIBUS: The sum of Ti and To is too high for the selected DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To. No isochronous PROFIBUS: The DP clock cycle must be at least 4x the current controller clock cycle. Notice: If this alarm is not observed, then message C01711 or C30711 – with the value 1020 ... 1021 – can sporadically occur.
Remedy:	Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time. Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0): Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. Acknowledge: IMMEDIATELY (POWER ON)

Cause: When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.
 If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.
 The message value that resulted in a STOP F is displayed in r9725.
 If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS:
 1007: communication error with the PLC (sign-of-life)
 1008: communication error with the PLC (CRC)
 The following described message values involve the crosswise data comparison between the Control Unit and Motor Module (safety functions integrated in the drive).
 The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:
 - cycle times not set uniformly (p9500/p9300 and p9511/p9311)
 - differently parameterized axis types (p9502/p9302).
 - excessively fast cycle times (p9500/p9300, p9511/p9311).
 - for message values 3, 44 ... 57, 232 and 1-encoder systems, differently parameterized encoder values (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).
 - incorrect synchronization.
 Message value (r9749, interpret decimal):
 0 to 999: Number of the cross-compared data that resulted in this fault.
 Message values that are not subsequently listed are only for internal Siemens troubleshooting.
 0: Stop request from the other monitoring channel.
 1: Status image of monitoring functions SOS, SLS or SLP (result list 1) (r9710[0], r9710[1]).
 2: Status image of monitoring function SCA or n < nx (result list 2) (r9711[0], r9711[1]).
 3: The position actual value differential (r9713) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349.
 4: Error when synchronizing the crosswise data comparison between the two channels.
 5: Function enable signals (p9501/p9301) Safety monitoring clock cycle too small (p9500/p9300).

- 41: Stop response for SLP1 (p9562[0]/p9362[0])
- 42: Shutdown speed, pulse canc. (p9560/p9360)
- 43: Memory test, stop response (STOP A).
- 44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to fault value 3). This can be ascertained by checking the safe actual positions.

- 44: Position actual value (r9713) + limit value for SLS1 (p9531[0]/p9331[0]) * Safety monitoring clock cycle
- 45: Position actual value (r9713) - limit value for SLS1 (p9531[0]/p9331[0]) * Safety monitoring clock cycle
- 46: Position actual value (r9713) + limit value for SLS2 (p9531[1]/p9331[1]) * Safety monitoring clock cycle
- 47: Position actual value (r9713) - limit value for SLS2 (p9531[1]/p9331[1]) * Safety monitoring clock cycle
- 48: Position actual value (r9713) + limit value for SLS3 (p9531[2]/p9331[2]) * Safety monitoring clock cycle
- 49: Position actual value (r9713) - limit value for SLS3 (p9531[2]/p9331[2]) * Safety monitoring clock cycle

- 256: Status image of monitoring functions SOS, SLS, SLP, test stop, SBR, SDI (result list 1 ext) (r9710).
- 257: Safety functions for motion monitoring functions without selection (p9512/p9312) different.
- 258: Fault tolerance, actual value sensing encoderless (p9585/p9385).
- 259: Scaling factor for safe position via PROFIsafe (p9574/p9374) or PROFIsafe telegram (p9611/p9811) different.
- 260: Modulo value including scaling (p9505/p9305 and p9574/p9374) for SP with 16 bit.
- 261: Scaling factor for acceleration for SBR different.
- 262: Scaling factor for the inverse value of the acceleration for SBR different.
- 263: Stop response for SLP2 (p9562[1]/p9362[1])
- 264: Position tolerance including scaling (p9542/p9342 and p9574/p9374) for SP with 16 bit.
- 265: Status image of all change functions (results list 1) (r9710).
- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:
User agreement after the timer has expired different.
The user agreement is not consistent. After a time of 2 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003:
Reference tolerance exceeded.
When the user agreement is set, the difference between the new reference point that has been determined after power up (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.
- 1004:
Plausibility error for user agreement.
 1. If the user agreement has already been set, then setting is initiated again. In this case, the user agreement is withdrawn.
 2. The user agreement was set, although the axis has still not been referenced.
- 1005:
 - For safe motion monitoring functions without encoder: pulses already suppressed for test stop selection.
 - For safe motion monitoring functions with encoder: STO already active for test stop selection.
- 1011: Acceptance test status between the monitoring channels differ.
- 1012: Plausibility violation of the actual value from the encoder.
- 1020: Cyc. communication failure between the monit. cycles.

- 1042: Current/voltage plausibility error
- 1043: Too many acceleration phases
- 1044: Actual current values plausibility error.

5000 ... 5140:

PROFIsafe message values.

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions.

5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140: An internal software error has occurred (only for internal Siemens troubleshooting).

5012: Error when initializing the PROFIsafe driver.

5013: The result of the initialization is different for the two controllers.

5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

5025: The result of the F parameterization is different for the two controllers.

5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.

5065: A communications error was identified when receiving the PROFIsafe telegram.

5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety fault F01611.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

Remedy:

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

Re message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

Re message value = 3:

Commissioning phase:

- Encoder evaluation for own or second channel has been set incorrectly --> Correct the encoder evaluation.

In operation:

- Check the mechanical design and the encoder signals.

Re message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with fault value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

Re message value = 11...14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

Re message value = 232:

- Increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

Re message value = 1 ... 999:

- if the message value is listed under cause: Check the crosswise-compared parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Re message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

Re message value = 1001:

- carry out a POWER ON (power off/on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

Re message value = 1002:

- Perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 2 s).

Re message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- Increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

Re message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

Re message value = 1005:

- For safe motion monitoring functions without encoder: check the conditions for pulse enable.

- For safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a power module, the test stop should always be performed for pulse enable (independent of whether with encoder or without encoder).

Re message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

Re message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

Re message value = 1011:

- for diagnostics, refer to parameter (r9571).

Re message value = 1012:

- upgrade the Sensor Module software.

- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).

- For a 2-encoder system (p9526 = p9326 = 2) the following applies: in order to correctly copy the encoder parameters from p04xx[1], p9700 must be set to 46 and p9701 must be set to 172.

- For DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

- check the electrical cabinet design and cable routing for EMC compliance

Re message value = 1020, 1021, 1024:

- check the communication link.

- increase the monitoring cycle clock settings (p9500, p9511).

- carry out a POWER ON (power off/on) for all components.

- replace the hardware.

Re message value = 1033:

- If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

Re message value = 1039:

- Check the conversion factors such as spindle pitch or gearbox ratios.

Re message value = 1041:

- Check whether the motor has sufficient current (>r9785[0]).

- reduce the minimum current (p9588).

- for synchronous motors increase the absolute value of p9783.

- Check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

Re message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).

- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).

- reduce the dynamic response of the setpoint value.

- Check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.

- increase the minimum current (p9588/p9388).

Re message value = 1043:

- increase the voltage tolerance (p9589).

- increase the ramp-function generator ramp-up/down time (p1120/p1121).

- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).

- reduce the dynamic response of the setpoint value.

Re message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact the Hotline.
- replace the Control Unit.

Re message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

Re message value = 5013, 5025:

- carry out a POWER ON (power off/on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

Re message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F_SIL, F_CRC_Length, F_Par_Version, F_Source_Add, F_Dest_add, F_WD_Time).

Re message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

Re message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

Re message value = 5066:

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

Re message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

Re message value = 7000:

- Increase the position tolerance (p9542/p9342).
- Determine the actual position of CU (r9713[0]) and the second channel r9713[1], and check the difference for plausibility.
- Reduce the difference of the actual position from CU (r9713[0]) and the second channel r9713[1] for a 2-encoder system.

Re message value = 7001:

- Increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- If required, reduce the traversing range.

Re message value = 7002:

- carry out a POWER ON (power off/on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

C01745 SI Motion CU: Checking braking torque for the brake test

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: POWER ON (IMMEDIATELY)

Cause: The scaling of the brake torque for the brake test can be changed using parameter p2003.
 An acceptance test must be carried out again for the braking test. This determines whether the braking test is still carried out with the correct braking torque.

Remedy:

- carry out a POWER ON (power off/on) for all components.
- repeat the acceptance test for the safe brake test if the brake test is used.

C01770	SI Motion CU: Discrepancy error of the fail-safe inputs/outputs
Message value:	%1
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The fail-safe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002 / p10102. Fault value (r0949, interpret bitwise binary): yyyyxxxx bin xxxx: Discrepancy error for fail-safe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for fail-safe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.
Remedy:	- check the wiring of the F-DI (contact problems). Note: This message can be acknowledged via F-DI or PROFIsafe. Discrepancy errors of an F-DI can only be completely acknowledged if safe acknowledgement was carried out once the cause of the error was resolved (p10006 or acknowledgment via PROFIsafe). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked: - $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10002 \geq p9500$ (discrepancy time must be no less than p9500) - $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply) td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9500). tp = period for a switching operation in ms. When debounce p10017 is active, the discrepancy time is directly specified by the debounce time. If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked. - $p10002 < p10017 + 1 \text{ ms} - td$ - $p10002 > td$ - $p10002 \geq p9500$

Example:

For a 12 ms SI monitoring cycle and a switching frequency of 110 ms ($p10017 = 0$), the maximum discrepancy time which can be set is as follows:

$p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$

Rounded-off, $p10002 \leq 36 \text{ ms}$ is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).

Example:

Fault F01773 (CU) is signaled with fault value = 0001_0127 and fault F30773 (MM) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the MM indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on the other channel (CU).

Remedy:

Check the wiring of the F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

In the event of multiple test stop faults, the first one that occurred is shown.

Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

SI Motion CU: Test stop necessary

Message value:

-

Drive object:

SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

NONE

Acknowledge:

NONE

Cause:

- after powering up the drive, a test stop has still not been carried out.

- a new test stop is required after commissioning.

- the time to carry out the forced checking procedure (test stop) has expired (p10003).

Note:

- The test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

Remedy:

Initiate test stop (BI: p10007).

Cause: The safe brake test was canceled as a result of a fault.
 Alarm value (r2124, interpret binary):
 Bit 17 = 1: fault in the brake test sequence (cause, see bits 0 ... 10).
 Bit 18 = 1: the internal brake is closed. It must be open when the external brake is tested (p10202).
 Bit 19 = 1: the external brake is closed. It must be open when the internal brake is tested (p10202).
 Bit 20 = 1: not all brakes are open (p10202).
 Bit 21 = 1: axis position during the brake test not valid due to parking axis.
 Bit 22 = 1: internal software error.
 Bit 23 = 1: the permissible position range of the axis was violated with the brake closed (p10212/ p10222).
 Bit 24 = 1: the tested internal brake was opened while the brake test was active.
 Bit 25 = 1: the tested external brake was opened while the brake test was active.
 Bit 26 = 1: during the active brake test, the test torque left its tolerance bandwidth (20 %).
 Cause for alarm value bit 17:
 Bit 0 = 1: operation when selecting the brake test not enabled (r0899.2 = 0).
 Bit 1 = 1: external fault occurred (e.g. the brake test that has already started is canceled by the user).
 Bit 2 = 1: when selecting the brake test a brake is closed.
 Bit 3 = 1: when determining the load torque a brake is closed.
 Bit 4 = 1: a fault with a stop response has occurred (e.g.. OFF1, OFF2 or OFF3).
 Bit 5 = 1: when selecting the brake test the axis speed setpoint is too high.
 Bit 6 = 1: the actual speed (r0063) of the axis is too high (e.g. brake does not hold during the brake test).
 Bit 7 = 1: incorrect speed controller mode (e.g. encoderless speed control or U/f operation).
 Bit 8 = 1: closed-loop control not enabled or function generator active.
 Bit 9 = 1: control does not switch over to the brake test (e.g. because PI speed control has not been parameterized).
 Bit 10 = 1: torque limit reached (r1407.7, r1408.8).
Note:

Alarm value (r2124, interpret decimal): 1: Wait for communication to be established to SINUMERIK. 2: Wait for communication to be established to TM54F. 3: Wait for communication to be established to PROFIsafe F-Host.
Remedy:	If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate: For communication with SINUMERIK, the following applies: - check any other PROFIBUS messages/signals present and remove their cause. - check that assignment of the axes on the higher-level control to the drives in the drive unit is correct. - check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it. For communication with TM54F, the following applies: - check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause. - check the setting of p10010. All the drive objects controlled by the TM54F must be listed. For communication with PROFIsafe F-Host, the following applies: - Check any other PROFIsafe communication messages/signals present and evaluate them. - check the operating state of the F-Host. - Check the communication connection to the F Host. - Check the communication connection to the Motor Module. It must be ensured that when the Control Unit powers up, the Motor Module is connected and at the latest is also switched-on with the Control Unit. Otherwise, if the Motor Module is subsequently inserted or switched-on, a POWER ON must be performed at the Control Unit.  Vector: NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP1, STOP2)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: A DRIVE-CLiQ connection fault has occurred.
 Fault value (r0949, interpret decimal):
 100 ... 107:
 Communication via DRIVE-CLiQ socket X100 ... X107 has not been switched to cyclic operation. The cause may be an incorrect structure or a configuration that results in an impossible bus timing.
 10:
 Loss of the DRIVE-CLiQ connection. The cause may be, for example, that the DRIVE-CLiQ cable was withdrawn from the Control Unit or as a result of a short-circuit for motors with DRIVE-CLiQ. This fault can only be acknowledged in cyclic communication.
 11:
 Repeated faults when detecting the connection. This fault can only be acknowledged in cyclic communication.
 12:
 A connection was detected but the node ID exchange mechanism does not function. The reason is probably that the component is defective. This fault can only be acknowledged in cyclic communication.

Remedy:

Re fault value = 100 ... 107:

- ensure that the DRIVE-CLiQ components have the same firmware versions.
- avoid longer topologies for short current controller clock cycles.

For fault value = 10:

- check the DRIVE-CLiQ cables at the Control Unit.
- remove any short-circuit for motors with DRIVE-CLiQ.
- carry out a POWER ON.

For fault value = 11:

- check the electrical cabinet design and cable routing for EMC compliance

For fault value = 12:

- replace the component involved.

Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	Synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle was started and was not able to be successfully completed (e.g. after switch-on). Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	1. Remove the cause of a possible DRIVE-CLiQ fault. 2. Initiate a new synchronization, e.g. as follows: - remove the PROFIBUS master and re-insert again. - restart the PROFIBUS master. - switch-off the Control Unit and switch-on again. - carry out a Control Unit hardware reset (RESET button, p0972). - carry out a parameter reset and download the saved parameters (p0009 = 30, p0976 = 2, 3).
A01955	CU DRIVE-CLiQ: Synchronization DO not completed

A02041 Function generator: Illegal value for bandwidth

Message value: -

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high. Depending on the time slice clock cycle, the bandwidth is defined as follows:
 $\text{Bandwidth_max} = 1 / (2 \times \text{time slice clock cycle})$
 $\text{Bandwidth_min} = \text{Bandwidth_max} / 100000$
 Example:
 Assumption: p4830 = 125 μs
 --> $\text{Bandwidth_max} = 1 / (2 \times 125 \mu\text{s}) = 4000 \text{ Hz}$
 --> $\text{Bandwidth_min} = 4000 \text{ Hz} / 100000 = 0.04 \text{ Hz}$
 Note:
 p4823: Function generator bandwidth
 p4830: Function generator time slice clock cycle
 See also: p4823 (Function generator bandwidth), p4830 (Function generator time slice cycle)

Remedy: Check the value for the bandwidth and adapt accordingly.
 Note:

Remedy: Restart trace.

A02097 MTrace: multiple trace cannot be activated

Message value: -
Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The following functions or settings are not permissible in conjunction with a multiple trace:
- measuring function.
- long-time trace
- trigger condition "immediate recording start" (IMMEDIATE)
- trigger condition "start with function generator" (FG_START).
Remedy:
- Deactivate multiple trace.
- Deactivate function or setting that is not permissible.

A02098 MTrace: cannot be saved

Message value: %1
Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: It is not possible to save the measurement results of a multiple trace on the memory card. A multiple trace is not started or is canceled.
Alarm value (r2124, interpret decimal):
1: memory card cannot be accessed (not inserted or blocked by a mounted USB drive).
3: data save operation too slow. A second trace has been completed before the measurement results of the first trace were able to be saved.
4: data save operation canceled (e.g. a file required for the save operation was no longer able to be found).
See also: p4840 (MTrace cycle number setting)
Remedy:
- insert or remove the memory card.
- use a larger memory card.
- configure the trace with a longer trace time or use an endless trace.
- avoid saving parameters while the multiple trace is running. Saving parameters can block writing measurement result files to the card, so that this alarm is output with alarm value 3
- check whether other functions are presently accessing measurement result files of the multiple trace.

A02099 Trace: Insufficient Control Unit memory

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The memory space still available on the Control Unit is no longer sufficient for the trace function.
Remedy: Reduce the memory required, e.g. as follows:
- reduce the trace time.
- increase the trace clock cycle.
- reduce the number of signals to be traced.
See also: r4708 (Trace memory space required), r4799 (Trace memory location free)

A02100 Drive: Computing dead time current controller too short

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The value in p0118 produces a dead time of one clock cycle because it is prior to setpoint availability.
 Possible causes:
 - A parameter backup with a version higher than 4.3 was loaded to a version less than or equal to 4.3.
 - The system properties after replacing a component no longer match the parameter assignment.
 Alarm value (r2134, floating point):
 Minimum value for p0118 where dead time no longer occurs.
Remedy:
 - set p0118 to zero.
 - set p0118 to a value greater than or equal to the alarm value (for p1810.11 = 1)
 - set p0117 (from the device) to an automatic setting (p0117 = 1).
 - check the firmware versions of the components involved.

Reaction: OFF1 (NONE, OFF2)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The wire-break monitoring for an analog input has responded.
 The input current of the analog input has exceeded the threshold value parameterized in p0761[0].
 p0756[0]: analog input 0 (X131.7/X131.8)
 Fault value (r0949, interpret decimal):
 Note:
 For the following analog input type, the wire breakage monitoring is active:
 p0756[0] = 3 (4 ... 20 mA with monitoring)

Remedy: - Check the wiring to the signal source for interruptions.
 - Check the magnitude of the injected current - it is possible that the infed signal is too low.
 - Check the load resistor (250 Ohm).
 Note:
 The input current measured by the analog input can be read in r0752[0].
 For p756[0] = 3 (unipolar current input monitored (+4 ... +20 mA)) the following applies:
 A current less than 4 mA is not displayed in r752[0] - but instead r752[0] = 4 mA is output.

F06000	Infeed: Precharging monitoring time expired
Message value:	-
Drive object:	A_INF, B_INF, S_INF
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	After the line contactor closes the power unit does not signal the READY state within the monitoring time (p0857). The end of the DC link pre-charging was not able to be completed for one of the following reasons: 1) There is no line supply voltage connected. 2) The line contactor/line side switch has not been closed. 3) The line supply voltage is too low. 4) Line supply voltage incorrectly set (p0210). 5) The pre-charging resistors are overheated as there were too many pre-charging operations per time unit. 6) The pre-charging resistors are overheated as the DC link capacitance is too high. 7) The pre-charging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link. 8) The pre-charging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module. 9) The DC link has either a ground fault or a short-circuit. 10) The pre-charging circuit is possibly defective (only for chassis units). See also: p0210 (Drive unit line supply voltage), p0857 (Power unit monitoring time)
Remedy:	In general: - check the line supply voltage at the connecting terminals. - check the line supply voltage setting (p0210). - check the monitoring time and, if required, increase (p0857). - where relevant, observe additional power unit messages/signals (e.g. F30027). - the following applies to booksize units: Wait (approx. 8 min.) until the pre-charging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply. Re 5): - carefully observe the permissible pre-charging frequency (refer to the appropriate Equipment Manual). Re 6): - check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC-link capacitance if necessary (refer to the appropriate Equipment Manual)

Re 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

Re 8):

- check the connections of the external line contactor. The line contactor must be open during DC-link fast discharge.

