Warranty and Liability

Note

The Application Examples are not binding and do not claim to be complete regarding the circuits shown, equipping and any eventuality. The Application Examples do not represent customer-specific solutions. They are only intended to provide support for typical applications. You are responsible for ensuring that the described products are used correctly. These application examples do not relieve you of the responsibility to use safe practices in application, installation, operation and maintenance. When using these Application Examples, you recognize that we cannot be made liable for any damage/claims beyond the liability clause described. We reserve the right to make changes to these Application Examples at any time without prior notice. If there are any deviations between the recommendations provided in these application examples and other Siemens publications – e.g. Catalogs – the contents of the other documents have priority.

We do not accept any liability for the information contained in this document.

Any claims against us – based on whatever legal reason – resulting from the use of the examples, information, programs, engineering and performance data etc., described in this Application Example shall be excluded. Such an exclusion shall not apply in the case of mandatory liability, e.g. under the German Product Liability Act (“Produkthaftungsgesetz”), in case of intent, gross negligence, or injury of life, body or health, guarantee for the quality of a product, fraudulent concealment of a deficiency or breach of a condition which goes to the root of the contract (“wesentliche Vertragspflichten”). The damages for a breach of a substantial contractual obligation are, however, limited to the foreseeable damage, typical for the type of contract, except in the event of intent or gross negligence or injury to life, body or health. The above provisions do not imply a change of the burden of proof to your detriment.

Any form of duplication or distribution of these Application Examples or excerpts hereof is prohibited without the expressed consent of Siemens Industry Sector.

1 Introduction

1.1 Overview

This document is part of SIMOCRANE CMS and refers to the CMS standard application based on SIMATIC WinCC.

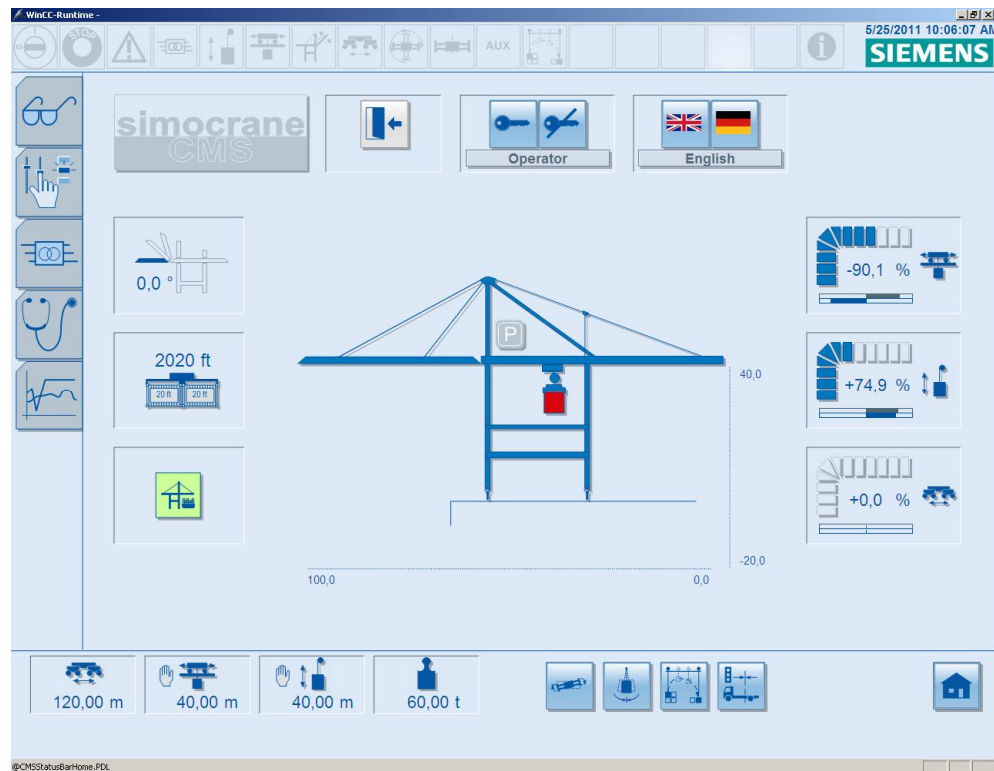

It describes the interface tags of the standard application. The address parameters described in this document are based upon SIMATIC S7.

The CMS standard application provides the following functions for a typical crane application:

- Control- and monitoring functions
- Fault diagnostics
- Acquisition of operational data
- Trends and Trace data display

User interface overview

Figure 1-1: Start screen of the CMS application

Target group

The CMS application addresses project engineers for HMIs in crane applications.

