For p0922 = 999 the following applies: p2079 can be freely set. If p2079 is also set to 999, then all of the interconnections can be set. For p0922 = 999 and p2079 < 999 the following applies: The interconnections contained in the telegram are inhibited. However, the telegram can be extended.

Description:	Sets the signal source for the connector-binector converter. A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection).		
Dependency:	Refer to: r2094, r2095		
Note:	From the signal source set via the connector input, the corresponding lower 16 bits are converted. p2099[0...1] together with r2094.0...15 and r2095.0...15 forms two connector-binector converters: Connector input p2099[0] to binector output in r2094.0...15 Connector input p2099[1] to binector output in r2095.0...15

Description:	Selects the faults for which the fault response should be changed		
Dependency:	The fault is selected and the required response is set under the same index. Refer to: p2101		
Notice:	For the following cases, it is not possible to re-parameterize the fault response to a fault: - if there is no existing fault number. - the message type is not "fault" (F).		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.

	Min	Max	Factory setting
	0	7	0
Description:	Sets the fault response for the selected fault.		
Value:	0: NONE 1: OFF1 2: OFF2 3: OFF3 4: STOP1 (being developed) 5: STOP2 6: Internal armature short-circuit / DC braking 7: ENCODER (p0491)		

Dependency: The fault is selected and the required response is set under the same index.
Refer to: p2100

Note: Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms").
Example:
F12345 and fault response = OFF3 (OFF1, OFF2, NONE)
--> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE.
Re value = 1 (OFF1):
Braking along the ramp-function generator down ramp followed by a pulse inhibit.
Re value = 2 (OFF2):
Internal/external pulse inhibit.
Re value = 3 (OFF3):
Braking along the OFF3 down ramp followed by a pulse inhibit.
Re value = 5 (STOP2):
n_set = 0
Re value = 6 (armature short-circuit, internal/DC braking):
The value can only be set for all motor data sets when p1231 = 3, 4.
a) For synchronous motors (p0300 = 2xx, 4xx), an internal armature short-circuit is executed.
b) For induction motors (p0300 = 1xx), a DC braking is initiated.
Re value = 7 (ENCODER (p0491)):
The fault response set in p0491 is executed if applicable.
Note:
IASC: Internal Armature Short Circuit
DCBRK: DC braking

p2119[0...19]	Setting the message type / Message type		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 1750, 8075
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 1	Max 3	Factory setting 1
Description:	Sets the message type for the selected fault or alarm.		
Value:	1: Fault (F) 2: Alarm (A) 3: No message (N)		
Dependency:	Selects the fault or alarm selection and sets the required type of message realized under the same index. Refer to: p2118		
Note:	Re-parameterization is also possible if a message is present. The change only becomes effective after the message has gone. The message type can only be changed for messages with the appropriate identification. Example: F12345(A) --> Fault F12345 can be changed to alarm A12345. In this case, the message number that may be possibly entered in p2100[0...19] and p2126[0...19] is automatically removed.		
r2120	CO: Sum of fault and alarm buffer changes / Sum buffer changed		
All objects	Can be changed: -	Calculated: -	Access level: 4

	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min -	Max -	Factory setting -
Description:	Displays the sum of all of the fault and alarm buffer changes in the drive unit.		
Dependency:	Refer to: r0944, r2121		

r2121	CO: Counter alarm buffer changes / Alrm buff changed		
All objects	Can be changed: - Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: 8065 Unit selection: - Expert list: 1 Factory setting -
Description:	This counter is incremented every time the alarm buffer changes.		
Dependency:	Refer to: r2110, r2122, r2123, r2124, r2125		
r2122[0...63]	Alarm code / Alarm code		
All objects	Can be changed: - Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dyn. index: - Units group: - Scaling: - Max -	Access level: 2 Func. diagram: 1750, 8065 Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the number of alarms that have occurred.		
Dependency:	Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123		
Notice:	The properties of the alarm buffer should be taken from the corresponding product documentation.		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). Alarm buffer structure (general principle): r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest) ... r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest) When the alarm buffer is full, the alarms that have gone are entered into the alarm history: r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest) ... r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)		
r2123[0...63]	Alarm time received in milliseconds / t_alarm rcv ms

	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Selects the faults for which the acknowledge mode is to be changed		
Dependency:	Selects the faults and sets the required acknowledge mode realized under the same index Refer to: p2127		
Notice:	It is not possible to re-parameterize the acknowledge mode of a fault in the following cases: - Fault number does not exist. - Message type is not "fault" (F).		
Note:	Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.		

p2127[0...19]	Sets acknowledgement mode / Acknowledge mode		
All objects	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: 1750, 8075
	P-Group: Messages	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	3	1
Description:	Sets the acknowledge mode for selected fault.		
Value:	1: Acknowledgment only using POWER ON 2: Ack IMMEDIATELY after the fault cause has been removed 3: Acknowledgement only for PULSE INHIBIT		

- Dependency:** Selects the faults and sets the required acknowledge mode realized under the same index
Refer to: p2126
- Notice:** It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:
- if there is no existing fault number.
- the message type is not "fault" (F).
- Note:** Re-parameterization is also possible if a fault is present. The change only becomes effective after the fault has been resolved.
The acknowledge mode can only be changed for faults with the appropriate identification.
Example:
F12345 and acknowledge mode = IMMEDIATELY (POWER ON)
--> The acknowledge mode can be changed from IMMEDIATELY to POWER ON.

	P-Group: Displays, signals	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the first status word of faults and alarms.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Being acknowledged	Yes	No	-
	01	Acknowledgment required	Yes	No	-
	03	Fault present	Yes	No	-
	05	Safety message present	Yes	No	-

	07	Alarm present	Yes	No	-
	08	Internal message 2 present	Yes	No	-
	11	Alarm class bit 0	High	Low	-
	12	Alarm class bit 1	High	Low	-

Note: Re bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present"/"alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121).

Re bit 06, 08:

These status bits are used for internal diagnostic purposes only.

Re bit 11, 12:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.																												
Note:	The binector input is automatically pre-assigned to r1199.2. The following applies for SERVO: The pre-assignment using the automatic calculation of the motor/control parameters in the drive (p0340 = 1, 3, 5) is only realized if, at the instant of the calculation, the "setpoint channel" function module is active (r0108.8 = 1). If the calculation in p0340 is not selected when downloading parameters, then the parameter is not preassigned.

Note: Re bit 00:
Alarm A07903 is output when the bit is set with $r2197.7 = 0$ ($n_set \ll n_act$).
Re bit 01:
When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).
Re bit 03:
When the bit is set, r2197 bit 1 and bit 2 are determined via separate hystereses.
Re bit 15:
The bit indicates whether the automatic parameterization ($p0340 = 1$, $p3900 > 0$) for the parameters of the extended monitoring functions was carried out. If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

Note:	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

Note:	The following applies for sensorless vector control: At low speeds a locked motor can only be detected if no change is made to open-loop speed controlled operation. If this is the case, the value in p2177 must be reduced accordingly (p2177 < p1758) before time p2177 has elapsed in order to detect the locked state reliably. As countermeasure, it is generally also possible to set p1750.6. This is only not permitted if the drive is slowly reversed by the load at the torque limit (speed below p1755 for longer than p1758).

	03	Non-volatile data save active for p2230.0 = 1	Yes	No	-
	04	Ramp-function generator always active	Yes	No	-

Dependency: Refer to: r2231, p2240

- Notice:** The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion:
- Firmware with V2.3 or higher.
 - Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).
- Note:** Re bit 00:
- 0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.
 1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.
- Re bit 02:
- 0: Without initial rounding-off
 1: With initial rounding-off.
- The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).
 It is calculated as follows:

$$r = 0.0001 \times \max(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$
 The jerk is effective until the maximum acceleration is reached ($a_{max} = p2237 [\%] / p2247 [s]$ or $a_{max} = p2238 [\%] / p2248 [s]$), after which the drive continues to run linearly with constant acceleration.
 The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.
- Re bit 03:
- 0: Non-volatile data save de-activated.
 1. The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).
- Re bit 04:
- When the bit is set, the ramp-function generator is computed independent of the pulse enable. The actual output value of the motorized potentiometer is always in r2250.

Description: Sets the configuration of the technology controller.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Ramp-up/down time independent of set-point sign	Yes	No	-
	01	Integrator independent of Kp	Yes	No	-
	02	Output signal without ramp active	Yes	No	-
	03	Act val lim	Yes	No	-

Dependency: Refer to: p2257, p2258, p2267, p2268, p2280, p2285

Note: Re bit 00 = 0:

The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle.

Re bit 00 = 1:

When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time.

Re bit 01 = 0:

The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time).

Re bit 01 = 1:

The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 > 0.

Re bit 02 = 0:

When the PID controller is de-activated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293.

Re bit 02 = 1:

When the PID controller is de-activated via p2200, the output signal r2294 is set directly to zero.

Re bit 03 = 0:

The actual values are not limited by p2267 and p2268.

Re bit 03 = 1:

The actual values are limited by p2267 and p2268.

Description: Setting to invert the actual value signal of the technology controller.
The inversion depends on the sensor type for the actual value signal.

Value:
0: No inversion
1: Inversion actual value signal

Caution: If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

Note: The correct setting can be determined as follows:
- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal of the technology controller.
--> If the actual value increases as the motor speed increases, then p2271 should be set to 0 (no inversion).
--> If the actual value decreases as the motor speed increases, then p2271 should be set to 1 (the actual value signal is inverted).

Description: Setting to invert the fault signal of the technology controller.
The setting depends on the type of control loop.

Value:
0: No inversion
1: Inversion

Caution: If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!

**Note:**

The correct setting can be determined as follows:

- inhibit the technology controller (p2200 = 0).
- increase the motor speed and in so doing, measure the actual value signal (of the technology controller).
- if the actual value increases with increasing motor speed, then the inversion should be switched out.
- if the actual value decreases with increasing motor speed, then the inversion should be set.

If value = 0:

The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor).

If value = 1:

The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

Note:	The position controller can only process position setpoints in the interpolator clock cycle (IPO clock cycle) in integer length units (LU, Length Unit). This is the reason that speed setpoints that are not a multiple integer of 1 LU per IPO clock cycle can only be realized as an average. The result speed setpoint steps are especially noticeable for a high loop gain or when the pre-control is active. Increasing p2506 counteracts this behavior.

Description: Activating the adjustment and display of the status of the adjustment for absolute encoders.

Value:
 0: Error occurred while adjusting
 1: Absolute encoder not adjusted
 2: Absolute encoder not adjusted and encoder adjustment initiated
 3: Absolute encoder adjusted

Dependency: Refer to: p2525, p2598, p2599

Caution: For rotating absolute encoders, when adjusting, a range is set up symmetrically around zero with half of the encoder range, within which the position must be re-established after powering down/powering up. In this range, it is only permissible that the encoder overflows.

After the adjustment has been completed, it must be guaranteed that the range is not exited. The reason for this is that outside the range, there is no clear reference any longer between the encoder actual value and mechanical system.

If the reference point (CI: p2598) lies in this range, then the position actual value is set when adjusting to the reference point. Otherwise, adjustment is canceled with F07443.

There is no overflow for linear absolute encoders. This means that after the adjustment, the position can be re-established in the complete traversing range after powering down/powering up. When adjusting, the position actual value is set to the reference point.

Note: The encoder adjustment is initiated with p2507 = 2. The status is displayed using the other values.

In order to permanently save the determined position offset (p2525) it must be saved in a non-volatile fashion (p0971, p0977).

This adjustment can only be initiated for an absolute encoder.

Description: Sets the input terminal for direct measuring probe 1.
The direct measuring probe can either be parameterized as a non-cyclic (value 1 ... 8) or a cyclic (value 11 ... 18) measuring probe.
After it has been activated via binector input: p2509 = 0/1 signal, the non-cyclic measuring probe measures once and can be used with EPOS.
After it has been activated via the p2509 = 1 signal, the cyclic measuring probe measures cyclically and cannot be used with EPOS.
In order to process signals faster, the direct measuring probe bypasses the handshake technique via the encoder control word and encoder status word.

Value:

Dependency: Refer to: p0490, p0728, p2509, p2510, p2511

Notice: To select the values:
For CX32, NX10 and NX15, only DI/DO 8, 9, 10, 11 can be selected as fast inputs (refer to the Equipment Manual).
To the terminal designation:
The first designation is valid for CU320, the second for CU310.

Note: DI/DO: Bidirectional Digital Input/Output
The terminal must be set as input (p0728).
If a parameter change is rejected, a check should be performed as to whether the input terminal is already being used in p0488, p0489, p0493, p0494, p0495, p0580 or p0680.
Direct measurement via p2517 has a higher priority than measurements via p0488.
For the direct measuring probe evaluation, the DP clock cycle must be integer multiple of the position controller clock cycle.

Description:	Sets the behavior of the position actual value preprocessing for the position controller for a DDS changeover. Re p2519 = 1: In the following cases, for a DDS changeover, the actual position actual value becomes invalid and the reference point is reset: - the EDS effective for the closed-loop position control changes. - the encoder assignment changes (p2502). - the mechanical relationships change (p2503 ... p2506). - the direction of rotation changes (p1821). For absolute encoders, the status of the adjustment (p2507) is also reset if the same absolute encoder remains selected for the closed-loop position control, but the mechanical relationships or the direction of rotation have changed. In the operation state, in addition, a fault (F07494) is generated.			
Notice:	The remaining setting values are intended for expanded functionality.			
Note:	The behavior for a DDS changeover is determined using the value of p2519 in the target data set.

	Min 0.000000 [kg]	Max 10000.000000 [kg]	Factory setting 1.000000 [kg]

Description: Sets the mass for the force pre-control.
Dependency: Refer to: p2534, r2564
Note: When calculating the force pre-control value (r2654), the derivation over time of the speed pre-control value is multiplied by p2567.
For reasons associated with the compatibility to earlier firmware releases, the factory setting for p2567 = 1 kg. This means that CO: r2564 remains, as standard, the derivation over time of the velocity pre-control value and refers, as before, to a weight of 1 kg. For force pre-control, the mass can now be directly entered into p2567 (instead of subsequently evaluating the pre-control value).