Re 9):

- check the DC link for ground faults or short circuits.

F06010 Infeed: Power unit EP 24 V missing in operation

Message value: -

Drive object: A_INF, B_INF, S_INF

Reaction: OFF2 (OFF1)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: In operation, the pulse enable via terminal EP at the Line Module (X21.3, X21.4) was withdrawn.

Note:

EP: Enable Pulses

Remedy:

- do not open the line side switch in operation - only when the pulses are inhibited.

- check the wiring of terminal EP (X21.3, X21.4) at the Line Module to exclude any poor contacts.

F06050 Infeed: Smart Mode not supported

Message value: -

Drive object: A_INF, S_INF

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The power unit does not support the Smart Mode.

Remedy:

- set the suitable sampling time $250 \mu\text{s} \leq p0115[0] \leq 400 \mu\text{s}$ (e.g. by setting p0112 and p0115 to the factory setting).

- upgrade the power unit software and/or hardware for the Smart Mode. The availability of the Smart Mode function is displayed in r0192.

- for A_INF the following applies: De-activate the Smart Mode with p3400.0 = 0 and activate the voltage control with p3400.3 = 1. For booksize power units, it must be noted that for a supply voltage $p0210 > 415 \text{ V}$ only the Smart Mode is possible in the pre-setting. If DC link voltages above 660 V are permissible in the application, then voltage-controlled operation can be activated with p0280, p0210, p3400 and p3510. The information regarding p0210 should be carefully noted.

F06200 Infeed: One or several line phases failed

Message value: -
Drive object: A_INF, S_INF
Reaction: OFF2 (OFF1)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: Failure overvoltage in one or several line supply phases.
The fault can be output in two operating states:
1. During the power-on phase of the infeed unit.
The measured line supply angle deviates from the regular characteristic for a 3-phase system - the PLL cannot be synchronized.
The fault occurs immediately after power-up if, when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.
2. While the infeed is operational.
After a voltage dip has been detected or an overvoltage (note A06205) in one or several line phases a fault occurred within 100 ms (also refer to other relevant messages). Generally, before fault message F06200 is output, Alarm A06205 occurs at least once, whose warning value can provide information regarding the cause of the line supply fault.
Possible causes:

- voltage dip on the line side or phase failure or overvoltage lasting longer than 10 ms.
- overload condition on the load side with peak current.
- line reactor missing.

Remedy:

- check the line supply and fuses.
- check the connection and size (rating) of the line reactor.
- check and correct the phase assignment at the VSM (X521 or X522) and at the power unit.
- check the load.
- if failed in operation, carefully note the previous alarm messages A6205 with alarm values.

A06205 (F) Infeed: Voltage dip in at least one line supply phase

Message value: %1
Drive object: A_INF, S_INF
Reaction: NONE
Acknowledge: NONE
Cause: Voltage dip or overvoltage in one or several line supply phases has been detected in operation.
The pulses are then inhibited for a time of at least 8 ms. The operating signal of the infeed unit in r0863.0 remains and the pulse inhibit due to the phase failure is displayed in r3405.2.
Alarm value (r2124, bitwise coded cause of the alarm):
Bit 0: Line angle deviation (limit value p3463) due to a line supply fault
Bit 2: Active current deviation

Bit 3: Line frequency deviation (limit values: 115 % * p0284, 85 % * p0285)
 Bit 4: Line overvoltage (limit value 120 % * p0281 * p0210)
 Bit 5: Line undervoltage (limit value 20 % * p0210)
 Bit 7: Peak current fault
 Bit 8: Smart Mode without VSM (p3400.5 = 0): Line angle deviation
 Bit 9: Smart Mode: DC link voltage dip
 Bit 10: Smart Mode: Line currents not symmetrical
 Bit 11: Smart Mode: Line supply voltage detection fault
 Bit 14: Recharging current fault

Remedy:

Generally, the following applies when an alarm message is output:
 - check the line supply and fuses.
 - check the line supply quality and system fault level.
 - check the load.
 Dependent on the alarm value in r2124, the following applies:
 Bit 0 = 1: Line fault occurred or poor/incorrect controller setting. For poor line quality or frequent line supply change-over operations, when required, limit value p3463 can be increased until the alarm value no longer occurs.
 Bit 2 = 1: Line fault occurred or poor/incorrect controller setting. - check the controller setting and load.
 Bit 3 = 1: Line fault occurred. For poor line quality or frequent line changeover operations, when required, limit values p0284 and p0285 can be increased until the alarm value no longer occurs.
 Bit 4 = 1: Line interrupted or line overvoltage has occurred.
 Bit 5 = 1: Line interrupted or line undervoltage has occurred.
 Bit 7 = 1: Peak current trip due to line fault or overload. Check the load.
 Bit 8 = 1: Line fault occurred.
 Bit 9 = 1: Line undervoltage or overload. Check the load.
 Bit 10 = 1: Line supply interrupted in at least one line phase. Check the fuses.
 Bit 11 = 1: Fault in at least one line phase. Check the fuses.
 Bit 14 = 1: Supply/infeed overload or fault in at least one line phase. Check the load. Check the line supply and fuses.

Cause: The actual line frequency f_{line} is higher than the parameterized alarm threshold ($f_{line} > p0211 * p0284$).
The alarm can be output in two operating states:
1. During the power-on phase of the infeed unit.
Consequence:
Synchronization of the infeed to the line supply is interrupted and is restarted.
2. While the infeed is operational.
Consequence:
The infeed remains in the operating (run) state and alarm A6350 is output. This signifies a critical operational fault.
Alarm value (r2124, floating point):
Actual line frequency determined.
See also: p0284 (Line supply frequency exceeded alarm threshold)
Remedy:
- check the parameterized line frequency and if required change (p0211).
- check the alarm threshold (p0284).
- check the line supply.
- check the line supply quality.

A06351 (F) Infeed: Measured line frequency too low

Message value: Line frequency: %1
Drive object: A_INF, S_INF
Reaction: NONE
Acknowledge: NONE
Cause: The actual line frequency f_{line} is lower than the parameterized alarm threshold ($f_{line} < p0211 * p0285$).
 The alarm can be output in two operating states:
 1. During the power-on phase of the infeed unit.
 Consequence:
 Synchronization of the infeed to the line supply is interrupted and is restarted.
 2. While the infeed is operational.
 Consequence:
 The infeed remains in the operating (run) state and alarm A06351 is output. This signifies a critical operational fault.

A06400 Infeed: Line supply data identification selected/active

Message value: -
Drive object: A_INF, S_INF
Reaction: NONE
Acknowledge: NONE
Cause: The line supply data identification is selected and active.
 The line inductance and the DC link capacitance are measured at the next pulse enable.
 See also: p3410 (Infeed identification method)
Remedy: Not necessary.
 The alarm automatically disappears after the measurement has been completed.

A06401 Infeed: Transformer data identification/test mode selected/active

Message value: %1
Drive object: A_INF
Reaction: NONE
Acknowledge: NONE
Cause: A transformer data identification type or a transformer test operation has been selected or is active.
 Alarm value (r2124, interpret decimal):
 11: Identification type 1 selected for transformer data (automatic determination of the magnetizing inductance).
 12: Identification type 2 selected for transformer data (automatic determination of transformer phase shift and gain correction).
 13: Identification type 3 selected for transformer data (determination of total leakage inductance of transformer during line data identification).
 101: Test mode 1 selected.
 102: Test mode 2 selected.
 See also: p5480 (Transformer magnetization mode)
Remedy: Not necessary.
 The alarm automatically disappears after the identification has been completed.

F06500 Infeed: Line synchronization not possible

Message value: -
Drive object: A_INF, S_INF
Reaction: OFF2 (OFF1)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The line synchronization is not possible within the monitoring time.
The infeed was re-synchronized to the line supply because it was interrupted due to a line frequency that was determined to be either too low or too high.
After 20 attempts, synchronization - and therefore also the power-on operation - were interrupted.
Remedy: - check the parameterized line frequency and if required change (p0211).
- check the setting of the threshold values (p0284, p0285).
- check the line supply.
- check the connecting terminals
When using a voltage sensing module (VSM):
- check the line supply connection at the terminals (X521, X522).
- check VSM activation (p0145, p3400).
- check the line supply quality.
Note:
In the case of chassis power units, the availability of correct VSM voltage measured values is imperative for line synchronization.

A06601 (F) Infeed: Current offset measurement interrupted

Message value: %1
Drive object: A_INF, S_INF
Reaction: NONE
Acknowledge: NONE
Cause: Defective current measurement or a DC current is present during the offset measurement.
 Alarm value (r2124, interpret decimal):
 1: Excessively high phase current has occurred during the current offset calibration.
 2: The measured current offset is greater than the 3% of the maximum permissible converter current (e.g. due to a ground fault in the DC link).
Remedy: Re alarm value = 1:
 - possible counter-measure if there is no line contactor: Power up an adequately long time before OFF1 = 1.
 Re alarm value = 2:
 - defective current measurement or a DC current is present during the offset measurement.
 - check the DC link for a ground fault.

A06602 (F) Infeed: Current offset measurement not possible

Message value: -
Drive object: A_INF, S_INF
Reaction: NONE

Cause: After an OFF1 = 1 no valid current offset measurement was able to be made within the monitoring time (p3491) before closing the line contactor. The current offset is set to 0.
 See also: p3491 (Infeed I-offset measurement monitoring time)
Remedy: - check the DC link for a ground fault. A ground fault can destroy parts and components!
 - Check the monitoring time setting and if required increase (p3491). At least 100 ms is required for a valid measurement (p3491 > 100 ms).
 Notice:
 If there is no valid measurement, then under certain circumstances the quality of the DC link control will be reduced.

F06700 (A) Infeed: Switch line contactor for load condition

Message value: -
Drive object: A_INF, B_INF, S_INF
Reaction: NONE (OFF2)
Acknowledge: IMMEDIATELY
Cause: For an ON command, the infeed line contactor should be switched under load.

Remedy:

- do not load the DC link if the infeed has not issued an operating signal (r0863.0 = 1).
- after the infeed has been powered down, all power units connected to the DC link should be powered down. To realize this, the operating signal of the infeed (r0863.0) must be suitably interconnected.

A06800 (F) Infeed: Maximum steady-state DC link voltage reached

Message value: -

Drive object: A_INF, S_INF

Reaction: NONE

Acknowledge: NONE

Cause: The DC link voltage setpoint has reached the maximum steady-state voltage parameterized in p0280. The DC link voltage is increased by the modulation depth reserve controller for the following reasons:

- modulation depth reserve is too low (p3480).
- line supply voltage is too high.
- supply voltage (p0210) parameterized to be too low.
- excessively high setpoint for the reactive line current.

Remedy:

- check the line supply voltage setting (p0210).
- check the line supply for an overvoltage condition.
- reduce the modulation depth reserve (p3480).
- reduce the reactive current setpoint.

A06810 (F) Infeed: DC link voltage alarm threshold

Message value: -

Drive object: A_INF, B_INF, S_INF

Reaction: NONE

Acknowledge: NONE

Cause: In operation, the DC link voltage has dropped to below the alarm threshold. The alarm threshold is obtained from the sum of p0279 and r0296. Possible causes include:

- line supply voltage dip or another line supply fault.
- overload of the infeed.
- for Active Line Module: Controller incorrectly parameterized.

See also: p0279 (DC link voltage offset alarm threshold), r0296 (DC link voltage undervoltage threshold)

Remedy:

- check the line voltage and line supply quality.
- reduce the power drawn, avoid step-like load changes
- for Active Line Module: Adapt the controller parameterization (e.g. automatic line supply identification (p3410 = 4, 5)).

A06849 (F, N) Infeed: Short-circuit operation active

Message value: -

Drive object: A_INF

Reaction: NONE

Acknowledge: NONE

Cause: The current hysteresis controller sequence control has detected a short circuit (r5452, r5522). The absolute line supply voltage (r5444[0], r5512[0]) is below the short-circuit voltage limit (p5459[2], p5529[2]), and the current limitation is active (r5402.3=1, r5502.3=1).

Note:

The effective current limit is obtained from the parameterized overcurrent (p5453) and the hysteresis width (p5454).

Remedy:

- check the parameterization of the current hysteresis controller (p5453).
- check the line supply cables for a short-circuit.

A06860 Infeed: Function module activation not possible

Message value: -

Drive object: A_INF

Reaction: NONE

Acknowledge: NONE

Cause: Function module activation is not possible. The power unit used does not have the "gating unit with current limitation control" feature (r0192.19).
 The affected function module is identified in fault value r0949 (the value of r0949 corresponds to the bit of parameter p0108).
 r0949 = 7 "Dynamic grid support" function module
 r0949 = 12: "Line droop control" function module
 See also: r0192 (Power unit firmware properties), p5401 (Line droop control activation)

Remedy: - check whether the power unit used has the "gating unit with current limitation control" feature (p0192.19).
 - If required, replace the power unit being used by a power unit that has the "gating unit with current limitation control" feature.

A06900 (F) Braking Module: Fault (1 -> 0)

Message value: %1

Drive object: A_INF, B_INF, S_INF

Reaction: NONE

Acknowledge: NONE

Cause: The Braking Module signals a fault (1 -> 0) via X21.4 ("booksize" format) or X21.5 ("chassis" format).
 This signal is wired to a system digital input and correspondingly interconnected using binector input p3866[0...7].
 Possible causes:
 - Wiring of the signal or BICO interconnection of the signal source incorrect.
 - Overtemperature
 - Electronics power supply missing.
 - Ground fault/short-circuit.
 - Internal component fault.
 See also: p3866 (Braking Module fault)

Remedy: - check binector input p3866[0...7] and the wiring from terminal X21.4 ("booksize" format) or X21.5 ("chassis" format).
 - reduce the number of braking operations.
 - Check the 24 V power supply of the component.

A07015 Drive: Motor temperature sensor alarm

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: An error was detected when evaluating the temperature sensor set in p0600 and p0601. With the fault, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.
Possible causes:
- wire breakage or sensor not connected (KTY: R > 1630 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm).
Alarm value (r2124, interpret decimal):
- if SME/TM120 is selected (p0601 = 10, 11), this is the number of the temperature channel leading to the message.

Remedy:
- make sure that the sensor is connected correctly.
- check the parameterization (p0600, p0601).

A07354 Drive: cogging torque compensation not possible

Message value: Fault cause: %1, drive data set: %2

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: Cogging torque compensation is selected and is not (completely) supported.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: yyyy = fault cause, xxxx = drive data set

yyyy = 1: The encoder evaluation does not support this function.

yyyy = 2: The encoder has no absolute information.

yyyy = 3: The motor has no encoder (p0187 = 99).

Remedy: If required, deselect the cogging torque compensation (p5250 = 0).

Re fault cause = 1:

Use an absolute encoder or an encoder evaluation that supports the function (r0459.13 = 1). If required, upgrade the firmware version (version 04.50.30.01 or higher is required).

Re fault cause = 2:

Use an encoder with absolute information (absolute track, unique zero mark, resolver with one pole pair). The function cannot be tested as long as the encoder is not reset after learning (encoder fault, parking, POWER ON). Continuous use is not recommended.

Re fault cause = 3:

Only select cogging torque compensation for operation with motor encoder.

A07400 (N) Drive: DC link voltage maximum controller active

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The DC link voltage controller has been activated because of the upper switch-in threshold (p1244).

A system deviation can occur between the setpoint and actual speed.

See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration)

Remedy: Not necessary.

This alarm automatically disappears after the upper threshold has been distinctly undershot.

Otherwise, apply the following measures:

- use a Braking Module or regenerative feedback unit.

- increase the ramp-down times (p1121, p1135).

- shut down the Vdc_max controller (p1240 = 0).

A07400 (N) Drive: DC link voltage maximum controller active

Message value: -

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282).

The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds.

When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.

See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration), p1280 (Vdc controller or Vdc monitoring configuration (U/f))

Remedy: If the controller is not to intervene:
 - increase the ramp-down times.
 - switch-off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).
 If the ramp-down times are not to be changed:
 - use a chopper or regenerative feedback unit.

F07412 Drive: Commutation angle incorrect (motor model)

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: ENCODER (NONE, OFF2)

Acknowledge: IMMEDIATELY

Cause: An incorrect commutation angle was detected that can result in a positive coupling in the speed controller. Possible causes:

- The phase sequence of the output phases for the motor is incorrect (e.g. the phases are interchanged).
- the motor encoder is incorrectly adjusted with respect to the magnet position.
- the motor encoder is damaged.
- the angular commutation offset is incorrectly set (p0431).

- data to calculate the motor model has been incorrectly set (p0356 (motor-stator leakage inductance) and/or p0350 (motor-stator resistance) and/or p0352 (cable resistance)).
- the changeover speed for the motor model is too low (p1752). The monitoring function only becomes effective above the changeover speed.
- pole position identification might have calculated an incorrect value when activated (p1982 = 1).
- the motor encoder speed signal is faulted.
- the control loop is instable due to incorrect parameterization.

Fault value (r0949, interpret decimal):

SERVO:

0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 80 ° electrical).

1: -

VECTOR:

0: The comparison of the pole position angle from the encoder and motor model resulted in an excessively high value (> 45 ° electrical).

1: The change in the speed signal from the motor encoder has changed by > p0492 within a current controller clock cycle.

Remedy:

- Check the phase sequence for the motor, and if required, correct (wiring, p1820).
 - if the encoder mounting was changed - re-adjust the encoder.
 - replace the defective motor encoder.
 - correctly set the angular commutation offset (p0431). If required, determine using p1990.
 - correctly set the motor stator resistance, cable resistance and motor-stator leakage inductance (p0350, p0352, p0356).
Calculate the cable resistance from the cross-section and length, check the inductance and stator resistance using the motor data sheet, measure the stator resistance, e.g. using a multimeter - and if required, again identify the values using the stationary motor data identification (p1910).
 - increase the changeover speed for the motor model (p1752). The monitoring is completely de-activated for p1752 > p1082 (maximum speed).
 - with pole position identification activated (p1982 = 1) check the procedure for pole position identification (p1980) and force a new pole position identification procedure by means of de-selection followed by selection (p1982 = 0 -> 1).
- Note:
For High Dynamic Motors (1FK7xxx-7xxx), for applications with a higher current, if necessary, the monitoring should be disabled.

F07413 Drive: Commutation angle incorrect (pole position identification)

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: ENCODER (NONE, OFF2)

Acknowledge: IMMEDIATELY

Cause: An incorrect commutation angle was detected that can result in a positive coupling in the speed controller. Within the pole position identification routine (p1982 = 2):
 - a difference of > 45 ° electrical to the encoder angle was determined.
 For VECTOR, within the encoder adjustment (p1990 = 2):
 - a difference of > 6 ° electrical to the encoder angle was determined.

Remedy:

- correctly set the angular commutation offset (p0431).
- re-adjust the motor encoder after the encoder has been replaced.
- replace the defective motor encoder.
- check the pole position identification routine. If the pole position identification routine is not suitable for this motor type, then disable the plausibility check (p1982 = 0).

F07414 (N, A) Drive: Encoder serial number changed

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: ENCODER (NONE, OFF2)

Acknowledge: IMMEDIATELY

Cause: The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).

Cause 1:

- The encoder was replaced.

Cause 2:

- A third-party, built-in or linear motor was re-commissioned.

Cause 3:

- The motor with integrated and adjusted encoder was replaced.

Cause 4:

- The firmware was updated to a version that checks the encoder serial number.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2118, p2119).

Remedy:

Re causes 1, 2:

Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.

SERVO:

If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.

or

Set the adjustment via p0431. In this case, the new serial number is automatically accepted.

or

Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

Re causes 3, 4:

Accept the new serial number with p0440 = 1.