Technical environment

This application was configured with SIMATIC WinCC 7.0 SP3 Upd6.

Purpose of this application

The CMS application provides a basis for a crane application in order to facilitate the start of an HMI project. This document mainly describes the CMS interface.

Delimitations

This application is a template for projects. Before using this application within a project you have to check and if necessary adapt the functionality of the application.

Required skills

Basic knowledge of SIMATIC WinCC is assumed.

1.2 Required Software Components**Standard software components**

The application was created with SIMATIC WinCC V7.0 SP3 Upd6.

Sample files and projects

The following list includes all files and projects that are used in this example.

Table 1-1: Sample files and projects

Component	Note
Application_CMS_4.2.zip	This zip file includes the WinCC project for CMS without RCMS Server
Interface_CMS_V4.2_en.pdf	This document

2 Interface Structure

2.1 General information

Naming conventions

The following naming-convention is used for the Tags in WinCC:

- Shortcut of data type + object-/component-name + tellingly description

Numeric values

All numeric values are transferred in physical units or in percent. The CMS uses no scaling function. Scaling has to be done on the PLC.

Binary values

Binary values are transferred as Byte or Word between PLC and CMS application. The description of binary values in this document distinguishes between two different types:

- Bit monitoring: One precise Bit in the Byte or Word is monitored.
- Status monitoring: The Byte or Word is used for a Status display. Each binary Status in this Byte or Word has to be distinct.

NOTE The Byte order in a Word or Dword might be different on PLC and in the CMS.

- “Little Endian” is the Byte order in the CMS while “Big Endian” is the Byte order on SIMATIC S7.
- Most of the binary information is transferred as Byte to avoid this problem.
- The description of binary data in this document is based upon the addressing of bits in WinCC. You have to swap the Bytes on the PLC if it is necessary.

Figure 2-1: Byte order

Order	Description
Big Endian	The Byte with the most significant bits has the lowest storage address
Little Endian	The Byte with the least significant bits has the lowest storage address

3.16 Technology_Functions

The CMS user interface can be used to adapt settings for advanced technologies (e.g. SIMOCRANE Sway Control or SIMOCRANE TPS):

Figure 3-1: Settings for advanced technologies

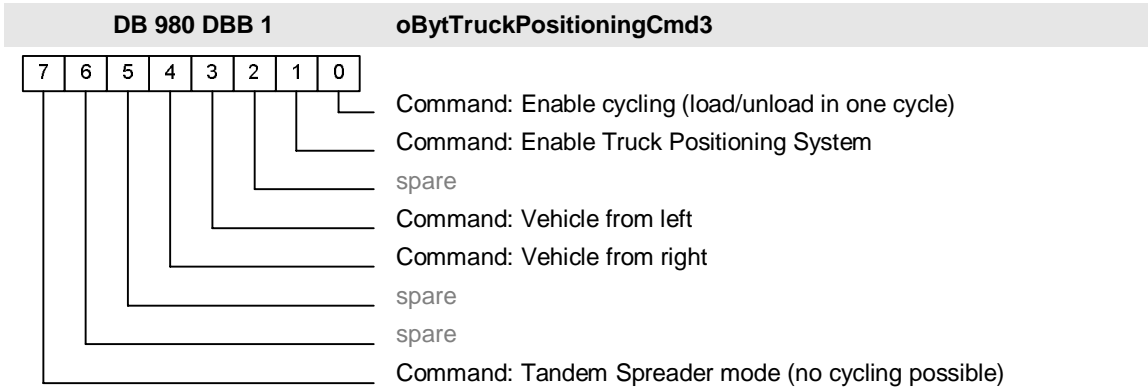

No.	Description
1.	The operator presses a button in the CMS user interface → The color of the button pressed turns yellow.
2.	A command bit is set in the CMS-PLC interface.
3.	The command bit is read in the PLC program and assigned to the correct advanced technology.
4.	The command bit is transferred to the Function-PLC interface (e.g. TPS-PLC).
5.	The advanced technology (e.g. TPS) reacts according to the command bit.
6.	The status bit for the requested function is transferred to the PLC interface again.
7.	The status bit is read in the PLC program.
8.	The status bit is set in the CMS-PLC interface.
9.	The color of the button pressed turns green if the requested function has been activated. Otherwise the color of the button stays yellow.

NOTE This document only describes the tags in the interface with the PLC. You will get further information on the advanced technologies in the documentation of these systems (SIMOCRANE TPS, SIMOCRANE Sway Control).