Description: Sets the moment of inertia for the torque pre-control.
Dependency: Refer to: p2534, r2564

Note: When calculating the torque pre-control value (r2654), the time derivation of the speed pre-control value is multiplied by $2 \text{ PI} * \text{p2567}$.
For reasons associated with the compatibility to earlier firmware versions, the factory setting for $\text{p2567} = 1 \text{ kgm}^2/2 \text{ PI}$. This means that CO: r2564 remains as standard the derivation over time of the speed pre-control value and is referred, as before, to a moment of inertia of $1 \text{ kgm}^2/2 \text{ PI}$. For torque pre-control, the moment of inertia can now be directly entered into p2567 (instead of subsequently evaluating the pre-control value).

Description:	Sets the jerk limiting		
Dependency:	Refer to: p2572, p2573, p2575		
Note:	The jerk limiting is internally converted into a jerk time as follows: Jerk time $T_r = \max(p2572, p2573) / p2574$ The jerk time is internally limited to 1000 ms and is rounded-off to an integer multiple of the sampling time positioning (p0115[5]). The jerk time is valid for the acceleration and deceleration phases also for unequal maximum acceleration (p2572) and maximum deceleration (p2573). For unequal maximum acceleration and maximum deceleration, the motion is not optimal from a time perspective as the jerk limit cannot be used for the lower of the two values.		

If, in the traversing profile, the acceleration time without jerk limiting is less than the jerk time T_r , then the motion with jerk limiting is not optimum from a time perspective.

For traversing motion with a direct transition between acceleration and deceleration (i.e. jerk time is greater than the constant velocity phase), jerk can increase up to twice the parameterized jerk.

CONTINUE_FLYING with direction reversal acts internally just like a CONTINUE_WITH_STOP without the "position reached" being set. Without jerk limiting, this behavior can hardly be noticed as, when reversing, the position setpoint is only kept at zero for one interpolator clock cycle.

For block change enable CONTINUE_WITH_STOP, jerk limiting results in a longer delay time.

Notice:	Target position for relative positioning outside software limit switch: The traversing block is started and the axis comes to a standstill at the software limit switch. An appropriate alarm is output and the traversing block is interrupted. Traversing blocks with valid position can be activated. Target position for absolute positioning outside software limit switch: In the "traversing blocks" mode, the traversing block is not started and an appropriate fault is output. Axis outside the valid traversing range: If the axis is already outside the valid traversing range, then an appropriate fault is output. The fault can be acknowledged at standstill. Traversing blocks with valid position can be activated.

Description: Sets the signal source to start the "search for reference" or "flying referencing".

BI: p2595 = 0/1 signal

Referencing is started.

BI: p2595 = 1/0 signal

Referencing is interrupted.

Dependency: Refer to: p2597, p2598, p2599, r2684

Notice: The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

Note: Search for reference (BI: p2597 = 0 signal):

The reference point approach can only be activated (0/1 edge) after traversing motion that is being processed has been completed.

With the start, where relevant, the state signal "reference point set" (r2684.11) is reset.

Flying referencing (BI: p2597 = 1 signal):

With the start, the state signal "reference point set" (r2684.11) is not reset.

Dependency: Refer to: p2502, p2507, p2595, p2596, p2597, p2599

Note: When the function module "basic positioner" (r0108.4 = 1) is activated, the following applies:
Incremental measuring system:
After the reference point is reached, the drive accepts the actual axis position from the position received via the connector input p2598[0].
Absolute encoder:
When adjusting the encoder, the position received via the connector input is set as the actual axis position. The position offset to the actual encoder value is displayed in p2525.

Description:	Sets the approach velocity after detecting the reference cam to search for the zero mark for the search for reference.		
Dependency:	If there is no reference cam (p2607 = 0), the search for reference immediately starts with the axis traversing to the zero mark. Refer to: p2595, p2597, p2604, p2607, p2609, p2610		
Caution:	If the reference cam is not adjusted so that at each search for reference the same zero mark for synchronization is detected, then an "incorrect" axis reference point is obtained. After the reference cam has been left, the search for the zero mark is activated with a time delay due to internal factors. This is the reason that the reference cam should be adjusted in this center between two zero marks and the approach velocity should be adapted to the distance between two zero marks.		
			
Note:	The velocity override is not effective when traversing to the zero mark.

Description:	Sets the signal source for the "no intermediate stop/intermediate stop". BI: p2640 = 1 signal No intermediate stop. BI: p2640 = 0 signal Intermediate stop.		
Dependency:	Refer to: p2631, p2641, p2647, p2649		
Caution:	For BI: p2649 = 1 signal, the following applies: Motion starts without any explicit control signal.		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	This signal is only effective in the modes "traversing blocks" and "direct setpoint input/MDI". When activating the intermediate stop, the axis brakes with the parameterized deceleration (p2620 or p2645).

Description: Sets the signal source for the positioning type in the mode "direct setpoint input/MDI".
BI: p2648 = 1 signal
Absolute positioning is selected.
BI: p2648 = 0 signal
Relative positioning is selected.

Dependency: Refer to: p2649, p2650, p2654
Refer to: A07461, F07488

Notice: Absolute positioning:
To traverse, the reference point must be set (r2684.11 = 1).
Relative positioning:
To traverse, it is not necessary that the reference point is set.

Note: Depending on p2649, the positioning type is either transferred continuously or edge-triggered.
Binector input p2648 is only evaluated when connector input p2654 = 0. If p2654 is a value other than 0, the positioning type is evaluated by means of the set signal source.

Description:	Display and connector output for the actual reference quantity for velocity and frequency. All velocities or frequencies specified as relative value are referred to this reference quantity. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word). The following applies: Reference frequency (in Hz) = reference velocity (in m/min) / 60			
Dependency:	Refer to: p2000			
Note:	This parameter represents the numerical value of the reference quantity in the currently selected units and is only available for interconnection with Drive Control Chart (DCC). If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a velocity setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute velocity setpoint using the reference velocity (p2000). Example 2: The setpoint from PROFIBUS (r2050[1]) is connected to a velocity setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute velocity setpoint via reference velocity (p2000).

Description:	Sets the configuration for the elasticity-based pole position identification. Depending on the mechanical design (sequence machine - encoder - brake) and the braking force, the pole position identification can cause deflections with a different control sense. Re bit 00 = 0: The deflection caused by the pole position identification acts in the positive control sense. Re bit 00 = 1: The deflection caused by the pole position identification acts in the negative control sense. This can only occur for a linear measuring system if a brake is installed between the machine and the measuring system and the brake is powerful enough to do this.

Note:	Re p3291 = 1: (internal Siemens): In this case, the signal source is defined via the memory address (p3292) and the data type (p3293). As the memory address can be different for each version, it must always be redetermined. Procedure: - Set the memory address and data type (p3292, p3293). - Establish the BICO interconnection (p3291 = 1).

	P-Group: Closed-loop control	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 1010 bin

Description: Sets the configuration word of the infeed.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Smart Mode	ON	OFF	-
	01	Flat-Top Mode	ON	OFF	-
	03	Vdc controller	ON	OFF	-
	05	Line supply voltage sensing with VSM	ON	OFF	-

Dependency: Refer to: p0210

Note: Re bit 00:

In the Smart Mode, the DC link voltage is not controlled - however, infeed can still regenerate. The magnitude of the DC link voltage depends on the actual line supply voltage and the DC link load.

For drive units belonging to the 400 V voltage class, for a drive unit supply voltage (p0210) greater than 415 V, the Smart Mode is activated. This means that the 660 V limit can be maintained for the steady-state DC link voltage (p0280) up to a line supply voltage of 480 V.

Re bit 01:

If the Flat Top Mode is de-activated, switching losses are higher. This means that the full power is no longer continuously available.

For p3400.0 = 1 or p1810.15 =1, this bit is not effective.

Re bit 03:

If the Vdc controller is switched out, overvoltage or undervoltage conditions occur in the DC link if no other voltage-regulating component is located in the DC link.

For p3400.0 = 1, this bit is not effective.

Re bit 05:

If a VSM is detected when commissioning the system, this bit is automatically set.

When the bit is set, the line supply voltage input of the VSM must be connected (connected at the line side of the line reactor).

The bit must be set in the case of chassis power units.

Note:

Re bit 00:
Smart Mode is activated with p3400.0.

Re bit 01:
The DC link voltage closed-loop control is activated with parameters p3400.3 and p3513.

Re bit 02:
When phase failure is detected the bit is set and alarm A06205 is output.
The bit is reset for the following events:
- the infeed had reached the normal operating state again after a phase failure has been bypassed/buffered (p3402 = 9).
- the pulse enable is withdrawn due to a fault or powering down with OFF1/OFF2.

Re bit 03:
The present current limit is displayed in r0067.

Re bit 04:
An active current setting r0078 >= 0 means infeed operation in motor mode; an active current setting r0078 < 0 means regenerative operation in generator mode.

Re bit 05:

The motor mode inhibit is activated with p3532.

Re bit 06:

The generator mode inhibit is activated with p3533.

Re bit 07:

The alarm threshold is dependent on r0296 and the setting in p0279.

Description: Sets the mode to detect the line supply frequency.

Value:
0: Line supply frequency setting 50/60 Hz off
1: Line supply frequency setting 50/60 Hz on

Dependency: Refer to: p0211, p0284, p0285

Refer to: A06350, A06351, F06500

Note:

For p3409 = 1, the following applies:

After operation has been enabled, the rated line supply frequency (p0211) is automatically set to a value of 50 Hz or 60 Hz corresponding to the currently measured frequency. This means that the parameter value of p0211 is, under certain circumstances, changed.

For p3409 = 0, the following applies:

The system does not change parameter p0211.

p3410		Infeed identification method / INF Ident_type

Description:	Sets the line and DC link parameter identification routine for the infeed module.			
Value:	0: Identification (Id) off 1: Activate identification (Id) 2: Set controller settings 3: Save identification and controller settings 4: Save identification and controller settings with L adaptation 5: Reset save Id and controller setting with L adaptation			
Dependency:	Refer to: r3411, r3412, r3414, p3415, p3416, p3417, p3421, p3422, p3424, p3555, p3560, p3614 Refer to: A06400			
Notice:	For p3410 = 1, 3, 4, 5, alarm A06400 is output and designates that the selected identification will take place the next time that the pulses are enabled. The line and DC link adaptation is not permissible for Smart Line Modules in the chassis format.			
Note:	p3410 is automatically set to 0 after an identification run has been completed. When p3410 = 1 an identification run for the total inductance and DC link capacitance is initiated when the pulses are next enabled. The results are displayed in r3411 and r3412. If a Voltage Sensing Module (VSM) is connected, then the line inductance (r3414) is also measured. The infeed then goes into the ready for switching on state. For p3410 = 2, the data (r3411, r3412 and r3414) determined during the identification run (p3410 = 1) are transferred into p3421, p3422 and p3424. The control loop parameters are suitably scaled to achieve a rugged controller setting (p3425); the fast controller response (p3555[2]) and the current actual value smoothing (p3614) are pre-set. Calculations for the controller are then repeated. The user must save the data in a non-volatile fashion so that the new controller setting is effective the next time that the system is switched on. When p3410 = 3 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters. When p3410 = 4 an identification run for the inductance and DC link capacitance is initiated when the pulses are next enabled. Data determined during the identification (r3411, r3412, r3414) are used, as described under p3410 = 2 for the setting of p3421, p3422, p3424, p3425, p3555 as well as p3614, and the controller is re-calculated. The line inductance identification is then repeated, if p3415[1] > p3514[0]. If the inductance measured the second time is lower than the first, the parameters are written to the current controller adaptation (p3620, p3622). All of the parameters for the infeed module are then automatically stored in a non-volatile memory. The infeed continues to operate without any interruption with the new controller parameters. For p3410 = 5, the same measurements and write operations are always carried out as for p3410 = 4. However, for the first identification run, initially the controller setting is reset by setting p3421 = p0223 + p0225, p3424 = p0225, p3422 = p0227 and p3425[0...1] = 100 %. Further, before the measurements are carried out, a brief identification run is executed to coarsely set the controller.

	Min 1.00 [%]	Max 75.00 [%]	Factory setting 20.00 [%]
Description:	Sets the magnitude of the excitation frequency for the L identification. The setting is made as a percentage of the maximum power unit current (r0209).		
Index:	[0] = Run 1 [1] = Run 2		
Dependency:	Refer to: p3410, r3411, p3421, p3620, p3622		
Notice:	To correctly identify the current level (p3410 = 4, 5) depending on the reactor inductance, the following must apply: p3415[0] < p3415[1] For A_INF booksized units, the following applies: The interrelationship between the reactor inductance and the current magnitude should be measured. Generally, the factory setting of p3415[0] and p3415[1] should be kept. For chassis units and S_INF booksized units, the following applies: Generally, there is only a very low inter-relationship between the reactor inductance and the current magnitude. This means that for the factory setting p3415[0] = p3415[1] = 20 %, i.e. run 2 is not executed.		
Note:	The reactive current for identification run 1 is set in p3415[0] (basic controller setting). The reactive current for identification run 2 is set in p3415[1] (adaptation of the current controller when reducing the reactor inductance with increasing current magnitude).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 1.00 [%]	Max 1000.00 [%]	Factory setting 100.00 [%]
Description:	Sets the scaling factors for controller parameters p3421, p3422 and p3424.		
Index:	[0] = Scaling inductance [1] = Scaling capacitance		
Dependency:	Refer to: p3410, p3421, p3422, p3424, p3614		
Note:	p3425 is automatically set to the optimum value when setting the control parameters using the line supply data identification p3410 >= 2. As the line supply inductance (p3424) increases in comparison to the total inductance (p3421), lower values must be selected for p3425. This means that the control is adapted to weak line supplies with high relative short-circuit voltage uk or high line supply inductance (also refer to p3614). The scaled control loop parameters become effective for closed-loop control, i.e. the products p3421 * p3425[0] and p3422 * p3425[1] represent the controller setting.