F07432	Drive: Motor without overvoltage protection
Message value:	%1
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	In the case of a fault at maximum speed, the motor can generate an overvoltage that can destroy the drive system. Fault value (r0949, interpret hexadecimal): Associated Drive Data Set (DDS).
Remedy:	Overvoltage protection can be implemented in the following ways: 1. Limit the maximum speed (p1082) without any additional protection. The maximum speed without protection is calculated as follows: Rotary synchronous motors: $p1082 \text{ [rpm]} \leq 11.695 * p0297/p0316 \text{ [Nm/A]}$ Linear motors: $p1082 \text{ [m/min]} \leq 73.484 * p0297/p0316 \text{ [N/A]}$ Rotary synchronous motor connected to the high-frequency converter: $p1082 \text{ [rpm]} \leq 4.33165E9 * (-p0316 + \text{root}(p0316^2 + 4.86E-9 * (r0297 * r0313)^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})) / (r0297 * r0313^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$ Linear motor connected to the high-frequency converter: $p1082 \text{ [m/min]} \leq 689.403 * p0315 * (\text{root}(p0316^2 * p0315^2 + 0.191865 * r0297^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}) / (r0297 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})$ Rotary induction motor connected to the high-frequency converter: $p1082 \text{ [rpm]} \leq \text{maximum}(2.11383E5 / (r0313 * \text{root}((r0377 \text{ [mH]} + r0382 \text{ [mH]}) * p0234 \text{ [\mu F]})); 0.6364 * r0297 * p0311 \text{ [rpm]} / p0304)$ 2. Use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801 – only for synchronous motors). When using a synchronous motor with VPM at the high-frequency converter, the following must apply: $p1082 \text{ [rpm]} \leq p0348 * (r0377 + p0233) / p0233$ When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" (STO) must be connected to the VPM. When using a VPM, p0643 must be set to 1.

3. Activate the internal voltage protection (p1231 = 3, only for synchronous motors).
 In so doing, the following hardware preconditions must be fulfilled:

- The infeed of the group must be capable of energy recovery (Active Line Module, Smart Line Module), and the energy recovery power of the infeed must not be less than the maximum utilized S1 power of the synchronous motor.
- For Control Unit and infeed, a 24 V power supply other than that for the Motor Module must be used with the voltage protection activated. The 24 V power supply of this Motor Module must be DC link buffered (e.g. CSM).
- A Braking Module with a correspondingly configured braking resistor must be available at the DC link.
- The synchronous motor must be short-circuit proof.

F07433 **Drive: Closed-loop control with encoder is not possible as the encoder has not been unparked**

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: NONE (OFF1, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: The changeover to closed-loop control with encoder is not possible as the encoder has not been unparked.

Remedy: - check whether the encoder firmware supports the "parking" function (r0481.6 = 1).
 - upgrade the firmware.

Note:
 For long-stator motors (p3870.0 = 1), the following applies:
 The encoder must have completed the unparking procedure (r3875.0 = 1) before a changeover can be made to closed-loop control with encoder. The encoder is unparked using binector input p3876 = 0/1 signal and remains until a 0 signal in this state.

F07434 **Drive: It is not possible to change the direction of rotation with the pulses enabled**

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: A drive data set was selected - with the pulses enabled - which has a different parameterized direction of rotation (p1821).
 It is only possible to change the motor direction of rotation using p1821 when the pulses are inhibited.

Remedy: - change over the drive data set with the pulses inhibited.
 - ensure that the changeover to a drive data set does not result in the motor direction of rotation being changed (i.e. for these drive data sets, the same value must be in p1821).

F07435 (N) **Drive: Setting the ramp-function generator for sensorless vector control**

Message value: Parameter: %1

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141) or bypassed (p1122). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen or was not able to be realized.
 The drive is switched-on with flying restart activated (p1200), and at the same time the ramp-function generator is bypassed (p1122).

Remedy: - de-activate the holding command for the ramp-function generator (p1141).
 - do not bypass the ramp-function generator (p1122).
 - suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

Note:

For sensorless vector control it is not practical to read in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.

Cause: The power unit does not support the selected function.
 Fault value (r0949, interpret decimal):
 1:
 The function "Current controller dynamics higher" (p1810.11 = 1) is selected, however is not supported by the power unit (r0192.27 = 0).
 - firmware of the booksize power unit is not up-to-date.
 - blocksize or S120 combi power unit was used.
 2:
 The function "Current controller dynamics higher" (p1810.11 = 1) is selected, however is not supported by the safety technology without encoder (9506 = 1, 3).
 3:
 The function "DC link voltage compensation in the power unit" (p1810.1 = 1) is selected, however is not supported by the power unit (r0192.28 = 0).
Remedy: For fault value = 1:
 - If necessary, upgrade the firmware of the booksize power unit to a later version (version >= 4.4).
 Note:
 If the firmware has already been automatically upgraded, then only a POWER ON (switch-off/switch-on) is required.
 - Use a booksize power unit (version >= 4.4).
 For fault value = 2:
 - If an encoder with Safety position actual values sensing is available (r0458[0...2].19 = 1), reparameterize the encoderless safety technology (p9506 = 1, 3) to safety technology with encoder (p9506 = 0).
 Re fault value = 1, 2:
 - Deselect the function "Current controller dynamics higher" (p1810.11 = 0) and if required, set the current, speed and position controller again or calculate (p0340 = 4).
 For fault value = 3:
 - If necessary, upgrade the firmware of the blocksize power unit to a later version (version >= 4.6).

A07440 EPOS: Jerk time is limited

Message value: -
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: NONE
Acknowledge: NONE
Cause: The calculation of the jerk time $T_r = \max(p2572, p2573) / p2574$ resulted in an excessively high value so that the jerk time is internally limited to 1000 ms.
 Note:
 The alarm is also output if jerk limiting is not active.
Remedy:
 - increase the jerk limiting (p2574).
 - reduce maximum acceleration or maximum deceleration (p2572, p2573).

Cause: The status of the absolute encoder adjustment has changed.
In order to permanently save the determined position offset (p2525) it must be saved in a non-volatile fashion (p0971, p0977).

Remedy: Not necessary.
This alarm automatically disappears after the offset has been saved.

F07442 (A) **LR: Multiturn does not match the modulo range**

Message value: -

Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC

Reaction: OFF1 (OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number.
This results in the adjustment being set back, as the position actual value cannot be reproduced after power-off/power-on.

Remedy: Make the ration between the multiturn resolution and the modulo range an integer number.
The ratio v is calculated as follows:

1. Motor encoder without position tracking
 $v = (p0421 * p2506 * p0433 * p2505) / (p0432 * p2504 * p2576)$
2. Motor encoder with position tracking for the measuring gear
 $v = (p0412 * p2506 * p2505) / (p2504 * p2576)$
3. Motor encoder with position tracking for the load gear
 $v = (p2721 * p2506 * p0433) / (p0432 * p2576)$
4. Motor encoder with position tracking for the load and measuring gear
 $v = (p2721 * p2506) / p2576$
5. Direct encoder without position tracking
 $v = (p0421 * p2506 * p0433) / (p0432 * p2576)$
6. Direct encoder with position tracking for the measuring gear
 $v = (p0412 * p2506) / p2576$

Note:

Cause: For a configured linear axis/no modulo axis, the currently effective motor encoder (encoder 1) has exceeded the maximum possible traversing range.
For the configured linear axis, the maximum traversing range is defined to be 64x (+/- 32x) of p0421. It should be read in p2721 and interpreted as the number of load revolutions.
Note:
Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in x = r0051 and the corresponding motor encoder is specified in in p0187[x].

Reaction:	NONE
Acknowledge:	NONE
Cause:	The maximum velocity (p2571) is too high to correctly calculate the modulo correction. Within the sampling time for positioning (p0115[5]), with the maximum velocity, a maximum of the half modulo length must be moved through. p2571 was limited to this value.
Remedy:	- reduce the maximum velocity (p2571). - increase the sampling time for positioning (p0115[5]).
A07456	EPOS: Setpoint velocity limited
Message value:	-
Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The actual setpoint velocity is greater than the parameterized maximum velocity (p2571) and is therefore limited.
Remedy:	- check the entered setpoint velocity. - reduce the velocity override (CI: p2646). - increase the maximum velocity (p2571). - check the signal source for the externally limited velocity (CI: p2594).
A07457	EPOS: Combination of input signals illegal
Message value:	%1
Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	An illegal combination of input signals that are simultaneously set was identified. Alarm value (r2124, interpret decimal): 0: Jog 1 and jog 2 (p2589, p2590). 1: Jog 1 or jog 2 and direct setpoint input/MDI (p2589, p2590, p2647). 2: Jog 1 or jog 2 and start referencing (p2589, p2590, p2595). 3: Jog 1 or jog 2 and activate traversing task (p2589, p2590, p2631). 4: Direct setpoint input/MDI and starting referencing (p2647, p2595). 5: Direct setpoint input/MDI and activate traversing task (p2647, p2631). 6: Start referencing and activate traversing task (p2595, p2631).
Remedy:	Check the appropriate input signals and correct.
F07458	EPOS: Reference cam not found
Message value:	-
Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction:	OFF1 (OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	After starting the search for reference, the axis moved through the maximum permissible distance to search for the reference cam without actually finding the reference cam.
Remedy:	- check the "reference cam" binector input (BI: p2612). - check the maximum permissible distance to the reference cam (p2606). - if axis does not have any reference cam, then set p2607 to 0. See also: p2606 (EPOS search for reference reference cam maximum distance), p2607 (EPOS search for reference reference cam present), p2612 (EPOS search for reference reference cam)

F07459 EPOS: No zero mark

Message value: -
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: After leaving the reference cam, the axis has traversed the maximum permissible distance between the reference cam and zero mark without finding the zero mark.
Remedy:
- check the encoder regarding the zero mark
- check the maximum permissible distance between the reference cam and zero mark (p2609).
- use an external encoder zero mark (equivalent zero mark) (p0495).
See also: p0495 (Equivalent zero mark input terminal), p2609 (EPOS search for reference max. distance ref. cam and zero mark)

F07460 EPOS: End of reference cam not found

Message value: -
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: During the search for reference, when the axis reached the zero mark it also reached the end of the traversing range without detecting an edge at the binector input "reference cam" (BI: p2612).
Maximum traversing range: -2147483648 [LU] ... -2147483647 [LU]
Remedy:
- check the "reference cam" binector input (BI: p2612).
- repeat the search for reference.
See also: p2612 (EPOS search for reference reference cam)

A07461 EPOS: Reference point not set

Message value: -
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: NONE

Cause: A traversing block selected via binector input p2625 ... p2630 was started via binector input p2631 = 0/1 edge "Activate traversing task".
- the number of the started traversing block is not contained in p2616[0...n].
- the started traversing block is suppressed.
Alarm value (r2124, interpret decimal):
Number of the selected traversing block that is also not available.
Remedy:
- correct the traversing program.
- select an available traversing block number.

A07463 (F) EPOS: External block change not requested in the traversing block

Message value: %1
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: NONE

Cause: The traversing block does not contain valid information.
 Alarm value (r2124, interpret decimal):
 Number of the traversing block with invalid information.
Remedy: Check the traversing block and where relevant, take into consideration alarms that are present.

A07465 EPOS: Traversing block does not have a subsequent block

Message value: %1
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: NONE
Acknowledge: NONE
Cause: There is no subsequent block in the traversing block.
 Alarm value (r2124, interpret decimal):
 Number of the traversing block with the missing subsequent block.
Remedy: - parameterize this traversing block with the block change enable END.
 - parameterize additional traversing blocks with a higher block number and for the last block, using the block change enable END.

A07466 EPOS: Traversing block number assigned a multiple number of times

Message value: %1

F07493 LR: Overflow of the value range for position actual value

Message value: %1
Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset.
 Fault value (r0949, interpret decimal):
 1: The position actual value (r2521) has exceeded the value range.
 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range.
 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value.
Note:
 For a linear encoder, the following must be maintained:
 - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$
 - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$

Remedy: If required, reduce the traversing range or position resolution (p2506). Increase the fine resolution of absolute position actual value (p0419).
Note for fault value = 3:
 If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow.
 For rotary encoders, the maximum possible absolute position (LU) is calculated as follows:
 1. Motor encoder without position tracking
 $p2506 * p0433 * p2505 / (p0432 * p2504)$
 $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$ for multiturn encoders
 2. Motor encoder with position tracking for measuring gear:
 $p2506 * p0412 * p2505 / p2504$
 3. Motor encoder with position tracking for load gear
 $p2506 * p2721 * p0433 / p0432$
 4. Motor encoder with position tracking for load and measuring gear
 $p2506 * p2721$
 5. Direct encoder without position tracking
 $p2506 * p0433 / p0432$
 $p2506 * p0433 * p0421 / p0432$ for multiturn encoders
 6. Direct encoder with position tracking for measuring gear
 $p2506 * p0412$

A07498 (F) LR: Measuring probe evaluation not possible

Message value: %1

Drive object: SERVO, SERVO_AC, VECTOR, VECTOR_AC

Reaction: NONE

Acknowledge: NONE

Cause: When evaluating the measuring probe, an error occurred.
Alarm value (r2124, interpret decimal):
6:
The input terminal for the measuring probe is not set.
4098:
Error when initializing the measuring probe.
4100:
The measuring pulse frequency is too high.
> 50000:
The measuring clock cycle is not a multiple integer of the position controller clock cycle.

Remedy: De-activate the measuring probe evaluation (BI: p2509 = 0 signal).
 Re alarm value = 6:
 Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).
 Re alarm value = 4098:
 Check the Control Unit hardware.
 Re alarm value = 4100:
 Reduce the frequency of the measuring pulses at the measuring probe.
 Re alarm value > 50000:
 Set the clock cycle ratio of the measuring clock cycle to the position controller clock cycle to an integer multiple.
 To do this, the currently effective measuring clock cycle can be determined from the alarm value as follows:
 $T_{meas} [125 \mu s] = \text{alarm value} - 50000$
 With PROFIBUS, the measuring clock cycle corresponds to the PROFIBUS clock cycle (r2064[1]).
 Without PROFIBUS, the measuring clock cycle is an internal cycle time that cannot be influenced.

F07502	Drive: Encoder Data Set EDS not configured
Message value:	Drive data set: %1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	Only for power units: The encoder data set was not configured - this means that a data set number was not entered into the associated drive data set. Fault value (r0949, interpret decimal): The fault value includes the drive data set number of p0187, p0188 and p0189. The fault value is increased by 100 * encoder number (e.g. for p0189: Fault value 3xx with xx = data set number).
Remedy:	The index of the encoder data set associated with the drive data set should be entered into p0187 (1st encoder), p0188 (2nd encoder) and p0189 (3rd encoder).

Message value:	%1
Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction:	Servo: NONE (OFF1, OFF2, OFF3) Vector: NONE
Acknowledge:	IMMEDIATELY
Cause:	The STOP cam MINUS was approached in the positive traversing direction or the STOP cam PLUS was approached in the negative traversing direction.
Remedy:	- check the wiring of the STOP cam (BI: p2569, BI: p2570). - check the traversing direction to approach the STOP cam.

Drive object:	A_INF, B_INF, ENC, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE

Cause:	A motor data set is not assigned to a drive object. All of the existing motor data sets in the drive data sets must be assigned using the MDS number (p0186[0...n]). There must be at least as many drive data sets as motor data sets. Alarm value (r2124, interpret decimal): Number of the motor data set that has not been assigned.
Remedy:	In the drive data sets, assign the non-assigned motor data set using the MDS number (p0186[0...n]). - check whether all of the motor data sets are assigned to drive data sets. - if required, delete superfluous motor data sets. - if required, set up new drive data sets and assign to the corresponding motor data sets. Drive object:	SERVO, SERVO_AC, VECTOR, VECTOR_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	In the U/f/SLVC mode, an attempt was made to execute a traversing block with the "fixed stop" task. This is not possible. Alarm value (r2124, interpret decimal): Number of the traversing block with an illegal task parameter.
Remedy:	- Check the traversing block and change the task. - change the open-loop/closed-loop control mode (p1300). See also: p1300 (Open-loop/closed-loop control operating mode), p2621 (EPOS traversing block task)

Cause:	A Drive Data Set (DDS) is assigned to a Motor Data Set (MDS) or Encoder Data Set (EDS) that does not have a component number. Alarm value (r2124, interpret decimal): nnmmmxyyy nn: Number of the MDS/EDS. mmm: Parameter number of the missing component number. xx: Number of the DDS that is assigned to the MDS/EDS. yyy: Parameter number that references the MDS/EDS. Example: p0186[7] = 5: DDS 7 is assigned MDS 5. p0131[5] = 0: There is no component number set in MDS 5. Alarm value = 0513107186
Remedy:	In the drive data sets, no longer assign MDS/EDS using p0186, p0187, p0188, p0189 or set a valid component number. See also: p0131, p0141, p0142, p0186, p0187, p0188, p0189
F07510	Drive: Identical encoder in the drive data set
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	More than one encoder with identical component number is assigned to a single drive data set. In one drive data set, it is not permissible that identical encoders are operated together. Fault value (r0949, interpret decimal): 1000 * first identical encoder + 100 * second identical encoder + drive data set. Example: Fault value = 1203 means: In drive data set 3, the first (p0187[3]) and second encoder (p0188[3]) are identical.
Remedy:	Assign the drive data set to different encoders. See also: p0141, p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0189 (Encoder 3 encoder data set number)
F07511	Drive: Encoder used a multiple number of times
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	Each encoder may only be assigned to one drive and within a drive must - in each drive data set - either always be encoder 1, always encoder 2 or always encoder 3. This unique assignment has been violated. Fault value (r0949, interpret decimal): The two parameters in coded form, that refer to the same component number. First parameter: Index: First and second decimal place (99 for EDS, not assigned DDS) Parameter number: Third decimal place (1 for p0187, 2 for p0188, 3 for p0189, 4 for EDS not assigned DDS) Drive number: Fourth and fifth decimal place Second parameter: Index: Sixth and seventh decimal place (99 for EDS, not assigned DDS) Parameter number: Eighth decimal place (1 for p0187, 2 for p0188, 3 for p0189, 4 for EDS, not assigned DDS) Drive number: Ninth and tenth decimal place See also: p0141
Remedy:	Correct the double use of a component number using the two parameters coded in the fault value.

Message value: %1

Drive object: A_INF, B_INF, ENC, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: Using p0141, a changeover of the encoder data set is prepared that is illegal. In this firmware release, an encoder data set changeover is only permitted for the components in the actual topology.
Alarm value (r2124, interpret decimal):
Incorrect EDS data set number.
See also: p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0189 (Encoder 3 encoder data set number)

Remedy: Every encoder data set must be assigned its own dedicated DRIVE-CLiQ socket. The component numbers of the encoder interfaces (p0141) must have different values within a drive object.
The following must apply:
p0141[0] not equal to p0141[1] not equal to ... not equal to p0141[n]

Cause:	A power unit (via PDS) was assigned to a motor (via MDS) in a drive data set that is not connected in the target topology. It is possible that a motor has not been assigned to the power unit (p0131). Fault value (r0949, interpret decimal): Number of the incorrectly parameterized drive data set.
Remedy:	- assign the drive data set to a combination of motor and power unit permitted by the target topology. - adapt the target topology. - If required, for a missing motor, recreate the component (drive Wizard). Remedy:	If you wish to operate a motor once with one motor encoder and then another time with the other motor encoder, then you must set up two different MDSs, in which the motor data are the same. Example: p0186[0] = 0, p0187[0] = 0 p0186[0] = 1, p0187[0] = 1

Cause: The motor cannot be changed over.
Alarm value (r2124, interpret decimal):
1:
The contactor for the motor that is presently active cannot be opened, because for a synchronous motor, the speed (r0063) is greater than the speed at the start of field weakening (p0348). As long as r0063 > p0348, the current in the motor does not decay in spite of the pulses being suppressed.
2:

F07800 Drive: No power unit present

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The power unit parameters cannot be read or no parameters are stored in the power unit.
 It is possible that the DRIVE-CLiQ cable between the Control Unit and power unit is interrupted or defective.
Note:
 This fault also occurs if an incorrect topology was selected in the commissioning software and this parameterization is then downloaded to the Control Unit.
 See also: r0200 (Power unit code number actual)

- Remedy:**
- carry out a POWER ON (power off/on) for all components.
 - check the DRIVE-CLiQ cable between the Control Unit and power unit.
 - Check the power unit and replace if necessary.
 - check the Control Unit, and if required replace it.
 - after correcting the topology, the parameters must be again downloaded using the commissioning software.