3.17 Messages

The CMS application is prepared for up to 3008 bit messages. The message bits are merged in Dword Tags.

The following naming convention is valid for the Dword-Tags in the CMS application:

- FDW_Message-bit-Start_Message-bit-End

The following table exemplarily shows the available message tags in the CMS interface:

No.	Address	Tag name	Description	Type
1.	DB 1000 DBD 0	FDW_0001_0032	fault message bits 01 – 32	Dword
2.	DB 1000 DBD 4	FDW_0033_0064	fault message bits 33 – 64	Dword
3.
4.	DB 1000 DBD 372	FDW_2977_3008	fault message bits 2977 - 3008	Dword

3.18 TimeSynch

In the CMS application an action to set the timestamp of the PLC (*PLCTimeSynchronisation*) can be activated by configuring the trigger of that action in the C-Editor. Two types of trigger have to be defined for the action:

- Cyclic trigger (e.g. 1 hour)
- Tag trigger *blnTriggerPLCStartup*

Figure 3-2: Time synchronization

No.	Description
1.	The cyclic trigger (e.g. 1 hour) starts the action <i>PLCTimeSynchronisation</i> : <ul style="list-style-type: none"> • The action writes the timestamp to the time stamp tags in the interface. • The action sets the trigger bit <i>blnTriggerTimeSynch</i> in the interface.
2.	The PLC <ul style="list-style-type: none"> • reads the timestamp tags from the interface • sets the PLC time • resets the trigger bit <i>blnTriggerTimeSynch</i> in the interface
3.	If the PLC is restarted: <ul style="list-style-type: none"> • The PLC sets the start up bit <i>blnTriggerPLCStartup</i> in the interface.
4.	The start up bit <i>blnTriggerPLCStartup</i> starts the action <i>PLCTimeSynchronisation</i> : <ul style="list-style-type: none"> • The action writes the timestamp to the time stamp tags in the interface. • The action sets the trigger bit <i>blnTriggerTimeSynch</i> in the interface.
5.	The PLC <ul style="list-style-type: none"> • reads the timestamp tags from the interface • sets the PLC time • resets the trigger bit <i>blnTriggerTimeSynch</i> in the interface • resets the start up bit <i>blnTriggerPLCStartup</i> in the interface

3.19 MoveData

The CMS acquires a set of move data for each load handling sequence from the PLC. You will find detailed information in the CMS System Manual, Chapter 4.1.8. (See also Related Literature)

Sequence

Figure 3-3: Move data sequence

No.	Description
1.	<p>A load handling sequence (Move) starts.</p> <ul style="list-style-type: none"> • Direct acquisition: The PLC set the start trigger <i>blnMoveStart</i> in the interface. • Buffered acquisition: The PLC stores the start time stamp for this data set and set the start trigger <i>blnMoveStart</i> in the interface. <p>The stop trigger has to be '0' before the start trigger is set.</p>
2.	<ul style="list-style-type: none"> • Direct acquisition: The CMS stores the start time stamp and resets the start trigger <i>blnMoveStart</i> in the interface. • Buffered acquisition: The CMS resets the start trigger <i>blnMoveStart</i> in the interface.
3.	<p>The load handling sequence ends:</p> <ul style="list-style-type: none"> • The PLC stores values of the data set to the interface or to the buffer.
4.	<p>The PLC sets the stop trigger <i>blnMoveStop</i> in the interface.</p> <p>The start trigger has to be '0' before the stop trigger is set.</p>
5.	<ul style="list-style-type: none"> • Direct acquisition: The CMS stores the stop time stamp, reads the data from the interface, writes the dataset to the Tag Logging archive and resets the stop trigger <i>blnMoveStop</i> in the interface. • Buffered acquisition: The CMS reads the data from the interface, writes the dataset to the Tag Logging archive and resets the stop trigger <i>blnMoveStop</i> in the interface.

Timestamps

The time stamps (start time and stop time) of a move data record can be acquired on the PLC or on the CMS-PC.

The first case can be used for data buffering on the PLC. In this case the time stamps are read together with the data set values from WinCC tags in the interface if the stop trigger is set *blnMoveStop* = 1.

NOTICE Timestamps on the PLC have to be decimal coded and 24 h –based. If the timestamp is transferred wrong to the WinCC anyway, please check if the BCD coding had been made in the PLC or in WinCC. This must only be made once.