Description:	Sets the configuration of the Smart Mode.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Soft Pulse Mode	ON	OFF	-
	01	Extended Smart Mode	ON	OFF	-
	02	De-select automatic line identification after POWER ON	Yes	No	-
Notice:	Re bit 00: This parameter influences the line harmonics for regenerative operation. For operation with switched frequency line filter (AIM) the soft-pulse mode must be activated.				
Note:	Re bit 00: When the pulsed mode for Smart Mode is de-activated, when regenerating, higher phase current gradients occur. For Smart Line Modules in the "chassis" format, pulsed operation is not effective. Re bit 01: The Extended Smart Mode can only be activated for booksize power units. For active Extended Smart Mode, for partial load operation, the line reactive power requirement must be reduced and the average value of the DC link voltage increased. At rated load and overload, the operating behavior is equivalent to the normal Smart mode. Re bit 02: When automatic line identification is selected, the inductance and DC-link capacitance values are calculated on the first pulse enable after each POWER ON and saved in p3448[0...1]. In the case of manual input of p3448[0...1], automatic line identification must be de-selected. The control loop parameters are required for the Extended Smart Mode.

Description:	Displays the active current requirement due to the line filter.		
Dependency:	Refer to: r0038, p0221, p0222		
Note:	With respect to the line supply, the sum of the active currents of the power unit (p0078) and line filter (r3470) are effective. The active current demand of the line filter is taken into account when calculating the power factor (r0038). The magnitude of the line filter active current depends on the capacitance (p0221) and the resistance (p0222) of the line filter.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Arms]	- [Arms]	- [Arms]
Description:	Displays the reactive current requirement as a result of the line filter. The reactive current requirement of a line filter is covered by the controlled infeed/regenerative feedback so that the converter always operates with a power factor of 1 compared to the line.		
Dependency:	Refer to: r0038, r0075, r0076, p0221		
Note:	With respect to the line supply, the sum of the reactive currents of the power unit (p0076) and line filter (r3471) are effective. The reactive current requirement of the line filter is taken into account when calculating the power factor (r0038). The amount of the reactive current depends on the capacitance (p0221) of the line filter that is automatically parameterized when a line filter is selected (p0220). If the line phases are reversed and the line voltage therefore has a negative orientation (r0066 < 0), it should be noted that the sign of the reactive current is reversed.

	Min	Max	Factory setting
	0.0 [ms]	1000000.0 [ms]	0.0 [ms]
Description:	Sets the delay time for the ON/OFF1 command of the infeed. After ON/OFF1 = 0 the infeed remains in operation for the specified time		
Dependency:	Refer to: p0840		
Notice:	The ON/OFF1 command of the infeed can be interrupted.		
Note:	This parameter is only relevant if a Motor Module and the infeed are controlled by the same OFF command. In this case, the delay time and the stop ramp time of the motor can be coordinated with one another.

	Min	Max	Factory setting
	0 [ms]	65000 [ms]	2000 [ms]
Description:	Sets the monitoring time for the current-offset measurement of the power unit. The time is started with the normal end of the measurement. If the measurement is invalid and if no valid measurement can be taken within the monitoring period (phase currents too high), an appropriate message is generated.		
Note:	Set this parameter to 0 to allow variations in the delay when running-up.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [s]	300 [s]	0 [s]
Description:	Sets the delay time for shutdown due to a line supply undervoltage condition (A06100). After the fault occurs, the power unit is only tripped (shut down) after this delay has expired. If the fault is removed during this design time, then the power unit is not tripped (shut down).		
Dependency:	Refer to: p0283 Refer to: F06100		

Note: The degree of ruggedness of the infeed with respect to fluctuations in the line supply voltage can be increased by parameterizing this delay value.
However, the following should be noted:

- the infeed power decreases proportionally (linearly) with the line supply voltage.
- when other components are connected, for low line supply voltage, operating faults or damage can occur. In this case, the specifications of the connected electrical components should always be carefully observed.

p3508 Infeed step-up factor maximum / Step-up factor max

A_INF	Can be changed: T	Calculated: -	Access level: 2

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.60	3.00	1.60

Description: Sets the maximum permissible step-up factor for the power unit used in conjunction with the line filter parameterized in p0220[0].

Dependency: Refer to: p0210, p0220, p3510

Note: The maximum step-up factor determines the maximum ratio between the DC link voltage setpoint (p3510) and the unit supply voltage (p0210).

The input of the DC link voltage setpoint (p3510) is limited corresponding to the permissible step-up factor (p3508):
 $p3510 \leq p0210 * p3508$.

Pre-setting values:

380 ... 480 V booksize units without Active Interface Module: 1.60

380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00

380 ... 480 V chassis units: 2.00

500 ... 690 V chassis units: 2.00

Maximum values:

380 ... 480 V booksize units without Active Interface Module: 1.60

380 ... 480 V booksize units with Active Interface Module (p0220 = 41 ... 45): 2.00

380 ... 480 V chassis units: 2.00

500 ... 690 V chassis units: 2.00

When the filter setting (p0220) is changed, then the setting of the maximum step-up factor (p3508) is also automatically adapted.

	Min	Max	Factory setting
	100.00 [V]	1600.00 [V]	600.00 [V]

Description: Sets the setpoint for the DC link voltage.

Dependency: Refer to: p0210, p0280, p3400, p3508, p3511

Warning:

Before increasing the voltage limit for pulsed operation of a controlled booksize infeed with line supply voltages $p0210 > 415$ V it should be checked whether the motors connected to the DC link are specified for the higher motor voltages.

The warning information associated with p0210 must be carefully observed.

Note:

When the Smart Mode is activated (p3400.0 = 1) the DC link voltage is not regulated, i.e. the value entered here is in this case not effective.

The permissible range of the DC link voltage depends on the parameterized unit supply voltage (p0210) and the permissible, maximum continuous DC link voltage (p0280).

In voltage-controlled operation (p3400.0 = 0) the following applies:

p3510 >= 1.42 * p0210 and

p3510 <= p3508 * p0210 and

p3510 <= p0280.

In the Smart Mode (p3400.0 = 1) the following applies:

The setpoint p3510 for the DC link voltage control is inactive. In order to permit an adapted display, deviating from voltage-controlled operation, the lower limit p3510 is >= 1.2 * p0210.

Description:	Sets the motoring limit for the active line current. The currently effective current limit is displayed in r0067[0].		
Dependency:	Refer to: r0067, p3532		
Caution:	If this limit is selected lower than the maximum current permissible for the power unit (r0067), the infeed can no longer provide its full controlled power. Operating faults of the infeed can occur due to the resulting DC link undervoltage.		
Notice:	For self-commutated infeeds, the DC link voltage decreases if more power is drawn from the DC link by the connected load than can be supplied by the line because of the power unit maximum current or a limit in p3530. If the DC link voltage decreases down to the rectified value, then the complete current - necessary to cover the required active power - flows, uncontrolled into the rectifier circuit via the diodes. This is the reason that, for physical reasons, the value in p3530 cannot act as current limit that is always maintained. The value forms a current threshold from which point onwards the DC link energy is used as buffer for brief power fluctuations.		
Note:	If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.

Description:	Sets the limit for the active line supply current when regenerating. The currently effective current limit is displayed in r0067[1].		
Dependency:	Refer to: r0067, p3533		
Caution:	If this limit is selected lower than the maximum current permissible for the power unit (r0067), the infeed can no longer provide its full controlled power. This can result in an overvoltage condition in the DC link.		
Notice:	For self-commutated infeeds, the DC link voltage increases if more power is input to the DC link through the connected source than can be fed to the line because of the maximum power unit current or a limit in p3531 If the DC link voltage exceeds the permissible threshold (p0297), defined by the hardware, then the unit is tripped due to overvoltage. The value in p3531 represents a current limit that is always maintained - however, this can result in overvoltage conditions in the DC link. The value in p3531 represents a current limit from which point onwards the capacitance of the DC link can be used as buffer for brief power fluctuations.		
Note:	If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.

Description:	Sets the signal source for inhibiting the motor mode of the infeed.		
Dependency:	Refer to: r3405, p3530		
Notice:	If the motor mode is inhibited although power is withdrawn from the DC link, then the DC link voltage drops to the rectified value. In this state, the DC link is post-charged through the diodes and motoring power is fed to the power unit in spite of the motoring inhibit. The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	The inhibit only becomes active after operation has been enabled and the Vdc has been ramped up (r0863.0 = 1). If Smart Mode is activated (p3400.0 = 1), the setting in this parameter is not active.

Description:	Sets the fast Vdc controller intervention for a step-like decrease of the DC link voltage due to a high motor load of the infeed. The Vdc controller fast intervention is de-activated for p3555[5] = 0 % or p3560 < 100% or p0225 > 0.5 * p0223. For a line supply and DC link identification (p3410 >= 2) the level of the fast controller intervention (p3555[2]) is automatically adapted to the line supply inductance.		
Recommend.:	Precise system knowhow is required when correctly changing this parameter! - generally, the fast controller intervention is used to improve the control behavior for high-speed load changes. The function can therefore always be de-activated with p3555[5] = 0 % if no peak load duty cycles are required in the application. - using p3555[0], the calculation of the modulation depth is determined in the case of high system deviations also when the controller intervention is de-activated. This is the reason that p3555[0] should generally not be changed.		
Index:	[0] = Intervention threshold 1: Vdc deviation from the setpoint [1] = Intervention threshold 2: Vdc difference to the rectified value [2] = Fast intervention automatic scaling [3] = Fast intervention pre-control [4] = Fast intervention timeout [5] = Fast intervention manual scaling		
Note:	p3555[0]: Vdc system deviation as a percentage of the setpoint of the DC link voltage (first condition to initiate fast controller intervention). The threshold is also used to internally change over the modulation depth calculation for high system deviations and should therefore generally not be changed! p3555[1]: Vdc threshold as a percentage of the rectified value of the actual line supply voltage (second condition to initiate the fast controller intervention). Both threshold conditions must be fulfilled to initiate the controller intervention. p3555[2]: Percentage overall level of the fast intervention (scaling factor). For a line supply identification with p3410 >= 2, the factor is automatically adapted or, for weak line supplies with a high inductance, set to 0. p3555[3]: Percentage correction of the pre-control for a fast voltage dip (dead time compensation). p3555[4]: Percentage minimum time between two controller interventions (100% corresponds to 100 ms). If high load change frequencies occur with the application, the minimum time between two controller interventions can be reduced using p3555[4].		

p3555[5]:

Percentage overall level of the fast intervention (scaling factor). With p3555[5] = 0, the fast controller intervention is inhibited. For weak line supplies with a high inductance, it makes sense to de-activate the fast intervention.

Description:	Sets the fixed setpoint for the reactive current. The permissible maximum absolute value for the reactive current is the device rated current r0207. The following applies: $ p3610 \leq r0207$		
Dependency:	Refer to: r0029, r0075, r0076		
Notice:	If the line phases are reversed and the line voltage therefore has a negative orientation ($r0066 < 0$), it should be noted that the sign of the reactive current is also reversed. The negated value of p3610 is effective in display parameters r0029, r0075, r0076 as appropriate.		
Note:	p3610 < 0: Inductive reactive current is produced, i. e. the current follows the voltage. p3610 > 0: Capacitive reactive current is produced, i. e. the current leads the voltage. This definition applies to 3AC voltage systems both with positive rotational orientation ($r0066 > 0$) and for negative rotational orientation ($r0066 < 0$).

Note:	The current actual value filter is de-activated with p3614[0, 1] = 0. Re index 0: The PT1 filter with a clock cycle dead time can be used to stabilize the closed-loop current control for extremely weak line supplies (with higher relative short-circuit voltage uk). For an automatic controller setting with p3410 >= 2, the current actual value filter is automatically pre-set. Description:	Sets the switch-in threshold for the current controller adaptation. The value refers to the maximum power unit current (r0209). From the starting threshold onwards, the inductance value (p3421) used for current control is reduced linearly as a function of the current value. The inductance value for the maximum power unit current is therefore $p3421 * p3622$.		
Dependency:	Refer to: p3410, p3415, p3622		
Note:	The parameter can be set automatically using the line supply identification (p3410 = 4, 5) (also refer to p3622). Pre-requisite for a reliable measurement of p3622 is that the current magnitude for run 2 (p3415[1]) is at least 10 % higher than the current magnitude for run 1 of the line supply identification. Otherwise, the measurement result is rejected. In the case of a correct measurement, p3620 is set to 80% of the current magnitude for run 1 (p3415[0]). For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415. For booksize power units, p3620 and p3622 are automatically adapted with the then valid default setting of the line identification p3415.

Dependency:	Refer to: p3410, p3415, p3620		

Note: The parameter for a line supply identification (p3410 = 4, 5) automatically optimized, if the following applies:
 $p3415[1] - p3415[0] > 10\%$. Otherwise, the measurement result is rejected.
 For chassis power units, it is generally not necessary to adapt p3620 and p3622 to the characteristics of the line supply. However, when required, the current controller adaptation can be optimized by selecting suitable current magnitudes for p3415.

 p3624[1]: Order of the line harmonics for the second harmonics controller.

Dependency: Refer to: p3625, r3626

Note: Harmonics in the line supply voltage can cause harmonics in the converter current. These types of current harmonics can be reduced by activating additional controller modules.

Example:

For a 50 Hz line supply harmonics at 250 Hz in the phase currents can be reduced by activating a harmonic controller with Order 5 (p3624[0] = 5).

Description: Setting of the temperature sensor for the Voltage Sensing Module (VSM).
The temperature sensor is connected to terminals X520.5 and X520.6 of the VSM.

Value:
0: No sensor
1: PTC
2: KTY84

Note: The pre-assignment of the parameter depends on the device type.
For chassis power units, the temperature monitoring of the line filter is active (p3665 = 2).