- Message value:** -
- Drive object:** SERVO, SERVO_AC, SERVO_I_AC
- Reaction:** OFF2 (NONE, OFF1, OFF3)
- Acknowledge:** IMMEDIATELY
- Cause:** The permissible motor limit current was exceeded.
- effective current limit set too low.
 - current controller not correctly set.
 - motor was braked with an excessively high stall torque correction factor.
 - U/f operation: Up ramp was set too short or the load is too high.
 - U/f operation: Short-circuit in the motor cable or ground fault.
 - U/f operation: Motor current does not match the current of Motor Module.
- Note:**
 Synchronous motor: Limit current= 1.3 x p0323
 Induction motor: Limit current= 1.3 x r0209

- Remedy:**
- check the current limits (p0323, p0640).
 - check the current controller (p1715, p1717).
 - reduce the stall torque correction factor (p0326).
 - increase the up ramp (p1318) or reduce the load.
 - check the motor and motor cables for short-circuit and ground fault.
 - check the Motor Module and motor combination.

 - U/f operation: Short-circuit in the motor cable or ground fault.
 - U/f operation: Motor current does not match current of power unit.
 - Switch to rotating motor without flying restart function (p1200).
- Note:**
 Limit current = 2 x minimum (p0640, 4 x p0305 x p0306) >= 2 x p0305 x p0306

- Remedy:**
- check the current limits (p0640).
 - vector control: Check the current controller (p1715, p1717).
 - U/f control: Check the current limiting controller (p1340 ... p1346).
 - increase the up ramp (p1120) or reduce the load.
 - check the motor and motor cables for short-circuit and ground fault.
 - check the motor for the star-delta configuration and rating plate parameterization.
 - check the power unit and motor combination.
 - Choose "flying restart" function (p1200) if switched to rotating motor.

Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY
Cause: After an internal power-on command, the infeed or drive does not signal ready.
- monitoring time is too short.
- DC link voltage is not present.
- associated infeed or drive of the signaling component is defective.
- supply voltage incorrectly set.
Remedy: - increase the monitoring time (p0857).
- ensure that there is a DC link voltage. Check the DC link busbar. Enable the infeed.
- replace the associated infeed or drive of the signaling component.
- check the line supply voltage setting (p0210).

Cause: A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.
Fault value (r0949, interpret decimal):
1: Short-circuit, phases U-V
2: Short-circuit, phases U-W
3: Short-circuit, phases V-W
4: Ground fault with overcurrent
1xxxx: Ground fault with current in phase U detected (xxxx = component of the current in phase V in per mille)
2xxxx: Ground fault with current in phase V detected (xxxx = component of the current in phase U in per mille)
Note:
Also when interchanging the line and motor cables is identified as a motor-side short circuit.
Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.

- Remedy:**
- check the motor-side converter connection for a phase-phase short-circuit.
 - rule-out interchanged line and motor cables.
 - check for a ground fault.
- For a ground fault:
- do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).
 - increase the de-energization time (p0347).
 - If required, deactivate the monitoring (p1901).

F07815 Drive: Power unit has been changed

- Message value:** Parameter: %1
- Drive object:** A_INF, B_INF, S_INF
- Reaction:** NONE
- Acknowledge:** IMMEDIATELY
- Cause:** The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum).
Fault value (r0949, interpret decimal):
Number of the incorrect parameter.
See also: r0200 (Power unit code number actual), p0201 (Power unit code number)
- Remedy:** Connect the original power unit and power up the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0.
For infeeds, the following applies:
Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without re-commissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.
For inverters, the following applies:
If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).
If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.

Reaction: NONE

Acknowledge: NONE

Cause: The temperature sensor for monitoring the motor temperature, specified in p0600, is not available.
 Alarm value (r2124, interpret decimal):
 1: p0601 = 10 (SME), but in p0600 - not evaluated via encoder is selected.
 2: p0600 = 10 (BICO), but the signal source (p0603) is not interconnected.
 3: p0601 = 11 (BICO), but in p0600 - not evaluated via BICO interconnection is selected (20 or 21).

- 4: p0601 = 11 (BICO) and p4610-p4613 > 0, but the associated signal source (p0608, p0609) is not interconnected.
- 5: Component with sensor evaluation not present or has been removed in the meantime.
- 6: Evaluation via Motor Module not possible (r0192.21).

Remedy:

Re alarm value = 1:
 - In p0600 set an encoder with temperature sensor.

Re alarm value = 2:
 - interconnect p0603 with the temperature signal.

Re alarm value = 3, 4:
 - set the available temperature sensor (p0600, p0601).
 - set p4610 ... p4613 = 0 (no sensor), or interconnect p0608 or p0609 with an external temperature signal.

Re alarm value = 5:
 - connect the component with the temperature sensor. Check the DRIVE-CLiQ connection.

Re alarm value = 6:
 - update the Motor Module firmware. Connect temperature sensor via encoder.

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (NONE)

Cause: The signal "infeed operation" is not present although the enable signals for the drive have been present for longer than the parameterized monitoring time (p0857).
 - infeed not operational.
 - interconnection of the binector input for the ready signal is either incorrect or missing (p0864).
 - infeed is presently carrying out a line supply identification routine.

Remedy: - bring the infeed into an operational state.
 - check the interconnection of the binector input for the signal "infeed operation" (p0864).
 - increase the monitoring time (p0857).
 - wait until the infeed has completed the line supply identification routine.

Cause:	The signal "infeed operation" was withdrawn in operation. - interconnection of the binector input for the signal "infeed operation" is either incorrect or missing (p0864). - the enable signals of the infeed were disabled. - due to a fault, the infeed withdraws the signal "infeed operation".
Remedy:	- check the interconnection of the binector input for the "infeed operation" signal (p0864). - check the enable signals of the infeed and if required, enable. - remove and acknowledge an infeed fault. Note: If this drive is intended to back up the DC link regeneratively, then the fault response must be parameterized for NONE, OFF1 or OFF3. so that the drive can continue to operate even after the infeed fails.

Cause:	Motor has been operating at the torque limit longer than the time specified in p2177 and below the speed threshold in p2175. This signal can also be initiated if the speed actual value is oscillating and the speed controller output repeatedly goes to its limit. See also: p2175, p2177 (Motor blocked delay time)
Remedy:	- check that the motor can freely move. - check the effective torque limits (r1538, r1539). - check the parameter, message "Motor blocked" and if required, correct (p2175, p2177). - check the inversion of the actual value (p0410). - check the motor encoder connection. - check the encoder pulse number (p0408). - for SERVO with encoderless operation and motors with low power ratings (< 300 W), increase the pulse frequency (p1800). - after de-selecting the "Basic positioner" (EPOS) function mode, check the motoring (p1528) and regenerative (p1529) torque limit and modify again.

F07902 (N, A) Drive: Motor stalled

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP1, STOP2)

Acknowledge: IMMEDIATELY

Cause: The system has identified that the motor has stalled for a time longer than is set in p2178.
 Fault value (r0949, interpret decimal):
 1: Stall detection using r1408.11 (p1744 or p0492).
 2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 - r0084).
 3: Stall detection using r0056.11 (only for separately excited synchronous motors).
 See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)

Remedy: For closed-loop speed and torque control with speed encoder, the following applies:
 - check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).
 - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.
 If there is no fault, then the fault tolerance (p1744 and p0492) can be increased.
 For closed-loop speed and torque control without speed encoder, the following applies:
 - check whether the drive in the open-loop controlled mode (r1750.0) stalls under load. If yes, then increase the current setpoint using p1610.
 - check whether the drive stalls due to the load if the speed setpoint is still zero. If yes, then increase the current setpoint using p1610.
 - if the motor excitation (magnetizing) time (r0346) was significantly reduced, then it should be increased again.
 - check the current limits (p0640, r0067). If the current limits are too low, then the drive cannot be magnetized.
 - check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.
 - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.
 If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.
 For separately-excited synchronous motors (closed-loop control with speed encoder), the following applies:
 - check the speed signal (interrupted cable, polarity, pulse number).
 - ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).
 - check the excitation equipment and the interface to the closed-loop control.
 - encoder the highest possible dynamic response of the closed-loop excitation current control.
 - check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.
 - do not exceed the maximum speed (p2162).
 If there is no fault, then the delay time can be increased (p2178).

Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP1, STOP2)

Acknowledge: IMMEDIATELY

Cause: The system has identified that the motor has stalled for a time longer than is set in p2178.
 Fault value (r0949, interpret decimal):
 1: Stall detection using r1408.11 (p1744 or p0492).
 2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 - r0084).
 3: Stall detection using r0056.11 (only for separately excited synchronous motors).
 See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)

Remedy: It should always be carefully ensured that the motor data identification (p1910) as well as the rotating measurement (p1960) were carried out (also refer to r3925). For synchronous motors with encoder, the encoder must have been adjusted (p1990).

For closed-loop speed and torque control with speed encoder, the following applies:

- check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).
- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.

If there is no fault, then the fault tolerance (p1744 or p0492) can be increased. For resolvers with a high signal ripple, for example p0492 should be increased and the speed signal smoothed (p1441, p1442).

If the stalled motor should take place in the range of the monitor model and for speeds of less than 30 % of the rated motor speed, then a change can be made directly from the current model into the flux impression (p1401.5 = 1). We therefore recommend that the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 x p0311; p1753 = 5 %).

- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.

For closed-loop speed and torque control without speed encoder, the following applies:

- Check whether the drive stalls solely due to the load in controlled mode (r1750.0) or when the speed setpoint is still zero. If so, increase the current setpoint via p1610 or set p1750.2 = 1 (sensorless vector control to standstill for passive loads).
- If the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again or quick magnetizing selected (p1401).
- check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.
- If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.

The following generally apply for closed-loop and torque control:

- Check whether the motor cables are disconnected.
- check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.
- If the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553.

For separately-excited synchronous motors (closed-loop control with speed encoder), the following applies:

- check the speed signal (interrupted cable, polarity, pulse number).
- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).
- check the excitation equipment and the interface to the closed-loop control.
- encoder the highest possible dynamic response of the closed-loop excitation current control.
- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.
- do not exceed the maximum speed (p2162).

If there is no fault, then the delay time can be increased (p2178).

zzzz = 00CC hex = 204 dec:

Internal voltage protection: The activation (p1231 = 4) is not given for all motor data sets with synchronous motors (p0300 = 2xx, 4xx).

Remedy:

For fault value = 1:

- an armature short-circuit / voltage protection is only permissible for permanent-magnetic synchronous motors. The highest position of the motor type in p0300 must either be 2 or 4.

For fault value = 101:

- the contactor for the external armature short-circuit configuration should be controlled using output signal r1239.0. The signal can, e.g. be connected to an output terminal via binector input p0738. Before this fault can be acknowledged, p1231 must be set again.

For fault value = 102:

- if the external armature short-circuit with contactor feedback signal (p1231 = 1) is selected, this feedback signal must be connected to an input terminal (e.g. r722.x) and then connected to BI: p1235.
- alternatively, the external armature short-circuit without contactor feedback signal (p1231 = 2) can be selected.

For fault value = 103:

- if the external armature short-circuit without contactor feedback signal (p1231 = 2) is selected, then a delay time must be parameterized in p1237. This time must always be greater than the actual contactor opening time, as otherwise the Motor Module would be short-circuited!

For fault value = 201:

- a Motor Module with a higher maximum current or a motor with a lower short-circuit current must be used. The maximum Motor Module current must be higher than 1.8 x short-circuit current of the motor.

For fault value = 202:

- for internal voltage protection, use a Motor Module in booksize or chassis format.

For fault value = 203:

- for internal voltage protection, only use short-circuit proof motors.

For fault value = 204:

- The internal voltage protection must either be activated for all motor data sets with synchronous motors (p0300 = 2xx, 4xx) (p1231 = 3) or it must be de-activated for all motor data sets (p1231 not equal to 3). This therefore ensures that the protection cannot be accidentally withdrawn as a result of a data set changeover. The fault can only be acknowledged if this condition is fulfilled.

Internal armature short-circuit: Motor terminals are not at zero potential after pulse suppression

Message value:

-

Drive object:

SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

NONE

IMMEDIATELY

Cause:

The function "Internal voltage protection" (p1231 = 3) was activated.

The following must be observed:

- when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)!
- it is only permissible to use motors that are short-circuit proof (p0320 < p0323).
- the Motor Module must be able to continually conduct 180% short-circuit current (r0331) of the motor (r0289).
- the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor.
- if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components.
- if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module.
- if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).

A07927	DC braking active
Message value:	-
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in in p1233. If the standstill threshold p1226 is undershot, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
Remedy:	Not necessary. The alarm automatically disappears once DC braking has been executed.

Message value:	-
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).
Remedy:	If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V < DC link voltage < 800 V), the armature short-circuit is withdrawn after 3 minutes.

Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	A connected motor holding brake has been detected with an S120 Combi. However, this brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly). Fault value (r0949, interpret decimal): 0: No motor holding brake is assigned (p1215 = 0 or 3 on all S120 Combi feed drives). 1: More than one motor holding brake has been assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive) - or there is more than one DRIVE-CLiQ motor with motor holding brake. 2: Brake was accidentally assigned to the spindle (p1215 = 1); this is not permitted for this software release. 3: An attempt was made to enable the function "Safe brake control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted for this software release.
Remedy:	Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2). The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive. See also: p1215 (Motor holding brake configuration)

Acknowledge:	IMMEDIATELY
Cause:	An incorrect motor holding brake configuration was detected. Fault value (r0949, interpret decimal): 0: A motor holding brake was detected where the brake control has not been configured (p1215 = 0). The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time). For a chassis unit with Safe Brake Adapter (SBA), the interconnection p9621 = r9872.3 was established (only when commissioning for the first time). For a parallel connection, the power unit was set in p7015, to which the motor holding brake is connected (only when commissioning for the first time). 1: A motor holding brake was detected where the brake control has not been configured (p1215 = 0). The brake control configuration was left at "No motor holding brake available" (p1215 = 0). 11: The identification had detected more than one motor holding brake for a parallel connection. 12: For the parallel connection, in p0121 there is no valid component number for the power unit data set that is set in p7015.

13:
With the "Safe brake control" (SBC) function activated, an attempt was made to change the value in p7015.

14:
For a parallel connection, the power units set in p7015 cannot be addressed.

Remedy:

For fault value = 0:
- No remedy required.
For fault value = 1:
- If required change the motor holding brake configuration (p1215 = 1, 2).
- If this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged.
For fault value = 11:
For a parallel connection, only connect one motor holding brake.
For fault value = 12:
Check the setting of the power unit data set for a parallel connection (p7015).
For fault value = 13:

Acknowledge: IMMEDIATELY
Cause: The absolute value of the speed difference from the two actual values (r2169, r1443) exceeds the tolerance threshold (p3236) for longer than permitted (p3238).
Possible causes:
- the interconnection or scaling of the external encoder signal is incorrect (p1440, p2000).
- speed encoder for external encoder signal faulty.
- encoder signal's polarity or gain incorrect.
- smoothing time constant for model speed for monitoring too high (p2157).
- smoothing time constant or threshold values for monitoring too low (p3236, p3238).
If an external encoder signal is not being used:
- check speed signal r0061. For a significant signal ripple: check the speed encoder, and if required increase p0492.

A07976 Drive: Fine encoder calibration activated

Message value: Parameter: %1

Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The alarm indicates the phases of the fine encoder calibration using the alarm value.
Alarm value (interpret decimal):
1: Fine encoder calibration active.
2: Rotating measurement started (set the setpoint speed > 40 % rated motor speed).
3: Rotating measurement lies within the speed and torque range.
4: Rotating measurement successful: pulse inhibit can be initiated to accept the values.
5: Fine encoder calibration is calculated.
10: Speed too low, rotating measurement interrupted.
12: Torque too high, rotating measurement interrupted.
See also: p1905 (Parameter tuning selection)

Remedy: Re alarm value = 10:
Increase the speed.
Re alarm value = 12:
Bring the drive into a no-load condition.

A07980 Drive: Rotating measurement activated

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The rotating measurement is activated. For the rotating measurement, the motor can accelerate up to the maximum speed and with maximum torque. Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).
The rotating measurement is carried out at the next power-on command.
See also: p1960

Remedy: Not necessary.
 The alarm automatically disappears after the rotating measurement has been successfully completed or for the setting p1960 = 0.
Note:
 If a POWER ON or a warm restart is performed with motor data identification selected, the motor data identification request will be lost. If motor data identification is required, it will need to be selected again manually following ramp-up.

Reaction: OFF1 (NONE, OFF2)
Acknowledge: IMMEDIATELY
Cause: A fault has occurred during the encoder test.
 Fault value (r0949, interpret decimal):
 1: The speed did not reach a steady-state condition.
 2: The speed setpoint was not able to be approached as the minimum limiting is active.
 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
 4: The speed setpoint was not able to be approached as the maximum limiting is active.
 5: The encoder does not supply a signal.
 6: Incorrect polarity.
 7: Incorrect pulse number.
 8: Noise in the encoder signal or speed controller unstable.
 9: Voltage Sensing Module (VSM) incorrectly connected.

Remedy: For fault value = 1:
 - check the motor parameters.
 - carry out a motor data identification routine (p1910).
 - if required, reduce the dynamic factor (p1967 < 25 %).
 For fault value = 2:
 - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).
 For fault value = 3:

 - do not start motor data identification routine while motor is still rotating.
- For fault value = 192:
 - check closed-loop speed control (motor rotor may be locked or closed-loop speed control is not functioning).
 - for p1215 = 1, 3 (brake the same as the sequence control) check the control sense (p0410.0).
 - ensure that enable signals are present during measurement.
 - remove any pulling loads from motor.
 - increase max. current (p0640).
 - reduce max. speed (p1082).
 - suppress meas. (p1959).
- For fault value = 193:
 - the motor has moved through more than 5 ° electrical (r0093). Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-5 °) and then start identification.
- For fault value = 194:
 - switch out all supplementary torques (e.g. Cl: p1511).
 - for hanging/suspended axes: Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/- 1 °) and then start identification.
- For fault value = 195:
 - de-select closed-loop torque control (p1300 = 21 or 20, or set the signal source in p1501 to a 0 signal).
- Re fault value = 200, 201:
 - set pulse frequency to 0.5 x current controller frequency (e.g. 4 kHz for a current controller sampling time = 125 us).
 - reduce cable length between Motor Module and motor.
 - read-out measured values (r1950, r1951) and therefore determine suitable values for p1952, p1953 according to your own estimation.

F07990	Drive: Incorrect motor data identification

Cause:	A fault has occurred during the identification routine. Fault value (r0949, interpret decimal): 1: Current limit value reached. 2: Identified stator resistance lies outside the expected range 0.1 ... 100% of Zn. 3: Identified rotor resistance lies outside the expected range 0.1 ... 100% of Zn. Separately excited synchronous motors: damping resistance outside 1.0 ... 15 % of Zn. 4: Identified stator reactance lies outside the expected range 50 ... 900 % of Zn. Separately excited synchronous motors: stator reactance outside 20 ... 500 % of Zn. 5: Identified magnetizing reactance lies outside the expected range 50 ... 900 % of Zn. Separately excited synchronous motors: magnetizing reactance outside 20 ... 500 % of Zn.