No.	Address	Tag name	Description	Type

13	shuffle in stack
14	shuffle out stack

3.20 MmbfData

The CMS acquires a set of MMBF data (Mean Moves Between Failure) from the PLC. You will find detailed information in the CMS System Manual, Chapter 4.1.8. (See also Related Literature)

Sequence

Figure 3-4: MMBF data sequence

No.	Description
1.	The MMBF data interval (e.g. 1 month) is active: <ul style="list-style-type: none"> • Direct acquisition: The PLC stores the values of the data set to the interface. • Buffered acquisition: The PLC stores the values and the time stamp of the data set to the interface or to the buffer.
2.	The PLC sets the trigger <i>blnMmbfTrigger</i> in the interface.
3.	<ul style="list-style-type: none"> • Direct acquisition: The CMS stores the time stamp, reads the values from the interface, writes the dataset to the Tag Logging archive and resets the trigger <i>blnMmbfTrigger</i> in the interface. • Buffered acquisition: The CMS reads the values from the interface, writes the dataset to the Tag Logging archive and resets the trigger <i>blnMmbfTrigger</i> in the interface.

Timestamps

The timestamp of the MMBF data record can be acquired on the PLC or on the CMS-PC.

The first case can be used for data buffering on the PLC. In this case the timestamp is read together with the data set values from WinCC tags if the trigger is set.

NOTICE Timestamps on the PLC have to be decimal coded and 24 h –based. If the timestamp is transferred wrong to the WinCC anyway, please check if the BCD coding had been made in the PLC or in WinCC. This must only be made once.

3.22 Counter_Reset

The reset counters are incremented parallel to the total counters on the PLC. The CMS reads the actual values of the reset-counters which can be reset by a reset-bit from the CMS. Each reset-counter has a dedicated reset bit:

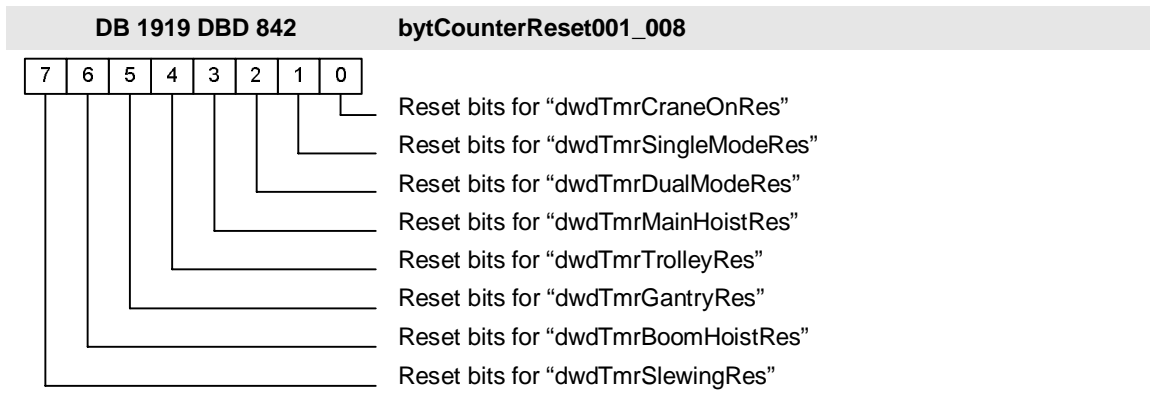

With a button in the CMS user interface the reset bit is set (= 1). With a positive edge of the reset bit the CPU resets the value of the corresponding reset counter. Afterwards the PLC resets the reset bit (= 0) again.

NOTICE Please mind the following naming convention for reset counters:

Total counter → Name (e.g. dwdTmrCraneOn)

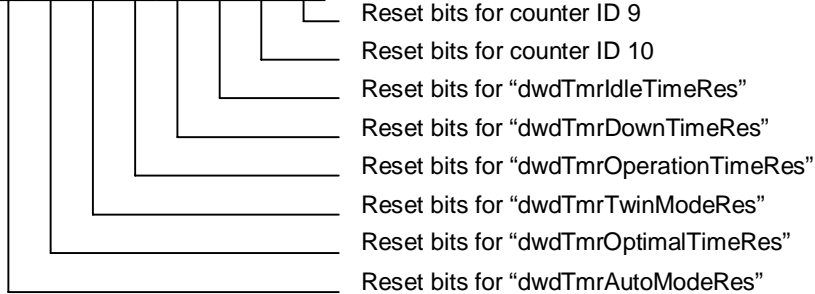

Reset counter → NameRes (e.g. dwdTmrCraneOnRes)

No.	Address	Tag name	Description	Type
1.	DB 1919 DBD 842	bytCounterReset001_008	Reset bits for counter ID 1-8	Byte