Description:	Sets the alarm threshold for the change of the capacitance of the line filter. The monitoring of the filter capacitance is de-activated with p3676 = 0.00 %.		
Dependency:	Refer to: p3670 Refer to: A06250		
Notice:	The following must be ensured before activating monitoring (e.g. p3676 = 10 %): Filter capacitance (p0221) = 3 x measured filter capacitance (r3677[0...2]) Otherwise, to establish this ratio, p3670 must be appropriately set.		

Example:

The filter capacitance is specified with $p0221 = 39 \mu\text{F}$. In order that the measured capacitance is 3x so high, $p3670 = 6.7 \text{ A}$ must be set in the gain factor.

$p0221[0] = 39 \mu\text{F}$

$r3677[0...2] = 3 \times 39 = 117 \mu\text{F}$

--> $p3670 = 6.7 \text{ A}$

Note: Prerequisites for monitoring the filter capacitance:

The phase currents must be measured at two capacitors of the line filter. To do this, CTs should be connected at the 10 V inputs of the VSM.

p3700	APC configuration / APC config			
SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: U, T	Calculated: -	Access level: 2	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 7012	
	P-Group: Closed-loop control	Units group: -	Unit selection: -	
	Not for motor type: REL	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	0000 0000 0000 0000 bin	
Description:	Sets the configuration for APC (Advanced Positioning Control).			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Activating APC	Yes	No
	01	APC acceleration sensor	Yes	No
	08	Activating pulse de-coupling/speed weight- ing	Yes	No
				FP

Note: Re bit 00:
For a 1 signal, the acceleration filter output is added to the speed setpoint.
For a 0 signal, the value 0 is added. This must be used to evaluate the filter frequency characteristics.

Re bit 01:
For a 1 signal, as APC actual value, the source of p3750 with high pass filtering is used.
For a 0 signal, as APC actual value, the encoder actual value selected with p3701 is used.

Re bit 08:
For bit 0 = 1 and bit 8 = 1 (pulse decoupling/speed weighting activated), the speed from the direct measuring system (p3701) selected for APC, weighted with p3702, and the motor speed is used as actual value for the speed controller.

SERVO (APC), SERVO_AC (APC), SERVO_I_AC (APC)	Can be changed: C1(4)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Data sets	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2	3	2

Description: Sets the number of the encoder used for for APC (Advanced Positioning Control).

Value: 2: Encoder 2
3: Encoder 3

Note: Encoder 1 is the motor encoder and cannot be used for APC as APC requires a load measuring system.
An encoder used for APC is, regarding its fault messages, treated just like a motor encoder - this means that its fault messages are assigned to the drive.

	Min	Max	Factory setting
	-10.000	10.000	1.000

Description: Sets the weighting factor to form the speed actual value from the load speed and motor speed.
p3700.8 = 1 must be set to activate weighting.

Dependency: Refer to: p3700, p3701

Note: 1.0: only corresponds to the load speed.
0.0: only corresponds to the motor speed.
0.5: corresponds to the average value from the load speed and motor speed.

Dependency:	Refer to: p3801, p3802		
Note:	When the ground fault monitoring initiates a fault for overlapping synchronizing the threshold value p0287[1] for the Motor Module and the associated infeed must be appropriately increased (e.g. p0287[1] = 100 %). For p3800 = 1, the following applies: The INTERNAL voltage actual values are used for synchronization. The effects that a (sine-wave) filter - that is connected between the Motor Module and motor - has on the voltage actual values are taken into account (theoretically) by appropriately selecting p0230. 	Min 0.00 [%]	Max 20.00 [%]	Factory setting 10.00 [%]		
Description:	Sets the threshold value of the voltage difference for the line-drive synchronization. A prerequisite for synchronism is reached if the voltage difference is less than the threshold value.				
Note:	Synchronism is reached (r3819.2 = 1), if the AND logic operation of the results from the phase measurement (p3813) and voltage measurement (p3815) is fulfilled. For voltage manipulated quantity margin (reserve) of the drive converter, the amplitude difference (r3814) between the setpoint and actual value is controlled (corrected) to zero.

Description:	Selects the upper changeover point of the friction characteristic for the frictional torque input controlled by the motor model of the induction motor. The speed of this changeover point is preassigned when automatically calculating with the changeover speed p1752. The changeover point located below is preassigned with the changeover speed p1752 * (1 - p1753). Example: p3844 = 3 means that the speed value for the change to the monitor model (p3823 = p1752) is entered into p3823 (friction characteristic value n3). Depending on the display of r3840.9, the frictional torque is calculated from the friction characteristic values, which are associated with these changeover points. For the changeover of the motor model, with hysteresis, the frictional torque smoothed with p3843 changes between these two states.			
Dependency:	As part of the automatic calculation (p0340), p3844 is only activated for closed loop control (p1300 = 21, 23) of induction motors with encoder. Refer to: p3843			

- Notice:** If the changeover point defined using p3844 does not match the changeover speed p1752, then internally, the model-controlled friction torque input is automatically deactivated (same as for p3844 = 0).
- Note:** For p3844 = 0, the model-controlled frictional torque changeover is deactivated. The frictional torque is then calculated the same as for the encoderless control by interpolating between the points along the friction characteristic.

Description: Setting for the friction characteristic record.
After the next power-on command, the friction characteristic is automatically recorded.

Value: 0: Friction characteristic record de-activated
1: Friction char record activated for all directions
2: Friction char record activated for positive direction
3: Friction char record activated for negative direction

Dependency: When selecting the friction characteristic measurement, the drive data set changeover is suppressed.
For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel.

Danger: For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out.

Notice: To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

Note: When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977).
When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842.
When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and re-magnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence.

Description: Sets the signal source for the "Fault" message of the Braking Module.

BI: p3866[0...7] = 1 signal --> No fault

BI: p3866[0...7] = 0 signal --> fault (A06900)

For a 0 signal, an acknowledgement via BO: r3861 is automatically carried out at certain time intervals.

Dependency: Refer to: A06900

Note: For the Braking Module, this message is output via the following terminal:
- X21.4 for the "Booksize" format
- X21.5 for the "Chassis" format

	01	Suppress Gx_ZSW.14	Active	Inactive	-

Dependency: Refer to: p3871, p3872, p3873, p3874, r3875, p3876, p3878, p3879

Notice: The following restrictions apply to this function:

- it is not permissible to change over the drive data set.
- the encoder/drive may not be parked using a PROFIBUS telegram.
- a maximum of 4 drives may be connected to the Control Unit.
- it is not permissible to commutate with the zero mark (p0404).

Note: Re bit 00:
All of the help functions for long stator motors can be enabled/disabled using this bit.
Re bit 01:
When the bit is set, bit 14 (parking encoder active) is set to 0 in the encoder status word GX_ZSW independent of whether the encoder is parked or not.

Description:	Sets the signal source for the digital output DO 0 (X542.1, X542.2, X542.3) of Terminal Module 31 (TM31). Digital output 0 of TM31 is a relay output. If the signal at the binector input p4030 is low, then terminal COM 0 (X542.2) is connected to NC 0 (X542.1). This connection also matches the mechanical quiescent setting of the relay. If the signal at the binector input p4030 is high, then terminal COM 0 (X542.2) is connected to NO 0 (X542.3).

Description:	Sets the limit for the total output voltage of terminals X541.1, X541.2, X541.3 and X541.4 (DI/DO 8 ... 11) of Terminal Module 31 (TM31).		
Value:	0: 0.1 A total current limit DI/DO 8 ... 11 1: 1.0 A total current limit DI/DO 8 ... 11		
Dependency:	Refer to: p4028		
Warning:	Since the sum of the output currents at terminals X541.1, X541.2, X541.3 and X541.4 is limited, an overcurrent or short circuit at one output terminal can cause a dip in the signal at the other terminals.

Warning:	The maximum voltage difference between the analog input terminals AI+, AI- and the ground of the TM31 (X520.6, X530.3) may not exceed 35 V.  For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 15 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.
Notice:	For operation as a voltage input/current input, switch S5.0 or S5.1 must be appropriately set.
Note:	When changing p4056, the parameters of the scaling characteristic (p4057, p4058, p4059, p4060) are overwritten with the following default values: For p4056 = 0, 4, p4057 is set to 0.0 V, p4058 to 0.0 %, p4059 to 10.0 V and p4060 to 100.0 %. For p4056 = 2, 5, p4057 is set to 0.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %. For p4056 = 3, p4057 is set to 4.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.

Description:	Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).			
Index:	[0] = Digital inputs/outputs (DI/DO) [1] = Analog inputs (AI) [2] = Analog outputs (AO)			
Dependency:	The parameter can only be modified for p0009 = 3, 29. The sampling times can only be set as an integer multiple of the basic sampling time (r0110, r0111). Refer to: p0009, r0110, r0111			
Note:	The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0). For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. A/D converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is powered down. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

- Dependency:** The parameter can only be modified for p0009 = 3, 29.
The sampling times can only be set as an integer multiple of the DRIVE-CLiQ clock cycle.
The minimum permissible sampling time is 125 µs.
Refer to: p0009, r0110, r0111
Refer to: A35228
- Note:** The value of the sampling time of the incremental encoder emulation p4099[3] can be pre-set in both operating modes (p4400). The next time that the system boots, the validity of the value is checked. For an invalid value, message F35228 and/or A01223 is output.
The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).
The sampling time of a TM41 in the SINAMICS mode (p4400 = 1) must be the same as that of the emulated encoder.
The sampling time of a TM41 in the SIMOTION mode (p4400 = 0) is determined by the topology used

Description: Sets the fault threshold/alarm threshold for Terminal Module 150 (TM150).

For alarms (even indices [0, 2, 4 ... 22]), the following applies:

- The corresponding alarm is initiated, if the temperature actual value associated with a temperature channel exceeds the associated alarm threshold (r4105[x] > p4102[2x]). In addition, the timer is started (p4103[x]).

- The alarm remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x] - hysteresis (p4118[x])).

For faults (uneven indices [1, 3, 5 ... 23]), the following applies:

- The corresponding fault is initiated, if the temperature actual value associated with a temperature channel exceeds the associated fault threshold (r4105[x] > p4102[2x+1]) or the associated timer (p4103[x]) has expired.

- The fault remains until the temperature actual value (r4105[x]) reaches or falls below the threshold value (p4102[2x+1]) - hysteresis (p4118[x]) and the fault has been acknowledged.

Description: Setting to start the measurement of the wire resistance for a channel for the Terminal Module 150 (TM150).
For a 2 wire evaluation, the total wire resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured wire resistance.

Procedure:

1. Select the measuring method (1x2/2x2) for the corresponding terminal block (p4108[0...5] = 0, 1).
2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11).
3. Jumper the sensor to be connected (short-circuit the sensor conductor close to the sensor).
4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-).
5. For the corresponding channel, start the measurement of the wire resistance (p4109[x] = 1).
6. After p4109[x] = 0, check the measured resistance value in p4110[x].
7. Remove the jumper across the temperature sensor.

Description: Is used to synchronize the timer of Terminal Module 15 (TM15) with the system time of the DP master.
Bit 12 ... 15:
After synchronization with the DP master, the module sends its sign-of-life in the form of a counter.
Bit 0:
This SYNC signal is set if the module has aligned its time to the system time of the DP master.
Bit 9:
This bit is set if a fault has occurred on the module (r0945).

	06	Deactivate residual value handling in the setpoint channel	Yes	No	-
	07	Activate output frequencies greater than 750 kHz	Yes	No	-

Note: Re bit 00, 01:
This bit is used to configure the zero mark via X520.
When the TM41 is operated in the SINAMICS mode (p4400 = 1), the following applies:
A new zero mark search is initiated by switching in the zero mark at the TM41 (p4401.0 = 1). The zero mark is output at the TM41 as soon as it was synchronized with the zero position/zero mark of the leading encoder.
For p4401.1 = 1, the following applies:
The zero pulse is only output via X520 when the absolute encoder passes the zero position of the absolute position (modulo converted).
For p4401.1 = 0, the following applies:
The zero pulse is output via X520 compatible with previous firmware versions (< V4.3). The zero pulse is output when the TM41 (modulo converted) passes the position it was in when the 24 V supply was switched on.
Re bit 07:
For hardware versions A and B, this bit has no significance (output frequency = 512 kHz).
For p4401.7 = 0, the following applies:
The maximum output frequency is 750 kHz (from hardware version C).
For p4401.7 = 1, the following applies:
The maximum output frequency is 1024 kHz (from hardware version C).

Description:	Sets the signal source for the incremental encoder emulation position setpoint.		
Recommend.:	The position actual value of the leading encoder in the current controller clock cycle is available in r0479. This is the reason that the following BICO interconnection should be preferably set: CI: p4420 (TM41) = r0479 (e.g. SERVO)		
Dependency:	Refer to: p4400, r4403		
Notice:	General conditions for incremental encoder emulation can be found in the following literature: SINAMICS S120 Function Manual Drive Functions		

Note: The parameter is not effective in the SIMOTION operating mode (p4400 = 0).
 An encoder actual value (r0479) can only be interconnected once on a TM41.
 For p4401.0 = 1(enable zero mark), the following applies:
 In this case, p4420 must be interconnected with r0479 of the leading encoder.
 After successful internal, automatic synchronization, the zero mark of the incremental encoder emulation is output in synchronism to the zero position/zero mark of the leading encoder.
 The zero position of the leading encoder depends on the encoder type and the selected referencing technique (p0493, p0494, p0495).

p4421 TM41 encoder emulation deadtime compensation / Enc_emul t_dead

TM41	Can be changed: U, T	Calculated: -	Access level: 3

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-10.00	10.00	0.00

Description: Sets the deadtime compensation for incremental encoder emulation.
 This factor defines the multiplier in which the encoder position setpoint of the incremental encoder emulation is shifted depending on the velocity.