- 6: Identified rotor time constant lies outside the expected range 10 ms ... 5 s. Separately-excited synchronous motors: damping time constant outside of 5 ms ... 1 s.
- 7: Identified total leakage reactance lies outside the expected range 4 ... 100 % of Zn.
- 8: Identified stator leakage reactance lies outside the expected range 2 ... 50% of Zn. Separately excited synchronous motors: stator leakage reactance outside 2 ...40 % of Zn.
- 9: Identified rotor leakage reactance lies outside the expected range 2 ... 50% of Zn. Separately excited synchronous motors: damping leakage reactance outside 1.5 ...20 % of Zn.
- 10: Motor has been incorrectly connected.
- 11: Motor shaft rotates.
- 12: Ground fault detected.
- 20: Identified threshold voltage of the semiconductor devices lies outside the expected range 0 ... 10 V.
- 30: Current controller in voltage limiting.
- 40: At least one identification contains errors. The identified parameters are not saved to prevent inconsistencies.
- 50: The selected sampling time is too low for the motor identification (p0115[0]).

Note:

Percentage values are referred to the rated motor impedance:

$$Z_n = V_{mot,nom} / \sqrt{3} / I_{mot,nom}$$

Re fault value = 1 ... 40:

- check whether motor data have been correctly entered in p0300, p0304 ... p0311.
- is there an appropriate relationship between the motor power rating and that of the Motor Module? The ratio of the Motor Module to the rated motor current should not be less than 0.5 and not be greater than 4.

- check configuration (star-delta).

Re fault value = 11 in addition:

- Deactivate oscillation monitoring (p1909.7 = 1).

For fault value = 2:

- for parallel circuits, check the motor winding system in p7003. If, for power units connected in parallel, a motor is specified with a single-winding system (p7003 = 0), although a multi-winding system is being used, then a large proportion of the stator resistance is interpreted as feeder cable resistance and entered in p0352.

Re fault value = 4, 7:

- check whether inductances are correctly set in p0233 and p0353.
- check whether motor has been correctly connected (star-delta).
- Set p1909.0 = 1.

For fault value = 12:

- check the power cable connections.
- check the motor.
- check the CT.

For fault value = 50:

- Perform a motor data identification with a higher sampling time, and after this, change to the required higher sampling time (p0115[0]).

A07991 (N)	Drive: Motor data identification activated

Reaction:	NONE
Acknowledge:	NONE
Cause:	The motor data identification routine is activated. The motor data identification routine is carried out at the next power-on command. See also: p1910, p1960
Remedy:	Not necessary. The alarm automatically disappears after the motor data identification routine has been successfully completed or for the setting p1910 = 0 or p1960 = 0. If a POWER ON or a warm restart is performed with motor data identification selected, the motor data identification request will be lost. F07993 Drive: Incorrect direction of rotation of the field or encoder actual value inversion

Message value: -
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY
Cause: Either the direction of the rotating field or the encoder actual value has an incorrect sign. The motor data identification automatically changed the actual value inversion (p0410) in order to correct the control sense. This can result in a direction of rotation change.
Note:
To acknowledge this fault, the correctness of the direction of rotation must first be acknowledged with p1910 = -2.
Remedy: Check the direction of rotation (also for the position controller, if one is being used).
If the direction of rotation is correct, the following applies:
No additional measures are required (except set p1910 = -2 and acknowledge fault).
If the direction of rotation is incorrect, the following applies:
To change the direction of rotation, two phases must be interchanged and the motor identification routine must be repeated.

A07994 (F, N) Drive: motor data identification not performed

Message value: -
Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The "vector control" mode has been selected and a motor data identification has still not been performed.
The alarm is initiated when changing the drive data set (see r0051) in the following cases:
- vector control is parameterized in the actual drive data set (p1300 >= 20).
and
- motor data identification has still not been performed in the actual drive data set (see r3925).
Note:
For SINAMICS G120, a check is made and an alarm is output also when exiting commissioning and when the system powers up.
Remedy: - Perform motor data identification (see p1900).
- If required, parameterize "U/f control" (p1300 < 20).
- switch over to a drive data set, in which the conditions do not apply.

F07996	Drive: Pole position identification routine not carried out
Message value:	-
Drive object:	SERVO, SERVO_AC, SERVO_I_AC
Reaction:	ENCODER (OFF2)
Acknowledge:	IMMEDIATELY
Cause:	In operation, the operating mode that requires a pole position identification was changed over, which is not possible in this state. - the drive was changed over, flying, from encoderless operation to operation with encoder without having previously carried out a pole position identification for the encoder. p1404 is then at a value between zero and the max. speed and the pulses in the speed range above p1404 were enabled without a pole position ident. routine having been previously carried out in operation with encoder. - in operation, an EDS changeover was made to an encoder where it is necessary to carry out a pole position identification. However, this has still not been carried out (p1982 = 1 or 2 and p1992.7 = 0).
Remedy:	- for a flying changeover between operation with and without encoder with pole position identification after POWER ON or commissioning (p0010 not equal to zero) enable the pulses once at zero speed. This means that the pole position identification routine is carried out and the result is available for operation. - carry out the EDS changeover with the pulses inhibited, or, before the changeover, carry out a pole position identification using this data set.

A08511 (F)	COMM BOARD: Receive configuration data invalid
Message value:	%1
Drive object:	A_INF, B_INF, CU_LINK, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The drive unit did not accept the receive configuration data. Alarm value (r2124, interpret decimal): Return value of the receive configuration data check. 1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978. 2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is determined by the number of indices in r2050/p2051 for PZD IF1, and in r8850/p8851 for PZD IF2. 3: Uneven number of bytes for input or output. 4: Setting data for synchronization not accepted. For more information, see A01902. 5: Cyclic operation not active. 17: CBE20 Shared Device: Configuration of the F-CPU has been changed. 223: Illegal clock synchronization for the PZD interface set in p8815[0]. 500: Illegal PROFIsafe configuration for the interface set in p8815[1]. 501: PROFIsafe parameter error (e.g. F_dest). 503: PROFIsafe connection is rejected as long as there is no isochronous connection (p8969). Additional values: Only for internal Siemens troubleshooting.
Remedy:	Check the receive configuration data. Re alarm value = 1, 2: - Check the list of the drive objects with process data exchange (p0978). With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange. Re alarm value = 2: - Check the number of data words for output and input to a drive object. Re alarm value = 17: - CBE20 Shared Device: Unplug/plug A-CPU. Re alarm value = 223, 500: - Check the setting in p8839 and p8815. - Ensure that only one PZD interface is operated in clock synchronism or with PROFIsafe. Re alarm value = 501: - Check the set PROFIsafe address (p9610).

Reaction: NONE
Acknowledge: NONE
Cause: The assignment of the hardware to the PZD interface has been incorrectly parameterized.
 Alarm value (r2124, interpret decimal):
 1: Only one of the two indices is not equal to 99 (automatic).
 2: Both PZD interfaces are assigned to the same hardware.
 3: Assigned COMM BOARD missing.
 4: CBC10 is assigned to interface 1.

Reaction: Infeed: NONE (OFF1, OFF2)
Servo: OFF3 (NONE, OFF1, OFF2)
Vector: OFF3 (NONE, OFF1, OFF2)

Acknowledge: IMMEDIATELY

Cause: A CAN communications error has occurred.
Fault value (r0949, interpret decimal):
1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller.
- bus cable short circuit.
- incorrect baud rate.
- incorrect bit timing.
2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]).
- bus cable interrupted.
- bus cable not connected.
- incorrect baud rate.
- incorrect bit timing.
- master fault.
Note:
The fault response can be set as required using p8641.
See also: p8604 (CAN life guarding), p8641 (CAN Abort Connection Option Code)

Remedy: - check the bus cable
- check the baud rate (p8622).
- check the bit timing (p8623).
- check the master.
The CAN controller must be manually restarted with p8608 = 1 after the cause of the fault has been resolved!

Cause: The know-how protection with copy protection for the memory card is active.
An error has occurred when checking the memory card.
Fault value (r0949, interpret decimal):
0: A memory card is not inserted.
2: An invalid memory card is inserted.
3: The memory card is being used in another Control Unit.
12: An invalid memory card is inserted (OEM input incorrect, p7769).
13: The memory card is being used in another Control Unit (OEM input incorrect, p7759).
See also: p7765 (KHP memory card copy protection)

Remedy: For fault value = 0:
- Insert the correct memory card and carry out POWER ON.
Re fault value = 2, 3, 12, 13:
- contact the responsible OEM.
- Deactivate copy protection (p7765) and acknowledge the fault (p3981).
- Deactivate know-how protection (p7766 ... p7768) and acknowledge the fault (p3981).

Cause: An error was identified when checking the consistency of the protected files. As a consequence, the project on the memory card cannot be run.
Fault value (r0949, interpret hexadecimal):
yyyyxxxx hex: yyyy = object number, xxxx = fault cause
xxxx = 1:
A file has a checksum error.
xxxx = 2:
The files are not consistent with one another.
xxxx = 3:
The project files, which were loaded into the file system via load (download from the memory card), are inconsistent.
Note:

Remedy: - Replace the project on the memory card or replace project files for download from the memory card.
- Restore the factory setting and download again.

F30001 Power unit: Overcurrent

Message value: Fault cause: %1 bin

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit has detected an overcurrent condition.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- U/f operation: Up ramp set too low.
- U/f operation: Rated motor current is significantly greater than that of the Motor Module.
- infeed: High discharge and post-charging currents for voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at power-up due to the missing line reactor.
- power cables are not correctly connected.
- the power cables exceed the maximum permissible length.
- power unit defective.
- line phase interrupted.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (powered down) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.
 Bit 1: Phase V.
 Bit 2: Phase W.
 Bit 3: Overcurrent in the DC link.

Note:
 Fault value = 0 means that the phase with overcurrent is not recognized (e.g. for blocksize device).

Remedy:

- check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star/delta).
- U/f operation: Increase up ramp.
- U/f operation: Check the assignment of the rated currents of the motor and Motor Module.
- infeed: Check the line supply quality.
- infeed: Reduce the motor load.
- infeed: Check the correct connection of the line filter and the line commutating reactor.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.
- check the line supply phases.

For a parallel switching device (r0108.15 = 1) the following additionally applies:

- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).

F30002 Power unit: DC link voltage overvoltage

Message value: %1

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit has detected overvoltage in the DC link.

- motor regenerates too much energy.
- device connection voltage too high.
- when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.
- line phase interrupted.

Fault value (r0949, interpret decimal):
 DC link voltage at the time of trip [0.1 V].

- Remedy:**
- increase the ramp-down time
 - activate the DC link voltage controller
 - use a brake resistor or Active Line Module
 - increase the current limit of the infeed or use a larger module (for the Active Line Module)
 - check the device supply voltage
 - check and correct the phase assignment at the VSM and at the power unit
 - check the line supply phases.

F30002 Power unit: DC link voltage overvoltage

- Message value:** %1
- Drive object:** VECTOR, VECTOR_AC, VECTOR_I_AC
- Reaction:** OFF2
- Acknowledge:** IMMEDIATELY
- Cause:** The power unit has detected overvoltage in the DC link.
- motor regenerates too much energy.
 - device connection voltage too high.
 - when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.
 - line phase interrupted.
- Fault value (r0949, interpret decimal):
DC link voltage at the time of trip [0.1 V].
- Remedy:**
- increase the ramp-down time
 - activate the DC link voltage controller
 - use a brake resistor or Active Line Module
 - increase the current limit of the infeed or use a larger module (for the Active Line Module)
 - check the device supply voltage
 - check and correct the phase assignment at the VSM and at the power unit
 - check the line supply phases.
 - set the rounding times (p1130, p1136). This is particularly recommended in U/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator.
- See also: p0210 (Drive unit line supply voltage), p1240 (Vdc controller or Vdc monitoring configuration)

F30003 Power unit: DC link voltage undervoltage

- Message value:** -
- Drive object:** A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
- Reaction:** OFF2
- Acknowledge:** IMMEDIATELY
- Cause:** The power unit has detected an undervoltage condition in the DC link.
- line supply failure
 - line supply voltage below the permissible value.
 - line supply infeed failed or interrupted.
 - line phase interrupted.
- Note:**
The monitoring threshold for undervoltage in the DC link is indicated in r0296.
- Remedy:**
- check the line supply voltage
 - check the line supply infeed and observe the fault messages relating to it (if there are any)
 - check the line supply phases.
 - check the line supply voltage setting (p0210).
 - booksized units: check the setting of p0278.
- Note:**
The ready signal for the infeed (r0863) must be interconnected to the associated drive inputs (p0864).

F30004 Power unit: Overtemperature heat sink AC inverter

Message value: %1

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The temperature of the power unit heat sink has exceeded the permissible limit value.
 - insufficient cooling, fan failure.
 - overload.
 - ambient temperature too high.
 - pulse frequency too high.
 Fault value (r0949):
 Temperature [1 bit = 0.01 °C].

Remedy:
 - check whether the fan is running.
 - check the fan elements.
 - check whether the ambient temperature is in the permissible range.
 - check the motor load.
 - reduce the pulse frequency if this is higher than the rated pulse frequency.
 Notice:
 This fault can only be acknowledged after this alarm threshold for alarm A05000 has been undershot.

Cause: The power unit was overloaded (r0036 = 100 %).
 - the permissible rated power unit current was exceeded for an inadmissibly long time.
 - the permissible load duty cycle was not maintained.
 Fault value (r0949, interpret decimal):
 I2t [100 % = 16384].

Remedy:
 - reduce the continuous load.
 - adapt the load duty cycle.
 - check the motor and power unit rated currents.

F30027 Power unit: Precharging DC link time monitoring

Message value: Enable signals: %1, Status: %2

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit DC link was not able to be pre-charged within the expected time.

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The pre-charging resistors are overheated as there were too many pre-charging operations per time unit.
- 6) The pre-charging resistors are overheated as the DC link capacitance is too high.
- 7) The pre-charging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The pre-charging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The pre-charging circuit is possibly defective (only for chassis units).
- 11) Infeed is defective and/or fuse has ruptured in the Motor Module (only Booksize units).

Fault value (r0949, interpret binary):

yyyyxxxx hex:

yyyy = power unit state

0: Fault status (wait for OFF and fault acknowledgement).

1: Restart inhibit (wait for OFF).

2: Overvoltage condition detected -> change into the fault state.

3: Undervoltage condition detected -> change into the fault state.

4: Wait for bridging contactor to open -> change into the fault state.

5: Wait for bridging contactor to open -> change into restart inhibit.

6: Commissioning.

7: Ready for pre-charging.

8: Pre-charging started, DC link voltage less than the minimum switch-on voltage.

9: Pre-charging, DC link voltage end of pre-charging still not detected.

10: Wait for the end of the de-bounce time of the main contactor after pre-charging has been completed.

11: Pre-charging completed, ready for pulse enable.

12: It was detected that the STO terminal was energized at the power unit.

xxxx = Missing internal enable signals, power unit (inverted bit-coded, FFFF hex -> all internal enable signals available)

Bit 0: Power supply of the IGBT gating shut down.

Bit 1: Ground fault detected.

Bit 2: Peak current intervention.

Bit 3: I2t exceeded.

Bit 4: Thermal model overtemperature calculated.

Bit 5: (heat sink, gating module, power unit) overtemperature measured.

Bit 6: Reserved.

Bit 7: Overvoltage detected.

Bit 8: Power unit has completed pre-charging, ready for pulse enable.

Bit 9: STO terminal missing.

Bit 10: Overcurrent detected.

Bit 11: Armature short-circuit active.

Bit 12: DRIVE-CLiQ fault active.
 Bit 13: Vce fault detected, transistor de-saturated due to overcurrent/short-circuit.
 Bit 14: Undervoltage detected.
 See also: p0210 (Drive unit line supply voltage)

Remedy:

In general:
 - check the line supply voltage at the input terminals.
 - check the line supply voltage setting (p0210).
 For booksize drive units, the following applies:
 - wait (approx. 8 minutes) until the pre-charging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.
 Re 5):
 - carefully observe the permissible pre-charging frequency (refer to the appropriate Equipment Manual).
 Re 6):
 - check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC-link capacitance if necessary (refer to the appropriate Equipment Manual)
 Re 7):
 - interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link
 Re 8):
 - check the connections of the external line contactor. The line contactor must be open during DC-link fast discharge.
 Re 9):
 - check the DC link for ground faults or short circuits.
 Re 11):
 - Check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).
 If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: Before the last restart, a problem occurred at the power unit power supply.
 The voltage monitor in the internal FPGA of the PSA signals an undervoltage fault on the module.
 Fault value (r0949, interpret decimal):
 Register value of the voltage fault register.
Remedy: - check the 24 V DC voltage supply to power unit.
 - carry out a POWER ON (power off/on) for the component.
 - replace the module if necessary.

Reaction upon F: Infeed: NONE (OFF1, OFF2)
 Servo: NONE (OFF1, OFF2)

Message value: %1
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The flowrate of the cooling unit has fallen below the fault threshold.
Remedy: - Check the feedback signals and parameter assignment (p0260 ... p0267).
 - Check the coolant feed.
 - Check the thermal conductivity of the coolant.
 - Check the coolant concentration.

A30048 Power unit: External fan faulty

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The feedback signal from the external fan indicates a fault.
 - fan faulty, blocked.
 - feedback signal inaccurate.
Remedy: - check the external fan and replace if necessary.
 - if you are using an external fan with feedback, check its wiring (X12.2 or X13.2).
 Note:
 If you are using an external fan without feedback, check that the feedback terminal wiring on the power unit is connected to ground and make this connection if necessary (X12.1/2 or X13.1/2).

A30049 Power unit: Internal fan faulty

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE

Cause: The internal fan has failed.
Remedy: Check the internal fan and replace if necessary.

F30050 Power unit: 24 V supply overvoltage

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: POWER ON
Cause: The voltage monitor signals an overvoltage fault on the module.
Remedy: - check the 24 V power supply.
- replace the module if necessary.

F30052 EEPROM data error

Message value: %1
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: POWER ON
Cause: EEPROM data error of the power unit module.
Fault value (r0949, interpret decimal):
0, 2, 3, 4:
The EEPROM data read in from the power unit module are incorrect.
1:
EEPROM data is not compatible to the firmware of the power unit application.
Additional values:
Only for internal Siemens troubleshooting.
Remedy: Re fault value = 0, 2, 3, 4:
Replace the power unit module or update the EEPROM data.
For fault value = 1:
The following applies for CU31x and CUA31:
Update the firmware \SIEMENS\SINAMICS\CODE\SAC\cu31xi.ufw (cua31.ufw)

F30053 FPGA data faulty

A30054 (F) Power unit: Undervoltage when opening the brake

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: When the brake is being opened, it is detected that the power supply voltage is less than $24\text{ V} - 10\% = 21.6\text{ V}$.
Alarm value (r2124, interpret decimal):
Supply voltage fault [0.1 V].
Example:
Alarm value = 195 --> voltage = 19.5 V
Remedy: Check the 24 V voltage for stability and value.
Reaction upon F: NONE (OFF1, OFF2, OFF3)

F30055 Power unit: Braking chopper overcurrent

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: An overcurrent condition has occurred in the braking chopper.

Remedy:

- check whether the braking resistor has a short circuit.
- for an external braking resistor, check whether the resistor may have been dimensioned too small.

Note:
The braking chopper is only enabled again at pulse enable after the fault has been acknowledged.

A30057 Power unit: Line asymmetry

Message value: %1

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed.
Fault F30011 is output if the alarm is present and at the latest after 5 minutes.
The precise duration depends on the power unit type and the particular frequencies.
Alarm value (r2124, interpret decimal):
Only for internal Siemens troubleshooting.

Remedy:

- check the line phase connection.
- check the motor feeder cable connections.

If there is no phase failure of the line or motor, then line asymmetry is involved.

- reduce the power in order to avoid fault F30011.

F30059 Power unit: Internal fan faulty

Message value: -

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2

Message value: Fault cause: %1 bin

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (NONE, OFF1)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: A feedback signal for the pre-charging contactor (ALM, SLM, BLM diode) or the line contactor (BLM thyristor) interconnected and the monitoring activated.
After switching-in/switching-out the contactor, a correct feedback signal was not received within the monitoring time set in p0255[0].
Fault value (r0949, interpret binary):
Bit 0: The time set in p0255[0] was exceeded when switching-in/switching-out the contactor.
Bit 1: The pre-charging contactor was opened while pre-charging or in the infeed mode (BLM thyristor).
Bit 2: The pre-charging contactor was switched-in in the OFF state or during infeed operation.