Dependency: For p4421 = 0, the deadtime compensation for the position setpoint is switched out.
 For p4421 <> 0, the deadtime compensation is taken into account as follows:
 Setpoint new = setpoint via CI: p4420 + delta s * p4421
 delta s: Position change per sampling time (p4099[3]), internally smoothed
 Refer to: p4400

Note: The parameter is not effective in the SIMOTION operating mode (p4400 = 0).

p4422 TM41 encoder emulation position setpoint inversion / Enc_emul s_set inv

TM41	Can be changed: C2(4)	Calculated: -	Access level: 3

Description: Setting to invert the position setpoint for Terminal Module 41 (TM41).
 0 -> Position setpoint (CI: p4420) is evaluated as normal.
 1 -> Position setpoint (CI: p4420) is processed inverted.

Dependency: Refer to: p4420

p4423 TM41 encoder emulation standstill adaptation / Enc_standst_adapt

TM41	Can be changed: C2(4)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: 9676
	P-Group: Encoder	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	2000	4

Description: Sets standstill adaptation on Terminal Module 41 (TM41).
 p4423 is used to specify the number of clock cycles (one clock cycle = p4099[3]) used for encoder standstill detection. Once this time has elapsed, any potential deviation is compensated when adaptation is active.
 Parameter value = 0: adaptation inactive
 Parameter value > 0: adaptation active

Dependency: Refer to: r4403, p4404, p4420

Danger:

The option p4404.1 = 1 is only effective if TM41 DAC is being used.

If the possibility of a TM41 DAC (new) being replaced by a TM41 SAC (old) cannot be excluded, this option should not be set.

TM41 SAC: order no. = 6SL3055-0AA00-3PA0

TM41 DAC: order no. = 6SL3055-0AA00-3PA1

Note:

The parameter is only effective in the SINAMICS operating mode (p4400 = 1).

The parameter value must be assigned a value of 4 or more to ensure that the system functions properly.

This parameter is only relevant in the following cases:

- TTL encoder is available

- the controller option "Pre-control with adaptation for TTL encoder" has been activated (p4404.1 = 1)

	11	Channel A act	Yes	No
	13	Commutation angle constant	Yes	No
	14	Suppress faults	Yes	No
	31	Extrapolation	ON	OFF
Notice:	Re bit 06: Setting the bit sets the velocity actual value (r0061) permanently to 0. Re bit 13: Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).			

Note: Re bit 09:
 A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid.
 A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid.
 Re bit 10, 11:
 If both channels are activated, the actual value is generated from the mean value of both channels. If a channel fails (actual value invalid), it is not included when the mean value is generated.
 Re bit 14:
 The bit is only evaluated for encoder 1. No effect for encoder 2 and encoder 3.

Description:	Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, then the pulse number is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.		
Dependency:	Refer to: p0437, p4688 Refer to: F31131		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). The positive limit describes additional pulses due to EMC.

Description:	Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (p4688). The accumulator can be de-activated using p0437.7.		
Dependency:	Refer to: p0437, p4681, p4688 Refer to: F31131		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 is effective. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

Note:	It only makes sense to trace the PINs using the commissioning software. For index 2(4) and 3(5) equal to zero, index 0(1) can only be written and vice versa. Re index 0 ... 1: Here, the trigger signal for trace 0 or 1 is entered as parameter in the BICO format. For trace with a physical address (p4789), the data type of the trigger signal is set here. Re index 2 ...3: The triggering PIN for trace 0 is entered here. Index 2 bit 31 ... 16: Number of the Drive Object (DO), bit 15 ... 0: Number of the chart Index 3 bit 31 ... 16: Number of the block, bit 15 ... 0: Number of the PIN Re index 4 ... 5: The triggering PIN for trace 1 is entered here. Index 4 bit 31 ... 16: Number of the Drive Object (DO), bit 15 ... 0: Number of the chart Index 5 bit 31 ... 16: Number of the block, bit 15 ... 0: Number of the PIN

Description:	Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

	Min -	Max -	Factory setting -
Description:	Displays the instant in time for fulfilling the trigger condition for trace recorder 0. The time comprises milliseconds (index 0) and days (index 1).		
Index:	[0] = Milliseconds [1] = Days		
Dependency:	Refer to: r2114, r3102, r4719		
Notice:	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a μ s accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. When referred to r4719, the trigger instant can therefore deviate somewhat.		
Note:	If the time calculation of the drive can be synchronized with a higher-level control, then this time can be taken from the actual UTC time (r3102). Otherwise, the time is based on the system runtime (r2114).

Description:	Displays the output signal for the function generator.		
Dependency:	Refer to: p4810		
Note:	The value is displayed independently of the function generator mode.		
p4819	BI: Function generator control / FG control		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Unsigned32 / Binary P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min -	Max -	Factory setting 1
Description:	Sets the signal source to control the function generator. When the function generator is running, signal generation is stopped with a 0 signal from BI: p4819 and p4800 is set to 0.		
Dependency:	Refer to: p4800		

p4820		Function generator signal shape / FG signal shape	
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: Integer16 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min 1	Max 5	Factory setting 1
Description:	Sets the signal to be generated for the function generator.		
Value:	1: Square-wave 2: Staircase 3: Delta 4: Binary noise - PRBS (Pseudo Random Binary Signal) 5: Sine-wave		

p4821		Function generator period / FG period duration	
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min 0.00 [ms]	Max 60000.00 [ms]	Factory setting 1000.00 [ms]
Description:	Sets the period of the signal to be generated for the function generator.		
Dependency:	Ineffective when p4820 = 4 (PRBS).		

p4822		Function generator pulse width / FG pulse width	
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min 0.00 [ms]	Max 60000.00 [ms]	Factory setting 500.00 [ms]
Description:	Sets the pulse width for the signal to be generated for the function generator.		
Dependency:	Only effective when p4820 = 1 (square-wave).		

p4823	Function generator bandwidth / FG bandwidth		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min 0.0025 [Hz]	Max 16000.0000 [Hz]	Factory setting 4000.0000 [Hz]
Description:	Sets the bandwidth for the signal to be generated for the function generator.		
Dependency:	Only effective when p4820 = 4 (PRBS). Refer to: p4830 Refer to: A02041		

p4824	Function generator amplitude / FG amplitude		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min -1600.00 [%]	Max 1600.00 [%]	Factory setting 5.00 [%]
Description:	Sets the amplitude for the signal to be generated for the function generator.		
Dependency:	Units are dependent on p4810. If p4810 = 1, 2, 4: The amplitude is referred to p2002 (reference current). If p4810 = 3, 5: The amplitude is referred to p2000 (reference speed).		

p4825	Function generator 2nd amplitude / FG 2nd amplitude		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min -1600.00 [%]	Max 1600.00 [%]	Factory setting 7.00 [%]
Description:	Sets the second amplitude for the signal to be generated for the function generator.		
Dependency:	Only effective for p4820 = 2 (staircase). Units are dependent on p4810. If p4810 = 1, 2, 4: The amplitude is referred to p2002 (reference current). If p4810 = 3, 5: The amplitude is referred to p2000 (reference speed).		

p4826	Function generator offset / FG offset		
CU_I, CU_I_D410, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN	Can be changed: U, T Data type: FloatingPoint32 P-Group: Trace and function generator Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 0
	Min -1600.00 [%]	Max 1600.00 [%]	Factory setting 0.00 [%]
Description:	Sets the offset (DC component) of the signal to be generated for the function generator.		
Dependency:	Units are dependent on p4810. If p4810 = 1, 2, 4: The offset is referred to p2002 (reference current). If p4810 = 3, 5: The offset is referred to p2000 (reference speed). If p4810 = 2: In order to avoid the undesirable effects of play (backlash), the offset does not act on the current setpoint, but instead on the speed setpoint.		
p4827	Function generator ramp-up time to offset / FG ramp-up offset

	Min 0	Max 4294967295	Factory setting 0
Description:	Sets the number of cycles of a multiple trace. The multiple trace is de-activated with a value = 0.		
Index:	[0] = Trace 0 [1] = Trace 1		
Dependency:	Refer to: r4841, p4844 Refer to: A02097, A02098		
Notice:	A multiple trace can have a negative impact on the total system performance. From their inherent principle of operation, flash memory cards are subject to wear as a result of write operations. As a consequence, the lifetime of flash memory cards is reduced when using the multiple trace functionality.

Description:	Display and connector output for the clamped state. Message A3x940 is output in states 2 and 11. The voltage threshold values for the states can be set using parameter p5041. The hysteresis is adapted using parameter p5040. The transition from state 4 to states 7, 8 or 10 can be influenced by the wait time p5042[0]. A transition is made into state 10 if the analog value in p5002 falls below the voltage threshold value in p5041[4]. However, if the analog value p5002 lies below the voltage threshold value in p5041[2] and the wait time in p5042[0] has expired, then a transition is made into state 7 or 8 - otherwise state 4 is kept.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0 [µs]	Max 340.28235E36 [µs]	Factory setting 0.0 [µs]

Description: Sets the transition times for the clamping state machine of the spindle.
 Re index 0:
 Sets the maximum time for staying in the state r5001 = 4, before a transition is made to state r5001 = 10 or 7/8.
 A higher value can force a direct transition from state r5001 = 4 to 10 without passing through the states r5001 = 7/8 and 9.
 Re index 1:
 Sets the maximum time for clamping without tool (see clamping operations inside and outside the tolerance in p5045).

Index: [0] = Stabilization time for "clamped with tool"
 [1] = Maximum time to clamp

Dependency: Refer to: r5001, r5002

Note: The input is limited to a maximum value of 20 seconds.

Description:	Sets the current setpoint filter 7 as low pass (PT2) or general 2nd-order filter.		
Value:	1: PT2 low pass 2: General 2nd order filter		
Dependency:	Current setpoint filter 7 is activated via p5200.2 and parameterized via p5212 ... p5215.		
Note:	For a general 2nd-order filter, by inserting the same natural frequency in both the numerator and in the denominator, i.e. bandstop frequency, a bandstop filter is implemented. If the numerator damping of zero is selected, the bandstop frequency is completely suppressed. The denominator damping can be determined from the equation for the 3 dB bandwidth: $f_{3dB \text{ bandwidth}} = 2 * D_{\text{denominator}} * f_{\text{bandstop frequency}}$

Description: Sets an imaginary supplementary inductance for the infeed.
 The supplementary inductance supplements the effect of the voltage droop, in particular for transient operations.

Dependency: Refer to: p5424

Warning: Unsuitable supplementary inductance and smoothing time settings will make line droop control unstable.

Note: The supplementary inductance is de-activated with p5523 = 0.
 The converter's output voltage is calculated so that the converter behaves like a supplementary inductance and as such achieves an effect similar to a line reactor with higher/lower inductance.
 The supplementary inductance can be used for damping in the event of resonance phenomena on the line.

Description:	Sets the parameters for rapid pre-control of the output voltage in the event of a voltage dip. The values relate to the voltage setpoint from the voltage droop (r5420). The voltage output by the converter is formed from the product of the voltage setpoint and the adaptation factor, which is calculated in rapid pre-control.		
Index:	[0] = Adaptation factor lower limit [1] = Adaptation factor increment current limit [2] = Adaptation factor increment voltage difference [3] = Adaptation factor increment increase		
Dependency:	Refer to: r5452		
Note:	Rapid adaptation of the voltage setpoint to a reduced line voltage (e.g. in the event of a line short circuit) reduces the number of additional switching operations completed by the lower-level rapid current hysteresis controller. Re index 0: Minimum value for the adaptation factor, must be complied with for the calculation of the reduced output voltage. The value is dependent upon the voltage drop at the line reactor when the current limit is reached. As such, the value results from the reactor inductance, the frequency, and the current limit. A value of 100% de-activates the function.		

Re index 1:

When the current limit is reached, the adaptation factor is weighted with this factor in each sampling cycle. A value of 0 means that the adaptation factor will jump to the minimum value (p5428[0]) if the current limit is reached. A value of 100% de-activates the function.

Re index 2:

If the voltage across the line reactor exceeds the minimum value (p5428[0]) for at least 2 current controller clock cycles, the adaptation factor will be weighted with this factor (p5428[2]) in every sampling cycle.

Re index 3:

If none of the above criteria for reducing the adaptation factor is met, the adaptation factor is increased by the percentage value p5428[3] in each current controller clock cycle (the increase is additive). If the adaptation factor reaches the maximum value of 100%, the effect of pre-control by means of multiplication by the droop setpoint r5420 is cancelled out.

Description:	Sets the mode for the transformer magnetization. Using this function, a transformer is magnetized using a voltage that is in synchronism with the external line supply; this means that no inrush currents flow when this transformer is connected to the line supply. If value = 11: Automatic determination of the magnetizing inductance. The magnetizing inductance determined in r5491 must be transferred to p5492 in order to take effect. If value = 12: Automatic determination of the transformer phase shift and the gain correction. The transformer phase shift determined in r6440 must be transferred to p6420 in order to take effect. The gain correction determined in r6441 must be transferred to p6421 in order to take effect. If value = 13: Determination of the total leakage inductance of the transformer during line data identification. p3410 = 1 is set automatically and the inductance is measured on the next power-up. Once the measurement has been taken the converter shuts down automatically and p3410 is set to 0. The total leakage inductance of the transformer determined in r5489 must be transferred to p5490 in order to take effect. If value = 101: The infeed goes into line droop control, however the main switch/circuit breaker is not closed, and the transformer magnetization remains in the state r5482 = 4. The test mode requires that the "line droop control" function module is activated (r0108.12 = 1).		

If value = 102:

The same as test operation 1. However, synchronization with the line is not realized (VSM2 measured data r5460 and following is not used); instead, the output voltage is generated corresponding to the rated data p0210, p0211, p5486.

Value:

- 0: De-activated
- 1: Normal operation
- 11: Identification transformer magnetizing inductance
- 12: Identification transformer phase shift/gain correction
- 13: Identification total transformer leakage inductance
- 101: Test operation 1 (without activation of circuit breaker)
- 102: Test oper. 2 (w/o activation of circuit breaker, without VSM2)

Dependency: Refer to: r5482, p5486, r5493, p5494, r5499, p5580

Caution: The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

Notice: For an active black start (p5580 > 0), a separate transformer magnetization is not performed.

Note: The transformer magnetizing function is used in order to magnetize a line transformer to which the ALM is connected.

The precondition is that the transformer can be isolated from the line supply on the primary side using a circuit breaker and that the DC link of the ALM is supplied from a separate power source before the circuit breaker is closed (e.g. with a separate pre-charging transformer or for photovoltaic applications).

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1

The status of the transformer magnetization, black start and island grid synchronization is displayed in r5499.

The status of the sequence control for transformer magnetization, black start and island grid synchronization is displayed in r5482.

If value = 13:

On low-power systems it is advisable to reduce the excitation current p3415 for inductance identification (e.g. p3415[0] = p3415[1] = 5%).

To repeat a measurement p5480 must first be set to 1 and then reset to a value of 13 once the measurement has been taken.

Note: Re index 0:
Setting the rated primary voltage of the line transformer, at whose secondary the AIM and the ALM are connected. If there is a circuit breaker at the transformer primary side, then the transformer can be magnetized before closing this circuit breaker in order to avoid high inrush currents.
The setting of this primary voltage and setting the device supply voltage (p0210) defines the transformer ratio. To magnetize the transformer, the voltage has to be measured at the line side of the circuit breaker. To do this, an additional VSM must be connected and parameterized using p0150[0] and following. The voltage actual values of this VSM are displayed in r5461[0] and r5462[0]. The voltages converted over to the transformer secondary side are displayed in r5488[0, 1, 2].

Re index 1:
Setting the rated primary voltage of the line transformer; an island grid with ALM in the grid droop mode (p5401) is connected to the secondary of this transformer. Typically, the transformer primary is connected to the grid or to another island grid through a circuit breaker.
The setting of this primary voltage and setting the device supply voltage (p0210) defines the island grid transformer ratio.
To synchronize the island grid voltage with the external grid, the external grid voltage must be measured. To do this, an additional VSM must be connected and parameterized using p0150[1] and following. The voltage actual values of this VSM are displayed in r5461[1] and r5462[1]. The voltages converted over to the transformer secondary side can be displayed in r5488[3, 4, 5]. To do this, the following BICO interconnections are acquired: p5487[2] = r5461[1], p5487[3] = r5462[1].

Notice: To transform the measured primary voltages to the transformer secondary side (ALM connection point), in addition to specifying the ratio (p0210, p5487), the phase angle (p6420) of the transformer must also be parameterized. Before commissioning it is absolutely necessary that this phase angle is roughly set!
Using the transformer test mode (p5480 = 12), for the supply transformer, this angle and a gain error can be finely set.

Note: The rated voltage for the transformer primary side is set using p5486.

Note:	Re bit 00: The signal is used to control the external bridging contactor in the pre-charging circuit. The external bridging contactor is closed if pre-charging is complete (r3402 > 5) and the circuit breaker has not been activated (r0863.1 = 0). Re bit 01: The signal is used to control the circuit breaker between the island grid and the external grid. The signal is set to 1, if the island grid was successfully synchronized. Dependency:	Refer to: p5507, r5510																																		
Note:	Re bit 00: If p5500.0 = 0 the output value of the grid support characteristic is added to the control's reactive current setpoint. $r0075 = p3610 + p3611 + r3471 + r5510[0]$. If p5500.0 = 1 the dynamic reactive current setpoint p3611 is subtracted if dynamic grid support is active (p5502.1 = 1). In this case, the following applies: $r0075 = p3610 + r3471 + r5510[0]$. Re bit 01: Only active for p5500.3 = 0. If p5500.1 = 0 the alpha and beta amplitudes of the line voltage, which were smoothed with p5507[2], are determined. The absolute value of the line voltage, calculated from these amplitudes, is used as input value for the characteristic for grid support. In the event of an asymmetrical line disturbance, oscillation of the reactive current setpoint (r5510) is prevented. If p5500.1 = 1, the smoothed absolute value of the measured line voltage is used as the input value for the grid support characteristic. Smoothing is set with p5507[3]. Re bit 02: Only effective if p5500.1 = 0 and p5500.3 = 0. If p5500.2 = 0, the maximum value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. The reactive current setpoint (r5510) will, therefore, remain virtually constant even in the event of asymmetrical line disturbance. Power fluctuations in the DC link are reduced. If p5500.2 = 1, the mean value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. Re bit 03: For p5500.3 = 0, no negative phase-sequence system current setpoint according to the characteristic is calculated. This means that the setpoints for the negative phase-sequence system current controller are also equal to 0 if the line supply is not symmetrical. For p5500.3 = 1, for an unsymmetrical line supply voltage, a negative phase-sequence system current setpoint is calculated, which counteracts the voltage dissymmetry and therefore supports the grid. The negative phase-sequence system current is impressed using the negative phase-sequence system controller (p3636 and following). The negative phase-sequence system controller is automatically activated and deactivated (the following applies, p3636.0 = p5500.3). Re bit 04: Only active for p5500.3 = 1. For p5500.4 = 0, a negative phase-sequence system current setpoint according to the characteristic p5505/p5506 is generated, if the difference between two line phase voltage amplitude is greater than p5509[8] and the amplitude of at least one line phase voltage exceeds the line tolerance range according to the characteristic. For p5500.4 = 1, an already supporting negative phase-sequence system current is impressed according to the characteristic, if only the difference between two line phase voltage amplitudes is greater than p5509[9].

Note: Re index 0:
 Minimum time for continuing grid support in accordance with the characteristic once the line voltage has returned to the permissible tolerance range between the two starting points (p5505[0], p5505[2]).
 Re index 1:
 Minimum time for line disturbance for the start of grid support in accordance with the characteristic.
 If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

Re index 2:

Smoothing time for the calculation of the alpha amplitude and the beta amplitude of the line voltage if p5500.1 = 0. An estimated value for the actual line voltage absolute value is calculated from the alpha and beta amplitudes and serves as the input value for the grid support characteristic.

A smoothing time of less than a line period makes no sense.

If the estimated absolute value deviates from the smoothed measured voltage absolute value by more than 25%, the smoothed measured value is used. This corresponds to a temporary automatic changeover from p5500.1 = 0 to p5500.1 = 1.

Re index 3:

Smoothing time for the measured absolute value of the line voltage if p5500.1 = 1.

The smoothed absolute value of the line voltage is used as the input value for the grid support characteristic.

Note:	To avoid imminent shutdown due to a DC-link overvoltage, the reactive current setpoint is reduced for dynamic grid support. Instead of this, the available converter current is used as the active current to reduce the DC-link voltage.

Description:	Sets the scaling values for dynamic grid support.		
Index:	[0] = Ramp reactive current at the beginning/end of grid support [1] = Ramp reactive current when Vdc threshold is overshoot [2] = Ramp reactive current when Vdc threshold is undershot [3] = Hysteresis line voltage to exit grid support [4] = Reference voltage scaling [5] = Current limitation scaling [6] = Line voltage change for fast negative sequence calculation [7] = Line asymmetry current limit positive phase-sequence system [8] = Line asymmetry current limit negative phase-sequence system [9] = Line asymmetry minimum value for start of grid support [10] = Line asymmetry maximum value for end of grid support [11] = Active current limitation scaling		
Dependency:	Refer to: p5505, p5506, p5508		
Note:	Re index 0: Change in the reactive current setpoint (% per ms) at the beginning and end of dynamic grid support. This avoids sudden changes in the reactive current if the starting points for the line voltage (p5505[0], p5505[2]) are overshoot. Re index 1: Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is overshoot. To avoid beat phenomena, the following must apply: p5509[1] > p5509[2]. Re index 2: Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is undershot. To avoid beat phenomena, the following must apply: p5509[1] > p5509[2]. Re index 3: Sets the hysteresis for the line voltage to exit grid support (as a percentage of the supply voltage p0210). To exit grid support, the line voltage must be in the interval reduced by the hysteresis width (the interval is defined with the starting points p5505[0] and p5505[2] and the hysteresis width p5509[3]). Re index 4: Sets the scaling factor for the reference voltage for dynamic grid support (as a percentage of the supply voltage p0210). As a result, the product of p0210 x p5509[4] is applied as the voltage zero. Re index 5: Sets the scaling factor for the permissible maximum converter current absolute value for dynamic grid support (as a percentage of the converter maximum current r0209). Values higher than 100% will not be applied.		

Re index 6:

Only active for p5500.3 = 1.

Sets the percentage voltage change (as a percentage of p0210) from which value the calculated positive phase-sequence system and negative phase-sequence system amplitudes are quickly adapted. As a consequence, the grid is quickly supported when step-type faults occur.

Re index 7:

Only active for p5500.3 = 1.

Sets the maximum positive phase-sequence system reactive current to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

Re index 8:

Only active for p5500.3 = 1.

Sets the maximum negative phase-sequence system absolute current to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

Re index 9:

Only active for p5500.3 = 1.

Sets the minimum value of the voltage asymmetry to impress a negative phase-sequence system current for asymmetrical grid support.

For p5500.4 = 1, a negative phase-sequence system current is already impressed, if the voltage asymmetry exceeds the set value.

For p5500.4 = 0, in addition, for at least one of the phase voltages, the tolerance condition from the characteristic p5505 / p5506 must be exceeded.

Re index 10:

Only active for p5500.3 = 1.

Sets the maximum value of the voltage asymmetry to end asymmetrical grid support.

This means that parameters p5509[9] and p5509[10] define a hysteresis range.

Re index 11:

Only active for p5500.3 = 1.

Sets the scaling factor for the permissible negative active current value for dynamic grid support (as a percentage of the converter maximum current r0209).

Re bit 00:
The monitoring bandwidths of the voltage and frequency criteria are defined using the thresholds p5543 and p5544. Also see the note regarding bit 03 and bit 05.
Re bit 01:
The frequency shift technique actively changes the frequency that is fed in. For islanding formation this results in the permissible frequency bandwidth being violated. Shut down is realized via fault F06851.
Re bit 04:
It is only possible to activate the FRT voltage time characteristic (HV RT, LV RT) when the voltage and frequency monitoring are activated (p5540.0 = 1 signal). The monitoring thresholds p5543 and p5544 are deactivated.

Re bit 05:

The behavior after an LVRT limit has been exceeded depends on the signal state.

0 signal = immediate shutdown.

1 signal = shutdown only after the time in p5545[2] has expired.

Re bit 07:

It is only possible to activate the frequency time characteristic (HFRT, LFRT) when the voltage and frequency monitoring are activated (p5540.0 = 1 signal). The monitoring thresholds p5543 and p5544 are deactivated.

Re bit 09:

The additional voltage and frequency check is activated when switching on. To do this, before operation is enabled, a check is made against the limits p5543[2, 3] and p5544[2, 3] and the system waits until these limits are maintained.

If the voltage and frequency limits are exceeded, then this is displayed in r5542.

Description: Sets the signal source for the voltage to be measured in alpha/beta coordinates.

Index:
[0] = Alpha
[1] = Beta

Note: PLL2 is deactivated with input signal 0.

The following interconnection is practical for synchronizing an island grid to another grid (typically: public grid):

- The voltage of the island grid is measured using a VSM (r5461[0] and r5462 [0]), which is connected in front of the circuit breaker between the island grid and the ALM.
- The voltage of the external grid is measured using another VSM (r5461[1] and r5462 [1]), which is connected in front of the circuit breaker between the external grid and the island grid. The voltages (r5488[3, 4]) transformed to the ALM supply voltage are used as input variables for the PLL2.

Description: Sets the mode for the black start.

An island grid, which at the start has no voltage, can be established using this function. In this case, the ALM acts as the grid voltage source or as grid generator for the connected island grid.

Prerequisite:

The ALM function module "line droop control" and line droop operation (p5501) are activated.

If value = 0:

The black start is deactivated.

If value = 2:

At the next switch on, a black start is carried out. Here, the precondition is that the line voltage is close to zero (less than p5586[0]). Using the grid droop control, the grid voltage is increased up to the rated value using a ramp function.

If value = 3:

At the next switch on, a black start is carried out if the grid voltage is less than p5586[0]. If on the other hand, a grid is connected within the regular tolerances (p0281, p0282), then a regular switch-on operation is carried out with synchronization to the existing grid voltage.

If, in so doing, transformer magnetization is activated (p5480 = 1), then this is performed.

Value:	0: De-activated 2: Grid black start completed 3: Grid black start automatic
Notice:	A black start is only possible when the grid droop control (p5501) is activated. A black start is only possible when the transformer test operation mode is deactivated (p5480 <= 1). The use of feedback signal contacts from the circuit breaker between the Active Interface Module and the island grid is urgently recommended (p0860).
Note:	Precondition for establishing a voltage in an island grid is that adequate power is supplied into the ALM DC link (e.g. generator, photovoltaic) as well as control of the DC link voltage using this power generation system. The power requirement of the Island grid must not exceed the power of the generating system - even briefly. In order to avoid the high inrush currents, when the grid is being established, the voltage is ramped up to the rated value. At the end of the voltage ramp, the system changes over into regular grid droop operation. The ALM then operates as grid-generating voltage source using active and reactive power droop, also with other sources of power in the island grid, in a stable fashion. The other power units can then act as a current source to support the grid or as a voltage source to form a grid. As grid forming unit, then the other power units must also have a grid droop function. The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1 Before closing this switch, it is checked as to whether the island grid is in a non-voltage condition. A possibly existing residual voltage in the Active Interface Module is automatically controlled down to zero.

Description:

Display and connector output of the supplementary setpoints for the frequency and voltage control during island grid synchronization.

Index:

[0] = Setpoint ramp frequency

[1] = Setpoint ramp voltage

Notice:

In order to avoid equalization operations, after island synchronization has been completed, it is not permissible that supplementary setpoints for frequency and voltage are suddenly set to zero (as step function). This is the reason that after ending synchronization, the setpoints are held constant and reset with the trigger signal p5583[2] = 1.

In the same controller cycle, the signals for smoothed frequency (p5406[0]) and voltage (p5416[0]) are corrected by the corresponding absolute values!

The supplementary setpoints (r5582) are automatically reset when synchronization is canceled and when the grid droop (p5401) is deactivated with a change into regular closed-loop current control operation (with adaptation to the grid frequency).