Remedy:

- check the monitoring time setting (p0255[0]).
- check the contactor wiring and activation.
- replace the contactor.

Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF2 (NONE, OFF1)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: A feedback signal for the bypass contactor is interconnected and the monitoring activated.
After switching-in/switching-out the contactor, a correct feedback signal was not received within the monitoring time set in p0255[1].

Fault value (r0949, interpret binary):
 Bit 0: The time set in p0255[1] was exceeded when switching-in/switching-out the contactor.
 Bit 1: The bypass contactor was opened in operation.
 Bit 2: The bypass contactor was switched-in in the OFF state or during pre-charging.

Remedy:
 - check the monitoring time setting (p0255[1]).
 - check the contactor wiring and activation.
 - replace the contactor.

Cause: A cycle is requested that is not supported by the power unit.
 Fault value (r0949, interpret hexadecimal):
 0: The current control cycle is not supported.
 1: The DRIVE-CLiQ cycle is not supported.
 2: Internal timing problem (clearance between RX and TX instants too low).
 3: Internal timing problem (TX instant too early).

Remedy: The power unit only supports the following cycles:
 62.5 µs, 125 µs, 250 µs and 500 µs
 For fault value = 0:
 Set a permitted current control cycle.
 For fault value = 1:
 Set a permitted DRIVE-CLiQ cycle.
 Re fault value = 2, 3:

Message value: %1
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: Communications between the Control Unit (CU) and Power Module (PM) via the interface no longer possible. The CU may have been withdrawn or is incorrectly inserted.
 Fault value (r0949, interpret hexadecimal):
 0 hex:
 - a Control Unit with external 24 V supply was withdrawn from the Power Module during operation.
 - with the Power Module switched off, the external 24 V supply for the Control unit was interrupted for some time.
 1 hex:
 The Control Unit was withdrawn from the Power Module during operation, although the encoderless safe motion monitoring functions are enabled. This is not supported. After re-inserting the Control Unit in operation, communications to the Power Module no longer possible.
 20A hex:
 The Control Unit was inserted on a Power Module, which has another code number.
 20B hex:
 The Control Unit was inserted on a Power Module, which although it has the same code number, has a different serial number.
 601 hex:
 The Control Unit was inserted on a Power Module, whose power/performance class (chassis unit) is not supported.
Remedy: Reinsert the Control Unit (CU) or the Control Unit adapter (CUAxx) onto the original Power Module and continue operation. If required, carry out a POWER ON for the CU and/or the CUA.

F30080 Power unit: Current increasing too quickly

Message value: Fault cause: %1 bin
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The power unit has detected an excessive rate of rise in the overvoltage range.
 - closed-loop control is incorrectly parameterized.
 - motor has a short-circuit or fault to ground (frame).
 - U/f operation: Up ramp set too low.
 - U/f operation: rated current of motor much greater than that of power unit.
 - infeed: High discharge and post-charging currents for voltage dip.

 - infeed: Short-circuit currents at power-up due to the missing line reactor.
 - power cables are not correctly connected.
 - power cables exceed the maximum permissible length.
 - power unit defective.
 Additional causes for a parallel switching device (r0108.15 = 1):
 - a power unit has tripped (powered down) due to a ground fault.
 - the closed-loop circulating current control is either too slow or has been set too fast.
 Fault value (r0949, interpret bitwise binary):
 Bit 0: Phase U.
 Bit 1: Phase V.
 Bit 2: Phase W.
Remedy:
 - check the motor data - if required, carry out commissioning.
 - check the motor circuit configuration (star-delta)
 - U/f operation: Increase up ramp.
 - U/f operation: Check assignment of rated currents of motor and power unit.
 - infeed: Check the line supply quality.
 - infeed: Reduce the motor load.

- infeed: Correct connection of the line reactor.
 - check the power cable connections.
 - check the power cables for short-circuit or ground fault.
 - check the length of the power cables.
 - replace power unit.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
 - check the setting of the closed-loop circulating current control (p7036, p7037).

Reaction: NONE
Acknowledge: NONE
Cause: The Motor Module has detected a communication error with the higher-level control or the TM54F to transfer the safety-relevant information or there is a communication error between Motor Modules connected in parallel.
Note:
This fault results in a STOP A that can be acknowledged.
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: For the higher-level control, the following applies:
- check the PROFIsafe address in the higher-level control and Motor Modules and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.
For TM54F, carry out the following steps:
- start the copy function for the node identifier (p9700 = 1D hex).
- acknowledge hardware CRC (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.
For a parallel connection, the following applies:
- check the PROFIsafe address in the Control Unit and Motor Module and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.
The following generally applies:
- upgrade the Motor Module software.

F30688 SI Motion MM: Actual value synchronization not permissible

Message value: -
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: - It is not permissible to enable actual value synchronization for a 1-encoder system.
 - It is not permissible to simultaneously enable actual value synchronization and a monitoring function with absolute reference (SCA/SLP).
 - It is not permissible to simultaneously enable actual value synchronization and safe position via PROFIsafe.
 Note:
 This fault results in a STOP A that cannot be acknowledged.
Remedy: - Either select the "actual value synchronization" function or parameterize a 2-encoder system.
 - Either de-select the function "actual value synchronization" or the monitoring functions with absolute reference (SCA/SLP) and carry out a POWER ON.
 - Either deselect the "actual value synchronization" function or do not enable "Safe position via PROFIsafe".

Cause: Safety parameters have been changed; these will only take effect following a warm restart or POWER ON.
 Notice:
 All changed parameters of the safety motion monitoring functions will only take effect following a warm restart or POWER ON.
 Alarm value (r2124, interpret decimal):
 Parameter number of the safety parameter which has changed, necessitating a warm restart or POWER ON.

Remedy:

- carry out a warm restart (p0009 = 30, p0976 = 2, 3).
- carry out a POWER ON (power off/on) for all components.

Note:
Before performing an acceptance test, a POWER ON must be carried out for all components.

C30711 SI Motion MM: Defect in a monitoring channel

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.
 If at least one monitoring function is active, then after the parameterized timer has expired, the message C30701 "SI Motion: STOP B initiated" is output. The message is output with message value 1031 when the Sensor Module hardware is replaced.

The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- differently parameterized cycle times (p9500/p9300, p9511/p9311).
- differently parameterized axis types (p9502/p9302).
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 ... 999:

Number of the cross-compared data that resulted in this message.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.

1001: Initialization error of watchdog timer.

1003: Reference tolerance exceeded. When the user agreement is set, the difference between the new reference point that has been determined after power up (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9344). In this case, the user agreement is withdrawn.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the actual value from the encoder.

1020: Cyc. communication failure between the monit. cycles.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder

1024: Sign-of-life error for HTL/TTL encoders.

1030: Encoder fault detected from another monitoring channel.

1031: Data transfer error between the monitoring channel and the Sensor Module (p9526/p9326).

1040: Pulses suppressed with active encoderless monitoring functions.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Actual current values plausibility error.

1045: CRC of the standstill position incorrect.

5000 ... 5140:

PROFIsafe message values.

For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these fault values, the failsafe control signals (failsafe values) are transferred to the safety functions.

The significance of the individual message values is described in safety fault F01611 of the Control Unit.

7000 ... 7002:

Message values of the "Safe position via PROFIsafe" function.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

Remedy:

Re message value = 1002:

- Perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 2 s).

Re message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- Increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

Re message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

Re message value = 1024:

- check the communication link.
- increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (power off/on) for all components. - replace the hardware.

Re message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1040:

- de-select encoderless monitoring functions, select and de-select STO.
- if monitoring function is active, issue "SLS" pulse enable within 5 s of de-selecting STO.

Re message value = 6000 ... 6999:

- The significance of the individual message values is described in safety fault F01611 of the Control Unit.

Re other message values:

- the significance of the individual message values is described in safety message C01711.

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C30711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, the safety message C30701 "SI Motion: STOP B initiated" is output after the parameterized timer has expired.

Message value (r9749, interpret decimal):

Number of the cross-compared data that resulted in this message.

Refer to the description of the message values in safety message C01712.

Remedy:

- check parameterization in the parameters involved and correct if required.

- ensure equality by copying the SI data to the second channel and then carry out an acceptance test.

- check monitoring clock cycle for equality (p9500, p9300).

C30770 SI Motion MM: Discrepancy error affecting the fail-safe inputs/outputs

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The fail-safe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002 / p10102.
 Fault value (r0949, interpret hexadecimal):
 yyyyxxxx hex
 xxxx: Discrepancy error for fail-safe digital inputs (F-DI).
 Bit 0: Discrepancy error for F-DI 0
 Bit 1: Discrepancy error for F-DI 1
 ...
 yyyy: Discrepancy error for fail-safe digital outputs (F-DO).
 Bit 0: Discrepancy error for F-DO 0
 ...

Note:
 If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.

Remedy: - check the wiring of the F-DI (contact problems).
Note:
 This message can be acknowledged via F-DI or PROFIsafe.
 Discrepancy errors of an F-DI can only be completely acknowledged if safe acknowledgement was carried out once the cause of the error was resolved (p10006 or acknowledgment via PROFIsafe). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally.
 For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency.
 If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked:
 - $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)
 - $p10002 \geq p9500$ (discrepancy time must be no less than p9500)
 - $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply)
 td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9500).
 tp = period for a switching operation in ms.
 When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.
 If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.
 - $p10002 < p10017 + 1 \text{ ms} - td$
 - $p10002 > td$
 - $p10002 \geq p9500$
Example:
 For a 12 ms SI monitoring cycle and a switching frequency of 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:
 $p10002 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$
 Rounded-off, $p10002 \leq 36 \text{ ms}$ is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).

 Y = 4: Expected states of the diag DOs were not fulfilled (CU305: internal readback on MM channel).
 Y = 5: Expected states of the second diag DOs were not fulfilled (CU305: internal readback on CU channel).
 X and V indicate the DI or Diag-DO state dependent upon the reason for the fault (2, 4 or 5).
 In the event of multiple test stop faults, the first one that occurred is shown.
 Z: Test stop state and associated test actions
 Z = 0 ... 3: Synchronization phase of test stop between CU and Motor Module no switching operations

Example:

Fault F01773 (CU) is signaled with fault value = 0001_0127 and fault F30773 (MM) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the MM indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on the other channel (CU).

Remedy:

Check the wiring of the F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

In the event of multiple test stop faults, the first one that occurred is shown.

Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

SI Motion MM: Axis not safely referenced

Message value:

%1

Drive object:

SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

NONE

Acknowledge:

IMMEDIATELY (POWER ON)

Cause:

The standstill position saved before powering down does not match the actual position determined at power-up.

Message value (r9749, interpret decimal):

1: Axis not referenced.

2: User agreement missing.

Remedy:

If safe automatic referencing is not possible the user must issue a user agreement for the new position using the softkey. This mean that this position is then designated as safety-relevant.

 Vector: ENCODER (IASC/DCBRK, OFF1, OFF2, OFF3, STOP1, STOP2)
Acknowledge: PULSE INHIBIT
Cause: The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.
 The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).
 Fault value (r0949, interpret decimal):
 Last measured zero mark distance in increments (4 increments = 1 encoder pulse).
 The sign designates the direction of motion when detecting the zero mark distance.
 See also: p0491 (Motor encoder fault response ENCODER)
Remedy:
 - check that the encoder cables are routed in compliance with EMC.
 - check the plug connections
 . check the encoder type (encoder with equidistant zero marks).
 - adapt the parameter for the distance between zero marks (p0424, p0425).
 - if message output above speed threshold, reduce filter time if necessary (p0438).

Acknowledge: PULSE INHIBIT

Cause: The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is under-shot.

Fault value (r0949, interpret hexadecimal):
 yyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)
 The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.
 The response threshold for the differential signal level of the encoder is < -1600 mV.
 A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:
 The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.

The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).
- Monitoring active (p0437.31 = 1).

See also: p0491 (Motor encoder fault response ENCODER)

- Remedy:**
- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
 - check that the encoder cables and shielding are routed in compliance with EMC.
 - check the plug connections and contacts of the encoder cable.
 - . check the encoder type (encoder with zero marks).
 - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly

Servo: ENCODER (IASC/DCBRK, NONE)

Vector: ENCODER (IASC/DCBRK, NONE)

Acknowledge: PULSE INHIBIT

Cause: The amplitude of track A or B for encoder 1 exceeds the permissible tolerance band.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV. This fault also occurs if the A/D converter is overcontrolled.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for sensors modules for resolvers (e. g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Cause: The amplitude (root of $A^2 + B^2$ or $|A| + |B|$) for encoder 1 exceeds the permissible tolerance.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = Amplitude, i.e. root from $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold for $(|A| + |B|)$ is > 1120 mV or the root of $(A^2 + B^2)$ > 955 mV.

A signal level of 500 mV peak value corresponds to the numerical value of 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Acknowledge: PULSE INHIBIT

Cause: The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical.

One period of track C/D corresponds to 360 ° mechanical.

One period of the Hall signal corresponds to 360 ° electrical.

The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A31429.

Fault value (r0949, interpret decimal):

For track C/D, the following applies:

Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °).

For Hall signals, the following applies:

Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

 - correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
 - check that the encoder cables are routed in compliance with EMC.

Cause: After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.

When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.

When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.

Acknowledge: PULSE INHIBIT

Cause: Absolute encoder:
 When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.
 Limit value for the deviation:
 - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).
 - other encoders: 15 pulses = 60 quadrants.
 Incremental encoder:
 When the zero pulse is passed, a deviation in the incremental position was detected.
 For equidistant zero marks, the following applies:
 - The first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.
 For distance-coded zero marks, the following applies:
 - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.
 Fault value (r0949, interpret decimal):
 Deviation in quadrants (1 pulse = 4 quadrants).

 - check the plug connections
 - replace the encoder or encoder cable
 - check whether the coding disk is dirty or there are strong ambient magnetic fields.
 - adapt the parameter for the clearance between zero marks (p0425).

Cause:	The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical. One period of track C/D corresponds to 360 ° mechanical. One period of the Hall signal corresponds to 360 ° electrical. The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

Alarm value (r2124, interpret decimal):

Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

Cause:	When powered down, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r0477. See also: p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)
Remedy:	Reset the position tracking as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - de-select encoder commissioning (p0010 = 0). The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507). See also: p0010, p2507

A31811 (F, N) Encoder 1: Encoder serial number changed

Message value: -

Drive object: A_INF, B_INF, ENC, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).
 Cause 1:
 - The encoder was replaced.
 Cause 2:
 - A third-party, built-in or linear motor was re-commissioned.
 Cause 3:
 - The motor with integrated and adjusted encoder was replaced.
 Cause 4:
 - The firmware was updated to a version that checks the encoder serial number.
 Note:
 With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).
 When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).
 Proceed as follows to hide serial number monitoring:
 - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.
 - parameterize F07414 as message type N (p2118, p2119).
 See also: p0491 (Motor encoder fault response ENCODER)

Remedy: Re causes 1, 2:
 Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.
 SERVO:
 If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.
 or
 Set the adjustment via p0431. In this case, the new serial number is automatically accepted.
 or
 Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.
 Re causes 3, 4:
 Accept the new serial number with p0440 = 1.

Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP1, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections . check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 2. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is under-shot.
 Fault value (r0949, interpret hexadecimal):
 yyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)
 The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.
 The response threshold for the differential signal level of the encoder is < -1600 mV.
 A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:
 The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.

The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).

The signal level is not evaluated unless the following conditions are satisfied:

- Sensor Module properties available (r0459.31 = 1).
- Monitoring active (p0437.31 = 1).

- Remedy:**
- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
 - check that the encoder cables and shielding are routed in compliance with EMC.
 - check the plug connections and contacts of the encoder cable.
 - . check the encoder type (encoder with zero marks).
 - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly
 - replace the encoder cable.

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: NONE

Acknowledge: NONE

Cause: The measured zero mark distance does not correspond to the parameterized zero mark distance.
 For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.
 The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).
 Alarm value (r2124, interpret decimal):
 Last measured zero mark distance in increments (4 increments = 1 encoder pulse).
 The sign designates the direction of motion when detecting the zero mark distance.

Reaction:	NONE

Cause:	For the actual value sensing, an error was detected. As a result of this error, it must be assumed that the actual value sensing supplies an incorrect coarse position. Alarm value (r2124, interpret decimal): 3: The absolute position of the serial protocol and track A/B differ by half an encoder pulse. The absolute position must have its zero position in the quadrants in which both tracks are negative. In the case of a fault, the position can be incorrect by one encoder pulse.
Remedy:	Re alarm value = 3: - For a standard encoder with cable, contact the manufacturer where relevant. - correct the assignment of the tracks to the position value that is serially transferred. To do this, the two tracks must be connected, inverted, at the Sensor Module (interchange A with A* and B with B*) or, for a programmable encoder, check the zero offset of the position.

Cause:	The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical. Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.

For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.

For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

Remedy:

The fault should be resolved as follows:

- select encoder commissioning (p0010 = 4).

- reset the position tracking as follows (p0411.2 = 1).

Cause:	When evaluating the temperature sensor, an error occurred. Fault cause: 1 (= 01 hex): Wire breakage or sensor not connected (KTY: R > 1630 Ohm). 2 (= 02 hex): Measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm). Additional values: Only for internal Siemens troubleshooting.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = channel number, xx = error cause

Remedy:

- check that the encoder cable is the correct type and is correctly connected.
- check the temperature sensor selection in p0600 to p0603.
- replace the Sensor Module (hardware defect or incorrect calibration data).

Cause: For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card.

The diagnostics data is saved in the following folder:

/USER/SINAMICS/DATA/SMTRC00.BIN

...

/USER/SINAMICS/DATA/SMTRC07.BIN

/USER/SINAMICS/DATA/SMTRCIDX.TXT

The following information is contained in the TXT file:

- Display of the last written BIN file.

- Number of write operations that are still possible (from 10000 downwards).

Note:

Only Siemens can evaluate the BIN files.

Remedy: Not necessary.

The alarm disappears automatically.

The data logger is ready to record the next fault case.

Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP1, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections . check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable

Cause: The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 3.
 The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is under-shot.
 Fault value (r0949, interpret hexadecimal):
 yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)
 The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.
 The response threshold for the differential signal level of the encoder is < -1600 mV.
 A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.
 Note:
 The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.
 The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).
 The signal level is not evaluated unless the following conditions are satisfied:

Remedy:
 - check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
 - check that the encoder cables and shielding are routed in compliance with EMC.
 - check the plug connections and contacts of the encoder cable.
 . check the encoder type (encoder with zero marks).

Acknowledge: PULSE INHIBIT

Cause: The amplitude (root of $A^2 + B^2$ or $|A| + |B|$) for encoder 3 exceeds the permissible tolerance.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = Amplitude, i.e. root from $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold for $(|A| + |B|)$ is > 1120 mV or the root of $(A^2 + B^2) > 955$ mV.

A signal level of 500 mV peak value corresponds to the numerical value of 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Remedy:
 - check that the encoder cables and shielding are routed in compliance with EMC.
 - replace the encoder or encoder cable

F33129 (N, A) Encoder 3: Position difference hall sensor/track C/D and A/B too large

Message value: %1

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

Acknowledge: PULSE INHIBIT

Cause: The error for track C/D is greater than $\pm 15^\circ$ mechanical or $\pm 60^\circ$ electrical or the error for the Hall signals is greater than $\pm 60^\circ$ electrical.

One period of track C/D corresponds to 360° mechanical.

One period of the Hall signal corresponds to 360° electrical.

The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A33429.

Fault value (r0949, interpret decimal):

For track C/D, the following applies:

Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1°).

For Hall signals, the following applies:

Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1°).

Remedy:
 - track C or D not connected.
 - correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
 - check that the encoder cables are routed in compliance with EMC.
 - check the adjustment of the Hall sensor.