Note:

In the default setting, the setpoints are connected with the unfiltered setpoint inputs (no-load frequency p5406[1], no-load voltage p5416[1]) of the grid droop. While synchronizing the island grid to an external grid, the amplitude, phase angle as well as the frequency of the island grid are adapted in this fashion.

The setpoints for synchronizing can also be used for synchronous voltage and frequency adaptation of additional power generating systems in the island grid.

Description:	Sets the signal sources for island grid synchronization. Index:	[0] = Start [1] = Circuit breaker feedback signal [2] = Reset setpoints			
Caution:	Re index 1: The feedback signal contact of the circuit breaker between the external grid and the island grid (in front of the grid transformer) must be connected in parallel via binector input p5583[1]. The feedback signal is required for a state change in the synchronization sequence control. This signal is not used to completely monitor the contactor (p860 and following).			
Notice:	In order to synchronize an island grid with an external grid, frequency, phase position and amplitude of the island grid must be changed in operation! This assumes that the components of the island grid are suitable for these parameter changes and that the ALM is the only grid generator in the island grid.			
Note:	Re index 0: Signal source for the start command to synchronize the island grid with an external grid. The target values for the synchronization, are the output values of the PLL2 (r6311[1], r6313, r6314). The PLL2 must be activated at the latest when synchronization starts (p5571, p5574). Description:

Sets the minimum possible pause time for the energy-saving mode.

The value is the sum of the following times:

- Energy-saving mode transition time
- Operating state transition time
- Energy-saving mode, dwell time minimal

Index:

[0] = Reserved
[1] = Mode 2

Note:

It is not permissible that the value is less than the sum of the "energy-saving mode transition time" and the "operating state transition time" (system properties).

Description:	Sets the phase shift between the line transformer's primary and secondary voltages.		
Index:	[0] = Supply transformer [1] = Island grid transformer		
Notice:	It is absolutely necessary to coarsely set this transformer parameter when commissioning the system the first time in order to avoid high inrush currents. For the infeed transformer, a fine setting can then be subsequently performed using the transformer data identification (p5480, r6440).		

Note: The phase shift is referred to the phase angle of the line voltage at the transformer primary.
 Example:
 A transformer with vector group Dy5n has a phase shift of $-5 \times 30^\circ = -150^\circ$.
 This means that the secondary voltage leads the primary voltage by 150° .
 This phase shift must be determined when commissioning the system, in order to achieve synchronous magnetization of the transformer before closing the circuit breaker.
 Re index 0:
 The data is used to calculate the secondary voltage r5488[0, 1, 2] from the measured primary voltages p5487[0, 1].
 Re index 1:
 The data is used to calculate the secondary voltage r5488[3, 4, 5] from the measured primary voltages p5487[2, 3].

Description: Sets the correction for the gain factor for fine calibration of the line transformer transformation ratio.
Index: [0] = Supply transformer
 [1] = Island grid transformer
Dependency: Refer to: r6441
Notice: It is absolutely necessary to coarsely set this transformer parameter when commissioning the system the first time in order to avoid high inrush currents.
 For the infeed transformer, a fine setting can then be subsequently performed using the transformer data identification (p5480, r6441).
Note: The ratio can be finely calibrated using the correction factor. Gain errors (e.g. as a result of a measuring transformer for the VSM) can be compensated.
 Re index 0:
 The data is used to calculate the secondary voltage r5488[0, 1, 2] from the measured primary voltages p5487[0, 1].
 Re index 1:
 The data is used to calculate the secondary voltage r5488[3, 4, 5] from the measured primary voltages p5487[2, 3].

Description: Sets the reference serial number for the Control Unit.
Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.

Dependency: Refer to: p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

- The OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

Dependency: Refer to: p7761, p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

Re bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

Re bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

Re bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

Re bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

Re bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765 = 1.

[0] = character 1 (e.g. 49 dec)
[1] = character 2 (e.g. 50 dec)
...
[5] = character 6 (e.g. 99 dec)
[29] = 0 dec (completes the entry)

Dependency: Refer to: p7767, p7768

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.
When using the STARTER commissioning software, the password should be entered using the associated dialogs.
The following rules apply when entering the password:
- Password entry must start with p7766[0].
- No gaps are permissible in the password.
- Entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

Note: KHP: Know-How Protection
When reading, p7766[0...29] = 42 dec (ASCII character = "**") is displayed.
Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection.
Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated.
A product-specific list of these parameters is also available in the corresponding List Manual.

Value:	0: Inactive 1: Load NVRAM data to parameters 2: Load parameters to NVRAM 3: Reset		

- Notice:** After action p7770 = 1 no more pulses may be enabled.
After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.
- Note:** If value = 1:
This action loads the NVRAM data to the parameters.
If value = 2:
This action loads the parameters to the NVRAM.
If value = 3:
This action sets parameters p7771 ... p7774 to the factory setting.
It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

Value:	0: Inactive 1: NVRAM data backup to memory card 2: Import NVRAM data from the memory card 3: Delete NVRAM data in the device 10: Error when clearing 11: Error when backing up, memory card not available 12: Error when backing up, insufficient memory space 13: Error when backing up 14: Error when importing, memory card not available 15: Error when importing, checksum error 16: Error when importing, no NVRAM data available 17: Error when importing		
Notice:	Re value = 2, 3: These actions are only possible when pulses are inhibited.		
Note:	After the action has been successfully completed, the parameter is automatically set to zero. The actions importing and deleting NVRAM data immediately initiate a warm restart. If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

After the update has been completed, it is necessary to carry out a new POWER ON (power-down/power-up) for the components involved. The firmware update procedure is displayed as follows: Control Unit (LED RDY): Flashes yellow with 0.5 Hz --> firmware is being updated. Flashing yellow with 2 Hz --> POWER ON is required for the components involved. Components involved: Flashing red/green with 0.5 Hz --> firmware is being updated. Flashing red/green with 2 Hz --> POWER ON of the components is required. Only components from firmware version 2.5 support the red/green flashing at 2 Hz.

Index 1:

Component number of the DRIVE-CLiQ component for which the reference firmware version, saved in r7825 on the memory card/device memory, is to be displayed.

Index: [0] = Firmware download
[1] = Reference firmware version

Dependency: Refer to: p0121, p0141, p0151, p7829

Note: For p7828[0] = 399, the firmware for all of the existing components is downloaded.
The firmware download is started with p7829 = 1.

Description: Activating the firmware download for the DRIVE-CLiQ components specified in p7828.

1: Activate download.

-1: activate the download and carry out a reset.

0: Download successfully completed.

> 1: Fault code

011: DRIVE-CLiQ component has detected a checksum error.

015: The selected DRIVE-CLiQ components did not accept the contents of the firmware file.

018: Firmware version is too old and is not accepted by the component.

019: Firmware version is not suitable for the hardware release of the component.

101: After several communication attempts, no response from the DRIVE-CLiQ component.

140: Firmware file for the DRIVE-CLiQ component not available on the memory card/device memory.

143: Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.

144: When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card/device memory is defective.

145: Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.

156: Component with the specified component number is not available.

Additional values:

Only for internal Siemens troubleshooting.

Dependency: Refer to: p7828

Note: p7829 is automatically set to 0 after the firmware has been successfully downloaded.
The new firmware only becomes active at the next system run-up.

Description:	Displays the version of the firmware stored on the memory medium of the drive device. Depending on the drive device being used, the memory medium is a memory card, or an internal non-volatile device memory.		
Index:	[0] = Internal [1] = External [2] = Parameter backup		
Note:	Re index 0: Displays the internal firmware version (e.g. 04402315). This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions. Re index 1: Displays the external firmware version (e.g. 04040000 -> 4.4). For automation systems with SINAMICS Integrated this is the runtime version of the automation system. Re index 2: Displays the internal firmware version of the parameter backup. With this CU firmware version, the parameter backup was saved, which was used when powering up.

Description:	Sets the global and unique component number in a drive system with several Control Units. Each index of the parameter corresponds to a possible local component number on the corresponding Control Unit. The indices are allocated to the global component numbers as follows: p7859[0]: Not used p7859[1]: Sets the global component number for the local component number 1 p7859[2]: Sets the global component number for the local component number 2 ... p7859[199]: Sets the global component number for the local component number 199		
Notice:	This parameter is preferably set via suitable commissioning software (e.g. UpdateAgent, STARTER, SCOUT). Changing the parameter via the AOP (Advanced Operator Panel) or BOP (Basic Operator Panel) can destroy a valid unique setting.		
Note:	The parameter is not influenced by setting the factory setting.

Description:	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - The drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK - If they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.		
Index:	[0] = Drive object number Control Unit [1] = Drive object number object 1 [2] = Drive object number object 2 [3] = Drive object number object 3 [4] = Drive object number object 4 [5] = Drive object number object 5 [6] = Drive object number object 6 [7] = Drive object number object 7 [8] = Drive object number object 8 [9] = Drive object number object 9 [10] = Drive object number object 10 [11] = Drive object number object 11 [12] = Drive object number object 12 [13] = Drive object number object 13 [14] = Drive object number object 14		

[15] = Drive object number object 15
 [16] = Drive object number object 16
 [17] = Drive object number object 17
 [18] = Drive object number object 18
 [19] = Drive object number object 19
 [20] = Drive object number object 20
 [21] = Drive object number object 21
 [22] = Drive object number object 22
 [23] = Drive object number object 23

Notice: This parameter may only be used by qualified service personnel.

Note: If the same drive object numbers are used and if the existing drive object numbers in the system are entered incompletely, the content of this parameter is ignored entirely. The behavior as with factory setting will then become effective.

	Min 0000 hex	Max FFFF FFFF hex	Factory setting 0000 hex
Description:	Sets the COB-ID for the emergency message (error telegram). It corresponds to the CANopen objects: - 1014 hex: COB-ID		

Note: If, when downloading, the pre-set value 0 is downloaded, then the CANopen pre-set value 80 hex + Node-ID is automatically set.
 Online, the value 0 is rejected as, according to the CANopen Standard, COB-ID 0 is not permitted here.
 The changeover of the node ID using the hardware switch at the Control Unit or per software has no effect on the COB-ID EMCY. The saved value remains effective.

p8604[0...1] CAN life guarding / Life guarding

	Min 0	Max 65535	Factory setting 0

Description: Sets the life guarding parameter for the following CANopen objects:

- 100C hex: Guard Time
- 100D hex: Life Time Factor

The life time is derived by multiplying guard time by the life time factor.

Index: [0] = Time interval [ms] for the life time
[1] = Factor for the lifetime

Dependency: Refer to: p8606
Refer to: F08700

Note: For p8604[0] = 0 and/or p8604[1] = 0, the life guarding event service (monitoring the node guarding, fault F08700 with fault value = 2) is deactivated.
 The node guarding protocol is active without the life guarding event service, if the heartbeat protocol is deactivated (p8606 = 0).

	Min 0 [ms]	Max 65535 [ms]	Factory setting 0 [ms]

Description: Sets the time [ms] to cyclically send heartbeat telegrams.

The smallest cycle is 100 ms.

For p8606 = 0, heartbeat telegrams are not sent.

Dependency: Refer to: p8604

Note: Corresponds to the CANopen object 1017 hex.
 Activating the heartbeat protocol automatically deactivates the node guarding.

	Min 0000 hex	Max FFFF 1000 hex	Factory setting 0000 hex
Description:	Displays the Pre-defined Error Field of the CAN node. It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history. The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code. Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code.		

CANopen error code:

0000 hex: No error present

8110 hex: Alarm A08751 present

8120 hex: Alarm A08752 present

8130 hex: Alarm A08700(F) with alarm value = 2 present

1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700)

All drive objects are acknowledged by writing the value 0 to the index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

p8620		CAN Node-ID / Node ID	
CU_S120_DP (CAN), CU_S120_PN (CAN), CU_S150_DP (CAN), CU_S150_PN (CAN)	Can be changed: T Data type: Unsigned8 P-Group: - Not for motor type: -	Calculated: - Dyn. index: - Units group: - Scaling: -	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1
	Min 1	Max 127	Factory setting 126
Description:	Display or setting of the CANopen Node ID. The Node ID can be set as follows: 1) Using the address switch on the Control Unit. --> p8620 can then only be read and displays the selected Node ID. --> A change only becomes effective after a POWER ON. --> CANopen Node ID and PROFIBUS address are identical. 2) Using p8620 --> Only if address 0 is set using the address switch. --> the Node ID is set as standard to 126. --> A change only becomes effective after save and POWER ON.		
Dependency:	Refer to: r8621		
Note:	Every node ID change only becomes effective after a POWER ON. The active node ID is displayed in r8621. The parameter is not influenced by setting the factory setting. It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (pre-requisite: the address 0 is set for the address switch).

	Min 0	Max 7	Factory setting 6
Description:	Setting the bit rate for the CAN bus. The appropriate bit timings are selected that are defined in p8623 in the associated sub-index. Example: Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6].		

Value:	0: 1 Mbit/s
	1: 800 kbit/s
	2: 500 kbit/s
	3: 250 kbit/s
	4: 125 kbit/s
	5: 50 kbit/s
	6: 20 kbit/s
	7: 10 kbit/s
Dependency:	Refer to: p8623
Note:	The parameter is not influenced by setting the factory setting.

Description: Sets the bit timing for the C_CAN controller to the associated and selected bit rate (p8622). Bits are distributed to the following parameters of the C_CAN controller in p8623[0...7]:
 Bit 0 ... 5: BRP (Baud Rate Prescaler)
 Bit 6 ... 7: SJW (Synchronization Jump Width)
 Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point)
 Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point)
 Bit 15: Reserved
 Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension)
 Bit 20 ... 31: Reserved
 Example:
 Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6

Recommend.: Use the factory setting when setting the bit timing.

Re bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

Re bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Dependency: Refer to: r2050, r2090, r2091, r2092, r2093, r8750, r8795, r8850, r8890, r8891, r8892, r8893

Note: The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer.
For SINAMICS S120 with CBC10, the PZD interface IF2 is used:
BI: p0840.0 = r889x.0
BI: p0844.0 = r889x.1
BI: p0848.0 = r889x.2
BI: p0852.0 = r889x.3
BI: p2103.0 = r889x.7
For SINAMICS S110, the PZD interface IF1 is used:
BI: p0840.0 = r209x.0
BI: p0844.0 = r209x.1
BI: p0848.0 = r209x.2
BI: p0852.0 = r209x.3
BI: p2103.0 = r209x.7
The write access is rejected if a CANopen control word is not mapped at one of these locations.
This also causes the project download of the commissioning software to be canceled.

Description: Selects the node address for the SINAMICS Link on the Communication Board Ethernet 20 (CBE20).
p8836 = 0: SINAMICS Link de-activated
p8836 = 1 ... 64: SINAMICS Link node address

Dependency: Refer to: p8835

Note: SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.

p8837 IF2 STW1.10 = 0 mode / IF2 STW1.10=0

Min	Max	Factory setting
0	2	2

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".
Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value:
0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommend.: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

Description: Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).

Value:
0: Inactive
1: Control Unit onboard
2: COMM BOARD
99: Automatic

Index:
[0] = Interface 1
[1] = Interface 2

Dependency: Refer to: p2030, p8815

Note: For value = 99 (automatic) the following applies:
- if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1.
- if a CBE20 is inserted, then the following applies:
-- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2.
-- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2.
- CAN CBC10 always communicates via IF2.
For a value not equal to 99 (automatic) the following applies:
- both indices must be set to a number not equal to 99 (automatic).
A change only becomes effective after POWER ON, reset or download.

Description:	Sets the monitoring time to monitor the process data received via COMM BOARD. If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.			
Dependency:	Refer to: F08501			
Note:	This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus. Value = 0: Monitoring is de-activated.

Description:	Sets the axis type (linear axis or rotary axis/spindle).		
Value:	0: Linear axis 1: Rot axis/spindle		
Dependency:	Refer to: p9502		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	For the commissioning software, after changing over the axis type, the units dependent on the axis type are only updated after a project upload. A change only becomes effective after a POWER ON.

Description:	Sets the modulo value in degrees for rotary axes of the "Safe position" function. This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled. The modulo function is deactivated for a value = 0.		
Dependency:	Refer to: F01681		
Notice:	When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output. If the absolute position is not enabled, then the parameterized modulo value is not taken into account. Description:	Sets the function configuration for the safe motion monitoring functions.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Extended message acknowledgement	Yes	No
	01	Setpoint velocity limit for STOP F	No	Yes
	02	Actual value sensing sensorless motor type	Synchronous motor	Induction motor
	03	SS1 with OFF3 (brake response)	SS1E external stop	SS1 with OFF3
Dependency:	Refer to: C01711			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	Re bit 00: When the function is activated, a safety-relevant acknowledgement (internal event acknowledge) can be performed by selecting/deselecting STO.			
	Re bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.			
	Re bit 02: This bit defines the type of motor, which the sensorless actual value sensing evaluates. For bit = 0, the actual velocity is calculated for an induction motor. For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300. Bit = 0 should be set if no motor is defined (p0300 = 0).			
	Re bit 03: When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated. SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)			

p9309		SI Motion behavior during pulse suppression (Motor Module) / SI Mtn behav IL MM

Description:	Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active
Dependency:	Refer to: C01711			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
	Re bit 00: If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.			

Note: SDI: Safe Direction
SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring)
Re bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
Re bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

p9311 SI Motion actual value sensing clock cycle (Motor Module) / SI Mtn act clk MM

SERVO, SERVO_AC, SERVO_I_AC, VEC- TOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95)	Calculated: -	Access level: 3

	P-Group: Safety Integrated	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0000 [µs]	Max 25000.0000 [µs]	Factory setting 0.0000 [µs]

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.
Setting criteria if the motion monitoring functions are executed with an encoder.
- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- The isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.
Setting criteria if the motion monitoring functions are executed without an encoder:
- The actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115).

Dependency: Refer to: p0115, p9300, p9511
Refer to: F01652

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).
The monitoring clock cycle from p9300 must be an integer multiple of this parameter.
In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.
The clock cycle time of the actual value sensing should not be set to more than 8 ms.
A change only becomes effective after a POWER ON.

Dependency:	Refer to: r9713		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C30711 with value 7001 is output and safety stop response STOP F.

SERVO, SERVO_AC, SERVO_I_AC, VEC- TOR, VECTOR_AC, VECTOR_I_AC	Can be changed: C2(95) Data type: Integer32 P-Group: Safety Integrated Not for motor type: - Min -1	Calculated: - Dyn. index: - Units group: - Scaling: - Max 4	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: p9507 Refer to: F30681, C30711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Dependency:	Refer to: C30711		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. A longer filter time results in a longer response time.		

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The smoothing is realized with a 1st order lowpass filter
For p9387 = minimum value, the filter is deactivated.

	Min 0.00 [%]	Max 1000.00 [%]	Factory setting 10.00 [%]

Description: Sets the minimum current for encoderless actual value sensing in reference to 10 mA (i.e. when 1 % = 10 mA).
- The value must be increased if C30711 has occurred with message value 1042.
- The value must be decreased if C30711 has occurred with message value 1041.
For synchronous motors, the following condition must be fulfilled:
|p0305 x p9783| >= p9388 x 1.2

Recommend.: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: Refer to: r9785
Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Description: Sets the acceleration limit to filter velocity fluctuations.
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.
If this value is decreased, and this dampens the velocity peaks when accelerating.
- The value must be increased if C30711 with message value 1043 has occurred.
- The value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommend.: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.
To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784
Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9389 = maximum value, the filter is deactivated.
Diagnostics parameter p9784 must be used to correctly set this parameter.

Bit	Signal name	1 signal	0 signal	FP
00	Extended message acknowledgement	Yes	No	-
01	Setpoint velocity limit for STOP F	No	Yes	-
02	Actual value sensing sensorless motor type	Synchronous motor	Induction motor	-
03	SS1 with OFF3 (brake response)	SS1E external stop	SS1 with OFF3	-

Dependency: Refer to: C01711

Note: Re bit 00:
When the function is activated, a safety-relevant acknowledgement (internal event acknowledgement) can be performed by selecting/deselecting STO.

Re bit 01:
When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

Re bit 02:
This bit defines the type of motor, which the sensorless actual value sensing evaluates.
For bit = 0, the actual velocity is calculated for an induction motor.
For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.
Bit = 0 should be set if no motor is defined (p0300 = 0).

Re bit 03:
When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.
SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

Description:	Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	SSM during pulse suppression and sensorless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and sensorless	Becomes inactive	Remains active	-
Dependency:	Refer to: C01711				
Notice:	Re bit 00: If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.				
Note:	SDI: Safe Direction SSM: Safe Speed Monitor (safety-relevant feedback signal from the velocity monitoring) Re bit 00: For bit = 1 and with the SSM safety function activated, the following applies: - During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level. For bit = 0 and with the SSM safety function activated, the following applies: - Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state. Re bit 08: For bit = 1 and with the SDI safety function activated, the following applies: - During pulse suppression, monitoring is switched off and the status signal indicates inactive. For bit = 0 and with the SDI safety function activated, the following applies: - Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

	0	1	0		
Description:	Setting for clock cycle synchronous communication between PROFIdrive controller and Control Unit. The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1). If a PROFIdrive controller exchanges process data in clock cycle synchronism with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data in clock cycle synchronism. Examples for clock cycle synchronous communication: - clock-cycle synchronous control for the motion control (e.g. SIMOTION). - clock-cycle synchronous PROFIsafe master (e.g. SIMATIC S7-400F).				
Value:	0: Communication not isochronous 1: Communication isochronous				

Dependency: Refer to: C01711, A01796
Notice: As of firmware version 2.6, the parameter has no effect.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0000 [ms]	Max 25.0000 [ms]	Factory setting 0.0000 [ms]

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring. Setting criteria if the motion monitoring functions are executed with an encoder.

- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- The isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Setting criteria if the motion monitoring functions are executed without an encoder:

- The actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115).

Dependency: Refer to: p0115
Refer to: F01652

Note: The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1). The monitoring clock cycle from p9500 must be an integer multiple of this parameter. In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended. The clock cycle time of the actual value sensing should not be set to more than 8 ms. A change only becomes effective after a POWER ON.

Description:

This is an evaluation factor to define the setpoint limit from the selected actual speed limit.
 The active SLS limit value is evaluated with this factor and is made available as setpoint limit in r9733.

Dependency:

This parameter only has to be parameterized for the motion monitoring functions integrated in the drive (p9601.2 = 1)

r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side)

r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side)

[x] = Selected SLS stage

Conversion factor from the motor side to the load side:

- motor type = rotary and axis type = linear: p9522 / (p9521 x p9520)

- otherwise: p9522 / p9521

Refer to: p9501, p9531, p9601

Note:

The active actual speed limit is selected via safety-relevant inputs (SGE).

When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

Description: Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".
 p9538[0...29] = CBA dec
 C = Assignment of the cam to the cam track.
 Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

	Min	Max	Factory setting
	1	100000	1000

Description: Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.

Dependency: Refer to: r9713

Note: The parameter is only effective when PROFIsafe telegram 901 is selected.
By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.
If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C0711 with value 7001 is output and safety stop response STOP F.

Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: r9787 Refer to: F01681, C01711		
Notice:	Reducing this value can adversely affect the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Dependency:	Refer to: C01711		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.		
Notice:	A longer filter time results in a longer response time.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order lowpass filter For p9587 = minimum value, the filter is deactivated.

Description:	Sets the minimum current for encoderless actual value sensing in reference to 10 mA (i.e. when 1 % = 10 mA). - The value must be increased if C01711 has occurred with message value 1042. - The value must be decreased if C01711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: p0305 x p9783 >= p9588 x 1.2		
Recommend.:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.		
Dependency:	Refer to: r9785 Refer to: C01711		
Notice:	If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 10.00 [%]	Max 3300.00 [%]	Factory setting 100.00 [%]
Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - The value must be increased if C01711 with message value 1043 has occurred. - The value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		
Recommend.:	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration. To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.		
Dependency:	Refer to: r9784 Refer to: C01711		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For p9589 = maximum value, the filter is deactivated. Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Sets the enable signal for the function "Safe Brake Control" (SBC) on the Control Unit.

Value:
0: Inhibit SBC
1: Enable SBC

Dependency: Refer to: p9802

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

23	SS1 cause selection PROFIsafe (Basic Functions)	Yes	No	-

Dependency:

Refer to: r9872

Note:

Re bit 00:

When STO or "Safe pulse cancellation" is selected, the cause is displayed in bits 16 ... 20.

Re bit 01:

- For p9772.1 = 1 and p9772.19 = 0, an STO from the Safety Basic functions is active.

- For p9772.1 = 1 and p9772.19 = 1, safe pulse cancellation is active, if safety functions without selection are activated via p9601.2/p9801.2 = 1 and p9601.5/p9801.5 = 1.

Note:

If p9601.0 = 1 and p9601.2 = 1 and p9801.5 = 1 then for bit 0 and 1, the STO function applies.

Re bit 05:

When SS1 is selected, the cause is displayed in bits 22 and 23.

Re bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

Re bit 19:

With SMM encoderless no actual value sensing is possible on account of OFF2.

With SMM with encoder no actual value sensing is possible on account of parking.

For Safety functions without selection, safe pulse cancellation to selected (p9772.19 = 1).

SMM: Safe Motion Monitoring

Re bit 22 and 23:

These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Description:	Sets the additional field-generating current for synchronous motors with sensorless actual value sensing. The set value is referred to p0305. This parameter ensures a "base load" for the motor. The value must fulfill the following condition: $ p0305 \times p9783 \geq p9588 \times 1.2$		
Dependency:	Refer to: p9588 Refer to: C01711		
Notice:	Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.		

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9783 = maximum value, current injection is deactivated.
Current injection is not effective in the U/f control mode.

Description:	Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module. 0: Inhibit SBC 1: Enable SBC			
Dependency:	Refer to: p9602			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1). Description:	Sets the tolerance time to change over the safety-related inputs (SGE) on the Motor Module. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a crosswise data comparison during this tolerance time.		
Dependency:	Refer to: p9650		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	For a crosswise data comparison between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The parameterized time is rounded internally to an integer multiple of the monitoring clock cycle. Description:	Sets the debounce time for the EP terminal of the Motor Module.		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	Rounding effects can occur in the last decimal place of the parameterized time. The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the fail-safe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Motor Module to brake along the OFF3 down ramp (p1135).		
Recommend.:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9652		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		

Note: For a crosswise data comparison between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated.
Rounding effects can occur in the last decimal place of the parameterized time.
The parameterized time is rounded internally to an integer multiple of the monitoring clock cycle.

Description: Displays the Safety Integrated status on the Motor Module.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	STO on Motor Module selected	Yes	No	2810
	01	STO on Motor Module active	Yes	No	2810
	02	SS1 delay time on Motor Module active	Yes	No	2810
	03	Safe Brake Adapter feedback signal	Yes	No	2814
	04	SBC requested	Yes	No	2814
	05	SS1 selected on the Motor Module (Basic Functions)	Yes	No	-
	06	SS1 active on the Motor Module (Basic Functions)	Yes	No	-
	07	STO terminal state on the Motor Module (Basic Functions)	High	Low	-
	09	STOP A cannot be acknowledged active	Yes	No	2802

10	STOP A active	Yes	No	2802
15	STOP F active	Yes	No	2802
16	STO cause: Safety comm. mode	Yes	No	-
17	STO cause selection via terminal (Basic Functions)	Yes	No	-
18	STO cause: selection via SMM	Yes	No	-
20	STO cause selection PROFIsafe (Basic Functions)	Yes	No	-
22	SS1 cause selection terminal (Basic Functions)	Yes	No	-
23	SS1 cause selection PROFIsafe (Basic Functions)	Yes	No	-
24	Slave Motor Module ready for communication	Yes	No	-