Cause: After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.
 When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.
 When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.
 Fault value (r0949, interpret hexadecimal):
 yyyyxxxx hex
 yyyy: Determined mechanical zero mark position (can only be used for track C/D).
 xxxx: Deviation of the zero mark from the expected position as electrical angle.
 Scaling: 32768 dec = 180 °
Remedy:
 - check that the encoder cables are routed in compliance with EMC.
 - check the plug connections
 - if the Hall sensor is used as an equivalent for track C/D, check the connection.
 - Check the connection of track C or D.

Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP1, STOP2)
Acknowledge: PULSE INHIBIT
Cause: Absolute encoder:
 When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.
 Limit value for the deviation:
 - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQ1 1325 > 2 quadrants, EQN 1325 > 50 quadrants).
 - other encoders: 15 pulses = 60 quadrants.
 Incremental encoder:
 When the zero pulse is passed, a deviation in the incremental position was detected.
 For equidistant zero marks, the following applies:
 - The first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.
 For distance-coded zero marks, the following applies:
 - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.
 Fault value (r0949, interpret decimal):
 Deviation in quadrants (1 pulse = 4 quadrants).

- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
 - check the plug connections
 - replace the encoder or encoder cable
 - check whether the coding disk is dirty or there are strong ambient magnetic fields.
 - adapt the parameter for the clearance between zero marks (p0425).

Cause: The amplitude (C^2 + D^2) of track C or D of the encoder or from the Hall signals, is not within the tolerance band-width.

Alarm value (r2124, interpret hexadecimal):
 yyyyxxxx hex:
 yyyy = Signal level, track D (16 bits with sign).
 xxxx = Signal level, track C (16 bits with sign).
 The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).
 The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.
 A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.
 Note:
 If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

Cause: The amplitude (root of A² + B²) for encoder 3 exceeds the permissible tolerance.
 Alarm value (r2124, interpret hexadecimal):
 yyyyxxxx hex:
 yyyy = Angle
 xxxx = Amplitude, i.e. root from A² + B² (16 bits without sign)
 The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).
 The response threshold is < 230 mV (observe the frequency response of the encoder).
 A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.
 The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.
 Note for sensors modules for resolvers (e. g. SMC10):
 The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).
 A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.
 Note:
 The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

- Remedy:**
- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
 - check that the encoder cables and shielding are routed in compliance with EMC.
 - check the plug connections
 - replace the encoder or encoder cable
 - check the Sensor Module (e.g. contacts).

Alarm value (r2124, interpret decimal):

3: The absolute position of the serial protocol and track A/B differ by half an encoder pulse. The absolute position must have its zero position in the quadrants in which both tracks are negative. In the case of a fault, the position can be incorrect by one encoder pulse.

Remedy:

Re alarm value = 3:

- For a standard encoder with cable, contact the manufacturer where relevant.
- correct the assignment of the tracks to the position value that is serially transferred. To do this, the two tracks must be connected, inverted, at the Sensor Module (interchange A with A* and B with B*) or, for a programmable encoder, check the zero offset of the position.

Message value: -

Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.
 For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.
 For p0411.3 = 1, the maximum traversing range for the configured linear axis is pre-set (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

Remedy: The fault should be resolved as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).

Cause:	<p>The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).</p> <p>- The encoder was replaced.</p> <p>Note:</p> <p>With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).</p> <p>When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).</p>

Proceed as follows to hide serial number monitoring:
 - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

Remedy: Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

F33912	Encoder 3: Device combination is not permissible
Message value:	%1
Drive object:	SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF1 (IASC/DCBRK, NONE)
Acknowledge:	PULSE INHIBIT
Cause:	<p>The selected device combination is not supported. Fault value (r0949, interpret decimal): 1003: The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of 2^n.</p>

1005:
The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.

1006:
The maximum duration (31.25 µs) of the EnDat transfer was exceeded.

2001:
The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.

2002:
The resolution of the linear measuring unit does not match the pole pair width of the linear motor

Remedy:
Re fault value = 1003, 1005, 1006:
- Use a measuring unit that is permissible.
For fault value = 2001:
- Set a permissible cycle combination (if required, use standard settings).
For fault value = 2002:
- Use a measuring unit with a lower resolution (p0422).

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The configuration for encoder 3 is incorrect.
 Alarm value (r2124, interpret decimal):
 1:
 Re-parameterization between fault/alarm is not permissible.
 419:
 When the fine resolution Gx_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.

Remedy:
 Re alarm value = 1:
 No re-parameterization between fault/alarm.
 Re alarm value = 419:
 Reduce the fine resolution (p0419) or deactivate the monitoring (p0437.25), if the complete multiturn range is not required.

Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP1, STOP2)
Acknowledge: IMMEDIATELY
Cause: A parameter of encoder 3 was detected as being incorrect.
 It is possible that the parameterized encoder type does not match the connected encoder.
 The parameter involved can be determined as follows:
 - determine the parameter number using the fault value (r0949).
 - determine the parameter index (p0187).
 Fault value (r0949, interpret decimal):
 Parameter number.
Note:
 This fault is only output for encoders where r0404.10 = 1 or r0404.11 = 1. It corresponds to A33905 with encoders where r0404.10 = 0 and r0404.11 = 0.

Remedy:
 - check whether the connected encoder type matches the encoder that has been parameterized.
 - correct the parameter specified by the fault value (r0949) and p0187.

Reaction: NONE
Acknowledge: NONE
Cause: When evaluating the temperature sensor, an error occurred.
 Fault cause:
 1 (= 01 hex):
 Wire breakage or sensor not connected (KTY: R > 1630 Ohm).
 2 (= 02 hex):
 Measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm).

 The expected states to be checked depend on the parameterized test mode (p10047).
 The following expected states are tested in the test steps when testing the F-DOs:
 The display format is as follows:
 Test step (SL MA): Expected Diag-DO mode 1 | Expected DI 20 ... 23 mode 2 | Expected DI 20 ... 23 mode 3
 (4C hex 57 hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V
 (62 hex 6D hex): Diag-DO = 0 V | DI = 0 V | DI = 0 V
 (78 hex 83 hex): Diag-DO = 0 V | DI = 0 V | DI = 24 V
 (8E hex 99 hex): Diag-DO = 24 V | DI = 0 V | DI = 24 V
 (A4 hex AF hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V
 Example:
 If an error with fault causes bb = 02 hex or 04 hex occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.
 Master signals fault value 0001_04AF and slave signals fault value 0001_04A4.
 aaaa = 1 --> F-DO 0 is involved.
 bb = 04 hex --> the test of the Diag-DO was unsuccessful.
 cc = The expected states were tested in test stop step AF on the master and A4 on the slave.
 The expected state Diag-DO = 0 V was checked in the table, i.e. Diag-DO was at 0 V instead of the expected 24 V.
 The associated test action took place in the previous step (99 hex DO OFF, A4 hex DO OFF). Both DOs were switched to OFF.

Remedy: Check the wiring of the F-DIs and F-DOs and restart the test stop.
 Note:
 The fault is withdrawn if the test stop is successfully completed.
 For fault value = CCCCCCCC hex, DDDDDDDD hex, EEEEEEEE hex the following applies:
 These fault values occur together with fault F35152. In this case, all parameters for the test stop should be checked.
 You should also check whether the firmware version of the TM54F matches that of the Control Unit.
 You also need to check p10001, p10017, p10046 and p10047.
 A POWER ON must be carried out after correcting the parameters.

Reaction:	NONE
Acknowledge:	NONE
Cause:	- after powering up the drive, a test stop has still not been carried out. - a new test stop is required after commissioning. - the time to carry out the forced checking procedure (test stop) has expired (p10003).
Remedy:	Initiate test stop (BI: p10007).

A35015	TM54F: Motor Module replaced or configuration inconsistent
Message value:	Fault cause: %1 bin
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	Cyclic communication of at least one drive with the Terminal Module 54F (TM54F) is not active. Possible causes: - at least one Motor Module was replaced (e.g. hardware was replaced). - The parameterization of the TM54F (p10010) is inconsistent with the number of axes, which have drive-based motion monitoring functions activated with TM54F. - For the signaled axis, it is not permissible that the "Safe motion monitoring without selection" (p9601.5 = 1) is parameterized. - And activated drive has no communication via DRIVE-CLiQ. - p10010 of the TM54F master module is not the same as p10010 of the TM54F slave module (in this case, F35051 is also output). - In p10010 of the TM54F master or slave module, the number of a drive object was entered several times.

Fault value (r0949, interpret binary):

yyyy yyyy xxxx xxxx bin

xxxx xxxx bin: inconsistent configuration

Bit 0 = 1: No communication with drive 1.

...

Bit 5 = 1: No communication with drive 6.

yyyy yyyy bin: Motor Module replaced or a DRIVE-CLiQ cable of a Motor Module not inserted.

Bit 8 = 1: Motor Module from drive 1 was replaced or does not communicate.

...

Bit 13 = 1: Motor Module from drive 6 was replaced or does not communicate.

Note:

When this fault is present, none of the drives listed in the fault value, which have drive-based motion monitoring functions operating with TM54F, are enabled.

For fault value = 0:

The number of drive objects specified in p10010 is not equal to the number of drives that have drive-based motion monitoring functions that have been enabled.

See also: p10010 (SI drive object assignment)

Remedy:

For all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).

Check as to whether F35051 is also output and remove the cause.

Check whether each drive object number is listed only once in the indices of p10010.

Note:

If a drive was deactivated and activated without first having established the DRIVE-CLiQ connection, then this alarm is also output.

When replacing a Motor Module, carry out the following steps:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).

- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).

- save all parameters (p0977 = 1).

- carry out a POWER ON (power off/on) for all components.

For SINUMERIK, the following applies:

HMI supports the replacement of components with Safety functions (operating area "Diagnostics" --> Softkey "Alarm list" --> Softkey "Confirm SI HW" etc.).

The precise procedure is given in the following document:

SINUMERIK Function Manual Safety Integrated

TM54F: Net data communication with drive not established

Message value:

Drive object:

A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Reaction:

NONE

Acknowledge:

NONE

Cause:

The cyclic net data communication within the Terminal Module 54F (TM54F) is still not active.

This message is output after the TM54F master and TM54F slave have booted and is automatically withdrawn as soon as communications have been established.

If a drive does not communicate with the TM54F, then none of the drives parameterized in p10010 are enabled.

Remedy:

When replacing a Motor Module, carry out the following steps:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).

- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).

- save all parameters (p0977 = 1).

- carry out a POWER ON (power off/on) for all components.

The following always applies:

- for all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).

- check whether fault F35150 is present and if required, remove the cause of the fault.

Cause:	The Terminal Module 54F (TM54F) has identified an error in the crosswise data comparison between the two control channels. This can be the result of incorrect parameterization. However, a fault may have occurred, which was identified by the Safety Integrated software (e.g. defective hardware). Remedy:

Carry out the following steps on the TM54F:
 - check the specified parameters for incorrect parameterization.
 - activate the safety commissioning mode (p0010 = 95).
 - start the copy function for SI parameters (p9700 = 57 hex).
 - acknowledge complete data change (p9701 = AC hex).
 - exit the safety commissioning mode (p0010 = 0).
 - save all parameters (p0977 = 1).
 - carry out safe acknowledgement (p10006).
 For an internal software error (aaaa > 0):
 - For TM54F, upgrade the firmware to a later version.
 - contact the Hotline.
 - replace the TM54F.

Cause: An internal communications error has occurred in the Terminal Module 54F (TM54F).
This message is also output in the following cases:
- The TM54F exists and no safety function of the TM54F has yet been parameterized.
- Parameter p10000 (TM54F master) is not set the same as p10000 (TM54F slave).
- Parameter p10010 (TM54F master) is not set the same as p10010 (TM54F slave).

Alarm value (r2124, interpret decimal):
Only for internal Siemens diagnostics.

Remedy: If TM54F exists and no safety function has yet been parameterized:
- Not necessary. The alarm disappears automatically after a safety function of the TM54F has been parameterized.
For p10010/p10000 from the TM54F master not equal to the TM54F slave:
- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.
For internal communication errors:
- check the electrical cabinet design and cable routing for EMC compliance
- upgrade the software on the TM54F.

Bit 3: Discrepancy for F-DO 3</p> <p>Note: If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs. The following options are available to analyze all of the discrepancy errors: - Using the commissioning software, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here. - Compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.</p>
Remedy:	<p>Check the wiring of the corresponding F-DI (contact problems). Discrepancy errors in the fail-safe digital inputs (F-DI) can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgement was carried out (see p10006). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state internally. For cyclic switching operations at the fail-safe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency: If the period of a cyclic switching pulse corresponds to twice the value of p10002, then the following formulas should be checked: - $p10002 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10002 \geq p10000$ (discrepancy time must be no less than p10000) - $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply) td: possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI sampling cycle (see p10000). tp: period for a switching operation in ms. For cyclic switching operations and when debounce (p10017) is active, the discrepancy time is directly specified by the debounce time. If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked. - $p10002 < p10017 + 1ms - td$ - $p10002 > td$ - $p10002 \geq p10000$</p> <p>Example: If the SI sampling cycle is 12 ms and the switching frequency is 110 ms ($p10017 = 0$), the maximum discrepancy time which can be set is as follows: $p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms}$ --> rounded-off, the following is obtained $p10002 \leq 36 \text{ ms}$ Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time. Cause:	The temperature measured using the temperature sensing of the Terminal Module (TM) (r4105[2]) has exceeded the threshold value to initiate this alarm (p4102[4]). Note: For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[2] = 1, 4), the following applies: - if r4101[2] > 1650 ohms, the temperature r4105[2] = 250 °C - if r4101[2] <= 1650 ohms, the temperature r4105[2] = -50 °C Alarm value (r2124, interpret decimal): Temperature actual value at the time of initiation [0.1 °C].

Remedy: - allow the temperature sensor to cool down to below p4102[4] - hysteresis (5 K); for TM150, can be set using p4118[2].

Reaction: Infeed: OFF1 (NONE, OFF2)
Servo: OFF1 (NONE, OFF2, OFF3)
Vector: OFF1 (NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The signals output from the Terminal Module 41 (TM41) for tracks A/B have reached the limit frequency. The output signals are no longer in synchronism with the specified setpoint.
SIMOTION (p4400 = 0) operating mode:
- If the TM41 has been configured as the technology project, this fault is also output in response to short-circuited A/B signals in X520.
SINAMICS (p4400 = 1) operating mode:
- the fine resolution of TM41 in p0418 does not match that of the connector input that was interconnected at p4420
- the encoder position actual value r0479 interconnected at connector input p4420 has an excessively high actual speed
- the output signals correspond to a speed, which is greater than the maximum speed (r1082 of TM41).

Remedy: SIMOTION (p4400 = 0) operating mode:
- enter a lower speed setpoint (p1155).
- reduce the encoder pulse number (p0408).
- check track A/B for short-circuits.
SINAMICS (p4400 = 1) operating mode:
- enter a lower speed setpoint (p1155).
- reduce the encoder pulse number (p0408).
Notice:
The output signal is no longer monitored after changing the message type to "Alarm" (A).

Cause: The encoder pulse number entered does not match the permissible pulse number from a hardware perspective.
 Fault value (r0949, interpret decimal):
 1: Encoder pulse number is too high.
 2: Encoder pulse number is too low.
 4: Encoder pulse number is less than the zero mark offset (p4426).
Remedy: - enter the encoder pulse number in the permissible range (p0408).
 - if necessary, replace TM41 SAC with TM41 DAC.
 Note:
 TM41 SAC: order no. = 6SL3055-0AA00-3PA0

Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The zero mark synchronization with the encoder to be emulated was interrupted. Alarm value (r2124, interpret decimal): 0: The encoder is not in the ready state (e.g. encoder parked) 1: An absolute encoder was connected. 2: The encoder r0479[0...2] interconnected via connector input: p4420 is already communicating with another TM41 (precisely one TM41 can be interconnected with a specific r0479[0...2]). 3: The BICO interconnection to Terminal Module 41 (TM41) was removed (CI: p4420 = 0 signal). 4: The encoder interconnected via connector input: p4420 has carried out an EDS changeover or has been re-parameterized (this operation is not supported, set p4420 to 0 and interconnect again). 5: The maximum number of revolutions of the encoder was exceeded. 6: Encoder in an invalid state. 7: Encoder in an invalid state. 8: Encoder in an invalid state (the encoder is not parameterized or the interconnected signal source is not in the cyclic state).
Remedy:	Not necessary. - if the encoder changes into the ready state, then a synchronization operation that was previously interrupted is carried out again. - if the synchronization was interrupted due to the maximum permissible synchronization duration, then a new synchronization is not carried out. - The alarm is only output, if, for an absolute encoder, the zero mark synchronization is set to the zero position (p4401.0 = 1 and p4401.1=0).

Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	There is no frequency setpoint for the Terminal Module 41 (TM41). The output of tracks A/B has been held (frozen). Possible causes: - Connector input p4420 is not interconnected. - the leading encoder is not in the "ready" state (parking encoder or encoder data set not parameterized). - TM41 has a fault. - The TM41 is in the commissioning mode (p0010 > 0). - The TM41 component is not connected to DRIVE-CLiQ.
Remedy:	- Appropriately interconnect connector input p4420. - Bring the leading encoder into the "ready" state. - Remove any TM41 faults.
A35227	EDS changeover/encoder data set change not supported
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	Terminal Module 41 (TM41) does not support the following application cases: - the encoder interconnected via connector input p4420 has carried out an EDS changeover. - the encoder interconnected with the TM41 was re-parameterized so that the position actual value of the encoder must be newly interpreted. For example, this is the case when changing the direction of rotation of the motor (p0410, p1821) or when changing the fine resolution (p0418). This may result in a sudden change in the position actual value of the encoder (position setpoint of the TM41), which must not be output at the TM41. See also: p4420 (TM41 encoder emulation position setpoint)
Remedy:	Set connector input p4420 = 0 and re-wire.
A35228 (F, N)	TM: Sampling time p4099[3] invalid

Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The sampling time set in p4099[3] for incremental encoder emulation in Terminal Module 41 (TM41) does not correspond to the valid value. To resolve the problem, correct the setting of p4099[3]. The system automatically performs a warm restart/sub-boot. Alarm value (r2124, interpret decimal): 1: A sampling time p4099[3] < 125 µs was set. 2: An integer multiple of the DRIVE-CLiQ clock cycle was not entered in p4099[3]. 3: - In the SINAMICS mode (p4400 = 1), the sampling time in p4099[3] is not an integer multiple of the current controller sampling time (p0115[0]) of the drive object, which supplies the position setpoint (CI: p4420) for the incremental encoder simulation. - The encoder interconnected via connector input p4420 (e.g. an SSI encoder) is sampled in a slower clock cycle.
Remedy:	- if necessary, cancel the BICO interconnection via connector input p4420. - check the rules specified under cause for setting the sampling time in p4099[3]. - if necessary, set the BICO interconnection via connector input p4420 again. Note: Every time the BICO interconnection is reset via connector input p4420, the sampling time is checked in p4099[3] and, where necessary, this message is output.

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The "master control by PLC" signal was missing in operation.
 - interconnection of the binector input for "master control by PLC" is incorrect (p0854).
 - the higher-level control has withdrawn the "master control by PLC" signal.
 - data transfer via the fieldbus (master/drive) was interrupted.
Note:
 This alarm is only decisive in the "SIMOTION" operating mode (p4400 = 0).
 In the "SINAMICS" operating mode (p4400 = 1), the setpoints at p4420 are evaluated independent of binector input p0854.
Remedy:
 - check the interconnection of the binector input for "master control by PLC" (p0854).
 - check the "master control by PLC" signal and, if required, switch in.
 - check the data transfer via the fieldbus (master/drive).
 - check the setting of parameter p2037.

Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM150, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	Infeed: OFF2 (NONE, OFF1) Servo: OFF2 (NONE, OFF1, OFF3) Vector: OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	For the temperature evaluation via the Terminal Module 150 (TM150), at least one of the following conditions to initiate this fault is fulfilled: - alarm threshold has been exceeded longer than that set in the timer (p4102[18], p4103[9]). or - fault threshold exceeded (p4102[19]). Note: For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[9] = 1, 4), the following applies: - if r4101[9] > 1650 ohms, the temperature r4105[9] = 250 °C - if r4101[9] <= 1650 ohms, the temperature r4105[9] = -50 °C The temperature actual value is displayed via connector output r4105[9] and can be interconnected. Notice: This fault only causes the drive to shut down if there is at least one BICO interconnection between the drive and the Terminal Module. Fault value (r0949, interpret decimal): Temperature actual value at the time of initiation [0.1 °C].
Remedy:	- allow the temperature sensor to cool down to below p4102[19] - hysteresis (p4118[9]). - if required, set the fault response to NONE (p2100, p2101). See also: p4102

Cause: The properties of the DRIVE-CLiQ component (Terminal Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.
Fault value (r0949, interpret decimal):
 Component number.

Remedy:

- carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	Fault detected on the DRIVE-CLiQ component (DRIVE-CLiQ Hub Module) involved. Faulty hardware cannot be excluded. Fault cause: 32 (= 20 hex): Error in the telegram header. 35 (= 23 hex): Receive error: The telegram buffer memory contains an error. 66 (= 42 hex): Send error: The telegram buffer memory contains an error. 67 (= 43 hex): Send error: The telegram buffer memory contains an error. 96 (= 60 hex): Response received too late during runtime measurement. 97 (= 61 hex): Time taken to exchange characteristic data too long. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
Remedy:	- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...). - check the electrical cabinet design and cable routing for EMC compliance - if required, use another DRIVE-CLiQ socket (p9904). - replace the component involved.
F36895	Hub DRIVE-CLiQ (CU): Alternating cyclic data transfer error

F36896 Hub DRIVE-CLiQ (CU): Inconsistent component properties

Message value: Component number: %1
Drive object: A_INF, B_INF, CU_LINK, HUB, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The properties of the DRIVE-CLiQ component (DRIVE-CLiQ Hub Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.
Fault value (r0949, interpret decimal):
Component number.
Remedy: - carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

F37004 HF damping module: Heat sink overtemperature

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The temperature of the heat sink in the HF damping module has exceeded the permissible limit value.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
Fault value (r0949, interpret decimal):
Temperature [0.01 °C].
Remedy:
- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
Notice:
This fault can only be acknowledged after this alarm threshold for alarm A05000 has been undershot.

F37005 HF damping module: I2t overload

Message value: %1
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The filter capacitor of the HF Damping Module was overloaded (r5173 = 100 %).
- The filter resonance frequency was excessively excited.
- The HF Choke Module is defective.
Fault value (r0949, interpret decimal):
I2t [100 % = 16384].
Remedy:
- Reduce the motor power in the proximity of the fault-generating frequency.
- The system should not stay in a steady-state condition in the vicinity of the fault-generating frequency.
- Check the HF Choke Module and if required replace.

F37024 HF Damping Module: Overtemperature thermal model

Message value: -
Drive object: SERVO, SERVO_AC, SERVO_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The temperature difference between the heat sink and chip has exceeded the permissible limit value.
 - the permissible load duty cycle was not maintained.
 - insufficient cooling, fan failure.
 - overload.
 - ambient temperature too high.
 - pulse frequency too high.
 See also: r0037

Remedy:
 - adapt the load duty cycle.
 - check whether the fan is running.
 - check the fan elements.
 - check whether the ambient temperature is in the permissible range.
 - check the motor load.
 - reduce the pulse frequency if this is higher than the rated pulse frequency.

F37025 HF Damping Module: Chip overtemperature

Message value: %1

Fault cause: 1 (= 01 hex): Checksum error (CRC error). 2 (= 02 hex): Telegram is shorter than specified in the length byte or in the receive list. 3 (= 03 hex): Telegram is longer than specified in the length byte or in the receive list. 4 (= 04 hex): The length of the receive telegram does not match the receive list. 5 (= 05 hex): The type of the receive telegram does not match the receive list. 6 (= 06 hex): The address of the power unit in the telegram and in the receive list do not match. 9 (= 09 hex): The error bit in the receive telegram is set. 16 (= 10 hex): The receive telegram is too early. 17 (= 11 hex): CRC error and the receive telegram is too early. 18 (= 12 hex): The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early. 19 (= 13 hex): The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early. 20 (= 14 hex): The length of the receive telegram does not match the receive list and the receive telegram is too early. 21 (= 15 hex): The type of the receive telegram does not match the receive list and the receive telegram is too early. 22 (= 16 hex): The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early. 25 (= 19 hex): The error bit in the receive telegram is set and the receive telegram is too early. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
Remedy:	- carry out a POWER ON (power off/on). - check the electrical cabinet design and cable routing for EMC compliance - check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...). See also: p9915 (DRIVE-CLiQ data transfer error shutdown threshold master)

F40875 CX32 DRIVE-CLiQ (CU): Supply voltage failed

Message value: Component number: %1, fault cause: %2

Drive object: All objects

Reaction: OFF1 (OFF2)

Acknowledge: IMMEDIATELY

Cause: The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.
 Fault cause:
 9 (= 09 hex):
 The power supply voltage for the components has failed.
 Note regarding the message value:
 The individual information is coded as follows in the message value (r0949/r2124):
 0000yyxx hex: yy = component number, xx = error cause

Remedy:

- carry out a POWER ON (power off/on).
- check the supply voltage wiring of the DRIVE-CLiQ component (interrupted cable, contacts, ...).
- check the dimensioning of the DRIVE-CLiQ component power supply.

F40885 CX32 DRIVE-CLiQ (CU): Cyclic data transfer error

Message value: Component number: %1, fault cause: %2

Drive object: All objects

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit. The nodes do not send and receive in synchronism.
 Fault cause:
 26 (= 1A hex):
 Sign-of-life bit in the receive telegram not set and the receive telegram is too early.
 33 (= 21 hex):
 The cyclic telegram has not been received.
 34 (= 22 hex):
 Timeout in the telegram receive list.
 64 (= 40 hex):
 Timeout in the telegram send list.
 98 (= 62 hex):
 Error at the transition to cyclic operation.
 Note regarding the message value:
 The individual information is coded as follows in the message value (r0949/r2124):
 0000yyxx hex: yy = component number, xx = error cause

Remedy:

- check the power supply voltage of the component involved.
- carry out a POWER ON (power off/on).
- replace the component involved.

F40886 CX32 DRIVE-CLiQ (CU): Error when sending DRIVE-CLiQ data

Message value: Component number: %1, fault cause: %2

Drive object: All objects

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit. Data were not able to be sent.
 Fault cause:
 65 (= 41 hex):
 Telegram type does not match send list.
 Note regarding the message value:
 The individual information is coded as follows in the message value (r0949/r2124):
 0000yyxx hex: yy = component number, xx = error cause

Remedy:

- Carry out a POWER ON (power off/on).

F40887 CX32 DRIVE-CLiQ (CU): Component fault

Message value: Component number: %1, fault cause: %2
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.
 Fault cause:
 32 (= 20 hex): Error in the telegram header.
 35 (= 23 hex): Receive error: The telegram buffer memory contains an error.
 66 (= 42 hex): Send error: The telegram buffer memory contains an error.
 67 (= 43 hex): Send error: The telegram buffer memory contains an error.
 96 (= 60 hex): Response received too late during runtime measurement.
 97 (= 61 hex): Time taken to exchange characteristic data too long.
 Note regarding the message value:
 The individual information is coded as follows in the message value (r0949/r2124):
 0000yyxx hex: yy = component number, xx = error cause
Remedy:
 - check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
 - check the electrical cabinet design and cable routing for EMC compliance
 - if required, use another DRIVE-CLiQ socket (p9904).
 - replace the component involved.

F40895 CX32 DRIVE-CLiQ (CU): Cyclic data transfer error

Message value: Component number: %1, fault cause: %2
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.
 Fault cause:
 11 (= 0B hex): Synchronization error during alternating cyclic data transfer.
 Note regarding the message value:
 The individual information is coded as follows in the message value (r0949/r2124):
 0000yyxx hex: yy = component number, xx = error cause
Remedy:
 Carry out a POWER ON (power off/on).
 See also: p9915 (DRIVE-CLiQ data transfer error shutdown threshold master)

F49150 Cooling unit: Fault occurred

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The cooling unit signals a general fault.
Remedy:
 - check the wiring between the cooling unit and the input terminal (Terminal Module).
 - check the external control device for the cooling unit.
 See also: p0266 (Cooling unit feedback signals signal source)

F49151	Cooling unit: Conductivity has exceeded the fault threshold
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The conductivity of the cooling liquid has exceeded the selected fault threshold (p0269[2]). See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source)
Remedy:	Check the device to de-ionize the cooling liquid.

F49152	Cooling unit: ON command feedback signal missing
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The feedback signal of the ON command of the cooling unit is missing. - after the ON command, the feedback signal has not been received within the selected starting time (p0260). - the feedback signal has failed in operation. See also: p0260 (Cooling unit starting time 1), r0267 (Cooling unit status word)
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the external control device for the cooling unit.

F49153	Cooling unit: Liquid flow too low
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The drive converter cooling unit signals that the cooling liquid flow is too low. - after the ON command, the feedback signal has not been received within the selected starting time (p0260). - in operation, the feedback signal has failed for longer than the permitted failure time (p0263). See also: p0260 (Cooling unit starting time 1), p0263 (Cooling unit fault liquid flow delay time), r0267 (Cooling unit status word)
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the external control device for the cooling unit.

F49154 (A)	Cooling unit: Liquid leak is present
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The liquid leakage monitoring function has responded. Caution: If this fault is re-parameterized as an alarm then using other monitoring functions it must be ensured that when cooling water is lost, the drive is powered down! See also: r0267 (Cooling unit status word)
Remedy:	- check the cooling system for leaks in the cooling circuit. - check the wiring of the input terminal (Terminal Module) used to monitor leaking fluid.
Reaction upon A:	NONE
Acknowl. upon A:	NONE

F49155	Cooling unit: Power Stack Adapter, firmware version too old
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.
Remedy:	Upgrade the firmware. Check EEPROM data.
F49156	Cooling unit: Cooling liquid temperature has exceeded the fault threshold
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The cooling liquid intake temperature has exceeded the specified fault threshold.
Note:	The value for the fault threshold depends on the power unit (hardware descriptive data, e.g. 52 ... 55 °C).
Remedy:	Check the cooling system and the ambient conditions.
A49170	Cooling unit: Alarm has occurred
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The cooling unit signals a general alarm.
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the external control device for the cooling unit.
A49171	Cooling unit: Conductivity has exceeded the alarm threshold
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	The conductivity of the cooling liquid has exceeded the selected alarm threshold (p0269[1]). The threshold cannot be set higher than the fault threshold specified in the equipment description.
Remedy:	Check the device to de-ionize the cooling liquid.
A49171	Cooling unit: Conductivity has exceeded the alarm threshold
Message value:	-
Drive object:	VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	Conductivity monitoring is set for the cooling liquid (r0267.7, from p0266[7]). See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source), r0267 (Cooling unit status word)
Remedy:	Check the device to de-ionize the cooling liquid.
A49172	Cooling unit: Conductivity actual value is not valid
Message value:	-
Drive object:	A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction:	NONE
Acknowledge:	NONE
Cause:	When monitoring the conductivity of the cooling liquid, there is a fault in the wiring or in the sensor.
Remedy:	- check the wiring between the cooling unit and the Power Stack Adapter (PSA). - check the function of the sensor to measure the conductivity.

A49173 Cooling unit: Cooling liquid temperature has exceeded the alarm threshold

Message value: -
Drive object: A_INF, B_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: NONE
Acknowledge: NONE
Cause: The cooling liquid intake temperature has exceeded the specified alarm threshold.
 Note:
 The value for the alarm threshold depends on the power unit (hardware descriptive data, e.g. 42 ... 50 °C).
Remedy: Check the cooling system and the ambient conditions.

F49200 Excitation group signal fault

Message value: %1
Drive object: VECTOR, VECTOR_AC, VECTOR_I_AC
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The excitation sequence control signals a fault.
 Fault value (r0949, interpret hexadecimal):
 Bit 0:
 When powered down or when powering down the excitation, the signal "excitation ready feedback signal" was not received within the monitoring time.
 Bit 1:
 After an ON command, the signal "excitation ready feedback signal" was not received within the monitoring time.
 Bit 2:
 After the pulses were enabled, the signal "excitation operational feedback signal" was not received within the monitoring time.
 Bit 3:
 The "excitation group signal fault" signal is present.
Remedy: - check the excitation.
 - check commands, feedback signals and BICO interconnections.

A49201 (F) Excitation group signal alarm

Message value: -

DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed I/O
DPRAM	Dual-Port Random Access Memory	Memory with dual access
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ

Abbreviation	Source of abbreviation	Meaning
DSC	Dynamic Servo Control	Dynamic Servo Control
DTC	Digital Time Clock	Time switch
E		
EASC	External Armature Short Circuit	External armature short circuit
EDS	Encoder Data Set	Encoder data set
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatically sensitive devices
ELCB	Earth Leakage Circuit Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder Data Interface	Encoder interface
EP	Enable Pulses	Pulse enable
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering System
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Electrostatically sensitive devices
ESM	Essential Service Mode	Emergency operation
ESR	Extended Stop and Retract	Extended stop and retract
F		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBL	Free Blocks	Free function blocks
FCC	Function Control Chart	Function Control Chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Failsafe Digital Input	Fail-safe digital input
F-DO	Failsafe Digital Output	Fail-safe digital output
FEM	Fremderregter Synchronmotor	Separately excited synchronous motor
FEPRM	Flash EPROM	Non volatile read/write memory
FG	Function Generator	Function generator
FI	-	Fault current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field Programmable Gate Array
FW	Firmware	Firmware

Abbreviation	Source of abbreviation	Meaning
G		
GB	Gigabyte	Gigabyte
GC	Global Control	Global Control Telegram (broadcast telegram)
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as G)
GSD	Generic Station Description	Generic station description: Describes the characteristics of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate Supply Voltage
GUID	Globally Unique Identifier	Globally Unique Identifier
H		
HF	High Frequency	High frequency
HFD	Hochfrequenzdrossel	High-frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear drive
HLG	Hochlaufgeber	Ramp-function generator
HMI	Human-Machine Interface	Human Machine Interface
HTL	High-Threshold Logic	Logic with high fault threshold
HW	Hardware	Hardware
I		
i. V.	In Vorbereitung	Available soon: This feature is not currently available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Commissioning
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor circuit breaker with integrated control electrode
IL	Impulslöschung	Pulse cancelation
IP	Internet Protocol	Internet Protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Three-phase line supply ungrounded
IVP	Internal Voltage Protection	Internal voltage protection
J		
JOG	Jogging	Jogging
K		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-How Protection	Know-how protection

Abbreviation	Source of abbreviation	Meaning
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY	-	Special temperature sensor
L		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light-emitting diode
LIN	Linear motor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
M		
M	-	Symbol for torque
M	Mass	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product designation
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (Class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
N		
N. C.	Not Connected	Not connected
N...	No Report	No message or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization body in the USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact

Abbreviation	Source of abbreviation	Meaning
NSR	Netzstromrichter	Line-side converter
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory
O		
OA	Open Architecture	Software component (technology package) which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware from which the OA application can be used
OASP	Open Architecture Support Package	Expands the STARTER commissioning tool by the corresponding OA application
OC	Operating Condition	Operating condition
OEM	Original equipment manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
P		
p...	-	Adjustable parameter
P1	Processor 1	CPU 1
P2	Processor 2	CPU 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control for master
PD	PROFIdrive	PROFIdrive
PDS	Power unit Data Set	Power unit data set
PE	Protective Earth	Protective earth (ground)
PELV	Protective Extra Low Voltage	Protective extra-low voltage
PEM	Permanent-magnet synchronous motor	Permanent-magnet synchronous motor
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point-to-Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point-To-Point	Point-to-point
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
Q		

Abbreviation	Source of abbreviation	Meaning
R		
r...	-	Display parameters (read-only)
RAM	Random Access Memory	Read/write memory
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RO	Read Only	Read only
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for cable-connected serial data transmission between a sender and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of senders and receivers, also known under EIA485)
RTC	Real Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space vector approximation
S		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SD Card	SecureDigital Card	Secure digital memory card
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch
SG	Sicher reduzierte Geschwindigkeit	Safely reduced speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe standstill
SI	Safety Integrated	Safety Integrated
SIL	Safety Integrity Level	Safety integrity level
SLM	Smart Line Module	Smart Line Module

Abbreviation	Source of abbreviation	Meaning
SLP	Safely-Limited Position	Safely-limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Vector control without encoder (sensorless)
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	SINAMICS Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial interface for connecting peripherals
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe stop 1 (monitored for time and ramping)
SS2	Safe Stop 2	Safe stop 2
SSI	Synchronous Serial Interface	Synchronous serial interface
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS Support Package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
T		
TB	Terminal Board	Terminal Board
TIA	Totally Integrated Automation	Totally Integrated Automation
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Three-phase line supply grounded
Tn	-	Integral-action time
TPDO	Transmit Process Data Object	Transmit Process Data Object
TT	Terre Terre	Three-phase line supply grounded
TTL	Transistor-Transistor Logic	Transistor-Transistor Logic
Tv	-	Rate time
U		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
V		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage

Abbreviation	Source of abbreviation	Meaning
VdcN	-	Partial DC-link voltage negative
VdcP	-	Partial DC-link voltage positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
W		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
X		
XML	Extensible Markup Language	Extensible markup language (standard language for Web publishing and document management)
Y		
Z		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status word

 - Iq and Id controllers, 2-2002
 - Kp_n/Tn_n adaptation, 2-1990
 - Resonance damping and slip compensation, 2-1994
 - Speed control configuration, 2-1996
 - Speed controller with/without encoder, 2-1989
 - Table of contents, 2-1985
 - Torque setpoint, 2-1991
 - V/f characteristic, 2-1993
 - Vdc_max controller and Vdc_min controller, 2-1992, 2-1995

Version

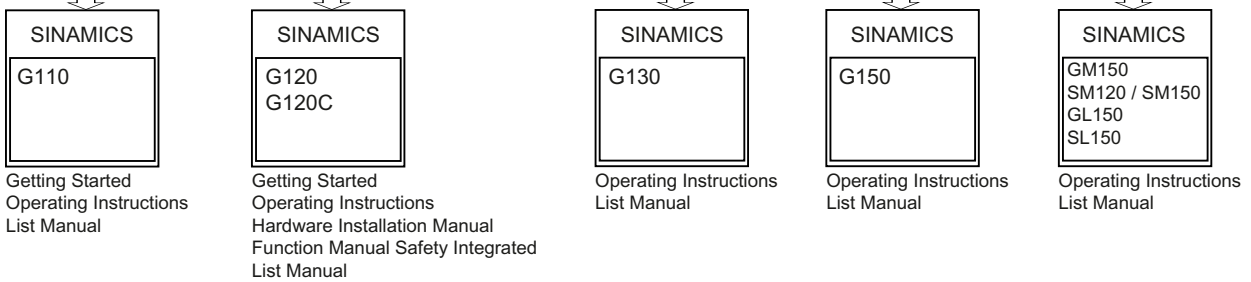

- List of all parameters, 1-34
 - List of faults and alarms, 3-2165
 - List of parameters for commanddata sets, 1-1699
 - List of parameters for drive data sets, 1-1702
 - List of parameters for encoder data sets, 1-1715
 - List of parameters for motordata sets, 1-1717
 - List of parameters for power unitdata sets, 1-1721
- Voltage Sensing Module (VSM)**
- Analog inputs, 2-2147
 - Sensor monitoring KTY/PTC, 2-2147
 - Temperature evaluation, 2-2147
